</table>
| glide.ui.html.toolbar | Configures the editing toolbar for HTML fields.  
• Type: string  
• Default value: list of buttons  
• Location: System Properties > UI Properties |
| glide.ui.incident_activity.fields | Defines what fields are visible in the activity formatter. If the activities are personalized, this property updates automatically.  
• Type: string  
• Default value: list of fields  
• Location: System Properties > UI Properties |
| glide.ui.incident_activity.max_addresses | Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).  
• Type: string  
• Default value: 5  
• Location: add to the System Property [sys_properties] table |
| glide.ui.incident_alert_activity.fields | Incident alert activity formatter fields. This is the list of fields tracked from the incident alert form in the activity formatter.  
• Type: string  
• Default value: opened_by, work_notes, comments, severity, estd_distruption_time, actual_disruption_time  
• Location: System Property [sys_properties] table |
| glide.ui.inline.images | Enables (true) or disables (false) use of data URLs for report images.  
• Type: true | false  
• Default value: false  
• Location: Add to the System Property [sys_properties] table |

</tbody>
</table>

### Add a property

Administrators can add or create a property to control system behavior.

Some properties in the system are not visible in an instance by default and must be added to the System Property [sys_properties] table. If a feature requires the addition of a property, use one of the following methods:

- Add the property using [sys_properties.list]
- Create a properties module restricted to an administrator

**Important:** System properties store configuration information that rarely or never changes. Each time you change or add a system property, the system flushes the cache to keep all nodes in the cluster in synch. This cache flush has a very high performance cost for one to ten minutes, which can potentially cause an outage if done excessively. To prevent such outages, do not use a system property to store configuration information that changes more than once or twice a month. Instead, use a custom table to store regularly changing configuration information.

### Add a property using sys_properties.list

Use the [sys_properties.list] to add a system property.

1. Enter `sys_properties.list` in the Navigation filter.
   - The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify the property does not already exist by searching for the property name.
3. Click **New**.
4. Complete the System Property form using the database name of the property. Make sure to specify the correct data **Type** and add the new value that you want the property to use.

Properties that you add already contain default values. You add properties to change this value.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type the name of the property you are creating.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a brief, descriptive phrase describing the function of the property.</td>
</tr>
<tr>
<td>Choices</td>
<td>Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000, Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the appropriate data type from the list (for example, integer, string, or true</td>
</tr>
<tr>
<td>Value</td>
<td>Set the desired value for property. All property values are stored as strings. When retrieving properties via the gs.getProperty() method, treat the results as strings. For example, a true</td>
</tr>
<tr>
<td>Ignore cache</td>
<td>Set this option to true to refresh the cache before processing the property. The cache stores commonly used items in memory such as forms and UI elements. Typically, you only ignore the cache if the system property depends upon a dynamic change on the form, and you want to ensure that the property uses the current value rather than a cached value.</td>
</tr>
<tr>
<td>Private</td>
<td>Set this property to true to exclude this property from being imported via update sets. Keeping system properties private prevents settings in one instance from overwriting values in another instance. For example, you may not want a system property in a development instance to use the same value as a production instance.</td>
</tr>
<tr>
<td>Read roles</td>
<td>Define the roles that have read access to this property.</td>
</tr>
<tr>
<td>Write roles</td>
<td>Defines the roles that have write access to this property.</td>
</tr>
</tbody>
</table>

The completed form looks similar to the following:
5. Submit the form.

Depending on the property name, an admin might be able to change its value only through this new Module. It may also appear in one of the Properties pages in System Properties. For example, any property whose name begins with `glide.ui` automatically appears in the **System Properties > UI Properties** page.

**Note:** If the **Ignore cache** check box is selected, the system flushes the server cache when the parameter is changed.

### Create a system properties module

You can add a module in the application navigator to access the list of system properties. This module makes it easy to add properties to the System Properties table.

1. Navigate to **System Definition > Application Menus**.
2. Search for the application you want to add the properties table to, for example **System Properties**. Select an application that is restricted to the admin role so that non-admin users cannot access it.
3. From the Modules related list, click **New**.
4. Complete the form fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Defines the module name. For example, <strong>All Properties</strong>.</td>
</tr>
<tr>
<td>Application Menu</td>
<td>Specifies the name of the application menu the module appears under. This field should automatically be populated with the name of the application you accessed the Modules related list from.</td>
</tr>
<tr>
<td>Link type</td>
<td>Specifies the type of link this module opens. For a list of system properties, select <strong>List of Records</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Table</td>
<td>Specifies the table used by the module. Select <strong>System Properties [sys_properties]</strong>.</td>
</tr>
</tbody>
</table>

5. Submit the form.
6. Verify that the module was created. For example, navigate to **System Properties > All Properties**.

**HTTP 500 error**

The HTTP 500 error is a generic error message that Internet Explorer passes to you when your web site errors for one reason or another; it provides no useful information.

We can change this setting, to allow you to see and read what the real error is. Good error information is essential to the debugging of any application, and the HTTP 500 error may in fact provide more information to the ServiceNow support team.

To enable Internet Explorer to show you the root cause of any error in your code, you need to make a change in the Internet Options window. You can access the Internet Options window by selecting the **Internet Options** item from the **Tools** menu at the top of Internet Explorer.

1. Select the Advanced tab.
2. Accessing the Advanced options displays a window that contains many settings that can be changed within Internet Explorer. These settings are broken down into categories. The category we are interested in is the Browsing Category.
3. Scrolling down the window will bring you to the **Show friendly HTTP error messages** checkbox. By default this box is checked in order to hide the real error from users. Once you have located this checkbox, remove the check and click the **OK** button.

You can now report any problem pages that you have had difficulty with and see the real error message that is being generated. Once you can see what the real error message is, then providing debugging information to the ServiceNow support team becomes so much easier.

**Query join and complexity size limits**

The ServiceNow ITSA Suite platform uses a relational database to store data. Retrieving data can involve multiple joins to create a single result set. While these joins are usually simple, in certain cases the system may issue very large joins to bring together large numbers (>20) of tables.
Database engines normally handle multiple joins quite well. The relational model assumes joins are cheap and efficient, and this is usually true. Rarely, however, exceedingly large joins may cause a database performance issue.

To mitigate this potential complexity, use the following property to limit join complexity and size. Navigate to System Properties > System to find the property with the description, Max number of database joins per query. Smaller values cause the system to issue a larger number of less complex queries. Larger values reduce the number of queries at the cost of additional complexity per query. In the absence of known database issues stemming from large join counts, this property should remain unchanged.

<table>
<thead>
<tr>
<th>Max number of database joins per query. Smaller values cause the system to issue a larger number of less complex queries. Larger values reduce the number of queries at the cost of additional complexity per query. In the absence of known database issues stemming from large join counts, this property should remain unchanged.</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
</tr>
</tbody>
</table>

**Figure 415: Query complexity limits**

This property specifies the maximum number of joins the system prefers to do. In certain edge cases, more complex queries might need to be issued, but generally no more than this number of joins will be issued. e.g., a value of 10 will result in no more than 10 tables being joined together in any given query.

The system must compensate for the fewer joins by issuing more queries to retrieve necessary data, so tuning this number down will result in more queries being sent to the database. In most cases, tuning this parameter is counterproductive.

**Note:** In the absence of known database issues stemming from large join counts, this parameter should remain unchanged.

### Tables and classes

If a table is not included in this list, it does not extend another table.

A table can "extend" another table.

A table that extends another table is called a child class, and the table it extends is the parent class.

If a table is extended, but itself is not extending another table, it is then called a base class.

For a child class record, the database stores new fields unique to the child class and stores the rest of the fields in the parent class. This means that one record in a child class exists both in the child class and the parent class. The record in the child class has a corresponding record (with the same sys_id identifier) in both the parent and child classes, which will always be accessed together as one record by the platform. When a record in one class is deleted, the platform automatically deletes its counterpart in its matching class.

**Important:** If you edit a field on a child table that is present on the parent table, you will also change it for the parent table and all other child tables.

To see the relationships between classes, use the schema map.

The following is a table of tables in the platform that extend other tables:

**Note:** If a table is not included here, it does not extend another table.

**Set up Section 508 compliance features**

Follow the instructions on this page to set up the ServiceNow Section 508 compliance features.

The ServiceNow platform includes features that support several specifications in the *Section 508 of the US compliance code* to make the interface accessible to users with disabilities. These features improve the user experience when using ServiceNow with screen readers and keyboard navigation.

- Enable the Section 508 accessibility feature.
- Disable the list editor feature.
• [Recommended] Customize the colors of mandatory field status indicators from the default settings to create greater contrast.

Enable the section 508 accessibility feature for UI16 and UI15

Alternative text is included for images throughout the user interface. Settings control the rendering of alternative text for screen readers in place of images and allows skip links to work more effectively.

Users can enable the Section 508 accessibility feature by selecting the Accessibility Enabled check box in the system menu. This enables accessibility for the current user.

System administrators can enable the Section 508 accessibility feature for all users:

1. Navigate to User Administration > User Preferences.
2. Select the glide.ui.accessibility preference.
3. Set the Value field to true.
4. Set the System field to true.

Enable the Section 508 accessibility feature for UI11

Alternative text is included for images throughout the user interface. Settings control the rendering of alternative text for screen readers in place of images and allows skip links to work more effectively.

The system administrator and users with the itil role can enable the glide.ui.section508 property and provide accessibility for all users.

1. Navigate to System Properties > UI Properties.
2. Select the check box for the following property: Controls rendering of alternate text. By default alternate text is NOT rendered (false).
3. Click Save.

Disable the list editor feature

The glide.ui.list_edit property controls list editing, which allows users to edit field values directly from a list without navigating to a form. When using the ServiceNow system with assistive technologies, disable this feature to allow users to tab between fields more quickly. The default value is true, which enables the list editor.

1. Navigate to System Properties > UI Properties.
2. Clear the check box for the Enable list editing property.
3. Click Save.

Change the color of mandatory field status indicators

Each element in a form can display a colored indicator to the left of the label. These field status indicators enable administrators to highlight certain fields and give status information to users.

The default indicators are:

• Red: mandatory field needs a value
• Light red: mandatory field has a value
• Green: field has changed
• Orange: your security access does not let you modify the field value

A system administrator can customize the colors of these field status indicators to be black and white or some other color combination with high contrast for easier viewing.
The field status indicator is accessible to assistive technologies such as screen readers, which read aloud the state of the field rather than the display color. The Alt and Tooltip fields are used to specify this alternative text.

See the following websites for information about CSS color declarations (including hex or RGB notation):

- HTML Colors (W3CSchools) for more information on hex and RGB notation.
- HTML Color Names (W3CSchools) for valid color names.

Use skip links

Skip links allow users to quickly navigate to the main content on a page, list, or form, bypassing icons, banner text, navigation links, and other elements.

The user interface includes skip links to the navigation menu, the content pane and, in UI11, to the form currently displayed in the content pane.

![Skip link image](image)

**Figure 416: Skip link**

- **Skip to Navigation Menu**: skips to the navigation filter in the application navigator.
- **Skip to Navigation Content**: skips to the first selectable field or link in the main content pane.
- **Skip to Form Content**: in UI11, skips to the first selectable field in the open form pane; if the form pane is not open, this link does not work.

**Attention**: You must enable the accessibility feature in order for skip links to work.

You may need to press the Tab key several times to move through the buttons in the Edge, the gray toolbar on the left side of the screen, to reach the skip links. When selected, skip links appear in the upper left corner of the user interface.

- Use the Tab and Shift+Tab keys to move forward and back through the skip links and other selectable fields.
- When a skip link is highlighted (outlined in blue), press Enter to select the link.

Tips for using search methods

There are several ways to search for information in the ServiceNow user interface.

- List views include a Go to search field in the list title bar. Using the * wildcard character in the search text allows you to perform a contains search rather than a starts with search. This type of query may take a little longer to run but can save keystrokes. You can also use several other wildcards with list searches.
• The navigation filter in the application navigator filters the applications and modules that appear in the navigator based on the entered text. To open a module, click the module name, or press the Down Arrow to highlight the module name, and then press Enter.

See *Available search options* on page 1068 for more information about these search methods.

**Web proxy**

Several ServiceNow properties support web proxy configuration.

**Basic proxy setup**

Use certain properties to manage connections to a ServiceNow instance through a proxy server.

Use the following properties to manage connections to a ServiceNow instance through a proxy server.

**Note:** Set these properties from the System Properties [sys_properties] table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.proxy_host</td>
<td>Specify the proxy server hostname or IP address.</td>
<td>proxy.company.com, 192.168.34.54</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Default value: none</td>
<td></td>
</tr>
<tr>
<td>glide.http.proxy_port</td>
<td>Specify the port number for the proxy server.</td>
<td>8080, 9100</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Default value: none</td>
<td></td>
</tr>
<tr>
<td>glide.http.proxy_username</td>
<td>Specify the username used to authenticate the proxy server.</td>
<td>proxyuser</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Default value: none</td>
<td></td>
</tr>
<tr>
<td>glide.http.proxy_password</td>
<td>Specify the password used to authenticate the proxy server.</td>
<td>password</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Default value: none</td>
<td></td>
</tr>
<tr>
<td>glide.email.override.url</td>
<td>Set the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do.</td>
<td><a href="https://servicenow.customerdomain.com/production/nav_to.do">https://servicenow.customerdomain.com/production/nav_to.do</a></td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Default value: instance URL</td>
<td></td>
</tr>
</tbody>
</table>
NTLM authentication

NTLM is the most complex of the authentication protocols supported by a basic web server.

NTLM is the most complex of the authentication protocols supported by a basic web server such as HttpClient. It is a proprietary protocol designed by Microsoft with no publicly available specification. Early versions of NTLM were less secure than Digest authentication due to faults in the design. However, these were fixed in a service pack for Windows NT 4 and the protocol is now considered more secure than Digest authentication.

NTLM authentication requires that an instance of NTCredentials be available for the domain name of the server or the default credentials. Since NTLM does not use the notion of realms, HttpClient uses the domain name of the server as the name of the realm. Also, the username provided to the NTCredentials should not be prefixed with the domain:

- Correct: adrian
- Incorrect: DOMAIN\adrian

There are some significant differences in the way NTLM works compared with basic and digest authentication. These differences are generally handled by HttpClient. However, having an understanding of these differences can help you avoid problems when using NTLM authentication.

- NTLM authentication works almost exactly the same as any other form of authentication in terms of the HttpClient API. The only difference is that you need to supply NTCredentials instead of UsernamePasswordCredentials (NTCredentials actually extends UsernamePasswordCredentials so you can use NTCredentials right throughout your application, if needed).
- The realm for NTLM authentication is the domain name of the computer being connected. This can be troublesome because servers often have multiple domain names. Only the domain name that HttpClient connects to, as specified by the HostConfiguration, is used to look up the credentials. While initially testing NTLM authentication, it is best to pass the realm in as null, which is used as the default.
- NTLM authenticates a connection and not a request. So you need to authenticate every time a new connection is made and keeping the connection open during authentication is vital. For this reason, NTLM cannot be used to authenticate with both a proxy server and the web server, nor can NTLM be used with HTTP 1.0 connections or web servers that do not support HTTP keep-alives.

Note: Set these properties from the System Properties [sys_properties] table.

Table 319: NTLM authentication

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.proxy_ntusername</td>
<td>Specify the username used to authenticate the proxy server with NTLM authentication.</td>
<td>username</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
Proxy servers for SOAP clients

Administrators can specify separate proxy settings for SOAP clients, such as the MID Server or ODBC Driver.

To specify a proxy server for a MID Server, see MID Server configuration. To specify a proxy server for the ODBC driver, see ODBC via proxy servers on page 3488.

Bypass the proxy server

Administrators can configure ServiceNow to bypass the proxy server for specific URLs or URL patterns. Typically, internal addresses do not need a proxy server for SOAP communications.

Table 320: Bypass the proxy server

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.proxy_bypass_list</td>
<td>Specify the semicolon-separated list of addresses that bypass the proxy server. Use an asterisk as a wildcard character to specify all or part of an address.</td>
<td>127.0.0.1;*.internal.com;localhost</td>
</tr>
</tbody>
</table>

Data management

Data in ServiceNow is stored and managed according to a principled structure that administrators can view and configure. Data management functions include importing, exporting, and archiving database data and configuring fields and tables.

- The data is stored in database tables and records.
- Various tools exist to manage this data.
• The schema map displays CI relations graphically.
• Data dictionary tables store structure and relationship definitions.
• Various plugins provide additional functionality.
• Data import and export simplifies managing large sets of data through import maps and a number of exportable formats.
• Field normalization makes records more readable and prevents duplication of data.
• Scripting support allows for advanced customizations and automation of data management.

Database structure

All of the information in the instances is stored in tables, which consist of a series of records. The record in turn holds a series of fields that hold the individual bits of data and can be viewed either as a list or a form.

Tables can be related to each other in the following ways:

• **Extensions**: A table can extend another table. The table doing the extending (child class) includes all of the fields of the other table (parent class) and adds its own fields. For instance, the Incident [incident] table has all of the Task [task] table fields (because an incident is a special form of task) and has its own incident-specific tasks.

• **One-to-Many**: Within a table, a field can hold a reference to a record on another table. There are three types of one-to-many relationship fields:
  - Reference Field: allow a user to select a record on a table defined by the reference field. For instance, the **Caller** field on the Incident table allows the user to select any record on the User table.
  - Glide List: allows a user to select multiple records on a table defined by the glide list. For instance, the **Watch list** field on the Incident table allows the user to select records on the User table.
  - Document ID Field: allows a user to select a record on any table in the instance. These fields are much less common, but one example is the **Document** field on the Translated Text [sys_translated_text] table.

• **Many-to-Many**: Two tables can have a bi-directional relationship, so that the related records are visible from both tables in a related list.

• **Database Views**: Two tables can be joined virtually with Database Views to enable reporting on data that might be stored over more than one table.

Data management tools

There are a number of tools that can help manage data within the instance.

**Schema Map**

The Schema Map displays the relationships between tables visually, helping to navigate through the database structure.

The Schema Map provides an interface for viewing the relationships between tables. The inter-table relationships it captures include many-to-many relationships, tables that extend other tables, and tables that reference other tables through reference fields.

**Data Dictionary Tables**

Data dictionary tables holds information that defines the database and can be accessed for information on the database schema.
These tables hold important information on the database and its structure:

- **Tables [sys_db_object]**: contains a record for each table.
- **Dictionary Entries [sys_dictionary]**: contains additional details for each table and the definition for every column on each table. Each row represents either a column on a table or a table.
- **Field Labels [sys_documentation]**: contains the human-readable labels and language information.

**Table Cleaner**

Table cleaner automatically deletes records on certain tables to prevent data growing exponentially.

The system automatically deletes records from specific tables after a specific time to deletion. Deleting these records automatically prevents the tables from growing to an unmanageable size. The time before a record is deleted begins on the date and time value in the tracked field.

The Table Cleaner scheduled job runs the table cleaner every hour. To view the list of tables that are auto-cleaned, in the Navigator filter, type: `sys_auto_flush_list.do`.

All records with `MatchField < (current_time - Age in seconds)` are deleted.

- The **MatchField** field represents a Date/Time column in the table that you are trying to clean up.
- The **Age in seconds** field represents a value in seconds.

You can set up multiple table cleaner entries for a particular table. Performance depends on the size of the table and the conditions used. For example, if you use a custom column in a very large table that has no index on, performance is severely degraded. Performance also depends on the number of rows to be deleted.

**Table 321: Cleaned tables**

Data management plugins

There are a few plugins that extend the data management functionality.

Plugins that extend the data management functionality

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Archiving plugin</td>
<td>provides the ability to archive records to minimize performance issues</td>
</tr>
<tr>
<td>Database Rotations plugin</td>
<td>provides tools for managing large tables to minimize performance issues</td>
</tr>
<tr>
<td>Discovery plugin</td>
<td>provides the ability to auto-populate the CMDB with data about hardware, software, and networks</td>
</tr>
<tr>
<td>Domain Support plugin on page 1439</td>
<td>provides the ability to separate an instance into different distinct domains</td>
</tr>
<tr>
<td>Many to Many Task Relations plugin on page 1438</td>
<td>provides the ability to define many-to-many relationships between task tables</td>
</tr>
</tbody>
</table>

Data Rotations plugin

The Database Rotations plugin mitigates performance issues caused by large tables by breaking up overly-large tables into a series of smaller tables, through two methods:

- Table Rotation: sets up multiple tables for the same purpose that the platform uses on a rotating basis, deleting old information as it goes.
- Table Extension: creates new tables for the same purpose as the platform fills old tables.

Many to Many Task Relations plugin

The Many to Many Task Relations plugin allows administrators to manage the many-to-many relationships between task tables and record the relationship in more detail beyond Parent > Child.
Domain Support plugin

The Domain Support plugin provides a method for separating an instance into different domains, including partitioning data and securing the domains so that only members of the domain can see the data from their domain. The Data Separation part of the plugin can be implemented separately, if desired.

Data import and export tools

Tools are available for exporting to and importing data from an instance.

**Note:** In addition, data can be imported or exported with web services. LDAP data can be accessed with the LDAP integration in the base system.

Data export tools

The following tools are available to export data from an instance:

- Manually exporting from a record list.
- Exporting data on a schedule with scheduled reports.
- Exporting data with a URL parameter.
- Exporting data with a .NET application.

Data import tools

The following tools are available to import data from an instance:

- Manually importing from a record list.
- Importing data with import sets.
- Accepting external data onto the ECC queue.

Import and export properties page

You can use the Import Export Properties page to configure import and export properties.

To access the page, navigate to **System Properties > Import Export**.

The page lists properties categorized by either import or export, and by data format such as CSV or XML. The **Current Value** appears in black if a custom value is set, or in grey if no custom value is set.

Field normalization features

Field Normalization includes two features: normalization and transformation.

Normalization

Normalization forces the ServiceNow platform to convert different forms of the same field value to a single, accepted value automatically. By forcing a field to use a simple, recognizable description for multiple variations of the same thing, normalization can eliminate duplicate records and make searches easier. In addition to reconciling different forms of the same value in fields, normalization can be configured to adjust queries automatically to return normalized results.
Transformation

Transformation enables an administrator to transform raw field input into standardized values that are more meaningful to an organization. An example of a standardized value might be to round RAM size in configuration items to a whole number, such as 4000 MB instead of 4112 MB. Transformations are controlled by parameters and conditions and can be configured to return transformed values in queries.

Data management scripts

ServiceNow provides a robust platform for managing and manipulating data through scripts. The primary API for querying and manipulating data in tables within an instance is GlideRecord.

Data dictionary tables

These tables provide data dictionary, data modeling, and entity relationship information:

- **Tables** [sys_db_object]: contains a record for each table.
- **Dictionary Entries** [sys_dictionary]: contains additional details for each table and the definition for every column on each table. Each row represents either a column on a table or a table.
- **Field Labels** [sys_documentation]: contains the human-readable labels and language information.

Tables

The Tables [sys_db_object] table contains a record for each table in the database.

Access the Tables list by navigating to System Definition > Tables. Administrators can create a custom table, add or modify columns in a searchable and sortable embedded list, and define the auto-number format.

The following image shows a list of the tables that extend the Task table.
Dictionary Entries

The Dictionary Entries [sys_dictionary] table, also called the System Dictionary, defines every table and field in the system. It contains information about a field's data type, character limit, default value, dependency, and other attributes.

Access the system dictionary in one of these ways:

- To see the system dictionary list view, navigate to System Definition > Dictionary.
- To view particular dictionary definition, right-click the list header, form header, or field label, and select Configure Dictionary.

The following image shows a filtered list of dictionary entries for the Incident table and the Task table, which it extends.
Field Labels

The Field Labels [sys_documentation] table, also called the Language File, contains information about the labels and hints for each table and column in the system.

Access the language file in one of these ways:

- To see the list view, navigate to System Definition > Language File.
- To see the field label for a particular field, right-click the field label on the form.

The following image shows the language file filtered to display only labels on the Incident table.
The system dictionary is a table, called Dictionary Entry [sys_dictionary], that contains details for each table and the definition for every column on each table in an instance.

Each row in the system dictionary represents either a table or a column in one of the tables. The system dictionary provides options for administrators to modify tables and fields, which in turn define lists and forms.

Use caution when changing system dictionary records because changes can have a high impact on functionality. In particular, changes to dictionary entries for system tables, which are tables that begin with sys_, can create system-wide issues such as the inability to use update sets.

Dictionary changes are difficult to reverse. Also, dictionary changes automatically apply to all extended tables unless a dictionary override is defined. Be sure that changes are well-tested before applying them to a production instance.

Dictionary entry creation options
When you create a field from the system dictionary, it is automatically added at the end of the first section of the default form view.

In most cases, use the following interfaces rather than creating entries directly on the system dictionary:

• To create new tables and fields, use the Tables module.
• To create new fields, configure the table form.

**Dictionary overrides**

Dictionary overrides provide the ability to define a field on an extended table differently from the field on the parent table.

For example, for a field on the Task [task] table, a dictionary override can change the default value on the Incident [incident] table without affecting the default value on Task [task] or on Change [change].

Administrators can override these aspects of a field:

- Reference qualifiers
- Dictionary attributes
- Default values
- Calculations
- Field dependencies
- Default column display values
- Mandatory and read-only status

**Define a dictionary override**

Define dictionary overrides from a related list on the *dictionary entry* form for the field. You can add dictionary overrides only on tables that are in the same scope as the dictionary override.

1. Navigate to **System Definition** > **Dictionary**.
2. Open the record for the field.
3. In the **Dictionary Overrides** related list, click **New**.
4. Fill in the fields on the form, as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the extended table to which the dictionary override applies.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the dictionary override.</td>
</tr>
<tr>
<td>Override reference qualifier</td>
<td>Select the check box to display the <strong>Reference qualifier</strong> field, which overrides the <strong>reference qualifier</strong> for the field on the extended table.</td>
</tr>
<tr>
<td>Override dependent</td>
<td>Select the check box to display the <strong>Dependent</strong> field, which overrides the field on which the current field depends.</td>
</tr>
<tr>
<td>Override attributes</td>
<td>Select the check box to display the <strong>Attributes</strong> field, which overrides the <strong>dictionary attributes</strong> for the field on the extended table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Any attributes defined on the base table are ignored. If there are attributes on the base table that should still apply to the extended table, make sure to include them in this field.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Override default value</td>
<td>Select the check box to display the Default Value field, which overrides the default value for the field on the extended table.</td>
</tr>
<tr>
<td>Override calculation</td>
<td>Select the check box to display the Calculation field, which overrides the calculation of the value for the field on the extended table.</td>
</tr>
<tr>
<td>Override mandatory</td>
<td>Select the check box to display the Mandatory field, which overrides whether the field on the extended table must contain a value to save a record.</td>
</tr>
<tr>
<td>Override read only</td>
<td>Select the check box to display the Read only field, which overrides whether a user can change the field value on the extended table.</td>
</tr>
<tr>
<td>Override display value</td>
<td>Select the check box to use this field as the display value on the extended table. For example, the Story [rm_story] table uses the short description as the display value in reference fields instead of the number, as defined in the Task [task] table.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

### Modify a dictionary entry from a form
You can modify dictionary entries by configuring a field on a form.

1. Navigate to a field on a form.
2. Right click the field and select **Configure Dictionary** or **Show <field name>**.
   - The system dictionary entry for the field opens.
3. Update the dictionary entry fields.
4. Click **Update**.

### Modify Dictionary Entries from the Dictionary module
You can modify table and field dictionary entries from the Dictionary module.

1. Navigate to **System Definition > Dictionary**.
2. Click an entry for a field or table. Entries for tables have **Type** set to **Collection**.
3. Update the dictionary entry fields.
4. Click **Update**.

### Dictionary entry form
The Dictionary Entry form was redesigned to provide an Advanced view and additional fields. You might need to configure the form to see all fields.
### Table 322: Dictionary Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
<td>Defines the table in which the element is created.</td>
</tr>
<tr>
<td>Note:</td>
<td>This list shows only the tables that meet the scope protections for adding fields. See.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Defines the field type of the column or, if the type is Collection, indicates that the dictionary entry represents the table.</td>
</tr>
<tr>
<td></td>
<td>You can change the type of a field. To preserve existing data, only change between logical types that map to the same physical type on the database. For example, Choice and String.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Enables or disables the field. When this check box is cleared, the field is not used by the system.</td>
</tr>
<tr>
<td><strong>Read only</strong></td>
<td>Determines whether users can change the field value. When this check box is selected, users cannot change the value. The data for the field is calculated and displayed by the system.</td>
</tr>
<tr>
<td>Note:</td>
<td>You can override this option for extended tables.</td>
</tr>
<tr>
<td><strong>Audit</strong></td>
<td>Enables or disables auditing for a table. Turning on Auditing (History) for a Table.</td>
</tr>
<tr>
<td>Note:</td>
<td>This option only applies to tables.</td>
</tr>
<tr>
<td><strong>Text index</strong></td>
<td>Determines whether searches index the text in a table.</td>
</tr>
<tr>
<td>Note:</td>
<td>This option only applies to tables. To exclude fields from indexing, see Remove an Index for a Specific Field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Column label</td>
<td>Defines a unique label for the column. The label appears on list headers and form fields for the column.</td>
</tr>
<tr>
<td></td>
<td>• Updating the <strong>Column label</strong> field also updates the label in the language file (for the current language).</td>
</tr>
<tr>
<td></td>
<td>• When you create a new column, the column name is populated automatically based on the label, which is prefixed with u_ to indicate that it is custom. For example, if you enter <strong>Activity Description</strong> as the column label, the column name defaults to u_activity_description.</td>
</tr>
<tr>
<td>Column name</td>
<td>Defines the field name of the column. When you create a new field, this name is populated automatically based on the label and a prefix as follows:</td>
</tr>
<tr>
<td></td>
<td>• For a field on a table in a different scope, the name is prefixed with the scope to indicate that it is custom and not part of that application.</td>
</tr>
<tr>
<td></td>
<td>• For a field on a table in the same scoped application, the name does not have a prefix, which indicates that it is part of the application.</td>
</tr>
<tr>
<td></td>
<td>• For a field in a global application the name is prefixed with u_ to indicate that it is custom.</td>
</tr>
<tr>
<td></td>
<td>You cannot modify the prefix; however, you can modify the rest of the name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). You cannot change the name of an existing dictionary record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Max length | Provides a logical limit for the size of string fields to determine how the system displays them in the user interface and how to map them to physical database data types.  
String fields with a length under 255 characters appear as a single-line text fields. String fields with a length over 254 characters appear as a multi-line text box.  
The system maps the field length to the closest physical data type available on the database. In some cases this results in significantly more available length than originally specified. For example, entering a length of 50 maps to the closest physical data type of VARCHAR(100), which provides up to a 100 character limit or double the requested field length. Likewise, entering a length of 1000 maps to the closest physical data type of MEDIUMTEXT, which provides up to a 4000 character limit or four times the requested field length. |
| Note: | You can only change this value for a **String** field. Changes for any other type of field are ignored.  
Users on an Oracle instance cannot increase the maximum length of a string field to anything greater than 4000 through the application UI as this requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with technical support to request the change.  
To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field will result in data loss. For a base system field, you cannot make a change that will result in data loss. |
<p>| Mandatory | Determines whether this field must contain a value to save a record. For more information, see <strong>Creating Mandatory Fields</strong>.                                                                                          |
| Note: | You can override this option for extended tables.                                                                                                  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Indicates that this field is the display value for reference fields. Set this to true for the one field whose value you want to use as the text displayed in links to this table on lists and forms. By default, the Number field is the display value for all task tables.</td>
</tr>
</tbody>
</table>

**Note:**
- This option does not control whether a list or form displays this field as part of the layout. Instead, see List Configuration and Personalizing Forms.
- The display value becomes part of the form title when viewing an individual record from a table.
- You can set a different display value on an extended table than the display value on a parent table by using a dictionary override.

<table>
<thead>
<tr>
<th>Attributes [Advanced view]</th>
<th>Alters the behavior of a field or functionality that depends on the field. For more information, see Dictionary Attributes. Attributes can be overridden for extended tables with dictionary overrides. You can also configure attributes for this dictionary entry through the Attributes related list.</th>

<tr>
<td></td>
<td>• Dynamic: A dynamic filter that you can use to build the qualifier.</td>
</tr>
<tr>
<td></td>
<td>• Advanced: A static encoded query string or JavaScript code that you can use to build the qualifier.</td>
</tr>
<tr>
<td>Reference qual condition</td>
<td>Specifies a condition when the reference qualifier runs if the Simple qualifier type is selected.</td>
</tr>
<tr>
<td>Dynamic ref qual [Advanced view]</td>
<td>Specifies the dynamic filter that determines the reference qualifier when the Dynamic qualifier type is selected.</td>
</tr>
<tr>
<td>Reference qual [Advanced view]</td>
<td>Filters the records available for a reference field if the Advanced qualifier type is selected. Reference qualifiers can be overridden with dictionary overrides.</td>
</tr>
<tr>
<td>Reference key [Advanced view]</td>
<td>Identifies a field other than sys_id to use as the unique identifier for reference fields.</td>
</tr>
<tr>
<td>Reference cascade rule [Advanced view]</td>
<td>Defines what happens to a record if the record it references is deleted. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Clear: clears the references (default).</td>
</tr>
<tr>
<td></td>
<td>• Delete: deletes all referencing records.</td>
</tr>
<tr>
<td></td>
<td>• Restrict: prevents record deletion if there is a referencing record.</td>
</tr>
<tr>
<td></td>
<td>• None: does not change referencing records.</td>
</tr>
<tr>
<td>Reference floats [Advanced view]</td>
<td>Enables the Edit button on related lists for one-to-many relationships.</td>
</tr>
<tr>
<td>Dynamic creation [Advanced view]</td>
<td>For reference fields, determines whether entering a value that does not match an existing record creates a new record on the referenced table. If selected, use the Dynamic creation script field to define how to create the new record.</td>
</tr>
<tr>

<tr>
<td>Calculated Value</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Calculated [Advanced view]     | Determines whether the value of the field is calculated from other values. If selected, use the Calculation field to define how the calculation is performed. When sorting or grouping by a calculated field, the sort order is based on the field value from the last time the field was updated, not the last time the field was displayed.  

**Note:** In relation to business rules, calculated fields are populated first before any business rule, even a before business rule, is run. Calculated fields are then populated again if necessary after any before business rules run.  

| Calculation [Advanced view]    | When the Calculated field is selected, allows you to enter a script for calculating the value of the field. These can be overridden for extended tables with dictionary overrides. You can use the current object in this script. Just as with access control rules, the script can:  

• Evaluate to true or false.  
• Return an answer variable set to true or false.  
• Set a field value directly, such as:  
  
  `current.display_name="name"`.  

<table>
<thead>
<tr>
<th>Additional fields</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>Identifies the table that the current table extends. Tables that do not extend other tables specify their own name in this field. For more information, see Tables and Classes.</td>
</tr>
<tr>
<td>Defaultsort</td>
<td>Obsolete. See Default list sort order.</td>
</tr>
<tr>
<td>Size class</td>
<td>Determines whether the platform handles this table as a large table by reducing the amount of memory stored for each row during queries. There is a scheduled job which runs and sets the value of this field.</td>
</tr>
<tr>
<td>Spell check</td>
<td>Enables or disables spell check on the field. For more information, see Adding Spell Check to a Field.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique</td>
<td>Requires the field value to be unique.</td>
</tr>
<tr>
<td>Warning:</td>
<td>Making a field unique when the corresponding table already has different</td>
</tr>
<tr>
<td></td>
<td>values for that field causes data loss. Before you enforce uniqueness on a</td>
</tr>
<tr>
<td></td>
<td>field, verify that no records in the table for the field have values, or</td>
</tr>
<tr>
<td></td>
<td>that they all have the same value.</td>
</tr>
</tbody>
</table>

### UI action

| Default view or Advanced view | Changes the form view to the default or advanced view. The fields change based on the view. If you are using the default view, you must write a script to accomplish the same tasks that advanced view fields provided. |

### Related Lists

| Access Controls | Provides access to the Access control rules on page 2498 that permit or limit access to the data in the table. |
| Choices         | Provides access to the options in the choice list field you are editing. |
| Dictionary overrides | Provides access to the dictionary overrides for this field. |
| Attributes      | Provides access to the dictionary attributes for this entry. |
| Labels          | Provides access to the labels used for the table or field you are editing. |

### Default list sort order

The system automatically sorts lists that meet one of the sort order criteria.

1. If there is a user preference specifying the sort order for the table, the system sorts by the field listed in the user preference.
2. If the table is the Task table or any of its extensions, the system sorts by the **Number** field.
3. If the table contains a field with the attribute isOrder=true, the system sorts by this field.
4. If the table contains an **Order** field, the system sorts by this field.
5. If the table contains an **Number** field, the system sorts by this field.
6. If the table contains an **Name** field, the system sorts by this field.

### Dictionary attributes

Dictionary attributes alter the behavior of the table or element that the dictionary record describes. Administrators can add or modify dictionary attributes.

#### Adding an Attribute
To add an attribute to a table or field, navigate to the **System Dictionary** record for the Dictionary entry, and add the attribute to the **Attributes** field. Attributes are comma-separated; if attributes already exist on a dictionary record, add a comma, with no spaces, before adding a new attribute.

For an attribute that accepts `true/false` values:

- To specify a value of **true**, you can either enter `attribute` or `attribute=true`.
- To specify a value of **false**, you can either ensure that the attribute does not appear or enter `attribute=false`. To maintain values during upgrades, do not remove an attribute that is on a table by default.

**Maintaining Attribute Values for Upgrades**

If you remove an attribute that is part of the base system, it is automatically restored during an upgrade. To prevent upgrades from changing the desired behavior of your system, leave the attribute on the table or field, but set its value as desired.

For example, if a field has the attribute `knowledge_search=true` by default, do not remove the attribute to set it to false; rather set it to `knowledge_search=false`.

**Available attributes**

This table lists the available dictionary attributes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Target Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_null</td>
<td>true/false</td>
<td>field_name field</td>
<td>If present or true, allows entering &quot;None&quot; as the field</td>
</tr>
<tr>
<td>allow_references</td>
<td>true/false</td>
<td>field_name field</td>
<td>If true, a tree is displayed to select from that includes reference fields so you can dot-walk.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>----------------</td>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>approval_user</td>
<td>name of field containing the user(s) for the approval type this field represents</td>
<td>integer field</td>
<td>The fields of the table are used to perform the lookup using a matcher. Approvals are specified as fields in the table that have an attribute of <code>approval_user=&lt;field_name&gt;</code>, where <code>&lt;field_name&gt;</code> indicates the field in the table that contains the users for this approval type. Fields with this attribute contain an integer value that indicates the sequence for the approvals. All approval fields with the same sequence number indicate that multiple approvals are required before continuing. Approvals are requested in the order of the sequence numbers. For example, all approvals with sequence number 100 must be approved before approvals with sequence number 200 are requested.</td>
</tr>
<tr>
<td>attachment_index</td>
<td>true/false</td>
<td>any table</td>
<td>If true, attachments on the table are indexed for search purposes. See <a href="#">Enable attachment indexing on a table</a> on page 1104.</td>
</tr>
<tr>
<td>barcode</td>
<td>true/false</td>
<td>string field</td>
<td>Allows a string field in the <a href="#">Mobile app UI</a> on page 1117 to access a mobile device's camera to scan and process a bar code.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>

<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------</td>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>base_table</td>
<td>name of base table type</td>
<td>table_name</td>
<td>A table_name field allows the user to choose any table derived from the table specified by this attribute. By default, the base table itself is also included in the choice list (but see skip_root to turn off this behavior).</td>
</tr>
<tr>
<td>calendar_elements</td>
<td>list of field names, separated by semicolons (&quot;;&quot;)</td>
<td>any calendar event</td>
<td>Specifies a list of fields to be used when constructing the description of a calendar event. If not specified, the usual display name plus short description are used. The calendar_elements attribute does not support derived (dot-walked) fields.</td>
</tr>
<tr>
<td>collection_interval</td>
<td>interval specified as &quot;HH:MM:SS&quot; (like &quot;01:02:30&quot; for one hour, two minutes, and thirty seconds)</td>
<td>collection field</td>
<td>Specifies the interval of metrics collection.</td>
</tr>
<tr>
<td>close_states</td>
<td>inactive state integer values</td>
<td>task state</td>
<td>Used by the TaskStateUtil API - identifies the list inactive state values delimited by semicolons (;)</td>
</tr>
<tr>
<td>critical</td>
<td>true/false</td>
<td>any field in the apm_application table</td>
<td>Defines fields that are critical information about an application. This allows tracking the entry of critical information.</td>
</tr>
<tr>
<td>current_location</td>
<td>true/false</td>
<td>string field</td>
<td>Allows a string field in the Mobile app UI on page 1117 to access the GPS location of a mobile device.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------</td>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>disable_execute_now</td>
<td>true/false</td>
<td>any table derived from sys_auto</td>
<td>If present or true, disables the usual <strong>Execute Now</strong> button. This is used by applications using schedules (such as Discovery) to substitute their own more appropriate action.</td>
</tr>
<tr>
<td>default_rows</td>
<td>integer value</td>
<td>mutitext fields</td>
<td>Sets the default number of rows in a mutitext field.</td>
</tr>
<tr>
<td>default_close_state</td>
<td>state integer value</td>
<td>task state field</td>
<td>Used by the TaskStateUtil API - identifies the default close state value for a task table</td>
</tr>
<tr>
<td>default_work_state</td>
<td>state integer value</td>
<td>task state field</td>
<td>Used by the TaskStateUtil API - identifies the default working state value for a task table</td>
</tr>
<tr>
<td>detail_row</td>
<td>name of field to display in detail row</td>
<td>any table</td>
<td>Displays the value of the specified field as a <strong>detail row</strong> for each record in the list view. UI15 is required to use this attribute.</td>
</tr>
<tr>
<td>email_client</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, causes an icon (an envelope) to appear in the more options menu in the form header. If clicked, a popup email client appears.</td>
</tr>
</tbody>
</table>

**Note:** If different **detail_row** attributes are defined for a parent table and a child table, the system uses the child table attribute.
<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Target Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_auto_recovery</td>
<td>true/false</td>
<td>any table</td>
<td>Disables automatic recovery of draft records for this table and its extensions.</td>
</tr>
<tr>
<td>extensions_only</td>
<td>true/false</td>
<td>any table</td>
<td>Table should only have records in tables that extend it. For example, the Task table has this attribute because you would create incident, problem, change records and not task records.</td>
</tr>
<tr>
<td>field_list_selector</td>
<td>true/false</td>
<td>any glide_list</td>
<td>Allows the user to select a field from the dependent table (or current if dependent is not specified). This is used in some workflow activities.</td>
</tr>
<tr>
<td>field_decorations</td>
<td>UI Macro name list, separated by semicolons (&quot;;&quot;)</td>
<td>most fields (except multi-line text fields)</td>
<td>Similar to ref_contributions, causes the named UI macro to be invoked when the field is rendered on a form.</td>
</tr>
<tr>
<td>format</td>
<td>format name</td>
<td>any numeric field</td>
<td>Specifies a named format to use instead of the standard numeric formatting. Options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• glide_duration: formats a time specified in milliseconds as ddd hh:mm:ss.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• none: disables automatic number formatting (for example, changes 2,500 to 2500).</td>
</tr>
<tr>
<td>fv</td>
<td>table name; field name; sys_id</td>
<td>field_value field</td>
<td>This uses the three values to set the display of the field_value field.</td>
</tr>
<tr>
<td>glide.db.oracle.ps.query</td>
<td>true/false</td>
<td>any table</td>
<td>If present and false, prevents the use of Oracle prepared queries on the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------</td>
<td>----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>global_visibility</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, makes this table visible globally even if there are domain restrictions (that is, the sys_domain field has a value).</td>
</tr>
<tr>
<td>hasLabels</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, marks this table as being the target of a label at some point. This attribute can be set manually, but it is set automatically whenever a label is generated. When true, the label engine will run on any change to the table, updating the labels as needed.</td>
</tr>
<tr>
<td>hasListeners</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, marks this table as available for listeners to get events (insert, update, delete) on.</td>
</tr>
<tr>
<td>hasWorkflow</td>
<td>true/false</td>
<td>any table</td>
<td>Tells the workflow engine to listen for changes to the table, firing events to a workflow when a record associated with a particular workflow has changed.</td>
</tr>
<tr>
<td>html_sanitize</td>
<td>true/false</td>
<td>any field</td>
<td>If present or true, HTML sanitization is enabled for the selected field.</td>
</tr>
<tr>
<td>icons</td>
<td>name of JavaScript class</td>
<td>any workflow field</td>
<td>Specifies a JavaScript class that produces workflow icons.</td>
</tr>
<tr>
<td>image</td>
<td>relative path of image file</td>
<td>any table</td>
<td>Specifies an image file to be used when the table is used in a module or BSM map. This specification overrides the icons that would otherwise be used for the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------</td>
<td>-------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>include_container_types</td>
<td>true/false</td>
<td>any internal_type field</td>
<td>Causes the field to render with container (split) types as well other types.</td>
</tr>
<tr>
<td>iterativeDelete</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, forces all row deletes to be executed iteratively. Otherwise, some deletes may be performed using a more efficient bulk method.</td>
</tr>
<tr>
<td>knowledge_custom</td>
<td>name of JavaScript function</td>
<td>any field</td>
<td>Specifies a JavaScript function to implement a custom knowledge search (see knowledge_search).</td>
</tr>
<tr>
<td>knowledge_search</td>
<td>true/false</td>
<td>string fields</td>
<td>If present or true, causes a knowledge search icon (a small book) to appear next to the field. Clicking this icon launches a pop-up window for searching the knowledge base, unless a custom knowledge search function has been specified (see knowledge_custom).</td>
</tr>
<tr>
<td>largeTable</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, marks this table as &quot;large&quot; for the purpose of preventing table locking with specific MySQL database operations (adding/removing a column/index, compacting a table). Without this attribute (or the smallTable attribute), whether a table is large is determined by the glide.db.large.threshold property, or the default value of 5,000.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>listen</td>
<td>true/false</td>
<td>any field</td>
<td>If present or true, causes a call to a JavaScript function named <code>&lt;tableName&gt;_&lt;fieldName&gt;Listen</code> or <code>globalListen</code> if that function does not exist. The function is called with arguments (tableName, fieldName, oldValue, newValue).</td>
</tr>
<tr>
<td>live_feed</td>
<td>true/false</td>
<td>any field</td>
<td>If present or true, creates a toggle option on the activity formatter header for incidents, tasks, and problems. The toggle provides the choice between the <strong>Live Feed</strong> for that record (also known as a document feed) or the activity formatter fields already in use. See Activity formatter on page 764 for more details.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>----------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>long_label</td>
<td>true/false</td>
<td>any field</td>
<td>Long or short labels refer to the label that is displayed for reference fields on a form. For example, if the field contains the caller’s email address, the long label would be Caller Email while the short label would just be Email. Usually the placement of the field on the form makes it clear what the field represents. The global property (glide.short.labels) is used to specify the type of labels that are displayed for all reference fields on any form. This global property can be overridden for any field by setting the short_label=true or long_label=true attribute for the field in the Dictionary.</td>
</tr>
<tr>
<td>mode_toggler</td>
<td>true/false</td>
<td>any composite_name field</td>
<td>If present or true, causes a name mode toggle icon (a small right-pointing triangle) to appear to the right of the label. Clicking this icon causes the field's rendering to change from a text field accepting <code>&lt;tablename&gt;.&lt;fieldname&gt;</code> to a pair of reference choice boxes (one for the table, the other for the field). The latter is the default.</td>
</tr>
<tr>
<td>model_class</td>
<td>binary Java class name</td>
<td>any field of type glide_var</td>
<td>Specifies a model variable within Java code. The model must have a class that implements the IVariablesModel interface.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>model_field</td>
<td>see description</td>
<td>any field of type glide_var</td>
<td>Identifies a reference field in the record that has the model defined for it. For example, a workflow activity is associated with an activity definition. The activity definition has a related list of questions that make up the model for that activity definition. By using the activity_definition as the model_field for the activity, the model for the workflow activity is built by reading the questions that are defined for the referenced activity definition.</td>
</tr>
<tr>
<td>nibble_size</td>
<td>positive integer</td>
<td>any table affected by the table cleaner.</td>
<td>Specifies the maximum number of records the table cleaner can delete in a single operation. The default value for this attribute is 250.</td>
</tr>
<tr>
<td>nibble_sleep</td>
<td>true/false</td>
<td>any table affected by the table cleaner.</td>
<td>If false, causes the table cleaner to perform cleanup operations without a pause between each operation.</td>
</tr>
<tr>
<td>no_attachment</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, prevents the attachment icon (a paperclip) from appearing on the form header.</td>
</tr>
<tr>
<td>no_attachments</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, attachments will not be checked for and deleted when a record from this table is deleted. Meant for high-activity tables that never have attachments.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------</td>
<td>-------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>no_audit</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, this field will not be audited, even if the table is being audited.</td>
</tr>
<tr>
<td>no_audit_delete</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, a sys_audit_delete record will never be created when a record from this table is deleted. Meant for high-activity tables that never need sys_audit_delete information.</td>
</tr>
<tr>
<td>no_auto_map</td>
<td>true/false</td>
<td>any table</td>
<td>If true, this field will not be mapped during an import set. This is primarily used for LDAP imports.</td>
</tr>
<tr>
<td>no_email</td>
<td>true/false</td>
<td>any glide_list field referencing sys_user</td>
<td>If present or true, the email box is removed from the glide_list field like the Watch list field.</td>
</tr>
<tr>
<td>no_multiple</td>
<td>true/false</td>
<td>any glide_list field</td>
<td>Hides the select multiple icon.</td>
</tr>
<tr>
<td>no_optimize</td>
<td>true/false</td>
<td>any table affected by the table cleaner.</td>
<td>If present or true, prevents the MySQL table compaction operation from running on the specified table. The table compaction operation normally runs after the table cleaner deletes at least 50% of the data in the specified table.</td>
</tr>
<tr>
<td>no_separation</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, marks this table as not participating in domain separation.</td>
</tr>
<tr>
<td>no_text_index</td>
<td>true/false</td>
<td>any field on a text indexed table</td>
<td>If a table is text indexed, the no_text_index attribute on a field will prevent this field from being included in the text index.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------</td>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>no_truncate</td>
<td>true/false</td>
<td>any string field</td>
<td>In a list view, shows the entire text value of the multi-text value in a list, without truncating it. Without this attribute the string is truncated based on the UI property <strong>Number of characters displayed in list cells</strong> which is 40 by default.</td>
</tr>
<tr>
<td>no_update</td>
<td>true/false</td>
<td>table</td>
<td>Is true for tables in which records are inserted or deleted but not updated. Prevents the system from creating sys_mod_count, sys_updated_by, sys_updated_on fields in the table when it is created. Does not stop the table from being updated. This attribute is used to save space on high volume system tables, such as syslog and sys_audit.</td>
</tr>
<tr>
<td>no_view</td>
<td>true/false</td>
<td>any glide_list field</td>
<td>Hides the view selected item icon.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>onlineAlter</td>
<td>true/false</td>
<td>any table</td>
<td>Tables with the onlineAlter attribute perform MySQL database operations using online schema changes. Online schema changes provides a lock-free table upgrade when adding, modifying, or removing columns and when adding or dropping indexes. Without online schema changes, these changes to the database lock write access during execution. Online schema changes use additional system resources. Oracle databases do not lock tables by default and do not use online schema changes.</td>
</tr>
<tr>
<td>order</td>
<td>numeric value</td>
<td>model variable fields</td>
<td>Used internally only (for model variables).</td>
</tr>
<tr>
<td>popup_processor</td>
<td>binary Java class name</td>
<td>any field or table</td>
<td>Specifies a custom popup processor for processing the field (or all fields in a table).</td>
</tr>
<tr>
<td>readable</td>
<td>true/false</td>
<td>any conditions field</td>
<td>When true, causes the conditions field to be rendered in any list view as a human-readable condition (instead of the encoded query actually stored in the database). The form view for this field is unaffected.</td>
</tr>
<tr>
<td>ref_ac_columns</td>
<td>list of field names separated by semicolons</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Specifies the columns whose display values should appear in an auto completion list in addition to the name. See the cmdb_ci field (Configuration Item) on the Incident form for a working example.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ref_ac_columns_search</td>
<td>true/false</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Causes auto-complete to work with all fields specified in the ref_ac_columns attribute. This overrides the default behavior, which searches only the display value column. See Configure auto-complete to match text from any reference field on page 882.</td>
</tr>
<tr>
<td>ref_ac_display_value</td>
<td>true/false</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Causes the reference field to hide a the display value column so that auto-complete only matches text from the columns listed in the ref_ac_columns attribute. This feature requires the use of the AJAXTableCompleter class and the ref_ac_columns, ref_ac_columns_search, and ref_ac_display_value attributes. See Remove the display value column on page 880.</td>
</tr>
<tr>
<td>ref_ac_order_by</td>
<td>field name</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Specifies the column that will be used to order the auto completion list.</td>
</tr>

</table>
| ref_auto_completer    | JavaScript class name              | any reference field (can be applied to a table to affect all reference fields on the table.) | Specifies the name of a JavaScript class (client side) that creates the drop-down auto completion choices. Valid class values include:  
  - **AJAXReferenceCompleter**: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the reference table's display value column. Reference fields automatically use this class if there is no other auto-completion class specified.  
  - **AJAXTableCompleter**: Displays matching auto-complete choices as rows in a table. The table displays the reference table's display value column and any columns listed in the ref_ac_columns attribute.  
  - **AJAXReferenceChoice**: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the reference table's display value column. Furthermore, the list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class.  

For more information, see Auto-complete for reference fields on page 877.

</tr>
</tbody>
</table>

Modify the Glide durations format

In order to convert fields that are displayed in milliseconds (such as ‘Resolution Time’ on the Incident table) to a duration format (Months/Days/Hours/Seconds), populate the attribute field on the dictionary with: `format=glide_duration`.

Now the value will be displayed as a duration in lists and can be utilized in the Configure Calculations functions. This may be very useful to illustrate ITIL KPIs such as Mean Time To Repair.

Field Dictionary:
Figure 420: Duration Dict

Results in list:
This page describes the approaches to managing table size growth and archiving old data.

With data constantly being added to the system, and activity being logged into system tables in the database, these tables grow in size and require management. As data sets increase in size, the amount of I/O traffic associated with actions such as cleaning, deleting, and archiving can negatively affect the performance of an instance. Additionally, working with all rows in a data set, rather than a smaller working set, can create unnecessary risk.

The Database Rotation plugin preserves instance performance and averts risk associated with querying growing data sets utilizing two techniques. Both techniques are based on the concept of managing large quantities of data by separating whole sets into individual tables based on user-specified time parameters. After this task is performed, each technique handles data in a different manner:

- **Table Rotation** works by rotating among a small set of tables, and deleting and reusing the old tables for new data.
- **Table Extension** works by periodically starting a new table and allowing old tables to be easily archived and removed from the system.

For an additional archiving option see [Archiving Data](#).

**Included with Database Rotation plugins**

The Data Management and Archiving techniques are contained in two separate plugins.

- **Database Rotations Plugin** activates Table Rotation and Extension without any tables automatically included (com.snc.db.rotation)
- **Database Rotations Default Tables Plugin** applies Table Rotation and Extension to specific tables (com.snc.db.rotation_default_tables)

**Activate database rotation**

For new instances, database rotation is active by default. If you are upgrading from a previous version, you can activate the Database Rotations plugin if it is not already active.

**Note:** Deployment of this plugin should be executed in partnership with a ServiceNow representative.

If it is not already active, you can activate the Database Rotations plugin if you have the admin role.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

Do not activate the Database Rotations Default Tables plugin. Instead, specify the tables manually, after consulting a ServiceNow representative.

**Archive data**

The archive application moves data that is no longer necessary for immediate day-to-day access from primary tables into a set of archive tables.

The longer an instance runs, the more likely it is to accumulate data that is no longer relevant to current business needs. For example, task records from two years ago are typically less relevant than currently active tasks. Old data may eventually cause performance issues by consuming system resources and slowing down queries and reports. If you cannot delete this data because you need it for auditing or for historical purposes, archive the data to remove it from immediate access and free up system resources.

Data archiving supports domain separation. For example, incidents that belong to a domain keep their domain designation even after they are archived.
Figure 422: Sample Benefits of Archiving Data

To setup data archiving:

1. Activate the Data Archiving plugin.
2. Create an archive rule for the table you want to archive.
3. Define how the archive rule handles related records.
4. Verify how many records the archive rule affects.
5. Activate the archive rule.

Activate data archiving

The Data Archiving plugin installs the System Archiving application.
Figure 423: System Archiving Application

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

*Create an archive rule*

The System Archiving application includes several sample archive rules that illustrate the archive features.

**Note:** The sample archive rules are not intended as best practice and are inactive by default.

1. Navigate to **System Archiving > Archive Rules**.
2. Click **New**.
3. Fill in the fields as appropriate.

**Table 325: Archive Rule form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Required. Enter a unique name that identifies the rule. Since this is the display field for archive rules, references to archive rules display the name you enter here.</td>
</tr>
<tr>
<td>Table</td>
<td>Required. Select the table containing records to archive. There can only be one archive rule per table. If there is an existing archive rule for a table, the table no longer appears as an option on the archive rule table list.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to enable the archive rule. Clear the check box to disable the rule. ServiceNow recommends leaving your archive rules inactive until you calculate an estimate of the number of records the rule affects and verify that rule behaves as expected.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the archive rule.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Required. Select the fields and values that must be true in order for the archive rule to run. Typically, you would archive inactive records older than a certain date.</td>
</tr>
<tr>
<td>Parent</td>
<td>Select an existing archive rule on which this rule depends to run. This archive rule only runs when the parent rule also runs.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Activate the archive rule**

After verifying that the archive rule is selecting records as expected, activate the archive rule.

The instance runs the archive rule as a *schedule job* set to run every 60 minutes.

1. Navigate to **System Archiving > Archive Rules**.
2. Select the archive rule you want to activate.
3. Select the **Active** check box.
4. Click **Update**.

**Activate the archive rule immediately**

If you do not want to wait for the scheduled job to run the archive rule, you can manually start the archive rule.

1. Navigate to **System Archiving > Archive Rules**.
2. Select the archive rule you want to run.
3. Click the **Run Archive Now** related link.

**Note:** The archive rule must be active in order to see the link.

**Set archive rule processing behavior**

In order to prevent the archive process from consuming too many system resources, the instance uses several system properties to control how many records the archive rule processes at one interval.

By default an archive rule follows these processing rules:

- Archives 100 records for each batch job
- Sleeps 1 second between batch jobs
- Runs 10 batch jobs in an archive run (every hour)

You can change these default settings by *adding the following system properties*.

**Table 326: Archive System Properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.db.archive.batch_size</td>
<td>Controls how many records an archive rule processes per batch job.</td>
<td>Integer</td>
<td>100</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Type</td>
<td>Default Value</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------</td>
<td>---------------</td>
</tr>
<tr>
<td>glide.db.archive.sleep_time</td>
<td>Controls how long each archive rule batch job runs, in seconds.</td>
<td>Integer</td>
<td>1</td>
</tr>
<tr>
<td>glide.db.archive.max_iterations</td>
<td>Controls the maximum number of batch jobs to run within an hour.</td>
<td>Integer</td>
<td>10</td>
</tr>
</tbody>
</table>

**Tables and modules created by an archive rule**

The first time you activate an archive rule, it performs the following actions:

- Creates the archive table in the database. The archive table has the same name as the primary table with an "ar_" prefix. For example, if you archive the Incident [incident] table, then the archive table is [ar_incident].
- Converts multiple joined tables into a single flat-file archive table. The archive table no longer consists of a base and extended tables.
- Converts reference field values (values set by references to records in other tables) into string values. The archive record contains the display value of the reference field at the time of the archive.
- Adds a module to the **Archive Tables** list in the **System Archiving** application. The module name is a combination of the word "Archive" plus the display name for the archived table. For example, the archive module for the Attachment [sys_attachments] table is **Archive Attachment**. Click the module name to view records in the archive table.
- Creates a list of the archive table using the default list view.
- Creates a form for the archive table using the default form view. The form excludes any **dot-walking** fields such as **Caller ID.Email**.
- Creates an activity formatter and variable formatter if they exist for the table being archived.
Figure 424: Conversion of Multiple Joined Tables into a Flat Archive Table

**Change an archive schedule**
All active archive rules are executed by a system scheduled job set to run every 60 minutes. You can modify the job if you need to change the interval.

1. Navigate to **System Scheduler > Scheduled Jobs**.
2. Open the **Archive** record.
3. Modify the **repeat** value.

**Query archived tables**
Archived tables are not optimized for ad hoc queries. They only contain index entries for the display value, creation date, and the primary key of sys_id.
For this reason ServiceNow does not recommend making ad hoc queries against an archived table, such as searching for all priority 1 archived incidents. Instead, only search against the indexed fields. For example, search for incident INC100001 or incidents created on a specific date.

**Setting the language of archived strings**

On internationalized instances, the archive process uses the language of the SYSTEM user to select the display value strings.

If there is no SYSTEM user, the instance uses the default language setting to select the display value strings. You can either create a SYSTEM user with a specific language setting or set the system default language to select the language of archived strings.

---

**Figure 425: Sample Archive Displayed in French**

*Verify the number of records affected*

Each archive rule provides an estimate of the number of records the rule affects in the Record estimate field.

This estimate only includes primary records and excludes any related records added to the archive rule. The estimate helps you determine if the archive rule affects the number of records you expect it to. If the estimate is too high or low, change the archive rule conditions and then click the Recalculate Estimate related link.

1. Navigate to System Archiving > Archive Rules.
2. Select the archive rule you want to estimate records for.
3. Click the Recalculate Estimate related link.

*Archive related records*

Use the Archive Related Records related list to add related records to the archive rule.

1. Navigate to System Archiving > Archive Rules.
2. Select the appropriate archive rule.
3. From the **Archive Related Records** related list, click **New**.

4. Fill in the Archive Related Records form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archive map</td>
<td>Displays the archive rule to which the related records apply.</td>
</tr>
<tr>
<td>Action</td>
<td>Select the action you want the archive rule to take on related records.</td>
</tr>
<tr>
<td></td>
<td>Choices include:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Archive</strong>: archive records that reference the archived record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Clear</strong>: remove the reference to the archived record.</td>
</tr>
<tr>
<td></td>
<td>The record no longer references the archived record and does not appear as</td>
</tr>
<tr>
<td></td>
<td>the related record in future archives.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Delete</strong>: delete records that reference the archived record.</td>
</tr>
<tr>

<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reference</td>
<td>Select the relationship of the records you want to apply an action to. The Reference field lists all relations that currently exist for the table being referenced. There are two types of possible relations.</td>
</tr>
</tbody>
</table>

- Another table has a reference field calling the archived table. For example, if you are archiving problem records, there is a Problem ID field in the Incident table that references the related problem records.

- The Archive action archives the related record in addition to the primary record. For example, if you select the Problem in Incident reference, the related record rule also archives any incident record that references an archived problem.

- The Clear action removes the reference to the primary record. For example, if you select the Problem in Incident reference, the related record rule updates any incident record with a reference to the archived problem record by clearing the reference. If the reference is a many-to-many relationship, the related record rule deletes the reference instead of clearing the reference.

- The Delete action deletes any record that references the primary record. For example, if you select the Problem in Incident reference, the related record rule deletes any incident record that references the archived problem record.

- Another table has a Document ID field which might point to the archived table. For example, if you are archiving problem records, there is a sys ID field in the Attachments table that may reference the problem record. The list indicates document ID relationships by displaying an asterisk (*) character at the end of the selection name.

- The Archive action updates the Document ID of the related record to point to the archived table. For example, if you select the Table sys ID Attachment(sys_attachment)* reference, the related record rule updates the attachment record to change the Document ID to refer to...
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference table</td>
<td>Displays the table where the rule looks for related records.</td>
</tr>
<tr>
<td>Reference element</td>
<td>Displays the reference field or <strong>Document ID</strong> the rule queries for.</td>
</tr>
<tr>
<td>Reference table rule</td>
<td>Select an existing archive rule that applies to the related records you are archiving. For example, if you already have an archive rule for the Incident table, you can select the existing Incident table rule when archiving records related to incidents records.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Archive a restored record**

Archive rules will not archive restored records. In order to archive a restored record you must manually archive the record.

1. Navigate to the restored record.
2. Click the **Archive Record** link.
View archived data
You can view archived tables from the **Archived Tables** list.

1. Navigate to **System Archiving > Archive Tables**.

2. Click the module name for the archived table you want to view. For example, **Archive Attachment**.
3. Click a record from the archived table to see the archived record.
Restore archived data
When you restore a record, the instance inserts it back into the primary table and flags the record as having been restored in the log.

1. Navigate to System Archiving > Archive Log.
2. Select the archived record to restore.
3. Click the Restore Record related link.
Reference values converted to strings

Archived data is stored as a flat file with no reference fields to other tables. The archive process converts any references to other tables to string values.

In the case of a reference field, the string uses the display value such as the caller’s user name. For example, the Caller reference field in an incident would display the string ITIL User. If the reference was a document ID and the archive rule included the option to archive related document IDs, then the string is the document ID of the related record.

It is important to note that archive records do not receive any future changes to referenced values. For example, if you change the user name for "John Smith" to "John A Smith", all active incident records automatically show the caller as "John A Smith" because of the reference between the Incident and User tables. However, all archived incident records display the user name that existed at the time of the archive.

Any incident for "John Smith" continues referencing this user. Likewise, if you delete a user from the system, current incidents no longer display the deleted user as a caller. However, there can be archived incidents that still display the string "John Smith" as the user because the user existed at the time of the archive.

Features

The System Definition Table Rotation module allows you to define a new table rotation, a new table extension or modify an existing one.
Figure 426: Database Rotation

- **Name**: auto-generated from table name
- **Duration**: overall time parameter for function
- **Initialized**: sets function as active (true) or inactive (false)
- **Rotations**: number of tables to be created within Duration
- **Type**: indicates Extension (archiving) or Rotation (deletion) functionality

When you define a new rotation, a schedule is created and new data is subsequently written to one of the tables in the rotation group. You'll notice the that the group includes the original table plus a number of additional tables. Be aware that deleting a rotation will delete the additional tables and all the data, therefore the rotation should not be deleted if the data is needed.

**Implementation**

See individual pages to implement either table rotation or table extension.

**Usage**

Table Rotation can be used for tables that:
- Hold data that is only valuable for a limited period of time
- Are written sequentially by inserting new rows

Table Extension can be used for tables:
- That hold data that's organized by time
- Where data is written and then never updated, or where updates are mostly focused on recent data
- Where data is needed for a period of time (e.g., two years) and can subsequently be discarded or archived off the system
Export data

ServiceNow offers a variety of ways for administrators and users with the itil role to export data.

ServiceNow offers a variety of ways for administrators and users with the itil role to export data:

• **Form export**: Export an individual record from the user interface. Choose PDF or XML format directly from a form.
• **List export**: Export multiple records from the user interface. Choose CSV, Excel, PDF, or XML format directly from a list.
• **Schedule a report**: Automatically export multiple records from a table on a set schedule. Create a scheduled job to regularly export data as a report.
• **Direct URL access**: Export multiple records from a table using the ServiceNow CSV, Excel, PDF, or XML processor. Specify the table form or list you want to export in the URL.
• **Web services/SOAP**: Export multiple records from a table when an external client makes a web services request. Create an external application or process to automate the retrieval of data from an instance via web services or SOAP.

Export and import XML files

To occasionally migrate data from one instance to another, you can export the XML data from one instance and import it to another.

This method ensures that all fields and values are transferred exactly. Migrating data in an XML file saves time for unscheduled data imports since there is no need to build an import set or a transform map.

Exporting and importing data in XML files is commonly used for records created in a development instance that must be migrated with the update sets as part of a migration procedure. Examples of these records include lookup tables, unit test records, and other information required to support production. Typically, this information is only migrated once and the overhead of an import set is not justified.

---

**Note**: Image field data is not preserved when exporting to XML.

---

**Export multiple records as XML data**

Suppose you created a table to look up approvers to support the problem management process.

**Role required**: admin

The table, fields, security, forms, and many other configuration parameters are captured by an update set; however, the data records are not. To promote the lookup records from the development instance to other instances, you must manually export all the records.

1. Sign in to the instance that contains the source data.
2. Navigate to the list you want to export.
3. Optional: Filter the list, if desired.
4. Right-click the list header and select Export > XML.
5. In the export progress dialog box, click **Download** when the export completes.

Depending on browser and settings, a dialog box may prompt you to save the file, or the browser may automatically save the XML file to the downloads folder specified in the browser preferences.

*Export a record as XML data*

How to export a single record as XML data.

**Role required:** admin

It is often useful to export a single record, such as an incident, a user, a configuration item (CI), or a scheduled job, from one instance to another. For example, if a user has issues in a production instance and you want to do in-depth diagnostics on the development instance without impacting the user, you can export the user, CI, or incident record as XML data for later import into the development instance.

1. Sign in to the instance that contains the source data.
2. Navigate to the record you want to export.
3. Right-click the form header and select **Export > XML (This record)**.

Depending on browser and settings, a dialog box may prompt you to save the file, or the browser may automatically save the XML file to the downloads folder specified in the browser preferences.

*Import a single XML file containing one or more records*

After you have successfully exported data from the source instance, you can import the XML file directly to the target instance.

**Role required:** admin

Importing XML does not trigger business rules or update the instance cache.

1. Sign in to the target instance (the instance that should receive the data).
2. In the banner frame, click the **Elevate privileges** icon (🪐) beside the user name.
3. In the **Activate an Elevated Privilege** dialog box, select the **security_admin** check box and click OK.
4. Navigate to any list in the system.
   Any list can be used because the XML file contains the destination table name for the records.
5. Right-click the list header and select **Import XML**.
6. In the import screen, click **Choose File** and select the previously exported XML file.

7. Click **Upload**.

   **Note:** If the data does not import, navigate to **System Definition > Tables & Columns** and verify that the table from which the data was exported also exists in the instance importing the data. If the table does not exist in that instance, you can move it using an update set.

---

**Example XML export**
The URL query produces an XML document similar to this sample.

The following URL query produces an XML document similar to the sample shown:

```plaintext
https://<instance name>.service-now.com/incident_list.do?XML&sysparm_query=priority=1&sysparm_orderby=assigned_to
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xml>
<incident>
<active>true</active>
<activity_due>2012-11-28 20:44:11</activity_due>
<approval>not</approval>
</incident>
</xml>
```
Available export formats

The platform supports certain export formats.

Table 328: Available export formats

<table>
<thead>
<tr>
<th>Export format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSV</td>
<td>Export table records as a comma-separated value text file. Use this option to export the currently displayed fields in the list or form as a text file. Configure the list or form to add or remove fields from the export. When exported to CSV, dot-walked fields appear using their full field name, such as u_assignment_group.parent.</td>
</tr>
</tbody>
</table>

**Note:** By default, ServiceNow exports all CSV files in Windows-1252 encoding. If you need to export translated data, set the glide.export.csv.charset system property to UTF-8.
<table>
<thead>
<tr>
<th>Export format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excel</td>
<td>Export table records as a Microsoft Excel spreadsheet. Use this option to export the currently displayed fields in the list or form as an Excel spreadsheet. Configure the list or form to add or remove fields from the export.</td>
</tr>
<tr>
<td>XML</td>
<td>Export table records as an XML document. Use this option to export all data from a table or all data for a particular record. The XML file has an XML element for each column in the table.</td>
</tr>
<tr>
<td>PDF</td>
<td>Export table records as a Portable Document Format file. Use this option to export the currently displayed fields in the list or form as a PDF file. Configure the list or form to add or remove fields from the export.</td>
</tr>
</tbody>
</table>

**Note:** The PDF export processor prints data from left-to-right, which can produce rendering errors when displaying right-to-left language data.

**Export format processors**
The ServiceNow platform provides a default upper limit for XML data exports.

ServiceNow provides the following export format processors:

**Table 329: Format processors**

<table>
<thead>
<tr>
<th>Export processor</th>
<th>URL syntax</th>
<th>Export limits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSV</td>
<td>?CSV</td>
<td>10,000 rows</td>
<td>Exports table records as a comma-separated value text file.</td>
</tr>
<tr>
<td>Excel</td>
<td>?EXCEL</td>
<td>10,000 rows</td>
<td>Exports table records as a Microsoft Excel spreadsheet.</td>
</tr>
<tr>
<td>XML</td>
<td>?XML</td>
<td>10,000 rows</td>
<td>Exports table records as an XML document.</td>
</tr>
<tr>
<td>PDF</td>
<td>?PDF</td>
<td>5,000 rows</td>
<td>Exports table records as a Portable Document Format file.</td>
</tr>
<tr>
<td>Schema</td>
<td>?SCHEMA</td>
<td>N/A</td>
<td>Exports the database schema for the table.</td>
</tr>
<tr>
<td>XSD</td>
<td>?XSD</td>
<td>N/A</td>
<td>Exports the table structure in XSD format.</td>
</tr>
</tbody>
</table>

See Export Limits for information about processor export limits and how to work around them if a table exceeds the export limit.
Note: Export processors return all requested records regardless of whether you use the table.do or table_list.do format to identify the export table.

Export limits

The ServiceNow platform provides a default upper limit for XML data exports. The purpose of the upper limit is to avoid creating performance issues when a table is excessively large. If you need to export more records than the threshold permits, break up the export into separate manageable chunks.

In addition to the format-specific limits, you may need to set com.glide.processors.XMLProcessor.max_record_count to match the upper limit set by the format-specific limit.

Export limit properties

You can set the number of records to return during an export using the URL parameter sysparm_record_count.

However, the system analyzes the following settings to determine whether an export limit should be applied.

1. First, the platform checks the property that defines the format-specific export limit (see table). Each format can have a different limit. Although this property can be set to any value, exceeding the default export limit can impact system performance. You may want to set the property at or below the default limit and have users export large amounts of data in smaller increments.

2. If the format-specific property is not set, the system checks the property for the general export limit (see table). This property can also be set to any value, but exceeding the default export limit can impact system performance.

3. If neither the format-specific export limit nor the general export limit property is set, the system enforces the default export limit (see table).

Note: These properties are not defined by default. You must add the property to assign a value to it.

Table 330: Default export limit

<table>
<thead>
<tr>
<th>Format</th>
<th>Format-specific export limit</th>
<th>General export limit</th>
<th>Default export limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML</td>
<td>glide.xml.export.limit</td>
<td>glide.ui.export.limit</td>
<td>10,000</td>
</tr>
<tr>
<td>CSV</td>
<td>glide.csv.export.limit</td>
<td>glide.ui.export.limit</td>
<td>10,000</td>
</tr>
<tr>
<td>EXCEL</td>
<td>glide.excel.export.limit</td>
<td>glide.ui.export.limit</td>
<td>10,000</td>
</tr>
<tr>
<td>PDF</td>
<td>glide.pdf.max_rows</td>
<td>N/A</td>
<td>5,000</td>
</tr>
<tr>
<td>PDF</td>
<td>glide.pdf.max_columns</td>
<td>N/A</td>
<td>25</td>
</tr>
</tbody>
</table>

Although the number of columns can be set higher than 25 in the PDF export, this is not advisable as only 25 header labels fit on a page.

A warning threshold property called glide.ui.export.warn.threshold controls how the records are exported. If a user attempts to export a number of records from a list that exceeds the warning threshold, a dialog box offers the choice of waiting for the export to complete or having the exported records emailed as an
attachment. The warning threshold can be changed in the system property. The email attachment must not exceed the maximum allowed email size or configured email attachment size.

### Table 331: Export limit examples

<table>
<thead>
<tr>
<th>Example</th>
<th>Property</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exporting to CSV</td>
<td>• glide.csv.export.limit = 20,000&lt;br&gt;• glide.ui.export.limit = 10,000&lt;br&gt;• com.glide.processors.XLSXProcessor.max_record_count = 20,000&lt;br&gt;• Default export limit for CSV = 10,000</td>
<td>Table 332: Exporting to CSV&lt;br&gt;<strong>Table 332: Exporting to CSV</strong>&lt;br&gt;<strong>Records to be Exported</strong>&lt;br&gt;15,000&lt;br&gt;30,000&lt;br&gt;<strong>Records Returned</strong>&lt;br&gt;15,000&lt;br&gt;20,000&lt;br&gt;<strong>Note</strong>&lt;br&gt;In the second export, the number of records returned from the database is limited because the number of records specified for export exceeds the value set in the glide.csv.export.limit property.</td>
</tr>
<tr>
<td>Exporting to Excel</td>
<td>• glide.excel.export.limit = no entry&lt;br&gt;• glide.ui.export.limit = no entry&lt;br&gt;• Default export limit for EXCEL = 10,000</td>
<td>Table 333: Exporting to Excel&lt;br&gt;<strong>Table 333: Exporting to Excel</strong>&lt;br&gt;<strong>Records to be Exported</strong>&lt;br&gt;10,000&lt;br&gt;30,000&lt;br&gt;<strong>Records Returned</strong>&lt;br&gt;10,000&lt;br&gt;10,000&lt;br&gt;<strong>Note</strong>&lt;br&gt;In the second export, the number of records returned from the database is limited because the number of records specified for export exceeds the default export limit for Excel, 10,000 records.</td>
</tr>
<tr>
<td>Exporting to PDF</td>
<td>• glide.pdf.max_rows = 3,500&lt;br&gt;• Default and maximum export limit for PDF = 5,000</td>
<td>Table 334: Exporting to PDF&lt;br&gt;<strong>Table 334: Exporting to PDF</strong>&lt;br&gt;<strong>Records to be Exported</strong>&lt;br&gt;2,000&lt;br&gt;10,000&lt;br&gt;<strong>Records Returned</strong>&lt;br&gt;2,000&lt;br&gt;5,000&lt;br&gt;<strong>Note</strong>&lt;br&gt;In the first export, all records are returned because the number of records specified for export does not exceed the glide.pdf.max_rows property. In the second export, the number of records returned is limited because the number of records specified for export exceeds the value in the glide.pdf.max_rows property.</td>
</tr>
</tbody>
</table>

**Excel export threshold**

Excel exports are intended for relatively small exports, fewer than 500,000 cells, while CSV can handle larger exports.
Whenever you export to Excel and the resultant spreadsheet has more than 500,000 cells (by default), the export process stops and you are given the Excel file at that point. In the bottom row, there will be the following message: Export stopped due to excessive size. Use CSV for a complete export:

![Excel export threshold 1](image)

**Figure 427: Excel export threshold 1**

The Excel export cell threshold is customizable using the `glide.excel.max_cells` integer property.

**Note:** Increasing this threshold may cause a memory issue in your instance. The threshold is set at an appropriate level to prevent resource issues.

The export will put the information into the Excel document with 32,000 rows per spreadsheet.

**Export form data**

How to export form data.

Export an individual record *from a form* by right-clicking a form header bar and selecting the export type. Export formats include:

- PDF (Portrait)
- PDF (Landscape)
- XML (This Record)
Note: When exporting PDF data from a form, only the fields that are visible from the current view are exported, with the exception of formatter elements. When exporting XML data, however, all the fields are exported, regardless of the view. You cannot export records to CSV or Excel from a form.

Export list data
You can export a list of records in a variety of formats.

Export a list of records by right-clicking a list header bar and selecting the export format.
**Figure 429: Export from list**

**Note:** To export records in an **embedded list**, export the **record** containing the list.

Export formats include:

- Excel
- CSV
- XML
- PDF (Portrait)
- PDF (Landscape)
- PDF (Detailed Portrait): Exports the list and the associated form for each record.
- PDF (Detailed Landscape): Exports the list and the associated form for each record.

**Note:** You can control how line breaks appear in exported CSV data using the glide.csv.export.line_break system property.

**Note:** To remove unwanted HTML tags from list data, see the blog *Rendering HTML in Exported Lists* by a ServiceNow employee in the ServiceNow Community.

**Determine which list fields are exported**

By default, exporting data from a list exports only the fields that are visible from the current view.

By default, exporting data from a list exports only the fields that are visible from the current **view**. If you want to export fields from another list view, you can switch views from the UI. Alternatively, you can add the sysparm_view parameter to the **URL request**. For example, to export fields visible from the Self Service (ess) view:

```plaintext
https://instance_name.service-now.com/incident.do?CSV=sysparm_view=ess
```
If you are exporting CSV or Excel data and do not specify a view, the export uses the default list view. You can export all fields by setting the `sysparm_default_export_fields` parameter to all. If you are exporting XML data, the export returns all fields unless you specify a particular view. The `sysparm_default_export_fields` parameter has no effect on XML exports.

**Use a URL query to filter a list result**

Use URL queries to programmatically generate filtered lists before exporting them.

URL queries are useful for scripts that generate a list of records and where no user will manually add the filter from the UI. You must be familiar with the table's column names and values to create a query.

1. Specify the instance URL. For example, `https://demo.service-now.com/`.
2. Specify the list URL for the table you want to export. For example, `incident_list.do`.
3. Specify the export format processor for the export. For example, `?XML`.
4. Specify the query as the value of the `sysparm_query` parameter. For example, `?sysparm_query=priority=1`.
5. Optional: Specify the result sort order with the `sysparm_orderby=` parameter. For example, `CSV&sysparm_orderby=assigned_to`.

**Note:** All queries use a column name, an operator, and a value. See Condition Builder for a list of available operators.

For example, to export a list of all priority 1 incidents as an XML file, use the following URL: `https://<instance name>.service-now.com/incident_list.do?XML&sysparm_query=priority=1&sysparm_orderby=assigned_to`

**Exporting currency fields to Excel**

Exporting currency fields to Excel applies Account formatting and can be configured to convert all values to US dollars.

When exporting currency fields to Microsoft Excel, the cells containing currency data use Accounting formatting. This formatting allows you to perform numeric operations on those values as well as view the currency symbol, such as $ or €.

When exporting currency fields the type of currency, such as $ or €, is preserved by default. You can choose to export all currency values in US dollars by setting the property `glide.excel.fixed_currency_usd` to true. The conversion rates for non-USD currencies are stored on the Exchange Rates [fx_rate] table.

**Export data with scheduled reports**

You can schedule regular or one-time exports from list reports.

You can schedule regular or one-time exports from list reports. ServiceNow sends the report to one or more users by email. Export formats include:

- Excel
- CSV
- PDF
- PDF (Landscape)

If you need to share data with another ServiceNow instance or integrate with another application, consider creating a web service or SOAP message instead.

**Export directly from the URL**

You may want to export data from the URL if you need to dynamically export data from a script or web service.
You must be familiar with the ServiceNow table and column names to export data directly from the URL. See URL schema on page 53 for more information about navigating to forms and lists.

To export data directly from the URL, create a URL containing the following parts:

1. Specify the instance URL. For example, https://<instance name>.service-now.com/.
2. Specify the table form or list to export. For example, incident_list.do.
3. Specify the export format processor to use for the export. For example, ?CSV.
4. Optional: Specify a query and sort order with URL parameters. For example, &sysparm_query=sys_id%3E%3Db4aedb520a0a0b1001af10e278657d27.

The final URL should look like one of these sample URLs:

<table>
<thead>
<tr>
<th>URL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/incident_list.do?CSV&amp;sysparm_query=sys_id%3E%3Db4aedb520a0a0b1001af10e278657d27</td>
<td>Export a particular incident to a comma-separated value text file.</td>
</tr>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/incident_list.do?CSV&amp;sysparm_orderby=sys_id</td>
<td>Export all incidents to a comma-separated value text file and sort the list by sys_id.</td>
</tr>
</tbody>
</table>
**Note:** ServiceNow enforces *basic authentication* for direct URL access. The data extracted from the URL contains only the fields to which the currently authenticated user has read access.

**URL query parameters**

ServiceNow provides certain URL query parameters.

ServiceNow provides the following URL query parameters:
### Table 336: URL query parameters

<table>
<thead>
<tr>
<th>URL Parameter</th>
<th>URL Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_query</td>
<td>sysparm_query=[column name] [operator][value]</td>
<td>Displays a list of records that match the query. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>https://&lt;instance name&gt;.service-now.com/incident_list.do?XML&amp;sysparm_query=priority=1</td>
</tr>
<tr>
<td>sysparm_orderby</td>
<td>sysparm_orderby=[column name]</td>
<td>Sorts a list of records by the column name provided. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>https://&lt;instance name&gt;.service-now.com/incident_list.do?XML&amp;sysparm_query=priority=1&amp;sysparm_orderby=assigned_to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can sort by only one column using sysparm_orderby. To sort by multiple columns, use sysparm_query=ORDERBY[column name]^ORDERBY[column name]. For example: sysparm_query=ORDERBYassigned_to^ORDERBYpriority.</td>
</tr>
</tbody>
</table>

### Call URL export programmatically

You can dynamically export data from a script or web service by calling a URL export from any programming language.

The following procedure includes code samples that demonstrate calling a URL export in C# for a .Net framework call:

1. **Add the following Imports:**

   ```csharp
   using System.Net;
   using System.IO;
   ```

2. **Call the Download method:**

   ```csharp
   static void Main(string[] args)
   {
     // Call to DownloadFile method supplying the URL and location to save CSV file locally
     int read = DownloadFile("https://<instance>.service-now.com/incident_list.do?CSV&sysparm_query=priority=1&sysparm_orderby=assigned_to", "c:\\test\\incident.csv");
   }
   ```

3. **Create a Download method as follows:**

   ```csharp
   public static int DownloadFile(String url, String localFilename)
   ```

   © 2017 ServiceNow. All rights reserved. 1507
{ // Function will return the number of bytes processed // to the caller. Initialize to 0 here.
int bytesProcessed = 0;
// Assign values to these objects here so that they can // be referenced in the finally block
Stream remoteStream = null;
Stream localStream = null;
WebResponse response = null;
// Use a try/catch/finally block as both the WebRequest and
Stream // classes throw exceptions upon error
try
{
    // Create a request for the specified remote file name
    WebRequest request = WebRequest.Create(url);
    // Create the credentials required for Basic Authentication
    // Add the credentials to the request
    request.Credentials = cred;
    if (request != null)
    {
        // Send the request to the server and retrieve the
        // WebResponse object
        response = request.GetResponse();
        if (response != null)
        {
            // Once the WebResponse object has been retrieved,
            // get the stream object associated with the
            response's data
            remoteStream = response.GetResponseStream();
            // Create the local file
            localStream = File.Create(localFilename);
            // Allocate a 1k buffer
            byte[] buffer = new byte[1024];
            int bytesRead;
            // Simple do/while loop to read from stream until
            // no bytes are returned
            do
            {
                // Read data (up to 1k) from the stream
                bytesRead = remoteStream.Read(buffer, 0, buffer.Length);
                // Write the data to the local file
                localStream.Write(buffer, 0, bytesRead);
                // Increment total bytes processed
                bytesProcessed += bytesRead;
            } while (bytesRead > 0);
        }
    }
    catch (Exception e)
    {
        Console.WriteLine(e.Message);
    }
} finally
{
    // Close the response and streams objects here
    // to make sure they're closed even if an exception
    // is thrown at some point
    if (response != null) response.Close();
    if (remoteStream != null) remoteStream.Close();
    if (localStream != null) localStream.Close();
Break up a large export

If the number of records to be exported exceeds the actual export limit, you may want to break the export into smaller increments that do not place a significant performance load on the platform.

1. **Filter the list** to display the records you want to export.
2. Write down the number of records returned.
3. If the record number is higher than the defined threshold, issue a `sysparm` query for the first 10,000 records using the following syntax:
   
   ```
   https://<instance name>.service-now.com/syslog_list.do?
   XML&sysparm_orderby=sys_id&sysparm_record_count=10000
   
   This exports the first 10,000 records in order, sorted by the sys_id number.
   ```

4. Find the next record in order, such as 10,001.
5. Right-click the row and copy the sys_id of the next record you want to export.
6. Access the next series of records with a greater than or equal to query run against the sys_id of record 10,001.

   The following example shows a query that uses a sys_id of b4ae6b520a0a1001af10e278657d27. Use the syntax shown in this query to export the next set of records.

   ```
   https://<instance name>.service-now.com/syslog_list.do?XML&sysparm_query=sys_id%3E%
   %3Db4ae6b520a0a1001af10e278657d27&sysparm_orderby=sys_id&sysparm_record_count=10000
   ```

   **Note:** URL queries use typical percent encoding. In this example, the greater than sign (>) is encoded as %3E and the equal sign (=) is encoded as %3D.

7. Continue issuing this query, using the starting sys_id for the next set of records until you have exported all the necessary records.

Enable export debug logging

When the property `glide.export.debug` is true, the instance logs export processing including database query time and the time taken to write data to the file.

When the property `glide.export.debug` is true, the instance logs export processing including database query time and the time taken to write data to the file. Debug logs are indicated by the text Export API. Prolonged use of this property can affect performance, so it is best to use it while debugging export processing, and then set the property back to false.

```

```
### Import sets

Import Sets allow administrators to import data from various data sources, and then map that data into ServiceNow tables.

<table>
<thead>
<tr>
<th>Explore</th>
<th>Set up</th>
<th>Administer</th>
</tr>
</thead>
<tbody>
<tr>

Import Sets is a powerful tool used to import data from various data sources, and then map that data into ServiceNow tables.

The Import Sets table acts as a staging area for records imported from a data source.

**Note:** Data should not be imported in extremely large chunks. Creating an extremely large import set can cause delays and system outages.

A transform map determines the relationships between fields displaying in an Import Set table and fields in an existing ServiceNow table, such as the Incidents or Users table.

Importing sets will skip records when the data in the instance matches the data being imported.

**Note:** Import Sets run as user System. Therefore, Import Sets cannot add data to encrypted fields.

**Import sets terminology**
A dictionary of key Import Set terms.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Set table</td>
<td>A table that acts as a staging location for records imported from a data source prior to transforming those records.</td>
</tr>
<tr>
<td>Data source</td>
<td>A record that defines where to get the data to import. A data source may point to a file, a JDBC-compatible database, or an LDAP organizational unit.</td>
</tr>
<tr>
<td>Transformation</td>
<td>The conversion of data from an import set table to another table according to the rules defined in a transform map.</td>
</tr>
<tr>
<td>Transform map</td>
<td>A set of field maps that define the relationships between fields in an import set and fields on a table, such as Incident. During transformation, data is copied from the Import Set table to the destination table based on the transform map. A single import set field may be mapped to multiple fields on other tables.</td>
</tr>
<tr>
<td>Foreign record insert</td>
<td>A foreign record insert occurs when an import makes a change to a table that is not the target table for that import. This happens when updating a reference field on a table. For example when updating a value for the caller on an incident the import is actually updating the sys_user table.</td>
</tr>
</tbody>
</table>
Supported import formats
You can import data from several different file formats.

Table 338: File formats

<table>
<thead>
<tr>
<th>Format</th>
<th>Limitations</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSV</td>
<td>CSV files must comply with the proposed CSV standard in RFC4180. In particular, this means that double quotes may not appear inside fields. The first row of data in an imported CSV file becomes the header row and defines the columns for that import set.</td>
</tr>
<tr>
<td>Excel</td>
<td>Excel files must have the XLS extension. Excel files with the XLSX extension will produce an error.</td>
</tr>
<tr>
<td>XML</td>
<td>XML files must have a consistent XPath for each data row.</td>
</tr>
</tbody>
</table>

ServiceNow can import data from the following external data sources.

Table 339: External data sources

<table>
<thead>
<tr>
<th>Data Source</th>
<th>Limitations</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC</td>
<td>Some network configurations may require a MID Server.</td>
</tr>
<tr>
<td>LDAP</td>
<td>LDAP imports require a valid transform map.</td>
</tr>
</tbody>
</table>

Data sources
Data sources are used to create an import set so that data can be processed, if necessary, prior to being mapped onto a production table.

Table 340: Data Source Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>Data is in a recognized file format, accessible locally or remotely through several file retrieval methods.</td>
</tr>
<tr>
<td>JDBC</td>
<td>Data is in a database, accessible using JDBC. ServiceNow supports Oracle, MySQL, Sybase, DB2 Universal, and MS SQL Server drivers.</td>
</tr>
<tr>
<td>LDAP</td>
<td>Data is in an LDAP server, accessible through the LDAP or LDAPS ports, 389 and 636 respectively.</td>
</tr>
</tbody>
</table>

File type data sources
You can import a file from a local source, a remote network server, or another instance by providing a path and authentication information.
For file type import sets, you can select from a list of file retrieval methods, including FTP, FTPS, SCP, and HTTPS.

File retrieval methods

The following file retrieval methods are available to copy the file from where it resides to ServiceNow to be loaded into an import set.

After defining the files that are compatible for importing, define how the files can be imported.

**Note:** For the import to succeed, your FTP server and client must be set up for the same authentication mechanism that you select here. Refer to the following article for an explanation of the supported protocols [http://en.wikipedia.org/wiki/FTPS](http://en.wikipedia.org/wiki/FTPS).

</tbody>
</table>
FTP data source extended properties

Certain properties are available for customizing your FTP data source.

To enter these properties, you must configure the Data Source form and add the Properties field. When specifying more than one property, use a comma to separate each property.

### Table 342: Available FTP Properties

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>

<td>true</td>
<td>connection.passive=false</td>
<td>FTPS</td>
</tr>
</tbody>
</table>
### File data source examples

These examples describe how to import various file types as data sources.

#### XLS data source file

XLS refers to the Microsoft Excel file format. This is the default format for spreadsheets created in Excel for versions 2003 and older. The .xlsx file format that is the default format for Excel 2007 is not currently supported. If importing a list from Excel 2007, it is necessary to save the file as .xls.

**Note:** All .xls files must use the 1900 date system as opposed to the 1904 date system as the latter will cause your dates to be imported with a year that is four years earlier than what your spreadsheet displays. Refer to MS Support for additional information about date systems.
XML data source file

XML data source definitions have an additional field to specify the "XPath for each row". This is an XPath expression to select the elements whose children will be converted to rows in the import set table. Each selected element will cause a row to be created in the import set table. The children of the selected element will be converted into columns in the row. For example, to import the asset information from the sample XML file below, the XPath expression should be specified as "/export/asset". This expression matches the 3 <asset> elements in the file, so 3 rows will be created. Although one could also specify "//asset" this expression is much less efficient for large files. It is strongly recommended that you use the absolute location path form for XPath expressions when using the XML loader. In other words, avoid expressions containing "//" unless strictly necessary.

Be careful not to specify an insufficiently restrictive XPath expression with a large XML file. For example, the expression "/export" would be wrong for the sample file below, since it matches the document (root) element. In general, you should never specify an XPath expression which matches the root element unless you want everything in the document to be made into a single row. Specifying an insufficiently restrictive XPath expression when attempting to load large XML files could result in lengthy processing times and incorrect output. For this reason, it is best to test and debug XML data source specifications with small XML files containing only a few rows worth of data. Once the specification has been tested, you can run it again with the full file.

Notice that the <userInfo> elements contained within <asset> contain child elements. This will cause a column called "userInfo" to be created containing XML for the userInfo element. If Expand child nodes is checked, individual columns will also be created for userInfo/lastName and userInfo/firstName. If Expand child nodes is not checked, only the userInfo XML column will be created.
Note that when loading data from an XML file, ServiceNow samples the first 10 records to determine what fields are required to hold the data. If none of the first 10 records specify a value for a field, ServiceNow does not add that field to the table that holds the imported data. Ensure that at least one of the first 10 records specifies a value for any fields being imported.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<export>
  <asset><assetTag>AT-01939</assetTag><type>Desktop</type><os>Windows 7 Professional</os><lastlogondate>12-07-2010 12:31:24</lastlogondate><userInfo><lastName>Loo</lastName><firstName>David</firstName></userInfo><isenabled>true</isenabled></asset><asset><assetTag>AT-53480</assetTag><type>Desktop</type><os>Windows 7 Professional</os><lastlogondate>09-07-2010 13:25:53</lastlogondate><userInfo><lastName>Merritt</lastName><firstName>Norris</firstName></userInfo><isenabled>true</isenabled></asset><asset><assetTag>AT-55782</assetTag><type>Desktop</type><os>Unknown</os><lastlogondate>01-01-1900 00:00:00</lastlogondate><userInfo><lastName>Currie</lastName><firstName>Mike</firstName></userInfo><isenabled>true</isenabled></asset>
</export>
```

**CSV data source file**

Character-separated value (CSV) files are used as a cross-compatible file format for transferring files across platforms. A CSV file is a text file that defines a grid, where columns are defined by commas and rows are defined by line breaks. To define precise spacing for importing strings you can optionally wrap text in quotes.

```
"user_name","name","email","sys_created_on","active"

```

When using CSV files, you can specify the encoding charset using the **Properties** field on the Data Source form. You may need to **configure** the Data Source form to see this field. For example, to use utf-8 encoding, enter **charset=utf-8**.

Processing custom CSV files
You can process CSV files that are delimited by a character other than commas.

This is an advanced step to create a CSV import. Normally, you would upload the data and import it directly using System Import Sets, which will create this CSV data source for you automatically.

1. Create the data source record.
2. Attach the CSV file to the data source.
3. Customize the Data Source form and add the **CSV Delimiter** field.
4. Enter the character you want to use as the CSV file delimiter, such as the pipe symbol (|).
5. Test load the data source.

---

### JDBC type data source

A JDBC data source retrieves its data via a JDBC driver, usually type 4 network.

The JDBC connection is available either directly from the ServiceNow instance (a VPN setup required), or via a dedicated MID Server installed inside your firewall that can access the database port.

---

**Note:** Any JDBC call from the MID Server is never encrypted. Limit the rights available to the MID Server user whenever making JDBC calls from a MID server.

**Caution:** The system loads JDBC drivers from the `lib` directory before it looks for the driver in the `extlib` directory. If you synched an updated version of a JDBC library into `extlib`, and the `lib` directory contains an outdated JDBC library, the instance loads the old library from the `lib` directory.

---

### Supported database connections

JDBC connections are supported for the following default databases:
### Table 343: Supported JDBC connections

<table>
<thead>
<tr>
<th>Database</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL</td>
<td>3306</td>
</tr>
<tr>
<td>MS SQL Server</td>
<td>1433</td>
</tr>
<tr>
<td>Oracle</td>
<td>1521</td>
</tr>
<tr>
<td>Sybase</td>
<td>5000</td>
</tr>
<tr>
<td>DB2 Universal</td>
<td>&gt;50000</td>
</tr>
</tbody>
</table>

**Note:** Oracle DATE fields are loaded as ServiceNow datetime fields.
JDBC data source SQL statement requirements

JDBC queries that run SQL statements must specify a column name.

For example, this query specifies the column name `ServerID`.

```sql
SELECT DISTINCT 'server_name:' + CONVERT ( VARCHAR , lg .ResourceID ) AS 'ServerID'
,LastHWScan
,Account0
,Category0
Fromv_GS_WORKSTATION_STATUSsInner  JOIN
v_GS_LocalGroupMembers0lg
```

© 2017 ServiceNow. All rights reserved.
SQL server integrated authentication for Windows
A JDBC data source can use the ID of for the Windows MID Server service user to authenticate with SQL Server.

The **Use integrated authentication** check box on the Data Source form determines if the JDBC data source uses the MID Server service user credentials. For this field to appear on the Data Source form, the integration must meet these criteria:

- The MID Server must be running on a Windows computer with SQL Server.
- The MID Server service must use the same credentials that SQL Server requires.
- The data source **Type** is JDBC.
- The data source **Use MID Server** field must not be empty.
- The data source **Format** is SQLServer.

**Important:** If integrated authentication is chosen, and you are integrating with Microsoft System Center Configuration Manager, the account running the MID Server service must have read rights on the SCCM database.
**Figure 431: Data Source form**

JDBC data source connection properties

You can control how ServiceNow communicates with a JDBC data source using properties.
### Table 344: JDBC Connection Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.jdbcprobeloader.retry</td>
<td>The number of times a JDBC probe loader attempts to process data returning from a JDBC data source. Sleeps on the value defined in &quot;glide.jdbcprobeloader.retry.millis&quot; between retries.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 60</td>
</tr>
<tr>
<td></td>
<td>• Location: Add the property</td>
</tr>
<tr>
<td>glide.jdbcprobeloader.retry.millis</td>
<td>How many milliseconds a JDBC probe loader waits in between retry attempts to process data from a JDBC data source.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 5000</td>
</tr>
<tr>
<td></td>
<td>• Location: Add the property</td>
</tr>
</tbody>
</table>

**JDBC drivers for unsupported sources**

Use the following procedures to extend the data source to use a driver for a database that is not provided in the base system.

**Install a driver on a MID Server**

You can install a new JDBC driver JAR file to a MID server to access database formats that are not supported by default.

Role required: agent_admin

1. Navigate to **MID Server > JAR Files**.
2. Click **New**.
3. Complete the following fields:
   - **Name**: A unique and descriptive name for identifying the file in the instance.
   - **Version**: A version number for the file, if one is available.
   - **Source**: Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description**: Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner and attach the JAR file to the record.
5. Click **Submit**.
6. Restart the MID Server service.
   
The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Add a new JDBC format choice

Extend the available JDBC driver options by creating a new choice list entry to specify the JDBC driver Java package name.

Role required: import_admin

Add a new choice list entry for the new database to the **Format** field in the sys_data_source table.

1. Navigate to **System Import Sets > Administration > Data Sources**.
2. Click **New**.
3. In the Data Sources form, right-click the **Format** field label, and select **Show Choice List** from the pop-up menu.

4. Click **New** in the list of choices.
5. Provide the following values to create the new database choice. Look at the existing drivers for examples.
- **Table**: sys_data_source
- **Label**: Database name that appears as an option in the **Format** choice list, for example: TeraData.
- **Value**: Package name and class of the driver. For example, the value for TeraData is `com.ncr.teradata.TeraDriver`.
- **Dependent value**: JDBC

6. Click **Submit**.
   The new data source now appears in the list of available JDBC formats.

Add Sybase or DB2 JDBC format choices
- Extend the available JDBC driver options by activating the Sybase or DB2 choices.

Roles required: admin

**Important**: To use Sybase or DB2 JDBC drivers, you must manually install the driver JAR file on a MID server. Refer to [KB0551236](#) for more information.

Activate the Sybase or DB2 JDBC drivers to connect with those database formats through a MID server. This procedure assumes you are using the following Sybase or DB2 drivers:
Table 345: Drivers

<table>
<thead>
<tr>
<th>Format</th>
<th>Driver</th>
<th>Driver class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sybase</td>
<td>jconnect-jdbc</td>
<td>com.sybase.jdbc3.jdbc.SybDriver</td>
</tr>
<tr>
<td>DB2</td>
<td>db2jcc</td>
<td>com.ibm.db2.jcc.DB2Driver</td>
</tr>
</tbody>
</table>

If you are using a different implementation of the Sybase or DB2 driver, you must modify the choice Value to use the driver class from your driver implementation.

1. Navigate to System Import Sets > Administration > Data Sources.
2. Click New.
3. In the Type field, select JDBC.
4. Right-click the Format field label, and select Configure Choices from the pop-up menu.
5. Move the Sybase or DB2 Universal choices from the Available column to the Selected column.
6. Click Save.

The new data source now appears in the list of available JDBC formats.

Create a new data source

Add a new JDBC data source by defining a data source record.

Role required: import_admin

1. Navigate to System Import Sets > Administration > Data Sources and click New.
2. In the Data Source form, select JDBC from the list in the Type field.
3. Select the new data source from the choice list in the Format field.
4. Configure the form and add the **Connection URL** field.

5. Provide the connection URL to the JDBC data source, and then click **Submit**.

No other connection information is required.

![Data Source](image)

**LDAP type data source**

An LDAP data source is automatically created when you configure your instance to integrate with LDAP.
Transform maps
A transform map is a set of field maps that determine the relationships between fields in an import set and fields in an existing ServiceNow table, such as Incident [incident] or User [sys_user].
After creating a transform map, you can reuse it to map data from another import set to the same table.

The **Transform Maps** module enables an administrator to define destinations for imported data on any tables. Transform mapping can be as simple as a drag and drop operation to specify linking between source fields on an import set table and destination fields on any table. Use transform mapping to map source and destination fields dynamically.

**Using multiple transform maps**
- Multiple transform maps can be applied to a single data source.
- One import set row is created per transform map. This behavior can cause a large number of temporary records to be generated.

**Run multiple transforms off a single import set**
- Users can select multiple transform maps during data import.
- The selected transform maps will be executed on the same import set in the order specified.
Transform map scripts
Transform Map scripts allow you to customize import operations using a robust programming interface to introduce advanced logic.

A transform map script executes as events occur while an import set is being transformed onto a ServiceNow table. Transform Map scripting is fully integrated into the ServiceNow scripting environment. There are two types of Transform Map scripts:

• Explicit Transform Map scripts, which explicitly define mapping relationships
• Transformation Event scripts, which modify the processing of events at different stages of a transformation

Transformation script variables
Multiple variables can be used to define explicit mapping relationships in a transform map script.

**Variable name: source**
Type: GlideRecord object
Description: Contains the import source record currently being transformed. Specify a specific field from the source record as an object property.

Example:
```
var x = source.incident_state;
```

**Variable name: target**
Type: GlideRecord object
**Variable name: map**

**Type:** GlideRecord object

**Description:** Contains the transformation map record currently being used for the transformation process. Specify a specific field from the transform map record with one of these properties.

- name
- sys_id
- source_table
- target_table
- order

**Example:**

```
var x = map.order;
```

---

**Variable name: log**

**Type:** Function

**Description:** Log information about the current import process. Each log level has its own method.

**Example:**

```
log.info("This is an information message");
log.warn("This is a warning message");
log.error("This is an error message");
```

---

**Variable name: action**

**Type:** Function

**Description:** Specify the transformation action occurring on the target record. This value can be either "insert" or "update".

**Example:**

```
if(action =="insert"){
    ignore = true;
}
```

---

**Variable name: ignore**

**Type:** Boolean

**Description:** When set to true, skips or aborts the current import action. In onStart scripts, this variable aborts the entire transformation process. In onBefore scripts, this variable only skips the current row being transformed.
Example:

```java
if(source.u_user_name.nil()){
    ignore = true;
}
```

Variable name: error

**Type:** Boolean

**Description:** When set to true, aborts the current import action and logs an error message in the Import Set Log.

Example:

```java
if(source.name=="no_transfrom"){
    error = true;
}
```

Variable name: error_message

**Type:** String (output message)

**Description:** When an error occurs, adds the specified error message to SOAP response.

Example:

```java
if(source.name=="no_transfrom"){
    error = true;
    error_message = "Source is not intended for transformation";
}
```

Variable name: status_message

**Type:** String (output message)

**Description:** Adds the specified status message to SOAP response.

Example:

```java
if(action =="insert"){
    status_message = "Inserting record";
}
```

Map with explicit transform map scripts

Explicitly define mapping relationships in the Transform Map record itself.

An explicit Transform Map script explicitly defines mapping relationships in the Transform Map record itself. It runs after the source field values have been copied over to the target record, and before they are written to the database.

CMDB software import facilitated by explicit mapping script

An example demonstrating how explicit map scripting can be used to facilitate an import of software instances to the CMDB where it is necessary to have the count in the software packages table reflect the number of instances.

In the CMDB there exist tables for software packages and software instances. A software package refers to a one individual software title, such as Mozilla Firefox. A software instance refers to an individual instance of a software title such as Mozilla Firefox on Jared_T60_Laptop.

In more technical terms a software instance is a many-to-many relationship with a software package and a configuration item. This script imports software instances. In doing so it checks to see if a software
package for the instance exists. If the software package doesn’t exist then it is created and the sys_id for the newly created package is associated with the instance via the instance record’s Software field.

```javascript
//First we will initialize some temporary variables, referencing
//values from the Import Set table source that will be used to
//reference software package records and create them if necessary.

var name = source.u_name;
var version = source.u_version;
var sid = "";

//Next we will perform a glide query on the software package table (Note: The target table
//for the import is software instances)
var sgr = new GlideRecord("cmdb_ci_spkg");

//Here we are building our query to search for software packages where the
//name and version
//of the package matches the name and version of the instance being
//imported
sgr.addQuery("name", name);
sgr.addQuery("version", version);
sgr.query();

//Now if a software package with the correct name and version are found then
//we
//record the sys_id of the package record
//otherwise we create the package and then record the sys_id
if (sgr.next()) {
    sid = sgr.sys_id; } else { // create it
    sgr.initialize();
    sgr.newRecord();
    sgr.name = name;
    sgr.version = version;
    sid = sgr.insert();

    //Here we make an entry in System Import Set Log saying that we had to
    //create a software package
    log.info("Created new spkg: " + name + " - " + version);
}

//Finally we set the reference field on our software instance record to the
//sys_id we have
//recorded for the software package. In doing so we are also relating the
//software
//package with the instance and so the count, which keeps track of
//the number of instances associated with a package, will automatically be
//incremented.
    target.software = sid;
```

Populating child tables by setting class names in an import to the CMDB

An example demonstrating how to import servers into the configuration management database.

The destination table for the import is the cmdb_ci_servers table.

```javascript
var operating_system = source.u_operating_system.toString();

//This if statement uses JavaScript regular expressions to search the
//operating system
if (operating_system.match(/linux/i) != null) {
    target.sys_class_name = "cmdb_ci_linux_server";
}
if (operating_system.match(/win/i) != null) {
```
User import data sanitation

An example script demonstrating how to sanitize user data before import.

```
var name = source.u_name.toString();

// Use native JavaScript function split to create an array for each word in
// the name "splitting"
// it anywhere that there is a space
var split_names = name.split(" ");

// Find the number of of names (i.e., first and last name only, or first
// middle and last name, etc.)
var num_names = split_names.length;

// If there is only one name then map it to the last name field in the user
// table
if(num_names ==1){
    target.last_name = split_names[0];}

// If there are two names then map the first one to first name and the last
// one to last name
if(num_names ==2){
    target.first_name = split_names[0];
    target.last_name = split_names[1];
}

// If there are more than 3 names then all middle names get combined into one
// middle name
// this is done by shifting off the first name (array element 0 )
// and mapping to first name and popping off the last
// name and returning it to the last name field
if(num_names >=3){
    target.first_name = split_names.shift();
    target.last_name = split_names.pop();
    target.middle_name = split_names.join(" ");}
```

Map with transformation event scripts

Transformation events occur during the process of transforming an import set table onto a table.

These events modify the transformation behavior from any type of mapping specification. Transformation Event scripts modify the processing of the events at various stages of the transformation.

For example, the processing of a mapping operation defined using the Mapping Assist Utility can be manipulated using the event scripts. There are a number of import set JavaScript objects that are accessible during these events. These objects represent tables or portions of tables. It is important to note that what these objects refer to varies depending on the context of the event in which they are referenced.

The following is a table of all of the transform events and their contextual variables:
Table 346: transform events and their contextual variables

<table>
<thead>
<tr>
<th>Event name</th>
<th>Event Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>onStart</td>
<td>When: The onStart event script is processed at the start of an import run, before any data rows are read.</td>
</tr>
</tbody>
</table>

Table 347: Import Set JS objects available to be referenced and their context in the onStart event

<table>
<thead>
<tr>
<th>Import Set JS object</th>
<th>Type</th>
<th>Context in the onStart import set event</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The first row of the source table, there is no data yet since the row has not been read.</td>
</tr>
<tr>
<td>import_set</td>
<td>GlideRecord</td>
<td>The import set that is currently being transformed.</td>
</tr>
<tr>
<td>map</td>
<td>GlideTransformMap</td>
<td>Read-only information about the current transform map record.</td>
</tr>
<tr>
<td>log</td>
<td>Function</td>
<td>The log object for the current import run. For example, log.info(...), log.warn(...), log.error(...).</td>
</tr>
<tr>
<td>ignore</td>
<td>Boolean</td>
<td>When set to true, the entire transformation will be stopped and no further processing will occur.</td>
</tr>
<tr>
<td>error</td>
<td>Boolean</td>
<td>When set to true, has the same effect as the ignore flag of stopping with an error.</td>
</tr>
<tr>
<td>Event name</td>
<td>Event Parameters</td>
<td></td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>onComplete</td>
<td>When: The onComplete event script is processed at the end of an import run, after all data rows are read and transformed.</td>
<td></td>
</tr>
</tbody>
</table>

### Table 348: Import Set JS objects available to be referenced and their context in the onComplete event

<table>
<thead>
<tr>
<th>Import Set JS object</th>
<th>Type</th>
<th>Context in the onComplete import set event</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The last row of the source import set table.</td>
</tr>
<tr>
<td>target</td>
<td>GlideRecord</td>
<td>The last row of target table.</td>
</tr>
<tr>
<td>import_set</td>
<td>GlideRecord</td>
<td>The import set that is currently being transformed.</td>
</tr>
<tr>
<td>map</td>
<td>GlideTransformMap</td>
<td>Read-only information about the current transform map record.</td>
</tr>
<tr>
<td>log</td>
<td>Function</td>
<td>The log object for the current import run. For example, log.info(...), log.warn(...), log.error(...).</td>
</tr>
<tr>
<td>error</td>
<td>Boolean</td>
<td>When set to true, will mark the current import set status to error after it completes.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
// Create a myimport_completed event that can be reacted by an email notification or script action. (there is already an import.finished event that the system will create at the end of an import)
var e = new GlideEvent("myimport_completed", import_set.sys_id, map.sys_id, "");
e.insert();
```

---

**Note:** GlideEvent replaces Packages.com.glide.policy.Event
Event name | Event Parameters
---|---
onBefore | When: The onBefore event script is processed at the start of a row transformation, before the source row is transformed into the target row.

### Table 349: Import Set JS objects available to be referenced and their context in the onBefore event

<table>
<thead>
<tr>
<th>Import Set JS object</th>
<th>Type</th>
<th>Context in the onBefore import set event</th>

</tr>
<tr>
<td>target</td>
<td>GlideRecord</td>
<td>The row of the target table that is currently being processed.</td>
</tr>
<tr>
<td>map</td>
<td>GlideTransformMap</td>
<td>Read-only information about the current transform map record.</td>
</tr>
<tr>
<td>action</td>
<td>String</td>
<td>Action returns a value of either &quot;insert&quot; or &quot;update&quot; indicating whether the current target row is about to be created or updated.</td>
</tr>
<tr>
<td>log</td>
<td>Function</td>
<td>The log object for the current import run. For example, log.info(...), log.warn(...), log.error(...).</td>
</tr>
</tbody>
</table>

Example:

```javascript
//Create an event
var e = new GlideEvent("myimport_onReject", action, "", ");
e.insert();
```
Updating records using coalesce

The coalesce option allows you to update existing target table records when transforming import data.

The coalesce option on a field map allows you to specify if the selected **Target field** should be used to coalesce on when import set records are transformed. If the field map **Coalesce** checkbox is selected, when the import set row is transformed the instance checks for an existing record in the target table that has the same value in the **Target field** as the import set row **Source field**.

If an existing record with a matching value in the target table is found, that record is updated. If no matching record is found, then a new record is created in the target table.

**Note:** Choose fields in the target table to coalesce on only if those fields will have unique values. If more than one record in the target table matches the specified coalesce options, only the first matching record in the target table is updated.

Coalesce options

There are several possible configurations you can use to coalesce data in import sets.

**No coalesce**

If no coalesce is defined, all imported rows are treated as new records. No existing records are updated.

**Single-field coalesce**

You can coalesce on a single field to update an existing record.

If a target table record exists with the same value in the coalesce field as the staging table record, the target table record is updated using the import set record values.

**Multiple-field coalesce**

You can coalesce on multiple fields to update an existing record.

If a target table record exists with the same values in all coalesce fields as the staging table record, the target table record is updated using the staging table record values. All coalesce field values between the target and staging tables must match to coalesce with multiple fields.

**Conditional coalesce**

You can use a script to determine if a staging table row should coalesce to a target record.

Most conditional coalesce scripts are defined in the **Source script** field of a field map for the sys_id field. To update a target record using the staging table record values, the script must return the sys_id of the target table record.

**Example conditional coalesce scripts**

Review examples of conditional coalesce scripts.
Updates only

To only update records where a match is found, and skip records where a match is not found, specify a coalesce field and add the following script as an `onBefore` script to the transform map.

```javascript
if (action == 'insert')
    ignore = true;
```

Conditional coalesce using dot-walking

You can use dot-walked fields in a conditional coalesce script, such as to match the email address of a user when importing incident data.

In this example, this script is defined in the **Source script** of a field map for the Incident target table `sys_id` field.

```javascript
var gr = new GlideRecord('incident');
gr.addQuery('caller_id.email', source.u_email); //check if the incident caller's email matches the import row email value
gr.query();
if (gr.next())
    answer = gr.sys_id; //if a match exists, return the sys_id of the matching Incident record
else
    answer = -1;
```

Conditional coalesce with an OR condition

You can use a conditional coalesce script to match source and target records based on multiple field values. Unlike multiple-field coalesce where all coalesce fields must match, you can specify a script to only require one of the fields to match.

In this example, this script is defined in the **Source script** of a field map for the User target table `sys_id` field.

```javascript
var gr = new GlideRecord('sys_user');
var qc = gr.addQuery('email', source.u_email); //first check if the user's email matches
qc.addOrCondition('user_name', source.u_name); //alternatively, check if the username matches
gr.query();
if (gr.next())
    answer = gr.sys_id; //if a match exists, return the sys_id of the matching User record
else
    answer = -1;
```
Case sensitive coalesce field values

Coalescence is the method by which import sets update existing records in a destination production table, rather than inserting new records.

This means that when importing the data onto the targeted production table, the import set application attempts to match source values to currently existing target values on a production table for updating. Otherwise, a new record is created.

A field called **Coalesce case sensitive** in the Field Map form (System Import Sets > Transform Maps > Field Map), enables you to coalesce field values by case sensitivity.

**Case sensitivity in coalescence**

By default, field values marked as Coalesce are used in a case insensitive lookup for existing records. Case insensitive records update existing records only, and do not cause new records to be created. If this check box is selected, the ServiceNow system attempts to match coalesce field values in import sets by case. If the case of a field in a record in the import set does not match the case in a value in an existing record, a new record is created.

**Figure 434: Case sensitivity in coalescence**

Coalesce on empty fields

You can control if an import set will coalesce on fields with no value.

The field map **Coalesce empty fields** field allows you to coalesce on fields with no value.

By default, fields marked as Coalesce in the field map cause the import set to check for a target record with a field value that matches the value from the import set staging record. When **Coalesce empty fields** is selected for that field map, an empty value in the target record and import set staging record counts as a match for the purpose of coalescing.

For example, the User transform map coalesces on the email field. With the **Coalesce empty fields** option selected, a source record containing an empty email address coalesces to a target record containing an empty email address.

**Standard import set tables**

Several Import Set tables are available by default.

**Notification**

A standard object for describing an external interface for a notification in the system, eg. alarms and alerts from monitoring systems. The default transform map for this object will create or update an incident record. The incoming notifications are coalesced into incidents based on the UUID field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>uuid</td>
<td>The universally unique identification number or string that uniquely identifies this notification. It is marked as the coalescing value in the default transform map for the corresponding Incident and is mapped to the correlation_id field of Incident.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>corrective_message</td>
<td>A free form string value that indicates the corrective or followup steps to be taken to address the issue identified in this notification. This field is not mapped by default.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>duration</td>
<td>A string value representing the time value duration affecting the issue reported in this notification. Out of box, the duration field is not mapped. The format of the time is up to the calling program and must be mapped accordingly in the default map to be used.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>expires_on</td>
<td>A string value representing the datetime value that the issue reported in this notification will expire. Out of box, the expires_on field is not mapped. The format of the time is up to the calling program and must be mapped accordingly in the default map to be used.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>message</td>
<td>A string value describing the nature of the issue related to this notification. It should be a concise description and is mapped to the short_description field of the Incident.</td>
<td>Character (80)</td>
</tr>
<tr>
<td>comments</td>
<td>A string value containing additional comments related to this notification. The value is mapped to the comments field of the Incident.</td>
<td>Character (4000)</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td>Data type</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>category</td>
<td>A string value categorising the nature of this notification. The value is mapped to the category field of the Incident, and therefore should be one of its valid values. If an existing value does not exist, the default behavior is to create a new category.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>assignment_group</td>
<td>A string value of the assignment group for this notification. The value is mapped to the assignment_group field of the Incident, and therefore should be one of its valid values. If an existing value does not exist, the default behavior is to create a new assignment group and set it for the resulting incident.</td>
<td>Character (40)</td>
</tr>
</tbody>
</table>
| severity     | A string representation of a numeric value that indicates the severity of the issue being reported in this notification. This field is mapped to the severity field on Incident. The out of box numeric values and their meanings are:  
  • 1 - High  
  • 2 - Medium  
  • 3 - Low | Character (40)     |
| state        | A string that indicates the state of the issue being reported in this notification. This field is mapped to the incident_state field on Incident. The out of box values are:  
  • New  
  • Active  
  • Resolved  
  • Closed | Character (40)     |
<p>| source       | A string value to indicate the source of the issue or the configuration item (by unique identifier eg IP address, host name etc) related to the issue in this notification. It is mapped to the cmdb_ci field of Incident. | Character (40)     |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>A string value representing the datetime value that marks the beginning of the issue reported in this notification. Out of box, the timestamp field is not mapped. The format of the time is up to the calling program and must be mapped accordingly in the default map to be used.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>type</td>
<td>A string value categorizing the type of issue related to this notification. Out of box, this field is not mapped to any field on Incident. Integrations using this Notification message may use this field to identify its source and trigger additional scripts.</td>
<td>Character (40)</td>
</tr>
</tbody>
</table>

**Computer**

A standard object for describing an external interface for a computer in the system. The default transform map will create/update a Computer (cmdb_ci_computer) or Server (cmdb_ci_server, cmdb_ci_win_server, cmdb_aix_server etc..) based on the operating_system field value. The incoming computers are coalesced based on the serial_number field. Additionally, the transform script of the map will map to various extensions of the Computer (cmdb_ci_computer) based on the operating_system value being entered.

- UNIX Server (cmdb_ci_unix_server)
  - AIX
  - HP/UX
  - Solaris
  - AIX
- Windows Server (cmdb_ci_win_server)
  - Windows 2000 Server
  - Windows 2003 Server
  - Windows NT 4.0
- Server (cmdb_ci_server)
  - Any operating system that contains the word "Linux"
Table 355: imp_computer

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>serial_number</td>
<td>The unique identifier for this computer. It is marked as the coalescing value in the default transform map for the corresponding Computer and is mapped to the serial_number field of Computer (cmdb_ci_computer).</td>
<td>Character (40)</td>
</tr>
<tr>
<td>cpu_count</td>
<td>The number of CPUs that this computer has. It is mapped to the cpu_count field of the Computer (cmdb_ci_computer) table.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>cpu_speed</td>
<td>The clock speed of the CPU in MHz. This field is mapped to the cpu_speed field of Computer (cmdb_ci_computer)</td>
<td>Character (40)</td>

<tr>
<td>ram</td>
<td>A numeric value for the total number of memory installed on this computer in MB. This value is mapped to the ram field of Computer (cmdb_ci_computer)</td>
<td>Character (40)</td>
</tr>
</tbody>
</table>
# User

A standard object for describing an external interface for a user in the system. The default transform map script sets the user_name field value to first_name.last_name if the web service's user_id field value is not supplied, otherwise, the user_id value is mapped directly to the user_name field in the User (sys_user) table.

<table>
<thead>
<tr>
<th>Field</th>

<td></td>
</tr>
</tbody>
</table>

# Location

A standard object for describing an external interface for a location in the system. The web service will create or modify records in the Location (cmn_location) table.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the location, for example &quot;Headquarters&quot;, &quot;Sales office&quot; etc. This field is mapped to the name field of Location (cmn_location) and is part of the coalesce to search for an existing location.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>street</td>
<td>The street address of the location, for example &quot;1234 ServiceNow way&quot; etc. This field is mapped to the street field of Location (cmn_location) and is part of the coalesce to search for an existing location.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>city</td>
<td>The city of the location, for example &quot;San Diego&quot;, &quot;London&quot; etc. This field is mapped to the city field of Location (cmn_location) and is part of the coalesce to search for an existing location.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>state</td>
<td>The state of the location, for example &quot;California&quot;, &quot;Connecticut&quot; etc. This field is mapped to the city field of Location (cmn_location) and is part of the coalesce to search for an existing location.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>zip</td>
<td>The zip code for the location, for example &quot;92130&quot;, &quot;10001&quot; etc. This field is mapped to the zip field of Location (cmn_location) and is part of the coalesce to search for an existing location.</td>
<td>Character (40)</td>
</tr>
<tr>
<td>country</td>
<td>The country for the location, for example &quot;USA&quot;, &quot;United Kingdom&quot; etc. This field is mapped to the country field of Location (cmn_location).</td>
<td>Character (40)</td>
</tr>
</tbody>
</table>

Import sets maximum row size

Rows imported using import sets must not exceed the maximum row size.

A single row in a database may not contain more than 8126 bytes of data. The size of each row is determined by the amount of content in all fields, as well as the character set for text fields. For example, a row with 10 text fields each containing 1000 characters using a French character set takes 15360 bytes.
Attempting to import more data to a single row than the maximum size causes the import to skip that row. Any rows that were skipped for this reason are listed in the import log.

Importing data using import sets

An import set acts as a staging table to store raw data from an external source.

The import process uses a transform map to add or update data from the import set to an existing ServiceNow table such as incident or problem.

Use import sets to:
- Manually import data from a file on your local system
- Manually import data from a data source
- Periodically import data from a data source with a scheduled import
- Programmatically import data from a file with a script
- Programmatically import data from a web service

Figure 435: Importing data: data flow
Create a data source
Create a data source record to define what data an import set should import.

Role required: admin

1. Navigate to System Import Sets > Data Sources.
2. Click New.
3. Set the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for this data source.</td>
</tr>
<tr>
<td>Import set table label</td>
<td>Specify a label for the import set staging table to use.</td>
</tr>
<tr>
<td>Import set table name</td>
<td>ServiceNow uses the label you entered to construct a unique table name.</td>
</tr>
<tr>
<td></td>
<td>This prevents namespace collision with an already existing table.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of data you are importing, such as from a remote File, a JDBC</td>
</tr>
<tr>
<td></td>
<td>database, or using LDAP.</td>
</tr>
</tbody>
</table>

4. Set additional fields based on the selected Type.
   Refer to the documentation for each data source type for additional field information.

5. Click Submit.

Define a transform map for the new data source and run an import.

File type data source fields
These additional fields appear on the data source form when the Type field value is File.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>Select one of the following formats from the list: CSV, CSV (tab), Excel, XML.</td>
</tr>
<tr>
<td>Zipped</td>
<td>Select this check box if the import file is compressed.</td>
</tr>
<tr>
<td>Xpath for each row</td>
<td>Specify an XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.</td>
</tr>
<tr>
<td>Expand node children</td>
<td>Select this check box child elements of the node should be converted into additional columns. Clear this field if the parent column value should be an XML fragment.</td>
</tr>
<tr>
<td>File retrieval method</td>
<td>Choose the appropriate retrieval method for this file. See File retrieval methods on page 1513 for more information.</td>
</tr>
<tr>
<td>File path</td>
<td>Specify the path to the file to import.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SCP authentication method</td>
<td>Select to authenticate with a Username and Password or with a Public key.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot authenticate to data sources with a public-private key pair. Use a username and password authentication instead.</td>
</tr>
<tr>
<td><strong>Server</strong></td>
<td>Enter the name of the server from which the file will be imported.</td>
</tr>
<tr>
<td><strong>Port</strong></td>
<td>Enter the port to use to connect to the specified server. This field appears if you select HTTP or HTTPS as the file retrieval method.</td>
</tr>
<tr>
<td><strong>User name</strong></td>
<td>Enter the user name for authentication on the file server.</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>Enter the password for authentication on the file server.</td>
</tr>
<tr>
<td><strong>Private keyfile</strong></td>
<td>Specify the keyfile when using legacy SCP public-private keyfiles.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot authenticate to data sources with a public-private key pair. Use a username and password authentication instead.</td>
</tr>
<tr>
<td><strong>System KeyStore</strong></td>
<td>Select this check box to validate the certificate from the FTPS server against all saved certificates. This certificate may be any type supported by the instance. If you do not select this check box, the instance uses the Java default certificate to validate the FTPS server. This field is available only for data sources with a File retrieval method value of FTPS (Auth SSL)</td>
</tr>
</tbody>
</table>

**JDBC type data source fields**
These additional fields appear on the data source form when the Type field value is **JDBC**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use MID Server</strong></td>
<td>Select a MID Server to use to connect to this data source.</td>
</tr>
<tr>
<td><strong>Format</strong></td>
<td>Select one of the supported database formats. Instances can connect to Microsoft SQL Server 2012 but not Microsoft SQL Server 2000.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Instance name</td>
<td>Used to support dynamic port connectivity with SQL Server. To ensure connectivity, provide the instance name for a SQL Server that receives a new port number dynamically after each reboot. This field only appears when <strong>SQLServer</strong> is selected as a data source format.</td>
</tr>
<tr>
<td>Database name</td>
<td>Enter the name of the database instance.</td>
</tr>
<tr>
<td>Database port</td>
<td>Enter the port number for the database. Leave this field empty when using dynamic port connectivity with SQL Server.</td>
</tr>
<tr>
<td>Use integrated authentication</td>
<td>Select this check box to allow the JDBC connection to use the ID of the user configured for the Windows MID Server service for SQL Server authentication. For additional details, see <em>SQL server integrated authentication for Windows</em> on page 1521.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name for authentication on the database server. The user name provided for the JDBC connection must be associated with an account on that database server; it cannot be a Windows Domain account.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for authentication on the database server.</td>
</tr>
<tr>
<td>Server</td>
<td>Enter the name of the server from which the data will be imported.</td>
</tr>
<tr>
<td>Query</td>
<td>Select the type of query to run: <strong>All rows from Table</strong> or <strong>Specific SQL</strong>. If you select to run a SQL statement, the SQL statement field appears.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Specify the number of seconds the JDBC driver will wait for a query (SELECT) to complete. Zero means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>Specify the number of seconds before MID Server connection cache pool closes and removes it from the pool. Zero means no timeout.</td>
</tr>
<tr>
<td>Table name</td>
<td>Type the name of the table from which the data is being exported.</td>
</tr>
<tr>
<td>SQL statement</td>
<td>Type a SQL statement to extract the desired data from the database.</td>

</tbody>
</table>

Create a transform map
Every import operation to a production table requires at least one transform map associated with an import set.

Role required: import_transformer, import_admin, or admin

The transform map specifies the data relationships between the import set and the target table. For every transformation, you must either create a new transform map or select an existing one.

1. Navigate to System Import Sets > Create Transform Map.
2. Fill in the fields, as appropriate (see table).

Table 359: Create transform map

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a user-friendly label for identifying the transform map.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source table</td>
<td>Select the import table containing the raw import set data. An import table is any table that extends the Import Set Row [sys_import_set_row] table. You can select only tables within the currently selected application scope.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the transform map available for use.</td>
</tr>
<tr>
<td>Run Business Rules</td>
<td>Select this check box to run business rules, workflows, approval engines, auditing, and field normalization while the transformation inserts or updates data into the target table. Clearing this check box runs GlideRecord.setWorkflow() with a value of false.</td>
</tr>
<tr>
<td>Enforce Mandatory Fields</td>
<td>Choose whether to enforce mandatory fields on the target table.</td>
</tr>
<tr>
<td>Copy Empty Fields</td>
<td>Select this check box to clear fields with existing values when an incoming field contains an empty value. See Using NULL as a Field Value for information on how to import empty values.</td>
</tr>
<tr>
<td>Created</td>
<td>Shows the transform map creation date. This field is automatically populated.</td>
</tr>
<tr>
<td>Target table</td>
<td>Select the table where you want transformed data to be placed. You can select only tables within the currently selected application scope, the global scope, or tables that grant write access to other applications</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which to apply transform maps in the event that more than one map fits the conditions. ServiceNow runs transform maps from lowest to highest Order.</td>
</tr>
<tr>
<td>Run Script</td>
<td>Select this check box to display the Script field.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the transform map script you want to use to transform field values in the source table to the target table. ServiceNow runs the transform map script in addition to any Field Maps. By default, new transform map scripts are wrapped in immediately-invoked function expressions.</td>
</tr>
<tr>
<td>Field Maps</td>
<td>Use this related list to add one or more field maps. ServiceNow runs the transform Field Maps in addition to any transform script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Transform scripts</td>
<td>Use this related list to add one or more transform map scripts. A transform script allows you to apply extra business logic at a specified stage of the transformation.</td>
</tr>
</tbody>
</table>

The sample User import transform map looks like this.
**Important:** The string `NULL` has a particular role in the code for the ServiceNow platform and is a reserved word. It should not be used as a field value in import set transform maps or anywhere in the First name or Last name fields. The reserved word is `NULL` in all capital letters. A field with the value `Null` or `null`, for example, is acceptable. `NULL` should be used only to clear out a particular field.

Create a field map

Field maps establish a relationship between a field in an import set table and a field in the target table.

Role required: import_transformer, import_admin, or admin

The field map determines what values from the source table the transformation adds to the target table.

1. Navigate to **System Import Sets > Transform Maps**.
2. Open a transform map.
3. In the **Field Maps** related list, click **New**.
4. Fill in the fields, as appropriate (see table).
5. Click **Save**.
6. Repeat steps 3-4 for each field mapping.
7. Click **Update**.

### Table 360: Creating a Field Map

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source table</td>
<td>Displays the table where the raw import set data is loaded (the source for the transformation). This field is automatically populated from the transform map. You can select only tables within the currently selected application scope.</td>
</tr>
<tr>
<td>Source field</td>
<td>Select the field on the source table to be transformed. This may be blank if the <strong>Source table</strong> only contains raw data.</td>
</tr>
<tr>
<td>Map</td>
<td>Displays the transform map that uses this field mapping. This field is automatically populated.</td>
</tr>
<tr>
<td>Date format</td>
<td>This field is available if the target field is a date or date-time field. This field specifies the date format of the source field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Choice action         | This field is available if the target field is a choice list or reference field. This field specifies what to do if the import set contains a reference or choice value other than those available. Select one of these options:  
• create: Create a new choice or record in the reference table.  
• ignore: Ignore the new value from the source table.  
• reject: Skip the entire row (record) containing the new value and continue to the next row. |
| Use source script     | Select this check box to use a script instead of the Source field.  
Source script          | Enter a script to determine the source of this field mapping instead of the Source field. The script should return the answer variable. For example, this source script combines information from multiple sources into a single value. |
<p>| Target table          | Select the table where you want transformed data to be placed. You can select only tables within the currently selected application scope, the global scope, or tables that grant write access to other applications |
| Target field          | Select the field where the values from the source field is stored.                                                                     |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Referenced value field name</td>
<td>When the target field is a reference field, the transform map needs a way to match incoming source values to existing records in the reference field's source table. Since most imports do not provide a 32-character sys_id value, you must specify a column from the reference field's source table that contains values that match the incoming source values. When there is a matching record, the transform map stores the sys_id of the matching record in the target field. If there is no matching record, the transform map creates a new record in the reference field's table and stores the sys_id of the new record in the target field. If you leave this field blank, the transform map looks for matching values from the display value column of the reference field table. For example, suppose you are importing incident records and the incoming data lists user IDs for the <strong>Assigned to</strong> field. If you leave <strong>Referenced value field name</strong> blank, the transform map searches for matching values in the User table's display value column: name. By setting the <strong>Referenced value field name</strong> to the user_name column you can match the user ID values to the appropriate user records.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Coalesce</td>
<td>Configuring a target field to coalesce causes the import set to treat the field as a unique key. When selected, the import set application attempts to match source values to records with values from an existing record. If a match is found, the transform map updates the record instead of creating a new record. When false, the import set application always creates new records for each transformation. If multiple fields are set to coalesce, all coalesce values must match an existing record. If two fields are set for coalescing and a matching value is found for one of the coalescing fields but not on the other, a new record is inserted. You must create an index on the target table if none of the coalesce fields are indexed. Indexing can improve performance for read and write operations. If one or more coalesce fields already has an index, you do not need to create an additional index. After setting the Coalesce value for all fields on the target table, use the Index Coalesce Fields related link to create an index. Before creating the index, ensure that the Coalesce value is set correctly for all fields on the target table to avoid creating unnecessary indexes for the same target table.</td>
</tr>
<tr>
<td>Coalesce empty fields</td>
<td>Select this check box to match an empty source field value to an empty target field value. For example, the User transform map coalesces on the email field. With this option selected, a source record containing an empty email address coalesces to a target record containing an empty email address.</td>
</tr>
<tr>
<td>Coalesce case sensitive</td>
<td>Select this check box to have case sensitive coalesce values result in the creation of new records. By default, values marked as Coalesce are used in a case insensitive lookup for existing records. Case insensitive records only update existing records and do not cause the creation of new records.</td>
</tr>
</tbody>
</table>

A completed field map record with coalescence enabled might look like this:
Field map script variables
Several predefined variables are available in the Source script field.

Table 361: Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The record from the source table that is currently being processed.</td>
</tr>
<tr>
<td>target</td>
<td>GlideRecord</td>
<td>The record from the target table that is currently being processed.</td>
</tr>
<tr>
<td>answer</td>
<td>String</td>
<td>The field value to set in the target record.</td>
</tr>
<tr>
<td>map</td>
<td>GlideTransformMap</td>
<td>Read-only information about the current transform map record.</td>
</tr>
<tr>
<td>log</td>
<td>Function</td>
<td>The log object for the current import run. Use this object to log messages such as log.info(&quot;&lt;Message&gt;&quot;) or log.warn(&quot;&lt;Message&gt;&quot;). This object logs to the import log for standard import sets, or other log locations as required, such as for web service imports.</td>
</tr>
<tr>
<td>Variable</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>action</td>
<td>String</td>
<td>Contains either the value insert or update depending on whether the current target row will be created or updated.</td>
</tr>
</tbody>
</table>

Mapping options
You can map fields in a number of ways depending on the circumstances of the import and whether data must be transformed prior to loading onto a production table.

It is also important to note that any given import operation may require taking advantage of multiple mapping methods, and these methods can be readily used in conjunction with one another.

**Automatic Mapping Utility**

The simplest mapping method is where all of the field names of the import sets match the names of the fields on the production tables onto which the data will be transformed. In this case, simply click **Auto map matching fields** in the related list in the Table Transform Map form and confirm proper matching. If there are any discrepancies in terms of how fields were automatically matched, use the mapping assist utility to correct them. When all fields are matched properly, click the **Transform** related link to begin transforming data onto the destination table.

**Mapping Assist Utility**

The mapping assist utility provides a visually intuitive environment for specifying mapping between import set fields and production table fields. The mapping assist utility makes it possible to map a single source field (field on an import set table) to multiple destination fields (fields on a production table).
Figure 436: Mapping assist

Changing the Date Format

If the date format of the source field does not match the format of the target field, you can set a date format mapping to transform dates from one format to another. For example, this mapping specifies that the date format of the CSV source file uses the **MM-dd-yyyy** format.
Date format options include:

Table 362: Mapping Options

<table>
<thead>
<tr>
<th>Date Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dd-MM-yyyy</td>
<td>Day-month-year</td>
</tr>
<tr>
<td>dd-MM-yyyy hh:mm:ss</td>
<td>Day-month-year hours-minutes-seconds</td>
</tr>
<tr>
<td>dd-MM-yyyy hh:mm:ss z</td>
<td>Day-month-year hours-minutes-seconds timezone</td>
</tr>
<tr>
<td>MM-dd-yyyy</td>
<td>Month-day-year</td>
</tr>
<tr>
<td>yyyy-MM-dd</td>
<td>Month-day-year hours-minutes-seconds</td>
</tr>
<tr>
<td>yyyy-MM-dd hh:mm:ss</td>
<td></td>
</tr>
</tbody>
</table>
### Date Format

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MM-dd-yyyy hh:mm:ss z</td>
<td>Month-day-year hours-minutes-seconds timezone</td>
</tr>
<tr>
<td>yyyy-dd-MM</td>
<td>Year-day-month</td>
</tr>
<tr>
<td>yyyy-MM-dd</td>
<td>Year-month-day</td>
</tr>
<tr>
<td>yyyy-MM-dd hh:mm:ss</td>
<td>Year-month-day hours-minutes-seconds</td>
</tr>
</tbody>
</table>

You can specify a custom date format using **HH** to denote 24 hour time. Converting from a 24 hour to 12 hour date format may cause times from 12:00 to 12:59 to be formatted as 00:00.

### Mapping to a Duration Field

ServiceNow duration fields use a special data type that lists the number of milliseconds the duration value is. To map import data to a duration field use one of the following methods to transform source values into a duration.

- Calculate the duration from a start and end date
- Convert an existing duration value into a ServiceNow duration value

### Calculating a Duration Value from a Start and End Date

If the import source has a start and end date, you can calculate a duration with JavaScript.

1. Navigate to **System Import Sets > Transform Maps**.
2. Select the transform map you want to calculate a duration value. For example, the Notification transform map that imports into the Incident table.
3. Select the **Run script** check box.
4. Enter JavaScript to transform the start and end dates into a duration. See the sample script.
5. Click **Update**.

This sample script transforms the source.u_start and source.u_end fields to a duration value in the target.duration field. Change the field names to match your source and target fields as needed.

```javascript
target.duration = gs.dateDiff(source.u_start.getDisplayValue(), source.u_end.getDisplayValue(), false);
```

### Convert a Duration Value into a ServiceNow Duration Value

If the import source already contains a start date and a duration value, you can convert the existing duration into a ServiceNow duration. For example, you might have an Excel data source that lists a duration in seconds. ServiceNow expects durations to have millisecond values.

1. Navigate to **System Import Sets > Transform Maps**.
2. Select a transform map.
   - For example, the Notification transform map that imports into the Incident table.
3. Select the **Run script** check box.
4. Enter JavaScript to convert existing duration values into a ServiceNow duration values. See the sample script.

5. Click Update.

This sample script converts a duration in seconds (from the source.u_duration field) to a duration in milliseconds (in the target.duration field). Change the field names to match your source and target fields, as needed.

```javascript
//Transform the value in source.u_duration from seconds to milliseconds
target.duration.setDateNumericValue(source.u_duration * 1000);
```

This sample script converts a duration already in milliseconds (from the source.u_duration field) to a ServiceNow duration (in the target.duration field). Change the field names to match your source and target fields, as needed.

```javascript
//Transform the value in source.u_duration to ServiceNow format
target.duration.setDateNumericValue(source.u_duration);
```

### Using a Script to Calculate a Source Value

You may want to use a source script instead of the Source field when:

- The source value is not in the format for the mapped target value.
- You want to look up a value before mapping to the target field.
- The source value must be computed from multiple fields.
- You need to create a compounded or calculated coalesce value in the target field.

For example, this example source script computes the value of the user_name field when it is blank in the source.
A source script expects the calculated value to be set in the global variable `answer`.

Mapping Binary or BLOB Fields

ServiceNow uses a special process to import binary and binary large object (BLOB) data from JDBC data sources. All binary data is automatically converted into a record in the Attachment [sys_attachment] table before the transformation occurs. The import set table only stores the attachment record's sys_id value in the import table field instead of the actual binary value. For example, suppose you use a JDBC data source to import data from a CA Service Desk system, which stores each record's key value as binary data. When you import the Service Desk key values into a ServiceNow table, the ServiceNow field only contains a sys_id reference to the corresponding binary data in the Attachment Record [sys_attachment] table rather than the actual binary data.

To have a transform map access the attachment, use the GlideRecord API in an onAfter script. The script needs to run in an onAfter event because the target.sys_id object is only available after the data is placed in the import set table. For example, to map the resulting attachment to the target transform record, you can use the following script.

```javascript
var agr = new GlideRecord("sys_attachment");
agr.addQuery("sys_id", source.u_blob_field);
// the source field needs to be mapped to the source that is the BLOB
agr.query();
if(agr.next()) {
    agr.table_name = "cmdb_ci"; // the target table of the transform map
    agr.table_sys_id = target.sys_id; // the target record
    agr.content_type = source.u_contenttype;
```
If you are mapping directly to the `db_image` table, run the following `onAfter` script to display the image:

```javascript
var strTemp = source.u_file_name;
var fType = strTemp.substr(- 3);
var iCont = "";
if(fType == 'jpg') {
    iCont = 'jpeg';
} else {
    iCont = fType;
}

var agr = new GlideRecord("sys_attachment");
agr.addQuery("sys_id", source.u_blob_field);
agr.query();
if(agr.next()) {
    agr.table_name = "ZZ_YYdb_image";
    agr.table_sys_id = target.sys_id;
    agr.content_type = 'image/' + iCont;
    agr.file_name = 'image';
    agr.update();
}
```

**Run an import**

You can manually run an import to immediately import data.

1. From a Transform Map, click **Run Import**.
   When the import is done, you'll see a link to go straight to the target table containing your imported records. The amount of time that it takes to run an import varies depending on the number of record to be imported and may take as long as several hours for very large import operations (tens of thousands of records).

2. [optional] Click on the link **View the imported data** to see the loaded import set table.

3. [optional] Click on the link **Create transform map** to create a new transform map to transform the data in the import set table to its target table.

4. [optional] Click on the link **Run import** to execute an existing transform map for the loaded data.

Three things to note at this point:
- The spreadsheet was imported, and a new table was created to hold the data.
- Within that table, the imported records are designated with their own "Set" value.
- A new module was created in the System Import Sets application for the new table.

**Cancel an import in progress**

You can stop an import that is taking too much time.

1. Navigate to **System Import Sets > Advanced > Progress**.
2. Open the Progress Worker that must be canceled.
3. Click the **Cancel job** related link.
Review the import set
Even if no errors were reported by the progress indicator, review how your data was imported into the new import set.

1. Click **View imported data**.
   
   There are several fields that will be visible in the table that were not part of the original data source, these are system rows can be used to facilitate scripted import operations.

2. Review the data.

3. Return to the previous page.

Create a transform map to associate with this import set.
Control import table dictionary entries
  
  Control whether an import can automatically change the dictionary entries for staging tables.
  
  - Set the system property to false to prevent an import from changing a staging table's dictionary entry.
### glide.import_set_row.dynamically_add_fields

Specifies whether an import set can add new columns to the staging table (true) or not (false). Instances that contain large numbers of import sets can sometimes become unresponsive when an import adds a column because the instance must alter every row in the staging table. In some cases, the database alter table action causes an outage. Setting this property to false prevents an import set from adding columns to the staging table and produces a log message. As a workaround, administrators can manually add a column to the staging table by creating a new dictionary entry and then reimporting the import set.

- **Type:** true | false
- **Default value:** true
- **Location:** Add to the System Properties [sys_properties] table

### com.glide.import_set.importlog_level

Specifies how much information import sets add to the log. Possible values are INFO, WARNING, and ERROR. You can set this to INFO in dev environment and change it to WARNING or ERROR in production to reduce amount of logging noise traffic to the database.

- **Type:** string
- **Default value:** INFO
- **Location:** Add to the System Properties [sys_properties] table

---

**Set the import log level**

Set the import log level to view detailed log information about import sets.

- Use the system property to control the log level for import sets.

---

#### Schedule a data import

Scheduled imports make it is possible to specify that certain import operations should occur at some regular interval.

**Role required:** import_scheduler, import_admin, or admin

**Important:** Do not schedule multiple imports at the same time. Running multiple imports concurrently may negatively impact performance or cause an instance outage.

1. Navigate to **System Import Sets > Administration > Scheduled Imports.**
2. Complete the form (see table).

Table 363: Scheduled Data Import form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for this scheduled data import.</td>
</tr>
<tr>
<td>Data source</td>
<td>Select the data source record that defines the data to import.</td>
</tr>
<tr>
<td></td>
<td>If you select a remote datasource, it is refreshed via the remote connection prior to the import operation.</td>
</tr>
<tr>
<td>Run as</td>
<td>Enter the name of a user whose credentials the import job will use. If you do not specify a value, the import job runs as the guest user.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to activate the scheduled import.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run</td>
<td>Select the frequency at which you want to run the import.</td>
</tr>
<tr>
<td>Time</td>
<td>Enter the time you want the import to begin. Do not schedule multiple imports at the same time. Running multiple imports concurrently may negatively impact performance or cause an instance outage.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box if you want to write a script to define the conditions that must evaluate to true before the import will run.</td>
</tr>
<tr>
<td>Condition</td>
<td>Write the script to be used to evaluate whether an import should run. This field is visible if you selected the Conditional check box.</td>
</tr>
<tr>
<td>Repeat interval</td>
<td>Select the period of time that must elapse before the import will be repeated. This field is visible if Run is set to Periodically.</td>
</tr>
<tr>
<td>Starting</td>
<td>Click the calendar icon and select the date on which the import should begin. This field is visible if Run is set to Periodically.</td>
</tr>
<tr>
<td>Execute pre-import script</td>
<td>Select this check box if you want to write a script to be run before the import is performed.</td>
</tr>
<tr>
<td>Pre script</td>
<td>Write the script you want to run before the data is imported. This field is visible if you selected the Execute pre-import script check box.</td>
</tr>
<tr>
<td>Execute post-import script</td>
<td>Select this check box if you want to write a script to be run after the import is performed.</td>
</tr>
<tr>
<td>Post script</td>
<td>Write the script you want to run after the import finishes. This field is visible if you selected the Execute post-import script check box.</td>
</tr>
</tbody>
</table>

Data import scripting options
Scheduled Import Pre and Post scripts have access to multiple JavaScript objects.
Table 364: Data import scripting options

<table>
<thead>
<tr>
<th>Object</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancel</td>
<td>Set this object to true to stop the import action.</td>
<td>Use the Pre script field to evaluate the conditions of the import and determine whether to cancel the import process. To cancel the import process, use the following call:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>cancel = true;</td>
</tr>
<tr>
<td>glide.scheduled_import.stop_on_error</td>
<td>Set this object to true to stop the import process when the parent scheduled import generates an error.</td>
<td>One import set can depend on the results of another import set. Use the following code to stop the current import set when the parent import set generates an error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>glide.scheduled_import.stop_on_error = true;</td>
</tr>
<tr>
<td>import_set</td>
<td>Get the GlideRecord object for the new import set. This variable allows you to query the following columns from the sys_import_set table:</td>
<td>If you want to use information from the import set, you can specify one of the properties of the import_set variable.</td>

<tr>
<td></td>
<td></td>
<td>var x = import_set.number;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>data_source</td>
<td>Specify the data source you want the scheduled import to use. The data source must be an existing GlideRecord object.</td>
<td>Typically, you define the data source with the Scheduled Data Import record. If you want to override this data source and use another data source in certain conditions, you can use the following call:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>data_source = &quot;Example LDAP Users&quot;;</td>
</tr>
</tbody>
</table>

*Post CSV or Excel files directly to an import set*

An administrator can post CSV or Excel files directly to instance.

The sys_import.do target lets you dynamically upload a CSV or Excel file into the import set table specified by the sysparm_import_set_tablename parameter. You must specify a name that matches an existing import set table name, if it does not exist, pre-create it by doing a manual import. The sysparm_transform_after_load=true parameter makes the CSV transform execute immediately, if a transform map exists.
• Use the following post syntax: https://instance.service-now.com/sys_import.do?sysparm_import_set_tablename=table_name&sysparm_transform_after_load=true&uploadfile=path/to/file.csv

Preserve leading spaces in excel imports
You can preserve leading spaces when importing data from Excel.
Role required: admin

Attention: The import process always removes trailing spaces from Excel data cells.

• Use the system property `glide.import_set.preserve.leading.spaces` to preserve leading spaces when importing data from Excel.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.import_set.preserve.leading.spaces</td>
<td>Specifies whether the import process preserves leading spaces in Excel data cells. When false, the import process removes leading spaces from Excel data cells. When true, the import process preserves leading spaces.</td>
</tr>
</tbody>
</table>
  * Type: true | false
  * Default value: false
  * Location: Add a property using `sys_properties.list` on page 1411 to the System Properties [sys_properties] table

Ignore bad data rows in CSV files
Ignore data from rows in CSV files that the instance cannot parse.
Role required: admin
By default, imports cannot ignore bad data rows in CSV files and fail on the first error.
• To allow an import to ignore one or more rows of bad data, set the system property `com.glide.csv.loader.ignore_non_parseable_lines` to true.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.csv.loader.ignore_non_parseable_lines</td>
<td>Allows an instance to ignore one or more lines (rows) that contain bad data (such as a row that is missing a column of data).</td>
</tr>
</tbody>
</table>
  * Type: true | false
  * Default value: false
  * Location: Add the property

• To specify the maximum number lines (rows) that an instance can ignore before the import fails, set the system property `com.glide.csv.loader.max_errors_allowed`. 
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| com.glide.csv.loader.max_errors_allowed | Specify the maximum number of lines (rows) that an import can ignore before failing. If the import succeeds, the import lists the number of rows the import ignored due to errors.  
- Type: integer  
- Default value: 100  
- Location: Add the property |

Posting a CVS file - Perl example
An example using Perl to post a CSV file with basic auth credentials.

```perl
# file: uploadafile.pl  
# call me like this:  
# uploadafile.pl --url="https://instance.service-now.com/sys_import.do?sysparm_import_set_tablename=dloo_test&sysparm_transform_after_load=true"  
# --uploadfile=/Users/davidloo/Desktop/test_files/test_users.csv  
#  
# the "sysparm_transform_after_load=true" parameter instructs the import set to transform immediately after loading  
#  
use strict;  
use LWP::UserAgent;  
use HTTP::Request::Common;  
use Getopt::Long;  
use File::Basename;  

my ( $o_url, $o_fqn );  
GetOptions(  
   "url=s" => \$o_url,  
   "uploadfile=s" => \$o_fqn,  
);  

# mandatory arguments: url  
&usage unless ( \$o_url && \$o_fqn );  
my \$url = \$o_url;  
my \$fname = \$o_fqn;  

# put timeouts, proxy etc into the useragent if needed  
my \$ua = LWP::UserAgent->new();  

# setup basic authentication credentials  
\$ua->credentials(  
   'demo.service-now.com:443',  
   'Service-now',  
   'admin' => 'admin'  
);  

my \$req = POST \$url, Content_Type => 'form-data',  
   Content => [  
      submit => 1,  
      upfile => [ \$fname ]  
   ];  
my \$response = \$ua->request(\$req);```

© 2017 ServiceNow. All rights reserved. 1578
if ($response->is_success()) {
    print "OK: ", $response->content;
} else {
    print $response->as_string;
}
exit;

sub usage {
    printf "usage:&nbsp;%s --url=%s --uploadfile=%s\n",
        basename(50), 'https://....', 'c:/data/test.csv';
    exit
}

Posting a CSV file - Java example

An example using the Java Apache HttpClient class to post a CSV file with basic auth credentials.

**Attention:** The Apache HttpClient may limit the amount of data you can import in a single transaction. This example is meant as a starting point and should not be used in production.

```
HttpClient httpclient = new HttpClient();
PostMethod post = new PostMethod("https://instance-name.service-now.com/
    sys_import.do?
    sysparm_import_set_tablename=u_test_upload&sysparm_transform_after_load=true");
try {
    Credentials defaultcreds = new UsernamePasswordCredentials("admin",
        "admin");
    httpclient.getState().setCredentials(AuthScope.ANY, defaultcreds); // Prepare HTTP post
    httpclient.getParams().setAuthenticationPreemptive(true);
    File targetFile = new File("/Users/davidloo/Desktop/test_files/
        nodeinfo2736820198834983863.csv");
    Part[] parts = { new FilePart(targetFile.getName(), targetFile) };
    post.setRequestHeader(new MultipartRequestEntity(parts,
        post.getParams()));
    int result = httpclient.executeMethod(post);
    // Display status code
    System.out.println("Response status code: " + result);
    // Display response
    System.out.println("Response body: "+post.getResponseBodyAsString());
} catch(Exception e) {  
    System.err.println(e.getMessage());
} finally {
    // Release current connection to the connection pool
    // once you are done
    post.releaseConnection();
}
```

**Completed import sets**

After an import set completes, you can review the completed import and clean up import set tables.

**Viewing the import log**

The import log is where you can find information about the internal processing that occurs during an import operation.
The log includes information generated by the system during the every step of the import operation from initialization of the import set table from a data source to transformation onto a target table. It is also possible to customize log outputs during the transformation by using log.info, log.warn, log.error statements.

**Figure 440: Import Log**

**Note:** Functionality described here requires the *Admin* role.
Run import utility

The Run Import utility is used to run an import operation using an existing Transform Map and Import Set table.

**Figure 441: Import History Record**

Import set scheduled cleanup

Import set scheduled cleanup is a scheduled job that runs every day at midnight.

By default, it will query all import sets that are older than 7 days and delete the import set and all related tables, eg. the import set table records. If this scheduled job is not active on your instance, we recommend that you activate it as soon as possible to mitigate the growing import set tables that you may have, especially if they are recurring imports.

**Note:** If the scheduled cleanup is not currently active on your system, you must ensure that your import set tables are not too big (> 5 million records total across all tables) before enabling this cleanup. If the tables are too big, you have to manually delete the records first before proceeding - please contact ServiceNow support to coordinate the deletion of this data.
Web service import sets

Web Service Import Sets complement Direct Web Services and Scripted Web Services in providing a web service interface to Import Set tables.

![Diagram of SOAP insert, Import Set Table, Transform, Target Table](image.png)

**Figure 442: WS Iset**

This type of web service will transform the incoming data synchronously based on the associated transform maps by default. If the associated import set mode is set to Asynchronous, the behavior is to save the...
data for transformation at a later time. Web Service Import Sets tables publish all the default Web Service functions in the WSDL.

![System Web Services](image)

Figure 443: System Web Services

This plugin also provides the following standard import set tables:

- Computer
- Location
- Notification
- User

Web service import set WSDL are accessed by specifying the import set table name + ".do?WSDL" on the URL. For example:

http://<instance name>.service-now.com/imp_notification.do?WSDL (The System Web Service plugin must be enabled first)

Creating an import set web service

Create a new web service import set table to define how to stage and transform imported data.

Navigate to System Web Services > Create New.
The Name of the web service is the table name of the import set table whereas the Label field is the resulting table field.

If you want to create a transform map after creating the web service, check the Create transform map checkbox and choose the target table you want the data to transform into. After the Create button is clicked, the web service will be created and you will be immediately put into the Table Transform Map form. You may then continue to specify the transform map or script.

**Web Service Fields**

The fields available for this web service. All fields by default are published as the XSD type of xsd:string. The Name is the field that is exposed for the web service and therefore appears as the name of the field in the WSDL. The Label is the label of the field as it appears for the import sets table.

You can Add, mark for Delete or modify (double click the field) an existing web service field in this list.

**Note:** After adding web service fields, click Create to create the web service import set table.

To add other fields after the Web Service is created, find the target table, and add the fields to that table.

**Mapping web service import sets**

During the creation of the web service import set, you may optionally create the transform map for it.
All transform maps will be executed for the service when it is invoked if the import set mode is set as "Synchronous" (the default).

The following image is an example of the transform map associated with the Notification web service import set.
Figure 445: Soap Transform Map

Script:

```java
target.comments = "Timestamp: " + source.timestamp + 
"\nExpires on: " + source.expires_on + 
"\nDuration: " + source.duration;
```
Adding Web Service Response Values

In the transform map script associated with a web service import set, setting certain variable values have the effect of changing the response values of the web service. In addition to the normal variables that are available in a transform map script, the table below documents the variables that are available and their effects.

Table 365: Adding Web Service Response Values

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>response</td>
<td>Output Object</td>
<td>Javascript object that holds dynamically created response elements used to customize the output response of a web service import set insert.</td>
</tr>
</tbody>
</table>

Example

```java
// create new elements called "transaction_id"
// and "hello" in the web service response
response.transaction_id="abc123";
response.hello="world";
status_message="message 1";
// this is the normal status_message variable
```

The code snippet above results in the following response being generated back to the web service consumer

```xml
<soapenv:Envelope
  xmlns:imp="http://www.service-now.com/imp_notification"
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Header/>
  <soapenv:Body>
    <insertResponse
      xmlns="http://www.service-now.com/imp_notification">
      <sys_id>969d157c0a0a0baf008ba5770ffa798c</sys_id>
      <table>incident</table>
      <display_name>number</display_name>
      <display_value>INC0010091</display_value>
      <status>Inserted</status>
      <status_message>message 1</status_message>
      <transaction_id>abc123</transaction_id>
      <hello>world</hello>
    </insertResponse>
  </soapenv:Body>
</soapenv:Envelope>
```

Debugging web service import sets

If you need to debug a SOAP Request coming into the system, create the system property `glide.processor.debug.SOAPProcessor`.

Once you have created it, set it to true to have all SOAP requests be logged in the System Log. Set it to false when you are done so as to keep the size of your System Log to a managed length.

Web service import set mode

When a SOAP message inserts a record into an import set table, and the table did not previously have an import set referenced, a new one will be created, and its Mode will be set as Synchronous.
An import set with a Mode of Synchronous will transform the data as soon as it is inserted (provided that the transform map already exists). This import set will also have a default State of Loading. By default, all Synchronous import sets will automatically be modified to Processed at midnight. As a result, when a new insert happens to the same table, a new Synchronous import set will be created.

![Figure 446: Synchronous import set](image)

Changing this import set to a mode of Asynchronous and a state of Loading has the effect of not transforming the incoming data as it is inserted, but rather "loading" the import set and deferring the data transformation later, either manually, or with a scheduled script job.

<table>
<thead>
<tr>
<th>Mode</th>
<th>State</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asynchronous</td>
<td>Loading</td>
<td>Data transformation is not occurring automatically and immediately. Data added to import set row has a state of &quot;Pending&quot;. Transform can be scheduled or executed manually when state is changed to Loaded</td>
</tr>
<tr>
<td>Asynchronous</td>
<td>Loaded</td>
<td>Marks the completion of data loading. Data transformation can now occur in a scheduled fashion or manually.</td>
</tr>
<tr>
<td>Synchronous</td>
<td>Loading</td>
<td>Data transformation is occurring automatically and immediately whenever data is inserted into the associated import set row.</td>
</tr>
</tbody>
</table>
### Controlling Insert Behavior

In imports sets that specify one or more coalesce fields, records with a matching coalesce value are transformed from source to target table serially (one at a time) to prevent duplicates.

In import sets that do not specify any coalesce field, records are transformed concurrently. You can control this behavior using the `glide.import_set_insert_serialized_when_no_coalesce` property.

The system property `glide.soap.import_set_insert_serialized.<table name>`, controls how the instance inserts records from web service calls into a specific import set table. When true, this property prevents identical simultaneous inserts from creating duplicate records by serializing the database insert operations. If a target table does not have any coalesce fields defined in a transform map, set this property to false to improve web service import set performance. The `glide.import_set_insert_serialized.<table name>` provides the same functionality.

Note: Setting this property to false can result in the creation of duplicate records.

### Standard SOAP Response

The SOAP response from a web service import set insert call returns the following standard values:

```
   xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
   xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
   SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/"/>
<SOAP-ENV:Body><insertResponse><sys_id>fa648f5f0a0a0b2b0048e7012448b8f1</sys_id><table>incident</table><display_name>number</display_name><display_value>INC10014</display_value><status>inserted</status></insertResponse></SOAP-ENV:Body></SOAP-ENV:Envelope>
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id</td>
<td>The Sys_id of the resulting record that was created or modified</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>table</td>
<td>The table name of the table that was affected. In the case of an Asynchronous call, the table name would be the import set table eg. imp_notification for the Notifications web service import set table</td>
</tr>
<tr>
<td>display_name</td>
<td>The name of the field that is set as the display field for the record that was created or modified</td>
</tr>
<tr>
<td>display_value</td>
<td>The value of the field designated as the display field. For example, the display field for the Incident table is the Number field and an example value would be INC10001</td>
</tr>
</tbody>
</table>
| status              | A string value that indicates the action that occurred as a result of the web service invocation, relating to the record defined by the sys_id and table field values  
  • inserted - the record was inserted  
  • updated - the record was updated  
  • ignored - the input was ignored, the record was not updated and no new record was created  
  • skipped - the input data was skipped (similar to ignored) due to missing coalesce values  
  • error - there was an error processing the input                                                                                               |
| status_message      | This value translates to the value found in the Comment field of the import set row and usually contains information related to the status value eg. "No field values changed" when the status is "ignored". Setting this value to a customized string value will cause the SOAP response to contain an optional status_message field to be returned. |
| error_message       | The message related to a status of error. When an error occurs, setting this value to a customized string value will cause the SOAP response to contain an optional error_message field to be returned. |

**Tailoring the SOAP Response**

It is possible to include information other than the information specified in the WSDL by overwriting the contents of status_message using the transform script.

*Inserting multiple records using insertMultiple*

You can insert multiple records in one SOAP request by using the insertMultiple operation.

The insertMultiple operation is available for the Direct Web Service API and Web Service Import Sets. To enable insertMultiple, activate the Insert Multiple Web Service plugin.
**Note:** Activating this plugin adds a new operation to the WSDL. After this plugin is activated, consume a new WSDL to update your web services client.

**Web service import sets security requirements**

Web Service Import Sets use the same security mechanisms as SOAP Web Services.

- Basic authentication requires a Web Service user provide a valid user name and password
- Contextual security requires a Web Service user meet the queried table's access control rules

If your instance uses high security settings, the Web Service user may also need the soap role.

**Web service import sets related links**

When displaying a mapped web service table, you will have the following related links.

- Import Sets - the import sets related to this web service import set
- Transform Maps - a list of transform maps related to this web service
- Transform History - the transformation history
- Edit Web Service - edit the web service

The following image shows a record that was inserted into the web service import set Notification. The target record is the resulting creation or modification to the Incident table record as a result of the transform.

![Figure 447: Soap Notification](image)

**Figure 447: Soap Notification**

**Web service import sets examples**

This example demonstrates the WSDL, SOAP envelope and response, Perl invocation, and result of a SOAP web service import.
Sample WSDL

```xml
<?xml version="1.0" encoding="UTF-8"?>
<wsdl:definitions
    <wsdl:types>
        <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema" elementFormDefault="unqualified" targetNamespace="http://www.service-now.com/imp_notification">
            <xsd:element name="insert">
                <xsd:complexType>
                    <xsd:sequence>
                        <xsd:element maxOccurs="1" minOccurs="0" name="corrective_message" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="duration" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="expires_on" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="message" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="severity" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="source" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="timestamp" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="type" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="1" name="uuid" type="xsd:string"/>
                    </xsd:sequence>
                </xsd:complexType>
            </xsd:element>
            <xsd:element name="insertResponse">
                <xsd:complexType>
                    <xsd:sequence>
                        <xsd:element maxOccurs="1" minOccurs="1" name="sys_id" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="1" name="table" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="1" name="display_name" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="1" name="display_value" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="1" name="status" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="status_message" type="xsd:string"/>
                        <xsd:element maxOccurs="1" minOccurs="0" name="error_message" type="xsd:string"/>
                    </xsd:sequence>
                </xsd:complexType>
            </xsd:element>
        </xsd:schema>
    </wsdl:types>
    <wsdl:message name="insertSoapOut">
        <wsdl:part name="imp_notification" element="tns:insertResponse"/>
    </wsdl:message>
    <wsdl:message name="insertSoapIn">
        <wsdl:part name="imp_notification" element="tns:insert"/>
    </wsdl:message>
    <wsdl:operation name="insert">
        <wsdl:input message="sncns:insertSoapIn"/>
        <wsdl:output message="sncns:insertSoapOut"/>
    </wsdl:operation>
    <wsdl:binding name="ServiceNowSoap" type="sncns:ServiceNowSoap">soap:binding style="document"
        transport="http://schemas.xmlsoap.org/soap/http"/>
    <wsdl:operation name="insert">
        <soap:body use="literal"/>
    </wsdl:operation>
</wsdl:service>
</wsdl:definitions>
```

Sample SOAP Envelope

```xml
<?xml version="1.0" encoding="UTF-8"?>
    <SOAP-ENV:Body>
        <imp_notification:insert>
            <corrective_message></corrective_message>
            <duration></duration>
            <expires_on></expires_on>
            <message></message>
            <severity></severity>
            <source></source>
            <timestamp></timestamp>
            <type></type>
            <uuid></uuid>
        </imp_notification:insert>
    </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
Sample SOAP Response

<?xml version="1.0" encoding="UTF-8"?>
 xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
 xmlns:SOAP-ENC2="http://schemas.xmlsoap.org/soap/encoding/"
 xmlns:SOAP-ENV2="http://schemas.xmlsoap.org/soap/envelope/"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <SOAP-ENV:Body>
    <insertResponse>
      <sys_id>b54aafbc0a8006f0058db95daa5b88d</sys_id>
      <table>incident</table>
      <display_name>number</display_name>
      <display_value>INC10008</display_value>
      <status>ignored</status>
      <status_message>No field values changed</status_message>
    </insertResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>

Example Invocation using Perl

The following example script will use the Notification web service to create an Incident as the itil user. It uses the Perl language and the SOAP::Lite package.

```perl
#!/usr/bin/perl -w

#use SOAP::Lite ( +trace => all, maptype => {} );use SOAP::Lite;

sub SOAP::Transport::HTTP::Client::get_basic_credentials{return 'itil' =>'itil';// set basic auth credentials for the itil user}

my $soap= SOAP::Lite->proxy('http://localhost:8080/glide/imp_notification.do? SOAP');

my $method= SOAP::Data->name('insert')->{xmlns =>'http://www.service-now.com/'};

# insert into the web servicemy@params=( SOAP::Data->name(message =>'problem
detected for database DB12DG'));push(@params, SOAP::Data->name(source =>'DB12DG'));push(@params, SOAP::Data->name(uuid =>'HGAF76251HGF2'));

my $result=$soap->call($method=>@params);

print_result($result); //print any results
print_fault($result); //print any faults

sub print_result {my ($result)=@_;if($result->body&&$result-body->'insertResponse'){
  my %keyHash=$%{ $result->body->'insertResponse' };%foreach $k(keys %keyHash)print "name=$k   value=
  $keyHash{$k}\n";}}

sub print_fault {my ($result)=@_;if($result->fault){print "faultcode=".
  $result->fault->'faultcode' ."\n";print "faultstring=".
  $result->fault->'faultstring' ."\n";print "detail=".
  $result->fault->'detail' ."\n";}}

© 2017 ServiceNow. All rights reserved.
The following is the result printed out by the Perl script on the console

```plaintext
name=display_value   value=INC10011
name=status   value=inserted
name=table   value=incident
name=display_name   value=number
name=sys_id   value=cd45649c0a0b2b006f27649d6bd2c
```

The following image shows the resultant row created for the import set table Notification (imp_notification).

![Image showing the resultant row created for the import set table Notification (imp_notification).](image)

**Figure 448: WS lset Perl**

**Easy import**

Easy import is a simplified import process that removes the need to use a transform map by providing a template that contains only the columns you want to import.

An administrator can use easy import from any list. You can import data to tables within the current scope, and tables that grant write access to other applications.

**Use easy import**

Follow the set workflow to import data using Easy Import.

**Download an import template**

Select the list you want to import data to and create an import template from that list.

Role required: admin

1. Navigate to any list, such as **Self-Service > Incidents**.
2. From the list view, right-click the column headings.
3. Select **Import**.
4. Select the import type.

**Table 368: Import template**

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert</td>
<td>Use this template to add new records to a table. The current list filter determines what columns the template contains.</td>
</tr>
<tr>
<td>Update</td>
<td>Use this template to change values within existing records in a table. This template contains one row for each record in the list.</td>
</tr>
</tbody>
</table>

5. Optional: Clear the **Include all fields in the template?** check box to include only columns that appear in the list in the template.

   Leave this check box selected to include all columns from the table in the template, even those columns that are hidden in the list.

6. Click **Create Excel Template**.
ServiceNow creates an import template that contains all fields from the current table, including those fields not displayed in the list.

**Note:** Each template contains a Directions tab describing how to use the template.

Add a record in the template
Add rows to the template to create new records.
Role required: admin

**Note:** The template only imports records on the first page of the template. The import process ignores all other pages.

Figure 449: Easy import insert template

1. Add a row for each record you want to add to the table. Each column corresponds to a field in the target table. Use the UI field hints to learn about the purpose and content of the field.

   The template validates values as you enter them and highlights cells containing invalid data. While you do not have to provide a value for every column, certain fields may fail validation if you do not provide a value.

2. Review any highlighted cell and resolve the issue.

3. When you finish entering new rows, save the spreadsheet as an Excel Workbook (.xls).

   Imports do not currently support .xlsx files.

The insert templates use special processing for certain fields:

- **Created by Field:** The insert template always lists the system administrator user (admin role) in the Created by field regardless of whether the import includes a Created by column. Even if you provide a different user value in the template, the import process overwrites this value with the system administrator user.
• Blank Values: Leaving a cell blank in the insert template results in a blank value in the imported record, provided the field supports a blank value. Fields that do not support a blank value will produce a validation error if you provide a blank value.

Update a record in the template
Modify rows in the template to update existing records.
Role required: admin

**Note:** The template only imports records on the first page of the template. The import process ignores all other pages.

---

**Figure 450: Easy import update template**

1. Edit the row for each existing record to be updated. Replace existing values with new values. Use the UI field hints to learn about the purpose and content of the field.

   The template validates values as you enter them and highlights cells containing invalid data. While you do not have to provide a value for every column, certain fields may fail validation if you do not provide a value.

2. Review any highlighted cell and resolve the issue.

3. When you finish updating existing rows, save the spreadsheet as an Excel Workbook (.xls).

Imports do not currently support .xlsx files.

The insert templates use special processing for certain fields:

- Updated by Field: The update template always lists the system administrator user (admin role) in the Updated by field regardless of whether the import includes an Updated by column. Even if you provide a different user value in the template, the import process overwrites this value with the system administrator user.

- Blank Values: The update template uses these rules when handling blank values in spreadsheet cells.
Import a record from the template

After updating the import template with new data, import the template to your instance.

Role required: admin

1. Navigate to the same list you used to download the import template.
2. From the list view, right-click the column heading and select **Import**.

3. From **Insert or update**, select the import type.
4. From **File**, select the import template to import.
5. Click **Upload and Preview Import Data**.

ServiceNow validates the template.

If the template passes validation and the imported preview matches your expectations, click **Complete Import** to import records into the current table. If the template fails validation, review the errors. Click **Ignore Errors and Complete Import** to continue the import by skipping any bad data cells.

---

**Controlling the easy import template row limit**

You can control the number of rows included in an Easy Import template.

---

<table>
<thead>
<tr>
<th>Original Value</th>
<th>New Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blank value</td>
<td>Any non-blank value</td>
<td>Valid update: the update changes the blank value to the new value.</td>
</tr>
<tr>
<td>Any non-blank value</td>
<td>Blank value</td>
<td>Invalid update: the update preserves the existing non-blank value.</td>
</tr>
</tbody>
</table>
By default, all templates generated using Easy Import contain at most 10,000 rows. If a table contains more than 10,000 records, only the first 10,000 are exported.

You can modify this limit by setting the glide.import_template.row_limit property. Add this property to the System Properties [sys_properties] table to specify a different value.

*Easy import template validation*
Each import template must pass two sets of validation.

### Table 370: Template validation

<table>
<thead>
<tr>
<th>Type of validation</th>
<th>Stored in</th>
<th>Results of failing validation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client-side validation</td>
<td>Import template</td>
<td>The template highlights the invalid cell.</td>
</tr>
<tr>
<td>Server-side validation</td>
<td>Instance</td>
<td>The import pauses and displays an error message.</td>
</tr>
</tbody>
</table>

**Template data validation**

Some cells in the template contain calculations or validation rules. These rules are intended to help you enter data that is appropriate for the field (column).
If you want to paste data from another spreadsheet, use the Paste Special command to paste only values or match the existing formatting.

Figure 451: Easy import paste special
Template type validations
Server-side validation verifies that the import template contains the necessary format.

Table 371: Template type validation

<table>
<thead>
<tr>
<th>Template type</th>
<th>Validation done</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert template</td>
<td>• Template contains a header row with valid field names.</td>
</tr>
<tr>
<td></td>
<td>• Template contains one or more data rows.</td>
</tr>
<tr>
<td></td>
<td>• Template does not contain a sys_id column.</td>
</tr>
</tbody>
</table>
Data type validations
Both client-side and server-side validation verify that template cells contain data that matches the ServiceNow field type.

Table 372: Data type validations

<table>
<thead>
<tr>
<th>ServiceNow field type</th>
<th>Validation done</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice list</td>
<td>Cell contains a value that matches a choice option from the choice list.</td>
</tr>
<tr>
<td>Integer</td>
<td>Cell contains a number without any decimal points.</td>
</tr>
<tr>
<td>Reference</td>
<td>Cell contains a value that matches an existing related record. This validation applies only to fields in which the list of possible choices is relatively small and mostly static. It does not apply to fields such as ‘Assigned To’ in which the list of possible choices is dynamic and large. Validation takes place when the data is inserted into the database, but not in Excel.</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
</tr>
</tbody>
</table>

Note: When you enter reference field values in the Excel spreadsheet, enter the display value and not the sys_id of the referenced record. Enter this value the same as you would on a form. For example, for a reference to a user record, enter the username.

Troubleshoot import set performance
Review these performance issues to troubleshoot and improve the performance of your import set jobs.

Running business rules during transform
Running business rules during transform may cause the transform to take longer than expected, or cause the instance to slow down.

Becomes an issue: When importing a very large amount of data. For example, importing all data from an old system.

Symptoms: The transform takes much longer than expected. Also, the entire instance may be slow during that time.

How to avoid this: Do not run items like business rules, workflows, approval engines, and so on during a transform unless you want all insert and update business rules, notifications, and workflows to run. For
example, when importing all data from an old system, you may not want notifications to run. To disable these items from running and to cease auditing and field normalization within the transform map for that import, deselect the **Run business rules** check box.

**Figure 453: Transform Map Checkbox**

*Note:* Consider using an **onComplete** transform script to run business logic such as calculations at the end of an import rather than on each record as business rules do.

---

**Slow transform scripts**

Using multiple GlideRecord queries or large loops may slow down transform scripts.

Becomes an issue: When the transform scripts are using multiple GlideRecord queries or looping through large collections of objects for each row. This issue may appear when the transform script is not efficient. In most cases, script goals can be accomplished using built-in functionality within the Import Set application. For example, you can script **case-sensitive coalesce** instead of writing scripts that use GlideRecord queries. GlideRecord queries typically slow down the import.

Symptoms: The transform takes much longer than would be expected. Depending on the script, the entire instance may be slow during that time.

How to avoid this: Use base system functionality whenever possible instead of writing custom scripts and if you do write scripts, avoid writing complicated scripts that use GlideRecord queries.

**Importing data that has not changed**

Repeatedly importing data that has not changed leads to many skipped rows.

Becomes an issue: When a customer is importing data from a table that is very large and most of the records are not getting updated on a regular basis.

Symptoms: The import set takes longer than expected. Under **System Import Sets > Progress**, expect to see an import with a Total count that is very high with a Skipped count that is also very high - this is found under the **Message** column. Indicating that most of the records imported had not actually changed. These records did not need to be imported.

How to avoid this: If you are running a JDBC import, use the last run datetime option in your import set **DataSource**. For a type of File import, be sure that whatever is generating your files is only adding data that is new, or has been changed.

**Coalescing on non-indexed fields**

Coalescing on non-indexed fields with a large amount of data may cause transforms to slow down.
Becomes an issue: When matching on fields that are not indexed, this causes the transform stage of an import to run slowly. However, it only becomes an issue if there is a large enough amount of data. In extreme cases, this causes performance issues with the database due to added load.

Symptoms: Time spent in the transform stage of the import is large relative to the time taken to load the data. Expect to see high transform times.

How to avoid this: If possible, you should coalesce on a field that unique and already indexed. To determine if a field is already indexed, navigate to System Definition > Tables & Columns and find the table. In the list of columns for that table, an indexed column has a blue icon with an i next to it if indexed. For assistance indexing a field contact ServiceNow Technical Support.

Running imports simultaneously
Running imports simultaneously may cause excessive load on the database.

Becomes an issue: When importing large amounts of data puts an additional load on the database. For example, importing 500,000 users and importing 200,000 configuration items at the same time. This can have a significant performance impact on all queries on the system due to the increased load on the database. This issue is especially severe when two imports are importing to the same table. In such a case, there is a possible contention issue for the table. Additionally, depending on which table is involved in processing, this can severely degrade performance of the import and the instance.

Symptoms: Multiple simultaneous imports running slowly combined with load on the database. You see large numbers of inserts and updates along; and if there is enough load or contention, high IO Wait times.

How to avoid this: Stagger your imports so they do not overlap.

Large import set tables
Failing to clean import set tables may lead to those tables becoming cluttered and slow.

Becomes an issue: When the Import Set Deleter job is not running.

Symptoms: This is a size issue. If the import sets are not cleaned on a regular basis (a cleanup is recommended after seven days worth of data) the table fills causing imports to stop.

How to avoid this: Verify the Import Set Deleter job is running. If it is not currently running, contact customer support as they will truncate all import set tables before enabling this job.

Altering table schema during import
Changing the table schema, such as by importing a new column locks the import set table.

Becomes an issue: Any time a new column is imported, the entire import set table is locked during that schema change and depending on the size of the table, can take between five and ten minutes. During that time, no data can be selected or inserted. If that table is not used often, this may not cause any problems. However, if that table is frequently used, for example the LDAP import table, issues may arise.

Symptoms: The symptoms of this problem may vary. In our example of the LDAP import table, any transactions requiring a query of the LDAP import table will have to wait until the schema change has completed. As the LDAP import table is used when logging into the instance, no users are able to log in while the schema change is happening.

How to avoid this: Truncate the import table before importing with a new column.

Importing very large data sets
Importing a very large data set takes longer than importing multiple smaller data sets.

Becomes an issue: When very large data sets are imported in a single job.

Symptoms: The import job takes a long time to complete.

How to avoid this: Break a very large data set into multiple, smaller jobs for faster results. Consider import sets under 100,000 records as a guideline. For example, importing 10 sets of 100,000 records completes faster than one import of 1 million records even though the total data imported is the same.
Importing from another ServiceNow instance

There are several methods for moving data from one instance to another. All of these methods assume you need to periodically move a collection of records from a table on one instance to a table on another instance. If you want an action on an individual record to trigger a corresponding action on another instance, consider using a REST web service instead.

Identifying Needed Related Records

All import processes work by fetching data from one table at a time. This process can produce unexpected results if the incoming data references new records in other tables such as users, locations, or companies. To prevent importing broken references to other tables you must identify the connections between your tables and import the common data prior to importing the application data.

For example, prior to importing incident data, you might want to first import related configuration items, users, and locations. Furthermore you might want to import incidents before importing problems or changes that refer to these incident records.

Available Import Processes

The system offers the following processes to move data from one instance to another.

- Export and import XML records directly from lists
- Create XML import sets and transform data as needed
- Export and import CSV files from lists

XML records from lists
You can directly export records as XML from any list or form.

This export process preserves all record field values including system generated field values such as:

- Sys ID
- Creation date
- Update date

The XML import process directly inserts records into the target table. During the import the system:

- Ignores any business rules that normally apply to the table.
- Does not provide any opportunity to transform incoming data.
- Automatically matches a reference field's display value to the local Sys ID for some tables.

This process is good for directly copying records from one system to another but does not remove the need to know the relationships between tables. If you need validate or transform data or reconcile the sys ID values of reference fields, use an XML import set instead.

Automatic matching of display values

During the import of XML records, the system attempts to match some reference field display values to a local sys_id value.

If the system finds an existing record with a matching display value on the local instance, the import uses the sys_id of the existing record rather than the sys_id of the imported record.

For example, suppose you export an incident record that is assigned to the user John Smith. In the exported XML file there is an entry such as:

```xml
<intcident>
```
This user already exists on the target instance but has a different sys_id value such as:

```xml
<sys_user>
  <name>John Smith</name>
  <sys_id>18cab8de2be80200c5244f74b4da15f7</sys_id>
</sys_user>
```

Since the display value matches an existing record, the system uses the local instance's existing sys_id value for the reference field such as:

```xml
<incident>
  <assigned_to display_value="John Smith">18cab8de2be80200c5244f74b4da15f7</assigned_to>
</incident>
```

The system can match display values for the following tables.

- User [sys_user]
- Group [sys_user_group]
- Role [sys_user_role]
- Group Roles [sys_group_has_role]

**Using XML import sets**

Use an XML import set to import data from another instance.

This method allows you to:

- Apply business rules
- Transform incoming data
- Reconcile sys_id values if necessary

**Note:** Administrators cannot set the update_synch attribute in Dictionary records to move data as part of update sets. This attribute was being used incorrectly to migrate data in large tables and was causing significant performance problems.

Create an XML data source

Data sources are used to create an import set so that data can be processed, if necessary, prior to being mapped onto a production table.

**Note:** To import using XML with High Security Settings enabled, you must possess elevated privileges.

1. Navigate to **System Import Sets > Data Sources**.
2. Click **New**.
3. Complete the form using the following values:
   - **Format:** XML
   - **Import set table label:** `<import_set_table_label>`
   - **Xpath root node:** `//<source_table_name>`
• **Expand node children**: true.
• **File retrieval method**: HTTPS
• **File path**: `<source_table_name>.do?XML`
• **Server**: `<instance name>.service-now.com`
• **User name**: A user account on the remote instance. The username used cannot be an email address.
• **Password**: The password for the same remote account.

4. Click **Submit**.
5. Click **Test Load 20 Records** to create the import set table and to ensure your data source is functional.

---

**Note:**
The 20 loaded records cannot be transformed and are for testing purposes only.

---

Create a transform map

A transform map is a set of field maps that determine the relationships between fields in an import set and fields in an existing ServiceNow table, such as Incidents [incident] or Users [sys_user].

After creating a transform map, you can reuse it to map data from another import set to the same ServiceNow table.

1. Open the data source record that you just created.
2. In the **Transforms** related list, click **New**.
3. Populate all the usual fields and be sure to choose the proper **Target table**.
4. Submit the record.
5. Click **Auto map matching fields**.

Add a field map for `sys_id`

1. Open the table transform map record you just created.
2. In the **Field Map** related list, click **New**.
3. Complete the form, using the following values
   - **Source field**: `sys_id`
   - **Target field**: `Sys ID`
   - **Coalesce**: Select the check box.
4. Click **Submit**.

Add onBefore scripts to the transform map

Create one onBefore transform map script to copy the `sys_id` of new records from the source to the target instance. Create a second onBefore transform map script to identify records on the target instance that have the same unique values but different `sys_id` values.

1. Open the table transform map record you just created.
2. In the **Transform Scripts** related list, click **New**.
3. In the **When** field, select onBefore.
4. Enter the following Script:

   ```javascript
   if (action == "insert") { target. setNewGuid (source. u_sys_id ); }
   ```

5. Click **Submit**.
6. In the **Transform Scripts** related list, click **New**.
7. In the **When** field, select **onBefore**.
8. Enter the following **Script**:

```javascript
/**
 * This script queries for a uniquely identifying value of the referenced record and then
 * updates the target reference field with the sys_id of the matching target record.
 * This sample assumes:
 * 1) The target table contains an assigned_to field which is a reference field.
 * 2) The reference field references the User [sys_user] table.
 * 3) You can use the email field to uniquely identify users.
 *     Alternatively you could use the user_name field.
 */
var ref = new GlideRecord("sys_user"); //Replace sys_user with any reference table
ref.addQuery("email", source.email); //Replace email with any unique field
ref.query();
if(ref.next()){
    target.assigned_to = ref.sys_id; //Replace assigned_to with any reference field
}
```

9. Click **Submit**.

**Retrieving data from a CSV formatted file**

In this method, you import data from another ServiceNow instance using an HTTPS data source to return a CSV formatted file containing the rows to be imported.

This approach uses the Import Sets application to retrieve the data from the source and import it to the destination.
1. Create a new data source by navigating to **Import Sets > Data Sources** on the destination instance.
2. Provide the following field values:
   - **Import set table name**: Select a table.
   - **Type**: File
   - **Format**: CSV
   - **File retrieval method**: HTTPS

   ![Data Source](image)

   **Figure 454: HTTPS Data Sources**

   - **File path**: `/incident\do?CSV`
   - **SCP authentication method**: `-- None --`
   - **Server**: `test.service-now.com`
   - **Private keyfile**

**Note:**

If the **Server**, **File path**, **Username**, and **Password** fields are not visible when you select HTTPS, change the file retrieval method temporarily to SCP and enter this information. Remember to reset the **File retrieval method** to HTTPS after you enter these fields.
• **File path:** `incident.do?CSV`

  **Note:** To import specific change records, you can add qualifiers to the path. For example, the following path would return all active change records: `incident.do ?CSV &sysparm_query =active = true "`

• **User name** and **Password:** Enter the user name and password for a valid user on the destination instance.

3. Click the **Test load 20 records** related link to verify that the import is configured correctly.

4. After setting up the data source, configure a standard transform map.

### Export sets

Export sets allow you to push data from an instance to an external file.

You can export data to a remote system using a MID server.

**Note:** You must use a MID server from the Geneva release. Earlier MID server releases do not support export sets.

### Create an export set

Create an export set to export records from your instance to a file on a MID Server.

**Role required:** export_set_admin

**Note:** Export sets do not export attachments to records. To download an attachment, either use the REST Attachment API (HTTP request originates from a third-party HTTP client), or use the outbound REST Message module to send the attachment from the instance (HTTP request originates from the instance).

1. Navigate to **System Export Sets > Create Export Set.**
2. Enter a descriptive **Name** for the export set.
3. In the **What to export** section, define what data to export in one of these ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Yes and select an Export Definition record.</td>
<td>Use this configuration if you have already created an export definition record specifying what data to export.</td>
</tr>
<tr>
<td><strong>Select No and select a table to export data from.</strong></td>
<td>Use this configuration if you have not created an export definition record. A new export definition record is created automatically using the selected table that includes fields from the default list view for that table. You can modify the export definition record as needed after creating the export set.</td>
</tr>
</tbody>
</table>

4. In the **Where to export to** section, define where you want to export data to in one of these ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Yes and select an Export Target record.</td>
<td>Use this configuration if you have already created an export target record specifying where to export data to.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Select No and select a MID Server, and specify a path on the MID Server to save the exported data to. | Use this configuration if you have not created an export target record. A new export target record is created automatically for the selected MID Server and file path. You can modify the export target record as needed after creating the export set.

5. Click **Submit**.

After creating the export set, the Export Set form appears. You can configure advanced options from the form such as specifying a data format or scheduling recurring exports.

**Export set fields**

These fields appear on the Export Set form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this export set.</td>
</tr>
<tr>
<td>File name</td>
<td>Enter a name for the target file.</td>
</tr>
<tr>
<td>Format</td>
<td>Select the format of the target file, such as CSV.</td>
</tr>
<tr>
<td>Append timestamp</td>
<td>Select this check box to append the current date and time to the name of the exported file.</td>
</tr>
<tr>
<td>Export definition</td>
<td>Select the export definition that specifies the data to export.</td>
</tr>
<tr>
<td>Export target</td>
<td>Select the export target that specifies the location you want to export to.</td>
</tr>
</tbody>
</table>

Create an export set from a list

You can quickly create an export set from a list.

Role required: export_set_admin

1. Navigate to a list of records.
2. Right-click on the list header and select **Export** > **Export Set**. The Export Set form appears. An export definition is created automatically based on the list.
3. Configure the export set as needed.
4. Click **Submit**.

**Export definition**

An export definition specifies the data to be exported in an export set.

An export definition specifies a table, one or more fields, and optionally a filter to limit the included records.

Create an export definition

Create an export definition to define what data to export in an export set.

Role required: export_set_admin

1. Navigate to **System Export Sets** > **Export Definition**.
2. Click **New**.
3. Enter a descriptive Name for the export definition.
4. Select the Table to export data from.
5. Select one or more Fields from the selected table to export data from.
6. Optional: Specify a Filter to export only certain records from the selected table.
   Specifying a filter condition on the Created (sys_created_on) or Updated (sys_updated_on) fields may prevent scheduled data exports from using delta exports functionality. Do not specify filter conditions on these fields if you intend to use scheduled delta exports.

Export target

An export target defines the destination file an export set saves data to.

You must use a MID server as the export destination.

Create an export target

Define where to export data to by creating an export target.

Role required: export_set_admin

Navigate to System Export Sets > Export Targets and create a new record (see table for field descriptions).

Table 374: Export target fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the export target.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Select the MID Server to export to. The MID Server must have a Validated value of Yes and a Status value of Up.</td>
</tr>
<tr>
<td>Note:</td>
<td>You must use a MID server from the Geneva release. Earlier MID server releases do not support export sets.</td>
</tr>
<tr>
<td>File Path</td>
<td>Specify a path relative to the MID Server directory to save the exported data to. The user account used to run the MID Server must have permission to write to this location.</td>
</tr>
</tbody>
</table>

Export set supported file types

Export sets support multiple file types for exporting and pushing data.

File types

You can export to these formats:

- CSV
- XML
- Excel
Scheduled export sets

You can schedule an export set to regularly export data.

By setting up a recurring, scheduled export you are able to regularly push data to an external location, such as for reporting or for preserving a snapshot of the data.

You can configure scheduled export sets to export only new or changed records using delta exports.

Schedule an export
You can schedule an export to regularly push data from an export set to a remote destination.

Role required: export_set_scheduler or export_set_admin

1. Navigate to System Export Sets > Scheduled Exports.
2. Click New.
3. Fill in the following fields.

Table 375: Schedule Data Export fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this scheduled export.</td>
</tr>
<tr>
<td>Export set</td>
<td>Select the export set to schedule.</td>
</tr>
<tr>
<td>Run as</td>
<td>Select the user to run the scheduled export as. Ensure the user has any roles needed to view the data to export.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the frequency for scheduled export.</td>
</tr>
<tr>
<td>Day</td>
<td>Select which day of the week or month to run this scheduled export on. This field appears when the Run field is set to Weekly or Monthly</td>
</tr>
<tr>
<td>Repeat interval</td>
<td>Enter the number of days and hours to wait before repeating this scheduled export. This field appears when the Run field is set to Periodically.</td>
</tr>
<tr>
<td>Time</td>
<td>Enter the time of day to run the scheduled export.</td>
</tr>
<tr>
<td>Delta Exports</td>
<td>Select this check box to enable delta functionality for this scheduled export. When selected, only new or changed records are exported.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Delta on or after</td>
<td>Select <strong>Updated</strong> to export all records that changed since the last export, including new records. Select <strong>Created</strong> to export only new records created after the last export.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the export definition already includes a filter condition on the <code>sys_updated_on</code> or <code>sys_created_on</code> fields, enabling delta exports will prevent you from saving the scheduled data export record. An error appears at the top of the form in this event.</td>
</tr>
<tr>
<td>Last export scheduled run</td>
<td>Leave this field blank to export all records from the export definition. When using delta exports, this field is set automatically each time the scheduled export runs. Records updated or created after this date and time are included in the export delta, depending on the <strong>Delta on or after</strong> value.</td>
</tr>
</tbody>
</table>

### Scripts

<table>
<thead>
<tr>
<th>Conditional</th>
<th>Select this check box to run the schedule only when a condition is met.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Write the script to be used to evaluate whether the export should run. This field is visible if you select the <strong>Conditional</strong> check box.</td>
</tr>
<tr>
<td>Execute pre-export script</td>
<td>Select this check box to run a script before the export begins.</td>
</tr>
<tr>
<td>Pre script</td>
<td>Write the script you want to run before the data is exported. This field is visible if you selected the <strong>Execute pre-export script</strong> check box.</td>
</tr>
<tr>
<td>Execute post-export script</td>
<td>Select this check box to run a script after the export finishes.</td>
</tr>
<tr>
<td>Post script</td>
<td>Write the script you want to run after the export finishes. This field is visible if you selected the <strong>Execute post-export script</strong> check box.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

You can click the **Execute Now** button to run the export immediately and confirm the data is exported as expected.

**Scheduled export set scripting options**

When scheduling an export set, you can access certain JavaScript objects.

Use these objects in scheduled export set scripts, such as the **Pre-script** and **Post-script** fields.
Table 376: Export set scripting objects

<table>
<thead>
<tr>
<th>Object</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancel</td>
<td>Set this object to true to stop the export action. Any child export sets are also cancelled if the parent is cancelled. This object is available only in the Pre-script field.</td>
<td>Use the Pre-script field to evaluate the conditions of the export and determine whether to cancel the export process. To cancel the import process, use the following call:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>cancel = true;</td>
</tr>
<tr>
<td>export_set</td>
<td>Get the GlideRecord object for the new export set. This variable allows you to query the following columns from the sys_export_set table: name, sys_id, state, table_name. This object is available in both the Pre-script and Post-script fields.</td>
<td>If you want to use information from the export set, you can specify one of the properties of the export_set variable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>var x = export_set.sys_id;</td>
</tr>
</tbody>
</table>

Export set history

An export set history record is automatically created whenever an export set runs, either scheduled or manually started by a user.

Export set history records allow you to monitor and troubleshoot the progress of export sets.

Fields on the Export History form display the current status of the export set. The Export Log related list shows a detailed list of changes to the export set status.

Cancel an export set

You can cancel a running export set to stop the data from being sent to a MID server.

Role required: export_set_admin

You can cancel only exports that have not yet been sent to a MID server. You cannot cancel an export after it reaches the MID Server Processing state.

1. Navigate to System Export Sets > Export Sets.
2. Select an export set.
3. In the Export Histories related list, select a record with the State value of Exporting.
4. Click Cancel Export Set.

Export set history fields

These fields appear on the Export History form.
### Table 377: Export History fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export set</td>
<td>The export set that was run.</td>
</tr>
<tr>
<td>Started</td>
<td>The date and time the export started.</td>
</tr>
<tr>
<td>Completed</td>
<td>The date and time the export completed.</td>
</tr>
<tr>
<td>Export time</td>
<td>The amount of time it took to export the data, excluding the time it took to transfer the data to the target.</td>
</tr>
<tr>
<td>Run time</td>
<td>The amount of time it took to export the data, including the time it took to transfer the data to the target.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the export.</td>
</tr>
<tr>
<td>Delta export</td>
<td>The export used delta export functionality if this check box is selected.</td>
</tr>
<tr>
<td>ECC queue</td>
<td>The ECC Queue record associated with this export set run. This field is visible only to users with the admin role.</td>
</tr>
<tr>
<td>MID Server Attachment</td>
<td>A MID Server attachment record containing a copy of the exported file. The exported file is attached to this record in addition to being saved on the MID Server.</td>
</tr>
</tbody>
</table>

The **State** field may have the following values.

### Table 378: States

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exporting</td>
<td>The export set is creating a file with the data to export.</td>
</tr>
<tr>
<td>MID Server Processing</td>
<td>The export set successfully created a file with the data to export. The file is being processed by the MID Server.</td>
</tr>
<tr>
<td>Completed</td>
<td>The export set successfully ran and sent the exported file to the target.</td>
</tr>
<tr>
<td>Completed with errors</td>
<td>The export set ran, but encountered one or more errors.</td>
</tr>
<tr>
<td>Cancel requested</td>
<td>A user requested that the export set be cancelled.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The export set was cancelled.</td>
</tr>
</tbody>
</table>

### Export Set properties

These properties control the behavior of export sets.
### Table 379: Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.scheduled_export.stop_on_parent_error</td>
<td>When true, if a parent scheduled export set encounters an error, scheduled child export sets do not run. This property is false by default.</td>
</tr>
</tbody>
</table>

### Table administration

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table.

Applications use tables and records to manage data and processes, such as Incident, Problem, and CMDB. Tables can extend other tables, creating parent tables and child tables.

Administrators can use these tools for viewing and modifying the database structure:

- Tables module: provides a list of all tables in the database.
- Tables & Columns module: provides a list of all existing tables, with columns, column attributes, and indexes.
- Schema map: provides a graphical representation of the relationships between tables.
- Data dictionary tables: contain additional information that defines database elements.

### Create a table

Administrators and application developers can create custom tables to store application data.

Role required: admin

1. Navigate to **System Definition > Tables**.
2. Click **New** and complete the form.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a unique label for the table (such as <strong>Laptops</strong> or <strong>Thin Clients</strong>). The label appears on list and form views for the table. Updating the <strong>Label</strong> field also updates the label record in the language file for the current language.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Edit the table name, which is automatically populated based on the table label and a prefix as follows:</td>
</tr>
<tr>
<td></td>
<td>• For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application.</td>
</tr>
<tr>
<td></td>
<td>Preface the name of the table with u_cmdb_ci_ to make it similar to the other CMDB classes (for example, u_cmdb_ci_laptop).</td>
</tr>
<tr>
<td></td>
<td>You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).</td>
</tr>
<tr>
<td>Extends Table</td>
<td>Select the table to extend. Extending a base table incorporates all of the fields of the original table and creates system fields for the new table. You can extend tables that are marked as extensible if they are in the same scope or if they allow configuration from other scopes.</td>
</tr>
<tr>
<td></td>
<td>For example, if the new class is Laptops, which is a subclass of Computers, select the cmdb_ci_computer table. If the new class is a top-level class, select the cmdb_ci table.</td>
</tr>
<tr>
<td></td>
<td>This option is available only when creating a table.</td>
</tr>
<tr>
<td>Application</td>
<td>[Read only] Displays the application associated with this table. If you are working on an application or are creating a table from an application record, the field defaults to that application. Otherwise, the field defaults to Global. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.</td>
</tr>
<tr>
<td>Create module</td>
<td>Select the check box and then complete the <strong>Add module to menu</strong> field to create a list module in the application menu.</td>
</tr>
<tr>
<td></td>
<td>This option is available only when creating a table.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Add module to menu</td>
<td>Select an existing menu or select <strong>Create new</strong> and enter a new menu name. This option is available only when the <strong>Create module</strong> check box is selected.</td>
</tr>
</tbody>
</table>

3. **In** the **Columns** section, use the **Table Columns** embedded list to add columns to the table.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column label</td>
<td>Define a unique label for the column. The label appears on list headers and form fields for the column.</td>
</tr>
<tr>
<td></td>
<td>• When you update the <strong>Column label</strong> field, the system also updates the label in the language file for the current language.</td>
</tr>
<tr>
<td></td>
<td>• When you create a new column, the column name is automatically populated based on the label. The name is automatically prefixed with <code>u_</code> to indicate that it is custom. For example, if you enter <strong>Activity Description</strong> as the column label, the column name defaults to <code>u_activity_description</code>.</td>
</tr>
<tr>
<td>Type</td>
<td>[Mandatory] Define the field type for the column. To preserve existing data, only change fields between the same basic type (for example, <strong>Choice</strong> and <strong>String</strong>). A warning appears if a change to a custom field will result in data loss. For a base system field, you cannot make a change that will result in data loss.</td>
</tr>
<tr>
<td>Reference</td>
<td>Make the field into a reference field by entering the referenced table name.</td>
</tr>
</tbody>
</table>

**Note:** Dynamic reference creation is enabled for this field. So, if you enter a table name that does not match an existing table, a new table is created when you save changes to the current table record. If the current table has a module in the application navigator, then a module for the newly created table is automatically created in the same application menu.
<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max length</td>
<td>[String fields only] Limit the length of the field. A length of under 254 appears as a single-line text field. Anything 255 characters or over appears as a multi-line text box.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• You can only change this value if the <strong>Type</strong> of the field is <strong>String</strong>. Changes for any other type of field are ignored.</td>
</tr>
<tr>
<td></td>
<td>• Users on an Oracle instance cannot increase the maximum length of a string field to anything greater than 4000 through the application UI because this requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with ServiceNow Technical Support to request the change.</td>
</tr>
<tr>
<td></td>
<td>• To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field will result in data loss. For a base system field, you cannot make a change that will result in data loss.</td>
</tr>
<tr>
<td>Default value</td>
<td>Specify the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field can use a default value of 2 but cannot use a default value of two. These values can be overridden with dictionary overrides.</td>
</tr>
<tr>
<td>Display</td>
<td>Indicate whether this field is the display value for reference fields (appears on records that reference this table).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This option does not control whether or not this field is displayed on lists or forms.</td>
</tr>
</tbody>
</table>

4. In the **Controls** section, define additional table options.
<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extensible</td>
<td>Select the check box to allow other tables to extend this table. Clear the check box to prevent the creation of additional child tables; existing child tables remain unchanged.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Select the check box to enable record feeds for the table. This option adds the <strong>Show Live Feed</strong> icon (ês) in the form header.</td>
</tr>
<tr>
<td>Auto-number</td>
<td>Select the check box, and then define the number format to add an auto-numbered field to the table. The check box is available only when a number format does not exist for the table. Otherwise, you can edit the existing number format.</td>
</tr>
<tr>
<td>Create access controls</td>
<td>Select the check box and then complete the <strong>User role</strong> field to create basic security rules for the table.</td>
</tr>
<tr>
<td>User role</td>
<td>Enter a new name or select an existing user role that is required to access this table. This option is available only when the <strong>Create access controls</strong> check box is selected.</td>
</tr>
</tbody>
</table>

5. In the **Application Access** section, define the scope protection for the table.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can read</td>
<td>Select the check box to allow script objects from other application scopes to read records stored in this table. This option offers runtime protection. For example, a script in another application can query data on this table. You must first select read access to grant any other API record operation.</td>
</tr>
<tr>
<td>Can create</td>
<td>Select the check box to allow script objects from other application scopes to create records in this table. This option offers runtime protection. For example, a script in another application can insert a new record in this table. This option is available only when the <strong>Can read</strong> check box is selected. Clear the check box to prevent script objects from other application scopes from creating records in this table.</td>
</tr>
</tbody>
</table>
### Control

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can update</td>
</tr>
<tr>
<td>Can delete</td>
</tr>
<tr>
<td>Allow access to this table via web services</td>
</tr>
<tr>
<td>Allow configuration</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can update</td>
<td>Select the check box to allow script objects from other application scopes to modify records stored in this table. This option offers runtime protection. For example, a script in another application can modify a field value on this table. This option is available only when the Can read check box is selected. Clear the check box to prevent script objects from other application scopes from modifying data stored in this table.</td>
</tr>
<tr>
<td>Can delete</td>
<td>Select the check box to allow script objects from other application scopes to delete records from this table. This option offers runtime protection. For example, a script in another application can remove a record from this table. This option is available only when the Can read check box is selected. Clear the check box to prevent script objects from other application scopes from deleting records from this table.</td>
</tr>
<tr>
<td>Allow access to this table via web services</td>
<td>Select the check box to allow users to make inbound web service queries to this table. This option offers both design-time and runtime protection. The user performing the query must have the correct permissions to access this table, even when this check box is selected. Clear the check box to prevent users from making web service queries to this table.</td>
</tr>
<tr>
<td>Allow configuration</td>
<td>Select the check box to allow applications from other application scopes to create configuration records for this table that change its functionality. For example, an application designer can select this table from the Tables list on business rules, client scripts, or UI actions. This option offers design-time protection. Clear the check box to prevent application designers from selecting this table when creating configuration records.</td>
</tr>
</tbody>
</table>

6. Click Submit.
Global default fields

When you create a new custom table, several fields appear in the **Table Columns** embedded list. For all tables, required system fields are added automatically. You cannot delete or modify these fields.

For tables that extend another table, fields on the parent table also appear on the **Table Columns** embedded list for the current table. If you modify these fields, remember that all changes to fields on the parent table also affect all child tables, not just the current table.

These required system fields are added to all tables:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class [sys_class_name]</td>
<td>System Class Name</td>
<td>If the table is extensible, a string field that indicates which child table contains the record.</td>
</tr>
<tr>
<td>Created [sys_created_on]</td>
<td>Date/Time</td>
<td>A time-stamp field that indicates when a record was created.</td>
</tr>
<tr>
<td>Created by [sys_created_by]</td>
<td>String</td>
<td>A string field that indicates the user who created the record.</td>
</tr>
<tr>
<td>Sys_id [sys_id]</td>
<td>Sys ID</td>
<td>The unique record identifier for the record.</td>
</tr>
<tr>
<td>Updates [sys_mod_count]</td>
<td>Integer</td>
<td>A numeric field that counts the number of updates for this record since record creation.</td>
</tr>
<tr>
<td>Updated by [sys_updated_by]</td>
<td>String</td>
<td>A string field that indicates the user who most recently updated the record.</td>
</tr>
<tr>
<td>Updated [sys_updated]</td>
<td>Date/Time</td>
<td>A time-stamp field that indicates the date and time of the most recent update.</td>
</tr>
</tbody>
</table>

Activate restore deleted records

Administrators can activate the Restore Deleted Records plugin to enable this functionality.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.
Create a many-to-many relationship

Many-to-many relationships allow a list to point to a list of entries, rather than to single field. For example, if a knowledge base article points to a list of related configuration items, it uses a related list. Not all lists can be used as related lists, however. For a list to be related to another list, a many-to-many relationship that refers to both tables must exist.

The Many to Many Definitions [sys_m2m] table allows administrators to create custom many-to-many relationships.

1. In the navigation filter, enter sys_m2m.list.
2. Click New.
3. In the From table field, specify a parent table.
4. In the To table field, specify a child table.
   The Many-to-Many form automatically populates the other fields with suggested values.
5. Optional: Edit other field values, if appropriate. Note that Many-to-Many table names cannot exceed 30 characters.

Reference default many-to-many relationships

Some many-to-many relationships are defined by default.

To reference many-to-many relationships that are available in the base system, administrators can enter sys_collection.list in the navigation filter.

---

**Note:** Only use this table to view many-to-many relationships in the base system. To create a new relationship, always use the Many-to-Many Definitions table.

Delete all records from a table

You may decide to delete all the records on a table without deleting the table itself. For example, the administrator may want to delete all incidents on a test instance without deleting the incident table itself.

When you prepare to delete many records from a table, consider the following guidelines to minimize impact on performance.

- Limit the number of records to be deleted in a single delete action to prevent the table from being locked. Use the setLimit() method described at setLimit.
- Minimize triggering an excessive number of business rules as a result of this deletion. Use the setWorkflow(Boolean e) method described at setWorkflow.

---

**Note:** Deleting all records for a table also deletes records from tables that extend the table.

There are several methods for deleting table records. Depending on the number of records to be deleted, choose the method that would be most efficient in your environment. Use these methods with caution. Before performing this procedure, be sure that you do not need any of the records.

- From the Tables and Columns module, complete the following steps.
  a) Navigate to System Definition > Tables and Columns.
  b) Select the table for which to delete records.
Notes: Some system tables do not allow this method of deleting records, for example, you cannot delete all user records [sys_user]. The list of tables does not include system tables that you cannot delete records from.

c) Click **Delete all records**.
d) In the confirmation dialog box, enter delete and click OK.

• From a list view, complete the following steps.
  a) Navigate to the list view that displays the table records, click the context menu, and then navigate to **Show**.
  b) Set the number of rows per page to display the max number.
  c) Select all the rows on the page.
  d) Click **Actions on selected rows**, and then click **Delete**.
  e) Continue deleting all rows on a page until all records are deleted.

The selected table is empty of records. The table still exists, and any references to the table on other tables (such as business rules or reference fields) are preserved.

**Delete a table**

Administrators can delete custom tables that are no longer needed. For example, delete a table from an application that is under development because the business requirements change.

A table is custom if it was created by an administrator and is not part of a system upgrade or plugin activation. Custom table names always begin with u_.

Base system tables cannot be deleted. Additionally, any missing base system tables are recreated when the instance is upgraded. You cannot delete a table if another table extends it.

**Warning:** You must delete the records in the table before you delete the table. If you do not delete the records first, errors can result on the parent table if it references the records. Deleting the records removes any references from the parent table.

**Delete a custom table**

1. Navigate to **System Definition > Tables**.
2. Open the table to delete.
3. Click **Delete All Records**.
   - Deleting all records before deleting the table ensures that the business logic is properly executed (for example, reference cascade rules or other delete business rules). If you do not delete all records from the table first, then you must manually fix any other records or tables that are impacted by the table deletion.
4. Click **Delete**.
5. In the confirmation dialog box, enter delete and click **OK**.

   The table and all items that reference the table are deleted, including:
   - Choice list items
   - Forms, form sections, lists, and related lists
   - Reports and gauges
   - Reference fields that reference the table
   - Access controls

**Restore deleted records**

In some cases, administrators can restore deleted records and references to those records.
In some cases, administrators can restore deleted records and references to those records. For example, if a user inadvertently deletes a user record that was referenced in the **Caller ID** field on several incident records, you may be able to restore the user record as well as the incident field values. You may also be able to restore records that were deleted as a result of a cascade delete action.

There are several methods for restoring deleted records:

- Restore data records without references on tables that audit deletions.
- Restore data records and references on tables that audit deletions (requires the Restore Deleted Records plugin).
- Restore configuration records with the app creator.

**Restore a deleted record and reference**

ServiceNow can track deletions on any table, and references on audited tables, except in these circumstances:

- Record deletions are not tracked on tables with the `no_audit_delete=true` dictionary attribute.
- **Attachments** are not restored when the record is restored.
- References to a restored record are restored only if the reference field is on an audited table.
- References to images using an **Image** type field are not restored.

To restore deleted records and references:

1. Navigate to **System Definition > Deleted Records**.
2. Open a deleted record that you want to restore.
   
   **Note:** You can only restore one deleted record and its associated references at a time.

3. In the Audit Deleted Record form, select **Restore Record and References** under **Related Links**.
   
   **Note:** To restore the record without restoring the references, select **Undelete Record**

   An instructions page appears, explaining the process and its limitations.

4. Click **Restore deleted record**.
   
   A Progress page shows the progress of the restore process, and displays a counter of the references restored.

When the process completes, a Restore Summary itemizes the changes and provides links for viewing the restored record or returning to the deleted records list.

**Restore data records with deletion audits**

You can restore deleted data records on tables that audit deletions.

Limitations for restoring data records include:

- Record deletions are not tracked for tables with the `no_audit_delete=true` dictionary attribute.
- **Attachments** are not restored when the record is restored.
- Deletions from tables with a sys prefix are not audited by default. You can use the app creator to **restore configuration records**, such as Business Rules [sys_script]. You can also **configure specific system tables to audit deletions**.
- References are restored only if the reference field is on an audited table and the Restore Deleted Records plugin is activated.
- References that use an **Image** field type are not restored.
Restore a system table

ServiceNow does not automatically track deletions from tables with a `sys` prefix. You can configure this behavior using these steps.

ServiceNow does not automatically track deletions from tables with a `sys` prefix. To track deletions from these tables, add the table name to the `glide.ui.audit_deleted_tables` property. *Activate the Restore Deleted Records plugin* adds several default values to this property.

To configure which tables are tracked:

1. Navigate to **System Properties > UI Properties**.
2. Locate the **List of system tables (beginning with "sys_", comma separated) that will have the delete audited property**.
3. Add or remove table names. Table names should be separated by commas, without any spaces.
4. Click **Save**.

*Note:* For more information about auditing, see *Understanding the sys audit Table*.

Schema map for tables

The schema map displays the details of tables and their relationships in a visual manner, allowing administrators to view and easily access different parts of the database schema.

The schema map can also be printed directly from a browser.

Schema relationship types supported, and the colors used for them, are:

<table>
<thead>
<tr>
<th>Relationship type</th>
<th>Color used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Referenced by</td>
<td>Red</td>
</tr>
<tr>
<td>Referencing</td>
<td>Orange</td>
</tr>
<tr>
<td>Extended by</td>
<td>Green</td>
</tr>
<tr>
<td>Extending</td>
<td>Blue</td>
</tr>
</tbody>
</table>

By default, all these types of relationship are displayed, but you can view or hide each type.

*Generate a schema map*
How to generate a schema map.

1. Navigate to **System Definition > Tables & Columns**.
2. In the **Table Names** pane, select a table.
3. Click **Schema map**.

   The schema map for the selected table opens in a separate tab or window.

   You can print this map from the browser, if required.

*View the schema map*

The schema map shows the selected table in yellow, typically centered, and all tables related to that table, typically shown at the sides.
Figure 455: Schema Map v3 1

From this map:

- The check boxes at the top allow you to control which relationships to display. Select or clear a relationship type to display or hide tables with that relationship to the selected table.
- Each related table has a colored bar indicating the relationship to the selected table.
- You can point to the connector lines to display the details of a relationship between the two tables.

**Note:** Since relationships are shown as single lines for simplicity, the diagrams rendered are not entity relationship diagrams.

Using the Table Selector:

To view a schema map as a list, point to the table selector in the right corner:
You can:

- Click a table in the list to scroll the schema map to that table.
- Click the eye icon beside a listed table to hide or show that table in the schema map.
- Click the pin icon in the selector to keep the list open.

Using Related Tables:

Right-click a table node header to display a context menu with these functions:

- **Focus on this table**: make the selected table the new focus table and redraw the schema map based on the new selection.
  
  The new focus table is added as a breadcrumb at the top, allowing you to return to the previous table at any time.
- **Go to list**: display the list of records for the table.
- **Go to dictionary**: display the system dictionary, filtered for the selected table.

To hide a related table from view, click the eye icon in the node header (the node can be made visible again with the table selector).

For tables that are part of their own inheritance hierarchy, click the expand button (+) in the node header to add their inheritance hierarchy to the schema map.

**Viewing More Information**

Click the expand button (+) beside **Columns** to expand the table fields.
The reference fields show a red notation of the table they refer to.

If any tables extend from a table, their columns are displayed in reverse inheritance order. For example:

![Diagram showing extended table relationships]

**Figure 458: Schema Map Related Tables**

Here, the Server [cmdb_ci_server] table extends from Computer [cmdb_ci_computer], Hardware [cmdb_ci_hardware], and Configuration Item [cmdb_ci], and displays the columns from those tables.

Similarly, the Computer table displays the columns from the Hardware and Configuration Item tables.

**Tables module**

The Tables [sys_db_object] table contains a record for each table in the database.

To view the list of tables, navigate to **System Definition > Tables**. For example, you can filter the list to see extended table relationships.
Figure 459: Extended Table Relationships

To open the record for an existing table, click a table label. You can:

- View, add, or modify columns with a searchable and sortable embedded list, define the auto-number format, make the table extendable by other tables, and create modules for the table.
- Launch a schema map for a table by clicking the Show Schema Map related link.
- Open the dictionary entries for the table by right-clicking the form header and selecting Show Dictionary Record.
- Navigate directly to the default list or form view for the table by clicking the Show List or Show Form related link.
- Delete all records from a table by clicking the Delete All Records.
Unique record identifier

Each record in ServiceNow is identified by a unique 32-character GUID (Globally Unique ID) called a sys_id. The same sys_id value will never be generated twice, ensuring every record created in every table in every instance of ServiceNow in the world has a unique identifying value.

If two records have the same sys_id value, then one was copied to the other at the database level outside of the ServiceNow application. When created within the application, sys_id values are unique. The ServiceNow application and database should manage all operations on sys_id values. Typical end users do not see a record's sys_id and database administrators rarely use sys_id values.

**Note:** A sys_id of -1 is the sys_id of a new record. Once the record is inserted, it will be given a new sys_id.
**Globally unique record identifier**
Each record in ServiceNow is identified by a unique 32-character GUID (Globally Unique ID) called a sys_id.

The same sys_id value will never be generated twice, ensuring every record created in every table in every instance of ServiceNow in the world has a unique identifying value.

If two records have the same sys_id value, then one was copied to the other at the database level outside of the ServiceNow application. When created within the application, sys_id values are unique.

The ServiceNow application and database should manage all operations on sys_id values. Typical end users do not see a record's sys_id and database administrators rarely use sys_id values.

---

**Note:** A sys_id of -1 is the sys_id of a new record. Once the record is inserted, it will be given a new sys_id.

---

**Get the sys_id from the header bar**
Users can locate the sys_id of a record using the header bar.

1. Navigate to the record.
2. Right click the header bar and select **Copy URL**.

The sys_id is inside of the URL, after the parameter sys_id=. For example, the following is a URL for an Incident:

```
https://<instance name>.service-now.com/nav_to.do?uri=incident.do?sys_id=9d385017c611228701d22104cc95c371
```

Therefore the sys_id is 9d385017c611228701d22104cc95c371.

**Get the sys_id from a script**
Users can locate the sys_id of a record using a script.

- The sys_id value of a record can be found in a business rule (or any other server-side JavaScript) by dot-walking from the GlideRecord.

```
var id = current.sys_id;
```

- The sys_id of a record can be found in client-side JavaScript using `g_form.getUniqueValue()` as shown in the following example.

```
function onLoad() {
    var incSysid = g_form.getUniqueValue();
    alert(incSysid);
}
```

**Get the sys_id from the URL**
Users can locate the sys_id of a record by viewing the URL.

Since the sys_id of a record is always part of the URL for a link to that record, it is possible to retrieve the sys_id by viewing the URL.

- View the sys_id in the information bar of the browser by hovering over a link to the record.

For example, an Incident with the following URL: https://<instance name>.service-now.com/nav_to.do?uri=incident.do?sys_id=23dc968f0a0a3c1900534f399927740e, would have this sys_id: 23dc968f0a0a3c1900534f399927740e.
Unique index

A unique index on a table guarantees that the index key contains no duplicate values and therefore ensures that every row in the table is unique in some way.

Specifying a unique index makes sense only when uniqueness is essential for the data in a table.

You can view a table’s indexes as well as create your own index for a table using the table’s related list of indexes.

Create a table index

Create a custom index for a table.

Role required: admin

Constructing an effective index requires specialized knowledge in database architecture. We recommend that if you do not have this expertise, you consult someone who does.

Note: In this release, custom indexes are not tracked in update sets.

1. Navigate to System Definition > Tables.
2. In the list, find the table you want and click its label.
3. Navigate to the Database Indexes related list.
4. Click New.
5. In the Index Name field, type a name for your index.
6. Use the slush bucket to select the fields you want included in the index.
   The order in which you select the fields affects how the index works. If you do not have expertise in database design, we suggest you consult someone who does.
7. To create a unique index, check the Unique Index box.
8. Click Create Index.
   The Table Name field is there for your reference only. Overriding the default has no effect.

Tasks

A task is a specific type of record, controlled by the base class task. Within the platform, all ITIL processes are handled through tasks.

Tasks are created by users who are requesting the task to be performed, and are then updated as the task moves along the workflow. A task is created, work is performed upon it, and eventually it moves to a resolved state. Tasks allow users to request tasks, and track how they are being fulfilled by the appropriate parties. Tasks can be assigned to specific users or user groups. Many tasks are extended by child classes, such as Incident or Change.
Figure 461: A task in Record List view

Task table

Task [task] is one of the core tables provided with the base system.

It provides a series of standard fields used on each of the tables that extend it, such as the Incident [incident] and Problem [problem] tables. In addition, any table which extends task can take advantage of task-specific functionality for driving tasks.

The Planned Task plugin provides the Planned Task [planned_task] table, which extends the Task [task] Table to provide more fields for tasks to measure duration and effort.

Create a task

Tasks are not created directly on the task table. Instead, tasks are created on task child tables.

1. Click the New button on the task record list will launch the Task Interceptor.
2. Follow the on-screen instructions to locate the desired table that extends Task.
Define assignment rules

The instance can automatically assign a task to a user or group based on pre-defined conditions by using data lookup rules and assignment rules.

Assignment lookup rules example

In this example, the Data Lookup Plugin assignment lookup rule automatically assigns any incident with the Category of Request and Subcategory of Password Reset to Fred Luddy.

Figure 462: Assignment data lookup
Assignment rules module
The Assignment rules module allows you to automatically set a value in the assigned_to and assignment_group fields when a set of conditions occurs.

An assignment rule must also meet these additional criteria to run:

- The task record has been created or updated. Assignment rules do not apply to unsaved changes on a form.
- The task record must be unassigned. The record cannot have an existing value for either the assigned_to or assignment_group fields. Assignment rules cannot overwrite existing assignments (including assignments set by a default value or a previously run assignment rule).
- The assignment rule is the first rule that matches the table and conditions. If more than one assignment rule matches the conditions, only the rule with the lowest order value runs.

Condition editor example
In this example, the assignment rule uses a condition statement to automatically assign any incident opened in the Network category to the System Administrator in the Network assignment group.

![Assignment Rule](image)

Figure 463: Assignment

Data lookup rules
Data lookup rules offer a generic way to change any field value, not just assignment fields.

Data lookup rules offer the following improvements over the Assignment module:

- Ability to change any field value not just an assignment field
- More options to define when a rule runs:
  - On form change (Allows assignment rules to apply to unsaved changes on a form)
  - On record insert
  - On record update
- Option to replace existing values (including default values)

**Note:** You can define data lookup and Assignment rules at the same time. The system ignores any duplicate rules after an incident has been assigned unless you are using a data lookup definition option to replace existing values.

Precedence between assignment rules and business rules
When creating new assignment rules, keep in mind that business rules can take precedence over assignment rules in certain circumstances.

Assignment rules and business rules run in the following order:

1. All before business rules that run on a record insert with an order value less than 1000.
2. The first assignment rule with the lowest execution order and matching condition.
3. All before business rules that run on a record insert with an order value greater than or equal to 1000.
4. All after business rules that run on record insert.

**Workflow assignments**
An alternative to creating data lookup or assignment rules is to create one or more workflow tasks that assign a task record as part of a workflow.

Consider using a workflow for assignment if your process includes multiple steps or conditions such as requiring a particular group approve a request.

When using a workflow to manage task assignments, add a brief timer activity to the start of the workflow. Without this timer activity, the workflow runs before the parent record, the current record, is inserted into the database. After the timer activity completes, the workflow resumes using the parent record information from the database instead of the original current. Note that pausing a workflow in this way does not change a default workflow to a deferred workflow. For more information on how the workflow engine interacts with the database, see [workflow engine operation order](#).

**Baseline assignment rules example**
A baseline instance contains certain assignment rules.

### Table 382: Baseline instance rules

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Conditions</th>
<th>Assigned to user, Assigned to group, or Script</th>
</tr>
</thead>
</table>
| Networking | incident     | Category is Network                             | User: System Administrator  
|         |             |                                                 | Group: Network                             |
| Database or Software | incident     | Category is one of Request, Inquiry / Help, Software, Hardware | User: System Administrator  
|         |             |                                                 | Group: Software                             |
| SC Item fulfillment - Field Services | Ticket  | Parent.Task type is Request item | Group: Field Services |
| Release Planning | release_phase | Name is Plan                                   | Script: current.release.product.service.assigned_to; |
| IT Hardware | sc_req_item  | Approval is Approved and Item.Category is Request Computers and Hardware | User: System Administrator  
|         |             |                                                 | Group: Hardware                             |
| Service Desk | incident     | Active is true                                 | Group: Service Desk                         |

**Script example**
In this example, the assignment rules use JavaScript code to assign incidents to a particular assignment group based on the incident category.
Table 383: script incident category

<table>
<thead>
<tr>
<th>This incident category</th>
<th>Is assigned to this assignment group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware</td>
<td>Hardware</td>
</tr>
<tr>
<td>Software</td>
<td>Software</td>
</tr>
<tr>
<td>Malware</td>
<td>Security</td>
</tr>
</tbody>
</table>

Figure 464: Assignment by script

The following script requires configuring the instance to add the Malware category and the Security assignment group.

```java
if(current.category=="Hardware"){
    current.assignment_group.setDisplayValue("Hardware");
} elseif(current.category=="Software"){
    current.assignment_group.setDisplayValue("Software");
} elseif(current.category=="Malware"){
    current.assignment_group.setDisplayValue("Security");
}
```

Assignment module rule

How to define an assignment rule.

1. Navigate to **System Policy > Rules > Assignment** and click **New**.
2. Complete the fields on the form (see table).
Figure 465: Assignment rule

Note: You might need to configure the form to see the fields.

Table 384: Assignment rule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The descriptive name for the assignment rule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>An indicator of whether the assignment rule is active. Only active assignment rules take effect.</td>
</tr>
<tr>
<td>Applies to</td>
<td>The table with the records that the assignment rule applies to.</td>
</tr>
<tr>
<td>Table</td>
<td>Note: The list shows only tables and database views that are in the same scope as the assignment rule. If you select a custom table that extends the task table, you must clear the instance cache by navigating to <code>https://&lt;instance_name&gt;.servicenow.com/cache.do</code> in order for the assignment rule to work.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions in which the assignment rule will apply.</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user which will be assigned the event.</td>
</tr>
<tr>
<td>User</td>
<td>The group which will be assigned the event.</td>
</tr>
<tr>
<td>Group</td>
<td>A script to determine advanced assignment rule functionality. The <code>current.variable_pool</code> set of variables is available.</td>
</tr>
<tr>
<td>Script</td>
<td>A script to determine advanced assignment rule functionality. The <code>current.variable_pool</code> set of variables is available.</td>
</tr>
<tr>
<td>Other fields</td>
<td>Choices are:</td>
</tr>
<tr>
<td>Match conditions</td>
<td>• Any - Assignment Rule will apply if any of the conditions are met.</td>
</tr>
<tr>
<td></td>
<td>• All - Assignment rule will apply if all of the conditions are met.</td>
</tr>
<tr>
<td>Order</td>
<td>A number to determine priority over conflicting assignment rules. If there are conflicting assignment rules, rules with lower Order values will take precedence over rules with higher Order values. If the Order values are all set to the same number the assignment rule with the first matching condition is run with precedence over the others. Only one assignment rule will run against a record, the first with a matching condition.</td>
</tr>
</tbody>
</table>
Create data lookup rules
How to define an assignment rule with Data Lookup and Record Matching Support.

1. Navigate to **System Policy > Rules > Assignment Lookup Rules**.
2. Click **New**.
3. Populate the assignment data lookup fields (see table).
4. Click **Submit**.

![Assignment Data Lookup](image)

**Table 385: Assignment data lookup fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Select the category the data lookup matches against.</td>
</tr>
<tr>
<td>Subcategory</td>
<td>Select the subcategory the data lookup matches against.</td>
</tr>
<tr>
<td>Configuration item</td>
<td>Select the configuration item the data lookup matches against.</td>
</tr>
<tr>
<td>Location</td>
<td>Select the location the data lookup matches against.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the assignment group to assign the incident to.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Select the user to assign the incident to.</td>
</tr>
<tr>
<td>Active</td>
<td>Set to Yes to run the rule or No to deactivate the rule.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the rule runs compared to other rules on the same table. The Data Lookup Plugin runs the rule with the lowest order and matching values.</td>
</tr>
</tbody>
</table>

**Note:** The assignment lookup rule assigns incidents matching the values in the matcher fields (Category, Subcategory, Configuration Item, and Location) to the values in the setter fields.
(Assignment Group and Assigned To). A valid assignment lookup rule requires at least one matcher field and one setter field.

Important Task table fields

The Task table is a base class that provides fields for the core ITSM applications such as Incident, Problem, and Change Management. All applications that extend the Task table share these fields in common.

Table 386:

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>active</td>
<td>boolean</td>
<td>Specifies whether work is still being done on a task or whether the task's work is complete. By default, only application-specific business rules set the value of this field. For example, the incident autoclose business rule closes resolved incident that have not been updated for one day.</td>
</tr>
<tr>
<td>Additional comments</td>
<td>comments</td>
<td>journal_input</td>
<td>Displays and allows entry of comments about the task record. Each comment is inserted into the Activity field. For more information, see Journal Fields.</td>
</tr>
<tr>
<td>Approval History</td>
<td>approval_history</td>
<td>journal</td>
<td>Displays the history of approvals for the record. For more information, see Approvals.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assigned To</td>
<td>assigned_to</td>
<td>reference</td>
<td>Specifies the user assigned to complete the task. By default, this field uses a <em>reference qualifier</em> to only display users with the itil role. Some applications override the parent reference qualifier to display relevant users. For example, the Service Order and Project Task tables filter users based on their skills.</td>
</tr>
<tr>
<td>Created</td>
<td>sys_created_on</td>
<td>glide_date_time</td>
<td>Displays the date and time when the task record was created.</td>
</tr>
<tr>
<td>Description</td>
<td>description</td>
<td>string</td>
<td>Displays and allows entry of a multi-line description of the work to be done.</td>
</tr>
<tr>
<td>Escalation</td>
<td>escalation</td>
<td>integer</td>
<td>Indicates how long the task has been open. Escalations are dynamically populated using service level agreements, which specify how long a task remains in each escalation state. Escalation states go from <em>Normal</em> to <em>Moderate</em> to <em>High</em>, and finally to <em>Overdue</em>. Record lists color code each task by escalation state.</td>
</tr>
<tr>
<td>Number</td>
<td>number</td>
<td>string</td>
<td>Displays an identifying number for each task record. This field is the display value for the Task table. The system generates this number when the task is created. To manage number generation, see <em>Number Maintenance</em>.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Opened</td>
<td>opened_at</td>
<td>glide_date_time</td>
<td>Displays the date and time when the task record was opened by a human for the first time.</td>
</tr>
<tr>
<td>Priority</td>
<td>priority</td>
<td>integer</td>
<td>Specifies how high a priority the task should be for the assignee. By default, this value is calculated by the calculatePriority business rule based on the <strong>Impact</strong> and <strong>Urgency</strong> values. Record lists color code each task by degree of priority.</td>
</tr>
<tr>
<td>Short Description</td>
<td>short_description</td>
<td>String</td>
<td>Displays and allows entry of a short description of the task, which is a human-readable title for the record.</td>
</tr>
<tr>
<td>State</td>
<td>state</td>
<td>Integer</td>
<td>Displays a choice list for status of the task:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Pending</td>
</tr>
<tr>
<td></td>
<td></td>

<td>work_notes</td>
<td>journal_input</td>
<td>Displays and allows entry of comments viewable only by ITIL users. Each comment is inserted into the Activity field. For more information, see Journal Fields.</td>
</tr>
<tr>
<td>Work notes list</td>
<td>work_notes_list</td>
<td>glide_list</td>
<td>Specifies users who receive email notifications when work notes are added to the record. By default, only the Change, Problem, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field.</td>
</tr>
</tbody>
</table>
Journal fields

Journal fields work together to create a log of changes and comments as tasks are worked on.

Note: Journal fields work on audited tables only.

Fields of the journal_input type are multi-line text boxes which, upon save, add the comments into the Activity field with a notation.

Table 387: Fields that accept input into the journal

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional comments</td>
<td>Can be updated by any user.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Can be updated by ITIL users.</td>
</tr>
</tbody>
</table>

These comments, as well as any changes to the record or email notifications sent out because of the record, are displayed in the activity formatter, which can be added to the form like a field.

Figure 466: Activity formatter for journal fields

Modify the task interceptor

You can modify the task interceptor.

1. Navigate to System Definition > Interceptors (this module may need to be activated).
2. Select the Task Interceptor.
   The Answers related list specifies what choices are presented and where the user is redirected after a choice is selected.
3. Modify the Answers related list as desired.
4. After making changes, test the interceptor by clicking **Try It**.

**Note:** To disable the task interceptor, rename it to something other than `task.do`. This disables it without deleting it.

---

### Out of box task fields

The table below lists out of box task fields.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the task, which is used as the name of the task. Numbers are generated automatically when the task is created. Administrators can modify the number generation using number maintenance.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Priority</td>
<td>A signal of how high a priority the task should be for the assignee. When viewed on the Record List, the priority field will be color coded by degree of priority.</td>
</tr>
<tr>
<td>State</td>
<td>The status of the task, such as: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped.</td>
</tr>
<tr>
<td>Assigned To</td>
<td>The user or user group responsible with fulfilling the task.</td>
</tr>
<tr>
<td>Escalation</td>
<td>A signal of how long the task has been open. Usually, escalations are automatically configured using a Service Level Agreement. The longer the task is open, the more urgent the task is, moving from Normal to Moderate to High, and finally becoming Overdue. Like priority, this field is color coded in the list view.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the task.</td>
</tr>
<tr>
<td>Task Type</td>
<td>A field which specifies the type of task, and adds a child class to extend the record.</td>
</tr>
</tbody>
</table>

**Planned task**

The Planned Task plugin provides a Planned Task [planned_task] table that extends the Task [task] table.

The Planned Task plugin cannot be activated independently. It gets activated when activating the Project Management plugin.

Planned tasks provide additional fields for tasks pertaining to time and effort as part of a planned, multi-stage process.

**Note:** If the Planned Task_v2 (com.snc.planned_taskv2) plugin is active when you upgrade to the Geneva or later releases, the system adds the Task column to the Planned Task [planned_task] table. The Task column is of type Composite Field, and stores the Short Description and Number of the task. During the upgrade, the system updates all records in the Planned Task table.

**Create a planned task**

Planned Tasks are not created directly on the Planned Task [planned_task] table.

Instead, planned tasks are created on planned task child tables. Clicking the New button on the Planned Task record list will launch the Planned Task Interceptor, which prompts the user to select a child table to create the planned task on:
To modify the planned task interceptor:

1. Navigate to System Definition > Interceptors (this module may need to be activated).
2. Select the Planned Task Interceptor.
3. The Related List Answers specifies what choices are presented, and where the user will be redirected to once they select the choice. Modify the list as desired.

Create a baseline

A Planned Task Baseline is a record of the planned task's start and end times at a particular moment in time.

To create a baseline, navigate to the top planned task's form and select the Create a Baseline related link:
To view the baseline, configure the related lists to add a related list of baselines:

![Baseline Table]

**Figure 468: Baselines tab**

The baseline can be viewed on a Gantt Chart using the related link.

*Measure time and effort*

The Planned Task `[planned_task]` table provides standard fields for tracking duration and effort.

Duration measures time from start to end date. Effort measures hours of work exerted on the project.

**Duration**

- Planned duration: the projected length of time for the planned task.
- Actual duration: the actual length of time so far for the planned task.
• Remaining duration: the Planned duration minus the Actual duration, which represents the projected length of time left.

Effort
• Planned effort: the projected amount of time that will be spent on the planned task.
• Actual effort: the actual amount of time that has already been spent on the planned task.
• Remaining effort: the Planned effort minus the Actual effort, which represents the project amount of work left.
• Percent complete: the Actual effort divided by the Planned effort, which estimates the percentage of planned work which has been completed.

Important planned task table fields
The following table contains a list of important Planned Task fields:

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual cost</td>
<td>work_cost</td>
<td>currency</td>
<td>The actual cost of the planned task, to be compared with the Estimated cost.</td>
</tr>
<tr>
<td>Actual duration</td>
<td>work_duration</td>
<td>glide_duration</td>
<td>The actual length of time (from start time to end time) of work on the planned task, to be compared with the Planned duration.</td>
</tr>
<tr>
<td>Actual effort</td>
<td>work_effort</td>
<td>glide_duration</td>
<td>The actual time spent working, to be compared to the Planned effort.</td>
</tr>
<tr>
<td>Critical Path</td>
<td>critical_path</td>
<td>boolean</td>
<td></td>
</tr>
<tr>
<td>Estimated cost</td>
<td>cost</td>
<td>currency</td>
<td>An estimation of the cost of the planned task, to be compared with the actual cost.</td>
</tr>
<tr>
<td>HTML Description</td>
<td>html_description</td>
<td>html</td>
<td>A description field that accepts HTML markup.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>percent_complete</td>
<td>decimal</td>
<td>A percentage of the completed effort. Generated using the Planned effort and Actual effort fields.</td>
</tr>
<tr>
<td>Planned duration</td>
<td>duration</td>
<td>glide_duration</td>
<td>The estimated length of time (from start time to end time) of the planned task.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Planned effort</td>
<td>effort</td>
<td>glide_duration</td>
<td>The estimated amount of time spent working on the planned task.</td>
</tr>
<tr>
<td>Planned end date</td>
<td>end_date</td>
<td>glide_date_time</td>
<td>The estimated date and time for the planned task to end.</td>
</tr>
<tr>
<td>Planned start date</td>
<td>start_date</td>
<td>glide_date_time</td>
<td>The estimated date and time for the planned task to start.</td>
</tr>
<tr>
<td>Remaining duration</td>
<td>remaining_duration</td>
<td>glide_duration</td>
<td>The difference in planned and actual duration, representing the time left for the planned task.</td>
</tr>
<tr>
<td>Remaining effort</td>
<td>remaining_effort</td>
<td>glide_duration</td>
<td>The difference in planned and actual effort, representing the amount of work time left for the planned task.</td>
</tr>
<tr>
<td>Rollup</td>
<td>rollup</td>
<td>boolean</td>
<td>Read-only field managed by the system that identifies the task as having child tasks. A rollup task will have a number of its fields calculated from the children so those fields will be read-only.</td>
</tr>
<tr>
<td>Time constraint</td>
<td>time_constraint</td>
<td>string</td>
<td>A description of time constraints that apply to the planned task.</td>
</tr>
<tr>
<td>Top Task</td>
<td>top_task</td>
<td>reference (planned_task)</td>
<td>When different planned tasks are stacked in a hierarchy, this field populates with the highest-level parent task. For example, if Project A has a child Project B, and Project B has a child Project C, then Project C's Top Task is Project A. Project A's Top Task field will be blank.</td>
</tr>
</tbody>
</table>

*Planned task scripts*

A number of business rules and one script include power the dynamic calculation of crucial Planned Task fields.
Table 389: Planned Task Scripts

<table>
<thead>
<tr>
<th>Business Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set Actual Work Start Value</td>
<td>Sets the planned task's Actual Start Date when State is set to the default work state.</td>
</tr>
<tr>
<td>Set Close Data on Inactive</td>
<td>Sets the planned task's close data when task becomes inactive.</td>
</tr>
<tr>
<td>Recalculate</td>
<td>Recalculates the planned task schedule fields when one of the schedule fields changes.</td>
</tr>
<tr>
<td>Auto close milestones</td>
<td>Automatically closes milestones when they are passed.</td>
</tr>
</tbody>
</table>

Planned task hierarchy

The Task Hierarchy tool available for Planned Task displays the relationship between parent and child planned tasks.

Out-of-box, the Task Hierarchy tool is available in both Project and Release Management.

Different Planned Task tables have different UI actions to launch the task hierarchy:

- To view a Project's hierarchy, navigate to the use the Task hierarchy context menu action.
- To view a Product's hierarchy in Release v2, navigate to the product and click the Product hierarchy related link.
- To view a Release's hierarchy in Release v2, navigate to the release and click the Release hierarchy related link.
The Task Hierarchy can be added to any planned task table by:

1. Navigating to **System UI > UI Actions**.
2. Selecting one of the existing Task Hierarchy UI Actions (e.g. Task hierarchy if Project Management is activated).
3. Change the table to the desired table and rename the UI Action if appropriate, and insert.

   The hierarchy should now be available as a UI Action on the new table’s form.

**Reminder table**

The Reminder [reminder] table provides a way to auto-generate reminders for a task.

The Reminder [reminder] table is one of the child tables of the Task [task] table. The Reminder [reminder] table can be used by any table that extends the Task table such as the Incident [incident] table.

Only the System Administrator can create or modify a Reminder table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>Refers to the parent task record.</td>
</tr>
<tr>
<td>User</td>
<td>Specifies the user who has logged in to the system.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Remind me| Specifies the time before which the reminder must be sent. Available values are: **15 minutes, 30 minutes, 1 hour and 2 hours**. You can add values to this field as required.  
  
  **Note:** Internally in the system, the value is always converted to minutes and then stored in the Remind me field. |
| Before    | Refers to the date from the date field of the parent task record. This date and the time that you mention in the Remind me field are considered to send a reminder. Available values are: **Activity due, Due date, Follow up, and SLA due**.  
  
  **Note:** The Activity due field and the SLA due field are legacy fields with an unknown value that you cannot use. You can only use the Due date and Follow up fields. |
| Using     | Specifies the method by which the reminder must be sent. Available options are: **Send an Email** and **Outlook Calendar**.                          |
| Subject   | Specifies the subject or the reason of the reminder. Maximum number of characters allowed on this field is 100.                                  |
| Notes     | Provides a space where you can enter your comments regarding the reminder. Maximum number of characters allowed on this field is 8000.            |

**Task table modifications**

Modifications made to the Task table are applied to all child tables.

Be sure that the changes being made are appropriate for all of the child tables. Adding fields is a low-impact change, because the field can be hidden on tables that do not need it. However, deleting fields may cause unwanted data loss if the field is being used across tables.

**Note:** When adding choice list entries to a choice list on the Task table, make sure the entry value is unique.

You can use **dictionary overrides** to change some parts of a field definition in a way that does not to not apply to all child tables.

**Tasks workflow**

An administrator can specify a specific workflow process to apply to tasks that meet certain conditions.

Once a task is created that meets the conditions, the workflow will apply the process to the task, asking for approvals, notifying users, generating other tasks, running scripts, etc.

**Time cards**

The time card management feature works with the Task table to record time worked on Projects, Incidents, Problems, and Change Requests.

Task assignees can record time worked in the Time worked field on a task record or enter hours directly into their time card. Some tables support automatic time card creation based on start and end date fields.

Time cards also have an optional approval mechanism for project managers. Administrators and other roles that act as approvers can see all the time cards for the week. All users who are in a role that is responsible for working on tasks also can access their personal time cards. Time cards can have any of the following states.
Create a time card

Time cards can be created automatically or manually.

- Automatic: Configure time cards to be created when a user updates a task record. This behavior is controlled by a time card property that is set to false by default. See the table of properties in this page for details. In Incident, Problem, and Change records, the Time worked field must be added to the form.

  Note: The time card management plugin is required to use time cards. Some of the procedures on this page require the project management feature, which activates time cards automatically.

- Manual: Create a new time card for each task and enter the times manually.

  Users with the timecard_admin role can create a time card manually:

1. Navigate to Time Cards > All and click New.

   The Week starts on, State, and Category fields are completed automatically. The category defaults to Task work, but can be any of the following:
   - Task work
   - Admin
   - Meeting
   - KTLO (maintenance of existing system)
   - Out of office
   - Training

2. Select a Task from the pop-up list.

   This can be anything from the Task table.

3. Select your name from the list in the User field.

4. Click Submit.

   After the time card is created, the hours for that task can be incremented automatically from the Time worked field in the task record. This is controlled by a time card property, which is set to true by default. See the table of properties in this page for details. If automatic updates are not configured, the time card must be updated manually by the user or an administrator.
Managing time cards

The **My Time Cards > Current** module presents a page showing all of your time cards for the current week. There is also a control to Generate Task Cards. This button will search for all planned tasks that are scheduled for the current time card period, if you don't already have a time card for the task.

**Activate Time Card Management**

Administrators can activate the time card management plugin.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

**Manage costs**

When the cost management feature is enabled, time cards can be used to manage the cost of labor in the Cost Management application.

Enable the cost management feature. When a time card is marked Approved, the user's rate (listed in the Labor Rate Card) is used to generate a one-time Expense Line for the time worked. If no Labor Rate Cards apply to the user, the property `com.snc.time_card.default_rate` defines a default rate.

**Roles**

The timecard_admin role enables users to approve, modify, and delete the time cards of other users.

**Record time worked**

Time accrued on a project or spent working on any record in the Task table is retrieved by the time card from the Time worked field.

This field is present on Project Task records by default, but does not appear on the Incident, Problem, and Change forms and must be added by personalizing the form. Time recorded in this field is used to populate an existing time card or to create a new time card if one does not already exist. This behavior is controlled by a time card property. The Time worked field has a counter that acts like a stopwatch for the duration of
the time spent in the record. The counter can be stopped and started by a button in the field. By default, the Time worked counter is enabled and begins recording the elapsed time when the record is opened. Stop the counter with the red stop sign button and restart it with the green play button.

Time counter started:

```
Time worked: 00:00:06
```

Figure 470: Time worked started

Time counter stopped:

```
Time worked: 00:00:26
```

Figure 471: Time worked stopped

If you are creating time cards from time worked entries, you can add the related list to display the time worked records on the time card form. You will also notice an informational message on the time card to let you know that changes to time worked records will override values in the time card. This is displayed using a formatter, which can be added or removed by configuring the form.

```
Time Card   ▼ = Required field

Time Worked property enabled, values may be overwritten by time worked records

Week starts on: 2011-01-02
State: Pending
Category: Task work
Task: INC0000003
User: John Roberts
```

Figure 472: Time worked notice

*Time card properties*
Users with the system administrator role can set time card properties by navigating to **Time Cards > Administration > Properties**.

Table 391: Time card properties table

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.snc.time_card.autocreate</td>
<td>Auto-create a user’s time card when they update a task</td>

</tr>
<tr>
<td>com.snc.time_card.start_day</td>
<td>What day should time cards start on, default is Sunday. Changing this value may create duplicate time cards for the week of the change, since time card queries are based on this value</td>
<td>Sunday</td>
</tr>
</tbody>
</table>

Tools for driving tasks

There are several tools available to drive tasks to completion.

These tools can be run on any table which extends Task.

- Approvals
  Approvals can be generated to a list of Approvers, either manually or automatically, according to Approval Rules. Approvals can be incorporated into workflows or can stand alone. For more information, see Process approvals on page 457.
  Approvals can be used on tables that do not extend Task.
- Assignments
  Assignment rules can automatically assign tasks to users or groups, ensuring that tasks are handled by the most appropriate team members. For more information, see Defining Assignment Rules.
- Service levels
  Service level agreements can track the amount of time that a task has been open, to ensure that tasks are completed within an allotted time.
- Inactivity monitors
  Inactivity monitors ensure that tasks do not fall by the wayside by notifying users when tasks have been untouched for a predefined period of time. For more information, see Setting Inactivity Monitors.
- Workflow
  An administrator can specify a specific workflow process to apply to tasks that meet certain conditions. After a task is created that meets the conditions, the workflow applies an automated process to the task. The process is defined in the graphical workflow editor.
Figure 473: Graphical workflow editor

As the process takes place, it updates any field designated as a workflow field.

Figure 474: Workflow field

Workflows are not specific to the tasks, but there are task-specific Workflow Activities (such as Task Activities and Approval Activities). For more information, see Workflow Overview.

Many to many task relations

By default, tasks can be related to each other using a parent/child relationship, such as a Problem with a group of child Incidents or a Catalog Request with a group of child Catalog Tasks.
However, it may prove useful to record exactly the nature of the relationship between the task records. When activated, the Many to Many Task Relations plugin allows administrators to define relationships between different tasks.

Request many to many task relations
How to request a plugin.

The Many to Many Task Relations plugin is included with the following plugins:

- Planned Task
- Field Service Management
- Project Management
- Governance, Risk, and Compliance

**Note:** Contact ServiceNow to activate the plugin by itself.

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

**Plugin manifest**
When the plugin is activated, the Task Relationships application is available with certain modules.

When the plugin is activated, the Task Relationships application is available with the following modules:
The following Relation Types are available by default:

- Knowledge Relation Types
  - Solution is documented in:
- Relationship Types
  - Caused by:
  - Contains:
  - Documenting Solution for:
  - Investigated by:
  - Permanent correction for:
  - Related to:
  - Requesting:
  - Solved by:

Define a relationship type

How to define a relationship type.

1. Navigate to Task Relationships > Relation Types and click New.
2. Populate the Parent Descriptor and Child Descriptor fields with a short description of the relationship between the two tasks, such as a parent descriptor of Caused By and a child descriptor of Causes.
3. Right-click the form header bar and select Save. The Name field automatically populates with the Parent and Child descriptors.
Define a task relationship allowed from the task relationship type record

It is possible to define Task Relationships Allowed from the Task Relationship Type record.

1. Scroll down to the related list and click **New**.
2. Populate the parent and child tables to define which tables are able to accept the relationship.
3. If desired, it is possible to define scripts to run in the Parent and Child script fields. These scripts are run when a parent or child record is run to automatically generate the other task (child or parent). These scripts use the current value of the new record, as opposed to the source record which triggered the script.
**View task relations**

How to view task relations.

The Task Relations field can now be added to the task form:

![Related Items](Image)

**Figure 476: Related items**

The plus icon can be used to add or remove tasks from the list:
Modify the displayed field
The fields displayed in the Task Relations field and editing interface are defined by the Reference Lookup’s list view.
To modify the displayed fields:

1. Navigate to a form that has a reference to the table whose display values you would like to modify within Task Relations field.
2. Click the magnifying glass to display the Reference Lookup list view.
3. Right-click the list header and select Configure > List Layout.

The selected List layout will be used as the display value for records within the Task Relations field.

**Mark as Solution button**

This button gets added to the KB popup view and is displayed when you search the knowledge base from a task record.

Clicking the button creates a record in the Task / KB Relationships [task_rel_kb] table to associate the KB article with a task. Its functionality has been replaced in the KCS plugin and is no longer necessary. You can disable this button by marking the active field false on the 'solution_button' UI macro.

**Task table UI actions**

Once the task relationships are defined, it is possible to use UI Actions to define the task relationship as a new task is being created from an old task.

Below are a few examples.

---

**Warning:** These examples may not work on all instances. They are provided as illustrative examples.

---

**UI Actions examples**

**Cause an incident**

This UI Action allows the change management team to log an incident directly from the change request and records that the incident was caused by the change.

Create a new UI Action on the Change Request [change_request] table and place the following into the script:

```javascript
var inccaus = new GlideRecord("incident");
inccaus.short_description= current.short_description;
inccaus.comments= current.comments.getHTMLValue();
// inccaus.parent = current.sys_id;
inccaus.insert();
CauIncident();
gs.addInfoMessage("Incident " + inccaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(inccaus);

function CauIncident(){
    var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= inccaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

**Cause a problem**

This is a UI Action to allow the change management team to record a problem from a change request and record that the problem was caused by the change.
Create a new UI Action on the Change Request [change_request] table and paste the following script:

```javascript
var probcaus = new GlideRecord("problem");
probcaus.short_description= current.short_description;
probcaus.comments= current.comments.getHTMLValue();
// probcaus.parent = current.sys_id;
probcaus.insert();
CauProblem();

gs.addInfoMessage("Problem " + probcaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(probcaus);

function CauProblem(){
var m2m = new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= probcaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

**Fix a problem**

This UI Action allows a change request to be generated from a problem, recording that the change will fix the problem.

Create a new UI Action on the Problem [problem] table, and paste the following code:

```javascript
var fixchg = new GlideRecord("change_request");
fixchg.short_description= current.short_description;
fixchg.comments= current.comments.getHTMLValue();
// fixchg.parent = current.sys_id;
fixchg.insert();
FixChange();

gs.addInfoMessage("Change " + fixchg.number+" created");
action.setRedirectURL(current);
action.setReturnURL(fixchg);

function FixChange(){
var m2m = new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= fixchg.sys_id;
m2m.type.setDisplayValue("Fixes::Fixed by");
m2m.insert();}
```

**Using special characters in an XML file**

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The most likely scenario to experience this conflict is when you set the password for a MID Server.

The following characters represent the five pre-defined entities:

- "
- &
- '
XML and Special Characters

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them.

To encode pre-defined entities into an XML document:

- replace " with &quot;
- replace & with &amp;
- replace ' with &apos;
- replace < with &lt;
- replace > with &gt;

For example, to specify the password as test& in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```

System clone

The System clone application allows users with the clone_admin or admin role to clone data from one instance to another.

This functionality is primarily used to clone a production instance over an existing sub-production instance before developing or testing changes. All clones are performed using the most recent nightly backup. This application applies to instances in Gen2 and later datacenters.

Figure 478: Clone process
Clone from a backup

The platform uses data from the most recent nightly backup of the source instance when cloning. Backups used for cloning are at most 36 hours old.

After cloning from a backup, the target instance is unavailable for several minutes before the clone is marked as complete in the source instance. If the source and target instances are on different versions of the ServiceNow platform, the target instance is modified to match the source instance version during this time.

When starting a clone from a backup, the date and time the backup was taken, as well as periodic progress messages, appear in the Clone Log related list.

Figure 479: System clone backup log

Clone over production instances

Production instances cannot be used as the target instance for a clone after the instance is live. Production clones are created during non-core business hours. Tables are backed up sequentially rather than simultaneously. Modifying data on the source instance during a clone can cause a data mismatch between records or duplicate record entries. This issue is minimized by running a clone after normal business hours.

When scheduling a clone for a production instance, the system automatically follows this process:

- Determines the instance region.
- Determines the non-core business hours for the region.
- Restricts the possible cloning time that can be specified on the Clone Request form to the non-core hours.

<table>
<thead>
<tr>
<th>Region</th>
<th>Non-core business hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>Americas East Coast</td>
<td>23:00 to 04:00 Eastern time (UTC –5) and all day Saturdays and Sundays</td>
</tr>
<tr>
<td>Americas West Coast</td>
<td>20:00 to 01:00 Pacific time (UTC –8) and all day Saturdays and Sundays</td>
</tr>
<tr>
<td>Region</td>
<td>Non-core business hours</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------</td>
</tr>
<tr>
<td>Australia</td>
<td>23:00 to 04:00 Australian Eastern time (UTC +10) and all day Saturdays and Sundays</td>
</tr>
<tr>
<td>Europe Amsterdam</td>
<td>00:00 to 05:00 Central European time (UTC +1) and all day Saturdays and Sundays</td>
</tr>
<tr>
<td>Europe London</td>
<td>23:00 to 04:00 British time (UTC) and all day Saturdays and Sundays</td>
</tr>
<tr>
<td>Asia Hong Kong</td>
<td>23:00 to 04:00 Hong Kong time (UTC +8) and all day Saturdays and Sundays</td>
</tr>
<tr>
<td>Asia Singapore</td>
<td>23:00 to 04:00 Singapore standard time (UTC +8) and all day Saturdays and Sundays</td>
</tr>
</tbody>
</table>

Use System clone

The System clone application automates much of the cloning process. Specific tasks are performed during the clone request process.

An administrator defines what data is preserved on the target instance and what data from the source is not cloned, then initiates the clone process. A background job ensures that all cloning requirements are met and carries out the clone process. These processes and procedures are performed on the source instance.

During a clone, the target instance may be intermittently unavailable. After clone completion, you have up to 24 hours to contact ServiceNow Customer Support and request a rollback of the target instance to its pre-clone state. You are notified when the rollback is complete.

Clone request process

In response to a clone request, the ServiceNow platform performs the following tasks.

1. Generates a file to preserve operational data on the target server.
   This file contains the data preserved by data preservers.
2. Copies the database schema from the source instance to the target instance.
3. Creates tables in the target instance database using the source instance table definitions.
4. Copies data from the most recent nightly backup of the source instance to the target instance database.
   Certain large tables are normally excluded. These include audit, log, and email tables.
5. Briefly disables UI traffic and requests to the target instance server.
6. Displays the message **Clone in progress...** to any user accessing the target instance.
7. Restores operational data preserved from the target instance.
8. Runs any post-clone cleanup scripts on the target instance.
9. Briefly suspends all email functions on the target instance.
10. Queues an event to regenerate text indexes.
11. Enables UI traffic and requests to the target instance server.

Create a clone target
You create a target instance record before the instance can be selected as clone target.
Role required: clone_admin or admin

Note: If you are using IP Access Controls on your instance, the target instance must allow the IP range 10.0.0.0/10.255.255.255 to communicate on a local network to allow the clone. For more information, see IP range based authentication on page 2479.

1. Navigate to System Clone > Clone Targets.
2. Click New.
3. Enter the URL for the receiving instance (target).
4. Enter the basic authentication credentials for a user account with the admin role on the target instance.

Note: These credentials must exist in the User [sys_user] table as a user record or as part of an LDAP integration. Clone requests cannot use single sign-on to authenticate users from an identity provider.

5. Click Submit.
   The system checks connectivity and validates the user credentials against the target instance.

Start a clone
For most instances, an administrator can start a clone.

Role required: clone_admin or admin

For instances that use an Oracle database, see KB0538884 - System Clone Support for Oracle Customers.

1. Navigate to System Clone > Request Clone.
2. Select a Target instance to receive the cloned data.
3. Complete the Options form section.
Table 393: Clone options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clone from</td>
<td>Select the source database, if more than one database is available. If only one source is available, the <strong>Clone from</strong> menu does not appear. By default, the clone process ignores this field and uses data from the most recent nightly backup of the source instance. The clone process only uses this field value if the clone from backup fails for some reason.</td>
</tr>
<tr>
<td>Exclude audit and log data</td>
<td>Select this option to prevent the cloning of tables specified in <strong>System Clone &gt; Exclude Tables</strong>. This option is selected by default. Clearing the check box causes the platform to ignore the <strong>Exclude Tables</strong> module.</td>
</tr>
</tbody>
</table>
| Exclude large attachment data | When selected, the clone excludes any record in the Attachment [sys_attachment] and Attachment Document [sys_attachment_doc] tables that meet these criteria.  
  • The table_name value does not start with ZZ_.  
  • The table_name value is not sys_certificate, ecc_agent_jar, ecc_agent_mib, or sys_store_app. |
| Preserve theme             | Select this option to prevent the cloning of CSS elements, colors, and banner displays. This option enables or disables any data preservers where **Preserve theme** is **True**.                                                             |

4. Schedule a **Date and time** to perform the clone.  
   Scheduling prevents multiple clones from occurring on the same target instance concurrently. A clone must be scheduled at minimum four hours in advance.

5. Enter an **Email** address to receive alerts after the clone finishes, is canceled, or has an error.
6. Click **Submit**.

7. In the authentication window that appears, enter the **Username** and **Password** for an administrator account on the target instance.

8. Click **Authenticate**.

9. Review the clone settings and click **OK**.
   An email is sent to the supplied address after the clone finishes, is canceled, or has an error.

**Warning:** If the clone from backup fails for some reason, the clone process fails over to the legacy clone engine. The legacy clone engine cannot preserve data from extended tables, relationships, hierarchies between tables, and dot-walked queries. You may want to reschedule a system clone or manually transfer data in such cases.

---

**Post-clone cleanup scripts**

The Cleanup Scripts module allows you to define scripts to automatically run on the target instance after a clone is finished.
Cleanup scripts run after data preservers and the clone is complete. You can add new post-cloning scripts on the source instance to perform any action that can normally be accomplished through script includes or business rules. The following post-clone cleanup scripts perform various actions on the target instance.

**Table 394: Post-clone cleanup scripts**

<table>
<thead>
<tr>
<th>Script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable emails</td>
<td>Disables email on the target instance. A default data preserver maintains other email settings from the target instance.</td>
</tr>
<tr>
<td>Regenerate text indexes</td>
<td>Rebuilds text indexes on the target instance after a clone. Text indexes are not cloned from the source to the target instance.</td>
</tr>
<tr>
<td>Clear scheduled job node association</td>
<td>Resets any scheduled jobs that were active on the source instance to the Ready state. This script also clears the value of the System ID and Claimed by fields on all scheduled jobs.</td>
</tr>
<tr>
<td>Install deactivated plugin</td>
<td>Enables the Domain Separation plugin for instances that use this feature.</td>
</tr>
<tr>
<td>Drop backup tables</td>
<td>Schedules the deletion of the data contained in the target instance database prior to the clone. This original data is preserved for 24 hours following a clone to allow you to roll back an instance to the pre-clone state. If the target instance is downgraded as part of the clone, backup data is not available.</td>
</tr>
</tbody>
</table>

**Work with clones**

You can add a system property to allow an instance to be cloned, cancel a clone, and send clone status notifications.

**Allow a clone**

Production instances cannot be used as the target instance for a clone after the instance is live. Also, the glide property glide.db.clone.allow_clone_target must be set to **True** to allow an instance to be a clone target. Attempting to clone over an instance where this property is **False** displays the following error:

*Figure 480: Clone target invalid*

This property is **False** by default, and to **True** on instances where the name ends in Dev, Test, Stage, UAT, or QA.

To modify the value of this property, *add the property* to the [sys_properties] table.
Cancel a clone

You can cancel a clone without negatively impacting system stability or usability. Canceling a clone restores the target instance to the pre-clone state, retaining all original data.

To cancel a scheduled or in-progress clone, navigate to System Clone > Clone History. Select the clone and click Cancel Clone.

Send clone status notifications

You can configure the instance to send notifications regarding an active clone. These notifications indicate when the clone finishes, is canceled, or has an error. Use the Email upon completion field to specify who to send status notifications to. Users specified as the primary or secondary support contacts for your company also receive these notifications.

Clone to an instance on a different version

The System Clone application can target an instance running a different ServiceNow version from the source.

A central web service controls clone processing and automatically modifies the target instance version to match the source instance version. This matching process starts up to eight hours before the time specified in the Date and time field on the System Clone form. This web service also ensures that there is enough disk space on the target instance for the clone to proceed.

When cloning from a backup, the target instance does not need additional time to upgrade or downgrade. The ServiceNow platform performs any version changes during a brief window where the target instance is unavailable, after it copies data from the source instance backup.

View clone history and active clones

You can view clone history information. All previously and currently scheduled clones from a particular instance display on this table. The clone history module additionally lists clones that have begun but have not yet finished.

Role required: clone_admin or admin

Navigate to System Clone > Clone History.

Clone history also displays the State for current and past clones. Clones in the draft state do not appear on the clone history table.
Table 395: Clone state

<table>
<thead>
<tr>
<th>Clone state</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested</td>
<td>The clone was requested and is awaiting approval.</td>
</tr>
<tr>
<td>Scheduled</td>
<td>The clone is ready to begin at the scheduled time and date.</td>
</tr>
<tr>
<td>Active</td>
<td>The clone is currently running.</td>
</tr>
<tr>
<td>Completed</td>
<td>The clone completed successfully.</td>
</tr>
<tr>
<td>Canceled</td>
<td>A user canceled the request.</td>
</tr>
<tr>
<td>Hold</td>
<td>The server rejected the clone request. This can happen either because the clone was not ready to proceed by the scheduled time or because additional clone requests were submitted before the first one completed.</td>
</tr>
<tr>
<td>Error</td>
<td>The clone encountered an error while running. Contact technical support for help resolving this issue.</td>
</tr>
</tbody>
</table>

Figure 481: Active system clone

After starting a clone, the Clone Log and Database Table Clones related lists appear on the form. These related lists show general log messages, and the details of individual tables respectively.

The duration of time a clone remains active varies depending on the amount of data being cloned, and whether the source and target instance are in the same physical location. If a clone takes longer than anticipated, ServiceNow Technical Support can identify additional details about the clone progress.
Create a data preserver

Data preservers maintain certain data on the target instance. Sometimes, preserving certain data on a target instance is desirable. For example, when using a MID Server, you can avoid overwriting the MID Server [ecc_agent] table.

Role required: clone_admin or admin

Preserved data is stored in a dynamically generated list on the target instance before the clone and restored on the target instance after the clone is complete. You define data preservers on the source instance.

Data preservers are primarily intended to preserve system settings and themes, such as instance-specific authentication settings. Do not use data preservers to transfer large sets of data, such as user groups. If you must preserve table data such as users, groups, and roles, consider exporting the records to a file and importing it after the clone is complete.

Consider whether to preserve the data in the following tables.

- Bookmark [sys_ui_bookmark]
- Recent Selection [sys_ui_recent_selection]
- User Preference [sys_user_preference]

1. Navigate to System Clone > Preserve Data.
2. Click New.
3. Enter the table label as the Name, for example, User Preference for the [sys_user_preference] table.
4. Select the Table to be preserved.
5. Select the Theme check box if the data being preserved is a UI property.
6. Define the data to be preserved using the Condition builder on page 157.

You can use conditions to define particular records you want to preserve during a clone. For example, to only preserve particular system properties, you can add conditions for each property name you want to preserve.
Warning: If the clone from backup fails for some reason, the clone process fails over to the legacy clone engine. The legacy clone engine cannot preserve data from extended tables, relationships, hierarchies between tables, and dot-walked queries. You may want to reschedule a system clone or manually transfer data in such cases.

7. Click Submit.

Delete a data preserver
You can delete data preservers that you no longer need. The platform protects certain essential data by default.

Role required: clone_admin or admin

Do not modify or delete the following data preserver records:

- Core Instance Properties
- Semaphores
- Email Accounts

1. Navigate to **System Clone > Preserve Data**.
2. Select the data preserver to delete.
3. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To delete a condition</td>
<td>Click the X icon beside the condition, and then click <strong>Update</strong>.</td>
</tr>
<tr>
<td>To delete the entire data preserver record</td>
<td>Click <strong>Delete</strong>, and then click <strong>Delete</strong> in the confirmation prompt.</td>
</tr>
</tbody>
</table>

**Exclude a table from cloning**

You can exclude a table to create an empty but usable table on the target instance.

Role required: clone_admin or admin

The **System Clone > Exclude Tables** module lists the tables that are not copied during a system clone. By default, the system excludes tables for logging, auditing, notifications, and license usage.

The system cannot exclude tables that extend the Task table and that are also flattened into it as part of the **table per hierarchy extension model**. Since these extended tables are part of the same physical database table, the system clones the data when it clones the Task table.

You can exclude tables that extend the Task table under two conditions. Either the system stores the tables in their own physical tables as part of the table per class extension model, or you exclude the Task table itself.

To preserve the existing data on the target instance, see preserving data. Data on tables that reference the table, such as business rules, is not excluded.

1. Navigate to **System Clone > Exclude Tables**.
2. Click **New**.
3. Enter the table **Name**.
4. Click **Submit**.

**Data preservation and multiple provider single sign-on**

The system automatically creates the necessary data preservers for cloning when you activate Multiple Provider Single Sign-On integration.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate</td>
<td>X.509 Certificates [sys_certificate]</td>
<td>None</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Conditions</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Core Instance Properties | System Property [sys_properties] | • [OR] [Name] [is one of] glide.authenticate.external, glide.authenticate.external.logout_redirect  
• [OR] [Name] [starts with] com.snc.integration.saml_esig  
• [OR] [Name] [is one of] glide.smtp.port, glide.smtp.auth, glide.smtp.encryption  
• [OR] [Name] [starts with] glide.authenticate.multisso  
• [OR] [Name] [is] glide.authenticate.sso.redirect.idp |
| Digest Properties        | Digest Properties [digest_properties] | None                                                                                                                                 |
| Identity Providers       | Identity Providers [sso_properties] | None                                                                                                                                 |
| SAML2 Update1 Properties | SAML2 Update1 Properties [saml2_update1_properties] | None                                                                                                                                 |

**Note:** Although you can modify these data preservers, a good practice is to avoid changing them. The Digest Properties [digest_properties], Identity Providers [sso_properties], and SAML2 Update1 Properties [saml2_update1_properties] tables are required for multiple source single sign-on to function properly. If multiple source single sign-on is disabled on the target instance, you can safely remove all three data preservers. Remove them at the same time, as the system terminates the clone with an error message when you attempt to clone with one or two of these tables being preserved.

**Clone an instance with a SAML integration**

Preserving SAML SSO-related settings can prevent the target instance from redirecting all authentication requests to the original IdP with the wrong issuer and audience parameters.

To preserve SAML settings, create data preservers for the following tables:

- System Property [sys_properties]
- X.509 Certificates [sys_certificate]
- User [sys_user]

**Preserve SAML properties**

For a clone target instance to keep its existing SAML integration, you must edit the **Core Instance Properties** data preserver to include the SAML properties.

Role required: admin

1. Navigate to **System Clone > Preserve Data**.
2. Select **Core Instance Properties**.
3. Add the following **Conditions**.
   - [OR] [Name] [is one of] glide.authenticate.external, glide.authenticate.external.logout_redirect, glide.authenticate.failed_requirement_redirect
• [OR] [Name] [starts with] [glide.authenticate.sso.saml2]
• [OR] [Name] [starts with] [com.snc.integration.saml_esig]
Clone Data Preserver - Core Instance Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Core Instance Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Theme</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>System Property [sys_properties]</td>
</tr>
</tbody>
</table>

**Conditions**

- **Name** is `.glide.sys.schedulers`
- **Name** starts with `glide.db`
- **Name** is `glide.ui.max.transaction`
- **Name** starts with `glide.email`
- **Name** starts with `glide.op3`
- **Name** is `instance_id`
- **Name** is `instance_name`
- **Name** starts with `glide.installation`
- **Name** is one of `glide.authenticate.external`, `glide.authenticate.external.logout_redirect`, `glide.authenticate.failure_requirement_redirect`
- **Name** starts with `glide.authenticate.ssos`
- **Name** starts with `com.snc.integration.san`
Note: Ensure the Theme check box is cleared so these properties are preserved regardless of whether you preserve the instance theme.

4. Click Update.

Preserve SAML certificates
Preserve the SAML 2.0 certificate in the target instance so the SAML integration to continue working after a clone.

If you activated Multiple Provider Single Sign-On, the system has already created a data preserver for this table. Verify that it is correctly configured.

1. Navigate to System Clone > Preserve Data.
2. Click New.
3. Enter the following field values.

Table 397: Data preserver field values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>X.509 Certificate [sys_certificate]</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Name] [starts with] [SAML 2.0]</td>
</tr>
</tbody>
</table>

4. Click Submit.

The system clone now preserves the SAML certificates.

Preserve SAML users
If the source instance does not include the SAML users that you log in with, create a data preserver for those users.

1. Navigate to System Clone > Preserve Data.
2. Click New.
3. Enter the following field values.

Table 398: Data preserver field values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Conditions</td>
<td>Enter the users you want to continue to log in from SAML.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Integration with third-party applications and data sources
Integration is the exchange of information between company applications and a ServiceNow instance. ServiceNow integrates with many third party applications and data sources.

The most common integrations are with CMDB, Incident Management, Problem Management, Change Management, User Administration, and Single Sign-on.
A variety of techniques can be used, most notably Web Services, JDBC, LDAP, Excel, CSV, and Email, as well as any industry standard technologies that use SOAP, REST, or WSDL. Additionally, API and command-line integrations can be done using a MID Server.

**Note:** You can establish integrations before or after the ServiceNow implementation goes live, however the best practice is to enable integrations before your implementation goes live. Enabling integrations prior to going live allows you to test the integration. This is especially important for integrations to user lists or single sign-on applications since a problem in one of these integrations can prevent users from logging on.

### Technologies

The ServiceNow platform is based on service-oriented architecture (SOA), in which all data objects can use web services to access bi-directional data-level integration. The interface is also direct and dynamic because all modifications to existing objects and all new objects are automatically published as a Direct Web Service. A more indirect web service creation and usage can be achieved through Mapped Web Service where a transform map is used to gather incoming web service data into the final targeted tables. Finally, an advanced Scripted Web Service technique is available for defining process-based web services, where data is irrelevant, but serves more as a trigger for a process or a composite of actions that execute at the server.

Additionally the platform offers a rich interface for loading external data using import sets. Using this feature, you can load from various data sources such as HTTPS, FTPS, and SCP using file formats such as XML, CSV, and Microsoft Excel XLS files. Information can also be pulled from a data source using a direct JDBC connection, provided the network connectivity allows.

Information can be pulled from the platform to an external platform using an **ODBC Driver**.

Forms, lists, and reports on the platform can be accessed directly using a URL, which facilitates integration on the UI level between two or more web applications.

A handful of single sign-on technologies is identified and implemented out of the box to allow fast integration with your portal, however, the technique is customizable in a script to allow for flexibility in the different SSO environments our customers have.

### Integration between ServiceNow Instances

There are times when you find you need to perform a specific integration between your instance and another ServiceNow instance. Instance-to-Instance integrations are a snap because all of the integration points exist between the two instances.

Update Sets also provide exchanges between instances. For more information, see *Getting started with Update Sets*.

### User interface integration

Integration at the user interface level allows standard, seamless embedding of ServiceNow charts and reports into portals, exposure of knowledge base articles into web sites, and the embedding of in-context URLs into other web enabled applications.

- Integrating ServiceNow with your Intranet (Web IFrame)
- Launch in-context
Integration options

Nearly all ServiceNow customers obtain additional value by integrating with third-party applications. ServiceNow customers have the following options for integrating with third-party applications.

- Activate a ServiceNow provided integration.
- Install a certified integration from the ServiceNow Store.
- Install an integration from Share.
- Contact your sales representative for available custom-built integrations.
- Build your own custom integration using the platform's integration interfaces.
- Use the Technology Partner program, which provides ServiceNow customers with certified integrations with third-party applications. Certification indicates that the integrations have passed a set of interoperability, security, and performance test criteria as defined and witnessed by ServiceNow.

See Technology Partner program for more information.

Note: Certified integrations have passed a set of interoperability, security, and performance test criteria defined by ServiceNow.

Login integration

Integrations that support a user logging into ServiceNow include techniques used for single sign-on, dynamic user record creation, as well as loading users, groups and location data.

Single sign-on

Bypass the ServiceNow login authentication by allowing a user of your corporate portal to automatically login to the system with centrally managed roles and authorization.

- External Authentication
- Intranet and Login Integration

User data

Using our integration with LDAP or secure LDAP, dynamically create user accounts by importing from your Active Directory or OpenLDAP implementation. You can do this securely via a point-to-point VPN. Additionally, you can use the dynamic mapping of data sources such as files or databases via JDBC, to import user, groups, and location data into ServiceNow using import sets.

- LDAP Integration
- LDAP Import Map
- Import Sets

Data and process integration

Data and process integration can be categorized as either event based, or batch load.

An event-based integration, more on-demand and usually with a smaller payload, creates records for the purpose of triggering additional workflow in the system. Event based integration records usually go through an external queueing table called the ECC Queue.
Batch or data load based integration is typically done with a scheduled import set, where mappings and script can be defined to gather data from various data sources into the system and transform them into records in tables.

**Event-based options**

- Web Services
- External Integration Using JMS
- MID Server

**ServiceNow provided integrations**

ServiceNow provides many integrations as part of the platform. These integrations are considered part of the platform and are provided at no additional charge.

**Table 399: Provided Integrations**

<table>
<thead>
<tr>
<th>Integration</th>
<th>Type</th>
<th>Integration Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Altiris (version 2.0)</td>
<td>MID Server</td>
<td>CMDB</td>

</tr>
<tr>
<td>Verizon eBonding</td>
<td>Web services</td>
<td>Incident</td>
</tr>
</tbody>
</table>

**Altiris integration 2.0**

The Altiris integration is a one direction import of the Altiris data into ServiceNow. CMDB (Configuration management database). The integration keeps the ServiceNow CMDB up to date with Altiris SQLServer database.

**Google Maps API support**

Map pages enable you to graphically display data on a Google map page based on location data.

**Microsoft SMS/SCCM integration**

The Microsoft SMS/SCCM integration is a one direction import of SMS/SCCM data into ServiceNow’s Configuration Management Database (CMDB).

**Migrate the Verizon eBonding Integration to a Production System**

This topic outlines the tasks required for moving the Verizon eBonding integration from a Dev/Test environment to a Production environment.

**Altiris integration 2.0**

The Altiris integration is a one direction import of the Altiris data into ServiceNow CMDB (Configuration management database). The integration keeps the ServiceNow CMDB up to date with Altiris SQLServer database.

**Note:** Functionality described here requires the Integration - Altiris 2.0 plugin.
Data Import

Relevant data is imported from the Altiris database to the CMDB. The Altiris database is not written to, it is considered an authoritative source. The import is achieved using a JDBC connection via the MID Server.

Figure 482: Altiris integration application

Information pulled from Altiris includes:

- PC Hardware (Model, Manufacturer, memory, clock speed, number of CPUs, etc.)
- Operating System Information (Name, Service Pack)
- Printers
- Disk information (physical, network, and logical)
• Network (IP Address, Netmask)

**Configuration and Operational Modules**

Enabling this integration will create the **Integration - Altiris** application.

The following are the configuration and operational modules for this integration.

**Setup**

- Configure the data sources from one form
  - Provide the Database Server IP Address
  - Provide the Database Name
  - Provide the Database User ID and Password (this will need to be created on SQL DB side, see this article for help with this step: [http://technet.microsoft.com/en-us/library/aa337562.aspx](http://technet.microsoft.com/en-us/library/aa337562.aspx)
  - Find and select the MID Server
- Specify Database server settings and MID server
- Test configuration

**Scheduled Import**

- Schedule the execution of the import or import immediately

**Data Sources**

- A list of the pre-configured data sources defining the external CMDB database

**Progress**

- A historical list of progress on scheduled imports

**Transform History**

- A historical list of transformations performed during scheduled imports

---

**Warning:** If you have activated an existing integration of the previous version:

1. Activating the 2.0 plugin does not "add to" or "remove" anything from the existing integration.
2. If transitioning from the old integration to this new one, considerations need to be given to customizations already done eg. mapping enhancements or using different coalesce values, these will have to be re-implemented.
3. Both plugins could run at the same time, provided data is coalescing the same way - until there is no need for the older plugin at which time it can be turned off.

---

**Supported Versions**

The Altiris integration only supports Altiris version 6.5. The integration does not currently Altiris version 7.0.

*Altiris import set data*

This topic lists module names displayed by the Altiris import set data.
The Altiris import set data section shows a list of import set tables used in containing data retrieved from using JDBC to query the Altiris database. The module names (hence the import set tables they point to) match Altiris's table names and structure that it is loading from.

**Module names**

*Note:* Functionality described here requires the Integration - Altiris 2.0 plugin.

- Scheduled Cleanup
  - Configure a schedule to cleanup/delete import set data that have already been transformed
- vComputer
- Inv_AeX_OS_Operating_System
- Inv_AeX_HW_CPU
- Inv_AeX_HW_Memory
- Inv_AeX_HW_Serial_Number
- Inv_AeX_HW_Logical_Disk
- Inv_AeX_OS_Add_Remove_Programs
- Inv_AeX_AC_TCPIP

When viewing each of these table lists, at the end of the list you have links to other operational functions of the import set.

*Figure 483: Altiris integration application*

- **Import Sets**
- **Transform Maps**
- **Transform History** - Log of completed import operations (where an import set was transformed into a table).
- **Edit Web Service**
Web services import set tables for Altiris

This topic will list the modules that define the web service import set tables - the schema for the import set tables that are receiving the JDBC import.

From each web service, you can add/remove fields as well as access the transform maps to make modifications.

**Note:** Functionality described here requires the Integration - Altiris 2.0 plugin.

Figure 484: Import set tables
Google Maps integration

Map pages enable you to graphically display data on a Google map page based on location data. Maps can be generated using basic JavaScript, but are flexible enough to display even the most complicated of queries. The maps you generate use standard Google Maps API mapping features, including a variety of link types to records in your instance. This feature requires the Google Maps plugin.

Figure 486: Map page

Google Maps plugin

The Google Maps Plugin provides the following configurable properties in System Properties > Google Maps.
## Table 400: Google Maps system properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| google.maps.auto_close | If true, automatically closes a map information window before opening a new one.  
  - Type: true/false  
  - Default value: true  
  - Location: System Properties > Google Maps |
| google.maps.client | Client ID for Google Maps API for Work.  
  - Type: string  
  - Default value: gme-servicenow  
  - Location: System Properties > Google Maps |
| google.maps.private.key | Private key for Google Maps API for Work. This key activates the geolocation feature, which locates users in the system precisely, using data from their mobile devices.  
  - Type: string  
  - Default value: empty  
  - Location: System Properties > Google Maps |
| google.maps.version | Version number of the current installation of Google Maps API.  
  - Type: string  
  - Default value: current version number  
  - Location: System Properties > Google Maps |
| google.maps.key | The Google Maps API key that is tied to the URL of the server. This key authorizes development use of Google Maps API.  
  - Type: string  
  - Default value: empty  
  - Location: System Properties > Google Maps |
| google.maps.latitude | Starting latitude of the map. This value determines the starting position displayed in Google Maps.  
  - Type: string  
  - Default value: 36.008522  
  - Location: System Properties > Google Maps |
<table>

### Google custom search integration

Replace Zing text indexing and search engine with Google Site Search functionality.

Activating custom search integration replaces the default search and provides Google Site Search functionality. You can configure your Google Site Search engine to include or exclude sites in your search results. For more information on the Google Site Search feature, see [Google Site Search](#).

**Activate Google custom search integration**
The Google Custom Search Integration plugin is available by request.

Role required: none

Request the plugin through the HI Service Portal.

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

<table>
<thead>
<tr>
<th>Reason/Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Microsoft SMS/SCCM integration**

The Microsoft SMS/SCCM integration is a one direction import of SMS/SCCM data into ServiceNow’s Configuration Management Database (CMDB).

The integration keeps the ServiceNow CMDB up to date with SMS / SCCM SQLServer database. Relevant data is imported from the SMS / SCCM database to the CMDB. The SMS / SCCM database is considered an authoritative source and is not written to. The import is achieved using a JDBC connection via the MID Server.

This table shows version compatibility between the various Microsoft SMS and SCCM versions and ServiceNow plugins. All versions import identical data, but do it in a different way and with different results in some areas.

**Table 401: Microsoft SCCM version and corresponding ServiceNow Plugin**

Asset Intelligence in SCCM

Asset Intelligence is an SCCM feature that can filter, normalize and clean up software records. When enabled, it populates normalized software data in a separate table within the SCCM database. ServiceNow customers may elect to target this separate table instead of the raw software data table. When you import software records into the CMDB with this feature enabled, you get a cleaner set of software data.

Asset Intelligence support is available for Microsoft SCCM 2007 (3.1.0) and Microsoft SCCM 2012v2 (4.1.0). To use this feature, you must enable it in the target ServiceNow instance, as well as in the source SCCM database.

Microsoft SCCM Integration 2007

This version is written based on SCCM 2007, and requires the Integration - Microsoft SCCM 2007 version 3.1.0 plugin. Use this version when you use SCCM 2007.

This version has the following features:

- No flat table configuration is required. You do not need to configure the flat table on the SCCM side.
- Improved performance and an improved process that only collects the changes since the last import for software reconciliation.
- Support for Asset Intelligence.

Software

Only two incremental transforms for software are available by default: one to support software reconciliation without the Software Asset Management plugin and one to support software reconciliation with the Software Asset Management plugin. Full software imports can be invoked by clearing out the Last run datetime field of the SCCM 2007 Software data source.

Microsoft SCCM Integration 2012

The Microsoft System Center Configuration Manager (SCCM) 2012 integration is a one direction import of SCCM data into the ServiceNow Configuration Management Database (CMDB). Scheduled imports bring relevant data from SCCM tables into the CMDB through the SQL database and map them to the ServiceNow instance. Beginning with this version, either a full data import or an incremental import can be performed. The import is achieved using a JDBC connection via the MID Server. This functionality requires the Integration - Microsoft SCCM plugin and a new table in the SQL Server database.

For SCCM 2012, ServiceNow supports the following SCCM versions:
### Table 403: Supported Version

<table>
<thead>
<tr>
<th>SCCM Plugin</th>

<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• Microsoft SCCM 2012R2 server has not been tested by ServiceNow. However, customers have reported success using it with the Integration - SCCM 2012 plugin</td>
</tr>
</tbody>
</table>

### Version 2012 Overview

Version 2012 is designed to work with SCCM 2012 release 1.

It comes with default table views and related column names from SCCM 2012. Version 2012 can work with SCCM 2007, but it will require configurations on the table name and column names for certain data source imports.

A major difference between version 3.0 and SCCM 2012 is that a flat table is no longer needed for the import. Instead, data is imported from the Computer Identity data source table within SCCM. The table can be easily extended and configured to include additional information.

SCCM 2012 also provides three transform maps for a software import. Only one transform map can be enabled at a time.

1. SCCM 2012 Software - Full Import
2. Incremental Import
3. Incremental Import (SAM enabled)

The first transform map performs a full import of the software data. This transform map automatically populates into the cmdb_ci_spkg and cmdb_software_instance tables or the cmdb_sam_sw_install table depending on if the Software Asset Management plugin is enabled. If the plugin is not enabled, the former tables are populated; if the plugin is enabled, the latter table is populated.

The second and third transform maps perform an incremental import and should be enabled or disabled depending on whether the Software Asset Management plugin was enabled. If the plugin is not enabled, use "Incremental import"; otherwise, use "Incremental import (SAM enabled)". By default, the incremental import transform map is enabled.

**Note:** ServiceNow SCCM Integration version 2012 supports Microsoft SCCM 2012.

### Identifiers

The Microsoft SCCM integration uses CI identification to update CIs created from data imported from SCCM with a resource ID. A Discovery Identifier called SCCM ID & Class Name returns the resource ID of a computer from SCCM and stores it in a table called Source [sys_object_source]. When resource IDs are first imported, either from SCCM or Discovery, ServiceNow populates the Source table with IDs for each CI it identifies. In subsequent imports, if an incoming ID matches that of an existing CI, ServiceNow
updates the information for that CI in the CMDB. If the incoming resource ID does not match that of an existing CI, ServiceNow creates a new CI and populates it with the resource ID.

**Scripts**

Data population scripts added with the Integration - Microsoft SCCM plugin populate the related data in the CMDB for each target CI discovered by the SCCM ID & Class Name identifier.

**Software**

The Microsoft SCCM Integration version 2012 reconciles the software package count in the records for a CI and removes a software instance from the Software Instance `[cmdb_software_instance]` table if the software package is uninstalled from the CI.

**Note:** The table data imported from SCCM in Microsoft SCCM Integration version 2012 must contain complete data for the CI. ServiceNow assumes that the import represents all relationships that exist and adjusts the CMDB accordingly. Partial data received from SCCM tables can cause the deletion of active relationships.

For a full import, the resulting relationship looks like this:

![Figure 487: SCCM 2012 Full Diagram](image)

For an incremental import, the resulting relationship looks like this:
Perform Full Import for SCCM 2007 or SCCM 2012
You must re-import all the software records when switching to the SCCM 2007 or SCCM 2012v2 plugin. Only a full import from Microsoft SCCM will allow correct data reconciliation.

Both plugins track the incremental import of information about software that was uninstalled from CIs. To support this feature, the following fields where added to the tables cmdb_software_instance and cmdb_sam_sw_install (when Software Asset Management plugin is enabled):

- The SCCM timestamp [sccm_timestamp] field.
- The SCCM group ID [sccm_group_id] field.

Note: Unlike previous SCCM integration plugins, the same transform map is used for full imports and incremental imports in SCCM 2007 and SCCM 2012v2.

To perform a full data import:
1. Navigate to Integration - Microsoft SCCM 20xx > Data Sources.
2. Click SCCM 20xx Software.
3. Clear the Use last run date time box.
4. Click Update.
5. Navigate to Integration - Microsoft SCCM 20xx > Scheduled Import.
6. Click Execute Now.

Verizon eBonding integration

This topic outlines the tasks required for moving the Verizon eBonding integration from a Dev/Test environment to a Production environment.

This process requires coordination with your assigned Verizon implementation manager.
General Tasks

The following work can be performed any time:

- Obtain a production SOAP password from Verizon. Your Verizon SOAP user ID is the same as that used against the Verizon test broker.
- Create an integration user for Verizon in the ServiceNow Production instance. Use the same user name and password that was created for the development instance, so that the communication between Verizon and ServiceNow is properly authenticated.

Migrating to a Production Environment

Perform these tasks in order.

- Task 1: Request the Verizon eBonding plugin for the production instance. When the plugin is installed, the only immediate user interface change is an additional **Category** field named **VZ eBonding**. All of the triggers for the integration are dependent on the category being set to **VZ eBonding**. Enabling the plugin on the production instance should not affect your users. If you wish to take additional precautions, disable the **VZ eBonding** category from the list when the plugin is activated for the instance.
- Task 2: Set up the Verizon certificate and keystore. Copy these directly over from the Dev instance or regenerate them so that you have separate versions for the Dev and Production instances.
- Task 3: Configure the integration properties to work with the Production Verizon eBonding system. This is userID, password, and other properties provided by your Verizon representative.
- Task 4: Change all the Verizon eBroker SOAP Message functions to use Verizon’s production SOAP Endpoint. In most cases, the endpoint URL will be: https://pubwebsvc.vzbi.com:443/Trouble_Management_v3r0. Verify this URL with the Verizon implementation specialist.
  - In the **SOAP Message Functions** related list, click each function, clear the **Lock** check box, and enter the production endpoint.
  - Configure the **SOAP Message Functions** related list and add the **SOAP endpoint** column. In the **SOAP Message Functions** list view, unlock and update the endpoint for all records by editing multiple records.
- Task 5: Apply any customizations. If customizations to the integration on the Dev system were captured in an update set, apply that update set to the Production system.
- Task 6: Provide Verizon with the production SOAP Endpoint. The SOAP endpoint should look something like this: https://yourproductioninstance.service-now.com/ETMSPublish.do?WSDL.
- Task 7: Coordinate a Production turn up with your Verizon representative to do basic testing.

**Warning:** Do not create test tickets against the production system without working with the Verizon team. Any tickets created are treated as real tickets.

Web services

This section will list the modules that define the web service import set tables - the schema for the import set tables that are receiving the JDBC import.

From each web service, you can add/remove fields, as well as access the transform maps to make modifications.

CMDB import integrations

A class of integrations with existing configuration management databases (CMDB) that imports CIs into ServiceNow CMDB.
CMDB import integrations use a combination of Import Sets, JDBC data sources, and a MID server \((JDBCProbe)\). Example integrations that fall into this category include:

- Altiris
- Microsoft SCCM / SMS

![Diagram of CMDB import process]

**Figure 489: CMDB Import**

**Import set data**

This section of the application lists the import set tables that have been predefined for the external CMDB we are integrating with.

Selecting the tables will display the data already retrieved from a JDBC data source import, including the import set it is associated with, its state, as well as any information related to the transformation of the import set table data row.

**Configuration**

After enabling the plugin for an integration of this type, you will have a new application that consists of the following common modules. Next, install a MID Server in your environment that will be used to execute JDBC queries connecting with your database. This MID server will require port level access to your database. For example, SQL Server port 1433.
Figure 490: CMDB Import JDBC Integration

Table 404: CMDB Import JDBC Integration

- **Scheduled Import** Proceed to setup schedule for import

Figure 492: Successful Test
MID server integrations

The system provides integrations that connect through a MID Server.

Syslog probe

The ServiceNow Syslog probe uses the MID Server to deliver log messages from a ServiceNow instance to another machine, such as a dedicated log server, using the syslog protocol over an IP network.

How the Syslog Probe Works

The syslog probe is launched by a ServiceNow Script Include (called Syslog) that can be invoked from a business rule, event, or Orchestration activity and is launched by a MID Server. A syslog server or any server that can receive messages using the syslog protocol must be installed on the recipient (target) machine. Typically, a dedicated log server in the network is configured to receive all internal syslog messages. Some products that accept syslog messages are:

- ArcSight
- Splunk
- LogLogic
- syslog-ng

Example

The Acme Corporation wants to send a log message from their ServiceNow instance to an ArcSight syslog server inside their corporate firewall each time a user login fails. The system administrator uses the login.failed event to trigger a business rule that invokes the Syslog Script Include each time a login fails. Acme’s MID Server checks the ECC Queue for work and picks up the syslog probe, which contains the log entry. The MID Server then sends the log message to the ArcSight server, which gathers log messages from all the machine in the internal network.
Figure 493: Syslog Probe Diagram

Code Sample

The following code sample, included in an event or a business rule, directly calls the Syslog Script Include and sends a syslog message to a designated syslog server:

```javascript
var sl = new Syslog('syslog.service-now.com ', 'mid.server.Eclipse', 16);
sl.log('This is a sample log message', 6);
```

This code does the following:
- Sends the log message to facility 16
• Sets the priority at 6 (informational)
• Sends the message to the syslog.service-now.com syslog server
• Launches the probe via the Eclipse MID Server

**Supported integration interfaces**

ServiceNow provides a number of interfaces to be able to directly integrate with the platform. These interfaces are considered part of the platform and are provided at no additional charge.

<table>

</tbody>
</table>

**Email Integrations**

The system provides integrations through email.

*Change Management Integration with Outlook*

ServiceNow's Change Management application can send your pending changes to your Microsoft Outlook Calendar automatically. This functionality is controlled by a script in the change events business rule.

**Note:** The following integration is not part of the supported platform. The integration may require additional customization prior to operating correctly. This integration is typically performed by an experienced administrator or consultant.

Outlook uses the standard iCalendar data format, which is simply a standardized way to describe a calendar event. Events in this format can be sent from a meeting originator (ServiceNow) to a meeting attendee (that's you) as specially formatted emails. So when a change request is assigned to you, ServiceNow will automatically send you an iCalendar-formatted email. You'll see the meeting request inside of Outlook, and you can click accept to add it to your calendar.
If you've turned on Calendar Integration, you'll be informed every time:

- You're assigned to a schedulable change
- A schedulable change of yours gets reassigned to somebody else
- A change gets rescheduled for a different time

**Note:** Note the deliberate use of the phrase schedulable change. A change needs a start date and an end date before it can be scheduled properly, otherwise it isn't considered schedulable and therefore won't show up in Outlook.

**Common Questions and Answers**

- If I change the start or end of a change in Outlook, will ServiceNow be updated?
  
  No, it won't. Currently this is a one-way integration. ServiceNow can send scheduled events to Outlook, but the reverse is not true.

- Does this integration work with other email clients?
  
  Yes. While we've only tested with Outlook 2003 and 2007, this integration should work with any email client that supports the iCalendar format.

- What about older versions of Outlook like Outlook 2000?
  
  There are known issues with Microsoft's Outlook 2000 iCalendar support. Many of these issues (though not all) can be resolved by installing Microsoft patches.

**Change Management Business Rule**

The following is the "change events" business rule associated with this enhancement:

```java
if (current.start_date.changes() || current.end_date.changes() || current.assigned_to.changes()) {
  if (!current.start_date.nil() && !current.end_date.nil() && !current.assigned_to.nil()) {
    gs.eventQueue("change.calendar.notify", current, current.assigned_to, previous.assigned_to);
  }
}
```
// Remove from previous assigned to, due to assigned_to changing
if (!previous.assigned_to.nil()) {
    if (!current.assigned_to.nil() && current.assigned_to.changes() &&
        (!previous.start_date.nil() && !previous.end_date.nil())) {
        gs.eventQueue("change.calendar.notify.remove", current,
                      current.assigned_to, previous.assigned_to);
    }
}

// Remove old calendar from current assigned to, due to date changing
else if (!current.assigned_to.nil()) {
    if ((current.start_date.changes() && !previous.start_date.nil()) ||
        (current.end_date.changes() && !previous.end_date.nil())) {
        gs.eventQueue("change.calendar.notify.remove", current,
                      current.assigned_to, current.assigned_to);
    }
}

Turn on Change Management Integration with Outlook
You can decide on a per user basis whether change requests assigned to that user are sent to their
Outlook calendar.

Naturally, if they don't use Outlook, you might not want to turn this option on. Even if they do have Outlook,
they may prefer to not receive calendar updates.

To turn on Outlook integration:
1. Open the user record for the user for whom you want to enable this feature.
2. Change the Calendar Integration field from None to Outlook.

   Tip: You may need to add this field to your User Record by configuring the form.

3. Save the record.
   Any changes assigned to that user generates calendar integration messages via email.

Event management integration

The purpose of an event management integration is to collect event-based information and convert it into
tasks or tickets within ServiceNow. When updates occur, the integration sends changes back to event
originator.

The integration collects source event data from an inbound web service invocation and transforms it into
target data as a ServiceNow ITIL service object. Data coalescing helps filter many source records into one
target record.
When acting as an event consumer, ServiceNow only accept SOAP inserts. ServiceNow uses a Web Service Import Set (WSIS) for event notification. The web service uses a synchronous transform, and the transform responds with a target detail record.

**Event notification**
Event management integrations monitor ITIL service objects. When ServiceNow updates or creates a monitored service object, the integration sends an event notification to the external service and identifies the service object by a common key.

**Figure 496: Event notification**
- Service objects have a unique Identifier on the event generator and event consumer systems.
- When using web services for communications, ServiceNow business rules or listeners send SOAP messages.
  - SOAPEnvelope
  - SOAPRequest
• When using a MID Server for communications, ServiceNow business rules or listeners queue work for the MID Server
  • The MID Server updates or adds service objects on the event consumer using CLI, Java API or JDBC

Computer Telephony Integration

A Computer Telephony Integration (CTI) is accomplished in ServiceNow simply by the external CTI client on the user machines formatting a URL to the ServiceNow instance.

The URL must have the following components:

1. The base URL. For example: https://<instance name>.service-now.com/cti.do? would get to the instance and ask for CTI processing
2. Parameters identify what parts of the incident form to display.
   • sysparm_caller_name=name where 'name' is the name for a user within the SNC system
   • sysparm_caller_phone=phone where 'phone' is the the phone number for a user within the SNC System. Either name or phone should be provided if you want to identify the user on the call. Other parameters may be supplied to identify the user as discussed later.
   • sysparm_task_id=taskID where 'taskID' identifies an existing issue within the system that the caller is calling about.
   • sysparm_view=view where 'view' is the name of the view within the SNC system that should be used to display the data
   • sysparm_xxxx=value where 'xxxx' is the name of a field within the 'incident' record that should be populated with the specified 'value'. For example sysparm_priority=1 would result in the priority field set to value of 1 when the new incident screen is popped.
   • sysparm_cti_rule=name is the name of a business rule that should be invoked for CTI processing rather than using the default behavior.

Example

So an example URL to bring up a screen shot for user Don Goodliffe would look like the following
https://<instance name>.service-now.com/cti.do?sysparm_caller_name=Don%20Goodliffe

The default activity that will happen in SNC when getting a CTI request is the following:

1. The system will try to identify the user by the sysparm_caller_name value if it was supplied
2. If no user has been found, the system will try to identify the user by the sysparm_caller_phone value if it was supplied
3. If a user has been identified then one of the following will occur
   a. If the user has incidents that are currently open the screen pop will be the caller screen pop that shows information about the current caller and all the incidents the caller has currently opened
   b. If the user does not have any open incidents, the screen pop will be for a new incident will all information provided in the cti URL filled in.
4. If a user was not identified and a taskID was given and the taskID exists, then the screen pop will be to show the details for the task.

If the default behavior is not what is wanted then the installation can write a business rule that decides what should be done. The business rule function name has a default value of 'cti' but can be overridden with a sysparm_cti_rule value in the CTI URL.
The business rule must return the URL that should be used for the screen pop. A sample business rule is supplied in the system with a name of “CTI Processing”. This business rule actually implements the ‘default’ behavior as described above.

Any parameter that was on the CTI URL is available to the business rule as a global value. For example to get the value of the caller name:

```
var name = sysparm_caller_name
```

Multiple sysparm parameters can be used, separated by ampersands (&).

Here is a screenshot of the result of calling the above mentioned URL:

![Figure 497: Computer Telephony Integration](image.png)
Linking to the ServiceNow login page

There are several ways you can add a ServiceNow login link to your intranet.

You can add a login link by:

- Enabling the PortletLogin Script include to be Client Callable.
- Creating a simple HTML link to your instance that takes your users directly to the ServiceNow login page.
- Adding an iframe link to the ServiceNow login portlet in one of your HTML pages to permit direct login.

Creating a Simple Link

Edit a web page on your intranet and add a direct link to your ServiceNow instance.

For example:

```html
<a href="https://yourinstance.service-now.com">Help Desk</a>
```

Enabling the PortletLogin Script include to be Client Callable

The login portlet (https://yourinstance.service-now.com/portal/login.html) uses the PortletLogin Script Include.

Since this script is not client callable by default, you must enable the client callable option.

1. Navigate to **System UI > Script Includes**.
2. Open the script **PortletLogin**.
3. Check the **Client Callable** check box.
4. Click **Update**.

Add the Login Portlet

Adding the login portlet to an iframe HTML element creates an unbranded user and password prompt on any HTML page.

The user enters their user id and password and either presses the ENTER key or clicks the Login button. Once validated, the browser transfers to the logged-in ServiceNow session.

The portlet's size is 240 pixels wide and 125 pixels high. The portlet looks like:

```
User:  
Password:  
Login
```

![Figure 498: Portal Login](image)

To enable the login portlet:

1. Set the high security properties `glide.security.use_csrf_token` and `glide.set_x_frame_options` to **false**.
2. Add the following HTML code to your portal:

```html
<iframe border="0" frameborder="0" width="240" height="125" src="https://yourinstance.service-now.com/portal/login.htm"></iframe>
```

If you do not want to change your instance's High Security settings, create a simple link instead.

© 2017 ServiceNow. All rights reserved. 1713
JDBCProbe

A JDBC probe runs on the MID Server to query an external database via [JDBC] and returns results to ServiceNowServiceNow.

Probes interact with the MID Server via the ECC Queue, therefore the response of a JDBC probe returns as an XML payload in an "input" ECC Queue record. By default, each response payload will contain up to 200 returned rows, this value can be modified by setting the probe parameter jdbcprobe_result_set_rows to the desired number.

Activating the Plugin

Contact Customer Support to activate the Integration - JDBC (com.snc.integration.jdbc) plugin.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. [Optional] Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Direct JDBC Probe

A direct JDBC probe specifies all the parameters necessary in the outbound ECC Queue XML payload.

It is a standalone probe that is decoupled from a JDBC Data Source and does not insert into an import set. The required field in the ECC Queue record for a direct JDBC probe is Topic and it must equal JDBCProbe. The Source field is reserved for the sys_id of the data source record in the case of a JDBC data source.

Note: If you have ServiceNowServiceNow Discovery enabled on your platform, add the skip_sensor parameter to the probe to avoid the discovery sensors from processing the probe and resulting in an "No sensors defined" error.

XML Structure

A direct JDBC probe has the following XML payload structure

```xml
<parameters>
  <parameter name="skip_sensor" value="true"/>
  <parameter name="parameter_name" value="parameter_value"/>
  ...
  <parameter name="work"><select>...</select></parameter>
</parameters>
```

JDBC Probes via Data Source

JDBC probes are executed via a JDBC data source when an import is running against the data source.

A JDBC data source JDBC probe is described by the JDBCProbe Topic and the sys_id of the data source in the Source field of the ECC Queue output record.

The data source record would look like this
The following ECC Queue output probe will be created when you *load* from the data source.
**Figure 500: JDBC Data Source Probe**

*Select * JDBC Probe short cut

Alternatively, you may specify a table_name parameter instead of a work element and the following query could be executed.

```sql
select * from <table_name>
```

For example, using the following XML payload

```xml
<?xml version= "1.0" encoding= "UTF-8" ?><parameters><parameter name = "jdbc_driver" value = "com.microsoft.sqlserver.jdbc.SQLServerDriver" />
<parameter name = "connection_string" value = "jdbc:sqlserver://xxx.service-now.com;databaseName=SMS_CRICKET;user=sms;password=sms" />
<parameter name = "table_name" value = "System_DATA" /></parameters>
```

**Counting Rows**

To count the number of rows in a table, you can indicate a select count(*) type query by including the count_rows parameter with a value of true.

For example

```xml
<?xml version= "1.0" encoding= "UTF-8" ?><parameters><parameter name = "jdbc_driver" value = "com.microsoft.sqlserver.jdbc.SQLServerDriver" />
<parameter name = "connection_string" value = "jdbc:sqlserver://xxx.service-now.com;databaseName=SMS;user=sms;password=sms" />
<parameter name = "count_rows" value = "true" />
<parameter name = "table_name" value = "System_DATA" /></parameters>
```

The resulting response XML payload

```xml
<parameters>
...
<result query = "SELECT count(*) as row_count FROM System_DATA" ><row id = "1" ><row_count class = "java.lang.Integer" length = "11" type = "4" >2312</row_count></row></result>
```
Parameters
The following parameters are available in a direct JDBC probe.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Example</th>
<th>Required?</th>
</tr>
</thead>
</table>
| jdbc_driver    | The Java class name for the JDBC driver to use, the currently supported drivers are:  
  • Oracle - oracle.jdbc.OracleDriver  
  • Microsoft SQL Server - com.microsoft.sqlserver.jdbc.SQLServerDriver  
  • MySQL - com.mysql.jdbc.Driver | com.microsoft.sqlserver.jdbc.SQLServerDriver | Y         |
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Example</th>
<th>Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>connection_string</td>
<td>The JDBC connection string/URL for defining the connection, usually contains information about the database server and name, the user id and password for connecting to the database. The syntax is vendor specific, refer to the following links for reference</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Oracle - [jdbc:oracle:thin:&lt;username/password&gt;@&lt;database&gt;]</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Microsoft SQL Server - [jdbc:sqlserver://localhost;user=MyUserName;password=*****;]</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MySQL - [jdbc:mysql://localhost/database?user=username%26password=passwd]</td>
<td>jdbc:sqlserver://xxx.service-now.com;databaseName=SMS;user=sms_user;password=sms_password</td>
<td>Y</td>
</tr>
</tbody>
</table>
| work | A parent element of an XML fragment describing the SQL command to execute | ...<parameter name= "work" >
  <select table = "System_DATA" where = "InstanceKey=692"
        >
      <MachineID />
      <SMSID0 />
    </select>
  </parameter>...
<p>| Y (if not using the table_name parameter short cut) |
| query_timeout | Specify the number of seconds the JDBC driver will wait for a query (SELECT) to complete. Zero means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state. | 60 | N (optional during SELECT) |</p>
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Example</th>
<th>Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>An alternate way of executing a <code>select *</code> query, instead of using the <code>work</code> element. Equivalent to executing &quot;select * from &lt;table_name&gt;&quot;</td>
<td>System_DATA</td>
<td>N (required during count_rows == true)</td>
</tr>
<tr>
<td>count_rows</td>
<td>Indicate the a <code>select count(*)</code> query should be executed returning the number of rows. The result of the count will be returned as a <code>row_count</code> element in the <code>result</code> element.</td>
<td>true</td>
<td>N</td>
</tr>
<tr>
<td>query</td>
<td>Indicate the type of query. If the query type is &quot;Specific SQL&quot;, the sql_statement will be required to specify the SQL statement.</td>
<td>The possible choices are &quot;All Rows from Table&quot; or &quot;Specific SQL&quot;.</td>
<td>N</td>
</tr>
<tr>
<td>sql_statement</td>
<td>Use a specific SQL query. The presence of this element will execute a direct query specified in the value attribute.</td>
<td>select * from any_table where id = 123</td>
<td>N</td>
</tr>
<tr>
<td>skip_sensor</td>
<td>Determines if Discovery will attempt to process the ECC input from the JDBCProbe. This parameter defaults to true.</td>
<td>true</td>
<td>N</td>
</tr>
</tbody>
</table>

For example, to query a table using a direct JDBC probe, requires the following parameters:

- JDBC driver class name
- JDBC connection string
  - Database server
  - Database name
  - User name
  - User password
- The table name
Figure 501: Queue form

*Using the Work Element*

The work element encodes SQL statements to be executed by the probe.

The following are the valid `work` child elements.

- `select`
- `update`
- `insert`
- `delete`

**SELECT**

Retrieve rows from the specified table in the database specified by the JDBC connection string. The simplest `select` work just specifies the table name and will retrieve all fields in a row, for example:

```xml

...<parameter name= "work" ><select table = "System_DATA" /></parameter>...

```

To specify a search criteria, specify the `where` attribute on the `select` element, for example:

```xml

... ...

```
To specify the fields you want returned, embed the fields as child elements of the `select` element, for example:

```xml
<parameter name="work" ><select table = "System_DATA" where = "InstanceKey=692" /></parameter>
```

To use a direct SQL statement, specify it in the `query` parameter

```xml
<parameter name="query" value="Specific SQL" /><parameter name="sql_statement" value = "select * from any_table where value='test'" />
```

**UPDATE**

An `update` SQL can be executed by specifying the `table`, optional `where` clause and required child elements for the fields and their values to update.

```xml
<parameter name="work" ><update table = "alerts.status" where = "ServerName %= 'NCOMS' AND ServerSerial=3935" ><Agent>ServiceNow - INC10020</Agent><URL>http://Macintosh-9.local:8080/glide/incident.do?sys_id=17a31f380a0a0bae0048ca875c8891d0</URL><Severity quoted = "false" >3</Severity><Acknowledged quoted = "false" >0</Acknowledged></update></parameter>
```

**INSERT**

An `insert` SQL can be executed by specifying the `table`, and required child elements for the fields and their values to insert.

```xml
<parameter name="work" ><insert table = "alerts.status" ><Agent>ServiceNow - INC10020</Agent><URL>http://Macintosh-9.local:8080/glide/incident.do?sys_id=17a31f380a0a0bae0048ca875c8891d0</URL><Severity quoted = "false" >3</Severity><Acknowledged quoted = "false" >0</Acknowledged></insert></parameter>
```

**DELETE**

A `delete` SQL can be executed by specifying the `table`, and optional `where` clause.

```xml
<parameter name="work" ><delete table = "alerts.status" where = "ServerName %= 'NCOMS' AND ServerSerial=3935" /></parameter>
```
User administration

Manage the individuals who can access ServiceNow by defining them as users in the system and assigning them to groups. Use the session control options to terminate ServiceNow sessions, for example when system maintenance is required. Create roles that provide selective access to ServiceNow functionality, then assign the roles to groups when all associated users need to access that functionality, or to individual users.

Administrative roles

In previous versions of the product, a great many administrative tasks and rights were granted through the admin role. The rights to change business rules, client scripts, and UI policy, and to create script includes were all controlled by this role. In the current system, a family of more granular administrative roles allows the granting of more specific rights to individual users without granting the broader privileges of the admin role.

For example, an administrator can now grant a user the rights to change UI policy, but not the rights to edit client scripts.

Note: The addition of these new roles does not change the existing behavior of the admin role, which still retains its general administrative privileges on the platform.

Roles

Roles control access to features and capabilities in applications and modules.

After access has been granted to a role, all of the groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

For a complete list of the roles included with the ServiceNow platform, see Base system roles on page 1724.

Create a role

Create a role to control access to features and capabilities in applications and modules.

Once access has been granted to a role, all of the groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

For a complete list of the roles included with the base instance, see Base System Roles.

1. Navigate to User Administration > Roles.
2. Click New.
3. Fill in the fields on the form and then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the role.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
</tbody>
</table>
### Field
<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elevated privilege</td>
</tr>
<tr>
<td>Description</td>
</tr>
</tbody>
</table>

The new role appears on the Roles list. The new role does not have access to any application or module until you add other roles to it or add the new role to the appropriate applications and modules.

**Add a role to an existing role**

When you add a new role to an existing role for a user, the user inherits the access that is granted by the new role.

1. Open the existing role and click **Edit** in the **Contains Roles** related list.
2. Use the slushbucket to add one or more roles to the existing role.
3. Click **Save**.

The users with the existing role inherit the access that is granted by the new role.

**Assign a role to a group**

You can assign a role to a group to grant access to applications and modules to group members.

Role required: user_admin or admin

When you assign roles to groups rather than to individual users, members of the group inherit the role. When a user switches groups, the new group role is assigned automatically.

1. Navigate to **User Administration** > **Groups**.
2. Click the group to assign a role.
3. In the **Roles** related list, click **Edit**.
4. Use the slushbucket to add the desired roles to the group.
5. Click **Save**.

**Create a group role**

Create a group role to control access to features and capabilities in applications for all members in a group.

1. Navigate to **User Administration** > **Group Roles**.
2. Click **New**.
3. Fill in the fields on the form and then click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>[Mandatory] Select a group.</td>
</tr>
<tr>
<td>Role</td>
<td>[Mandatory] Select the role to apply to the group.</td>
</tr>
</tbody>
</table>
Grant a role access to applications and modules

Roles control access to features and capabilities in applications and modules. You add a role to an application or module to enable the role to grant access to the application or module for all users with the role.

1. Navigate to **System Definition > Applications** or **System Definition > Modules**.
2. Click the appropriate application or module to open it in form view.
3. Click the lock to open the **Roles** field.
4. Use the slushbucket to add the desired roles to the application or module.
5. Click the lock to close the **Roles** field, and then save your changes.

Base system roles

Administrators can assign one or more base system user roles to grant access to base system platform features and applications.

The following standard roles are included in the base ServiceNow system with a new instance.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>The administrator role. This role has special access to all system features, functions, and data because administrators can override ACL rules and pass all role checks. Consider these implications when using admin overrides on ACLs. If you have sensitive information, such as HR records, that you need to protect, you must create a custom admin role for that area and train a person authorized to see those records to act as the administrator. Also note the <em>Special Administrative Roles</em>.</td>
</tr>
<tr>
<td>agent_admin</td>
<td>Can manage MID Server-related scripts.</td>
</tr>
<tr>
<td>approval_admin</td>
<td>Can approve or reject approvals.</td>
</tr>
</tbody>
</table>

*Note:* The system does not support changing the name of any base system role. Changing the name of a base system role will prevent users and groups from accessing base system resources that depend on these roles.
<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>approver_user</td>
<td>Can modify requests for approval routed to them. They also have all capabilities of Requesters.</td>
</tr>
<tr>
<td>assign_rule_admin</td>
<td>Can manage Assignment Rules.</td>
</tr>
<tr>
<td>asset</td>
<td>Can manage hardware and software assets.</td>
</tr>
<tr>
<td>catalog</td>
<td>Has access to service catalog requests.</td>
</tr>
<tr>
<td>catalog_admin</td>
<td>Can manage the Service Catalog application, including catalog categories and items.</td>
</tr>
<tr>
<td>catalog_editor</td>
<td>Can create, modify, and publish items within categories they are assigned to.</td>
</tr>
<tr>
<td>catalog_item_designer</td>
<td>Can view the status of their category requests.</td>
</tr>
<tr>
<td>catalog_manager</td>
<td>Can view and assign catalog editors to their categories. Can also create, modify, and publish items within their categories.</td>
</tr>
<tr>
<td>category_manager</td>
<td>Can create, edit, and delete model categories.</td>
</tr>
<tr>
<td>contract_manager</td>
<td>Can create, edit, and delete contracts through the Contract Management application.</td>
</tr>
<tr>
<td>ecmdb_admin</td>
<td>Can administer the CMDB.</td>
</tr>
<tr>
<td>filter_admin</td>
<td>Can manage filters.</td>
</tr>
<tr>
<td>filter_global</td>
<td>Can create global filters.</td>
</tr>
<tr>
<td>filter_group</td>
<td>Can create filters that belong to groups of which the user is a member.</td>
</tr>
<tr>
<td>gauge_maker</td>
<td>Can create gauges from reports or charts.</td>
</tr>
<tr>
<td>image_admin</td>
<td>Can manage image files on the Images [db_image] table.</td>
</tr>
<tr>
<td>impersonator</td>
<td>Can impersonate users. Does not allow impersonation of admin users.</td>
</tr>
<tr>
<td>import_admin</td>
<td>Can manage all aspects of import sets and imports.</td>
</tr>
<tr>
<td>import_scheduler</td>
<td>Can schedule imports.</td>
</tr>
<tr>
<td>import_set_loader</td>
<td>Can load import sets.</td>
</tr>
<tr>
<td>import_transformer</td>
<td>Can manage import set transform maps and run transforms.</td>
</tr>
<tr>
<td>inventory_admin</td>
<td>Can create and delete stock information. Only users with the inventory_admin role can edit stock rules, stockrooms, and stockroom types.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>inventory_user</td>
<td>Has access to stock information. Can create and manage transfer orders.</td>
</tr>
<tr>
<td>itil</td>
<td>Can perform standard actions for an ITIL helpdesk technician. Can open, update, close incidents, problems, changes, configuration management items. By default, only users with the itil role can have tasks assigned to them.</td>
</tr>
<tr>
<td>itil_admin</td>
<td>Possesses more privileges than the itil role and is intended for team leads. This role has the ability to delete incidents, problems, changes, and other related entities when both the itil and itil_admin roles are assigned.</td>
</tr>
<tr>
<td>knowledge</td>
<td>Can create, edit, and review knowledge base articles.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Can manage the knowledge base.</td>
</tr>
<tr>
<td>list_updater</td>
<td>Can use Update Entire List and Update Selected menu options on lists.</td>
</tr>
<tr>
<td>maint</td>
<td>Reserved for ServiceNow use.</td>
</tr>
<tr>
<td>mid_server</td>
<td>Role that any MID server user should be granted. This role gives the MID server access to the tables it ordinarily uses.</td>
</tr>
<tr>
<td>model_manager</td>
<td>Can create new CMDB models. Model manager can control the base models and any model extensions that are not hardware, software, or consumables. Hardware and consumable models are controlled by the asset manager role (asset). Software models are control by the software asset manager role (sam).</td>
</tr>
<tr>
<td>nobody</td>
<td>The nobody role means that nobody has access - not even admin or maint. The nobody role takes precedence over the admin override option on ACLs, so even admins cannot have access. See Create an ACL rule on page 2515.</td>
</tr>
<tr>
<td>personalize</td>
<td>Can configure forms, lists, rules, controls, scripts.</td>
</tr>
<tr>
<td>personalize_choices</td>
<td>Can configure choices and predefined responses for non-journal fields designated as choice or suggestion fields.</td>
</tr>
<tr>
<td>personalize_control</td>
<td>Can configure controls on lists, such as filters, links, and buttons.</td>
</tr>
<tr>
<td>personalize_dictionary</td>
<td>Can configure dictionary entries and labels.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>personalize_form</td>
<td>Can configure forms.</td>
</tr>
<tr>
<td>personalize_list</td>
<td>Can configure lists and list calculations.</td>
</tr>
<tr>
<td>personalize_responses</td>
<td>Can configure predefined responses for journal fields designated as suggestion fields.</td>
</tr>
<tr>
<td>personalize_rules</td>
<td>Can configure business rules and scripts. This role contains the following specialized roles for granting selective, administrative access to rules and scripts:</td>
</tr>
<tr>
<td></td>
<td>• business_rule_admin</td>
</tr>
<tr>
<td></td>
<td>• client_script_admin</td>
</tr>
<tr>
<td></td>
<td>• ui_policy_admin</td>
</tr>
<tr>
<td></td>
<td>• ui_action_admin</td>
</tr>
<tr>
<td>personalize_styles</td>
<td>Can configure field styles.</td>
</tr>
<tr>
<td>personalize_ui</td>
<td>Can configure forms and lists.</td>
</tr>
<tr>
<td>public</td>
<td>No login is required to access features or functions with the public role.</td>
</tr>
<tr>
<td>release_admin</td>
<td>Can edit Release history for a release.</td>
</tr>
<tr>
<td>report_admin</td>
<td>Can manage reports.</td>
</tr>
<tr>
<td>report_global</td>
<td>Can create global reports.</td>
</tr>
<tr>
<td>report_group</td>
<td>Can create reports and share reports with groups that the user is a member of. Users with this role can edit reports shared by other users in the group.</td>
</tr>
<tr>
<td>report_publisher</td>
<td>Can make reports available on a public page.</td>
</tr>
<tr>
<td>report_scheduler</td>
<td>Can schedule a report to be emailed.</td>
</tr>
<tr>
<td>script_fix_admin</td>
<td>Can manage fix scripts.</td>
</tr>
<tr>
<td>soap</td>
<td>Can query, create, update, and delete records on all tables, as well as execute scripts.</td>
</tr>
<tr>
<td>soap_create</td>
<td>Can create records on all tables and columns.</td>
</tr>
<tr>
<td>soap_delete</td>

**Special administrative roles**

Certain roles grant specific administrative rights without the full privileges of the admin role. For example, an administrator can grant a user the right to change UI policy but not client scripts.

These roles do not change the behavior of the admin role, which grants full administrative privileges.

**Note:** The system does not support changing the name of any special administrative role. Changing the name of a special administrative role will prevent users and groups from accessing base system resources that depend on these roles.

<table>

</tbody>
</table>

**Read only role**

The read-only role (snc_read_only) restricts a user (or a group of users) to read-only access on the tables to which the user already has access.

This role is not intended to be the only role a user has. It is intended to be an additional role (in addition to the roles that the user normally has) for the purpose of restricting insert, update, and delete operations on the tables that the user can access as defined by the other roles.

After you assign this role to a user, they can no longer can create, update, or delete records on ANY tables.

**Note:** Assign this role only to users. Do not assign this role to other resources in the system, including applications, ACLs, and so on.

The snc_read_only role is included in the base ServiceNow system starting with the Fuji release and is active by default. Customers who upgrade to Fuji automatically have access to this role.

User administrators can assign the snc_read_only role to any user as a simple way to limit access to data without having to create ACLs for system and custom tables and fields. This is useful for performing internal or external audits without allowing a user to have insert or update access to data.

Users with the snc_read_only role have the following restrictions regardless of other roles and privileges they have.

- Cannot insert, update, or delete records from the UI or when using the GlideRecord API.
- Cannot activate or upgrade plugins.
- Cannot directly run SQL.
- Cannot upload XML files.
- Can only run background scripts when on an instance in the public sandbox environment.

**Note:** These role restrictions are in place even if impersonating another user with write access such as an admin.

**Activate the read only role**

An administrator can activate the Read Only User Role (com.snc.read_only.role) plugin if it is not already active.

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the **Load demo data** check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click **Activate**.

Read only role properties

   These system properties control the snc_read_only role. Administrators need to add these properties to the sys_properties table.

### Table 409: Read only role properties

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Log on with the read only role
Users logging into a production instance should log in using the snc_read_only role to prevent unwanted modifications to the instance data.

1. Click To log on with different role(s), click here.
2. Enter read_only, maint.
3. Click Refresh.
4. Click read_only, maint to login.

Contextual security

The contextual security manager provides incredible flexibility and power to protect information by controlling read/write/create/delete authorization.

Key advantages

- **Contextual security**: Secure a record based on its contents
- **Hierarchical security**: Can apply security rules to any level in our object hierarchy

Everything you can do with the simple security manager you can also do with the contextual security manager. Likewise, after conversion to the contextual security manager, you should not see any behavior changes in your instance.

Securing Fields and Tables

Under the simple security manager, you could secure fields and tables by adding roles to the appropriate dictionary entry. After installing the contextual security manager, these dictionary roles are no longer tested. Instead the system looks for ACL rules on fields and or tables.

**Warning**: After you install the Contextual Security Manager you must secure fields and tables via ACL rules. Even if you configure the dictionary form and add roles to a dictionary entry, no change in rights will occur.

Granting Roles to Users

Roles can still be granted to users or groups using the same logic as under the simple security manager. The one noteworthy exception is that the "roles" field on the user record is no longer checked under the contextual security manager (and should be, in fact, removed from your user and group forms upon installation).

**Note**: To add roles to a user or group record under Contextual Security you must add them to the Roles related list instead of to the user or group record itself.

Applications and Modules

Applications and modules both contain lists of roles under which they can be viewed. For example, the System Definition application requires the admin role to be viewed.

Security rights for Applications and Modules are still defined via these role arrays although they may be transitioned to ACLs at some future date.
Catalog Items and Variables

Both catalog items and catalog variables contain lists of roles under which they can be viewed. Security rights for these entities are still defined via these role arrays although they may be transitioned to ACLs at some future date.

Inheritability of Group Roles

Under the contextual security manager, a group still automatically inherits any role granted to the group.

Note: The role's inherits flag is set to true.

Plugins

These plugins are automatically installed on new instances and can be activated for upgrades:

- **Contextual Security**: Provides contextual security functionality.
- **Contextual Security: Role Management Enhancements**: Eliminates duplicate inherited entries in the User Roles [sys_user_has_role] table (starting with the Geneva release) by tracking the number of times a role is inherited from another role or group. Once activated, inherited entries in the User Roles table are automatically managed and cannot be deleted directly. Instead, a containing role or group is expected to be removed from the user.

Rule search order

The system is aware of the instance object hierarchy when it tries to identify a security rule to apply to a particular entity in the contextual security model.

The search order for a field level rule is:

1. explicit rule on self
2. explicit rule on field in parent
3. ... until parent doesn't contain field
4. wildcard rule on self
5. wildcard rule on field in parent
6. ... until parent doesn't contain field

Example: Given incident.number

Search is:

1. incident.number
2. task.number
3. *.number
4. incident.*
5. task.*
6. **
Precedence between Row and Field Level Rules

What happens if a row level rule and a field level rule are in conflict? Perhaps my row level field indicates that I shouldn't be able to write to a particular row, but the field level rule indicates I do have write access?

In a nutshell, both rules must be met before an operation is allowed.

So, given a row level rule on incident, and a field level rule on incident.number, access to the number field would be allowed only if both rules evaluated to true.

Multiple Rules at the Same Level

What if the system, for example, finds two rules for incident.number?

The system will evaluate both rules and if either is true, then the requested access is allowed.

Category users and stakeholders

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

**Note:** Category users and stakeholders are used only for scheduled assessments.

Category users

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.

Stakeholders

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- *Configure the system to create stakeholders automatically.*
- *Associate multiple category users to multiple assessable records.*
- *Associate multiple category users to one assessable record.*
- *Associate one category user to one assessable record.*

**Note:** Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.
Designate a role delegator

Administrators (users with the admin role) can grant users the right to be role delegators. These delegators can assign roles to users who are in a particular group. The roles that delegators can assign to other users include the roles that the delegator inherits from a group those roles that the administrator specifies.

Users assigned the role_delegator role can act as delegators.

1. Navigate to **User Administration > Designate Role Delegator**.
2. Select the group that includes the user who you want to be the role delegator.
3. Select the user.

   ![Delegate roles](image)

4. Click **Submit**.

   A change request for the role delegator request is created and automatically approved.

   ![Change Request](image)

**Delegate roles**

To delegate specific roles to members of a group, navigate to **User Administration > Delegate Roles in Group** and fill out the form.

This module is available to users with the role_delegator role.
Figure 502: Role delegation

Table 410: Delegating Roles

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>Select the group in which a member shall be delegated a role or roles. Any group can be selected, including groups that the role_delegator does not belong to or groups that the role_delegator does not manage.</td>
</tr>
<tr>
<td>User</td>
<td>Select the member who shall be delegated roles in that group.</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Roles to delegate</td>
<td>Select the roles to delegate to the group member. The roles available for delegating are only the roles that the role_delegator has.</td>
</tr>
</tbody>
</table>

Upon submission, a change request is created for the delegation request. This change request is approved automatically, and the specified roles are granted to the named user in the group selected.

Delegated roles can be removed in the same form by reversing the process. Select the group and user, remove the unwanted roles from the Roles slushbucket, and then re-submit the request.

*Designate a role delegator*

Administrators (users with the admin role) can grant users the right to be role delegates.

These delegates can assign roles to users who are in a particular group. The roles that delegates can assign to other users include the roles that the delegator inherits from a group those roles that the administrator specifies.

Users assigned the role_delegator role can act as delegates.

1. Navigate to **User Administration > Designate Role Delegator**.
2. Select the group that includes the user who you want to be the role delegator.
3. Select the user.

4. Click **Submit**.

A change request for the role delegator request is created and automatically approved.

*View delegated roles*

An administrator can view role designation in the following locations.

- User records
- Role Delegates module
- Role Audit module
User Records

Open a user record by navigating to User Administration > Users and selecting the user. You can see all the roles assigned to that user in the Roles related list.

Figure 503: List of role delegators

Role Delegates

To view existing role delegators and the groups in which they can delegate roles, navigate to User Administration > Role Delegates. All the role delegators and the groups they belong to are listed.

Figure 504: Role Delegator List

Role Audit

The Audit Role list view displays all the role changes made in the instance by user and group. To access the Audit Role list, navigate to System Security > Reports > Role Audit.

Prevent a role from being delegated
You can prevent roles from being delegated to users.

By default, the following roles cannot be delegated.
• admin
• public
• nobody
• role_delegator, a user with the role_delegator role cannot delegate this role to other group members

1. Navigate to User Administration > Roles.
2. Open the role.
3. Configure the form to add the Grantable or Can delegate fields.
4. Clear the check box for one or both of these fields.
5. Click Update.

Role delegation and record producers
The Role Delegation modules link to record producers. These record producers create change requests that are automatically approved by graphical workflows.

These graphical workflows include the following:
• Grant role_delegator role to user in group
• Delegate roles to group member

These workflows can be customized as desired to add approval steps.

Group manager change business rule
The Group Manager Change business rule, which is disabled by default, automatically grants the role_delegator role to a user who is designated manager of a group in the Manager field on the Group form. The role is removed when the user is no longer the manager of the group.

Activate the business rule to take advantage of it.

Security jump start - ACL rules
The Security Jump Start (ACL Rules) Plugin is installed automatically on all new instances.

Note:
• Plugin Required
• Functionality described here requires the Security Jump Start (ACL Rules) plugin. The plugin is automatically installed for new instances.

These rules were written to provide a jump start on securing many system tables, to make it easier for an organization to more quickly get into production.

This plugin is not intended for existing instances, as it might modify security access to tables that are already in use in a production environment. If an admin is interested in the new ACL rules provided by this plugin, one or more of them may be created manually in an existing instance as specific needs dictate. This list of ACLs may be used as a guideline in that case. Should an admin strongly want this plugin installed on an existing instance, we highly recommend the plugin be tested extensively in a test instance first, to ensure that the rules do not conflict with the operational needs of the organization's current implementation.

The following ACLs are included in this plugin. Click the icon in a header row to sort that column in ascending or descending order. The Operation key is as follows:
• R=read
• W=write
- D=delete
- C=create

Audit user roles

Changes to user roles are automatically tracked in the Audit Roles [sys_audit_role] table.

Role required: admin

**Note:** If the Contextual Security: Role Management Enhancements on page 2508 plugin is installed, you must Enable role auditing with Contextual Security: Role Management Enhancements on page 2510.

Navigate to the Audit Roles [sys_audit_role] table.

The Audit Roles table displays changes to user roles.

<table>
<thead>
<tr>

<td>The affected user.</td>
</tr>
</tbody>
</table>

**Groups**

A group is a set of users who share a common purpose.

Groups may perform tasks such as approving change requests, resolving incidents, receiving email notifications, or performing work order tasks. Any business rules, assignment rules, system roles, or attributes that refer to the group apply to all group members automatically. When you add users, make sure that each one is associated with a group. Users with the user_admin role can create and edit groups.

**Create a user**

You can add a user to ServiceNow by navigating to **User Administration > Users**.

1. Navigate to **User Administration > Users**.
2. Click **New**.
3. Enter the user's information (see *table*).

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>Create a unique identifier for this user's ServiceNow login user name. Typical examples of user IDs are cwitherspoon and charlie.witherspoon. You cannot create a new user whose User ID duplicates an existing user. If you do import duplicates from an update set, the more recently created names takes the duplicate User ID.</td>
</tr>
<tr>
<td>First name</td>
<td>Enter the user's full first name.</td>

<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Mobile phone</td>
<td>Enter this user's mobile phone number.</td>
</tr>
<tr>
<td>Photo</td>
<td>Attach a photo of the user, if appropriate.</td>
</tr>
<tr>
<td>Geolocation tracked</td>
<td>Select the check box to enable location tracking. The Geolocation tracked field, which is available when Geolocation is activated, provides the option to track a user's location.</td>
</tr>
<tr>
<td>Location</td>
<td>Select the user's usual location. This field is visible when geolocation is active.</td>
</tr>
</tbody>
</table>

4. Optional: *Customize the form* to add the **Schedule** field and assign a *schedule* to the user.

5. **Click Submit.**

   The new user record appears at the top of the list.

**Allow a user to view a profile**

Users are able to view their profile by clicking their name in the Welcome banner. If your users cannot do this, enable a system property.

1. **Navigate to the System Properties [sys_properties] table.**
2. **Search for the glide.ui.welcome.profile_link property.**
3. **Set the value to true.**

**Deactivate the validation script during user creation**

To enter a non-standard email address that does not pass field validation, you must deactivate the validation script first.

1. **Navigate to System Definition > Validation Scripts.**
2. **Select the email record.**
3. **Clear the Active check box and save the change.**
4. **Complete the user profile, including the email address, and update or submit the record.**
5. **Reactivate the email validation script.**

**Add a new company**

How to add a new company.

1. **Navigate to User Administration > Companies.**
2. **Click New.**
3. **Complete the fields, as appropriate (See table).**
Table 411: Adding A Company

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Any information about the company that would be helpful for others to know.</td>
</tr>
</tbody>
</table>

Fields that can be added by configuring the form:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latitude</td>
<td>The latitude of the company, if applicable. This field is populated by a business rule called get_lat_long. Deactivate this business rule to prevent the system from overwriting any values populated in the field manually. Latitude is expressed as a floating point data type. Latitude from upgraded versions of ServiceNow expressed in any format other than floating point appears in a column called Old Latitude. The system attempts to convert all latitude values from previous versions to the floating point notation, where possible.</td>
</tr>
<tr>
<td>Longitude</td>
<td>The longitude of the company, if applicable. This field is populated by a business rule called get_lat_long. Deactivate this business rule to prevent the system from overwriting any values populated in the field manually. Longitude is expressed as a floating point data type. Longitude from upgraded versions of ServiceNow expressed in any format other than floating point appears in a column called Old Longitude. The system attempts to convert all longitude values from previous versions to the floating point notation, where possible.</td>
</tr>
</tbody>
</table>

**Note:** The IT Finance application adds a Finance view to the Company form. The Finance view adds a chart that shows expenses that were allocated to the company.

---

**Add a new department**

Departments are another way to categorize users, groups, and assets.

1. From the left navigation pane, select **User Administration > Departments**.
2. Click **New** to add a new department.
3. When done, click **Submit**.
Associate a user to a group

You can associate users with a group.

1. Navigate to User Administration > Groups.
2. Click the group to which you want to assign the user.
3. In the Group Members related list, click Edit.
4. Select the user in the Collection list, and then click Add.
5. Click Save.

Non-interactive sessions

The Non-Interactive Sessions plugin creates a distinction between interactive and non-interactive users.

- Interactive users can log in to the ServiceNow UI and can use their credentials for SOAP connections if allowed by strict security. They can use their credentials for other API connections such as WSDL, JSON, XML, or XSD without restriction.
- Non-interactive users can only use their credentials to authorize API connections such as JSON, SOAP, and WSDL. They cannot log in to the ServiceNow UI. The strict security high security setting determines if non-interactive users are subject to Contextual Security requirements.

Distinguishing between interactive and non-interactive users increases instance security by ensuring that users conform to the principle of least privilege.

Installed with Non-Interactive Sessions

The Non-Interactive Sessions plugin installs certain changes.

- Adds a column Web Service Access Only [web_service_access_only] to the User [sys_user] table.
- Changes all existing users to be interactive users (web_service_access_only=false).
- Updates the User form to display the Web Service Access Only [web_service_access_only] field by default.

Create an interactive user

Interactive users have the following access rights.

They can:

- Use their user name and password to log in to the UI or a content management system (CMS) portal.
• Connect to an instance from a URL that calls a **UI page**, form, or list (for example, https://<instance name>.service-now.com/incident.do).
• Connect with single sign-on (for example, digest authentication or SAML).
• Use their credentials to authorize SOAP connections if allowed by **strict security**.
• Use their credentials to authorize any other type of API connection without restriction.

When you activate the Non-Interactive Sessions plugin all existing users automatically become interactive users. New users default to interactive users unless you manually make them non-interactive. Use the following steps to manually switch a non-interactive user back to an interactive user.

1. Navigate to **User Administration > Users**.
2. Search for the user you want to update. For example, System Administrator.
3. Clear the **Web Service Access Only** check box.
4. Click **Update**.

**Create a non-interactive user**
Non-interactive users can only connect to ServiceNow from an API protocol.
They cannot:
• Use their user name and password to **log in** to the UI or a content management system (CMS) portal.
• Connect to an instance from a URL that calls a **UI page**, form, or list (for example, https://<instance name>.service-now.com/incident.do).
• Connect with single sign-on (for example, digest authentication or SAML).
• Be used as the MID Server user.

After installing the Non-Interactive Sessions plugin, consider updating your existing web service user accounts to be non-interactive users.

1. Navigate to **User Administration > Users**.
2. Search for the user to be updated. For example, SOAP user.
3. Select the **Web Service Access Only** check box.
4. Click **Update**.

**Note:**
ServiceNow always uses any user name and password credentials supplied with a request even if the **High Security Settings** do not require authorization for a given API protocol. For example, if a SOAP request supplies a user name and password, the instance verifies those credentials even if SOAP requests do not require authorization. To avoid verifying user credentials, the request must not include them.

**Update web service user accounts for strict security**
If your instance requires strict security, add the soap role to any user accounts used for web services.

1. Navigate to **User Administration > Users**.
2. Select a web service user from the list.
3. From the **Roles** related list, click **Edit**.
4. Add soap to the **Roles List**.
5. Click **Save**.
6. Click **Update**.
Request the Non Interactive Sessions plugin

The Non-Interactive Sessions feature is enabled for all new instances starting with the Calgary release. For instances that upgraded from a previous release, you can request the Non Interactive Sessions plugin (com.glide.security.non_interactive_users) through the HI Customer Service system.

Role required: none

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

Require authentication

You can specify whether non-interactive connections require authentication from the **High Security Settings** module.

A non-interactive connection bypasses the UI to connect to the instance at an API level. Typically, non-interactive connections use set protocols such as JSON, SOAP, XSD, or WSDL. By default, all non-interactive connections require authentication.

1. Login with an administrator user with the security_admin role.
2. Elevate your privileges to use security_admin.
3. Navigate to **System Security > High Security Settings**.
4. Select the matching "Requires authorization" option for the protocol you want to set. For example, **Requires authorization for incoming SOAP requests**.
5. Select the checkbox to require authentication for the non-interactive connection method. Clear the checkbox to allow the non-interactive connection method to connect without providing any credentials.

---

**Note:** Activating the Non-Interactive Sessions plugin on an existing system may prevent any existing users that authorize SOAP and WSDL-based integrations from logging in unless they already have the soap role. See [Updating Web Service User Accounts for Strict Security](#) to manually update existing integration users.
Create a group

Users with the user_admin role can create groups.

1. Navigate to User Administration > Groups.
2. Click New.
3. Fill in the form.

To see some of the fields, you may need to personalize the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the group.</td>
</tr>
<tr>
<td>Manager</td>
<td>Group manager or lead.</td>
</tr>
<tr>
<td>Type</td>
<td>Category for this group. For example, a group designated as type catalog is a service catalog group and can also be accessed under the Service Catalog &gt; Catalog Policy &gt; Fulfillment Groups module. You may need to personalize the form to add the Type field. Activating the Work Management plugin adds the Type field automatically.</td>
</tr>
<tr>
<td>Group email</td>
<td>Group email distribution list or the email address of the group's point of contact, such as the group manager.</td>
</tr>
<tr>
<td>Parent</td>
<td>Other group of which this group is a member. If a group has a parent, the child group inherits the roles of the parent group. The members of the child group are not members of the parent group. For example, if an incident is assigned to the parent group and you click the Assigned to lookup icon, only the members in the parent group are available. The members of the child group are not available.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that indicates whether the group is active or inactive. Inactive groups still appear in any reference field that already references the group, but are not visible by non-admin users in: • lists of groups • the reference lookup list for reference fields • the auto-complete list of groups displayed when you type into a reference field</td>
</tr>
<tr>
<td>Exclude manager</td>
<td>Check box that controls whether the group's manager receives email notifications.</td>
</tr>
<tr>
<td>Include members</td>
<td>Check box that controls whether the group members receive individual emails when someone sends an email to the Group Email address. The only exception to this functionality is for approval notifications, whereby all members</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the group.</td>
</tr>
</tbody>
</table>

**Add a user to a group**

Users with the user_admin role can add a user to a group.

1. Navigate to User Administration > Groups.
2. Click a group Name.
3. In the Group Members related list, click Edit.
4. Select one or more names in the Collection list.
5. Click Add.
6. Click Submit.

**Remove a user from a group**

Users with the user_admin role can remove a user from a group.

1. Navigate to User Administration > Groups.
2. Click a group Name.
3. In the Group Members related list, select the check box next to a group member name.
4. From the Actions on selected rows menu, select Delete.

**Hide groups**

You can hide groups by introducing a hidden field to the group form and then creating a business rule to filter out groups marked as "hidden."

Only users in the hidden group will be able to see the hidden field when selecting a group in a reference field.

**Add a business rule to filter out hidden groups**

This business rule filters out hidden groups. Only users within the hidden group and users marked admin or groups_admin can see the group.

Create a new "before query" business rule on the sys_user_group (Group) table with the following script:

```javascript
if (!gs.hasRole("admin") && !gs.hasRole("groups_admin") &&
    gs.getSession().isInteractive()) {
    var qc = current.addQuery("u_hidden", "!=", "true"); //cannot see hidden groups...
    qc.addOrCondition("sys_id", "javascript:getMyGroups()" ); //...unless in the hidden group
}
```

**Add a "hidden" field to a group form**

To add a hidden field to a group form:

Create a new true/false field labeled Hidden on the Group form.

The system creates new field called u_hidden on the sys_user_group table and enables use of the Hidden check box to designate a hidden group.

**Assign a role to a user**

You can assign roles to a user by navigating to User Administration > Users.
A user automatically inherits roles from all groups the user belongs to. These roles cannot be deleted from the user's record, only from the group's record. Roles can also be associated directly with the user.

To add roles to a user's record:

1. Navigate to **User Administration > Users**.
2. Open a user's record.
3. In the **Roles** related list, click **Edit**.
4. Select the desired roles in the **Collection** list, and then click **Add**.
5. Click **Save**.

**Configure group types for assignment groups**

The **Type** field can be used to define categories of groups, which can be used to filter out assignment groups based on the group type using a reference qualifier on [task.assignment_group].

For example, when selecting an assignment group from the Incident form, **Type** can be used to filter groups based on whether they are typically involved in the Incident Management process. Groups such as Network or Help Desk are displayed as they are typically involved. Groups such as HR or New York are omitted.

The following items are provided in the base system.

- The types **catalog**, **itil**, and **survey**.
- The reference qualifier on [task.assignment_group] filters on **[Type] equals [none]**.
- A reference qualifier named GetGroupFilter is available to filter for group types.

**Note:** Dictionary overrides allow administrators to filter for a group type on an extended table with a simple reference qualifier override.

**Add a new group type**

You can add additional group types to filter assignment groups for tasks.

Role required: user_admin or admin

You may need to configure the form to display the **Type** field.

1. Navigate to **User Administration > Groups**.
2. Select a group record.
3. Click the lock icon beside **Type**.
4. Click the lookup icon beside the selection field.
   The Group Types dialog opens.
5. Complete the following steps.
   a) Click **New**.
   b) Enter the group type name and description.
      For example, to define a group's type as incident and problem, enter: **incident,problem**.
      Click **Submit**.

      The Group form reopens with the new type listed.
6. Optional: Add additional group types if needed.
7. Click **Update**.

**Assign a group type**

You can assign group types to filter assignment groups for tasks.
Role required: user_admin or admin

1. Navigate to User Administration > Groups and select the desired group.
2. Click the lock icon beside Type.
3. Click the lookup icon beside the selection field and select one or more group types.

   Note: Because the default behavior of [task.assignment_group] is to filter out groups with group types defined, adding a type to a group filters it out of the Assignment Group field on tasks. To change the behavior, set up the reference qualifier.

4. Click Update.

Reference qualifier setup
The reference qualifier on [task.assignment_group] filters which groups are available to be used as an assignment group.

Changing the reference qualifier on [task.assignment_group] affects every table which extends the Task Table. Dictionary overrides can be used to define reference qualifiers on tables that extend Task without affecting other task tables.

There are two ways to use reference qualifiers to filter assignment group types, simple or advanced reference qualifiers.

Simple reference qualifier
In the base system, the simple reference qualifier type=null is used to allow groups with no defined type to be selected. In the same way, if there is one specific type which should be available from the Assignment Group, specify it in the same format. For example, if there is a group type assignment which all assignment groups have, use the reference qualifier type=assignment to return only those groups.

Advanced reference qualifiers
If a simple reference qualifier doesn't provide enough control over filtering, an advanced filtering function can be defined in a business rule and called using advanced reference qualifiers. The business rule GetGroupFilter (available in the base system) can be called by an advanced reference qualifier to filter group types based on arguments.

For example, the following reference qualifier restricts the choice list to groups with type database or network:

```
javascript:GetGroupFilter('database,network')
```

The GetGroupFilter function can also be called from reference qualifier functions which you create.

⚠️ Warning: Exercise caution if the tree picker is used in conjunction with filtering by group type. The reference qualifier function must select groups at all levels of the tree because a group is only selectable if its parent is selectable.

Create an advanced reference qualifier
For more advanced filtering, create an Advanced Reference Qualifier for the Assignment Group field on the Task table.

For more advanced filtering, create an advanced reference qualifier for the Assignment Group field on the Task [task] table. Note that this reference qualifier will apply to all tables based on [task], unless dictionary overrides are used.
The following example reference qualifier assumes that you have created a group type named database. If the task is an incident record and the category is Database, then the reference qualifier will only select database groups. In all other circumstances it will select any group which is not a catalog group.

```javascript
function TaskAssignmentFilter() {
  var classname = current.getRecordClassName();
  var filter = "type=null";
  if (classname == "incident" && current.category == "database") {
    filter = GetGroupFilter("database");
  } else {
    // append 'catalog' group exclusion to the filter
    var cat = new GlideRecord("sys_user_group_type");
    cat.addQuery("name", "catalog");
    cat.query();
    if (cat.next()) {
      filter += " OR type!=" + cat.sys_id;
    }
  }
  gs.log("TaskAssignmentFilter: " + filter);
  return filter;
}
```

Once the business rule above is defined, it can be called by the following reference qualifier:

```javascript
javascript:TaskAssignmentFilter()
```
User self-registration

The User Registration Request plugin provides the ability for unregistered users to request access to a ServiceNow instance. An administrator can activate the plugin.

A user can request an account by navigating to the instance. If the plugin is installed, the following section is added to the welcome screen.

---

**Request a user account**

*If you do not yet have a user account you can request one using the self registration form.*

The user can complete and submit the self-registration form, and see a confirmation that it was submitted. An email is received by the user when the account is registered.

**Note:** If the email address entered in the self-registration form is already in the system, the request is not submitted.

Approve an account

When a user submits a self-registration form, it can be reviewed and approved.

Role required: admin

1. Navigate to **User Administration > Pending User Registration** and open the request.
2. Use the **Create User** and **Reject** related links on the registration request form to approve or deny the request.
   - If **Create User** is selected, a new user is created using the email address as the **User ID**.
   - If **Reject** is selected, the request is marked **Rejected**.

The user is sent an email notification with the login information if the request was accepted, or the rejection information.

3. Optional: To view past registration requests, remove the **[State] [is] [Pending]** breadcrumb from the list view.

---

Enable auto processing of a request

You can enable auto processing of user self-registration requests by setting a property.
Role required: admin

1. Navigate to **System Properties > System**.
2. Select the check box for the property Enable auto processing of user registration requests.
3. Click **Save**.
   - If enabled, registration requests do not require approval. Instead, the business rule Auto-Process User Registration creates the user record from the information provided.

### Impersonate a user

Administrators can impersonate other authenticated users for testing purposes.

When impersonating another user, the administrator has access to exactly what that user would have access to in the system, including the same menus and modules. ServiceNow records anything the administrator does while impersonating another user as having been done by that user.

Use this feature to test what different users can do in the system and to perform actions for them in their stead.

### Useful logins

Several different logins are recommended to test the system.

Several different logins are recommended to test the system:

- An admin account to do work.
- An itil (or similar) login to test as a technician.
- An ess login to test as an end user.

More logins may be required to adequately test the system.

---

**Note:** When you impersonate a user who is locked out or is inactive, the system forces you out of the system as well after you generate an event or click a link.

---

### Impersonate a user in UI16

How to impersonate a user in UI16.

Role required: impersonator

1. In the banner frame, click your user name to open the user menu.
2. Select **Impersonate User**.
   - The Impersonate User dialog box appears.
3. Select a user from the Recent Impersonations list or enter a different user's name in the user selection field.

4. To return to your original login, follow these same steps then select your name from the list.

Impersonate a user in UI15 or UI11

How to impersonate a user in UI15 or UI11.

Role required: impersonator

1. Click the impersonate icon (in UI15, in UI11) in the banner frame. The Impersonate User dialog box appears.

2. Select the user from the Recent Impersonations list, click the lookup icon and select the user's name from the full list, or type the user's name.
3. Click OK.

Impersonate a user on a mobile phone

How to impersonate a user on a mobile phone.

The impersonation option is not visible in the mobile view of the platform, and impersonating is not supported for mobile phones. For most mobile phones, however, it is possible to impersonate a user by switching to standard view, performing the impersonation, and switching back to mobile view. Some mobile devices may have problems rendering the Impersonation dialog.

Modify the impersonate option

You can modify, enable, or disable the impersonate option.

Invoke or modify the impersonate option

The impersonation option and its effects are contained in a UI macro.

The UI macro is called impersonate_button. Modifying this UI macro is not recommended.

Enable or disable the impersonate option

The impersonation capability can be enabled/disabled with the glide.ui.impersonate_button.enable UI Property, "Enable impersonation button in banner line".
Log impersonations

Impersonations are logged in the System Log.
Logging can be enabled or disabled with the glide.sys.log_impersonation property.

Figure 506: Impersonate log

Force logout

In some cases, impersonating a user might cause an issue that makes it difficult to switch back (for example, if in a test environment, the user is being presented with a broken page).
To return to the user, navigate to http://<instance name>.service-now.com/logout.do and log back in.

Manage user sessions

The ServiceNow platform provides the ability to view and terminate individual user sessions, lock out users from the system, and make users inactive..

- Terminating a specific user session effectively logs that user out of the next transaction, which is usually the next browser click. Use the terminate sessions feature when you want to perform system maintenance.
- Locking a user out of the system means the user can no longer log in or generate any actions from any email messages that the user sends to the instance. Locking out users also terminates their user sessions.
- Making a user inactive means that the user does not show up in any fields that reference active users on the User table.

Modify session timeout

The base system uses the default Apache session timeout of 30 minutes.
The application logs the user out automatically, unless the Remember Me check box in the login screen is selected. Making the interval longer can lead to the unnecessary maintenance of inactive sessions in memory. It is recommended to adjust this timeout setting to no more than a few hours, although up to 24 hours is workable.

Note: Regardless of how many windows a user has open in a browser, it is considered to be one session. However, if a user has two separate browsers open (such as Internet Explorer and Firefox), it is considered to be two separate sessions.

To set the session timeout manually:

1. Clear the Remember Me check box in the login screen.
2. Add a new property using the following values:
   - Name: glide.ui.session_timeout
• **Description:** Type a brief description. In this case, enter something like *Override the default session timeout (30). This value is in minutes.*

• **Type:** Select the appropriate data type. In this case, select **Integer**.

• **Value:** Change the default value from 30 minutes to a value of your choice.

**Note:** The session timeout can also be set through installation exit customizations.

**Notes and limitations:**

- Ajax calls to the server keep the session alive (such as Labels and Refreshing homepages).
- Polling keeps the session alive when the chat desktop is open (requires the **Chat** plugin).
- Administrators can add the following properties to the System Properties table.
  - `glide.security.csrf.handle.ajax.timeout`: Handles errors for timed out Ajax requests when set to true.
  - `glide.security.auto.resubmit.ajax`: Automatically resubmits timed-out Ajax requests when set to true and the **Remember Me** checkbox is selected or **automatically set**. A popup appears to users asking them to continue.
  - `glide.ui.auto_req.extend.session`: When set to **true**, the system automatically extends a user’s session by the value the user selects for the homepage refresh time. If there is no homepage refresh time, the standard timeout value applies. Tablet and mobile devices do not support this property. When set to **false**, user sessions will timeout if the Remember me checkbox is clear. The timeout is based on whether there is a homepage refresh time. When there is no homepage refresh time, the standard timeout value applies. When there is a homepage refresh time, the user session times out after the timeout value plus one interval of the homepage refresh time. For example, if a user selects to refresh interval of 5 minutes, then user sessions expires after the timeout value plus five minutes.
**Note:** Users who select the **Remember me** checkbox will never timeout and are unaffected by session timeout properties.

---

**Lock out a user**

Lock out a user when you do not want the user to access the instance.

1. From the left navigation pane, select **User Administration > Users**, and select the user from the list.
2. Select the **Locked Out** check box, and update the record.

---

**Mark a user inactive**

How to mark a user inactive.

Making a user inactive does not lock out the user. The Lock Out Inactive Users business rule, which is active by default in all instances, sets the **Locked Out** flag to **true** on the User record when the Active flag is set to **false**. If you do not have this business rule active, inactive users are not automatically locked out and can still log in the instance.

1. From the left navigation pane, select **User Administration > Users**, and select the user from the list.
2. Uncheck the **Active** checkbox, and update the record.
Terminate a specific user session

How to terminate a specific user session.

1. From the left navigation pane, select **User Administration > Logged in users**. You can only see users who are logged into the same application node as you. If the Active field on a user record value is false, the user is logged in but not currently running a transaction. Most users appear as inactive at any given time.

2. Select the session you want to end.

3. Click **Lock Out Session**.

   The session is terminated, and the user is redirected to the login page at the next attempted transaction. The user is not locked out. Multiple user sessions may be associated with one user; terminating a user session only affects the specific session.
System Usage

The System Usage modules track usage for ServiceNow applications and for ServiceNow Store applications.

The usage analytics process collects data on all your instances and regularly updates the reports in the Usage Overview and ServiceNow Store Usage Overview modules. Application usage data is collected whenever an application is opened, and counts on tables are collected once a day. Data is collected on:

- The number of active users in the system
- The hardware CIs discovered (for instances that use Discovery)
- The number of cloud management service catalog items available to users in instances that use Cloud Management

All users with the admin role can view Usage Overview and ServiceNow Store Usage Overview reports.

System Usage Overview reports

The Usage Overview modules display reports on usage of ServiceNow applications and ServiceNow Store applications.

See the illustration for tips on using the charts. Navigate to **System Usage** > **Usage Overview** and **System Usage** > **ServiceNow Store Usage Overview** to view the following reports and charts:
<table>
<thead>
<tr>
<th>Chart or report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Usage of ServiceNow Applications and Usage of ServiceNow Store Applications</td>
<td>Shows the number of accesses (views or operations performed) for each of the listed applications, grouped by month.</td>
</tr>
<tr>
<td>Users of ServiceNow Applications and Users of ServiceNow Store Applications</td>
<td>Shows the number of active users who have used the instance, grouped by month. An active user is any user who could have accessed the applications, not only users who actually did access the applications.</td>
</tr>
<tr>
<td>Additional Metrics</td>
<td>Shows any of the following items, depending on your licensing agreement:</td>
</tr>
<tr>
<td></td>
<td>• Configuration automation nodes</td>
</tr>
<tr>
<td></td>
<td>• Custom Orchestration workflow activities</td>
</tr>
<tr>
<td></td>
<td>• Hardware CIs found by Discovery</td>

<tr>
<td></td>
<td>• Public catalogs your organization is using</td>
</tr>
<tr>
<td></td>
<td>• Password credentials that the Password Reset application is managing</td>
</tr>
<tr>
<td></td>
<td>• Performance analytics indicators</td>
</tr>
<tr>
<td>Other Metrics (ServiceNow applications only)</td>
<td>Shows the number of items that extend a table other than the Task base table or a custom table.</td>
</tr>
</tbody>
</table>
Figure 507: Working with charts on the Usage Overview report
On-call scheduling

The on-call scheduling application provides a way to determine which member of a user group is available to complete a task.

For example, finding the right person to assign an incident. It does this by rotating an on-call position within some or all members of that group of users on a regular basis.

On-call scheduling can help answer questions like:

• For a specific group, who is the primary contact person right now?
• Who is the primary contact at any given time?
• How do I escalate notifications for this group?
• When am I on-call for this group this year?

Activate on-call scheduling

Administrators can activate the On-Call Scheduling plugin.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Installed with on-call scheduling

Several types of components are installed with on-call scheduling.

Demo data is available with on-call scheduling.

Tables installed with on-call scheduling

On-call scheduling adds the following tables.

Tables

Table 413: Tables for on-call scheduling

<table>
<thead>
<tr>
<th>Display name [Table name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate Rotation Schedule [v_alternate_rotation]</td>
<td>Lists the alternate user schedules by rota and roster and the start and end date and time stamps.</td>
</tr>
<tr>
<td>On-call Member [cmn_rota_member]</td>
<td>Lists the selected group members participating in the on-call schedule and escalations.</td>
</tr>
<tr>
<td>On-call Notifications [v_on_call]</td>
<td>Lists the reminder notifications that were sent.</td>
</tr>
<tr>
<td>Display name [Table name]</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Roster [cmn_rota_roster]</td>
<td>Determines the members on-call, the rotation interval and escalation settings.</td>
</tr>
<tr>
<td>Roster Schedule Span [roster_schedule_span]</td>
<td>Contains the schedule span definitions. on-call scheduling adds a group reference and the on-call type to the Type field.</td>
</tr>
<tr>
<td>Rota [cmn_rota]</td>
<td>Holds the on-call schedule for a particular shift.</td>
</tr>
<tr>
<td>Rotation [v_rotation]</td>
<td>Lists rotation schedules by start date and time and includes user contact information, if available.</td>
</tr>
<tr>
<td>Rotation Escalation [cmn_rota_escalation]</td>
<td>Lists the escalations including the event and last updated time stamp.</td>
</tr>
<tr>
<td>Trigger Rule [trigger_rule]</td>
<td>Extends the Assignment Rule [sysrule_assignment] table and stores when the escalation process is triggered and what actions to take.</td>
</tr>
<tr>
<td>User Rotation Schedule [v_user_rotation]</td>
<td>Lists the rotation schedule by user.</td>
</tr>
</tbody>
</table>

**Note:** The tables whose name starts with prefix v such as [v_alternate_rotation] are view-only tables and are used for generating reports.

**Properties installed with on-call scheduling**

On-call scheduling adds the following properties.

**Note:** To open the System Property [sys_properties] table, enter sys_properties.list in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.snc.on_call_rotation.access.debug</td>
<td>Enable logs for debugging.</td>
</tr>
<tr>
<td>• <strong>Location</strong>: System Property [sys_properties] table</td>
<td></td>
</tr>
</tbody>
</table>

**Roles installed with on-call scheduling**

On-call scheduling adds the following user roles.
## Roles

### Table 414: Roles for on-call scheduling

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rota administrator [rota_admin]</td>
<td>Creates new rotas and edits or deletes existing rotas. Can also manage all other aspects of on-call rotas and rosters (duty shifts).</td>
<td>• assignment_rule_admin</td>
</tr>
<tr>
<td>Rota manager [rota_manager]</td>
<td>Has delegated access to a specific group's rota and can manage this group's rota and associated data. Cannot edit or delete rotas.</td>
<td>• none</td>
</tr>
<tr>
<td>Roster administrator [roster_admin]</td>
<td>Manages on-call rotation information.</td>
<td>• none</td>
</tr>
</tbody>
</table>

### Script includes installed with on-call scheduling

On-call scheduling adds the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OnCallFilters</td>
<td>Reference qualifiers for on-call rota or roster lookup.</td>
</tr>
<tr>
<td>OnCallReminderEmailGenerator</td>
<td>Generates an HTML email used to send reminders to users that have on-call duty.</td>
</tr>
<tr>
<td>OnCallRemindersNG</td>
<td>This is run by a schedule job to send reminders to on-call persons on a daily basis.</td>
</tr>
<tr>
<td>OnCallRotation</td>
<td>This class wraps the On-call Rotation support to make it easy to use from a business rule or script.</td>
</tr>
<tr>
<td>SncOnCallRotation</td>
<td>Legacy wrapper to maintain old GlideScriptable calls that have been migrated to use reflection rhino prefixes.</td>
</tr>
<tr>
<td>OnCallRotationCalculator</td>
<td>Calculate the rotation for a group, storing the results in the Rotation Schedule [v_rotation] table.</td>
</tr>
<tr>
<td>OnCallRotationPersonal</td>
<td>API for quickly getting on-call rotation data relevant to current logged in user.</td>
</tr>
<tr>
<td>OnCallRotationRecalc</td>
<td>Recalculates on-call rotation schedules. Called from Update Rotation Schedules business rules on On-call Member [cmn_rota_member] and Roster [cmn_rota_roster] tables.</td>
</tr>
<tr>
<td>Script include</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OnCallSecurityNG</td>
<td>New security model checks for on-call rotas, rotations, and associated data. Access model: • Rota_admin role gives access to manipulate all aspects of rotas. • Rota_manager role gives access to a specific group’s rota and can also modify that group’s rota and associated data.</td>
</tr>
<tr>
<td>OnCallUserReminder</td>
<td>User reminder data for sending on-call user reminder emails. Used by the On-Call Reminders NG script include.</td>
</tr>
<tr>
<td>RotaScheduleEntryValidation</td>
<td>Specific validation for rota schedule entries. Called by Rota Schedule Item Validate business rule.</td>
</tr>
<tr>
<td>ValidateSchedule</td>
<td>Checks if schedule spans start and end dates are valid and that they don't overlap with any other rotation schedule.</td>
</tr>
<tr>
<td>RosterMember</td>
<td>Handles roster and member requests.</td>
</tr>
<tr>
<td>FormattedScheduleReport</td>
<td>Generates formatted report on the on-call schedule for the selected groups or the given rotation in the a time span.</td>
</tr>
</tbody>
</table>

Client scripts installed with on-call scheduling

On-call scheduling adds the following client scripts.

<table>
<thead>
<tr>
<th>Script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Handle Group Visibility</td>
<td>Schedule Entry</td>
<td>Handles group visibility when creating schedule entries for on-call. [cmn_schedule_span]</td>
</tr>
<tr>
<td>Question Choice Related List</td>
<td>Question</td>
<td>Handles the choice related list when sending on-call notifications. [question]</td>
</tr>
<tr>
<td>Validate</td>
<td>Roster</td>
<td>Provides client side validation for Roster fields. [cmn_rota_roster]</td>
</tr>
</tbody>
</table>

Business rules installed with on-call scheduling

On-call scheduling adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OnCallEscalation</td>
<td>None</td>
<td>Default escalation handler for on-call rotation escalations.</td>
</tr>
<tr>
<td>Remove rotation records</td>
<td>[sys_user_grmember]</td>
<td>Rotation records removed for a user group member.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Change active</td>
<td>[cmn_rota_roster]</td>
<td>Activate or deactivate the roster.</td>
</tr>
<tr>
<td>Update Rotation Schedules (Member)</td>
<td>[cmn_rota_member]</td>
<td>Recompute the rotation schedules if a member order value was changed.</td>
</tr>
<tr>
<td>Initial Roster Members</td>
<td>[cmn_rota_roster]</td>
<td>Creates a new group member when a roster is created.</td>
</tr>
<tr>
<td>Show records for user</td>
<td>[v_on_call]</td>
<td>Show schedules for a specific user.</td>
</tr>
<tr>
<td>Rota Updated</td>
<td>[cmn_rota]</td>
<td>Recompute the rotation schedules for the roster members after the rota has been updated.</td>
</tr>
<tr>
<td>Update Rotation Schedules (Roster)</td>
<td>[cmn_rota_roster]</td>
<td>Recompute the rotation schedules when the m2m or the roster definition change.</td>
</tr>
<tr>
<td>Delete roster member schedule</td>
<td>[cmn_rota_member]</td>
<td>Recalculate the rotation when a member is removed.</td>
</tr>
<tr>
<td>Delete group member on-call schedule</td>
<td>[sys_user_grmember]</td>
<td>Delete all spans associated to the group member being deleted.</td>
</tr>
<tr>
<td>Delete Rota Schedule</td>
<td>[cmn_rota]</td>
<td>Delete the schedule when the rota is deleted.</td>
</tr>
<tr>
<td>Validate Rota</td>
<td>[cmn_rota]</td>
<td>Verify the schedule entry being updated is valid.</td>
</tr>
<tr>
<td>Edit Schedule</td>
<td>[v_rotation]</td>
<td>Redirects to the schedule page passing the group as parameter.</td>
</tr>
<tr>
<td>Show records for user</td>
<td>[v_rotation]</td>
<td>Display notification.</td>
</tr>
<tr>
<td>Rota Schedule Item validate</td>
<td>[cmn_schedule_span]</td>
<td>Validate that the schedule entry is valid</td>
</tr>
<tr>
<td>Roster Properties</td>
<td>[v_rotation]</td>
<td>Redirects to a list of rosters filtered by groups.</td>
</tr>
<tr>
<td>Refresh Report</td>
<td>[v_rotation]</td>
<td>Refreshes the UI when UI action is executed.</td>
</tr>
</tbody>
</table>

Email notifications installed with on-call scheduling

On-call scheduling adds the following email notifications.

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On-Call Reminder</td>
<td>Sends a reminder to an on-call member when their shift is upcoming.</td>
</tr>
</tbody>
</table>

Events installed with on-call scheduling
On-call scheduling adds the following events.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rota.on_call.reminder</td>
<td>Reminder for upcoming on-call shift.</td>
</tr>
<tr>
<td>incident.on_call.user</td>
<td>On-call user for an assignment group should be notified.</td>
</tr>
<tr>
<td>incident.on_call.device</td>
<td>On-call device for an assignment group should be notified.</td>
</tr>
<tr>
<td>incident.on_call.escalation.device</td>
<td>On-call escalation to a device occurred for a particular roster.</td>
</tr>
<tr>
<td>incident.on_call.escalation.user</td>
<td>On-call escalation to a user occurred for a particular roster.</td>
</tr>
<tr>
<td>trigger_rule.process</td>
<td>Process trigger rule will process the event.</td>
</tr>
</tbody>
</table>

Scheduled jobs installed with on-call scheduling

On-call scheduling adds the following scheduled jobs.

<table>
<thead>
<tr>
<th>Schedule job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On-Call Reminders</td>
<td>Run by a schedule to send reminders to on-calls on a daily basis.</td>
</tr>
</tbody>
</table>

On-call scheduling concepts

On-call scheduling comprises a number of elements.

- **Rota**: the calendar definition of on-call shift hours, personnel lists, and escalation settings, such as escalation type and a catch-all for a group. Rotas define the time slots within which the duty schedule is active.
- **Rosters**: a list of users who are part of the schedule. Rosters define which users are assigned to which time slots within the rota.
- **Schedules**: the basic entity from which rotas and rosters are defined. For example, a company that wants coverage of tasks around the clock would use a 24-7 schedule. Companies that provide support around the globe, could use a follow the sun schedule to cover different time zones across different continents.
- **Holidays**: time off for participants in a rota can be planned and managed in the on-call calendars.
- **Escalations**: the chain of persons and the actions to be taken, for example, when a P1 incident comes in.
- **Notifications**: can be sent to remind people who are on-call of their obligations or if an important event occurs. Notifications are by email with on-call scheduling, or by voice mail or SMS with Notify.

On call scheduling roles

For more information, see User Roles.
Table 415: Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rota administrator</td>
<td>Creates new rotas and edits or deletes existing rotas. Can also manage all other aspects of on-call rotas and rosters (duty shifts).</td>
<td>• assignment_rule_admin</td>
</tr>
<tr>
<td>[rota_admin]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Rota manager</td>
<td>Has delegated access to a specific group's rota and can manage this group's rota and associated data. Cannot edit or delete rotas.</td>
<td>• none</td>
</tr>
<tr>
<td>[rota_manager]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Roster administrator</td>
<td>Manages on-call rotation information.</td>
<td>• none</td>
</tr>
<tr>
<td>[roster_admin]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Delegating the rota manager role

As a rota manager, you can delegate your role to a member of your rota.

Role required: admin or rota_manager

1. Navigate to **User Administration > Delegate Roles in Group**.
2. Follow the instructions to **delegate** the rota manager role to a member of your rota.

**Note:** Ensure that you select your rota group within which you want to delegate the rota manager role.

3. Submit the role delegation request.

On-call scheduling wizard

A simple way to set up a new on-call schedule is to use the wizard functionality.

On-call scheduling can easily be used with Notify, which can send notifications by SMS and voice mail. See **Use Notify with on-call scheduling**.

After running the on-call wizard, you can adjust individual rosters, and escalation and reminder settings to fine-tune your setup. You can also enable on-call notifications by setting up rotation workflow triggers.

Schedule templates

You can also define schedule templates that are used in the new schedule wizard. For more information, see **Use Schedules**.

Set up a new on-call schedule

You can use the on-call scheduling wizard to add a new on-call schedule.

Role required: rota_admin or admin

1. Navigate to **On-call Scheduling > Administration > Create New Schedule**.
   The first page of the wizard opens where you define the basic information for your schedule.

2. Answer the questions, and then click **Next**.
Table 416: Basic info questions

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What would you like your schedule’s name to be?</td>
<td>The friendly name users see when they view the rotas.</td>
</tr>
<tr>
<td>Which group does this schedule apply to?</td>
<td>The group this on-call schedule affects. Only members of this group can be added to this schedule’s rosters. A group is not allowed to have overlapping schedules. For example, if a group has a 24x7 schedule, you cannot create another schedule for the same group. However, for a group with an 8 A.M. to 8 P.M. schedule, you can create an 8 P.M. to 8 A.M. schedule.</td>
</tr>
<tr>
<td>When would you like your new schedule to begin?</td>
<td>The starting date for the on-call schedule. By default, this value is set to the current date.</td>
</tr>
</tbody>
</table>

The Schedule Definition page opens.

3. Answer the questions, and then click **Next**.

Table 417: Schedule definition questions

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Would you like to use an existing schedule?</td>
<td>Select <strong>Yes</strong>, and then select one of the predefined options in the next question. Select <strong>No</strong> to set up the schedule’s configuration manually.</td>
</tr>
<tr>
<td>What type of schedule would you like to use?</td>
<td>Some options are available in the base system, for example, 24x7, Workday 8-5. Select the value to base your schedule on. This question appears only if you answer <strong>Yes</strong> to the first question. The logged-in user’s time zone is used to build these schedules. If the logged-in user does not have a time zone specified, the system time zone is used.</td>
</tr>
</tbody>
</table>

The following questions appear if you answered No to the first question.

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What would you like your new schedule’s name to be?</td>
<td>The friendly name of the schedule that appears on the <strong>On-call calendar</strong> page.</td>
</tr>
<tr>
<td>Is the shift for this schedule all day?</td>
<td>Option for indicating whether each shift is a 24-hour shift. If you select <strong>Yes</strong>, the shift start time is reset to 00:00:00 and the end time is no longer required.</td>
</tr>
<tr>
<td>Question</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>When must the shift for your new schedule start?</td>
<td>The time of day the shift is scheduled to start. For a 24-hour shift, this is set to 00:00:00.</td>
</tr>
<tr>
<td>When must the shift for your new schedule end?</td>
<td>The time of day the shift is scheduled to end. The start and end time represent one shift, and the date is only different if the shift spans midnight. For example, for the 8 A.M. to 8 P.M. shift, the start is 2014-01-01 08:00:00 and end is 2014-01-01 19:59:59. For the 8 P.M. to 8 A.M. shift, the start is 2014-01-01 20:00:00 and the end is 2014-01-02 07:59:59. This field is available only for shifts that are not 24-hour.</td>
</tr>
<tr>
<td>In which time zone does your schedule apply?</td>
<td>By default the logged-in user's time zone is selected. If the schedule needs to be set up in a different time zone, change the value.</td>
</tr>
<tr>
<td>How often does 1 shift repeat?</td>
<td>The days that the shift repeats, such as Daily, Weekly, or Every Weekday (Mon-Fri). Several options are listed by default. If the value needed is not in the list, select the closest match and manually edit it after the on-call schedule is generated. The repetition interval determines how long it takes to rotate each member in the schedule. For example, if you select Daily, then each member's shift in the schedule rotates on a daily basis. If you select Weekly, then each shift continues for a week before rotating to the next member in the roster. The wizard does not provide a monthly or yearly option. Although you could create a monthly or a yearly shift by editing the schedule manually, this is not advised because it is hard to determine the on-call person over a long period of time. In this case, create a yearly or a monthly schedule with only one roster and one member so that the same person is always on-call. Any exceptions can be made as a one-time change in the roster.</td>
</tr>
</tbody>
</table>
The Escalations and notifications setup page opens.

4. Answer the questions, and then click Next.

### Table 418: Escalation and notification settings

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How many duty rotations are there in your on-call schedule?</td>
<td>The simplest on-call schedule contains only one roster. Selecting more than one generates multiple rosters with the same members shifted by one position in each.</td>
</tr>
<tr>
<td>Which members would you like to be in your schedule?</td>
<td>Select from the people in the group that you entered on the Basic Information page.</td>
</tr>
<tr>
<td>How many reminders should be sent out before escalating?</td>
<td>When escalations are configured for this group, the system first sends the number of reminders designated here before notifying the backup personnel.</td>
</tr>
<tr>
<td>How long should we wait until sending the next reminder?</td>
<td>By default, there is a 15 minute wait before the next reminder is sent. If the needed value is not available, select the closest match and edit the roster to update the number of reminders after the on-call schedule is generated.</td>
</tr>
</tbody>
</table>

The following results occur.

- An on-call schedule is created.
- A roster is created for the number of duty rotations specified.
  - Each roster follows the specified schedule.
  - A lineup of the selected members from the group is created. For multiple duty rotations, the order of the members is offset by 1 to prevent scenarios where users are scheduled as their own backup during an escalation.
- Escalation settings are created.

### Change rota escalation settings

Rota escalations are set after the wizard has been completed.

Role required: rota_admin or admin

**Escalation type** determines the order in which certain members of a group are notified about the escalation. The escalation type depends on the number of rosters. Its value is automatically set to **Rotate Through Members** if a rota has only one roster. The escalation chain goes through all members of that roster. If a rota has more than one roster, its value is **Rotate Through Rosters**. The escalation chain goes through all the rosters to determine who to notify.

**Catch-all** identifies the user who receives notifications if none of the on-call staff accepted the incident assignment. It can be none, a group manager, an individual, or all roster members.

1. Navigate to **On-Call Scheduling > My Group Schedules**.
2. Select the rota to edit.
3. Change the escalation settings.
4. Click Update.

**Change rota reminder settings**
The **Send on-call reminders** and **Reminder lead time (days)** settings send an email notification to the on-call person a specified number of days before the on-call obligation.

Role required: rota_admin or admin

The reminder is sent to the email address specified in the user record, unless it is specified somewhere else in the notification preferences. Notification preferences take precedence over the user record.

1. Navigate to **On-Call Scheduling > My Group Schedules.**
2. Select the rota to edit.
3. Change the reminder settings.
4. Click **Update.**

**Access the roster for a rota**
The **Rosters** related list in the Rota form contains the defined rosters. Each roster identifies a subset of group members who participate in the on-call roster.

Role required: rota_admin or admin

1. To access rosters for a specific rota, navigate to **On-Call Scheduling > On-Call Calendars.**
2. Right-click a rota and select **Edit rota.**
   
   If a roster’s rotation should begin at a particular time of day, perhaps on-call responsibility transfers at 8 A.M. instead of midnight, clear the **All day rotation** check box so you can specify a start time.
3. Open a roster to see the members.
   
   Initially, roster members are automatically populated from the **Group.**
4. Optional: To remove users who do not participate in a rotation, click the **Edit** button on the **Members** related list, use the slushbucket to remove members, and then click **Save.**
   
   You cannot add members to a roster who are not in the group.

**Escalation and reminder settings**
Escalation settings allow you to control how and when escalations occur and notifications are sent.

**Escalation settings**

- **Forced communication channel:** If Notify is active, you can specify a mandatory communication channel, either SMS or email. Keep in mind that if the on-call member does not have an SMS device, they are not contacted. No further communication attempts are made and the lack of an SMS device is logged.
- **# reminders:** The number of times the ServiceNow platform sends reminders to a person who doesn't reply within the time frame defined in **Time between reminders.**
- **Time between reminders:** The time between the reminders being sent.

Values in these fields determine the value in the **Time before escalation** field. For example, if **# reminders** is 2 and **Time between reminders** is 10 minutes, then the **Time before escalation** is 30 minutes. That is the time that passes between the first notification of a specific person and the first notification of the next person if the first one does not reply to the notification or reminders.
Reminder settings

Reminder settings can be defined for each individual roster. They enable configuration of sending reminders and the reminder lead time in days.

On-call notifications

To enable on-call notifications so that rota workflows have an effect, you must define trigger rules.

Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken. For more information, see Trigger Rules.

On-call scheduling management

You can edit a rotation schedule directly from the calendar.

After you create a rotation schedule, you can edit it directly from the calendar. This allows easy access to the rotation, especially for one-time changes. Users with the admin, rota_admin, or rota_manager role can edit schedule data. Only users with the admin or rota_admin role can delete schedule data.

Adjust an existing shift

You can adjust an existing schedule from the on-call calendar.

Role required: rota_admin or rota_manager

1. Navigate to On-Call Scheduling > On-Call Calendars.
2. Select a Group.
   The rotation schedules are shown for that group.
3. Double-click an existing shift.
4. Select one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify extra times when a rota is active</td>
<td>Select the Rota to change if multiple rotas are available. If a span overlaps with another rotation schedule, an error is shown.</td>
</tr>
<tr>
<td>Schedule time off for a group member</td>
<td>Select the Member to schedule time off for.</td>
</tr>
<tr>
<td></td>
<td>Time off is shown as a different color, and the member’s name is followed by a time off notation. To give a group member time off for more than one day, double-click to open the time-off record you just created and set it to repeat, for example, daily until a specified date.</td>
</tr>
</tbody>
</table>

Note: When you specify time off for a group member, it only applies to the current group selected. If users are on multiple rotas, time off must be entered separately for each rota.

5. Click OK.

Designate a substitute for a shift

You can substitute a shift from the on-call calendar.

Role required: rota_admin or rota_manager

1. Navigate to On-Call Scheduling > On-Call Calendars.
2. Select a Group.
The rotation schedules are shown for that group.

3. Double-click the appropriate shift.

4. Select **Provide on-call coverage for another roster member**.

5. Select the **Member** scheduled to work the shift as a substitute.

6. In **Covering on**, select the desired roster or **All**.

7. Click **OK**.

The changed shift is shown in orange and the information for the roster schedule entry states the selected shift, for example, **Primary coverage**, or **Secondary coverage**. If you selected **All**, the member you selected covers for all rosters at that particular time and as many entries are made as there are rosters.

The final result looks like the following illustration.
Change the rota or span for a group
You can change the rota or span for a group from the on-call calendar.

Role required: rota_admin or rota_manager

Note: When creating or changing calendar entries manually via On-Call Scheduling > On-Call Calendars, enter the start time as a whole hour and the end time minus one second to prevent
unintentional overlap with other entries, resulting in an incorrect on-call lineup. For example, a span from 16:00 to 24:00 P.M. should be entered as: 16:00:00 to 23:59:59.

1. Navigate to On-Call Scheduling > On-Call Calendars.
2. Right-click the appropriate rota and select one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit rota</td>
<td>To change the schedule or related information.</td>
</tr>
<tr>
<td>Edit span</td>
<td>To change the dates and frequency that the rota is active.</td>
</tr>
</tbody>
</table>

3. Make the changes and click Submit.
   If you click Resend Reminders on the Rota form, you can inform the rota members of the changes you made.

On-call scheduling ITIL functions

Users with the itil role can use on-call scheduling functions to keep track of rotation schedules.

The following list describes these ITIL functions.

- View schedules for their groups.
  - View their personal schedule.
- View calendars on page 1785
- View reports

View my group schedules
You can see the on-call schedules for groups that you are a member of.

Role required: itil

1. Navigate to On-Call Scheduling > My Group Schedules.
2. Open a schedule to view the details.
3. Optional: To view a roster, click its order number in the Rosters related list.

View my schedule
You can view when you are on-call and the escalation lineup for a particular date range.

Role required: itil

1. Navigate to On-Call Scheduling > My Schedule Report.
2. In Show for, select a date range.
3. Click Submit.
This shows the rota, the roster, and the start and end times for each timeslot.

4. To view alternate rosters, expand an entry by clicking the arrow.
This shows other rosters for that timeslot. For example, if you are the primary contact, this shows secondary and tertiary contacts for that timeslot.

**View calendars**
On-call calendars provide a way of visualizing the on-call rotation for a group.

*Role required: itil*

A calendar shows the rotation schedule in light blue and the roster in deep blue for a specific rotation. If there is more than one rotation schedule on a particular day, the secondary rotation is shown in green and the tertiary in yellow.
1. Navigate to **On-Call Scheduling > On-Call Calendars**. The calendar display defaults to the first group with a roster. Each time slot specified for the group’s roster is displayed along with the on-call person assigned to that slot.

2. In the **Group** choice list, select the group you are interested in viewing.

3. Use any of the following icons and controls to navigate within the calendar.

---

</table>
### View the monthly calendar
Click the monthly icon ( )

### View the weekly calendar
Click the weekly icon ( )

### View the daily calendar or move to a specific date
Click the daily icon ( )

### Move the calendar back and forward in time
Click the left and right arrows beside the date.

### View the calendar as a timeline
Click the timeline icon ( )
The on-call shifts are shown as horizontal bars for each day. By default one week is shown. Use the + and - buttons to expand or collapse the timeline to 21, 35, 49, 63 days and so on.

### Add item
You can add extra coverage, specify extra times for when a rota is active, and schedule time off.
Role required: group_manager or rota_manager

1. Navigate to **On-Call Scheduling > On-Call Calendars**. The on-call coverage for the selected group’s calendar displays.
2. Double-click the time-slot for which to add a schedule entry. The **Add Item** pop-up window displays.
3. Select one of the following options, as appropriate.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Provide on-call coverage for another roster member** | Select details of the member who will provide coverage for another roster member. The following options appear when you select this option:  
• Member: Select the member to provide extra coverage  
• Covering on: Select the roster for which the member will provide coverage. |
| **Specify extra times when a rota is active** | Specify extra coverage for the selected rotation.                           |
| **Schedule time off for a group member**    | Specify the group member who will take scheduled time-off during the selected time frame. |

### Modify schedule entry
You can make updates to a schedule entry such as changing schedule entry type, date, and time.
Role required: group_manager or rota_manager

1. Navigate to **On-Call Scheduling > On-Call Calendars**. The on-call coverage for your group’s calendar displays.
2. Double-click the schedule entry on the calendar to modify.
3. Update in the fields on the pop-up form.

Table 419: Schedule Entry

<td>If the schedule entry is selected to repeat, then specify how often it repeats. For example, if you select weekly repetitions, specify the frequency such as every week or every two weeks.</td>
</tr>
<tr>
<td>Repeat on</td>
<td>If the schedule entry is selected to repeat, then specify when it repeats. For example, if you select weekly repetitions, specify the days of the week when it would repeat.</td>
</tr>
<tr>
<td>Repeat until</td>
<td>If the schedule entry is scheduled to repeat, then specify an end date until which the schedule entry repeats itself.</td>
</tr>
</tbody>
</table>

4. Click **Update** to save changes.

**View a report for on-call scheduling**

You can schedule a report of users who are on-call or a catch-all for one or more groups during a specific time period.

Role required: itil

1. Navigate to **On-Call Scheduling > Schedule Report**.
2. Select the start and end dates for the report.
3. Enter the first few letters of the desired group into the **Name** field to see a list of groups that start with those letters, or select the **All groups** check box to see a list of all available groups.
4. Select at least one group in the slushbucket.
5. For **Report style**, select one of the following.
   - **Table**: to display the report on-screen as a list that can be sorted, filtered, and configured, like other lists.
   - **Formatted**: to generate a report in PDF format.
6. Click **Run Report**.
7. If you selected **Formatted**, click the **Click to Print** button to print the report.
   
   The report shows the on-call commitments for all selected groups during the selected date range.
View an escalation report

The escalations report shows you what the escalation sequence is and which rules apply for the selected date. For each group, you can choose to show either the active roster members or the on-call person.

Role required: itil

You can see the on-call persons only for the groups you are authorized to see. If you select an unauthorized group, a message appears stating that a number of rows have been removed due to security constraints.

1. Navigate to On-Call Scheduling > Escalations > Escalations Report.
2. Select the date for the report.
3. Enter the first few letters of the desired group into the Name field to see a list of groups that start with those letters, or select the All groups check box to see a list of all available groups.
4. Select at least one group in the slushbucket.
5. For **Report style**, select one of the following.
   - **Active roster members**: to display the on-call persons and catch-all persons in the escalation order, along with their delay times.
   - **On call person**: to quickly find out who is currently on duty.

6. **Click Run Report**.

**Define lead time for email reminders**

On-call scheduling includes a scheduled job that checks if any on-call members need to be notified about upcoming on-call commitments. The lead time for when reminders are sent can be modified.

**Role required**: rota_admin or rota_manager

The On-Call Reminders job runs the OnCallRemindersNG script include to generate the notifications.

1. Navigate to **On-Call Scheduling > On-Call Calendars**.
2. Right-click the rota and select **Edit rota**.
   
   The rota is the listing in the calendar above the scheduled users.
3. Change the **Reminder lead time (days)** field for the on-call schedule record or for any of its rosters.

   The reminder lead time defined on a roster is always respected. If no lead time is defined, the on-call schedule's reminder lead time is used. If the reminder lead time is not defined for either the on-call schedule or its rosters, then a default of 2 days is used.

**Note**: Keep in mind that the Reminder lead time on the Roster form is different from the # reminders and Time between reminders fields in the Escalation Settings section of the form. The escalation settings are only used to configure reminders for escalations. The Reminder lead time is in the Reminder Communication section of the Roster form, and is used to email reminders for upcoming on-call commitments.

**Resend on-call email reminders**

You can resend email reminders, which can be useful to inform group members about changes in their shift.

**Role required**: rota_admin or admin

1. Navigate to **On-Call Scheduling > My Group Schedules**.
2. Open the rota to resend email reminders.
3. **Click Resend reminders**.
   
   The option is also available when you edit a rota for a group in **On-Call Calendars**.

**On-call scheduling escalations**

Escalations provide a mechanism to ensure that important issues are addressed in a timely manner within on-call scheduling.

Escalations use a mechanism similar to SLAs to monitor response time and take time measurements. You can take action if these times are breached. The actions, like sending out an email or an SMS, are fired by trigger rules. You define trigger rules to determine the conditions under which specified actions are taken.

For example, a critical incident is raised for Acme Pharmaceuticals regarding a problem with their network access. An SMS notification is sent to James Jones, the third-line support engineer who is currently on-call for this type of incident. However, James is unavailable, and does not respond within the defined 30-minute response time.
Trigger rules defined for Acme Pharmaceuticals' critical incidents initiate an escalation after 30 minutes without a response. The person defined as the next point-of-contact is Ken Kramer, James' line manager, so an SMS notification is sent to Ken.

Users with the rota_admin role can configure escalation settings and define trigger rules.

Escalation triggers
Escalation triggers define the conditions under which escalation actions occur in on-call scheduling. These actions can be defined with a workflow or server-side JavaScript.

When a task is created or updated, the system compares the assignment rules with the trigger conditions, to see if any of the trigger conditions are matched. If a match is found, the system activates the associated workflow or script, which holds the escalation steps and actions.

For example, a new P1 incident is created and assigned to the Software Group. A trigger condition states that if P1 incidents are created and assigned to this group, then an associated script or workflow should run.

Escalation trigger rules

Escalations use trigger rules to define conditions under which a trigger action is to be executed. A trigger action can be either a script or workflow. Trigger rules are an extension of assignment rules and are therefore run by the system. The behavior of assignment rules is used for trigger rules.

Trigger rules and trigger actions allow users to quickly set up escalation scenarios.

Example escalation scenario

Acme Pharmaceuticals needs to support a simple escalation process. When a critical or high incident is raised, a member of the Network group should be assigned to the incident based on the Network group's on-call schedule.

First, the trigger rule is defined with its conditions.
Create a trigger rule

You can create trigger rules to define conditions under which a trigger action is to be executed.

Role required: rota_admin or admin

Trigger rules fire only if the \texttt{assigned\_to} and \texttt{assignment\_group} fields are not populated on a record.

1. Navigate to \textbf{On-Call Rotations} \textgreater{} \textbf{Escalations} \textgreater{} \textbf{Trigger Rules}.
2. Click \textbf{New}.
3. Complete the form.

\begin{table}
\centering
\caption{Trigger rule form}
\begin{tabular}{|l|l|}
\hline
\textbf{Field} & \textbf{Description} \\
\hline
Name & The name of this trigger rule. \\
Order & The execution order of this trigger rule. \\
Table & A task table that applies to the trigger rule. \\
\hline
\end{tabular}
\end{table}

\textbf{Note}: The list shows only tables and database views that are in the same scope as the trigger rule.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match conditions</td>
<td>How the conditions should be applied. If you select <strong>All</strong>, all of the conditions have to be matched. If you select <strong>Any</strong>, it is sufficient if any one of the conditions is matched.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions which must be met before the trigger rule executes.</td>
</tr>
<tr>
<td>Group</td>
<td>Define the group that is applied to the <strong>Tasks assignment group</strong> field when the trigger rule is applied to the task.</td>
</tr>
<tr>
<td>Trigger action</td>
<td>Run a <strong>Workflow</strong> or <strong>Script</strong> when the trigger conditions are met.</td>
</tr>
<tr>
<td>Trigger workflow</td>
<td>The workflow to execute. This field is available only if <strong>Trigger action</strong> is set to <strong>Workflow</strong>.</td>
</tr>
<tr>
<td>Trigger script</td>
<td>The script to execute. This field is available only if the <strong>Trigger action</strong> is set to <strong>Script</strong>.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Escalations by email workflow for on-call scheduling**

The workflow enables sending an email notification regarding a newly raised incident to the on-call members of a particular group.

The workflow does not expect a response to the email notifications it sent, but instead checks the source incident record for changes in the **assigned_to** field. Depending on the value of the **assigned_to** field of the source record, the workflow branches or loops until the escalation chain is exhausted or the **assigned_to** field of the source incident is populated. If none of the users accepts assignment in time, the catch-all person is notified, if configured.

The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

The workflow is intended to be used on a trigger rule based on the Incident table but other tables can be used as well. If you want to use a different table for this workflow, select the appropriate table, for example, Problem, in the **Trigger Workflow** field on the trigger rule form. This workflow is provided with on-call scheduling.
Escalation chain
An escalation chain describes the order in which rosters and roster members receive escalation notifications.

Depending on the number of rosters, the rota escalation type is one of the following.

- **Rotate through members**: the escalation chain goes through the member list of a specific roster (primary, secondary, tertiary) to determine who is to be notified.
- **Rotate through rosters**: the escalation chain goes through all the rosters to determine who is to be notified.

Depending on the escalation type you chose, the Escalations Report result can vary greatly. Following are example reports for each choice.
Figure 511: Rotate through rosters

The image shows the case in which reminders are defined for the **Primary**, **Secondary**, and **Tertiary** rosters. The members of the primary roster are notified first, then the members of the secondary, and so on for as many rosters as there are.
For this example, users can see which rotas they are part of in the My Schedule Report module. Users who are not the first on-call person are displayed as well. This enables the user to view the rota from a personal perspective, which is the preferred method for most users.

Use Notify with on-call scheduling

Within on-call scheduling, you can use Notify functions to send an SMS to on-call resources when an incident gets assigned to them.

A mobile number is required in their user record. Be aware that some phone numbers have only voice mail capabilities.

Notify is available as a separate subscription from the ServiceNow platform. To purchase a subscription, contact your ServiceNow account manager.

Notify workflow for on-call scheduling

The On-Call: Assign by Acknowledgement workflow is provided with Notify. The workflow uses data from the escalation settings of rotas and rosters. Depending on these settings, the workflow iterates through the defined escalation chain and sends notifications by SMS or email to users about incident assignment.

If Force communication channel is specified in the Escalation settings for rosters, the preferred user device is used, either SMS or email. The setting Force communication channel is only available if Notify is installed.
If the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is
not contacted even if they have an email address. When forcing a communication channel on an escalation
level does not succeed, no further communication attempts are made. The fact that the user could not be
reached is logged in the log files.

The workflow respects time-off as specified in the rosters. People who have time-off are not included in the
escalation chain and no notifications are sent to them.

Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that
must be met before a notification is sent and what action must be taken. Keep in mind that trigger rules
supersede some of the on-call business rules in previous versions.

Note: If you have customized on-call business rules in previous versions, you need to deactivate
these business rules before you can work with trigger rules.

Upgrade to on-call scheduling

Group on-call rotation is replaced with on-call scheduling.

Upgrading from a previous version is completely automatic, and all events are recorded in the upgrade
logs (System Diagnostics > Upgrade History).

- The existing On-Call plugin has been changed. When you upgrade, the plugin changes are applied
  automatically (this is not optional).
- The group device functionality is deprecated in favor of a Catch All person.
- On-call scheduling replaces the existing business rules for escalations based on
  Graphical Workflow.
- The workflow uses Notification Activities, so it sends emails and not SMS messages. It must be
  modified to use Create Events activities to send SMS messages.

Keep these and the following changes in mind as you transition to on-call scheduling.

Additional workflows for Notify

Workflows have superseded the notification rules on rotation schedules.

Some example workflows are provided in the demo data available with the plugin. When you upgrade an
instance running group on-call rotation, some data from the notification rules is migrated to other tables.
The migrated information is recorded in the Notification rules - migration report, which the administrator can
run in Reports > View/Run.

Please be aware that in on-call scheduling some business rules related to escalations and notifications
were deprecated and replaced with workflows.

When you use Notify with on-call scheduling, additional workflows enable users to receive notifications and
accept or reject auto-assignment via SMS.

On-call wizard

This wizard enables users to create a basic rotation schedule and one or more rosters, along with
escalation and reminder settings.

The Create New Schedule module presents an enhanced wizard for creating schedules. The Create New
Rota module and the option for manually creating rotas are deprecated.

Option rotate through rosters

The Rotate through rosters option has been added to the My Group Schedules module.

Navigate to On-Call Scheduling > My Group Schedules and choose a rota to view this setting. It is part
of the escalation settings. The option is used automatically when there is more than one active roster. It
helps to prevent on-call users from being their own backups, as the on-call lineup order is staggered by
one for each roster.
Trigger rules upgrade
When an instance running group on-call rotation is upgraded, some data from the notification rules is migrated to other tables.

The migrated information is recorded in the Notification rules - migration report, which the administrator can run in Reports > View/Run.

Figure 513: Notification rules migration report

Trigger rules supersede the On-call Rotation Notify and On-call Rotation Cancel on-call business rules used in previous releases. If you customized on-call business rules in previous versions, you must deactivate these business rules before you can work with trigger rules.

Note: This is a one-time upgrade. If you have already upgraded trigger rules in the earlier release, you do not need to upgrade again. When you upgrade to an instance that has on-call scheduling application installed, the behavior of trigger rules for on-call scheduling changes.

Skills Management

The Skills Management feature enables an administrator to assign configured competencies, called skills, to groups or individual users. These skills can then be used to determine who can be assigned to particular tasks.
Skills can contain other skills. Any access granted to a parent skill is granted to any skill that it contains. Once a skill is assigned to a group, all members of the group automatically inherit that skill and any others contained within it. The skills mechanism is similar to the ServiceNow platform role management.

Activate skills management

The Skills Management plugin is automatically activated by the Field Service Management and Project Management plugins. Administrators can also activate the Skills Management plugin manually.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Create a skill

You can create skills to specify the competencies of your users.

Role required: skill_admin or admin

1. Navigate to Skills > Skills.
2. Click New.
3. Enter a unique, descriptive Name.
4. Enter a Description of the skill.
5. Right-click the form header and click Save.
   - The Contains Skills, Users, and Models related lists appear.
6. Optional: Use the Contains Skills related list to add subskills.
7. Optional: Use the Models related list to add any models that are associated with the skill.
   - The Users related list contains users (based on their User record or the groups they belong to) who have the skill and subskills named in this record. You can also add users to specify they have the skill.

Assign a user skill

You can assign skills individually to users.

Role required: skill_admin or admin

If you assign a skill that contains other skills to a user, the user automatically inherits the contained skills.

1. Navigate to Skills > Users.
2. Select a user from the list.
3. In the User record, select the Skills related list.
4. Click Edit and select one or more existing skills from the slushbucket.
5. Click Save.

Assign a group skill

You can assign skills to groups, and the members of the group inherit all the assigned skills.

Role required: skill_admin or admin
If you assign a skill that contains other skills to a group, the group and all its members automatically inherit the contained skills.

1. Navigate to Skills > Groups.
2. Select a group from the list.
3. In the Group record, select the Skills related list.
4. Click Edit and select one or more existing skills from the slushbucket.
5. Click Save.
   The skill is added to the group and all the group members who are granted this skill are listed at the top of the form.

Filter potential assignees based on skills

In the base system, field service management tasks and project tasks use skills to filter assignments. If a skill is identified in the Skill field, only groups or users with the appropriate skill can be assigned to the task.

The Skills Management feature contains a script include that builds a qualifier based on the assignment group and required skills for the task. For example, the Assigned To field on the Project Task record uses the following reference qualifier (using a dictionary override):

```
javascript:var util = new SkillsUtils(); util.assignedToRefQual(current);
```

This script has the following results.

- If an Assignment group is set, the list is filtered on members of that group.
- If Skills are set (the Skills field may need to be added to the form), the list is filtered on users with all the selected skills.
- If Assignment group and Skills are both set, the list is filtered on group members with the defined skills.

You can introduce the same behavior to other task tables by using the same reference qualifier.

Authentication

Authentication means validating the identify of a user who is trying to access an instance, and then authorizing the user to access features that match the user's role or job function.

Available authentication methods

You can use several different methods to authenticate users. User credentials are matched to different saved credentials for each method.

<table>
<thead>
<tr>
<th>Authentication methods</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>Local database</td>
<td>The user name and password in their user record in the instance database.</td>
</tr>
<tr>
<td>Multifactor</td>
<td>The user name and password in the database and a passcode sent to the user's mobile device that has Google Authenticator installed. See Multifactor authentication on page 1802.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
<table>
<thead>
<tr>
<th>Authentication methods</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP</td>
<td>The user name and password in their LDAP account, which has a matching user account in the database. See <em>LDAP integration</em> on page 1809.</td>
</tr>
<tr>
<td>SAML</td>
<td>The user name and password configured in a SAML identity provider account, which has a matching user account in the database. See <em>SAML 2.0</em> on page 1904.</td>
</tr>
<tr>
<td>OAuth 2.0</td>
<td>The user name and password of OAuth identity provider, which has a matching user account in the database. See <em>OAuth 2.0</em> on page 1952.</td>
</tr>
<tr>
<td>Digest Token</td>
<td>An encrypted digest of the user name and password in the user record. See <em>Digest token authentication</em> on page 1947.</td>
</tr>
</tbody>
</table>

Multiple Provider SSO allows you to choose use several identity providers (IdPs) to manage authentication as well as retain local database authentication. You can use SAML and Digest Authentication through the Multiple Provider SSO application.

**Tips for choosing an authentication method**

- Development environments can use the instance's database credentials to speed up the development of new features.
- Customers who manage their users with existing LDAP or identity providers should use a matching authentication method.

**Enable external authentication**

You can enable external authentication on your instance.

1. Navigate to **System Definition > Installation Exits**.
2. Activate the **ExternalAuthentication** installation exit.

   **Note:** If you are using the Digest authentication method, you must also enable the DigestSingleSignOn installation exit.

3. Navigate to **System Properties > Single Sign-on**.
4. Select **Enable external authentication** and click **Save**.

Administrators may need to bypass external authentication when testing an SSO integration. Administrators can use the following URL to bypass external authentication and log in with a local user. A logged-in user cannot access this page. Attempting to access this page while logged in produces a page not found error. [http://<your-instance>.service-now.com/side_door.do](http://<your-instance>.service-now.com/side_door.do)

**Multifactor authentication**

Multifactor authentication, also known as two-step verification, is a security requirement that asserts a user enter more than one set of credentials to authenticate to an instance.
The basic level of authentication to an instance is local database authentication—the user enters a username and password combination. Multifactor authentication, in contrast, gives administrators and users the ability to require a second level of authentication—the user must enter a passcode or token in addition to the password. A mobile application on a user mobile device generates the passcode.

- Users can require multifactor authentication for their own login credentials.
- Administrators can require multifactor authentication for any user login credentials.

Multifactor authentication supports only the Google Authentication mechanism as the token provider. Users should install the recommended *Google Authenticator application* to their mobile devices.

**Supported authentication methods**

- You can use multifactor authentication in combination with the following authentication methods:
  - Local Database Authentication (native ServiceNow authentication)
  - SSO with the *LDAP integration* on page 1809

**Authentication methods that are not supported**

- Multifactor authentication is not supported in combination with the following authentication methods:
  - SSO SAML
  - SSO Digest

**Authentication flow**

*Note:* If a user is required to perform a password change while multifactor authentication is enabled on the user profile, the user does not need to enter the authorization code.

1. The user or administrator goes to a user profile in the instances and initiates multifactor authentication.
2. The instance displays a QR code and a QC code number.
3. The user takes a photo of the code with the Google Authenticator application on their mobile device, or manually enters the QC code number in the authenticator application.
4. A passcode is sent to the user's mobile device.
5. The user enters the passcode to enable multifactor authentication.
6. The next time the user tries to log in, the user looks at the Google Authenticator application to get the latest passcode.
7. The user enters the username and password and appends the passcode to the password.
8. If the username and password + passcode combination are correct, the user is authenticated to the instance.

**Activate multifactor authenticator**

Administrators can activate the *Integration- Multifactor Integration plugin*, which is not active by default.
Configure multifactor authentication

You can enable multifactor authentication on the instance and specify how many times users can skip the additional passcode requirement.

Role required: admin

1. Navigate to **Multifactor Authentication > Properties**.
2. Configure these properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Multifactor Authentication (glide.authenticate.multifactor)</td>
<td>Select this check box to allow users and administrators to use this feature.</td>
<td>Enabled</td>
</tr>
<tr>
<td>Number of times a user can bypass multifactor authentication (glide.authenticate.multifactor)</td>
<td>Enter a number that represents how many times a user can choose to skip the additional passcode requirement. This gives your users the ability to still log in the instance if they do not have their mobile device with them. If you disable this feature and then re-enable it, the counter starts over again.</td>
<td>3</td>
</tr>
<tr>
<td>The time in minutes, the one-time code sent to user’s email address is valid for (glide.multifactor.onetime.code.validity)</td>
<td>Enter a number in minutes that specifies how long the reset code is valid. See <strong>Log on with multifactor authentication</strong> on page 1807.</td>
<td>10</td>
</tr>
</tbody>
</table>
Additional time in seconds for which the code will be valid to accommodate for the clock skew. Max value is 60 seconds. (glide.authenticate.multifactor.clock_skew)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional time in seconds for which the code will be valid to accommodate for the clock skew. Max value is 60 seconds. (glide.authenticate.multifactor.clock_skew)</td>
<td>Enter a number in seconds with a maximum of 60. By default, the instance validates the code entered by the user against the single app-generated code generated at whatever the current time is. You can skew the time window with this property and allow one or more codes generated during a time window to be considered valid. The property's value is used in the following calculation: <code>current time - x/2</code> and <code>current time + x/2</code>, where 'x' is the value of this property. If you use the value of 10, for example, the instance considers any codes generated by the app between the time range `[the current time - 5 seconds] and [current time + 5 seconds] to be valid. Use this property to prevent log in issues where the user is unable to enter the correct code in the default time allotted.</td>
<td>10</td>
</tr>
</tbody>
</table>

3. Click Save.

### Require multifactor authentication for a user

You can require multifactor authentication for any user record in the system that you have access to.

Role required: admin

1. Navigate to User Administration > Users.
2. Configure the list to show the Enable Multifactor Authentication column.
3. Change the values of the Enable Multifactor Authentication column for the selected users to true.

When the user logs in with their user name and password, they are prompted to set up multifactor authentication.

### Set up multifactor authentication upon initial login

If your administrator enabled multifactor authentication on your profile but you have not yet set up the application, you can set it up upon login.
Role required: none

1. Log into your instance using your user name and password. The multifactor authentication setup screen intercepts your login.

2. If you want to skip the authentication setup at this time, click Bypass Setup. You can bypass multifactor authentication for a limited number of times that your administrator allows. Eventually you need to configure multifactor authentication.

3. If you do not yet have the Google Authenticator application in your mobile device, you can download it from one of the links provided under Download the app.

4. Take a photo of the QC code with the Google Authenticator application or enter the string in the application manually.

5. Enter the code and click Pair device and log in.

The application responds with a six digit code that refreshes every 30 seconds. If you entered the correct code, a message appears telling you that Multifactor Authentication is set up. If you entered
an invalid code, look for the code on your mobile device again as it may have refreshed, and enter the code that you see.

**Note:** For the code to work property, the system time on your computer must be in the same timezone as the time on your mobile device.

Log on with multifactor authentication

After multifactor authentication is enabled for your User profile, you can log in with the addition of the passcode that the Google Authenticator app gives you.

You must have multifactor authentication enabled for your profile. You can enable it yourself on your user profile or your administrator can enabled it for you.

Role required: none

1. Go to the URL of your instance to open the log in screen.
2. Open the Google Authenticator application on your mobile device and make note of the number. The number refreshes every 30 seconds.
3. Enter your user name and password, and append the passcode that you currently see on your mobile device to your password without any extra spaces. For example, if your password is **12345** and the current passcode is **424 058**, enter **12345424058**.
   
   If you forget to enter the code and you only enter the password, you are prompted to enter the code in a new window.

4. Enter the code and click **Login**.
5. If you do not remember the passcode, click the **Click to send one-time passcode** link.
   
   The temporary passcode is sent to your email address. You can append this passcode to your password as you would the original passcode. You can only use this temporary passcode once and it is only valid for 10 minutes.

**Note:** You must have an email address configured in your user profile on the instance to receive this email message.

Set up multifactor authentication on your own profile

You can set up multifactor authentication on your own User profile.
Role required: none

1. Navigate to **Self-Service > My Profile.**
2. Click the **Multifactor Authentication** related link on your User record.
   
The multifactor authentication window appears.

### Complete the steps below to enable multifactor authentication

<table>
<thead>
<tr>
<th>1. Download the app</th>
<th>2. Scan the QR Code:</th>
<th>3. Type in the App’s response:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Apple iTunes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Google Play</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Windows Store</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Or type in: KW2YUUCQ6SIBOEN

3. If you do not yet have the Google Authenticator application in your mobile device, you can download it from one of the links provided under **Download the app.**

4. Take a photo of the QC code with the Google Authenticator application or enter the string in the application manually.

5. Enter the code and click **Validate Response.**

   The application responds with a six digit code that refreshes every 30 seconds. If you entered the correct code, a message appears telling you that Multifactor Authentication is set up. If you entered an invalid code, look for the code on your mobile device again as it may have refreshed, and enter the code that you see.

**Note:** For the code to work properly, the system time on your computer must be in the same timezone as the time on your mobile device.
Disable multifactor authentication on your User profile

Users can disable multifactor authentication on their own user profile.

Role required: admin

1. Log in the instance using your multifactor authentication code appended to your password.
2. Navigate to Self-Service > My Profile.
3. Click the Multifactor Authentication related link on your User record.
4. Click Disable Multifactor Authentication.
5. Confirm the action.

You return to the user record. The setting is automatically saved. You do not need to save your User record again.

Disable multifactor authentication on the User table

You can disable multifactor authentication for the users that you have access to on the User table.

Role required: admin

1. Log in the instance.
2. Open the User [sys_user] table.
3. Configure the list to show the Enable Multifactor Authentication column.
4. Change the values of the Enable Multifactor Authentication column for the selected users to false.

These users will no longer need the passcode. However, each user can still enable multifactor authentication for their own user profile. To disable the ability for any user to enable multifactor authentication, disable the system property, disable the system property.

LDAP integration

An LDAP integration allows your instance to use your existing LDAP server as the master source of user data.

Administrators integrate with a Lightweight Directory Access Protocol (LDAP) directory to streamline the user login process and to automate administrative tasks such as creating users and assigning them roles. An LDAP integration allows the system to use your existing LDAP server as the master source of user data. Typically, an LDAP integration is also part of a single sign-on implementation.

The integration uses the LDAP service account credentials to retrieve the user distinguished name (DN) from the LDAP server. Given the DN value for the user, the integration then rebinds with LDAP with the user’s DN and password. The password that the user enters is contained entirely in the HTTPS session. The integration never stores LDAP passwords.

The integration uses a read-only connection that never writes to the LDAP directory. The integration only queries for information, and then updates its internal database accordingly.
Aspects of LDAP integration

Administrators integrate with a Lightweight Directory Access Protocol (LDAP) directory to streamline the user login process and automate administrative tasks such as user creation and role assignment.

User data is refreshed from your master source into the instance. The instance integrates with your organization's internal directory services through an LDAP query as a read-only connection, never updating your corporate LDAP.
Data population

An integration to your LDAP server(s) allows you to quickly and easily populate the instance with user records from your existing LDAP database. In case of data inconsistencies, configuration settings provide the ability to create, ignore, or skip records.

You can also specify the data that is imported by specifying attributes. We recommend importing only the data that you want to expose to the instance.

**Note:** You must specify all the attributes used in your transform map. If attributes are not specified, all available object attributes are imported from the LDAP server. This peripheral data accumulates in temporary import set tables, slowing import time.

For more information, see *Specify LDAP attributes* on page 1832 for configuration information and *Create a transform map* on page 1556 to help you create a transform map.

Authentication

When one of your users enters their domain credentials in the login page, the application passes those credentials to the defined LDAP server(s). The LDAP server responds with an authorized or unauthorized message which the application uses to determine if access should be granted. By authenticating against your LDAP server, users use the same credentials for the application that they use for other internal resources on your domain. Also, you can leverage any existing password and security policies that are already in place (for example: account lockout after a number of failed logins and password expiration dates). Because the application is receiving a “yes” or “no” from the LDAP server, these policies are enforced.

Features of LDAP integration

LDAP integration features include scheduled refresh, a dedicated listener, and on-demand login.

Scheduled LDAP refresh

A scheduled scan of your LDAP server is usually run once a night. It queries all applicable user records’ attributes and compares them with the account on our servers. If there is a difference, we modify our user record with the changed attribute. The load placed upon the LDAP server during the refresh depends on how many records are queried, and the number of attributes being compared. We recommend scheduling the refresh during off-peak hours. A large refresh operation can affect other scheduled operations, such as running reports, and should be planned to minimize any conflicts.

LDAP listener

LDAP listener is our version of a persistent query (or persistent search). We issue a standing query for changes made to your LDAP server, and constantly listen for a response. Assuming your server supports a persistent search, any changes made to any of your applicable LDAP accounts are returned to the LDAP listener and sent to your instance within approximately 10 seconds. This is an extremely useful tool, allowing us to have a nearly real-time copy of your users’ account details, without having to wait for the next scheduled refresh.
On-demand LDAP login

After LDAP integration is complete, your instance has the ability to allow new users to login to the system, even if their accounts have not yet been created. When a new user attempts to login to your instance, we look to see if this user has an account. When the account is not found, the instance automatically queries the LDAP server for the username that was entered. If an account is found, we then try to authenticate with the user's password. If the password checks out, the instance creates an account for the user, populates the account with all applicable LDAP information, and logs the user into your instance.

LDAP data population

An LDAP integration involves data population and authentication.

Note: Functionality described in this integration is not available by default. This integration involves post-deployment customization performed by an experienced administrator or by ServiceNow professional services consultants.

An integration to the LDAP servers allows you to quickly and easily populate the instance's database with user records from the existing LDAP database. To prevent data inconsistencies, configuration settings provide the ability to create, ignore, or skip incoming LDAP records.

You can also limit the data the integration imports by specifying LDAP attributes, thereby importing only the data that you want to expose to an instance. Typically, the LDAP attributes you specify become part of the integration transform map. If you do not specify any LDAP attributes, the integration imports all available object attributes from the LDAP server. The instance stores imported LDAP data in temporary import set tables, so the more attributes you import, the longer the import time. For more information, see Specify LDAP attributes on page 1832.

LDAP scheduled refresh

It is recommended that you run a scheduled scan of the LDAP server once a night.

The scan queries all applicable user records' attributes and compares them to accounts on your instances. If the scan identifies a difference, the integration modifies the instance user record with the changed attribute.

The load placed on the LDAP server during the refresh depends on how many records are queried and the number of attributes being compared.

Schedule the refresh during off-peak hours at a time that minimizes conflicts. A large refresh operation can affect other scheduled operations, such as running reports.

LDAP authentication

Use LDAP authentication to access using LDAP credentials.

When a user enters network credentials in the login page:

1. The instance passes the credentials to an LDAP server to find the instance.
2. With RDNs, it validates the user's DN string. It validates only if at least one of the LDAP OU configurations with table=sys_user has an RDN configured.
3. The LDAP server responds with an authorized or unauthorized message that the system uses to determine whether access should be granted.

By authenticating against your LDAP server, users access the platform with the same credentials that they use for other internal resources on your network domain. Also, you can reuse any existing password and security policies that are already in place. For example, the LDAP server may already have account lockout and password expiration policies.

When you enable LDAP, the system updates user records with these fields.
Table 423: LDAP user record updates

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Identifies whether or not LDAP is used to validate a user. If the source starts with ldap, then the user is validated via LDAP. If the source does not start with ldap, then the password on the user record is used to validate the user upon login.</td>
</tr>
<tr>
<td>LDAP Server</td>
<td>Identifies which LDAP server authenticates the user when there are multiple LDAP servers.</td>
</tr>
</tbody>
</table>

**Note:** The system does not support LDAP password authentication through a MID Server. An instance must be able to directly connect with an LDAP server to support password authentication.

LDAP on-demand login
Create new accounts by matching users to existing LDAP accounts.

After an LDAP integration is established, the instance can allow new users to log in to the system even if they do not yet have an account on the instance. When a new user attempts to log in to the instance, the integration checks to see if this user has an account in the instance. If the integration does not find an existing user account, it automatically queries the LDAP server for the username that was entered. If a matching LDAP account is found, the integration tries to authenticate with the password the user entered. If the password is valid, the instance creates an account for the user, populates the account with all applicable LDAP information, and logs the user in to the instance.

On-demand login uses the LDAP User Import transform map. For more information on transform map requirements, see *LDAP transform maps* on page 1842.

LDAP integration requirements
Review the requirements for LDAP integration, which include a PKI certificate and LDAP compliment directory services server.

LDAP integration requires:
- An LDAP v3 compliant directory services server
  - Allows inbound network access through the firewall (to the LDAP server)
  - *(Optional)* Accepts anonymous login
  - *(Optional)* Supports paging for large LDAP queries
- The external IP address or fully-qualified domain name of the LDAP server. You can also use a MID server.
- A read-only LDAP account of your choosing
- For multiple domains, network access for each domain controller
- For LDAPS, a PKI certificate
- For LDAP listener, a Microsoft Active Directory server that supports persistent queries (ADNotify)

Supported LDAP servers
The instance supports several LDAP servers.

Using JNDI to interface with the LDAP server, the instance has successfully integrated with the following servers:
- Microsoft Active Directory

© 2017 ServiceNow. All rights reserved.
• Novell
• Domino (Lotus Notes)
• Open LDAP

LDAP query limits
There are several methods of handling LDAP limitations.

By default, Active Directory 2000/2003 has an LDAP query limit (maxPageSize) of 1000 objects to prevent excessive loads and denial of service attacks. The system has two methods of dealing with this limit.

• The default method is to break up the query to return fewer than 1000 objects at a time. For example, query only for objects starting with the letter a, then query for b objects.
• The more efficient method for large environments is to enable paging, which is supported by default on all Microsoft Active Directory servers. Paging automatically splits the results into multiple result sets so the integration does not have to split up the query into multiple requests.

LDAP configuration options
There are several optional add-ons you can consider when you configure LDAP.

Secure LDAP connections
Secure connections provide additional protection for an LDAP integration.

The LDAP integration ensures security by connecting from a single machine that uses a fixed IP address through a specific port on the firewall. Furthermore, the connection requires a read-only LDAP account of your choosing for authentication. If you need additional protection for the LDAP integration, you can use one of these security features:

<table>
<thead>
<tr>
<th>Connection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server</td>
<td>To shield your LDAP server from external network traffic, install a MID Server on the local network and configure the system to communicate with the MID Server over a secure channel.</td>
</tr>
<tr>
<td>LDAPS</td>
<td>To establish an encrypted LDAPS connection, load the public side of your LDAP server’s SSL certificate. The integration uses the certificate to encrypt all communication between the LDAP server and the instance.</td>
</tr>
<tr>
<td>VPN</td>
<td>To secure the LDAP server with an encrypted point-to-point IPSEC VPN tunnel, speak to your account manager for details and pricing.</td>
</tr>
</tbody>
</table>

For more information about VPNs, Mid Servers, and LDAP integrations, see *You Don’t Need A VPN Part I* on the ServiceNow Community.

LDAP listener
A listener is a dedicated process that periodically searches for changes to users and groups on the LDAP server.

The listener can be deployed on a Microsoft Active Directory server that supports persistent queries (ADNotify), or on an LDAP server that supports persistent search request control (with OID 2.16.840.1.113730.3.4.3)
If the LDAP server supports a persistent search, the LDAP listener recognizes any user and group changes made to any of the applicable LDAP accounts and forwards them to your instance within approximately 10 seconds. This allows the instance to have a nearly real-time copy of your users’ account details without having to wait for the next scheduled refresh. The LDAP listener can only synchronize objects that map to the User [sys_users] and Group [sys_user_group] tables.

**Note:** If a user is added via the listener, but the user does not meet the requirements as defined by the OU filter, then the instance ignores the record on the LDAP server. If it meets the criteria, the user is added to the instance.

**LDAP monitor**
The LDAP monitor provides the current status of the LDAP servers and listener (starting with the Eureka release).

Monitoring the current health of your LDAP configuration can help with LDAP diagnostics and maintenance.

![LDAP Monitor](image)

**Figure 515: LDAP monitor**

The available states are:

- **Active**
• Inactive
• Error
• Active (Shutting down...)
• Error (Shutting down...)

In addition to its current state, the monitor also shows:
• The last message detected by the listener, such as waiting for LDAP changes, error connecting, and so forth.
• The last LDAP user change, such as new user, updated user, and so forth.
• The last error that occurred.

View LDAP monitor
You can view current information about LDAP servers and listeners using LDAP monitor.

Role required: admin

To view LDAP monitor:

Navigate to **LDAP > System LDAP > LDAP Monitor.**

See the table for descriptions of the properties and fields in the screen.
Table 425: LDAP monitor

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh</td>
<td>You can configure the refresh rate by clicking the <strong>Refresh</strong> field in the LDAP Server Monitor header bar, and selecting the number of seconds between each data refresh. You can also select <strong>None</strong> to suppress refreshing.</td>
</tr>
<tr>
<td>Connection Status</td>
<td>The server connection indicator is located on the right side, above the LDAP Listener Status fields. When the server is connected, the box is green and shows Connected. When the server is not connected, the box is red and shows Not Connected. When the server connection is being tested, the box is yellow and shows Testing Connection.</td>
</tr>
<tr>
<td>LDAP Server Properties</td>
<td>As you monitor LDAP servers, you can make changes to the properties by clicking <strong>Edit</strong> in the LDAP Server Monitor screen.</td>
</tr>
</tbody>
</table>
| Server URL       | The combination of the server name and server port where the LDAP Server is listening. Frequently, the port is set to one of the following:  
  • 389: the default port for connecting to LDAP in clear text  
  • 636: the standard port for connecting to LDAP via an SSL connection  
  Example value: ldap://10.10.10.3:389/  
  Your LDAP Server may have more than one URL address. This does NOT establish multiple directory structures from which you can import data, which is done by creating another LDAP Server entry, but does provide for redundancy when you have multiple LDAP Servers to avoid a single point of failure. The LDAP URL addresses are separated with a space character, and the system automatically tries each server address in turn until a valid connection can be made. |
Field | Description
--- | ---
Starting search directory | The starting directory or RDN (Relative Distinguished Name) where the system begins searching for users or groups. Example value: DC=service-now,DC=com

No data ABOVE this point is available for import. The instance has visibility into the specified directory and directories BELOW it in the LDAP hierarchy.

MID Server Status | The current connection status of the MID Server.

LDAP Listener Status

Current Status | This indicates whether the listener is active.

Last Info Message | This shows the last message the LDAP server received relating to user and group changes, and the time the message was received.

Last Change | This shows the last change made to the LDAP server, and the time it was made.

Last Error | This shows the last error that occurred on to the LDAP server, and the time it occurred.

**Multiple LDAP domains**

You can establish multiple network domains within the same forest or for completely non-trusted domains.

The recommended method for handling multiple domains is to create a separate LDAP server record for each domain. Each LDAP server record must point to a domain controller for that domain. This means the local network must allow connections to each of the domain controllers.

After expanding to more than one network domain, it is critical that you identify unique LDAP attributes for the application user names and import coalesce values. A common unique coalesce attribute for Active Directory is `objectSid`. Unique user names may vary based on the LDAP data design. Common attributes are `email` or `userPrincipalName`.

**LDAP integration FAQs**

Review these frequently-asked questions about LDAP integration in the instance.

**What are the prerequisites for an LDAP integration?**

- The directory services server must be LDAP v3 compliant
- Inbound network access through the firewall must be allowed (to the LDAP server)
- External IP or Name of the LDAP server
- User credentials with read-only access
- For LDAPS, a PKI certificate
When is an LDAP integration usually done?

LDAP integrations are usually done before the instance Go Live, but can be integrated at any time.

Is this a synchronization or a copy?

This question comes up regularly during our pre-integration discussions, and is centered around a concern of a third party (the instance in this case) making changes (writing) to your LDAP server. In an LDAP integration, your instance does not write to the internal LDAP directory. The instance queries for information, and updates its database accordingly.

No changes are made to the internal LDAP server by the instance. The service account is read only.

Is it secure?

Yes. The connection is made from a single machine using a fixed IP address through a specific port on your firewall. Authentication is done with a read-only LDAP account of your choosing. You can use standard LDAP, or load the public side of an SSL certificate installed on your directory, in which case we can use LDAPS. To add another layer of security, we also offer the option of a point-to-point IPSEC VPN tunnel. Speak to your account manager for details and pricing.

Another security aspect to consider is the data shared in an LDAP integration. To limit the data exposed to your instance, specify attributes in your transform map. For more information, see Create a transform map on page 1556.

How up to date is the information?

Most changes (including additions) to your LDAP server are available to the instance within seconds, depending on how many components of the full LDAP integration are in place.

Which attributes need to be pulled from the directory into the instance?

It is recommended that attributes are defined to import only required data. Defined attributes get mapped into the instance user database.

We cannot answer the question of which specific attributes are needed because this is determined by the scope of the project and business requirements.

What types of LDAP servers does the instance support?

The instance has successfully integrated with Microsoft Active Directory, Novell, Domino (Lotus Notes), and Open LDAP. We use JNDI to interface with the LDAP Server. As long as your LDAP server is LDAP v3 compliant, the integration is successful.

Since my users are already authenticated on my local network, how can I keep them from having to enter a password to access the application?

A single sign-on method is the solution. Along with the data population functionality provided with the LDAP import, you can use the External Authentication functionality supported by the application.
Can I integrate with multiple domains?

Yes, multiple domains can be within the same forest or completely non-trusted domains. The recommended method is to create a separate LDAP server record for each domain. Each LDAP server record must point to a domain controller for that given domain. This means that connections must be allowed to each of the domain controllers.

When you expand to more than one domain, it is critical that you identify unique LDAP attributes to be used as the application user names and import coalesce values. A common unique coalesce attribute for Active Directory is objectSid. Unique user names may vary based on your LDAP data design; common attributes are email or userPrincipalName.

How do you handle querying more than 1000 users?

By default, Active Directory 2000/2003 has an LDAP query limit (maxPageSize) of 1000 objects to prevent excessive loads and denial of service attacks. We have two methods of dealing with this limit.

The default method is to break up the query to return less than 1000 objects at a time. For example, query only for object starting with the letter 'a', then query for 'b' objects. The more efficient method for large environments is to enable paging. Paging is supported by default on all Microsoft Active Directory servers. It automatically splits the results into multiple result sets, so we don't have to split up the query into multiple requests.

What type of LDAP query is done?

If an LDAP password is supplied then a "Simple Bind" is performed. If no LDAP password is supplied then "none" is used, in which case the LDAP server must allow anonymous login.

How is LDAP authentication accomplished when the username is provided?

We use provided service account credentials for LDAP to retrieve the user DN from the LDAP server. Given the DN value for the user, we then rebind with LDAP given the user's DN and the provided password.

How is the user password stored?

The password that the user enters is contained entirely in their HTTPS session. We do not store that password anywhere.

Are LDAP records synchronized or just copied?

The instance does not synchronize department records. Users and group memberships are kept up-to-date by the LDAP Listener mechanism and a daily full LDAP Browse, but the instance does not delete any of these entries once they disappear from LDAP.

If an entry were to be deleted, the entire history would also get deleted, and any references to it would be cleared or deleted. Configuration Items (CIs), SLA Agreements, Software Licenses, Purchase Orders, and Service Catalog Entries all have a reference to Department, and if Department is deleted, then those references get cleared. There are many references to Users, and so deleting a user would lose all history of what that user did. Currently, the decision to delete or not to delete is made by our customers.
How is a user record defined to use LDAP authentication?

These fields on the user record pertain to LDAP:

- **Source:** The Source field identifies whether or not a user is validated using LDAP. If the source field starts with "ldap", then the user is validated via LDAP. If the Source field does not start with "ldap", then the password on the user record is used to validate the user upon login.

- **LDAP Server:** The instance supports multiple LDAP servers, so the LDAP Server field determines which server should be used to authenticate the user.

How can we keep LDAP records synchronized?

Schedule a periodic scan of the LDAP server to pick up changes.

I'm ready to configure my LDAP integration. Now what?

Let's go! Start with *LDAP integration setup* on page 1821.

**LDAP integration setup**

Administrators can enable LDAP integration to allow single sign-on of users from their company LDAP directory.

After the integration, the MID Server connects to the instance and the MID Server also connects to the LDAP server. In both cases, the MID Server initiates the connection:

1. First, the MID Server connects to the LDAP server via LDAP on Port 389.

2. Then, the MID Server initiates an HTTPS encrypted connection to the instance on Port 443 to push the data to the instance.

*LDAP communication channels*

LDAP typically uses one of these types of communication channels.
<table>
<thead>
<tr>
<th>Connection</th>
<th>Description</th>
<th>LDAP import support?</th>
<th>LDAP authentication support?</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server connection</td>
<td>Communicates over HTTP on port 80 by default. This communication channel does not require a certificate. The connection between the MID Server and the instance is over HTTPS (port 443). You can use the MID Server to import data over LDAP, but you cannot use the MID Server for LDAP authentication. Proceed to <em>Define the LDAP Server.</em></td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Standard LDAP integration</td>
<td>Communicates over TCP on port 389 by default. This communication channel does not require a certificate. Proceed to <em>Define the LDAP Server.</em></td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SSL-encrypted LDAP integration (LDAPS)</td>
<td>Communicates over TCP on port 636 by default, This communication channel requires a certificate. Proceed to <em>Upload the LDAP X.509 SSL certificate</em> on page 1823 to obtain and upload the certificate.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>VPN connection</td>
<td>Communicates over an IPSEC tunnel. Purchase or create an IPSEC tunnel on your local network. Proceed to <em>Define the LDAP Server.</em></td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

A MID server initiates one connection to an LDAP server via port 389, then initiates an encrypted HTTPS connection to an instance via port 443 to push data to the instance. When using a MID server, the instance does not make the connection to the LDAP server. The MID server does.

The instance can also connect to the LDAP server directly, using LDAP or LDAPS, either over the internet or through a VPN tunnel.
For more information about VPNs, Mid Servers, and LDAP, see *You Don't Need A VPN Part II* on the community.

**Upload the LDAP X.509 SSL certificate**
If your administrator is setting up an SSL-encrypted LDAP integration (LDAPS) to communicate over TCP on port 636, and has not already uploaded a certificate as part of your instance Go Live activities.

Role required: admin

1. Purchase or generate an SSL certificate on your LDAP server.
2. Upload the LDAP certificate to the instance.

**Define an LDAP server**
Create a new LDAP server record in the instance.

Role required: admin

1. Navigate to **System LDAP > Create New Server**.
2. Fill in the form fields.
3. Click Submit.

Note: You can also modify an existing LDAP server record by navigating to System LDAP > LDAP Servers and making the needed changes.

LDAP server fields
You can configure LDAP servers after you create a new server record.
Figure 516: LDAP server form

Table 427: LDAP connection properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the server.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box if the server is active.</td>
</tr>
<tr>
<td>LDAP Server URLs</td>
<td>Enter the URLs of the primary and backup LDAP servers. Servers are first ordered by operational status, with servers that are Up listed first, then ordered by the Order value that you specify. The first server listed is the primary LDAP server. The others are redundant servers.</td>
</tr>
<tr>
<td>Server URL</td>
<td>Enter the URL of the server. Configure the form to add this field if necessary. It is a calculated read-only field that shows the list of LDAP servers that you can also see in the <strong>LDAP Server URLs</strong> field, separated by a space, and ordered by operational status and the order values of the URLs.</td>
</tr>
<tr>
<td>Login distinguished name</td>
<td>Enter the distinguished name (DN) of the user authenticating the LDAP connection.</td>
</tr>
<tr>
<td>Login password</td>
<td>Enter the server's password.</td>
</tr>
<tr>
<td>Starting search directory</td>
<td>Enter the relative distinguished name (RDN) of the default search directory. All queries to this LDAP server will start from this RDN.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| MID Server   | Select the MID Server you want to use to connect to the LDAP server. Using a MID Server to establish an LDAP connection prevents you from having to expose the LDAP server to external network traffic. It also eliminates the need to establish a VPN tunnel between your LDAP server and ServiceNow data centers.  
  **Note:**  
  - The MID Server user must have the user_admin role in order to be able to read LDAP server configuration records.  
  - The following are not available with the MID Server:  
    - LDAP authentication  
    - SSL connection |
<p>| Connect timeout | Specify the maximum number of seconds that the instance has to establish an LDAP connection. If no connection is made by this time, the connection is terminated. |
| Read timeout  | Specify the number of seconds the integration has to read LDAP data. The integration stops reading LDAP data after the connection exceeds the read timeout. If you enable an SSL connection, you can also set a read timeout value with the <code>com.glide.ssl.read.timeout</code> system property. If you enter timeout values for both this field and the system property, the lowest timeout value takes precedence. |
| SSL           | Select this check box to require the LDAP server to make an SSL-encrypted connection. For more information, see Enable SSL. If you selected a MID Server, this field is not available. |
| Listener      | Select this check box to enable the integration to periodically poll Microsoft Active Directory servers or LDAP servers that support persistent search request control. Additionally, if you selected a MID Server, the listener functionality is available for that MID Server. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Listener</td>
<td>Select this check box to enable the integration to periodically poll Microsoft Active Directory servers or LDAP servers that support persistent search request control. Additionally, if you selected a MID Server, the listener functionality is available for that MID Server. See <a href="#">LDAP listener</a> on page 1814 and <a href="#">Enable an LDAP listener</a> on page 1831 for more information.</td>
</tr>
<tr>
<td>Listen interval (timeout value)</td>
<td>Specify the listener timeout value in the number of minutes that the integration listens for LDAP data with every connection. The integration stops listening for LDAP data after the connection exceeds the listen interval.</td>
</tr>
<tr>
<td>Paging</td>
<td>Select this check box to have the LDAP server split up LDAP attribute data into multiple result sets rather than submit multiple queries.</td>
</tr>
</tbody>
</table>

Specify a redundant LDAP server
The LDAP integration uses a redundant server if the primary LDAP server experiences a service interruption.

Role required: admin

Administrators can specify redundant servers from either the Create New Server module or from an individual LDAP Server record. The instance searches for an available LDAP server in the order in which they are listed.

1. Navigate to **System LDAP > Create New Server**.
2. Fill out the form as specified in *Define the LDAP Server*.
3. In the **Server URL** field, the valid URLs of all servers appear separated by a space. Servers are first ordered by operational status, with servers that are **Up** listed first, then ordered by the **Order** value that you specify. The first server listed is the primary LDAP server. The others are redundant servers.

    **Note:** There is a slight delay between the change in the actual operational status and the display.

4. Enter other LDAP server fields as needed.
5. Click **Submit**.

© 2017 ServiceNow. All rights reserved. 1827
Specify a redundant LDAP server from an LDAP server record
The LDAP integration uses a redundant server if the primary LDAP server experiences a service interruption.

Role required: admin

1. Navigate to System LDAP > LDAP Servers.
2. Select the LDAP server for which you want to specify a redundant server.
3. From the LDAP Server URLs embedded list, click Insert a new row.
4. Fill in the fields for the row (see table).
5. Right-click the form header and click Save.
6. Repeat these steps for each additional server you want to specify.
Set up SSL-encrypted LDAP integration (LDAPS)
Set up an SSL connection for your LDAP server.
Role required: admin
If you use an LDAPS integration and the default SSL port is 636, no further configuration is necessary; SSL is automatically enabled. If the LDAPS integration uses another SSL port, define the alternate SSL connection properties.

1. Navigate to **System LDAP > LDAP Servers**
2. Select the LDAP server to configure.
3. Under **Related Links**, click **Advanced view**.
4. In the **Server URL** field, specify the LDAP IP address and alternate SSL communications port.
5. Select the **SSL** check box.
   If this option does not appear on the form by default, configure the form and add it.
6. Click **Update**.

**Note:**
Be sure a network administrator configures the local firewall to allow the application server to access the LDAP server. If the LDAP server is located within an internal network, the firewall forwards (or NATs) the application server's IP address through the firewall on the correct port.

---

Provide LDAP server login credentials
The LDAP login credentials determine what organizational units the integration can see.
Role required: admin
Servers that allow anonymous login generally limit the organizational unit (OU) data available to anonymous connections.

1. Navigate to **System LDAP > LDAP Servers**.
2. Select the LDAP server to configure.

---

**Table 428: LDAP Server URLs embedded list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>The URL or IP address to the redundant LDAP server.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the instance searches for an available LDAP server from</td>
</tr>
<tr>
<td></td>
<td>lowest value to highest. A business rule automatically populates this value</td>
</tr>
<tr>
<td></td>
<td>if you leave the field blank.</td>
</tr>
<tr>
<td>Active</td>
<td>A true/false field indicating whether the LDAP server is available for use</td>
</tr>
<tr>
<td></td>
<td>as a backup server. Only active servers can be used as backup servers.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>A read-only true/false field indicating whether the LDAP server is currently available. Only servers that are currently operational can be used as backup servers.</td>
</tr>
</tbody>
</table>
3. In Login distinguished name, enter the user credentials for an account with read access to the directory levels from which you want to import users or groups. The system uses these credentials to connect to your LDAP server. If this information is not entered, the application attempts an anonymous login to the LDAP server.

The Login distinguished name fields accepts several formats.
To access a Microsoft Active Directory (AD) server, use one of the following:

- user@domain.com, domain\user
- cn=user,ou=users,dc=domain,dc=com>

To access a different LDAP directory server, the username must be in the full distinguished name format:

- cn=user,ou=users,dc=domain,dc=com

4. In Login password, enter the password for the LDAP user.

   **Note:** Consider enabling LDAPS to encrypt this password during transmission.

5. Select the Active check box.

6. [Optional] In the Starting search directory field, explicitly specify the LDAP OU attributes you want the instance to import.

7. Click Update.

   **Note:**
   If you provide an LDAP password, the integration performs a Simple Bind operation. If you do not provide an LDAP password, the LDAP server must allow anonymous login or the integration cannot bind to the LDAP server.

---

Enable an LDAP listener

Enabling a listener is optional. If enabled, a listener notifies the system to process LDAP records soon after there is an update on the LDAP server.

Role required: admin

A listener is a dedicated process that periodically searches for changes on the LDAP server.

The listener can be deployed on a Microsoft Active Directory server that supports persistent queries (ADNotify), or on an LDAP server that supports persistent search request control (with OID 2.16.840.1.113730.3.4.3).

To enable a listener:

1. Navigate to System LDAP > LDAP Servers.
2. Select the LDAP server to configure.
3. Select the Listener check box.
4. Click Update.

**Note:**

The system only imports user records that match the LDAP OU filter. Incoming user records that do not meet the filter requirements are flagged as invalid and ignored by the import. Administrators can enable verbose LDAP logging to determine if incoming records are not matching the LDAP OU filter.
Specify LDAP attributes

By configuring the LDAP Server form and adding the **Attributes** field, you can specify, and thereby limit, the attributes the LDAP server query returns. This can enhance performance as well as security.

Role required: admin

By default, the system loads all of the attributes for each object that it has permission to read from your LDAP server. By configuring the LDAP Server form and adding the **Attributes** field, you can specify, and thereby limit, the attributes the LDAP server query returns. Using this approach for large LDAP imports can greatly improve the speed of those imports.

For best results, define attributes where possible. If there is information that you do not want exposed to the system, exclude the attribute.

If you do not specify LDAP server attributes, user transactions may freeze for extended periods of time when new attributes are added to an LDAP server object because the system will be busy loading data from the new attributes.

**Note:** To use the manager lookup scripts described in Select or Create a Transform Map for LDAP Data, specify **manager** and **dn** (distinguished name) in the **Attributes** field. Neither attribute is required to be a part of a transform map.
Set LDAP connection properties
Configure your LDAP server connection properties.

Role required: admin

1. Navigate to System LDAP > LDAP Servers.
2. Select the LDAP server to configure.
3. Set the connection property fields (see table).
4. Click Update.

Table 429: LDAP connection properties

<table>

</tr>
</tbody>
</table>

Automatic LDAP server validations

When an LDAP Server record is set to active, the system automatically tests every connection to validate it.

Validations include:

- The LDAP server is accessible at the provided URL and port
- The LDAP server URL is properly formatted
• The login credentials are valid

Starting with the Fuji release, the system displays colored dots next to each server URL:

**Table 430: LDAP server connection icons**

<table>
<thead>
<tr>
<th>Color</th>

<td>The server if active and operational.</td>
</tr>
<tr>
<td>Gray</td>
<td>The server is neither active nor operational.</td>
</tr>
<tr>
<td>Red</td>
<td>The server is active but not operational.</td>
</tr>
</tbody>
</table>
Figure 517: LDAP server connection status

Test an LDAP connection manually
You can manually test the connection to the LDAP server from the LDAP server form.
Role required: admin

1. Navigate to System LDAP > LDAP Servers.
2. Select the LDAP server to test.
3. Under Related Links, click Test connection.
4. Under Related Links, click Browse to verify that the appropriate LDAP directory structure is visible to the system.
5. (Optional) If the connection was successful, click Browse to view the source LDAP directory structure that is visible to the instance.

Note:
The Filter and RDN fields on the left of the Browse window are ignored when you use the search field on the right.

Test communication between LDAP and MID Servers
The instance tests the connection automatically every time a user opens the LDAP Server form.

Role required: admin

The instance supports an LDAP connection timeout of 29 seconds or less. Error messages appear on the form if there are any issues connecting to the LDAP server.

Employees can also verify connectivity between the instance and the LDAP server. Contact Technical Support for assistance verifying LDAP connectivity.

LDAP connection timeout
The instance tests the connection automatically every time a user opens the LDAP Server form.

Error messages appear on the form if there are any issues connecting to the LDAP server.

Note: Employees can also verify connectivity between the instance and the LDAP server. Contact Technical Support for assistance verifying LDAP connectivity.

Automatic LDAP operational status update
The instance changes the operational status of LDAP servers depending on the result of the connection test.

- If your instance establishes a connection to a server that has a Operational Status value of down, the Operational Status value is automatically changed to up. This functionality is supported for both automatic and manual connection tests.
- If a connection cannot be established to a server that has a Operational Status value of up, the Operational Status value is automatically changed to down. This functionality is supported for automatic connection tests only, not manual tests.

Define LDAP organizational units
An organizational unit (OU) definition specifies the LDAP source directories available to the integration.

Role required: admin

OU definitions can contain locations, people, or user groups. Every LDAP server definition contains two sample OU definitions: one for importing groups into the system and the other for users.

1. Navigate to System LDAP > LDAP Servers.
2. Select the LDAP server to configure.
3. In the LDAP OU Definitions related list, select either the Groups or Users sample OU definition.
4. Complete the LDAP OU Definition form (see table).
5. Click Update.
The system automatically tests the connection to the LDAP server.

6. Under Related Links, click Browse to view the LDAP directory records that the OU definition returns.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify the name the integration uses when referencing this OU. The name you enter here becomes an LDAP target in the data source record.</td>
</tr>
<tr>
<td>RDN</td>
<td>Specify the relative distinguished name of the subdirectory you want to search. This RDN is combined with the start-searching directory from the LDAP server definition to identify the subdirectory containing information for this organizational unit. For example, the sample OU definition uses the RDN value of CN=Users to search the LDAP directory CN=Users,DC=service-now,DC=com and any directory below this point. This field must match a subdirectory in your LDAP system.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Query field</td>
<td>Specify the name of the attribute within the LDAP server to query for records. The query field must be unique in both single and multiple domain instances. For best results, use email addresses or other credentials that uniquely identify the user in a multiple domain instance. Active Directory uses the sAMAccountName attribute. Other LDAP servers tend to use the cn attribute.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Query field must map to the User ID field in the User [sys_user] table. For example, if an Active Directory user logs in as joe.example, there must be a user record with a User ID value of joe.example and an LDAP record with an sAMAccountName value of joe.example.</td>
</tr>
</tbody>
</table>
Further suppose that you want to exclude the HR group and HR users from the application. Do the following:

1. Create an LDAP server record with a starting search directory of `dc=my-domain,dc=com`.
2. Create an OU definition record for `ou=Groups` with a filter to exclude `cn=HR`.
3. Create an OU definition record for `ou=Users` with a filter to exclude `ou=HR`.

If you do not specify additional attributes or filters with an OU definition, the LDAP query returns the entire sub-tree from the starting directory and RDN.

In these examples, an OU definition with the RDN value of `ou=Groups` and no filter would have returned all groups. Likewise, an OU definition with the RDN value of `ou=Users` and no filter would have returned all users and child organizational units.

**Create an LDAP OU data source**

Each LDAP organizational unit (OU) definition has its own related list of data sources.

Role required: admin

---

**Note:** Both the **LDAP Server** and **LDAP OU Definition** must be active for the test load action to function properly. When the test load is activated for the first time, the system samples up to 20 records to determine the length of the import set fields. If the sampled records do not contain values for the **User ID** field, the system sets the field length for all subsequent imports to the default length of 40. The import truncates any imported data that exceeds the import set table field length. Additionally, the **User ID** field is truncated to a maximum of 40 characters. Be aware that the 20 loaded records cannot be transformed and are for testing purposes only. If the test records contain values for the **User ID** field, the field length is set based on the field length of the longest user ID in the test records.

To create a new data source:

1. Navigate to **System LDAP > LDAP Servers**.
2. Select the LDAP server to configure.
3. In the **LDAP OU Definitions** related list, select an item, such as **Groups** or **Users**.
4. In the **Data Sources** related list, click **New**.
5. Complete the Data Source form (see table).
6. Click **Submit**.
7. Under **Related Links**, click **Test Load 20 Records** to test whether the data source can bring LDAP data into the import table.
Table 432: Data Sources form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify the name the integration uses when referencing this data source.</td>
</tr>
<tr>
<td>Import set table name</td>
<td>Enter the name of the staging table where the system temporarily places the imported LDAP records and attributes. Review this table to view imported LDAP records. You can use the same import set table name for all LDAP data sources.</td>
</tr>
<tr>
<td>Type</td>
<td>Select LDAP to indicate the imported data is LDAP data. After you select the type LDAP, the form displays the LDAP target field.</td>
</tr>
<tr>
<td>LDAP target</td>
<td>Select the LDAP OU definition associated with this data source.</td>
</tr>
</tbody>
</table>

**LDAP transform maps**

The transform map moves data from the import set table to the target table (User or Group).

The LDAP integration uses standard import sets and transform maps. You can also create custom LDAP transform maps.

**Important**: Whether you select or create custom LDAP transform maps, there should be one active transform map for a set of source and target tables. Enabling multiple transform maps for the same source and target tables can produce duplicate entries in the target table unless you coalesce against the matching fields.

**Default LDAP transform maps**

By default, the system provides two transform maps for LDAP data.

Table 433: Default LDAP transform maps

<table>
<thead>
<tr>
<th>Transform Map</th>
<th>Source Table</th>
<th>Target Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP User Import</td>
<td>ldap_import</td>
<td>sys_user</td>
<td>Default transform map for creating user records from LDAP credentials as part of LDAP on-demand login. Contains mappings for an Active Directory LDAP server.</td>
</tr>
</tbody>
</table>
**LDAP Group Import**

<table>
<thead>
<tr>
<th>Transform Map</th>
<th>Source Table</th>
<th>Target Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Group Import</td>
<td>ldap_group_import</td>
<td>sys_user_group</td>
<td>Default transform map for creating group records from LDAP OUs. Contains mappings for an Active Directory LDAP server.</td>
</tr>
</tbody>
</table>

**Note:** By default, the system does not have a transform map for LDAP department records.

**Requirements for custom LDAP transform maps**

If you choose to create a custom transform map, the transform map must meet the following mapping requirements.

**Table 434: Requirements for custom LDAP transform maps**

<table>
<thead>
<tr>
<th>Source Table</th>
<th>Source Field</th>
<th>Target Table</th>
<th>Target Field</th>
<th>Coalesce</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap_import</td>
<td>u_source</td>
<td>sys_user</td>
<td>source</td>
<td>false</td>
<td>The <strong>u_source</strong> field identifies the LDAP DN of the imported user or group. The system uses this field to determine that a user requires LDAP authentication, to find a user's manager, and to put users into groups.</td>
</tr>
</tbody>
</table>
| ldap_import    | Select one of the following fields:  
  • u_samaccountname  
  • u_dn  
  • u_cn | sys_user     | user_name    | true     | If LDAP integrates to Active Directory, select **u_samaccountname** as the source field. If other LDAP directories are used, select **u_dn** or **u_cn** as the source field. |
**LDAP data transformation**

If an LDAP attribute contains simple data, the transform map links an imported LDAP attribute to an appropriate field in the target table (User or Group).

For example, sample data in the sAMAccountName attribute maps to the User ID field in the User table.

If the imported LDAP data maps to a reference field, the instance searches for an existing matching record. If no matching record exists, the instance creates a new record for the reference field unless the field mapping specifies otherwise.

For example, suppose the LDAP attribute l maps to the Location reference field in the User table. Whenever the import brings in an attribute value that does not match an existing location record value, the transform map creates a new location record. The new location record has the same value as the imported attribute, and the imported user record now has a link to the new location record.

However, there are times when LDAP attribute returns a distinguished name (DN), which is essentially a reference to another record within the LDAP directory. For example, the manager attribute typically contains the distinguished name for the manager of the current LDAP directory entry. An imported DN typically uses a long text string such as: cn=Beth Anglin,ou=Users,dc=my-domain,dc=com.

**Warning**: Make sure your target fields are long enough to contain a DN. Many text fields use the default length of 40, which may not be long enough for some DN values. The ServiceNow system truncates any value that exceeds the field length.

Administrators do not typically want the system to create new users from the DN value because the new user has no association with an existing user. Instead, administrators want the import to locate the manager’s existing user record and associate it with the newly imported user. The LDAPUtils script include contains the setManager and processManagers functions that can parse a DN and search for an existing user. For best results, use these functions to create a custom transform map.

For example, the LDAP User Import transform map script calls the setManager function:

```java
// The manager coming in from LDAP is the DN value for the manager.
// The line of code below will locate the manager that matches the DN value and set it into the target record. If you are not interested in getting the manager from LDAP then remove or comment out the line below
ldapUtils.setManager(source , target );
```

In some cases, the integration imports a user’s record before importing the associated manager’s user record. To handle such cases, you may want to call the processManagers function after the transform completes. For example, the LDAP User Import transform map uses an onComplete transform script to call the processManagers function.

```java
// It is possible that the manager for a user did not exist in the database when the user was processed and therefore we could not locate and set the manager field. // The processManagers call below will find all those records for which a manager could not be found and attempt to locate the manager again. This happens at the end of the import and therefore all users should have been created and we should be able to locate the manager at this point
ldapUtils.processManagers();
```

Remove or comment out the setManager and processManagers function calls if your LDAP integration does not use the manager attribute.

**onStart and onAfter LDAP scripts**

Any custom transform map should include onStart and onAfter scripts.
The `onStart` script should call the `LDAPUtils` script include and start logging. For example, the LDAP User Import transform map has an `onStart` script that uses this code:

```javascript
gs.include ( "LDAPUtils" ) ; var ldapUtils  = new LDAPUtils ( ) ;
ldapUtils.setLog (log ) ;
```

The `onAfter` script should call the `addMembers` function. For example:

```javascript
ldapUtils.addMembers (source , target ) ;
```

### Scheduled data imports for LDAP
A scheduled import allows administrators to import LDAP data on a regular schedule.

By default, the LDAP integration includes two sample scheduled imports:

- Example LDAP User Import
- Example LDAP Group Import

Neither example is active by default. Change these scheduled imports to meet your company's business needs.

### Auto provision LDAP users
You automatically provision users who are in the LDAP server but not yet in your instance.

#### Role required: admin
- Create the following properties in the System Properties `[sys_properties]` table:

<table>
<thead>
<tr>
<th>LDAP property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.ldap.authentication</code></td>
<td>Enables LDAP authentication by using LDAP to authenticate users. Set this property to <code>true</code> (the default value).</td>
</tr>
<tr>
<td><code>glide.ldap.user.autoprovison</code></td>
<td>Enables LDAP the system to automatically create users in the User <code>[sys_user]</code> table when the user exists in LDAP but is not yet in the instance. Set this property to <code>true</code> (the default value).</td>
</tr>
</tbody>
</table>

Both of these properties must be set to `true` for auto-provisioning to work.

### LDAP import maps
LDAP import maps match fields in your LDAP database to fields in your instance.

**Note:** LDAP mapping has a performance effect, so the recommended approach is to schedule it during off-peak hours, or process a few records at a time to maintain system availability.

The best practice is to define a transform map that only imports the needed or required attributes. Depending on the version of the instance you are using, the method for specifying LDAP mapping relationships varies.

The easiest way to know whether or not you are running a version which uses the System LDAP application for LDAP integration is to find the application from the application navigator.
The **Run Business Rules** option is applied only for the target table. Only transform maps associated to the target table run the business rules associated with different tables. If you are updating a user group and have business rules running on a user group table, the group must have roles define.

### Table 436: LDAP import mapping options

<table>
<thead>
<tr>
<th>System LDAP application?</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Use a <em>transform map</em> to specify your mapping.</td>
</tr>
<tr>
<td>No</td>
<td>Use a LDAP <em>legacy import map</em> to specify your mapping, or the default LDAP transform that is included in baseline instances. Remember to adjust the <strong>Coalesce</strong> field to match against the correct fields.</td>
</tr>
</tbody>
</table>

* Differences between LDAP transform maps and legacy import maps *

When specifying LDAP mapping relationships using transform maps, there is a major difference in how reference fields are set for manager and department.

When using a *transform map*, it is necessary to use a *transform script* to create references. This is because the value associated with an LDAP attribute like “manager” is the distinguished name (DN) of the manager.

Without some extra logic in place, the result is the creation of a user record with a manager name that is the distinguished name of that user in LDAP. The integration includes a transform script to facilitate the creation of these references. The default transform map “LDAP User Import” includes transform scripts for these references.

**Existing mapping relationships**

When updating legacy import maps to transform maps, you can retain the LDAP mapping relationships that existed prior to the addition of the System LDAP application. The LDAP server has a **Map** field that is a reference to the legacy import map.

**Note:** By default this field is hidden, so you have to configure the form to display it.

If you want to transition to using a transform map, clear the reference to the legacy import map.

**LDAP import map settings**

Verify and use attributes to limit the fields the integration imports from the LDAP source. Additionally, it is important to map the user_name field to the LDAP attribute that contains the user's login ID. For Active Directory this is usually the sAMAccountName attribute. If you would like to import and coalesce on a binary attribute (such as objectSID or objectGUID), you have to create a custom transform script.

**Note:** Any value mapped to the user_name field must be unique.

If you do not specify a transform map (such as LDAP User Import), the integration uses the following default mappings:
### Table 437: LDAP import default mapping

<table>
<thead>
<tr>
<th>User field or variable</th>
<th>LDAP attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>sAMAccountName</td>
</tr>
<tr>
<td>email</td>
<td>mail</td>
</tr>
<tr>
<td>phone</td>
<td>telephoneNumber</td>
</tr>
<tr>
<td>home_phone</td>
<td>homePhone</td>
</tr>
<tr>
<td>mobile_phone</td>
<td>mobile</td>
</tr>
<tr>
<td>first_name</td>
<td>givenName</td>
</tr>
<tr>
<td>last_name</td>
<td>sn</td>
</tr>
<tr>
<td>title</td>
<td>title</td>
</tr>
<tr>
<td>department</td>
<td>department</td>
</tr>
<tr>
<td>manager</td>
<td>manager</td>
</tr>
<tr>
<td>middle_name</td>
<td>initials</td>
</tr>
<tr>
<td>u_memberof</td>
<td>groups</td>
</tr>
<tr>
<td>u_member</td>
<td>members</td>
</tr>
<tr>
<td>u_manager</td>
<td>manager</td>
</tr>
</tbody>
</table>

**LDAP import default mapping**

If you do not specify a transform map (such as LDAP User Import), the integration uses the following default mappings.

### Table 438: LDAP import default mapping

<table>
<thead>
<tr>
<th>User field or variable</th>
<th>LDAP attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>sAMAccountName</td>
</tr>
<tr>
<td>email</td>
<td>mail</td>
</tr>
<tr>
<td>phone</td>
<td>telephoneNumber</td>
</tr>
<tr>
<td>home_phone</td>
<td>homePhone</td>
</tr>
<tr>
<td>mobile_phone</td>
<td>mobile</td>
</tr>
<tr>
<td>first_name</td>
<td>givenName</td>
</tr>
<tr>
<td>last_name</td>
<td>sn</td>
</tr>
<tr>
<td>title</td>
<td>title</td>
</tr>
<tr>
<td>department</td>
<td>department</td>
</tr>
<tr>
<td>manager</td>
<td>manager</td>
</tr>
<tr>
<td>middle_name</td>
<td>initials</td>
</tr>
<tr>
<td>u_memberof</td>
<td>groups</td>
</tr>
<tr>
<td>u_member</td>
<td>members</td>
</tr>
<tr>
<td>u_manager</td>
<td>manager</td>
</tr>
</tbody>
</table>
**LDAP scripting**

These sample scripts automate common LDAP tasks.

Set disabled Active Directory users to inactive

Use the following script to automatically deactivate users when the associated AD user is disabled.

**Role required:** admin

You can identify disabled Active Directory users by checking the value of the `userAccountControl` attribute. This rule executes whenever the `userAccountControl` value changes and deactivates user accounts if the **User Account Control** signifies a disabled AD account.

Use the following script to automatically deactivate users when the associated AD user is disabled.

1. Configure the User form and create a new integer field called **User Account Control**.
2. Add mapping for `userAccountControl (external)` to the new field.
3. Create a new business rule with the following properties:

<table>
<thead>
<tr>
<th>Business rule field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Disable AD Users</td>
</tr>
<tr>
<td>Table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>When</td>
<td>Before</td>
</tr>
<tr>
<td>Condition</td>
<td><code>current.u_user_account_control.changes()</code></td>
</tr>
</tbody>
</table>

The Script field should contain the following:

```javascript
var disabledFlag = 2;
//perform a bitwise comparison on userAccountControl to see if the 2 bit flag is enabled
if (current.u_user_account_control & disabledFlag) {
  gs.log('Disabling user: ' + current.user_name + 'userAccountControl=' +
           current.u_user_account_control);
  current.active='false';
  current.locked_out='true';
}
```

Assign field values for LDAP

You can use a script to assign a value to any field for which there is a field mapping.

For example, to assign a value to the `sys_user.company` field, create a field map for the company field and add a transform script of:

```javascript
company = "Don's Sporting Goods";
```

Exclude particular LDAP users

If you cannot completely filter the LDAP user list using LDAP filter properties, you can exclude users with a map script.
After you have run the logic to identify a user that should not be imported, set the user_name field to an empty string and this user will not be imported.

```
user_name='';
```

One way to identify users to filter out is to look for a string in the distinguishedName attribute. For example, this script excludes accounts that are not in a Users OU. You might use this script if you have too many Users OU to include in the target OU LDAP Option.

```javascript
//vdn is a variable mapped to distinguishedName
gs.include("LDAPUtils");
var vdn = source.getElement(this.distinguishedName);
if (vdn.indexOf('OU=Users')<0) {
    user_name='';
    gs.log('LDAP Import Skipping User: ' + vdn);
}
```

A more complex method of filtering is to use regular expressions.

```javascript
//vcn is a variable mapped to cn
//vdn is a variable mapped to distinguishedName
//c is the regular expression string
gs.include("LDAPUtils");
var vdn = source.getElement(this.distinguishedName);
var vcn = source.getElement(this.cn);
var c = /^[a-z][a-z][a-z][0-9][0-9][0-9]$/;
var nvcn = vcn.toLowerCase();
//test to see if the cn is in the form of 3 letters followed by 3 numbers, only import these
if (c.test(nvcn)) {
    user_name = nvcn;
} else {
    gs.log("LDAP import rejected username: " + vcn + " for DN: " + vdn);
    user_name = "";
}
```

**Verify LDAP mapping**

After creating an LDAP transform map, refresh the LDAP data to verify the transform map works as expected.

**Role required:** admin

1. Navigate to **System LDAP > Scheduled Loads**.
2. Click your LDAP import job.
3. Click **Execute Now**.

**Record creation options during an LDAP transform**

Administrators can specify when to create new records based on changes from incoming LDAP records.

If the LDAP transform map updates a field in the import set table, the integration automatically creates a new record whenever there is a new record in the LDAP data. If the LDAP transform map updates a reference field storing data from another table, the administrator can choose to create, ignore, or reject new LDAP records.

For example, if the integration receives a new department record that does not match any existing department, you may want to update all of the other LDAP record fields without creating a new department record in the instance. The transform map allows you to set the record creation options for each reference field.

Set choice action in the LDAP transform map
The LDAP transform map determines how fields in the Import Set table map to fields in existing tables such as Incident or User.

Role required: admin

1. Navigate to System LDAP > Transform Maps.
2. Select one of the following actions from the Choice action field:
   - **create** – creates a new reference field record if a matching record does not exist.
   - **ignore** – ignores new records in the reference field and completes processing of all other fields in the transform map.
   - **reject** – stops the transform for the entire record.

   **Note:** The field map only displays the Choice action field for reference fields.

## LDAP integration via MID Server

Administrators can integrate using an LDAP data source over a Management, Instrumentation, and Discovery (MID) Server.

The MID Server facilitates communication and movement of data between the platform and external applications, data sources, and services. The MID Server is installed automatically for new instances.

You can use the MID Server to import data over LDAP, but you cannot use the MID Server for LDAP authentication. A MID Server does not support SSL connections.

Using a MID Server to establish an LDAP connection prevents you from having to expose the LDAP server to external network traffic. It also eliminates the need to establish a VPN tunnel between your LDAP server and data centers.

**Note:**
- The MID Server user must have the user_admin role in order to be able to read LDAP server configuration records.
- The following are not available with the MID Server:
  - LDAP authentication
  - SSL connection

### Set up LDAP integration via MID Server

Setting up an LDAP integration via MID Server involves several steps.

Role required: admin

1. Define the LDAP server
2. Configure the LDAP server
   - Provide LDAP server login credentials.
   - Enable a listener.
   - Specify attributes for improving performance or security.
3. Set up communication between the LDAP and MID Servers
4. Define organizational units (OUs) on the LDAP server
5. Create a data source
   - Create a transform map or select an existing transform map.
   - Transform LDAP data into data types that the instance supports.
• Include *onStart and onAfter scripts* in a custom transform map.

6. Create and execute a scheduled data import.
7. Test an LDAP connection manually on page 1837.

Configure an LDAP server
After an LDAP server record exists, you can configure login credentials, enable a listener, and add attributes to the LDAP server that can be used to improve server performance and security.

Role required: admin
1. Provide LDAP server login credentials.
2. Enable a listener.

Provide LDAP server login credentials
The LDAP login credentials determine what organizational units the integration can see.

Role required: admin

Servers that allow anonymous login generally limit the organizational unit (OU) data available to anonymous connections.

1. Navigate to System LDAP > LDAP Servers.
2. Select the LDAP server to configure.
3. In Login distinguished name, enter the user credentials for an account with read access to the directory levels from which you want to import users or groups. The system uses these credentials to connect to your LDAP server. If this information is not entered, the application attempts an anonymous login to the LDAP server.

The Login distinguished name fields accepts several formats.

To access a Microsoft Active Directory (AD) server, use one of the following:

• user@domain.com, domain\user
• cn=user,ou=users,dc=domain,dc=com

To access a different LDAP directory server, the username must be in the full distinguished name format:

• cn=user,ou=users,dc=domain,dc=com

4. In Login password, enter the password for the LDAP user.

   **Note:** Consider enabling LDAPS to encrypt this password during transmission.

5. Select the Active check box.
6. [Optional] In the Starting search directory field, explicitly specify the LDAP OU attributes you want the instance to import.
7. Click Update.

   **Note:**
   If you provide an LDAP password, the integration performs a Simple Bind operation. If you do not provide an LDAP password, the LDAP server must allow anonymous login or the integration cannot bind to the LDAP server.

Specify LDAP attributes
By configuring the LDAP Server form and adding the **Attributes** field, you can specify, and thereby limit, the attributes the LDAP server query returns. This can enhance performance as well as security.

Role required: admin

By default, the system loads all of the attributes for each object that it has permission to read from your LDAP server. By configuring the LDAP Server form and adding the **Attributes** field, you can specify, and thereby limit, the attributes the LDAP server query returns. Using this approach for large LDAP imports can greatly improve the speed of those imports.

For best results, define attributes where possible. If there is information that you do not want exposed to the system, exclude the attribute.

If you do not specify LDAP server attributes, user transactions may freeze for extended periods of time when new attributes are added to an LDAP server object because the system will be busy loading data from the new attributes.

**Note:** To use the manager lookup scripts described in Select or Create a Transform Map for LDAP Data, specify **manager** and **dn** (distinguished name) in the **Attributes** field. Neither attribute is required to be a part of a transform map.
Set up communication between LDAP and MID servers

Configure your LDAP and MID servers to communicate with each other.

Role required: admin

A MID Server connection communicates over HTTP on port 80 by default. This communication channel does not require a certificate. The connection between the MID Server and the instance is over HTTPS (port 443).

An instance can connect to an LDAP server via the MID Server. When you do this, the instance communicates with the MID Server via HTTPS, and the MID Server communicates with the LDAP server via LDAP (port 389). The instance can also connect to the LDAP server directly, using LDAP or LDAPS, either over the internet or through a VPN tunnel.

**Note:** LDAP cannot communicate via the MID Server with password authentication.

To set connection properties for a specific LDAP server:

1. Navigate to **System LDAP > LDAP Servers**.
2. Select the LDAP server to configure.
3. Set the connection property fields (see table).
4. Click Update.

Table 440: LDAP connection properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the server.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box if the server is active.</td>
</tr>
<tr>
<td>LDAP Server URLs</td>
<td>Enter the URLs of the primary and backup LDAP servers. Servers are first ordered by operational status, with servers that are Up listed first, then ordered by the Order value that you specify. The first server listed is the primary LDAP server. The others are redundant servers.</td>
</tr>
<tr>
<td>Server URL</td>
<td>Enter the URL of the server. Configure the form to add this field if necessary. It is a calculated read-only field that shows the list of LDAP servers that you can also see in the LDAP Server URLs field, separated by a space, and ordered by operational status and the order values of the URLs.</td>
</tr>
<tr>
<td>Login distinguished name</td>
<td>Enter the distinguished name (DN) of the user authenticating the LDAP connection.</td>
</tr>
<tr>
<td>Login password</td>
<td>Enter the server’s password.</td>
</tr>
<tr>
<td>Starting search directory</td>
<td>Enter the relative distinguished name (RDN) of the default search directory. All queries to this LDAP server will start from this RDN.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Select the MID Server you want to use to connect to the LDAP server. Using a MID Server to establish an LDAP connection prevents you from having to expose the LDAP server to external network traffic. It also eliminates the need to establish a VPN tunnel between your LDAP server and ServiceNow data centers.</td>
</tr>
</tbody>
</table>

Note:
- The MID Server user must have the user_admin role in order to be able to read LDAP server configuration records.
- The following are not available with the MID Server:
  - LDAP authentication
  - SSL connection
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect timeout</td>
<td>Specify the maximum number of seconds that the instance has to establish an LDAP connection. If no connection is made by this time, the connection is terminated.</td>
</tr>
<tr>
<td>Read timeout</td>
<td>Specify the number of seconds the integration has to read LDAP data. The integration stops reading LDAP data after the connection exceeds the read timeout. If you enable an SSL connection, you can also set a read timeout value with the com.glide.ssl.read.timeout system property. If you enter timeout values for both this field and the system property, the lowest timeout value takes precedence.</td>
</tr>
<tr>
<td>SSL</td>
<td>Select this check box to require the LDAP server to make an SSL-encrypted connection. For more information, see Enable SSL. If you selected a MID Server, this field is not available.</td>
</tr>
<tr>
<td>Listener</td>
<td>Select this check box to enable the integration to periodically poll Microsoft Active Directory servers or LDAP servers that support persistent search request control. Additionally, if you selected a MID Server, the listener functionality is available for that MID Server.</td>
</tr>
<tr>
<td>Listen interval (timeout value)</td>
<td>Specify the listener timeout value in the number of minutes that the integration listens for LDAP data with every connection. The integration stops listening for LDAP data after the connection exceeds the listen interval.</td>
</tr>
<tr>
<td>Paging</td>
<td>Select this check box to have the LDAP server split up LDAP attribute data into multiple result sets rather than submit multiple queries.</td>
</tr>
</tbody>
</table>

**Test communication between LDAP and MID Servers**

The instance tests the connection automatically every time a user opens the LDAP Server form.

Role required: admin
The instance supports an LDAP connection timeout of 29 seconds or less. Error messages appear on the form if there are any issues connecting to the LDAP server.

Employees can also verify connectivity between the instance and the LDAP server. Contact Technical Support for assistance verifying LDAP connectivity.

Configure LDAP connection monitoring
Change or disable LDAP connection monitoring and notifications.

Role required: admin

The instance automatically sends an email to users configured in the LDAP Admins group when an LDAP server connection fails. This uses the email notification, which is launched by the LDAP Connection Test scheduled job. This email notification is enabled by default.

Note: The instance does not send the email notification unless there is at least one member in the LDAP Admins group. Make sure to populate this group with the users you want to receive the email.

By default, the scheduled job tests the connection every 15 minutes. To change this interval or disable monitoring:

1. Navigate to System Definition > Scheduled Jobs.
2. Open LDAP Connection Test.
3. Do one of the following:
   • Change the interval in the Repeat Interval field.
   • Disable monitoring by clearing the Active check box.

Scheduled data imports for LDAP
A scheduled import allows administrators to import LDAP data on a regular schedule.

By default, the LDAP integration includes two sample scheduled imports:

• Example LDAP User Import
• Example LDAP Group Import

Neither example is active by default. Change these scheduled imports to meet your company's business needs.

Import binary data through a MID Server
As an administrator, you can import binary large object (BLOB) data with an LDAP integration through the MID Server.

Role required: admin

Use the examples in the following steps to add choice tables, notes, tables, figures, step results, and postrequisites to the task.

1. Add the name of the LDAP column you want to import binary data from to the system property glide.ldap.binary_attributes.
2. Add a MID Server property with the Name glide.ldap.binary_attributes and the same value you set for the system property.

Create a concept topic to introduce the background needed to perform this process or task.

Troubleshooting LDAP integration via MID Server
You may encounter issues in the following areas while integrating LDAP via MID Server.

You can troubleshoot these issues by viewing the outputs found in the External Communication Channel (ECC) Queue (Discovery > Output and Artifacts > ECC Queue).
Test Connection Issues

When defining OUs within the server, there is a Test connection related list that is used to verify the LDAP connection. When you click this link, the ECC Queue should show a single output message with a topic name of LDAPConnectionTesterProbe. After the test has completed on the MID Server, the ECC Queue should show an input message with the same topic name. If the Name column for the input message shows true, the test was successful. Drill down into the record to view the payload and ensure it does not contain error messages.

![Figure 518: Test Connection](image)

Browse Issues

When defining OUs within the server, there is a Browse related list that is used to view the LDAP directory records that the OU definition returns. When you click this link, the ECC Queue should show a single output message with a topic name of LDAPBrowseProbe. After data has been returned from the MID Server, the ECC Queue should show an input message with the same topic name. If the Name column for the input message shows true, the test was successful. Drill down into the record to view the payload and ensure it does not contain error messages.

Load Import Issues

When uploading data (for example, using the Test Load 20 Records feature), the ECC Queue should show a single output message with a topic name of LDAPProbe. After data has been returned from the MID Server, the ECC Queue should show another input message called LDAPProbeCompleted. The Name column for this input message shows the total number of records returned.

An additional input messages, also named LDAPProbe, is displayed. The Name column for this input message displays the highest record number in the batch. If the total number of records returned is 258 and the batch size is 200 (the default), two LDAPProbe (200, 258) incoming messages will be received, and one LDAPProbeCompleted (258) incoming message will be received.

Drill down into the record to view the payload and ensure it does not contain error messages.

![Figure 519: Import Load](image)

Also keep an eye out for an output message called LDAPProbeError.
Figure 520: Error message

Click the link in the Name column to view the details of the error.

LDAP integration troubleshooting

If you are integrating your LDAP server and have questions, these items may help you troubleshoot the issue.

Preliminary checks

- If the LDAP is unavailable, users cannot log in to the instance. A good practice is to have local accounts for administrators so that if the LDAP is down, administrators can still access the instance.
- Check the service account to ensure that it is not expired or locked out.
- Check the format of the user name. Instead of using just the user name, try using the domain with the user name, or username@domain.
- Verify that you have changed the system_id entry on the ldap_server_config record. If you modify the system_id unintentionally with an Update Set, system_id points to the wrong node for the target instance and does not work.

Error codes

The LDAP Log file lists industry standard error codes for both LDAP and Active Directory (AD). The LDAP error codes are two-digit numbers, while the Active Directory error codes are three-digit numbers. For a list of the most-common error codes, see LDAP Error Codes.

Multiple domain integration

You can integrate multiple domains within the same forest or in completely non-trusted domains. It is recommended that you create a separate LDAP server record for each domain. Each LDAP server record must point to a domain controller for that given domain. This means you will have to allow connections to each of the domain controllers. Multiple AD forests through LDAP with one LDAP account is not supported.

When you expand to more than one domain, it is critical that you identify unique LDAP attributes for the application user names and import coalesce values. A common unique coalesce attribute for Active Directory is objectSid. Unique user names will vary based on your LDAP data design. Common unique attributes are email or userPrincipalName.

Incoming records

See Record creation options during an LDAP transform on page 1849 to set how the integration processes incoming LDAP records that are missing matching values in reference fields.
Common authentication errors

- User Cannot Log In (Invalid DN)
- Invalid CN
- Invalid Connection

Automatic LDAP connection tests

You can manually test connections to LDAP servers or allow ServiceNow to automatically test the connections.

The system tests the connection automatically:

- Every time a user opens the LDAP Server form
- Through the LDAP Connection Test scheduled job, which runs every 15 minutes by default.

You can change how often this scheduled job runs. If this scheduled job is not able to establish a connection, a new one-time schedule job retries the connection test after either five minutes, or half the Repeat Interval value in the scheduled job, whichever occurs first.

Error messages appear on the form if there are any issues connecting to the LDAP server. Also supported are test connections for servers behind a MID server.

Troubleshooting LDAP integration via MID Server

You may encounter issues in the following areas while integrating LDAP via MID Server.

You can troubleshoot these issues by viewing the outputs found in the External Communication Channel (ECC) Queue (Discovery > Output and Artifacts > ECC Queue).

Test Connection Issues

When defining OUs within the server, there is a Test connection related list that is used to verify the LDAP connection. When you click this link, the ECC Queue should show a single output message with a topic name of LDAPConnectionTesterProbe. After the test has completed on the MID Server, the ECC Queue should show an input message with the same topic name. If the Name column for the input message shows true, the test was successful. Drill down into the record to view the payload and ensure it does not contain error messages.

Browse Issues

When defining OUs within the server, there is a Browse related list that is used to view the LDAP directory records that the OU definition returns. When you click this link, the ECC Queue should show a single output message with a topic name of LDAPBrowseProbe. After data has been returned from the MID Server, the ECC Queue should show an input message with the same topic name. If the Name column for the input message shows true, the test was successful. Drill down into the record to view the payload and ensure it does not contain error messages.
Load Import Issues

When uploading data (for example, using the Test Load 20 Records feature), the ECC Queue should show a single output message with a topic name of **LDAPProbe**.

After data has been returned from the MID Server, the ECC Queue should show another input message called **LDAPProbeCompleted**. The **Name** column for this input message shows the total number of records returned.

An additional input messages, also named **LDAPProbe**, is displayed. The **Name** column for this input message displays the highest record number in the batch. If the total number of records returned is 258 and the batch size is 200 (the default), two LDAPProbe (200, 258) incoming messages will be received, and one LDAPProbeCompleted (258) incoming message will be received.

Drill down into the record to view the payload and ensure it does not contain error messages.

![Figure 522: Import Load](image)

Also keep an eye out for an output message called **LDAPProbeError**.

![Figure 523: Error message](image)

Click the link in the **Name** column to view the details of the error.

**Test an LDAP connection manually**

You can manually test the connection to the LDAP server from the LDAP server form.

Role required: admin

1. Navigate to **System LDAP > LDAP Servers**.
2. Select the LDAP server to test.
3. Under **Related Links**, click **Test connection**.
4. Under **Related Links**, click **Browse** to verify that the appropriate LDAP directory structure is visible to the system.
5. (Optional) If the connection was successful, click **Browse** to view the source LDAP directory structure that is visible to the instance.

**Note:**

The **Filter** and **RDN** fields on the left of the Browse window are ignored when you use the search field on the right.

**LDAP error codes**

The LDAP Log file lists industry standard error codes for both LDAP and Active Directory (AD).
### Standard error codes

#### Table 441: Standard LDAP errors

<table>
<thead>
<tr>
<th>Error / data code</th>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LDAP_SUCCESS</td>
<td>Indicates the requested client operation completed successfully.</td>
</tr>
<tr>
<td>2</td>
<td>LDAP_PROTOCOL_ERROR</td>
<td>Indicates that the server has received an invalid or malformed request from the client.</td>
</tr>
<tr>
<td>3</td>
<td>LDAP_TIMELIMIT_EXCEEDED</td>
<td>Indicates that the operation's time limit specified by either the client or the server has been exceeded. On search operations, incomplete results are returned.</td>
</tr>
<tr>
<td>4</td>
<td>LDAP_SIZELIMIT_EXCEEDED</td>
<td>Indicates that in a search operation, the size limit specified by the client or the server has been exceeded. Incomplete results are returned.</td>
</tr>
<tr>
<td>5</td>
<td>LDAP_COMPARE_FALSE</td>
<td>Does not indicate an error condition. Indicates that the results of a compare operation are false.</td>
</tr>
<tr>
<td>6</td>
<td>LDAP_COMPARE_TRUE</td>
<td>Does not indicate an error condition. Indicates that the results of a compare operation are true.</td>
</tr>
<tr>
<td>7</td>
<td>LDAP_AUTH_METHOD_NOT_SUPPORTED</td>
<td>Indicates that during a bind operation the client requested an authentication method not supported by the LDAP server.</td>
</tr>
<tr>
<td>8</td>
<td>LDAP_STRONG_AUTH_REQUIRED</td>
<td>Indicates one of the following: In bind requests, the LDAP server accepts only strong authentication. In a client request, the client requested an operation such as delete that requires strong authentication. In an unsolicited notice of disconnection, the LDAP server discovers the security protecting the communication between the client and server has unexpectedly failed or been compromised.</td>
</tr>

</tr>
<tr>
<td>20</td>
<td>LDAP_TYPE_OR_VALUE_EXISTS</td>
<td>Indicates that the attribute value specified in a modify or add operation already exists as a value for that attribute.</td>
</tr>
<tr>
<td>21</td>
<td>LDAP_INVALID_SYNTAX</td>
<td>Indicates that the attribute value specified in an add, compare, or modify operation is an unrecognized or invalid syntax for the attribute.</td>
</tr>
<tr>
<td>22-31</td>
<td>Not used.</td>
<td></td>
</tr>
<tr>
<td>32</td>
<td>LDAP_NO_SUCH_OBJECT</td>
<td>Indicates the target object cannot be found. This code is not returned on following operations: Search operations that find the search base but cannot find any entries that match the search filter. Bind operations.</td>
</tr>
<tr>
<td>33</td>
<td>LDAP_ALIAS_PROBLEM</td>
<td>Indicates that an error occurred when an alias was dereferenced.</td>
</tr>
<tr>
<td>34</td>
<td>LDAP_INVALID_DN_SYNTAX</td>
<td>Indicates that the syntax of the DN is incorrect. (If the DN syntax is correct, but the LDAP server’s structure rules do not permit the operation, the server returns code 53: LDAP_UNWILLING_TO_PERFORM.)</td>
</tr>
<tr>
<td>35</td>
<td>LDAP_IS_LEAF</td>
<td>Indicates that the specified operation cannot be performed on a leaf entry. (This code is not currently in the LDAP specifications, but is reserved for this constant.)</td>
</tr>
<tr>
<td>36</td>
<td>LDAP_ALIAS_DEREF_PROBLEM</td>
<td>Indicates that during a search operation, either the client does not have access rights to read the aliased object’s name or dereferencing is not allowed.</td>
</tr>
<tr>
<td>37-47</td>
<td>Not used.</td>
<td></td>
</tr>

<tr>
<td>-------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>50</td>
<td>LDAP_INSUFFICIENT_ACCESS</td>
<td>Indicates that the caller does not have sufficient rights to perform the requested operation.</td>
</tr>
<tr>
<td>51</td>
<td>LDAP_BUSY</td>
<td>Indicates that the LDAP server is too busy to process the client request at this time but if the client waits and resubmits the request, the server may be able to process it then.</td>
</tr>
<tr>
<td>52</td>
<td>LDAP_UNAVAILABLE</td>
<td>Indicates that the LDAP server cannot process the client's bind request, usually because it is shutting down.</td>
</tr>
<tr>
<td>52e</td>
<td>AD_INVALID_CREDENTIALS</td>
<td>Indicates an Active Directory (AD) AcceptSecurityContext error, which is returned when the username is valid but the combination of password and user credential is invalid. This is the AD equivalent of LDAP error code 49: LDAP_INVALID_CREDENTIALS.</td>
</tr>
<tr>
<td>53</td>
<td>LDAP_UNWILLING_TO_PERFORM</td>
<td>Indicates that the LDAP server cannot process the request because of server-defined restrictions. This error is returned for the following reasons: The add entry request violates the server's structure rules...OR...The modify attribute request specifies attributes that users cannot modify...OR...Password restrictions prevent the action...OR...Connection restrictions prevent the action.</td>
</tr>
<tr>
<td>54</td>
<td>LDAP_LOOP_DETECT</td>
<td>Indicates that the client discovered an alias or referral loop, and is thus unable to complete this request.</td>
</tr>
<tr>
<td>55-63</td>
<td></td>
<td>Not used.</td>
</tr>
<tr>
<td>Error / data code</td>
<td>Text</td>
<td>Description</td>
</tr>

<td>-------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>64</td>
<td>LDAP_NAMING_VIOLATION</td>
<td>Indicates that the add or modify DN operation violates the schema's structure rules. For example, The request places the entry subordinate to an alias. The request places the entry subordinate to a container that is forbidden by the containment rules. The RDN for the entry uses a forbidden attribute type.</td>
</tr>
<tr>
<td>65</td>
<td>LDAP_OBJECT_CLASS_VIOLATION</td>
<td>Indicates that the add, modify, or modify DN operation violates the object class rules for the entry. For example, the following types of request return this error: The add or modify operation tries to add an entry without a value for a required attribute. The add or modify operation tries to add an entry with a value for an attribute which the class definition does not contain. The modify operation tries to remove a required attribute without removing the auxiliary class that defines the attribute as required.</td>
</tr>
<tr>
<td>66</td>
<td>LDAP_NOT_ALLOWED_ON_NONLEAF</td>
<td>Indicates that the requested operation is permitted only on leaf entries. For example, the following types of requests return this error: The client requests a delete operation on a parent entry. The client request a modify DN operation on a parent entry.</td>
</tr>
<tr>
<td>67</td>
<td>LDAP_NOT_ALLOWED_ON_RDN</td>
<td>Indicates that the modify operation attempted to remove an attribute value that forms the entry’s relative distinguished name.</td>
</tr>
<tr>
<td>68</td>
<td>LDAP_ALREADY_EXISTS</td>
<td>Indicates that the add operation attempted to add an entry that already exists, or that the modify operation attempted to rename an entry to the name of an entry that already exists.</td>
</tr>
<tr>

</table>

**LDAP record synchronization**

Administrators can synchronize inactive, disabled, or deleted LDAP records with their LDAP records.
LDAP record synchronization is the process of detecting inactive records on the LDAP server and updating the corresponding LDAP records. Detecting inactive LDAP records involves defining consistent data indicators for each user object, importing LDAP data, and evaluating the data indicators.

A data indicator can be:

- a date field
- membership in a specific OU (identify by parsing the dn attribute), using the useraccountcontrol attribute
- a combination of these indicators

Imported data comes into the instance through import set tables where the data can be evaluated and processed.

The import process can use:

- **LDAP extraction** on page 1870: a single import job to gather all user records into the import set temporary tables for evaluation
- **LDAP refresh filters** on page 1869: multiple import jobs to divide different types of user records, segregating records for separate processing

**LDAP refresh filters**

Filters on the LDAP refresh process can be used to specify processing that ignores inserts of disabled users.

You can loosen the LDAP OU filter to bring all of the data in to your import set table (including inactive users) and then specify processing that ignores inserts of disabled users. The sample ‘Users’ OU definition that the instance provides in its out-of-box LDAP sample contains a filter.

This filter is important because it defines which user records are brought into the import set table to be evaluated. While achieving a smaller data load, a limitation of this filter is that it filters out inactive users, so the inactive user records are not imported into the import set temporary tables. Since there is not visibility of the inactive user records, there is no ability to evaluate the record indicators.
To use filtering within the main LDAP refresh process, change the filter to bring in all of the user records. The result is that all the records will be loaded into the import set temporary table where they can be evaluated and transformed.

**Note:** There is a precaution here: because the filtering brings in all the records, you may end up with a vast amount of older inactive LDAP accounts that should not be inserted into the instance. A user record should never be created for a disabled user.

**Alternative method**

*LDAP extraction* on page 1870 uses a single import job to gather all user records into the import set temporary tables for evaluation.

*LDAP extraction*  
An LDAP extraction process can be implemented to detect disabled users.

An extract from your LDAP source can filtered for disabled users using an active flag that can be set for every record in the import to ‘false’. Specify (`target.active=false`) and copy into the **Script** field directly on the Table Transform Map record.
Benefits

Benefits to this method include:

• Simple scripting
• Existing user records are not involved in processing
• Inactive users are not loaded into a temporary import table
• No performance impact

Drawbacks

Drawbacks to this method include:

• An additional process is created
• The extract set must be placed in a location where your data source can access it

Alternative method

LDAP refresh filters on page 1869 use multiple import jobs to divide different types of user records, segregating records for separate processing.

Inactive LDAP user accounts
Detect that an existing, current, user account is inactive or has been disabled or deleted from an Active Directory (AD) LDAP.

A common LDAP integration issue is how to detect disabled or deleted users in an Active Directory (AD) and then deactivate them in the instance. In an Active Directory LDAP, a filter is usually set to exclude inactive users when refreshing, so the instance is not aware of users that are disabled or deleted in AD.

The issue is how to detect that an existing, current user is inactive or has been deleted from AD.

Note: The recommended approach is to deactivate user records and all other types of records, not delete them. Each record is linked to other records, and deleting a record destroys all the relationships to those other records. Deactivating records keeps those relationships in place.

There are two approaches that you can use to find disabled and deleted AD accounts to synchronize your user records:

• Find inactive LDAP accounts using the lastRefresh time on page 1871
• Find inactive LDAP accounts using the userAccountControl field on page 1872

Find inactive LDAP accounts using the lastRefresh time
Locate accounts with inactive or missing LDAP connections.

Role required: admin

One method is to add a lastRefresh field to the user record and set the value during the import process. Then create a scheduled job that checks for users that have not been refreshed in 30 days, and deactivate them.

Warning: If the LDAP import fails for 30 days then everyone is deactivated.

To find and deactivate inactive user accounts:

1. Create a datetime field on the User [sys_user] table. For example, u_last_refreshed.
2. Create an LDAP transform script to set the field value.

```javascript
target.u_last_refreshed = gs.now();
```

3. Create a scheduled job to find and deactivate the user accounts that have not been refreshed in 30 days.

```javascript
disable_users();
function disable_users() {
    /* query for active users with ldap source and last updated more than 30 days ago
    * disable them
    */
    var gr = new GlideRecord("sys_user");
gr.addQuery('u_last_refreshed', '<', gs.daysAgoStart(30));
gr.addQuery('active', true);
gr.addQuery('source', '!=', '');
gr.query();
while (gr.next()) {
gr.active = false;
    gs.log("Disabled inactive user: " + gr.user_name + " - last updated: " + u_last_refreshed);
gr.update();
}
gs.log("Completed disabling inactive accounts");
}
```

4. Create a report of user accounts that have been inactive for 15 days.

Find inactive LDAP accounts using the userAccountControl field
Identify when an Active Directory (AD) user is deleted (or made inactive).

Role required: admin

One method is to track the active status of AD users and create a business rule to update corresponding accounts when an AD account is inactive.

To find and deactivate inactive user accounts:

1. Create a new string field on the User [sys_user] table to track the value of the AD userAccountControl field. For example: u_ad_user_account.

2. Create an LDAP transform script to set the field value.

```javascript
target.u_ad_user_account = source.userAccountControl
```

3. Update the LDAP filter to show disabled AD accounts.
Here is an example of a filter.

```javascript
(&(objectClass=person) (sn=*)(!(objectClass=computer))(!(userAccountControl:1.2.840.113556.1.4.803:=2)))
```

Here is an example of a replacement filter you can use.

```javascript
(&(objectClass=person) (sn=*)(!(objectClass=computer)))
```

4. Create an onChange business rule to set the active field to false whenever the u_ad_user_account field has the value 514.

'514' indicates an inactive account.
**LDAP script examples**
The following script examples assume you use an Active Directory (AD) for your LDAP server.

**userAccountControl attribute values script**
This example tests the source for the userAccountControl attribute values associated with a disabled user (514 or 546).

```javascript
//Deactivate LDAP-disabled users during transform based on 'userAccountControl' attribute
if(source.u_useraccountcontrol == '514' || source.u_useraccountcontrol == '546'){
   target.active=false;
   target.locked_out=true;
}
```

Here is an example using a bitwise check:

```javascript
if(source.u_useraccountcontrol & 2){
   active =false;
}
```

**userAccountControl attribute script**
This example examines the userAccountControl attribute but does not test for specific values. It also contains the option of reactivating LDAP user accounts.

```javascript
/*
* Deactivate LDAP-disabled users during transform based on 'userAccountControl' attribute
* Convert the userAccountControl attribute back to a hex value
*/
var ctrl = parseInt(source.u_useraccountcontrol, 10);
ctrl = ctrl.toString(16);

/*. The only digit we care about is the final one
* A final hex digit value of '2' in 'ctrl' means disabled
*/
if(ctrl.substr(-1) == "2"){
   //Deactivate and lock the user account
   target.active = false;
   target.locked_out = true;

   //Ignore any insert of a disabled record
   if(action == 'insert'){
      ignore = true;
   }
}
/* Optional: Uncomment else block to reactivate and unlock the user account
else {
   target.active = true;
   target.locked_out = ctrl.substr(-2, 1) == "1";
}
*/
onBefore transform map script

Here is an example of a onBefore transform map script. The script identifies disabled records and records being inserted. If an insert of a disabled user is occurring, then the operation transform ignores the record.

```javascript
//Ignore any insert of a disabled record as defined by the 'userAccountControl' attribute
var uc = source.u_useraccountcontrol;
if((uc == '514' || uc == '546') && action == 'insert'){
  ignore = true;
}
```

DN member script

This script example introduces flexibility by not relying on the 546 and 514 userAccountControl values, but instead checking whether the user is a member of a particular Distinguished Name (DN). You can use this script either in the Script field of the ‘Table Transform Map’ record or in an onBefore transform map script.

```javascript
//Deactivate LDAP-disabled users during transform based on OU membership in 'dn'
if(source.u_dn.indexOf('OU=Disabled Accounts') > -1){
  target.active = false;
  target.locked_out = true;
}
```

Active Directory Application Mode (ADAM)

Active Directory Application Mode (ADAM) is an Lightweight Directory Access Protocol (LDAP)-compliant directory service.

Note: A basic level of understanding with Microsoft Windows Server and Active Directory is needed for understanding this topic. You must also have administrator permissions on the server you are configuring for ADAM.

These are sample procedures. Due to installation and environment variations, we cannot offer direct support. We recommend working with a Microsoft consultant.

ADAM has a simple install and runs as a service on Windows operating systems. It can be fully customized and distributed as an application component or used as a stand-alone LDAP directory. ADAM uses the same technologies found on Active Directory Domain Controllers (including replication and delegation features) and has its own administration and customization features. It can be run as a Windows service. ADAM can be installed on Windows XP, 2000, 2003, and 2008 operating systems. ADAM is included as part of Windows Server 2003 R2 and Windows Server 2008. A download is available at [http://www.microsoft.com/downloads](http://www.microsoft.com/downloads) for earlier operating systems.

Security

Some company security policies prohibit external vendors and partners from connecting directly to an Active Directory (AD) Domain Controller. If exposing certain AD objects or attributes to an external vendor or partner is prohibited, access to objects and attributes can be blocked using AD Security Access Control Entries (ACE or ACL). Depending on security requirements, this method can introduce complexity in the integration. Consolidating multiple domains and forests is recommended. If all LDAP imports and authentications need to be channeled through a single source, ADAM can be used as a consolidated source. With the release of Windows 2008 this functionality has been renamed to Light-Weight-Directory Service, LDS. Installation and configuration is similar to Windows Server 2003 R2.
**Recommended Knowledge**

For this task, you must understand AD, object classes and attributes. To have a successful integration, you need to be knowledgeable of the current AD object structure, familiar with Active Directory delegations, and have a strategy on how to use ADAM and for what purposes. If you are not familiar with AD or ADAM, work with your AD administrator to configure a new ADAM environment.

**Trusts**

If `userProxy` objects is used, the computer hosting ADAM needs to be a member of the domain that has the AD accounts, or a member of a trusted domain.

**Internal Connectivity**

If `userProxy` objects is used, the ADAM computer must be able to connect to the related Domain Controllers to perform proxy authentication.

*Configuring an instance with ADAM*

The first install copies the ADAM files to your computer, registers requires components, and creates the application shortcuts.

Role required: admin

By default, all of the application files are installed to `%systemroot%\ADAM`.

- Windows Server 2003 R2 - ADAM can be installed using the Control Panel > Add and Remove Programs > Optional Component Manager.

Create the first instance service which functions as the first directory service hosted by ADAM. Do one of the following:

- Run `adaminstall.exe` from the ADAM folder.
- Use the Create an ADAM instance shortcut from the Start Menu > Programs > ADAM folder.
  a) Select the A unique instance install option.

  **Note:** You can use this option to install an instance replica on a second server to provide a fault tolerant system.

  b) Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Name</td>
<td>used primarily to identify the Windows Service name and display name</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Ports</td>
<td>sets the port numbers to be used for LDAP and LDAPS Listeners. The default LDAP port is 389, LDAPS is 636. If these ports are in use on the server, the setup wizard selects new ports. Work with your network administrator to determine the best ports to use.</td>
</tr>
<tr>
<td>Application Directory Partition</td>
<td>creates an application directory partition. Not needed at this step, we recommend creating the new partition now. A good practice is to use the same distinguished name as your forest or domain, but replace the highest level domain with adun instead of com or local. For example, if your forest partition is <code>dc=myCompany,dc=com</code>, you could create the ADAM partition as <code>dc=myCompany,dc=adam</code>.</td>
</tr>
<tr>
<td>File Locations</td>
<td>selects the location(s) for the ADAM partition data.</td>
</tr>
<tr>
<td>Service Account Selection</td>
<td>selects a service account that the instance runs as. For stand-alone services, you can use the default network service account. If you plan on using replicas, you need to use an account that has access to all ADAM instances.</td>
</tr>
<tr>
<td>ADAM Administrators</td>
<td>the delegation on the ADAM directory that leverages Windows integrated authentication. This is how the initial access is granted for administration. Once the initial account is granted rights, this user or group delegates rights to other Windows users or ADAM users. You can select the default to only grant admin access to the current user, or grant access to a different user or group based on your needs.</td>
</tr>
<tr>
<td>Import LDIF Files</td>
<td>the files to import. MS-UserProxy is the most important file to import, but it’s worth adding all available files since there is little overhead to the schema and you won’t have to worry about extending it later if your needs expand. Confirm the details and the wizard complete the configuration.</td>
</tr>
</tbody>
</table>
Setting up the ADAM console

Even though there are many similarities between ADAM and Active Directory, the administration can be very different since there is no Users and Computers management console.

Role required: admin

Most of the general administration is performed using the ADAM ADSI MMC console available from the ADAM start menu. The first time you run the ADAM ADSI console, you must connect to the partition you created.

1. Right-click the ADAM ADSI Edit item in the left frame.
2. Give the new connection a name and update the server name, port fields with the information used when you created the instance.
3. Select distinguished name or naming context and specify the distinguished name of the application partition you created earlier. You can connect to the Configuration and Schema partitions for advanced configuration options.
   You should now be able to see into the partition and the default containers for LostAndFound, NTDS Quotas, and Roles. The Roles container has not been configured yet.

Create containers and organizational units for ADAM

Objects stored in ADAM can be logically grouped into containers and organizational units (OU) just as they would in Active Directory.

Role required: admin

1. Right-click the root partition and select New > Object > organizationalUnit. You can also view the list of other objects that are available. This list varies based on the schema extensions installed when you imported the LDF files.

   Note: You can also view the list of other objects that are available. This list varies based on the schema extensions installed when you imported the LDF files.

2. When prompted for a value, enter the name of OU, for example Users.
3. The next screen displays a More Attributes button; use this to assign values to additional attributes. For OUs and containers, no additional values are needed.
   After creating OUs, the new OUs are listed as a child of the root object.

Delegation with ADAM

Once the OU structure is created, define the permission delegations to properly secure the objects to limited users.

As with Active Directory, there are two general ways to grant permissions:

- Add users to a group that already has the appropriate permissions assigned.
- Define new permissions on the ADAM objects.

For this task, we discuss object level permissions. Refer to the Group Administration section for information on group memberships.

Since we don’t have a Users and Computers console for ADAM, all object level permissions are defined using the Active Directory utility DSACLS.exe. This file is found in the ADAM program directory. When running ADAM utilities it is best to launch the ADAM Tools Command Prompt. This ensures the proper versions of the tools. DSALCS is used to view and set object access rights.

Example: "dsacls \localhost:50010\dc=myCompany,dc=adam" displays the permissions assigned to the root of partition dc=myCompany,dc=adam running on the localhost, port 50010. DSACLS is a complex tool used to create complex delegation. Run "DSACLS /?" for usage notes.

Populating ADAM Objects

ADAM Objects include User Objects, UserProxy Object, and Group Objects.
User Objects

Users can be created using the ADAM ADSI Edit console just as we did for OU creation. Users can also be administered using AD command line tools, which is beyond the scope of this document. The only mandatory attribute for new user objects is the cn, which is a short name or the user’s full name. There are also a wide range of optional attributes similar to Active Directory user attributes. You can access the full list of attributes by selecting properties from the user object.

UserProxy Objects

For ServiceNow LDAP integration we recommend you use UserProxy objects in ADAM which creates a proxy account that links to the related AD user account. This allows you to have ADAM authenticate logon credentials using AD usernames and passwords from the domain without ServiceNow directly connecting to the Domain Controller. UserProxy objects are very similar to AD and ADAM User objects except that do not store passwords and has an objectSID attribute that contains the SID from the linked AD User object. This is how the proxy works. UserProxy objects are created using the ADSIEdit console or command line tools, but this can be tedious. It is recommended that you use an automated process as defined below.

Group Objects

Groups are created using the ADSIEdit console and AD command-line tools. Group concepts are similar to AD and are used to integrate groups and members to ServiceNow. The biggest difference is ADAM groups can contain members from ADAM or from trusted AD Domains.

Automating ADAM Object Creation

If you are interested in synchronizing Active Directory accounts to ADAM, we recommend you use Microsoft ADAMSync tool. This is the most common use of ADAM for ServiceNow LDAP integration.

About Permission Delegation

ADAM contains some built-in groups with default permissions. These groups are found in the container cn=roles,dc=myCompany,dc=adam. These are similar to domain level groups and have rights to objects in the current partition. Similar to AD Forests you can also set a higher level of permissions using the default groups in cn=roles,cn=configuration,dc=myCompany,dc=adam. You must connect to the configuration partition in ADSIEdit. The Administrators group by default includes the account specified during the setup. This member is not always visible since it’s inherited through the configuration groups. Administrators have full control of all partition objects. The Readers group does not contain any members by default and has read access to all objects in the partition. The Users group is a dynamic group just as it is in Active Directory. Transitivity it includes all ADAM users created in the partition.

Testing and troubleshooting ADAM setup

The primary tool used for testing is LDP. This allows you to fully test user authentication.

Most of the object management can be completed using the ADAM ADSI Edit console which will provide access to the entire collection of objects and attributes. The highest level of control and troubleshooting ADAM services is using the Windows service created during the instance setup. The service name will vary and depends on the name of the instance created. This service must be running in order for the ADAM service to run. If you are experiencing connection problems, you should review the network configurations to ensure you have the appropriate network access to connect to the server and ADAM port. For each
ADAM instance installed, a Windows Event Log is created. This is also a great tool for troubleshooting ADAM services.

The Windows Security Event Log is also helpful when troubleshooting userProxy authentications. All userProxy logon attempts are logged in the Security Log and reference the remote client device address, the distinguished name of the user trying to log on, and the result or status code.

**Backup and recovery with ADAM**

All ADAM data can be backed up using standard file system backup methods.

We recommend following Microsoft procedures for restoring (recovery of) an ADAM instance.

**Redundancy**

ADAM has built-in replication utilities based on the same technology as AD. A full read and write replica of an ADAM partition can exist on the same or different computer. You can use this replica in a variety of ways to provide a fault-tolerant LDAP integration with the instance. One option is to expose both partitions to the instance through the firewall and define both servers in the LDAP Properties server field.

**Use LDAPS with ADAM**

The default configuration for userProxy object authentication is to enforce LDAPS (secure LDAP) communications. LDAPS requires SSL certificates to secure the network traffic.

To remove this requirement make the following change using the ADSIEdit console connected to the configuration partition.

```
Object: CN=Directory Service, CN=Windows NT, CN=Services, CN=Configuration
Attribute: msDS-Other-Settings
Value: change RequiresSecureProxyBind from 1 (enforced) to 0 (disabled)
```

Restart the ADAM service to use the new setting.

To support secure binds and encrypt the user and password information being transmitted, a SSL certificate must be installed on the server and any LDAP client. Since there is limited and controlled uses to the ADAM service, it is feasible to use a self-signed certificate which would meet the needs without incurring certificate costs or building a Certificate Authority (CA) infrastructure. If you already have a CA, you can issue a certificate. Otherwise, create a self-signed certificate.

**Creating a Self-Signed Certificate**

To use the selfssl utility, Internet Information Services (IIS) must be installed. This service can be removed after you generate the certificate. You can get the selfssl.exe utility from the IIS Resource Kit. If IIS is already installed, create a new website so that the current sites will not be impacted during the certificate generation. Selfssl needs to temporarily attach the new self-issued certificate to a valid web site. Selfssl is a command-line tool and has the following common parameters.

**Table 444: Selfssl Parameter Descriptions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/T</td>
<td>Adds the cert to ‘Trusted Certificates’ on the local machine</td>
</tr>
<tr>
<td>/N:cn</td>
<td>Set the common name of the certificate. This must match the fully qualified domain name of the server running the web service using the certificate</td>
</tr>
</tbody>
</table>
The common name attribute should match the external name or address that the instance will use to connect to your ADAM computer. You will need to get the IIS Website site id unless you are using the default website which is 1 and does not need to be defined in the selfssl command. A sample command to generate a certificate for myCompany would be:

```
selfssl /N:CN=myCompany.externaldomain.com /K:1024 /V:3650 /S:12345 /P:50001 /T
```

This statement creates a certificate that is valid for 10 years. Set the value to any duration, but be aware the new certificate must be generated and submitted to the instance before the old one expires. We recommend making a note of the expiration date on the certificate.

Once the certificate is generated you can remove it from the website, or delete the entire web site if you created a temporary site.

### Assigning the Certificate to ADAM

To support secure binds and encrypt the user and password information being transmitted, a SSL certificate must be installed on the server and any LDAP client.

Role required: admin

Since there is limited and controlled uses to the ADAM service, it is feasible to use a self-signed certificate which would meet the needs without incurring certificate costs or building a Certificate Authority (CA) infrastructure.

To assign the certificate to ADAM.

1. Open the Certificates MMC console. Create two console connections, one for Local Computer Certificates, and the other for Local Computer Services Certificates on the new ADAM service. The new certificate can be found under Certificates (Local Computer)\Personal Certificates.
2. Copy the certificate to the container for the ADAM service, Certificates – Service (ADAM Service Name)\ADAM_ADAM Service Name\Trusted Root Certificates\Certificates. Also copy the certificate to Certificates – Service (ADAM Service Name)\ADAM_ADAM Service Name\Personal\Certificates.
3. Open the details tab on the certificate you copied. Note the Valid from date stamp. Now assign read access to the certificate key file. Go to C:\Documents and Settings\All Users\Application Data\Microsoft\Crypto\RSA\MachineKeys and identify the certificate with the matching time stamp. Assign Read & Execute rights to the service account running ADAM. By default this is Network Service.
4. Restart the ADAM service to activate the new certificate.

### Exporting the Public Key Certificate

LDAPS clients, including the instance need the public key certificate in order to make a secure connection to ADAM.

Role required: admin
From the server certificate consoles you used above, export a public key to be used by the clients.

1. Select the certificate, right-click, select **all tasks/export**. Do not export the private key. Select the default DER encoded binary X.509 format and specify the export file name.

2. Install the public certificate on the LDAP clients that connect to the server using LDAPS. When prompted, add the certificate to the **Trusted Root Certificate Authorities store**.

Test communication between LDAP and MID Servers
The instance tests the connection automatically every time a user opens the LDAP Server form.

Role required: admin

The instance supports an LDAP connection timeout of 29 seconds or less. Error messages appear on the form if there are any issues connecting to the LDAP server.

Employees can also verify connectivity between the instance and the LDAP server. Contact Technical Support for assistance verifying LDAP connectivity.

**ServiceNow ITSA Suite Access Account**
ServiceNow requires a user account to read the ADAM object information that is imported into the application instance.

Create the account by using one of the following methods:

- Create a local ADAM user account and assign it a password and assign permissions.
- Assign permission to a Windows domain account on the ADAM partition.
- Use a **userProxy** account.

When using ADAM as an LDAP source, you must specify the fully qualified distinguished name (FQDN) of the ADAM account in the instance’s LDAP server’s **Login distinguished name** field.

**Testing LDAPS Connections**
There are two console connections, one for Local Computer Certificates, and the other for Local Computer Services Certificates on the new ADAM service.

Role required: admin

1. Run **LDP.exe** from the ADAM install folder `c:\windows\adam`. Verify that the ADAM version is selected because this is not the standard Windows LDP client.

2. Open a new connection using the **Connection/Connect** menu. The server name must match the CN assigned to the certificate.

3. Enter the **LDAPS port** and select the **SSL** checkbox.
The results of a successful connection are some general server information and no errors.

4. Bind (log in) to the service. To replicate typical LDAP client connections select the Simple bind option. Enter a valid ADAM user or **userProxy** distinguished name in the user field and the associated password.
If you see a return message stating ‘Authenticated as:…..’ then you have successfully connected using LDAPS.

**Use ADAMSync to populate ADAM**
Administrators use MS ADAMSync to populate LDAP directories that use MS ADAM.

**Note:**
This document assumes you have at least a basic level of understanding with Microsoft Windows Server, Active Directory, and ADAM and that you already have a functional **ADAM** instance with a partition.
These are sample procedures. Due to the complexity and the fact that it is running in your environment, we cannot offer direct support. We recommend you work with Microsoft or a Microsoft consultant if you run into any trouble.

Once ADAM has been installed and the first partition has been created, you can populate it with objects. The following options are available:

- Manual object creation using GUI or scripts. This option is inefficient and slow.
- Integrate with Active Directory using Microsoft Integration Information Server. This option ultimately provides the most flexibility and functionality but does require some advanced configurations. There is a free version of MIIS available that is compatible with Active Directory, ADAM, and Microsoft Global Address Lists from Exchange. Unless you already have experience with MIIS we advise that you don’t attempt to implement a new environment for LDAP integration only.
- Use ADAMSync, a synchronization tool that Microsoft provides with ADAM. This is the option that is explained here.

Define ADAM user accounts

Define the following user accounts in ADAM. One is used for the instance to connect with and the other for ADAMSync.

Role required: admin

These accounts can be local ADAM User objects, UserProxy objects, or a Windows account from a trusted domain.

User Account

This account requires read-only access to the directory structure you are importing to your instance. The best way to accomplish this is to add the account to the member attribute on the Readers group found in cn=roles,dc=myCompany,dc=adam.

New ADAM User accounts are disabled by default. You will need to enable the new accounts and set a password.

1. Enable users by changing the attribute msDS-UserAccountDisabled to FALSE.
2. Right-click the user object and reset the password.
3. Test the new accounts using LDP as defined in ADAM to make sure they can connect. Use the LDAP > View/Tree option, leaving the Base DN blank to make sure you can view the objects in the directory using the new accounts. The Configuration, Schema, and the domain partition should be visible in the left pane. Traverse the domain partition. If you are using a new local ADAM account, it will show ‘No Children’ which means you don’t have read access to the objects. Verify the Setup group memberships and re-test.

ADAMSync User Account

ADAMSync uses this account to manage objects in the ADAM partition. This account requires admin level rights since it will create, update, and delete ADAM objects.

ADAMSync AD Account

ADAMSync uses this account to read the AD objects that will be synchronized to ADAM.

Set up ADAMSync

ADAMSync is included with Windows Server 2003 R2. Download and install ADAMSync if you are using a different OS.

Extending the schema

The ADAM schema needs to be extended to support ADAMSync.
1. Run the following command from c:\windows\adam to import the ADAMSnc schema extensions. You may have to change the server:port and add credentials if the current user doesn't have access. See the AdamSyncMetadata.ldf file for details.

```
ldifde -i -f MS-AdamSyncMetadata.LDF -s localhost:50000 -j . -c "cn=Configuration,dc=X" #configurationNamingContext
```

2. Do the same with MS-AdamSchemaW2k3.ldf to support Windows 2003 attributes.

```
ldifde -i -u -f MS-AdamSchemaW2K3.LDF -s localhost:50000 -j . -c "cn=Configuration,dc=X" #configurationNamingContext
```

**Recommended schema changes**

Here are some additional schema changes we recommend.

1. Open a new MMC console and add the ADAM Schema Snap-in.
2. Connect to the ADAM instance.
3. Expand the Classes folder and locate the userProxy class, open **Properties**.
4. Verify the following optional attributes on the Attributes tab, add any that do not already exist.
   - company
   - department
   - givenName
   - mail
   - physicalDeliveryOfficeName
   - sAMAccountName
   - sn
   - telephoneNumber
   - title
   - userAccountControl
   - userPrincipalName

5. Restart the ADAM Service to enable the new settings.

**Install the ADAM configuration file**

You can install the ADAM configuration file through the Windows command line.

Role required: admin

1. Install the configuration file.

```
C:\WINDOWS\adam>adamsync /install localhost:50000 MS-AdamSyncConfSNC.XML
```

2. Run the synchronization file. This will log to the console and may run for a long time.

```
C:\WINDOWS\adam>adamsync /sync localhost:50000 "ou=users,dc=service-now,dc=adam" /log -
```

3. Review the results by using the ADSIEdit console. You should see the new objects and attributes that were created by ADAMSnc.
4. Run ldap to test the UserProxy authentication.
Automating the sync process

Setup the sync process as a Windows Scheduled Task. You must either provide the credentials in the config file, command line, or run the Scheduled Task with an account that has access.

Special notes

- You can create multiple configuration files and scheduled jobs to sync ADAM from multiple sources.

  This example imports the sAMAccountName attribute which can be used as the application logon. If you are going to sync source you need to make sure you have a unique attribute value that can be used for the logon credentials. sAMAccountName is guaranteed to be unique within a domain, but not across multiple domains.

- If you are using Microsoft Exchange, we recommend excluding cn=SystemMailbox* objects as part of the object-filter configuration.

Example ADAM configuration files

All of the configurations for ADAMSsync are stored in xml files.

**Default configuration file with comments**

There is a default configuration file called MS-AdamSyncConf.xml included with the ADAMSsync install. Make a copy of this file so you have a base example to refer to in the future. This example is the default configuration file with comments added.

```xml
<?xml version="1.0"?>
<doc>
  <configuration>
    <!-- Sync File Description -->
    <description>MyCompany ADAMSync Configuration</description>
    <security-mode>object</security-mode>;
    <!-- source-ad-name = fqdn of the domain controller -->;
    <source-ad-name>;fully.qualified.domain.name.of.domain.controller</source-ad-name>;
    <!-- source-ad-partition = root AD domain partition -->;
    <source-ad-partition>;dc=myCompany,dc=com</source-ad-partition>;
    <!-- source-ad-account = use this to specify an account to connect to AD --
    >; <source-ad-account>;</source-ad-account>;
    <account-domain>;</account-domain>;
    <!-- target-dn = target ADAM OU -->;
    <target-dn>;ou=servicenow users,dc=myCompany,dc=adam</target-dn>;
    <query>;
    <!-- base-dn = should be the root AD partition if you want all users -->;
    <base-dn>;dc=myCompany,dc=com</base-dn>;
    <!-- object-filter = standard ldap query format, this will grab all users --
    >; <object-filter>;(&objectCategory=person)</object-filter>;
    <attributes>;
    <!-- include=userproxy requires objectSID to link back to the AD account --
    >; <include>;objectSID</include>;
    <include>;givenName</include>;
    <include>;sn</include>;
    <include>;description</include>;
    <include>;title</include>;
    <include>;company</include>;
```
LDAP filters configuration file

You can provide any level of filtering in the object-filter value in the configuration file. Use standard LDAP query syntax with the following xml escape characters in place of the standard operators.

- **AND** = "&" replace with &\#38;
- **OR** = "|" (vertical line) replace with &\#124;
- **NOT** = "!" replace with &\#33;

Reference configuration file

Here's an actual configuration file that can be referenced as a sample.

```xml
<?xml version="1.0"?>;
<doc>;
<configuration>;
<description>;SNCTest ADAMS Syn Configuration</description>;
<security-mode>;object</security-mode>;
<source-ad-name>;domaincontroller.service-now.com</source-ad-name>;
<source-ad-partition>;dc=service-now,dc=com</source-ad-partition>;
<source-ad-account>;\</source-ad-account>;
<account-domain>;</account-domain>;
</configuration>;
</doc>
```
Configure Microsoft Active Directory for secure LDAPS communication

Use certificate pairs to enable Microsoft Active Directory (AD) LDAPS communications.

**Note:** These procedures were designed and tested using Windows 2003 R2 Standard Edition and work with all versions of Windows 2003.

Secure LDAP (LDAPS) communication is similar to SSL (HTTPS) communication in that both encrypt the data between servers and clients. To accomplish this, the server and clients share common information by using certificate pairs. The server holds the private key certificate and the clients hold the public key certificate. These certificates are required to enable Microsoft Active Directory (AD) LDAPS communications.
To configure LDAPS for Active Directory you must:

- Ensure that the Active Directory domain is set up and that the instance is able to connect to the Active Directory server through the firewall.
- Verify that there is a Certificate Authority (CA) that can issue a certificate for the domain controller (DC). If you don't already have a CA infrastructure there are two options.
  - Setup a stand-alone CA to issue the certificate
  - Request a third party certificate
- If you already have a CA in place, you can generate a certificate from an internal CA.

All certificates have a defined expiration date which can be viewed in the certificate properties. If the certificate expires, all LDAPS traffic fails, and your users can no longer log into the instance. To resolve this, a new certificate must be issued and installed on your instance.

The default expiration for Microsoft CA certificates is one year. External CA certificates are usually purchased in one year increments. Note when your certificate expires, or use the application's Expiration Notification function (located in System LDAP > Certificates). Ensure that you have a new certificate ready before the old one expires. This gives you time to install and test the new certificate before the old one expires.

**Set up a stand-alone certificate authority**

The first step to configure Microsoft Active Directory for SSL access is to set up a stand-alone Certificate Authority (CA).

Role required: admin

Do not worry about addition resource utilization because both of the required services (IIS & CA) can be disabled after issuing the certificate(s).

1. Install Internet Information Server (IIS).
2. Install Certificate Authority Services in stand-alone mode.
3. Verify the Certificate Services web application is installed and active.

Using the IIS Manager console, expand the local computer and select Web Sites. The state of Default Web Site should be Running. You should also see a CertSrv application listed under the Default Web Site. If the site is not running or the application is missing, you must resolve the issue before you proceed.

**Generate a certificate from an internal certificate authority**

When you configure Microsoft Active Directory for SSL access, you must generate an internal certificate and request the external certificate.

Role required: admin

These steps apply to Microsoft CA services. If you have a different internal CA platform, see your local CA administrator for assistance.

1. From the domain controller (DC) you want to create a certificate for, browse to http://localhost/certsrv or specify the CA server name if it is on a remote server.
2. From the Welcome page, click Request a certificate and select advanced certificate request.
3. On the Advanced Certificate Request page, select Create and submit a request to this CA.
4. Complete the Advanced Certificate Request as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The fully qualified domain name (FQDN) of the DC that is requesting the certificate.</td>
</tr>
<tr>
<td>Field</td>
<td>Entry</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>

</table>

5. Click **Submit**.
   You are directed to a page that provides your **Request ID**, make note of this ID.

6. To process the pending request, complete the following:
   a) Open the Certificate Authority management console.
   b) Expand the server node and select **Pending Requests**.
   c) Locate the Request ID for the request you just submitted, right-click, and select All Tasks/Issue to approve the request and issue the certificate.

7. To retrieve the issued certificate, complete the following:
   a) From the DC you made the request from, browse to `http://localhost/certsrv`, or specify the CA server name if it is on a remote server.
   b) Select **View the status of a pending certificate request**.
   c) Select the link to the new certificate.
   d) Select the link to **Install this certificate**.

You need to request a third party certificate. Certificates from external CAs can be purchased for as little as $30 per year. For detailed procedures on requesting a certificate from an external CA, see Microsoft article [321051](http://support.microsoft.com/articles/321051).

After it is received, installed, and tested, follow the export procedure.

**Test the LDAPS Connectivity Locally**

When you configure Microsoft Active Directory for SSL access, you must test the DLAPS connectivity after installing the internal and third party certificates.

Role required: admin

1. Ensure that Windows Support Tools are installed on the domain controller (DC).
   The Support Tools setup (suptools.msi) can be found in the `\Support\Tools` directory on your Windows Server CD.

2. Select **Start > All Programs > Windows Support Tools > Command Prompt**. On the command line, type `ldp` to start the tool.

3. From the `ldp` window, select **Connection > Connect** and supply the local FQDN and port number (636). Also select the SSL.
If successful, a window displays and lists information related to the Active Directory SSL connection. If the connection is unsuccessful, try restarting your system and repeat this procedure.

*Export the public key certificate to trust the LDAP certificate*
When you configure Microsoft Active Directory for SSL access, you must export the public key certificate and import it into the application.

Role required: admin

If your Certificate Authority is not a trusted third party vendor, you must export the certificate for the issuing CA so we can trust it, and, by association, trust the LDAP server certificate. For MS Certificate Services users, you can view the certificate path by viewing the certificate in the console used to export; select the **Certificate Path** tab. You must export all certificates in the chain. You can find the CA certificate in the same folder as the LDAP certificate by looking for the name in the Certificate Path. Submit all certificates for importing to your instance.

1. From a current or new MMC console, add the Certificate (Local Computer) snap-in.
2. Open the **Personal/Certificates** folder.
3. Locate the new certificate. The **Issued To** column shows the FQDN of the domain controller.
4. Right-click the certificate and select **All Tasks/Export**.
5. Export to DER or Base-64 format. Name the file using the format: `MyCompany.cer`.
   - This is the public key certificate that needs to be used on the instance to communicate securely with your domain controller.
6. Test LDAPS locally before you submit the certificate to the instance.

After completing this procedure, import the public key certificate into the application.

See [*Upload the LDAP X.509 SSL certificate*](#) on page 1823 to upload the certificate into the application.

*LDAP global catalog usage*

A DC can be granted the Global Catalog (GC) role. Global Catalog (GC) role is an LDAP-compliant directory consisting of a partial representation of every object from every domain within a forest.

Administrators configure Active Directory to host Lightweight Directory Access Protocol (LDAP) directory information using one of the following hosting methods.

- The common method of hosting LDAP directory information is to use the default LDAP or LDAPS (secure LDAP) on ports 389 or 636. These standard LDAP ports always exist on a Domain Controller (DC) and are rarely changed. Accessing this directory partition provides access to all of the objects within the domain that is hosted on the DC. There is no way to access objects from other domains using this method.
- A DC can also be granted the Global Catalog (GC) role. Global Catalog (GC) role is an LDAP-compliant directory consisting of a partial representation of every object from every domain within the forest. This LDAP directory can be accessed on port 3268, with LDAPS on port 3269. LDAPS and the default LDAP ports’ certificate requirements are the same.

*Global Catalog LDAP dependencies*

- The domain controller that your instance connects to must have the Global Catalog role enabled.
- Firewall rules must allow inbound traffic to the domain controller on port 3268 (LDAP) or 3269 (LDAPS).
Special notes

- Not all attributes are replicated to the GC partition. Common attributes such as first name, last name, email, phone number, description, and address are included. Additional attributes can be added to the GC but should be limited to minimize the impact to forest replication traffic.
- Standard LDAP integrations usually use sAMAccountName as the instance's UserID and as the coalesce key in the LDAP import map since this is guaranteed to be unique within a domain. This attribute is no longer unique when viewing an entire forest of domains. A new unique attribute needs to be identified and as the UserID and the coalesce key. These do not need to be the same attribute and may vary based on your forest design. Consult your Active Directory administrator. Typically, the userPrincipalName is a unique attribute across domains but this may not be a user-friendly name to login with, but it could be used for the unique identifier on imports. A common attribute that is used for the UserID is email address. These decisions impact the LDAP Properties and LDAP Mapping.
- The value used for the coalesce key on the LDAP import map must be unique and exist on every object being imported. If it is not unique or does not exist, incorrect records are updated with changes.
- If you already have an LDAP integration and wish to change it to a GC, change the import coalesce key. The new key values must be imported before you can change the coalesce key.
- If you make any changes to your LDAP integration that break your integration, your first step should be to revert those changes. After that, contact Customer Support with complete information about what you're attempting.

OpenLDAP minor schema modification

In OpenLDAP 2.3 systems that use the back-bdb (Berkley backend), administrators make a minor modification to their schema to facilitate the integration.

Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

In OpenLDAP 2.3, back-bdb has limited support for inequality indexing (ordering). It is implemented only for generalizedTime and ChangeSequenceNumber syntax. It cannot be supported on syntax that support substrings. Search filters containing inequalities are processed using the presence index.

We recommend creating a custom attribute for this purpose, instead of changing what is already indexed or present in the schema (for example, servnowid).

Modify the OpenLDAP schema

These steps detail a schema modification to OpenLDAP 2.3 provided by one of our customers that helped them integrate with their instance.

Role required: admin

Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

To modify the OpenLDAP schema for integration with the instance:

1. Create a custom attribute.

   ```
   attribute { 1.3.6.1.4.1.3403000.2.1.8
                  NAME 'servnowid'
                  ORDERING caseIgnoreOrderingMatch
   ```
2. Include the attribute in the selected objectclass OID.

   objectclass { 1.3.6.1.4.1.3403000.2.2.1
                 NAME 'BcfUserIdentifiers' SUP top AUXILIARY
                 MAY ( uniqid $ unixid $ servnowid )
   }

In OpenLDAP 2.3, you can dynamically change the server configurations, but you can only extend the schema. You cannot modify or delete the existing schema. Instead of creating another objectclass for this attribute in the dynamic configuration, use the static configuration file, slapd.conf.

3. In slapd.conf, include indexing for the new attribute in the bdb section of your main database backend.

   database bdb (configs here) ....
   index servnowid pres
   (other indexes here) .....  

4. As root, run slapindex to index this attribute to make it available in search filters. Make sure that the OpenLDAP daemon is not running or is in read-only mode before starting slapindex.

Record LDAP deletions

By default, the instance does not delete any entries after they disappear from LDAP.

Deleting an entry, also referred to as a record, also deletes the entire history and references to the deleted entry.

For example, configuration items (CIs), SLA agreements, software licenses, purchase orders, and service catalog entries all have a reference to Department, and if a department is deleted, then the integration clears all references to the department. Also, deleting a user results in losing all history of what that user did.

Decide whether to retain or manually delete records according to your organization's needs.

Multiple provider single sign-on

The multiple provider single sign-on (multi-SSO) feature allows organizations to use several SSO identity providers (IdPs) to manage authentication as well as retain local database (basic) authentication.

The integration supports any combination of local and external authentication methods on a single instance:
- SAML 2.0
- Digest Authentication
- LDAP
- Local database authentication

For example, a globally dispersed corporation might require one SSO provider for their employees, a different one for their vendors, and local database authentication for their administrators. Alternatively, a company might implement SAML 2.0 and a digest token authentication solutions on the same instance.

Changes to SAML 2.0 and digest token configuration

Multiple provider single sign-on allows administrators to configure SAML 2.0 Update 1 and digest token as authentication methods. Multiple provider single sign-on should be activated before you configure your
SAML 2.0 Update 1 and digest token properties. After you activate multi-provider SSO, you must then set it up. After setting up multi-provider SSO, you can create or update the SAML 2.0 Update 1 and digest token configurations. You can use either or both authentication solutions with multi-provider SSO.

**Note:** The Integration - Multiple Provider Single Sign-On Installer plugin removes the SAML application from the navigator. The necessary SAML settings are migrated to the Multi-Provider SSO application into the SAML2 Migrated table. You can still modify items like the x509 certificate, IdP details, and so on through the Multi-Provider SSO application.

---

**Use E-Signature with Multi-Provider SSO**

When approval with e-signature is active, approving a request, like a change or a service catalog order, usually requires the approver to enter their credentials. After you configure multi-provider SSO, approvers enter their IdP login credentials instead.

When Multi-Provider SSO is enabled, make sure to configure the Identity Provider form and add the **Assertion Consumer URL for eSignature authentication** field. In most cases, this URL will be: https://YOURINSTANCE.service-now.com/consumer.do. However, if you employ a customized method of handling the SAML authentication for eSignature, you can set up your own consumer URL.

If you are only using SAML 2.0 Update 1 and not using Multi-Provider Single Sign-on, configure the assertion consumer URL with **E-signature SAML properties**.

**Local database authentication with Multi-Provider SSO**

If you still want to use local database authentication when Multi-SSO is active, you must set the glide.authentication.external.disable_local_login property to `false`. See **Redirection Properties**.

**Installed with multi-provider SSO**

The following items are installed with the Integration - Multiple Provider Single Sign-On Installer plugin.

**Properties**

Multi-Provider SSO adds the following system properties.

### Table 446: Multi-provider SSO properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.authenticate.multisso.debug</td>
<td>Enables (true) or disables (false) debug logging for the multi-provider SSO integration.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>glide.authenticate.multisso.enabled</td>
<td>Enables (true) or disables (false) multi-provider SSO.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
</tbody>
</table>
Tables

Multi-Provider SSO adds the following tables.

Table 447: Multi-provider SSO tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSO Properties [sso_properties]</td>
<td>Stores data for each IdP, schema, common SSO data, and so on.</td>
</tr>
<tr>
<td>SAML 2 Update 1 Properties</td>
<td>Stores data for SAML 2.0 Update 1 configurations such as SAML certificates.</td>
</tr>
<tr>
<td>Digest Properties [digest_properties]</td>
<td>Stores data for digest token authentication configurations.</td>
</tr>
<tr>
<td>SSO Federation [sso_federation]</td>
<td>Stores data for each SSO federation.</td>
</tr>
</tbody>
</table>

Scripts

Multi-Provider SSO adds the following scripts.

Table 448: Multi-provider SSO scripts

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MultiSSO</td>
<td>Allows a customer to have an SSO type defined on a company basis.</td>
</tr>
<tr>
<td>MultiSSOLogin</td>
<td>Allows each domain to have their own login script.</td>
</tr>
<tr>
<td>MultiSSOLogout</td>
<td>Allows each domain to have their own logout script.</td>
</tr>
<tr>
<td>MultiSSO_Abstract_Core</td>
<td>Provides a base class for all multi-provider SSO classes.</td>
</tr>
<tr>
<td>MultiSSO_ClientHelper</td>
<td>Provides a client callable utility functions for multi-provider SSO.</td>
</tr>
<tr>
<td>MultiSSO_DigestedToken</td>
<td>Provides a base system logic for digested token authentication.</td>
</tr>
<tr>
<td>MultiSSO_SAML2_Update1</td>
<td>Provides logic to process SAML 2.0 Update 1 authentication for a multi-tenant single sign-on.</td>
</tr>
</tbody>
</table>

Activate multiple provider single sign-on

This integration requires the Integration - Multiple Provider Single Sign-On Installer plugin.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.

If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.

Set up multi-provider SSO

You must perform several steps to set up Multi-SSO, including configuring properties, creating identity providers (IdPs), and configuring users to use Multi-SSO.

Create a SAML 2.0 update 1 SSO configuration for Multi-SSO

You can create and update SAML 2.0 Update 1 SSO configurations from the multiple provider single sign-on feature.

Role required: admin

1. Navigate to Multi-Provider SSO > Identity Providers.
2. To update a configuration, click an SSO configuration record.
3. To create a new configuration, click New.
4. Click SAML2 Update 1.
5. Complete the form, using the fields from the table and submit the record.

For more information on multi-provider single-sign on, see Multi-Provider Single Sign-On.

Table 449: Multi-provider single sign-on fields

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name for the SSO property record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to set the SAML configuration to active.</td>
</tr>
<tr>
<td>User Field</td>
<td>Enter the field on the User table that contains the value the IdP needs to identify the user.</td>
</tr>
<tr>
<td>Identity Provider URL</td>
<td>Enter the URL to your IdP.</td>
</tr>
<tr>
<td>Identity Provider's AuthnRequest</td>
<td>Enter the URL to the HTTP-Redirect binding obtained from the SingleSignOnService element. Add the value to the glide.security.url.whitelist property.</td>
</tr>
<tr>
<td>Identity Provider's SingleLogoutRequest</td>
<td>Enter the URL obtained from the SingleLogoutService element.</td>
</tr>
<tr>
<td>Failed Requirement Redirect</td>
<td>Enter the URL for redirecting failed authentication requests. Typically, the URL endpoint is an error page or logout page.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>Enter the URL, including login page, of the instance for which the IdP authenticates. For example: <a href="https://yourinstance.service-now.com/navpage.do">https://yourinstance.service-now.com/navpage.do</a></td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Entity ID/Issuer</td>
<td>Enter the base URL, excluding login page, of the instance for which the IdP authenticates. For example: <code>&lt;nowiki&gt;https://yourinstance.service-now.com&lt;/nowiki&gt;</code></td>
</tr>
<tr>
<td>Protocol Binding for the IDP’s SingleLogoutRequest</td>
<td>Enter one of the supported values listed in the Binding attribute from the SingleLogoutService element.</td>
</tr>
<tr>
<td>NameID Policy</td>
<td>Enter the value of the NameIDFormat element the integration uses.</td>
</tr>
<tr>
<td>NameID Attribute</td>
<td>Leave this field blank unless you configure a new NameID policy. If you do configure a new policy, the system needs to know which field in the User table it should use to identify the user logging in by matching the NameID token. Enter the name of that User table field here.</td>
</tr>
<tr>
<td>Create AuthnContextClass</td>
<td>Select the check box to specify a particular context class such as Password Protected Transport. If the check box is cleared, the IdP selects the most appropriate context class.</td>
</tr>
<tr>
<td>AuthnContextClassRef Method</td>
<td>Enter the URN of the login mechanism you want the IdP to use to authenticate users.</td>
</tr>
<tr>
<td>External logout redirect</td>
<td>Enter the URL where the integration redirects users after they log out.</td>
</tr>
<tr>
<td>Signing/Encryption Key Alias</td>
<td>Enter the alias of the key entry stored in SAML 2.0 SP Keystore.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Enter the password of the key entry stored in SAML 2.0 SP Keystore.</td>
</tr>
<tr>
<td>Encrypt Assertion</td>
<td>Select the check box to encrypt the assertion in the SAML response. The metadata generated for the IdP embeds the x509 certificate, which the IdP uses to encrypt the assertion in the SAML response that it generates.</td>
</tr>
<tr>
<td>Clock Skew</td>
<td>Enter the number of seconds between the two attributes that make up the SAMLResponse nonce. A valid SAMLResponse must fall between the notBefore and notOnOrAfter date-time values. See Sample SAML 2 Response with the SubjectConfirmation and SubjectConfirmationData Elements and Sample SAML 2 Response with the AudienceRestrictions and Audience Elements for a sample SAMLResponse message.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Force AuthnRequest</td>
<td>Select the check box to force AuthnRequests to occur.</td>
</tr>
<tr>
<td>Is Passive AuthnRequest</td>
<td>Select the check box if the AuthnRequest is passive.</td>
</tr>
<tr>
<td>Sign AuthnRequest</td>
<td>Select the check box to enable the IdP's single-sign on service to receive a signed AuthnRequest.</td>
</tr>
<tr>
<td>Signing Signature Algorithm</td>
<td>Enter the URL that points to the SAML 2.0 Identity Provider AuthnRequest Consumer for eSignature Authentication.</td>
</tr>
<tr>
<td>Auto Provisioning User</td>
<td>Enable automatic user provisioning, which creates a user in the instance's User table when the user exists on the IdP but does not exist in the User table.</td>
</tr>
<tr>
<td>Update User Record Upon Each Login</td>
<td>Updates user information in the instance's User table with the information in the IdP each time the user logs in using SAML.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>X.509 Certificates</td>
<td>The IdP certificates. You can add as many certificates as necessary after you install them. When there are multiple certificates, the system uses the first active certificate that is found.</td>
</tr>
</tbody>
</table>

Configure multi-provider SSO properties
Configuring Multi-Provider SSO Properties.

Role required: admin

1. Navigate to Multi-Provider SSO > Properties.
2. Select the Enable Multi-Provider SSO check box. This adds the link Use external login to the login page.
3. To enable the debug messages to appear at the bottom of the content frame, select the Enable debug logging for the Multi-Provider SSO integration check box.
   If enabled, the debug logging feature will slow down performance and use up disk space in order to generate the logs.
4. In the property The field on the user table that identifies a user accessing the User identification login page, enter the field on the User table that contains the value the IdP needs to identify the user. The default value is user_name.
5. Click Save.
6. Instruct your users to click the Use external login link when they log in to the instance.
7. Open the System Properties [sys_properties] table and add the following property:
   glide.security.url.whitelist
   Add the Identity Provider’s AuthnRequest URLs to the whitelist, separated by commas.
Create and update identity providers
After you have configured the multi-provider SSO properties, you can update or create new SAML 2.0 Update 1 or digest token identity providers.

Role required: admin

1. Navigate to Multi-Provider SSO > Identity Providers.

2. To edit an identity provider record, click the record.
   • For digest token configurations, manually update the properties.
   • For SAML2 Update 1 configurations, automatically update the identity provider metadata with the Import Identity Provider Metadata related link or update the properties manually.

3. To create a new identity provider, click New.
   • For digest token configurations: Click Digest SSO and enter the digest properties for multi-provider single sign-on.
   • For SAML2 Update 1 configurations: Click SAML2 Update 1 and import the identity provider metadata from a URL, as XML, or manually enter the identity provider information.

4. To make the IdP the failover IdP that is used when the default IdP is not available, select the Default check box.

   If you have SAML 2 Update 1 active and you upgrade to the Fuji release, the SAML 2 Update 1 IdP is selected as the default failover. No default failover IdP is selected for new instances or if you are upgrading from a release on which SAML 2 Update 1 is not active.

**Note:** The metadata import process automatically creates a certificate record for the identity provider. Navigate to the x509 Certificate module to see the certificate.

**Note:** Certificates for single-sign on should always be in PEM format to work with SAML certificates.
5. If E-Signature is active, configure the Identity Provider form and add the **Assertion Consumer URL for eSignature authentication** field.

   In most cases, this URL is: `https://YOURINSTANCE.service-now.com/consumer.do`. However, if you employ a customized method of handling the SAML authentication for E-Signature, you can set up your own consumer URL. If you are only using SAML 2.0 Update 1 and not using Multi-Provider Single Sign-on, configure the assertion consumer URL with **E-signature SAML properties**.

Modify the primary and default IdP

You can set one IdP as the primary IdP to which new users are automatically redirected when they access the base instance URL. You can also set one IdP as the default IdP.

Role required: admin

The **Integration - Multiple Provider Single Sign-On Installer** plugin must be active.

1. To set one IdP as primary, create the following property and enter the IdP record's sys_id as the value:
   - **Name**: glide.authenticate.sso.redirect.idp
   - **Type**: String
   - **Value**: sys_id of the identity provider record

2. To set a default IdP, open the IdP record and select the **default** option.

   When this default is set to true, and a user with no SSO configuration selects **Use external login**, the user is redirected to the default IDP.

**Configure users for multi-provider SSO**

Administrators can configure Multi-Provider SSO for individual users or for all users who belong to a company. You cannot configure Multi-Provider SSO for groups.

Role required: admin

1. Navigate to **Multi-Provider SSO > Identity Providers**.
2. Right-click an identity provider record and select **Copy sys_id**.
3. Copy the data to your clipboard.
4. Navigate to a user record or a company record.
5. Configure the form and add the **SSO Source** field.
6. In the **SSO Source** field, enter one of the following:
   - **SAML users**: enter `sso:` followed by the sys_id of the identity provider's record.
   - **SSO Federation users**: enter `federation:` followed by the sys_id of the federation record.

7. Click **Update**.

**Test IdP connections**

Administrators can test the connection to an identity provider to validate settings before enabling external authentication.

Role required: admin

---

**Note**: The test connection user interface only works for identity providers that support displaying content in a frame. Some identity providers might require additional configuration to list your instance URL as an allowed origin in the X-Frame-Options response header. Contact your identity provider for more information.

---

1. Navigate to **Multi-Provider SSO > Identity Providers**.
2. Select an identity provider record.
3. Click Test Connection.
4. Enter login credentials for the identity provider and login.
5. Use the Testing SSO Logs section to see log messages.
6. Click Cancel when testing is complete.
Test SAML Connection (SSO: http://idp.devscn.com/openam)

SSO Login Test Results
✅ SAML Login response received
✅ SAML Assertion retrieved
❌ Unable to evaluate key against signature
  - Unable to evaluate key against signature
  - Ensure that the IDP's x509 certificate is present, valid and active.

SSO Logout Test Results
✅ SAML Logout response received
✅ SAML Logout Response 'InResponseTo' validated
✅ SAML Logout Response 'Status' validated

Common connection errors
The following table describes some of the common connection errors and their solutions.

Table 450: Troubleshooting IdP test connections

<table>
<thead>
<tr>
<th>Error messages</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Field validation failed. Invalid User Field</td>
<td>Verify the contents of the User table field you selected matches the SAML NameID token.</td>
</tr>
<tr>
<td>Assertion issuer is invalid.</td>
<td>Verify Identity Provider URL contains a valid URL to your IdP.</td>
</tr>
<tr>
<td>AudienceRestriction validation failed.</td>
<td>Verify the Audience URI contains a valid URL to your instance.</td>
</tr>
<tr>
<td>Cannot logout of IdP’s session.</td>
<td>Verify the SingleLogoutRequest URL contains a valid URL to your IdP’s logout service.</td>
</tr>
<tr>
<td>Signature did not validate against the credential’s key.</td>
<td>Verify the IdP has a valid certificate installed.</td>
</tr>
</tbody>
</table>

Troubleshoot script issues with SAML
You might encounter script issues if SAML is already active at the time you activate Multiple Single Sign-On and if you already customized the installation exits.

Role required: admin
1. Back up the modified installation exit SAML2SingleSignon_update1 and script include SAML2_update1.
2. Revert both the installation exit and script include to the version that is available with the baseline system.
3. Activate or upgrade the Integration - Multiple Provider Single Sign-On Installer plugin. The system upgrades SAML and all necessary files to SAML 2 Update 1.
4. Open the Multiple SSO properties page and select the Enable Multi-Provider SSO check box to enable it.
5. Put the SAML2SingleSignon_update1 installation exit changes into the baseline script include MultiSSO_SAML2_Update1 and the SAML2_update1 script include changes into the baseline SAML2_update1 script include.

Log in using Multi-SSO
The recommended and most efficient method for users to log in using multi-provider SSO is to use a specifically configured URL.

Role required: admin
After multi-provider SSO is configured, you can send a URL to your users with the correct IdP in the parameter string. For example:

```
/login_with_sso.do?glide_sso_id=<sys_id of the sso configuration>
```

After a user successfully logs in to the IdP page, a cookie containing the IdP sys_id is added to the browser. The next time the user attempts to log in, the system redirects the user to log in to the IdP server, which automatically logs in to the instance.

If a URL parameter is not set or the browser cache has been cleared, users can also do the following:
1. Click the Use external login link on the login page.
   The external login page appears. Users can click Use local login to return to the standard login page.
2. Enter the value for the specified field on the user table that you configured in Multi-Provider SSO properties.

The user is redirected to the IdP server, where they log in.

After users successfully log in to an IdP, they are automatically redirected to that IdP whenever they attempt to access the instance. To have a user access a different IdP, send the user a URL with the new IdP information in the parameter. The new IdP overwrites the old IdP in the cookie if the user successfully logs in. If the user does not log in successfully, the old IdP information is retained in the cookie.

Allow users to choose the identity provider for login

SSO federation support allows users to choose which IdP to log into.

Role required: admin

SSO federations aggregate metadata from multiple IdPs and service providers, including your instance. Federations then publish the metadata as an XML file, which includes information like IdP names and IdP certificates. Administrators can then instruct the instance to read the XML file and automatically populate the SSO Properties table with all the necessary IdP information.

1. Navigate to Multi-Provider SSO > SSO Federation.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. Click Submit.
5. After you configure a federation, enable the Refresh SSO Metadata scheduled job, and then configure the users who you want to access the federation IdPs. Use the sys_ID of the federation record you just created.

<table>
<thead>
<tr>
<th>Field</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>✔</td>
</tr>
<tr>
<td>Type</td>
<td>SAML</td>
</tr>
<tr>
<td>Discovery Service URL</td>
<td></td>
</tr>
<tr>
<td>Meta Data URL</td>
<td></td>
</tr>
<tr>
<td>x509 Certificate</td>
<td></td>
</tr>
</tbody>
</table>

The instance populates the SSO properties table with the IdP information. When users who are configured to use the federation log in, they are redirected to the discovery service URL you configured. Then they select the IdP and provide the necessary credentials. Alternatively, you can send users a URL with the IdP in the parameter.
Table 451: Allowing users to choose the identity provider for login

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the federation.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the instance to pull the XML file from the federation.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of authentication this federation supports.</td>
</tr>
<tr>
<td>Discovery Service URL</td>
<td>Enter the URL of the discovery service for this federation. This is the site where users are directed to select an IdP and log in.</td>
</tr>
<tr>
<td>Meta Data URL</td>
<td>Enter the URL of the XML file that holds the federation metadata.</td>
</tr>
<tr>
<td>x509 Certificate</td>
<td>Select the federation certificate.</td>
</tr>
<tr>
<td>Domain</td>
<td>Select the domain that the data will belong to.</td>
</tr>
</tbody>
</table>

**Note:** The InCommon federated identity management IdP is preconfigured.

*Use ESS pages with multi-provider SSO*

You can redirect ESS users to an employee self-service page by adding a system property.

Role required: admin

You can add a global property to the system properties table. It applies to all IdPs. You cannot set multiple values for different IdPs.

1. Add the following system property: `glide.entry.loggedin.page_ess`.
2. Set the value of this property to the ESS page name: `myesspages`.

   If the user has no role, they are redirected to that URL. If the user has a role, they are redirected to `instance.service-now.com/navpage.do`

*Changes to SAML 2.0 and digest token configuration*

Multiple provider single sign-on allows administrators to configure SAML 2.0 Update 1 and digest token as authentication methods.

Multiple provider single sign-on should be activated before you configure your SAML 2.0 Update 1 and digest token properties. After you request and activate multi-provider SSO, you must then set it up. After setting up multi-provider SSO, you can create or update the SAML 2.0 Update 1 and digest token configurations. You can use either or both authentication solutions with multi-provider SSO.

**Note:** The Integration - Multiple Provider Single Sign-On Installer plugin removes the SAML application from the navigator. The necessary SAML settings are migrated to the Multi-Provider SSO application into the SAML2 Migrated table. You can still modify items like the x509 certificate, IdP details, and so on through the Multi-Provider SSO application.
SAML 2.0

The Security Assertion Markup Language (SAML) is an XML-based standard for exchanging authentication and authorization data between security domains.

SAML exchanges security information between an identity provider (a producer of assertions) and a service provider (a consumer of assertions). SAML is a product of the OASIS Security Services Technical Committee. When implemented correctly, SAML is one of the most secure methods of single sign-on available.

The SAML 2.0 integration enables single sign-on by exchanging XML tokens with an external Identity Provider (IdP). The identity provider authenticates the user and passes a NameID token to the system. If the system finds a user with a matching NameID token (for example, the email address), the instance logs in that user.

If you are using the SAML 2.0 plugin for Single Sign-on authentication, then you need to set the glide.ui.rotate_sessions property to false. Otherwise, it interferes with the session information sharing that takes place between the instance and the Identity Provider. Users with the security_admin elevated privilege can access this high security property by selecting System Security > High Security Settings.

**Note:** It is recommended that customers using an existing SAML 2.0 integration upgrade to the latest SAML 2.0 integration update.

SAML concepts

Familiarize yourself with these SAML concepts.

*Typical SAML process flow (diagram)*

A typical SSO logic flow involves looking for an active session, checking user credentials, and creating the necessary token.
Figure 525: SSO Standard

Login (AuthnRequest) process flow

SAML 2.0 specifies a Web Browser SSO Profile that involves exchanging information among an identity provider (IdP), a service provider (SP), and a principal (user) on a web browser.

The identity provider can be any SSO service offering SAML authentication services (for example SSOCircle). The service provider is always an instance. The message flow begins with a request for a secured resource at the service provider.

Request the target resource at the SP

The principal requests a target resource at the service provider:

https://instance.service-now.com/
The instance checks the request to see if the SAMLRequest and RelayState URL parameters are present. If they exist, the user has already validated with the IdP and can skip steps 2–6.

**Issue AuthnRequest to Identity Provider**

The instance constructs an AuthnRequest to be sent to the IdP using the SAMLRequest value. The instance also constructs and sends a RelayState URL parameter value.

The RelayState token is an opaque reference to state information maintained at the service provider. The value of the SAMLRequest parameter is the deflated and base64 encoded value of the `<samlp:AuthnRequest>` element:

```
```

The integration then URL-encodes the `<samlp:AuthnRequest>` element and sends it as the SAMLRequest URL parameter.

The SSO service processes the `<samlp:AuthnRequest>` element by URL-decoding, base64-decoding and inflating the request, in that order. It then performs a security check. If the user does not have a valid security context, the IdP identifies the user by prompting for login credentials. If the user is already logged in, the IdP simply responds with the SAMLResponse and RelayState URL parameters (see step 3).

**Respond with an SAMLResponse and RelayState**

After collecting the required login credentials, the SSO service validates the request and responds with a document containing an XHTML form:

```
<form method="post" action="https://instance.service-now.com/navpage.do" ...><input type="hidden" name="SAMLResponse" value="response ..." /><input type="hidden" name="RelayState" value="token ..." />
...
<input type="submit" value="Submit" /></form>
```

The value of the RelayState parameter comes from this step. The value of the SAMLResponse parameter is the base64 encoding of the following `<samlp:Response>` element:

```
<samlp:Response xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
 ID="s2cdc74f37f923e26felaeeec42b70a93d24230334f"
 InResponseTo="90AA6073F01567BFB0DF194F596314E2" Version="2.0"
 xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion" ID="s23e536bc51b84874d32999dec162d9c2e338823b"
```

© 2017 ServiceNow. All rights reserved. 1906
Validate SAMLResponse

The SAMLResponse value is base64 decoded and inflated to reveal the XML document in step 3. The login script extracts the XML value from the //Subject/NameID element and uses it to look up an existing user in the User table.

The login script also extracts the session ID from the //AuthnStatement/@SessionIndex element and stores it for the LogoutRequest.

Logout (LogoutRequest) process flow
During logout, the instance issues the SAML 2.0 LogoutRequest service call to the IdP.

This service logs the user out and then redirects back to the specified logout URL.
Figure 526: SAML 2 Logout

**User Clicks the Logout Button**

The user clicks the **Logout** button and the instance executes the logout script.
LogoutRequest issued

The logout script constructs a SAML 2.0 LogoutRequest and posts it to the preconfigured SingleLogoutRequest SAML 2.0 service at the IdP. The IdP deflates the request and then base64 encodes it. An example LogoutRequest looks like this:

```xml
```

User Logs Out

The user logs out of the IdP. The IdP redirects back to the instance, which in turns redirects back to the IdP since the user is not logged in.

URL information for an SSO provider

During a login challenge resulting from a URL link into the instance that requires an SSO session, the referring URL might need to be supplied to the SSO provider so that after authentication, the URL can be passed back to the instance and linked to the correct resource.
Figure 527: SSO Target Redirect

Installation exit return values have been enhanced to pass a URL instead of, or in addition to the URL defined by the properties. Usually, you would return a username or a predefined string value to control
authorize or challenge the SSO session. The following examples show the extended behavior of passing a URL.

```
return "failed_missing_requirement:%26amp;TARGET=https://instance.service-now.com/nav_to.do?uri=incident.do?sys_id=12345";
```

The example above passes the URL `https://instance.service-now.com/nav_to.do?uri=incident.do?sys_id=12345` to the SSO provider in the form of a URL parameter named TARGET.

**Note:** It is assumed that the SSO provider will use that information in the TARGET parameter to redirect back to the instance when the user credentials have been collected and authentication passed.

A colon : demarcates the two return values and an encoded & (%26amp;) concatenates the URL defined in the property glide.authenticate.failed_missing_requirement and the TARGET parameter.

SAML 2.0 Single Sign-On - Update 1

The SAML 2.0 Single Sign-On - Update 1: security enhancements plugin improves integration security by requiring additional checks against the SAMLResponse URL parameter.

The integration explicitly checks the SAML response for the proper Identity Provider (IdP) and intended audience URLs.

**Additional SAML response validations**

With Update 1, the integration validates these elements in the SAMLResponse.

- An Issuer element that matches the value listed in the issuer system property
- The SubjectConfirmation and SubjectConfirmationData elements with a Recipient attribute
- The AudienceRestriction and Audience elements that match the value listed in the audience system property

**Support for Signed SingleLogoutRequest**

With Update 1, the SAML 2.0 integration has the option to sign SingleLogoutRequest elements. Some IdPs, such as Microsoft ADFS, require a signed SingleLogoutRequest.

**Support for AuthnContextClass**

With Update 1, the SAML 2.0 integration has the option to specify the method by which the IdP authenticates the user in the AuthnContextClass element. For example, the integration can now specify contexts such as form-based Password Protected Transport or Kerberos. See *(Optional) Enable Providing an Authentication Context Class* for instructions on setting an authentication context class.

**Properties**

The SAML 2.0 Update 1 plugin includes the following system properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Identity Provider URL which will issue the SAML2 security token with user info. glide.authenticate.sso.saml2.idp</td>
<td>Enter the value of the Issuer element that the integration uses to validate the IdP URL.</td>
</tr>
<tr>
<td>Sign LogoutRequest. Set this property to true if the Identity Provider's SingleLogoutRequest service requires signed LogoutRequest. glide.authenticate.sso.saml2.require_signed_logoutrequest</td>
<td>Select whether the IdP requires a signed logout request.</td>
</tr>
<tr>
<td>Select whether the IdP requires a signed logout request. glide.authenticate.external.logout_redirect</td>
<td>Enter the URL where the integration redirects users after they log out. Typically, you set this property to a UI page if you are using Kerberos authentication to prevent users from being redirected back to the IdP and logging in again after a logout request.</td>
</tr>
<tr>
<td>The audience uri that accepts SAML2 token. (Normally, it is your instance URI. For example: https://&lt;instance name&gt;.service-now.com.) glide.authenticate.sso.saml2.audience</td>
<td>Enter the value of the Audience element that integration uses to validate the SP URL in the SAMLResponse.</td>
</tr>
<tr>
<td>Create an AuthnContextClass request in the AuthnRequest statement. glide.authenticate.sso.saml2.createrequestedauthncontext</td>
<td>Select whether to create an AuthnContextClass element in the SAMLRequest that specifies the login mechanism the IdP should use to authenticate the user. Not all IdPs support a AuthnContextClass element in the SAMLRequest. If you select Yes, you must specify the URN of the context class with the glide.authenticate.sso.saml2.authncontextclassref property.</td>
</tr>
<tr>
<td>The AuthnContextClassRef method that we will request in our SAML 2.0 AuthnRequest to the Identity Provider glide.authenticate.sso.saml2.authncontextclassref</td>
<td>Enter the URN of the login mechanism you want the IdP to use to authenticate users. For example, by default the system uses the forms-based Password Protected Transport authentication context urn:oasis:names:tc:SAML:2.0:ac:classes:PasswordProtectedTransport.</td>
</tr>
<tr>
<td>The alias of key entry stored in SAML 2.0 SP Keystore used to sign SAML 2 requests. glide.authenticate.sso.saml2.signing_key_alias</td>
<td>Enter the alias of the key that signs SAML 2 logout requests. You will have to create a Java Keystore for the alias.</td>
</tr>
<tr>
<td>The password of key entry stored in SAML 2.0 SP Keystore used to sign SAML 2 requests. glide.authenticate.sso.saml2.signing_key_password</td>
<td>Enter the password for the key that signs SAML 2 logout requests.</td>
</tr>
<tr>
<td>The number in seconds before &quot;notBefore&quot; constraint, or after &quot;notOnOrAfter&quot; constraint, to consider still valid. glide.authenticate.sso.saml2.clockskew</td>
<td>Enter the number of seconds between the two attributes that make up the SAMLResponse nonce. A valid SAMLResponse must fall between the notBefore and notOnOrAfter date-time values.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>AuthnRequest URL for eSignature Authentication. com.snc.integration.saml_esig.idp_authnrequest_url</td>
<td>Enter the URL that points to the SAML 2.0 Identity Provider AuthnRequest Consumer for eSignature Authentication. In most cases, this will be the same as the AuthnRequest URL used in general authentication. Leave this setting blank if you intend to use the same AuthnRequest Consumer URL that is used for general SAML 2.0 authentication in your instance.</td>
</tr>
<tr>
<td>The SAML 2.0 Assertion Consumer URL for eSignature authentication. com.snc.integration.saml_esig.approval_consumer_url</td>
<td>In most cases, this URL will be: <a href="https://YOURINSTANCE.service-now.com/consumer.do">https://YOURINSTANCE.service-now.com/consumer.do</a>. However, if you employ a customized method of handling the SAML authentication for eSignature, you can set up your own consumer URL.</td>
</tr>
<tr>
<td>The SAML 2.0 Assertion Consumer Index for eSignature authentication. com.snc.integration.saml_esig.assertion_consumer_service_index</td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Width. com.snc.integration.saml_esig.popup_dlg_width</td>
<td>When a user approves a request using eSignature, a dialog allows the user to enter their credentials. This setting controls the width of that dialog box.</td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Height. com.snc.integration.saml_esig.popup_dlg_height</td>
<td>When a user approves a request using eSignature, a dialog allows the user to enter their credentials. This setting controls the height of that dialog box.</td>
</tr>
</tbody>
</table>

**SAML 2.0 update 1 requirements**

The SAML 2.0 update requires:

- Activating the SAML 2.0 Update 1 plugin
- Additional metadata from the SAML 2.0 Identity Provider (IdP)
  - SAML Request can include an AuthnContextClass element to specify the Service Provider's preferred login mechanism such as form-based authentication or Kerberos. If this element is not specified, the IdP chooses the login method.
  - SAML Response must include an Issuer element that matches the value listed in the issuer system property
  - SAML Response must include SubjectConfirmation and SubjectConfirmationData elements with a Recipient attribute
  - SAML Response must include AudienceRestriction and Audience elements that match the value listed in the audience system property

**SAML 2.0 integration requirements**

The SAML 2.0 integration requires several items, such as an IdP that provides a certificate and a single logout service.
• Activating the latest SAML 2.0 plugin
• Access to a SAML 2.0 Identity Provider (IdP)
  • Must provide an authentication request service
  • Must provide a single logout service
  • Must have a valid certificate
  • Must accept Service Provider (SP) metadata
  • Must use the NameID element in the SAMLResponse

Upgrade from previous versions

The following table lists the actions to take if you are running a previous versions of SAML.

<table>
<thead>
<tr>
<th>Previous SAML version</th>
<th>Action required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAML 1.1</td>
<td>Contact Customer Support to migrate your instance to SAML 2.0 Update 1.</td>
</tr>
<tr>
<td>SAML 2.0</td>
<td>Update to SAML 2.0 Update 1.</td>
</tr>
</tbody>
</table>

SAML setup

SAML 2.0 setup involves several steps, including configuring IdP settings and installing the certificate.  
*Activate SAML 2*

SAML 2.0 is activated as part of the Integration - Multiple Provider Single Sign-On Installer plugin, which can be activated by an administrator.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

*Identity Provider (IdP) system properties*

An IdP generally offers an XML document containing their authentication and logout metadata.

For example, **SSOCircle** publishes their metadata online.

Browse the IdP metadata to find these entries:

• The **SingleSignOnService** element with a **Binding** attribute that contains a value of HTTP-Redirect. The **Location** attribute lists the URL the integration requires for the AuthnRequest service.
• The **SingleLogoutService** element with a **Binding** attribute that contains a value of HTTP-Redirect. The **Location** attribute lists the URL the integration requires for the SingleLogoutRequest service.
Note: The SAML 2.0 integration only supports binding to IdP services by HTTP-Redirect.

For example:

```
```

```
```

Figure 528: IdP properties

Set the IdP issuer URL

Provide the URL to the IdP's who will issue the security token.

Role required: admin

The integration verifies that each SAML response contains the same URL listed in this system property as the URL listed in the Issuer element. For example:

```
<samlp:Response xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
    Destination="https://demoi2.service-now.com/navpage.do"
    ID="s28da6774c88ae1eab292bf25fe625db81919d8e1e"/>
```
1. Navigate to SAML 2 Single Sign-on > Properties.

2. In the property The Identity Provider URL which will issue the SAML2 security token with user info., enter the URL to your IdP. By default, the integration contains the URL to SSOCircle http://idp.ssocircle.com.

Set the AuthnRequest service URL
Using the IdP's metadata, set the request service URLs for the integration's IdP.

Role required: admin

1. In the property The base URL to the Identity Provider's AuthnRequest service. The AuthnRequest will be posted to this URL as the SAMLRequest parameter, enter the URL to the HTTP-Redirect binding obtained from the SingleSignOnService element.

2. Select the check box next to Sign AuthnRequest to enable the Identity Provider's single-sign on service to receive a signed AuthnRequest.

3. In the property When SAML 2.0 single sign-on fails because the session is not authenticated, or this is the first login, redirect to this URL. This is the base URL where the initial SAML 2.0 AuthnRequest is sent using the SAMLRequest parameter, enter the URL to the HTTP-Redirect binding obtained from the SingleSignOnService element.

By default, the integration contains the URL to the SSOCircle service.

Set the SingleLogoutRequest service URL
Using the IdP's metadata, set the request service URLs for the integration's IdP.

Role required: admin

1. In the following property, enter the URL obtained from the SingleLogoutService element: The base URL to the Identity Provider's SingleLogoutRequest service. The LogoutRequest will be posted to this URL as the SAMLRequest parameter. The LogoutRequest is posted to this URL as the SAMLRequest parameter.

By default, the integration contains the URL to the SSOCircle service.

2. In the property URL to redirect users after logout, typically back to the portal that enabled the SSO (e.g. http://portal.companya.com/logout), enter the URL where you want to redirect users after they successfully logout. If your IdP uses form-based authentication, enter the URL to your IdP’s login form. If your IdP uses a non-form-based authentication method such as Kerberos, you should set the URL to a static logout page. This way, users who log out do not get immediately get redirected to the IdP and login again.

By default, the integration contains the URL to the static UI page external_logout_complete.do.

(Optional) Enable signed logout requests
Some IdPs require the Service Provider to sign logout requests with a certificate.

Role required: admin
If your IdP requires signed logout requests, use the IdP's metadata to set the following system properties.

1. From the property Sign LogoutRequest. Set this property to true if the Identity Provider’s SingleLogoutRequest service requires signed LogoutRequest, select Yes to specify that your IdP requires a signed logout request, or select No to use unsigned logout requests.

2. If you selected Yes to Sign LogoutRequest, then in The protocol binding for the Identity Provider's SingleLogoutRequest service. (Value can be either "urn:oasis:names:tc:SAML:2.0:bindings:HTTP-Redirect" or "urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST").) property, enter the one of the supported values listed in Binding attribute from the SingleLogoutService element.

   By default, the integration uses an HTTP-Redirect binding.

3. Click Update.

4. Install a Service Provider (SP) key store.

Examples of third-party SAML identity provider configurations

These documents provide examples of possible IdP setup configurations.

While the instance does not typically provide instructions for configuring third-party SAML IdP products, customers occasionally provide examples of how they have implemented their SAML IdP with the instance.

**Note:** The instance does not provide support for these example configurations.

<table>
<thead>
<tr>
<th>Identity Provider</th>
<th>Example Setup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Active Directory Federation Services 2.0</td>
<td>Configuring ADFS 2.0 to Communicate with SAML 2.0</td>
</tr>
<tr>
<td>SSOCircle</td>
<td>SSOCircle (Video Tutorial)</td>
</tr>
</tbody>
</table>

_Service Provider (SP) system properties_

These system properties define how the instance interacts with the IdP as a Service Provider.
**Service Provider (Service-Now) properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The URL to the Service-now instance homepage.</td>
<td><a href="https://yourinstance.service-now.com/navpage.do">https://yourinstance.service-now.com/navpage.do</a></td>
</tr>
<tr>
<td>The entity identification, or the issuer</td>
<td><a href="https://yourinstance.service-now.com">https://yourinstance.service-now.com</a></td>
</tr>
<tr>
<td>The audience uri that accepts SAML2 token. (Normally, it is your instance URL. For example: <a href="https://demo.service-now.com">https://demo.service-now.com</a>.)</td>
<td><a href="https://yourinstance.service-now.com">https://yourinstance.service-now.com</a></td>
</tr>
<tr>
<td>The User table field to match with the Subject's NameID element in the SAMLResponse</td>
<td>email</td>
</tr>
<tr>
<td>The NameID policy to use for returning the Subject's NameID in the SAMLResponse. Your SAML identity provider will have to support this by declaring the policy in its metadata. The NameID value is used to match with the specified field in the User table to lookup the user.</td>
<td>um:oasis.names.tc:SAML:1.1:nameid-format:emailAddress</td>
</tr>
</tbody>
</table>

Create an AuthnContextClass request in the AuthnRequest statement. This tells the IdP that ServiceNow requires that they present a specific login mechanism such as a form, Kerberos, etc. If the AuthnRequest doesn't specify an AuthnContextClass, the IdP will choose the most appropriate method.

- Yes | No

The AuthnContextClassRef method that we will be included in our SAML 2.0 AuthnRequest to the Identity Provider

- um:oasis.names.tc:SAML:2.0:ac.classes:PasswordProtectedTransport

The alias of key entry stored in SAML 2.0 SP Keystore used to sign SAML 2 requests.

- saml2sp

The password of key entry stored in SAML 2.0 SP Keystore used to sign SAML 2 requests.

- ********

---

**Figure 529: Service Provider properties**

Set the instance URL for SAML.
Set the instance-specific URLs in SAML system properties.
Role required: admin

1. In the property The URL to the Service-now instance (usually this instance), enter the URL (including login page) of the instance for which the IdP authenticates. For example: https://yourinstance.service-now.com/navpage.do

2. In the property The entity identification, or the issuer, enter the base URL (excluding login page) of the instance for which the IdP authenticates. For example: https://yourinstance.service-now.com/

Set the audience URL for SAML
The Audience system property allows your instance to verify that it is the intended recipient of a SAML response.

Role required: admin

The integration verifies that each SAML response contains the same URL listed in this system property as the URL listed in the Audience element. For example:

```
<samlp:Response xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
ID="s2cdc74f37f923e26fe1aeec42b70a93d24230334f"
InResponseTo="90AA6073F01567BF0DF194F596314E2" Version="2.0"
...
<saml:Conditions NotBefore="2012-01-30T19:57:10Z"
...
</samlp:Response>
```

1. Navigate to SAML 2 Single Sign-on > Properties.
2. In the property The audience uri that accepts SAML2 token. (Normally, it is your instance URI. For example: https://<instance name>.service-now.com.), enter the URL of your instance. For example, https://demoi2.service-now.com. This URL must match the value of the Audience element in the SAML Response.
3. Click Update.

Set up a NameID policy for SAML
SAML 2.0 requires the IdP to exchange a NameID token with the service provider.

Role required: admin

For the SAML 2.0 integration the NameID token must map to a particular field in the User table. The integration uses the NameID token's value to determine what user the IdP authenticates.

1. Browse the IdP metadata to find the NameIDFormat element that contains a value of emailAddress. The value of this element is the default format that the integration uses.
2. Review other NameIDFormat elements to determine if there are formats that match other fields in the User table.

Determine what User table field matches the NameID token
Identity providers specify what format the NameID token has.

Role required: admin

Setting up SAML 2.0 requires selecting a field from the User table that matches the format of the NameID token. Typically, IdPs offer the option to use an email address as the NameID token. Since the User table contains an email field, this field is a logical choice for use as a NameID token. To use another field from
the User table as the NameID token, first verify that the IdP offers a NameID format that matches the value of a User table field. This may require adding the field to the User table.

1. Compare the available formats in the IdP’s NameIDFormat element to fields in the User table.
2. Select a NameID format where there is a matching value in the User table.
3. In the The User table field to match with the Subject's NameID element in the SAMLResponse field, enter the name of the User table field to search for matching values in the NameID token.

By default, the integration uses the email field.

Set the IdP NameID policy
Specify what format the IdP uses for the NameID token.
Role required: admin
This format is listed as part of the IdP’s metadata.

1. In the property The NameID policy to use for returning the Subject’s NameID in the SAMLResponse. Your SAML identity provider will have to support this by declaring the policy in its metadata. The NameID value is used to match with the specified field in the User table to lookup the user., enter the value of the NameIDFormat element the integration uses.

By default, the integration uses the SSOCircle NameIDFormat for email addresses.

2. Click Save.

Values in the User table field for SAML
Ensure that the integration’s User table field contains appropriate matching values.

For example, if the integration uses the email field as the NameID token, ensure that the instance lists the same email address as the IdP. The integration fails to authenticate any user who does not have a matching value for the NameID token.

(Optional) Enable providing an authentication context class for SAML
You can enable the instance to send an authentication context class request to the IdP containing your instance’s preferred authentication request format.
Role required: admin
If you enable creating an AuthContextClass message, then you must also specify an authentication context class reference format.

**Note:** Some IdP’s do not allow the Service Provider to set the authentication context class. Disabling this setting allows the IdP to choose the authentication context class.

1. From the property Create an AuthnContextClass request in the AuthnRequest statement, select Yes to specify a particular context class such as Password Protected Transport, or select No to have the IdP select the most appropriate context class.
2. If you selected Yes to Create an AuthnContextClass request in the AuthnRequest statement, then in The AuthnContextClassRef method that we will request in our SAML 2.0 AuthnRequest to the Identity Provider property, enter the URN of the context class you want to use for authentication (see table).

<table>
<thead>
<tr>
<th>Authentication type</th>
<th>Authentication context class URN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forms-based authentication</td>
<td>urn:oasis:names:tc:SAML:2.0:ac:classes:PasswordProtectedTransport</td>
</tr>
<tr>
<td>Kerberos-based authentication</td>
<td>urn:federation:authentication:windows</td>
</tr>
</tbody>
</table>
By default, the integration uses a Password Protected Transport authentication method.

3. Click **Update**.

(Optional) Set keystore properties for signing logout requests for SAML

The Keystore properties allow the integration to sign logout requests using your signed server and signed CA certificates.

Role required: admin

1. In the property The alias of key entry stored in SAML 2.0 SP Keystore used to sign SAML 2 requests, enter the alias name you created for the SAML 2.0 Keystore. By default, the integration looks for the alias saml2sp.
2. In the property The password of key entry stored in SAML 2.0 SP Keystore used to sign SAML 2 requests, enter the password to your SAML 2.0 Keystore. By default, the password is the same as the default alias name.
3. Click **Update**.
4. Regenerate your **SP metadata**.

Install a service provider keystore for signing SAML requests

Use the following steps to remove the existing example key store and install your own Service Provider key store containing your public and private key pair.

Role required: admin

1. Create a Service Provider key store.
2. Navigate to **SAML 2 Single Sign-on > Certificate**.
3. Click **SAML 2.0 SP Keystore**.
4. Click the **Manage Attachments** link.
5. Select the Delete checkbox next to saml2sp_keystore.
6. Click **Remove**.
7. Click **Choose Files** and select the Keystore containing your signed certificates.
8. Click **Attach**.
9. Close the Attachments popup.
10. In Key store password, enter the password to access the SAML 2 alias.
11. Click **Update**.

Create a service provider keystore

In order for your instance to sign logout requests, you must create a Java Key store containing the following items.

- Signed server certificate for the instance
- Signed CA certificate
- Public and private key pair

You may create your own signed certificate with a private certificate authority or purchase one from a public certificate authority.

The following steps illustrate how to generate a new Java Keytool keystore file, create a certificate signing request (CSR), and import certificates. Any root or intermediate certificates need to be imported before importing the primary certificate for your domain. Type these commands in a command line interface.
**Note:** These instructions are not specific to the platform and require technical knowledge of security certificates to complete. Technical Support cannot assist in creating the certificates.

1. Generate a Java keystore and key pair.

   ```
   keytool -genkey -alias mydomain -keyalg RSA -keystore my.keystore
   ```

2. Generate a CSR for an existing Java keystore.

   ```
   keytool -certreq -alias mydomain -keystore my.keystore -file mydomain.csr
   ```

3. Import a root or intermediate certificate authority CA certificate to an existing Java keystore.

   ```
   keytool -import -trustcacerts -alias root -file Thawte.crt -keystore my.keystore
   ```

4. Import a signed primary certificate to an existing Java keystore.

   ```
   keytool -import -trustcacerts -alias mydomain -file mydomain.crt -keystore my.keystore
   ```

*(Optional) Advanced SAML properties*

The following advanced settings allow you to further increase security and debug the integration.

### Advanced settings

- **The number in seconds before "notBefore" constraint, or after "notOnOrAfter" constraint, to consider still valid**
  - 60

- **Turn on debug logging for SAML 2.0 Authentication**
  - Yes | No

Figure 530: Advanced settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The number of seconds &quot;notBefore&quot; constraint, or after &quot;notOnOrAfter&quot; constraint, to consider still valid</td>
<td>Enter the number of seconds to add to the NotBefore and NotOnOrAfter constraints to account for time differences between the IdP clock and SP clock. These constraints prevent against replay attacks by denying requests that are not made within the specified time frame. If the IdP clock and SP clock are significantly different, network latency may result in the SAML request being unauthorized. This property adds a grace period during which SAML requests and responses are still considered valid.</td>

</tr>
<tr>
<td>Turn on debug logging for SAML 2.0 Authentication</td>
<td>Select <strong>Yes</strong> to enable additional logging information for SAML 2.0 events.</td>
</tr>
</tbody>
</table>

**Install the identity provider certificate**

You can paste a PEM certificate into a X.509 Certificate form so the identity provider can verify communications with the service provider.

Role required: admin

The IdP's certificate is located within the IdP's metadata. The IdP developer determines where the certificate metadata resides when creating the local IdP.

**Tip:** Make sure that the **Certificate Expiring** and **Certificate Expired** notifications are enabled so you remember to update the certificate.

**Note:** Certificates for single-sign on should always be in PEM format to work with SAML certificates.

1. Navigate to **SAML Single Sign-on > Certificate**.
2. Fill in the form fields (see table).
3. Click **Save**.
**Note:** The integration does not currently sign the certificate in communications between the instance and the IdP.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The certificate name. Do not change the Name entry. The name of the X.509 certificate must be SAML 2.0 in order for the integration to use it. This requirement is only true if you are not using Multiple provider single sign-on on page 1891.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>Select this option to send a notification to the users selected in the <strong>Notify on expiration</strong> field. By default, this is enabled.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Select the users to revive the notification regarding certificate expiration. If no users are selected, the logged in user is added by default, along with the last two logged in users with the administrator role.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>The number of days before expiration that the instance send the notification. Enter a value of at least 20.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box to indicate that this certificate is active.</td>
</tr>
<tr>
<td>Format</td>
<td>A PEM or DER certificate. SAML uses PEM format.</td>
</tr>
<tr>
<td>Type</td>
<td>The certificate container. The instance recognizes certificates from trust stores, Java keystore, and PKCS#12 keystores.</td>
</tr>
<tr>
<td>Valid from</td>
<td>The instance automatically adds the certificate valid from date to this field. Attach the certificate to the X.509 certificate record to populate this field.</td>
</tr>
<tr>
<td>Expires</td>
<td>The instance automatically adds the certificate expiration date to this field. Attach the certificate to the X.509 certificate record to populate this field.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>The calculated number of days to expiration.</td>
</tr>
<tr>
<td>Short description</td>
<td>A description for the certificate.</td>
</tr>
<tr>
<td>Issue</td>
<td>The instance automatically adds the certificate issuer to this field. Attach the certificate to the X.509 certificate record to populate this field.</td>
</tr>
<tr>
<td>Subject</td>
<td>The instance automatically adds the certificate subject to this field. Attach the certificate to the X.509 certificate record to populate this field.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Enter the value of the X509 certificate.</td>
</tr>
</tbody>
</table>

Replacing a missing SAML certificate
If the Certificate module displays a blank page, the SAML 2.0 certificate record has been deleted. You can replace the missing certificate by manually creating a certificate record.

Role required: admin

1. Navigate to System Definition > Certificates.
2. Create a new record called SAML 2.0.

**Important:** You MUST use this name.

3. Click SAML 2 Single Sign-on > Certificate.
4. In the PEM Certificate field, enter the value of the ds:X509Certificate element from your IdP’s metadata.
5. Click Save.

Add a Java keystore for SAML
You can add Java keystores to the SAML application if you want another repository for your SAML security certificates.

Role required: admin

By default, SAML 2 Single Sign-on provides a default keystore named **SAML 2.0 SP Keystore**. This keystore is active by default. You can add keystores as needed and specify which one to use by default with a property.

1. Navigate to **System Definition > Certificates**.
2. Fill in the fields on the form (see table).
3. Click **Submit**.

### Table 457: X.509 Certificate form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select <strong>Active</strong> to keep the key store available.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a description for the key store.</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Enter the password for the key store.</td>
</tr>
</tbody>
</table>

4. To set the default key store, enter `sys_properties.list` in the application filter.
   The list of system properties opens.
5. Find and open the following property: `glide.authenticate.sso.saml2.keystore`.
Geneva ServiceNow ServiceNow Platform

The Value field shows the Sys ID of the default key store: **SAML 2.0 SP Keystore**. Use this property when the system has multiple key stores for signed authentication or signed logout. Starting with Geneva Patch 7, the glide.authenticate.sso.saml2.keystore property uses your configured key store if you upgrade from a version prior to the Geneva release. Prior to the Geneva Patch 7, this property kept the default value upon upgrade, regardless of any changes you made.

6. Paste the Sys ID of the key store record that you created into the **Value** field.
7. Click **Update**.

*Generate instance service provider (SP) metadata*

After setting all the integration properties, generate the instance SP metadata.

Role required: admin

The IdP needs the instance SP metadata to authenticate and forward requests.

1. Navigate to **SAML 2 Single Sign-on > Metadata**. The integration automatically generates the instance's SP metadata from the system property settings.
2. Copy the SP metadata in the text box. For example:

   ```xml
   <EntityDescriptor xmlns="urn:oasis:names:tc:SAML:2.0:metadata"
     entityID="https://demoi2.service-now.com"/>
     <SPSSODescriptor
     AuthnRequestsSigned="false" WantAssertionsSigned="false"
     protocolSupportEnumeration="urn:oasis:names:tc:SAML:2.0:protocol">
     <SingleLogoutService
     Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-Redirect"
     Location="https://demoi2.service-now.com/navpage.do" />
     <NameIDFormat>urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress</
     NameIDFormat><AssertionConsumerService isDefault="true" index="0"
     Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST"
     Location="https://demoi2.service-now.com/navpage.do"/>
     SPSSODescriptor</EntityDescriptor>
   
   3. Provide the instance SP metadata to the IdP. For example, SSOCircle allows a user to provide the SP metadata online.

*Test the SAML integration*

After completing all other setup tasks, test the integration.

Role required: admin

1. Log in to the instance as a user with the admin role.
2. Navigate to **SAML 2 Single Sign-on > Properties**.
3. In the property **Enable external authentication**, select **Yes**.

**Note:**

Enabling external authentication requires all users to use SAML 2.0 single sign-on. Thus, if anyone tries to access the application in an unauthenticated state, the instance automatically sends an authentication request to the (IdP) and redirects the user to the SAML IdP Authentication page.

4. Click **Save**.
5. Log out of the instance.
6. Browse to the instance URL. If the integration is functioning properly, the IdP should ask for the users credentials.

List of common SAML login errors

Use this list of common login errors and their solutions to troubleshoot your SAML integration.
### Table 458: Troubleshooting login errors table

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication fails and the login request generates an infinite loop between the system and the IdP.</td>
<td>Set (or create) the system property <code>glide.authenticate.failed_redirect</code> to redirect failed authentication requests to this URL. Typically the URL endpoint is an error page or logout page.</td>
</tr>
<tr>
<td>Login requests generate an infinite loop between the system and the IdP when High Security is active.</td>
<td>The High Security plugin's rotating session feature can cause problems with the SAML 2.0 authentication process. Disable the rotating session feature when using SAML 2.0 for authentication. SAML 2.0 needs to redirect URLs to an IdP. When rotating sessions are enabled, any redirection causes the session to rotate and forces the instance to query the IdP again. This causes an endless loop of new sessions between the instance and the IdP.</td>
</tr>
</tbody>
</table>

**Force single sign-on login (SSO) only**

When single sign-on is enabled, you might not want users to see the login page or allow user to login locally.

In other words, if a user attempts to go to https://customerX.service-now.com, the internal company portal should be displayed instead of the default login page. Likewise, when a user logs out of the application, the browser should redirect them to a specific internal page. You can set redirection properties within the instance to ensure that users see the single sign-on page rather than the default login page.

**Redirection properties**

When a user logs out, or if there is a failed attempt to sign on using SSO, you can define where the user is taken next, such as a main portal page or a knowledge base article with SSO login information. Use the following properties to specify the URLs. If one of these properties does not exist in your instance, you can create the property.

- **glide.authenticate.failed_requirement_redirect** URL to redirect users when they attempt to access a page that is private (for example, to view an incident) and do not provide SSO credentials. The property is typically set to a customer's login portal (for example, http://portal.companya.com/).

- **glide.authenticate.failed_redirect** URL to redirect users after a failed SSO attempt. You can redirect to a public knowledge article that describes the error and has helpful links (for example, http://portal.companya.com/error).

- **glide.authenticate.external.logout_redirect** URL to redirect users after logging out, typically back to the portal that enabled the single sign-on log in (for example, http://portal.companya.com/logout).

- **glide.authentication.external.disable_local_login** When set to true, requires SSO credentials for the main login page. Defaults to false. This property needs to be used in conjunction with the
The following table shows the relationship between the Installation Exit return values, the properties, and the expected behavior.

### Table 459: Forcing login using SSO only

<table>
<thead>
<tr>
<th>Return value</th>
<th>Property</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>failed_missing_requirement</td>
<td>glide.authenticate.failed_requirement_redirect</td>
<td>When this value is returned, it indicates that the required SSO credentials are not present in the session. Login fails and the session is redirected to the URL specified by the property. This is usually the URL for the SSO provider where login is challenged and credentials are collected.</td>
</tr>
<tr>
<td>failed_authentication</td>
<td>glide.authenticate.failed_redirect</td>
<td>When this value is returned, it indicates that the supplied SSO credentials failed authentication, the user does not exist, or the user is locked out. Login fails and the session is redirected to the URL specified by the property. This is usually the URL for the SSO provider where login is challenged and credentials are collected.</td>
</tr>
<tr>
<td>&lt;user_id&gt;</td>
<td>N/A</td>
<td>Login authorized for the user specified by <code>&lt;user_id&gt;</code>. This value matches with the field name defined in the SSO property glide.authenticate.header.value (&quot;the instance's field name to match against the incoming header&quot;)</td>
</tr>
</tbody>
</table>

### Restricting local login

As a security precaution, you should do more than rely on redirection properties to prohibit logging in locally. If a user should never log in locally and will always be authenticated by your internal single sign-on system, then a random password should be assigned to each user that is imported into the instance. The random password is most easily set at the time of the user import. If the user data is imported into your system through an import set, you can create an onBefore transform script using the following code.

```javascript
var r = new Packages.java.util.Random();
var str1 = Packages.java.lang.Long.toString(Packages.java.lang.Math.abs(r.nextLong()), 36);
var str2 = Packages.java.lang.Math.abs(r.nextDouble());
```

© 2017 ServiceNow. All rights reserved.
Integrating SAML 2.0 with other features

You can integrate your SAML 2.0 solution with other features like E-Signature, deep linking, and ADFS.

**Add E-Signature support for SAML**

Configure the following properties for E-Signature with SAML 2.0 update 1.

When E-signature is active with Multi-SSO, SAML properties are not used. The system adds E-signature properties to the SAML2 Update1 Properties [saml2_update1_properties] table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assertion Consumer Index for eSignature authentication</td>
<td>An index number that identifies the endpoint.</td>
<td>1</td>
</tr>
<tr>
<td>Assertion Consumer URL for eSignature authentication</td>
<td>The URL that identifies the consumer.</td>
<td><a href="https://yourinstance.service-now.com/consumer.do">https://yourinstance.service-now.com/consumer.do</a></td>
</tr>
<tr>
<td>AuthnRequest URL for eSignature Authentication</td>
<td>The URL for authentication</td>
<td>none</td>
</tr>
</tbody>
</table>

If you are using E-Signature with SAML 1.0 or SAML 2.0 (not including update 1), see the special configuration instructions: *Using E-Signature with Single Sign-On (SSO).*

**Note:** If you are a Life Science Customer using E-Signature, you must deactivate the User self-lockout prevention business rule. See *KB0547061* for more information.

**Add deep linking support for SAML**

Deep linking allows instances to support direct email links to a particular record in the system.

With the SAML 2.0 integration enabled, deep-linking URLs must pass an authentication check before the IdP redirects the user to the originally requested URL. For example, consider an email that contains this URL: https://<instance name>.service-now.com/nav_to.do?url=incident.do?sys_id=46c88ac1a9fe1981014de1c831fbcf6d

The instance sends an authentication request to the IdP and uses the RelayState URL parameter to preserve the originally requested resource (in this case, url=incident.do?sys_id=46c88ac1a9fe1981014de1c831fbcf6d). After the IdP authenticates the user, the instance reads the value of the RelayState URL parameter and redirects the user to the requested resource (if it exists in the instance).

To add support for deep linking verify that the identity provider supports the RelayState URL parameter.

**ADFS integration with SAML 2.0**

SAML 2.0 single sign-on (SSO) supports integration with Microsoft Active Directory Federation Services (ADFS) 3.0.

For information about installing and configuring ADFS, see *Active Directory Federation Services Overview*.

Set up ADFS for SAML
This procedure uses ADFS 2.0 and shows samportal.example.com as the ADFS website. Replace this with your ADFS website address.

Role required: admin

1. Log into the ADFS 3.0 server and open the management console.
2. Right-click Service and choose Edit Federation Service Properties.

3. Confirm that the General settings match your DNS entries and certificate names.
4. Browse to the certificates and export the Token-Signing certificate.
   a) Right-click the certificate and select **View Certificate**.
   b) Select the **Details** tab.
   c) Click **Copy to File**. The Certificate Export Wizard opens.
   d) Select **Next**.
   e) Ensure the **No, do not export the private key** option is selected, and then click **Next**.
   f) Select **DER encoded binary X.509 (.cer)**, and then click **Next**.
   g) Select where you want to save the file and give it a name. Click **Next**.
   h) Select **Finish**. The instance requires that this certificate be in PEM format. You can convert this certificate using client tools or even online tools such as: SSL Shopper.

5. Use the DER/Binary certificate that you just created, and export it in Standard PEM format.
Set up the instance for ADFS

After you set up ADFS 2.0 or 3.0, set up the instance and SAML 2.0 settings to work with ADFS.

Role required: admin

1. If not already active, contact Technical Support to activate the SAML 2.0 Single Sign-On plugin.
2. Configure SAML 2.0 on page 1904, but when you install the IdP certificate, attach the PEM certificate you created when you Set up ADFS for SAML on page 1930.
3. Click Save.
4. Verify that the Issue and Subject fields have values and that there are no errors. If an error occurs, open the saved PEM formatted certificate in Notepad and copy and paste the certificate into the PEM Certificate field.
5. Verify that the SAML2SingleSignon_update1 installation exit is active.
6. Continue the SAML 2.0 configuration.

Note: When a certificate is updated on the ADFS server, you also need to upload an updated certificate to the instance.

Configure an ADFS relying party

At this point you can take the instance metadata and import it into your ADFS server. However, manual configuration of the relying party appears to be easier to implement.

Role required: admin

1. Navigate to SAML 2 Single Sign-on > Properties and verify that the SAML property Sign AuthnRequest (glide.authenticate.sso.saml2.require_signed_authnrequest) is not active. Only keep this property active if your ADFS administrator can verify that you require signed requests.
2. Copy the metadata that you generated through the SAML 2 metadata link and save it to a file.
3. Log into the ADFS server and open the management console.
5. Select Add Relying Party Trust from the top right corner of the window.
6. The add wizard appears.
7. Click Start to begin.
8. Use the Import File option to import the metadata file.
9. Give it a display name such as ServiceNow and enter any notes you want.
10. Select ADFS 3.0 Profile.
11. Do not select a token encryption certificate. It will use the certificate that is defined on the service that has already been exported. Defining a certificate here will prevent proper communication with the instance.
12. Do not enable any settings on the Configure URL.
13. Enter the instance site to which you connected as the Relying Party trust identifier. In this case use https://company.service-now.com and click Add.
14. Permit all users to access this relying party.
15. Click Next and clear the Open the Claims when this finishes check box.
16. Right-click on the relying party trust and select Properties.
17. Browse to the Advanced tab and set the Secure hash algorithm to SHA-1.

Configure ADFS relying party claim rules
Edit the Claim rules to enable proper communication with the instance.

Role required: admin

1. Log into the ADFS server and open the management console.
2. Right-click the relying party trust and select **Edit Claim Rules**.
3. Click the **Issuance Transform Rules** tab.
4. Select **Add Rules**.
5. Select **Send LDAP Attribute as Claims** as the claim rule template to use.
6. Give the claim a name such as **Get LDAP Attributes**.
7. Set the **Attribute store** to **Active Directory**, the **LDAP Attribute** to **E-Mail-Addresses**, and the **Outgoing Claim Type** to **E-mail Address**.
Edit Rule - Get Attribute

You can configure this rule to send the values of LDAP attributes as claims. Select an attribute store from which to extract LDAP attributes. Specify how the attributes will map to the outgoing claim types that will be issued from the rule.

Claim rule name:

Get Attribute

Rule template: Send LDAP Attributes as Claims

Attribute store:

Active Directory

Mapping of LDAP attributes to outgoing claim types:

<table>
<thead>
<tr>
<th>LDAP Attribute (Select or type to add more)</th>
<th>Outgoing Claim Type (Select or type to add more)</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-Mail-Addresses</td>
<td>E-Mail Address</td>
</tr>
</tbody>
</table>

---

c:[Type == "http://schemas.microsoft.com/ws/2008/06/identity/claims/windowsaccountname", Issuer == "AD AUTHORITY"]

=> issue(store = "Active Directory",

© 2017 ServiceNow. All rights reserved.
8. Select Finish.
9. Select Add Rules.
10. Select Transform an Incoming Claim as the claim rule template to use.
11. Give the Claim a name such as Email to Name ID.
12. Set the Incoming claim type to the Outgoing Claim Type in the previous rule. For example, E-Mail Address.
13. Set the Outgoing claim type to Name ID and the Outgoing name ID format to Email.

   Note: These values must match the Name ID policy you define during SAML 2.0 configuration.
14. Select Pass through all claim values.
This claim rule should look similar to the following rule language.

c:[Type == "http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress"]
15. Click Finish.

Create a SAML logout endpoint

Create a SAML logout endpoint to allow single logout.

Role required: admin

See this article on ADFS signout for more information.

1. Go to ADFS manager > Trust Relationships > Relying Party Trusts > properties.
2. Under the Endpoints tab, click Add.
3. Configure the settings:
   • Endpoint Type: SAML Logout
   • Binding: POST
   • URL: https://myadfsserver.domain.net/adfs/ls/?wa=wsignout1.0

Test the ADFS configuration

Test your ADFS configuration to verify that it is properly functioning as an identity provider.

Role required: admin

1. Open an Internet Explorer browser.
   This page contains a drop down list of all configured Relaying Party Trusts.
3. Select the relaying party associated with your instance.
4. Click Continue to Sign In.
   If you have configured the SAML 2.0 external authentication properly, you should be automatically logged into the instance.

(Workaround) Enable service provider-initiated authentication

A workaround is available if authentication fails because you do not have SAML 2.0 Update 1. This can happen if users attempt to skip IdP authentication and navigate directly to the instance.

Role required: admin

This is an error with the instance not providing ADFS with the needed definition and semantics for the SPNameQualifier attribute in the SAMLResponse.

To enable service provider-initiated authentication, do one of the following

• Upgrade to SAML 2.0 Update 1 and clear the option to create an AuthnContextClass request. See SAML setup on page 1914 for more information.
• Modify the SAML2 script include to comment out the definitions of the SPNameQualifier attribute when you have SAML 2.0 active (not SAML 2.0 Update 1).
Comment out these lines in the createNameID and createNameIDPolicy functions:

```java
//nid.setSPNameQualifier (serviceURL ) ;
//nameIdPolicy. setSPNameQualifier (serviceURLStr ) ;
```

If you do not want the login prompt from your ADFS server to appear when you access the instance, set the following SAML 2.0 Update 1 property to false: **Create an AuthnContextClass request in the AuthnRequest statement**(glide.authenticate.sso.saml2.createrequestedauthncontext).

(Workaround) Support Kerberos authentication
A workaround is available for the SAML 2.0 integration that changes the authentication context from forms-based authentication to Windows-based authentication.

Role required: admin
Currently, the SAML 2 integration uses a PasswordProtectedTransport or "forms-based authentication" authentication context. This authentication context requires the IdP to present users with a form for authentication credentials. With Kerberos, a SAML session is already active through an established Windows login, so the user does not need to authenticate with the IdP.

1. Navigate to **Multi-Provider SSO > Identity Providers**.
2. Open the **SAML2 Update1** IdP record.
3. Select the **Create an AuthnContextClass request in the AuthnRequest statement** checkbox.
4. Set the **The AuthnContextClassRef method that we will be included in our SAML 2.0 AuthnRequest to the Identity Provider** to one of the following:

   **Table 460: AuthnContextClassRef method values**

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>urn:oasis:names:tc:SAML:2.0:ac:classes:PasswordProtectedTransport (Default)</td>
</tr>
<tr>
<td>urn:federation:authentication:windows</td>
</tr>
</tbody>
</table>

5. Click **Update**.

**Email links with SSO**
When using External Authentication (or SSO) that requires URL parameter additions, you must establish how to handle links in email notifications.

The default links contain a URL that directs you to a specific location in the instance, like an Incident or Change Request, without incorporating SSO credentials. Below are examples for directing the user to the location in the instance without logging in on the instance login page.

- **Unencrypted HTTP technique to connect to the /demo instance (it does not navigate to specific record):**
  ```
  https://<instance name>.service-now.com/?
  SM_USER=user_name&DE_USER=lQjIVp7aRJtyPx5+2O/vgU24tbE=
  ```

- **Link (in an email notification) to a specific record, so that the user first goes to the company's own login portal:**
  ```
  https://login.company_portal_page.com/nav_to.do?uri=incident.do?
  sys_id=009f8eda0a0a0b2b01ab4eb094223466%26sysparm_stack=incident_list.do
  %3Fsysparm_query=active=true
  ```

You must set the glide.email.override.url property in your instance to contain the URL of the company portal page. If this property does not exist, you can create it.
• The company portal must then take that URL and construct the redirect URL to the instance preserving the segment necessary to access the specific record, and adding the SSO credentials to the end of the URL:

```
https://<instance name>.service-now.com/nav_to.do?uri=incident.do?
sys_id=009f8eda0a0a0b2b0ab4eb094223466%26sysparm_stack=incident_list.do
%3Fsparm_query=active=true&SM_USER=user_name&DE_USER=lQjIVp7aRJtyPx5+2O/vgU24tbE=
```

Migrating an existing SAML 1.1 integration to SAML 2.0

To migrate from a SAML 1.1 integration to a SAML 2.0 integration, contact customer support.

Update existing SAML 2.0 integration

Perform these steps to update your existing SAML 2.0 integration.

Role required: admin

Request the SAML 2.0 Update 1 Plugin

Contact customer support to request the SAML 2.0 Single Sign-On - Update 1: security enhancements plugin. The plugin applies updated versions of the SAML2SingleSignon installation exit (login script), SAML2Logout installation exit (logout script), and SAML2 script include (script object). See Activate a plugin on page 1233.

Merge Customizations from Existing Installation Exit Scripts into New Scripts

The update saves an inactive copy of the integration’s original installation exit scripts. You can use these copies to merge any customizations you made to the login and logout scripts to the new versions of these installation exits.

### Table 461: Merge Customizations from Existing Installation Exit Scripts into New Scripts

<table>
<thead>
<tr>
<th>Original Installation Exit Script Name</th>
<th>Original Script Status</th>
<th>New Installation Exit Script Name</th>
<th>New Script Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAML2SingleSignon</td>
<td>Inactive</td>
<td>SAML2SingleSignon_update1</td>
<td>Active</td>
</tr>
<tr>
<td>SAML2</td>
<td>Inactive</td>
<td>SAML2_update1</td>
<td>Active</td>
</tr>
<tr>
<td>SAML2Logout</td>
<td>Inactive</td>
<td>SAML2Logout_update1</td>
<td>Active</td>
</tr>
</tbody>
</table>

You can navigate to the SAML 2.0 login and logout installation exit scripts using these paths.

- **SAML 2 Single Sign-on > Login script.**
- **SAML 2 Single Sign-on > Logout script.**
- **System Definition > Installation Exits.**

You can navigate to the SAML 2.0 update 1 script include using these paths.

- **SAML 2 Single Sign-on > Script object.**
- **System Definition > Script Includes.**

Test the Update

Perform these steps to troubleshoot your integration update.

1. **Add a new system property** called glide.authenticate.sso.saml2.debug with a value of true.
2. Attempt SAML 2.0 login.
3. Review the system log. SAML2 validation errors begin with the text SAML2ValidationError.
4. Identify and fix any common login errors.

Sample SAML 2 responses after the update
The following sections illustrate the new required elements and attributes that the IdP should provide in the SAML Response.

Sample SAML 2 Response with Issuer Element
The following SAML 2 response uses the Issuer element.

```xml
<samlp:Response xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
Destination="https://demoi2.service-now.com/navpage.do"
ID="s28da6774c88ae1eb292bf25fe625db81919d8e1e"
InResponseTo="SNC841720c227c81948cf68cadcdad235c6"
IssueInstant="2012-01-30T20:07:10Z" Version="2.0">
  <saml:Issuer xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">
    http://idp.ssocircle.com
  </saml:Issuer>
  ...
  <saml:Assertion xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"
ID="s2f347f973c063836cf70eaa38302d94976f9c5b851"
IssueInstant="2012-01-30T20:07:10Z" Version="2.0">
    http://idp.ssocircle.com
  </saml:Assertion>
  ...
</samlp:Response>
```

Sample SAML 2 Response with the SubjectConfirmation and SubjectConfirmationData Elements
The following SAML 2 response uses the SubjectConfirmation and SubjectConfirmationData elements with the NotOnOrAfter and Recipient attributes.

```xml
<saml:SubjectConfirmationMethod="urn:oasis:names:tc:SAML:2.0:cm:bearer">
  <saml:SubjectConfirmation
InResponseTo="SNC841720c227c81948cf68cadcdad235c6"
NotOnOrAfter="2012-01-30T20:17:10Z"
Recipient="https://demoi2.service-now.com/navpage.do"/>
</saml:SubjectConfirmation>
```

Sample SAML 2 Response with the AudienceRestrictions and Audience Elements
The following SAML 2 response uses the AudienceRestrictions and Audience elements with the NotBefore and NotOnOrAfter attributes.

```xml
<saml:ConditionsNotBefore="2012-01-30T19:57:10Z"
NotOnOrAfter="2012-01-30T20:17:10Z">
  <saml:AudienceRestriction>
    https://demoi2.service-now.com
  </saml:AudienceRestriction>
</saml:Conditions>
```

Clone an instance with a SAML integration
Preserving SAML SSO-related settings can prevent the target instance from redirecting all authentication requests to the original IdP with the wrong issuer and audience parameters.

To preserve SAML settings, create data preservers for the following tables:
SAML user provisioning

If users exist in your IdP but are not in your instance, SAML user provisioning can automatically create the users in your instance's User [sys_user] table.

SAML user provisioning is supported for SAML 2.0 Update 1 when Multi-SSO is enabled.

How SAML user provisioning works

When SAML user provisioning is enabled and the system encounters a new user that is not in the instance, the instance automatically creates a record in a temporary table with the name \texttt{u\_import\_saml\_user\_<suffix>}, where \texttt{<suffix>} is an automatically generated text identifier. The system also creates transform map that specifies the data relationships between the import table and the User table. Each IdP in identified in the system has its own transform map. The transform map is created once for each IdP. Administrators can update it as necessary.

When the user logs in, they access an IdP to log in.

- The system presents a list of all IdPs that are able to use SAML user provisioning. If there is only one IdP that can use SAML user provisioning, that one is used automatically.
- If none of the above conditions are true, the system uses the default IdP.

Administer SAML user provisioning

To update the User table with the users in your IdP, you must first set up field mapping and then enable user provisioning through Multi-SSO IdP settings.

Set up your IdP mapping to identify what fields in the IdP are mapped to the correct fields in the User table.

Role required: admin

1. Navigate to Multi-Provider SSO > Properties.
2. Select Enable Auto Importing of users from all identity providers into the user table (glide.authenticate.multisso.user.autoprovision) to activate this feature.
3. Click Save.
5. Open the SAML2 Update1 record.
6. To create a record in the User table when the user does not already exist, select Auto-provision Users. If you upgraded to this release, you need to configure the form and add this field.
7. To enable user records to be updated when users log in to the IdP and the information on the IdP is out of date with the information on the User table, select Update User Record Upon Each Login. If you upgraded to this release, you need to configure the form and add this field.
8. Click User Provisioning Transform Map to see the map that the system automatically creates.
9. Make changes to the map as needed.

When the first unknown users tries to log in, the system creates the fields in the import set table from the metadata.xml file.

\textbf{Note:} You cannot map the fields from the IdP table until this first user logs in.
SAML 2.0 troubleshooting

Before contacting support, try the troubleshooting solutions available in the knowledge base on Hi.

**Note:** The instance does not support solutions provided by external sites.

See the following knowledge base article: [KB0540617 “SAML Error Matrix”](#).

### Table 462: Other Common Issues

<table>
<thead>
<tr>
<th>Error or Symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error message: “is not a function.”</td>
<td>This error occurs because the plugin was not active and did not load the .jar file. Therefore, the code appears to be missing. Contact Technical Support to restart nodes that are missing the plugin.</td>
</tr>
<tr>
<td>This issue might occur in a multi-node environment. If the plugin does not get activated on all nodes, an error like the following appears: org.mozilla.javascript.EcmaError: [JavaPackage org.opensaml.saml2.core.impl.AuthnRequestBuilder] is not a function.</td>
<td></td>
</tr>
<tr>
<td>SAML does not authenticate users accessing CMS pages.</td>
<td>By default, CMS pages are public and therefore do not require authentication. If you want SAML to authenticate CMS pages, change the view_content.do public page from active=true to active=false.</td>
</tr>
<tr>
<td>Cannot redirect a user back to a CMS page after SAML authentication.</td>
<td>By default, the SSO integration uses a URL parameter called URI to control where the user is directed after authentication at the IdP. SSO ignores relative URLs. For example, SSO cannot redirect users to a /ess relative URL. Instead, the user has to navigate to a URL such as /nav_to.do?uri=/ess, which uses deep linking syntax. However, this puts the ESS portal inside the main navigation content IFrame. In other words, the site does not take up the full page, but rather loads as a page in your instance. For more information, see CMS Sites and Single Sign-On. If you change the CMS entry page to make it private by setting view_content.do to active=false, deep linking behavior then requires a customization to the Installation Exit login script. Create a script that looks for the URI portion of the URL and constructs a RelayState URL parameter containing the relative URL path to redirect users after authenticating at the IdP.</td>
</tr>
</tbody>
</table>
Geneva  ServiceNow  ServiceNow Platform

<table>
<thead>
<tr>
<th>Error or Symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAML does not redirect users to the appropriate page after authentication.</td>
<td>Determine if the relay state is passed out to the IdP and then passed back during authentication. You can do this with a browser capable of saving HTTP request headers and POST info, such as Chrome with its built-in developer tools, or Firefox with the add-on called HTTPfox. For Internet Explorer, use a third-party application such as Fiddler. The goal is to watch the requests pass from the client (browser) to the instance, and from the client to the IdP.</td>
</tr>
</tbody>
</table>

Monitor the event queue for login activities

Every single sign-on integration creates events for login activities.

You can use these events to monitor for login failures and determine if there are any security concerns to address.

Table 463: Monitoring the event queue for login failures

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Description</th>
<th>Record</th>
<th>Parameter 1</th>
<th>Parameter 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>external.authentication.succeeded</td>
<td>External authentication succeeded and the user accessed the instance URL.</td>
<td>Session ID</td>
<td>User ID of user who successfully logged in</td>
<td>The URL the user accessed (which may be a deep link)</td>
</tr>
<tr>
<td>external.authentication.failed</td>
<td>The single sign-on requirements are not present or are missing.</td>
<td>Session ID</td>
<td></td>
<td>The missing authentication requirements</td>
</tr>
<tr>
<td>external.authentication.failed</td>
<td>The user does not exist in the User [sys_user] table</td>
<td>User ID</td>
<td></td>
<td>The string, &quot;User does not exist&quot;</td>
</tr>
<tr>
<td>external.authentication.failed</td>
<td>The user is locked out.</td>
<td>User ID</td>
<td></td>
<td>The string, &quot;User locked out.&quot;</td>
</tr>
</tbody>
</table>

Event queue login events

The SAML 2.0 integration creates events for login activities.

You can use these events to monitor for login failures and determine if there are any security concerns to address.
### Table 464: Login activities events

<table>
<thead>
<tr>
<th>Event name</th>
<th>Description</th>
<th>Session ID</th>
<th>User ID</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>saml2.logout.validation.failed</td>
<td>The logout response from the IdP failed validation against your logout request. The event validates the &lt;inResponseTo&gt; element against the session ID (ID attribute of the <a href="">saml2p:LogoutRequest</a> element). For example, see the workflow for logout request issued.</td>
<td></td>
<td>Session ID</td>
<td>The string, &quot;SAML2 LogoutResponse validation failed.'</td>
</tr>
<tr>
<td>external.authentication.succeeded</td>
<td>External authentication succeeded and the user accessed the instance URL.</td>

</tbody>
</table>

## OKTA SSO integration

Administrators can enable the Okta SSO integration to provide single sign-on access to instances through Okta.

This integration allows users to access their instance without logging in with their user credentials. Users only need to sign on to their organization's Okta service to gain access to the instance.

### How the Okta integration works

Organizations using Okta for single sign-on services typically have user information stored in another user management system, such as Active Directory. The user data is shared between Okta and these services or applications so that Okta always has the most up-to-date user credentials necessary to automatically log users into their applications. Organizations using Okta might also enter user data directly into the Okta user management service.
For Okta to automatically authenticate users to the instance, user data must be shared between Okta and the instance. The user management system in Okta manages this data sharing. In the user management system, administrators identify the users that are users by either manually configuring the user data or by importing users from the database. If changes need to be made at a later time, the user management system can import the updates from the database or, if the updates were made in Okta, the user management system can push the updates to the user table. This keeps the user data in synch.

When a user successfully authenticates with Okta and tries to access the instance, a token is sent to the instance authorizing the user so they do not have to sign in again.

Activate OKTA SSO

An administrator can activate the SSO Provided by Okta, Inc. plugin, which also activates the SAML 2.0 Update 1 plugin.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Set up the OKTA SSO integration

The OKTA site contains the up-to-date instructions on how to set up the integration with your instance.

Role required: admin

1. Activate the SSO Provided by Okta, Inc. plugin.
2. Navigate to the following external URL: ServiceNow Deployment Guide page.
3. Download the documentation.

Instruct users to log in with OKTA SSO

Users should log in to Okta before logging in to the application.

Role required: admin

This gives them access to all the applications that are configured to work with Okta, including the application, without signing in to each one separately.

After you activate Okta SSO, users can log into the application by:

- Clicking the Click here to log in with Okta, Inc. link on the login page.
- Clicking the application link on your organization’s Okta site.

In both cases, users who are already logged in to Okta are immediately redirected to the instance as a logged-in user. If they are not logged in to Okta, they must log in with their Okta credentials before being automatically redirected to the instance.
Digest token authentication

The digest token authentication passes user credentials and a digest token within an unencrypted HTTP header.

The instance reads the HTTP header value and compares its computed hash value of the digest token. If the computed hash value matches the digest token value, then the instance searches for a matching value in the User table. If there is a matching value in the User table, the instance considers the user pre-authenticated and logs the user in.

Digest token authentication is more secure than simple unencrypted HTTP headers because any accidental or intentional change to the unencrypted HTTP header produces a different hash value. If the hash value fails to match, the instance denies the user access to the requested instance. This prevents users from attempting to login with another user’s credentials.

Integration requirements

A Digest Token Authentication integration requires:

- A web server
- SiteMinder or another single sign-on application to pre-authenticate the user on the local network
- A web page or portal that passes user credentials to the target instance in one of these formats
  - HTTP Header
  - URL parameter
  - Cookie
- A web page or portal that creates and passes a digest token to the target instance using one of these encoding techniques
  - SHA1
  - MD5

Set up Digest Token Authentication

Setting up digest token authentication involves generating an unencrypted HTTP header and token, then enabling an installation exist and configuring properties.

Generate an unencrypted HTTP header

The first step in setting up digest token authentication is to generate an unencrypted HTTP header.

Role required: admin

The system only accepts one HTTP header as the source of pre-authentication.

1. Choose an HTTP header that matches data from the User (sys_user) table.
2. Configure your single sign-on software or authentication portal to generate the desired HTTP header.

For example, here are some sample SiteMinder HTTP headers.

<table>
<thead>
<tr>
<th>User credential</th>
<th>Sample HTTP header</th>
<th>Matching sys_user field</th>
</tr>
</thead>
<tbody>
<tr>
<td>User name</td>
<td>SM_USER</td>
<td>user_name</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
User credential | Sample HTTP header | Matching sys_user field
--- | --- | ---
Email address | EMAIL | email

Generate a digest token
After generating an unencrypted HTTP header, generate a digest token for authentication.

Role required: admin

The system only accepts one HTTP header as the source of pre-authentication.

Configure your single sign-on software or authentication portal to generate an HTTP header to contain the digest token.

For example, here is a sample SiteMinder HTTP header.

Table 466: Sample SiteMinder HTTP headers

<table>
<thead>
<tr>
<th>Sample HTTP header</th>
<th>Sample digest HTTP header</th>
<th>Sample HTTP headers with digest</th>
</tr>
</thead>
<tbody>
<tr>
<td>SM_User</td>
<td>DE_USER</td>
<td>SM_USER=joe.employee;DE_USER=KfNr4nlt86b9gEfcoiT0dU/YLM0=</td>
</tr>
</tbody>
</table>

Typically, the authentication portal or web page runs the code to generate a digest token from the unencrypted HTTP header and includes the digest token in the URL to the target instance. See SNC Guru for code samples of generating a digest token.

Enable digest installation exit script
After generating a digest token for authentication, enable a digest installation exist script.

Role required: admin

The system uses an installation exit to identify and decode incoming digest tokens. By default, the installation exit uses SHA1 to compute a hash value.

1. Navigate to System Definition > Installation Exits.
2. Click DigestSingleSignOn.
3. Set Active to true.
4. Click Update.
5. To use MD5 for computing the digest token hash value, change this line: var MAC_ALG ="HmacSHA1"; to this: var MAC_ALG ="HmacMD5";

Enter single sign-on system properties
After enabling a digest installation exist script, configure properties for single sign-on. If you are configuring digest token for multi-provider SSO, skip this step and enter the digest properties for multi-provider single sign-on.

Role required: admin

Set these properties to enable single sign-on with an unencrypted HTTP header.

1. Navigate to System Properties > Single Sign-on.
2. For Enable external authentication, select Yes.
3. For **HTTP header name to look for an externally authorized user (e.g. for SiteMinder)**, enter the HTTP header you generated. For example, `SM_USER`.

4. For **HTTP header name to look for an externally authorized user (e.g. for Digest Encryption)**, enter the HTTP header you generated. For example, `DE_USER`.

5. For **Service-now.com field name to match against the incoming header**, enter the `sys_user` field that contains matching data. For example, `user_name`.

6. For **Secret passphrase for single sign-on (SSO) encryption/decryption**, enter the secret key (password) to use for encoding digest keys. For example, `SecretKey123`.

7. Click **Save**.

---

**Enter the digest properties for multi-provider single sign-on**

After enabling a digest installation exist script, configure properties for multi-prover single sign-on. If you are not using multi-provider single sign-on, configure standard single sign-on properties.

**Role required:** admin

1. In the **Name** field, enter the name of the digest token.
2. In the **User** field, enter the `sys_user` field that contains the matching data for the incoming header.
3. In the **HTTP Digest header name** field, enter the HTTP header you generated. For example, `DE_USER`.
4. In the **HTTP header name field**, enter the HTTP header you generated in Step 1. For example, `SM_USER`.
5. In the **Secret Passphrase** field, enter the secret key to use for encoding digest keys. For example, `SecretKey123`.
6. In the **Failed SSO Redirect field**, enter the URL to redirect users after a failed authentication.
7. In the **External logout redirect** field, enter the URL to redirect users after a logout.
8. In the **Single Sign-on Script**, select `MultiSSO_DigestedToken`.
9. Click **Update**.
Test the integration
This single sign-on method allows pre-authentication from URL parameters, HTTP headers, or cookies.

Role required: admin

Verify users can sign-on from all methods.

For example:

- **URL Format**: https://<instance name>.service-now.com?
  SM_USER=joe.employee&DE_USER=KfNr4nlt86b9gEfoiT0dU/YLM0=

- **HTTP Header Format**:
  SM_USER=joe.employee;DE_USER=KfNr4nlt86b9gEfoiT0dU/YLM0=

- **Cookie Format**: 'SM_USER=joe.employee;
  DE_USER=KfNr4nlt86b9gEfoiT0dU/YLM0=; expires=Fri, 27 Jul 2012
  02:47:11 UTC; path=/'

Create links for digest authentication
After you set up digest token authentication, construct URLs to take users to a particular page or resource.

Role required: admin

- Create a URL to your instance and append the appropriate user (SM_USER) and digest (DE_USER) request parameters.

Example URLs are as follows:

  https://demo.service-now.com/nav_to.do?
  uri=ess&SM_USER=itil&DE_USER=nqQ82LONeYQnXPmdxnsvsArrQ=

  https://demo.service-now.com/nav_to.do?uri=incident.do?
  sys_id=9d385017c611228701d22104cc95c371&SM_USER=itil&DE_USER=Uj/
  HopjjPczCNpN2xcCX17kQty4=

  http://demo.service-now.com/nav_to.do?uri=incident_list.do?
  sysparm_userpref_module=4dedbac7d0bbf538017a7f13c4af257%26sysparm_query=caller_id=javascript:gs.getUserID()^active=true^EQ&SM_USER=itil&DE_USER=Uj/
  HopjjPczCNpN2xcCX17kQty4=

**Note**: If you are using request parameters inside a URI (nav_to.do?uri=), ampersands (&) are encoded as %26.

Sample digest token implementations
Here are several samples of creating a digest token.

**Table 467: Sample digest authentication implementations**

<table>
<thead>
<tr>
<th>Digest built with</th>
<th>Secret key value</th>
<th>Hash method</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java</td>
<td>abc123</td>
<td>SHA1</td>
<td>Sample Java Digest Algorithm for Encryption</td>
</tr>
</tbody>
</table>
Sample Java digest algorithm for encryption

This Java algorithm illustrates creating a digest token from an HTTP header.

This sample assumes:

- The web server supports Java
- The hash computation method is SHA1
- The secret key value is abc123
- The unencrypted HTTP header name is user_name

Change the Java code to use another hash computation mechanism (such as MD5), change the secret key value, or HTTP header name.

```java
import javax.crypto.Mac; import javax.crypto.spec.SecretKeySpec; import sun.misc.BASE64Encoder; // public class DigestTest { private static final String MAC_ALG = "HmacSHA1"; // default to something JDK 1.4 has String fKey = "abc123"; public byte[] getDigest ( String acct ) { try { byte[] bkey = fKey.getBytes( ); byte[] data = acct.getBytes( ); Mac mac = null; try { mac = Mac.getInstance (MAC_ALG ); mac. init ( new SecretKeySpec (bkey, MAC_ALG ) ) ; } catch ( Exception e ) { e.printStackTrace ( ) ; } byte[] sig = mac. doFinal (data ) ; String signature = new String (sig ) ; System. out. println ( "value:" + acct ) ; System. out. println ( "digested value:  " + signature ) ; return sig ; } catch ( IllegalStateException e ) { e.printStackTrace ( ) ; } return null ; } public static void main ( String[] args ) { BASE64Encoder encoder = new BASE64Encoder ( ) ; DigestTest test = new DigestTest ( ) ; String userName = "user_name" ; System. out. println ( "base 64 digest username: " + encoder. encode (test. getDigest (userName ) ) ) ; } }
```

Sample C

This C class illustrates creating a digest token from three input parameters.

- strEncryptionMethod – lists the hash computation method (SHA1 or MD5)
- message – lists the value to be converted into a digest token
- sharedKey – lists the secret key

This sample assumes:

- The web server supports C
- Other code calls this class and passes the expected parameters
Sample Code

```csharp
private string digestData(string strEncryptionMethod, string message, string sharedKey) {
    UnicodeEncoding myUnicodeEncoding = new UnicodeEncoding();
    byte[] messageBytes = System.Text.Encoding.ASCII.GetBytes(message);
    byte[] sharedKeyBytes = System.Text.Encoding.ASCII.GetBytes(sharedKey);
    byte[] hashedMessage;
    string b64SHA1Message;

    if (this.DEBUG) {
        MessageBox.Show(message);
        TextBoxSecret.Text = sharedKey;
    }

    switch ((strEncryptionMethod))
    {
        case "SHA1":
            HMACSHA1 hmacsha1 = new HMACSHA1();
            hmacsha1.Key = sharedKeyBytes;
            hashedMessage = hmacsha1.ComputeHash(messageBytes);
            b64SHA1Message = Convert.ToBase64String(hashedMessage);
            if (this.DEBUG) MessageBox.Show(Convert.ToString(hashedMessage));
            break;
        case "MD5":
            HMACMD5 hmacmd5 = new HMACMD5(sharedKeyBytes);
            hashedMessage = hmacmd5.ComputeHash(messageBytes);
            b64SHA1Message = Convert.ToBase64String(hashedMessage);
            if (this.DEBUG) MessageBox.Show(Convert.ToString(hashedMessage));
            break;
        default:
            b64SHA1Message = "Unknown Encryption Method";
            break;
    }

    MessageBox.Show(b64SHA1Message);
    return b64SHA1Message;
}
```

OAuth 2.0

Your instance supports Open Authorization (OAuth) 2.0.

Configure OAuth 2.0 settings for these scenarios:

- **OAuth external client scenario**: Your instance provides an endpoint for third-party clients to pull data from the instance.
- **OAuth provider scenario**: Your instance pulls data from a third-party provider.
Attention: Using OAuth to allow your users to authenticate to the instance is not currently supported.

Both the simple security and high security frameworks support OAuth 2.0. High Security is recommended. See High Security Settings on page 2437 for information about which versions have high security already active and how to activate high security. You must have the security_admin role to manage the OAuth integration.

**OAuth 2.0 concepts**

The following table describes the key concepts of the OAuth 2.0 implementation.

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource Owner</td>
<td>An entity capable of granting access to a protected resource. When the resource owner is a person, it is referred to as an end-user. The resource owner is always a user account.</td>
</tr>
<tr>
<td>Client</td>
<td>An application making protected resource requests on behalf of the resource owner and with its authorization.</td>
</tr>
<tr>
<td>Resource Server</td>
<td>The server hosting the protected resources, capable of accepting and responding to protected resource requests.</td>
</tr>
<tr>
<td>Authorization Server</td>
<td>The server issuing access tokens to the client after successfully authenticating the resource owner and obtaining authorization.</td>
</tr>
<tr>
<td>Authorization Request</td>
<td>The permission a client needs to access a protected resource. The authorization request is always an HTTP POST message containing the ID of the client acting on the resource owner's behalf and credentials authorizing the request.</td>
</tr>
<tr>
<td>Authorization Grant</td>
<td>A credential representing the resource owner's authorization to access a resource. The authorization grant is either a user's login credentials or a refresh token.</td>
</tr>
<tr>
<td>Access Token</td>
<td>A secure string that a client uses to access protected resources. An instance issues access tokens to clients that have a valid authorization grant. Each access token has a specific scope, lifespan, and other attributes. By default, an instance issues access tokens with a 30 minute lifespan in the scenario where the instance is the OAuth provider. For third-party tokens, 30 days.</td>
</tr>
<tr>
<td>Concept</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Refresh Token</td>
<td>A credential that a client uses to obtain new access tokens without requiring additional user authorization. An instance issues a refresh token to a client when it is first authorized to have an access token. By default, an instance issues refresh tokens with a 100 day lifespan in the scenario where the instance is the OAuth provider. For third-party tokens, 365 days.</td>
</tr>
</tbody>
</table>

**OAuth process**

In general, an instance uses the following workflow to authorize access to an OAuth-protected resource.

1. The client requests authorization from the resource owner through the authorization server and the resource owner's login credentials or an authorization code.
2. The authorization server provides the client with an authorization grant on behalf of the resource owner.
3. The client requests an access token from the authorization server using the authorization grant. If valid, the authorization server grants the client an access token and refresh token.
4. The client uses the access token to request the protected resource.
5. The resource server validates the access token.
6. If valid, the resource server grants the client access to the protected resource.

**OAuth grant type**

*Grant type* refers to

- **Authorization code**: the consumer sends an authorization code to get an access token. You can specify this by creating an *OAuth profile*. This is also referred to as OAuth code flow.
- **Resource owner password credentials**: the consumer of the resource already has the user credentials to get the access token. This is also referred to as password flow.
  
  The OAuth application supports both grant types.

**Storage of authentication credentials**

The OAuth client secret is stored as a *password2* type field, which is encrypted in Triple DES. User passwords, which are used to check incoming endpoint requests, are stored as a hash value in the User table in a *password* type field (SHA 256).

**OAuth enhancements**

Brief introduction to the topic that appears on overview pages and in link previews.
OAuth third-party provider application registries now use profiles and scopes:

- The OAuth profile specifies the grant type (authorization code flow or password flow) and the scope. See Specify an OAuth profile on page 1962 for more information.
- OAuth scopes specify the level of access to a restricted resource. Typically access is write or read. See Specify an OAuth scope on page 1964 for more information.

- The getToken method in GlideOAuthClient allows you to retrieve the access token, refresh token, and expiration date and time for the access token.
- OAuth supports the authorization code flow grant type, which you can specify in an OAuth profile. This feature allows a user to access a resource by authenticating directly with a third-party OAuth server that trusts the resource, instead of authenticating with username + password credentials.
- OAuth supports application scoping by providing access by providing access to all OAuth methods using the sn_auth prefix. See Scoped OAuth APIs on page 1968.
- A new method, requestTokenByRequest, is available for the GlideOAuthClient class.

Activate OAuth

By default, the OAuth plugin is active on new and upgraded instances. If it is not active on your instance, you can activate it.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Set up OAuth

Set up OAuth by registering applications to OAuth, enable the OAuth system property, and generate token requests.

Role required: admin

You must have the security_admin role to set up OAuth.

1. Activate the plugin.
2. Register the application to be authorized by OAuth. You can do this for:
   
   - External clients
   - Third-party OAuth providers
3. Set the OAuth property.
4. Configure applications to create an HTTP POST requesting an OAuth token. The application must also be able to parse the JSON response to use the provided access and refresh tokens.

Set the OAuth property

You must add a property to generate OAuth 2.0 tokens to registered applications.
Role required: admin

1. Type `sys_properties.list` in the application navigator filter.
2. Click New.
3. Fill out the form with the following settings:
   - **Name**: com.snc.platform.security.oauth.is.active
   - **Type**: true | false
   - **Default value**: false
4. Set the property to **true** to use OAuth 2.0.

*Create endpoint for external clients*

Each client application must register with the instance to participate in OAuth authorization.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the interceptor page, click Create an OAuth API endpoint for external clients.
4. Fill out the fields, as appropriate (see table).
5. Click **Submit**. The record is saved in the Application Registries [oauth_entity] table.
Table 469: Application registration field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name identifying the application you are requiring OAuth access for.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>[Read-Only] The automatically-generated unique ID of the application. The instance uses the client ID when requesting an access token.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>[Required] The shared secret string that both the instance and the application use to authorize communications with one another. The instance uses the client secret when requesting an access token. Leave this field blank to have the instance automatically generate a client secret.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>The URL containing an image to use as the application logo.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box for indicating that the instance can authorize access to the application. Only active applications can request access tokens.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>The number of seconds a refresh token is valid. The instance uses this lifespan value when requesting a refresh token. By default refresh tokens expire in 100 days (8640000 seconds).</td>
</tr>
<tr>
<td>Access Token Lifespan</td>
<td>The number of seconds an access token is valid. The instance uses this lifespan value when requesting an access token. By default access tokens expire in 30 minutes (1800 seconds).</td>
</tr>
<tr>
<td>Comments</td>
<td>Any additional information you want to associate with this application.</td>
</tr>
</tbody>
</table>

*Use a third-party OAuth provider*

Each client application must register with the instance to participate in OAuth authorization.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the interceptor page, click **Connect to a third party OAuth Provider**.
4. Fill out the fields, as appropriate (see table).
5. Click **Submit**. The record is saved in the Application Registries [oauth_entity] table.
OAuth provider details:
- Name: New Test
- Client ID: client076237
- Client Secret: Password
- OAuth MPI Social: Unconfigured
- Token URL: http://datatables.com
- Redirect URL: http://channel/users.service
- Refresh Token Lifespan: 0,040,300
- Accessible from: All application scopes

OAuth Entity Profiles:

Define the OAuth Provider Profile including name, Grant Type and OAuth Scope combinations. Click each profile entry to update the OAuth scopes. When a new OAuth provider is created, the system automatically generates a default profile for it without any scope.

OAuth Entity Profiles:

- Name: New Test
- Is default: No
- Grant type: None
- Authorization Code:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name identifying the application you are requiring OAuth access for.</td>
</tr>
<tr>
<td>Client ID</td>
<td>The unique ID of the application. The instance uses the client ID when requesting an access token.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>[Required] The shared secret string the instance and the application use to authorize communications with one another. The instance uses the client secret when requesting an access token. Enter a string.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>The script used to customize the request and response to the third-party OAuth provider. The script name must have the prefix <code>OAuth</code>.</td>
</tr>

<tr>
<td></td>
<td>• <strong>Authorization code</strong>: The code granted to the client to obtain an access token, which is then used to obtain access to the resource. You need an authorization URL if you select this option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource owner password credentials</strong>: The user name and password of the user trying to obtain access to the resource.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>The refresh token lifespan in seconds.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>The application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box for indicating that the instance can authorize access to the application. Only active applications can request access tokens.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>The URL of the endpoint to authorize the user if you are using the authorization code grant type.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The location of the token endpoint that the instance uses to retrieve and refresh tokens.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The application endpoint that receives the authorization code. Leave this field empty to have the instance automatically generate this URL.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token Revocation URL</td>
<td>The location of the endpoint that the instance uses to revoke the token.</td>
</tr>
<tr>
<td>Comments</td>
<td>Any additional information you want to associate with this application.</td>
</tr>
</tbody>
</table>

**Embedded lists**

- **OAuth Entity Profiles**
  - The profiles associated with the OAuth provider. The profile includes the grant type. Click the profile name to go to the OAuth Entity Profile form.

- **OAuth Entity Scopes**
  - The entity scopes associated with the OAuth provider. The scope identifies the services the application has access to. Click the scope name to go to the OAuth Entity Scope form.

---

After you create the third-party application registry, the system automatically generates a default profile using the specified grant type, but without any scopes. You can create additional profiles, each with scopes.

**OAuth support for authorization code flow**

OAuth 2.0 authorization code flow allows a user to access a resource by authenticating directly with a third-party OAuth server that trusts the resource, instead of authenticating with username/password credentials.

This implementation of OAuth authorization code flow allows a user to get access to a resource via REST. The authorization code framework automatically gets the access and refresh tokens through the authorized URL that the administrator configures, instead of requiring the user to enter a user name and password to get access to the resource.

**OAuth profiles and scopes**

In the OAuth provider scenario, profiles and scopes specify the grant type, authorization type, and the level of access.

In the OAuth provider scenario, the OAuth profile refers to a combination of a grant type and at least one scope. The scope specifies the access that the user has to the protected resource, such as read or write. You can create a profile for each third-party provider and obtain the specific set of scopes from the provider. See Specify an OAuth profile on page 1962 and Specify an OAuth scope on page 1964 for more information. The instance also uses OAuth profiles when a REST call specifies OAuth 2.0 authentication. A default profile is automatically created for each third-party provider record that you create. There can only be one default.

OAuth profiles and scopes are available with the Geneva release.

Specify these parameters, which are saved in the OAuth Requestor Profile [OAuth_requestor_profile] table:

**Table 471: OAuth parameters for default profile support**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oauth_requestor</td>
<td>The Sys ID of the object, which can be a user record or an email account.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oauth_requestor_context</td>
<td>A descriptor that provides context for the oauth requestor. As a good practice, use the name of the table where the <code>oauth_requestor</code> object is saved.</td>
</tr>
<tr>
<td>oauth_provider_profile</td>
<td>The Sys ID of the OAuth profile record that is the default.</td>
</tr>
</tbody>
</table>

When the user attempts to authenticate, the provider accesses the OAuth Requestor Profile table to look for the user. If the user is found, the authentication is successful. If not, the provider accesses the default profile to determine the grant type and how to proceed with the authentication.

Specify an OAuth profile
An OAuth profile includes the grant type that the third-party OAuth provider needs to obtain access to the restricted resource.

Role required: admin

1. Open a third-party OAuth provider record.
2. In the OAuth Entity Profiles embedded list, click **Insert a new row**.
3. Enter a name for the profile.
4. Right-click Application Registry form header and select **Save**.
   The profile record is created.
5. Click the name of the profile you created.
6. Fill in the form fields (see table).
### Table 472: OAuth Entity Profile form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>OAuth provider</td>
<td>Verify the provider associated with this profile.</td>
</tr>
<tr>
<td>Grant type</td>
<td>Select the grant type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Authorization code</strong>: The code granted to the client to obtain an access token, which is then used to obtain access to the resource. You need an authorization URL if you select this option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource owner password credentials</strong>: The user name and password of the user trying to obtain access to the resource.</td>
</tr>
</tbody>
</table>
7. Click **Update**.

Specify an OAuth scope

Specify the OAuth scopes that you get from the provider. Scopes can be any level of access specified by the provider, such as read, write, or any string, including a URL.

Role required: admin

1. Open a third-party OAuth provider record.
2. Open a profile associated with the provider.
3. In the OAuth Entity Profile Scopes embedded list, click **Insert a new row**.
4. Enter a name for the profile.
5. Right-click OAuth Entity Profile form header and select **Save**.
   The profile record is created.
6. Click the name of the scope you created.
7. Fill in the form fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is default</td>
<td>Select this option to make this profile the default option for the associated provider.</td>
</tr>
<tr>
<td>Embedded list</td>
<td>OAuth Entity Profile Scopes *Specify the OAuth entity scope.*</td>
</tr>
</tbody>
</table>

Table 473: OAuth Entity Scope form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>OAuth provider</td>
<td>Verify the provider associated with this scope.</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>The scope that you are granted by the provider. Typical scopes are read and write. Scopes can be any string that the provider specifies.</td>
</tr>
</tbody>
</table>
8. Click Update.

**OAuth tokens**
Instances offer an OAuth 2.0 token generation API for client applications to access instance data on behalf of a user account. The API accepts HTTP POST messages to the access token endpoint URL and returns a JSON response containing the access token.

**Access token request format**

You can use the OAuth 2.0 API to construct an access token request.

- **Endpoint URL**: `<instance-name>.service-now.com/oauth_token.do`
- **Request format**: All requests should formatted as a URL-encoded HTTP POST body.
- **Request parameters**: Most request parameters are required.
- **Response format**: JSON
- **Response parameters**: The response contains one or more OAuth tokens.

**OAuth parameters for default profile support**

The default profile feature require a set of parameters that you can use with the setParameter() API to specify the oauth requestor, a context for the request, and the provider profile.

In the OAuth provider scenario, you must set three parameters that tells the OAuth provider which OAuth profile to use by default. When these three parameters are set, the access token is saved in the instance database. Use these parameters with GlideOAuthClientRequest.

These parameters are available starting with the Geneva release.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oauth_requestor</td>
<td>The Sys ID of the object, which can be a user record or an email account.</td>
</tr>
<tr>
<td>oauth_requestor_context</td>
<td>A descriptor that provides context for the oauth requestor. As a good practice, use the name of the table where the oauth_requestor object is saved.</td>
</tr>
<tr>
<td>oauth_provider_profile</td>
<td>The Sys ID of the OAuth profile record that is the default.</td>
</tr>
</tbody>
</table>

You do not need to set the grant type and scope using parameters. These items are configured in the OAuth profile record. If you do not use these parameters, you can use the setScope and setGrantType methods. See the GlideOAuthClientRequest setScope method and setGrantType methods. Access the API on the developer portal at https://developer.servicenow.com.

**OAuth API request parameters**

Access token requests use the following request parameters.

See the ServiceNow Developers site for API information.
### Table 475: Access token request parameters

<table>
<thead>
<tr>
<th>Request parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **grant_type**    | [Required] The type of credentials authorizing the request for an access token. This parameter must have a value of either password or refresh_token:  
  - **password**: A set of user credentials authorize the access token request. Specify the user credentials in the username and password parameters.  
  - **refresh_token**: An existing refresh token authorizes the access token request. Specify the refresh token in the refresh_token parameter. |
| **client_id**     | [Required] The automatically-generated unique ID of the client application requesting the access token. |
| **client_secret** | [Required] The shared secret string the instance and the OAuth application use to authorize communications with one another. |
| **username**      | The user account name authorizing the access token request. This parameter is required for access token requests with a **grant_type** of password. |
| **password**      | The password for the user account authorizing the access token request. This parameter is required for access token requests with a **grant_type** of password. |
| **refresh_token** | The existing refresh token authorizing the access token request. This parameter is required for access token requests with a **grant_type** of refresh_token. |

**Requests Using User Credentials**

The instance requires clients to provide user login credentials when first authorizing the client or when authorizing the creation a new refresh token. This type of request always produces two tokens in the response:

- An access token
- A refresh token

The instance verifies that the user is active, not currently locked out, and has an interactive session. If any of these conditions are false, the instance does not produce an access token. Access requests made within the access token's expiration time always return the current access token.
Note: This type of authorization grant relies on TLS encryption to protect the user's credentials during transmission.

The following example illustrates requesting an access token with a set of user credentials. Spaces have been added to improve readability.

```
$ curl -d"grant_type=password&client_id=be3aeb583ace210011c15b24a43e25d8
&client_secret=client_password
&username=admin&password=admin"
https://instancename.service-now.com/oauth_token.do
```

Requests Using a Refresh Token

The instance can use an existing refresh token to create a new access token. This type of request only produces an access token in the response. The instance confirms that the refresh token has not expired before generating a new access token. Access requests made within the refresh token's expiration time always return the current refresh token. Transmitting refresh tokens is generally more secure than transmitting user credentials. The following example illustrates requesting an access token with an existing refresh token. Spaces have been added to improve readability.

```
$ curl -
-d"grant_type=refresh_token&client_id=be3aeb583ace210011c15b24a43e25d8
&client_secret=client_password
&refresh_token=w599voG89897rGVDmdp12WA681r9E5948c1CJTPi8g4HGC4NWaz62k6k1K0PMxHW4O84H8yOO3H
https://instancename.service-now.com/oauth_token.do
```

OAuth API response parameters

The OAuth 2.0 API produces a JSON response containing the following parameters as name:value pairs.

See the ServiceNow Developers site for API information.

Table 476: Access token response parameters

<table>
<thead>
<tr>
<th>Response parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scope</td>
<td>The amount of access granted by the access token. The scope is always useraccount, meaning that the access token has the same rights as the user account that authorized it. For example, if Abel Tuter authorizes an application by providing his login credentials, then the resulting access token grants the token bearer the same access privileges as Abel Tuter.</td>
</tr>
<tr>
<td>token_type</td>
<td>The type of token issued by the request as defined in the OAuth RFC. The token type is always Bearer, meaning that anyone in possession of the access token can access a protected resource without providing a cryptographic key. See RFC6750 for more information about how OAuth 2.0 uses bearer tokens.</td>
</tr>
<tr>
<td>expires_in</td>
<td>The lifespan of the access token in seconds.</td>
</tr>
<tr>
<td>Response parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>refresh_token</td>
<td>The string value of the refresh token.</td>
</tr>
<tr>
<td>access_token</td>
<td>The string value of the access token. Access requests made within the access token's expiration time always return the current access token.</td>
</tr>
<tr>
<td>format</td>
<td>[Optional] The output format of the response. This value is always JSON.</td>
</tr>
</tbody>
</table>

The following example illustrates the JSON string returned by an access token request. Spaces have been added to improve readability.

```
{"scope":"useraccount","token_type":"Bearer","expires_in":1800,
"refresh_token":"w599voG89897rGVDmdp12WA681r9E5948c1CJTPi8g4HGC4NWaz62k6k1K0FMxHW4c",
"access_token":"F0jh9korTyzd9kaZqZ0SzjKZuS3ut0i4P46Lc52m2JYHiLcquistFAumpyxshU9mMQ13g
```

**Revoke an OAuth token**

You might want to revoke an OAuth access or refresh token for security reasons.

Role required: admin

Revoking the token pertains to the situation where your instance acts as the OAuth resource server.

- Access your instance using `oauth_revoke_token.do` and append the access or refresh token.
  
  For example: `https://[Your_ServiceNow_Instance]:[port]/oauth_revoke_token.do?token=[access or refresh token]` without the brackets `[ ]`.

This endpoint access does not require authentication. The token in this request is marked as expired.

**OAuth client APIs**

The OAuth client API provides methods to request and revoke OAuth tokens.

All APIs are available on the developer portal. Go to [https://developer.servicenow.com](https://developer.servicenow.com) to access the APIs. Search for the following APIs:

- GlideOAuthClient: Use these methods for requesting and revoking the refresh and access tokens.
- GlideOAuthClientRequest: Use these methods for handling client requests.
- GlideOAuthClientResponse: Use these methods for handling client responses.
- GlideOAuthToken: Use the GlideOAuthToken methods for retrieving the access token and information about the access token.

You can also customize the OAuthUtil script include to intercept the request parameters and also parse the responses from external OAuth providers.

OAuth supports application scoping by providing access to all OAuth methods in the available OAuth classes using the `sn_auth` prefix. See [Scoped OAuth APIs](#) on page 1968.

**Scoped OAuth APIs**

OAuth supports application scoping by providing access to all OAuth methods in the available OAuth classes using the `sn_auth` prefix.

See the [ServiceNow Developers site](#) for API information.
For example, the following code accesses the requestToken:

```javascript
var oAuthClient = new sn_auth.GlideOAuthClient();
var tokenResponse = oAuthClient.requestTokenByRequest('TestClient', text);
```

You can still access the methods in the global scope by omitting the `sn_auth` prefix. However, methods that access tokens on locally scoped applications must use the prefix.

## Upgrades and conversions

The ServiceNow platform includes tools to help you during and after an upgrade, and also allows you to convert a ServiceNow Express instance to a ServiceNow Service Management enterprise platform.

### See also

**Upgrade to Geneva**

The upgrade process moves your instance to a new ServiceNow release version. Understand the difference between upgrading and patching, release definitions, rollback and backup options, and how to test your sub-production and production instance upgrades.

### Upgrade History module

The Upgrade History module tracks every upgrade that has been made to an instance. Administrators can use the module to resolve upgrade conflicts and optionally to revert customizations to base system versions to take advantage of new features.

An upgrade history record is created for each upgrade that is run. The *Disposition* field logs the action that was taken on each record during an upgrade. To view an upgrade history record, navigate to **System Diagnostics > Upgrade History** and click the upgrade.

### Table 477: Upgrade History record

</tbody>
</table>
Review Skipped Records form section

The Upgrade Details list displays each record that was skipped during the upgrade process. Use the list to review the reason for each skipped record in the list and then either merge your customization or revert your customization to the base system.

See Resolve a skipped update on page 1972 for instructions.

Upgrade Details related list

To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. To assist you in resolving skips, the Upgrade Details form is filtered by default to list all updates that were skipped during the upgrade process.

Navigate to System Diagnostics > Upgrade History to view the Upgrade Details related list.

Table 478: Upgrade Details list

<table>
<thead>
<tr>

</tbody>
</table>
Resolve a skipped update

To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. One of your responsibilities as the administrator is to resolve each skipped update after an upgrade.

Role required: admin

You resolve an update by either retaining the customization or (when the software upgrade contains a feature that you would like to implement) by merging or overwriting the customization with the base system update.

**Note:** Objects that are customized and that did not change in the base system since the last upgrade require no action on your part.

When an object is customized, the system adds a corresponding record to the Customer Updates [sys_update_xml] table and then maintains current version information for all customized objects. The upgrade process skips changes to objects that have a current version in the Customer Updates table. When you follow the procedure, you perform one of the following actions:

- Retain (keep) a customization with no changes
- Retain a customization by merging changes from the updated object
- Revert a customized object to the updated version (that is, overwrite the customization)
- Review the skip and perform no action on the object

1. Navigate to System Diagnostics > Upgrade History.
2. Select the desired software version.
3. In the Upgrade Details related list, select the update record to resolve.

**Note:** By default, the list is filtered by Disposition = Skipped and Resolution Status = Not Reviewed. The Priority value is color-coded with red for P1 and green for P5 priority.

4. Review the list of changes. For text fields, you can click in the field to open the Diff/Merge tool. The File differences field displays a side-by-side comparison of the customization and the update version. Deletions are highlighted red, additions green, and changes yellow. Review the differences. Click a text box to view and edit the detailed differences.

5. Perform one of the following actions. You have the option to add a Comment to any record, for example, to explain the action to future reviewers.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain the customization with no changes</td>
<td>After reviewing the changes, set Resolution Status to Reviewed and Retained.</td>
</tr>
<tr>
<td>Retain the customization by merging changes from the updated object</td>
<td>Review the differences. To merge a field, click the right-arrow button for the field. Click a text box to view and edit the detailed differences. When you have merged all appropriate fields, click Merge.</td>
</tr>
<tr>
<td></td>
<td>• The Disposition changes from Skipped to Merged.</td>
</tr>
<tr>
<td></td>
<td>• The Resolution Status changes to Reviewed and Merged.</td>
</tr>
</tbody>
</table>
Revert a customization

To prevent customizations from being overwritten by system upgrades, the upgrade process automatically skips changes to objects that have been customized. You may want to overwrite your customizations when a software upgrade contains a feature that you would like to implement.

Role required: admin

To identify customized objects, the system adds a corresponding record in the Customer Updates [sys_update_xml] table. The table maintains the current version information for all objects that have been customized. The upgrade process skips changes to objects that have entries in the table. The upgrade process does not skip objects if only excluded fields have changed.

1. Navigate to System Diagnostics > Upgrade History.
2. Select the desired software version.
3. Filter the Upgrade Details related list by Disposition is Skipped.
4. Optional: Add another filter condition for Changed is True to return only the objects that have changed since the last upgrade.
5. Select the update record to implement.
   The File differences field displays a side-by-side comparison of the customization and the default version. Deletions are highlighted in red, additions in green, and modifications in yellow.
6. Click Revert to base system to overwrite your customized object with the system default version.
   • The Disposition changes from Skipped to Reverted.
   • After you revert a customization, you can click Reapply Changes to reapply your customizations (undo the revert).
Upgrade Monitor

The Upgrade Monitor helps you upgrade an individual instance. You can monitor the progress of an upgrade and resolve conflicts between the upgrade and customizations.

Set up

- Upgrade Monitor overview on page 1974

Use

- Monitor an upgrade to an instance on page 1976
- Process the skipped records list on page 1984
- Resolve conflicts for an individual record on page 1986

Troubleshoot and get help

- Ask or answer questions in the Developer Community
- Search the HI knowledge base for known error articles
- Contact ServiceNow Support

Upgrade Monitor overview

The Upgrade Monitor helps you upgrade an individual instance. You can monitor the progress of an upgrade and resolve conflicts between the upgrade and customizations.

Set up for the Upgrade Monitor

In Geneva, the Upgrade Monitor is installed by default.

If you log in with the admin role while an upgrade is underway, the system automatically displays the Upgrade Progress screen. If no upgrade is in progress, you can navigate to System Diagnostics > Upgrade Monitor.

How the Upgrade Monitor fits into the upgrade process

The Upgrade Monitor concerns only part of the larger upgrade process:

1. Clone the production instance to a test instance and a sub-production instance.
2. Apply the upgrade to the sub-production instance.
3. On the upgraded sub-production instance, process the skipped list.
4. Test the sub-production instance to confirm that the instance still works and performs adequately. Compare to benchmark data from pre-upgrade production instance.
5. Apply the upgrade to the test instance. Import the update sets created on the sub-production instance when you processed the skipped list. Repeat the testing to make sure that the process is working.
6. Apply the upgrade to the production instance. Import the update sets created on the sub-production instance when you processed the skipped list. Test to confirm that the instance works and performs adequately.

Within this larger process, the Upgrade Monitor helps you upgrade individual instances:

- during the upgrade, it shows where in the process the system is
- after the upgrade, it reports what the upgrade did and for how long
- as you upgrade the first sub-production instance, it helps you resolve conflicts between customizations and changes that are part of the upgrade
• on sub-production instances, it provides information that can help you estimate how long the upgrade takes on the production instance.

Monitoring an individual instance as it upgrades

While the upgrade is in progress the Upgrade Progress screen on page 1976 shows what the upgrade process has done, what it is doing, and what remains to be done.

When the upgrade completes, the system displays the Upgrade Complete on page 1978. The Upgrade Summary Report provides information about conflicts between customizations versus the upgrade and provides a link to reconcile these conflicts. For information about understanding and resolving these conflicts, see Process the skipped records list on page 1984.

When you upgrade a sub-production instance, the Upgrade Summary Report can help you estimate how long the same upgrade takes on a production instance. For details about the elements on this report and how to use this information, see Upgrade Details form on page 1986.

Resolving conflicts

To prevent losing customizations, the system skips upgrading records you have customized and provides you with a list of these skipped records.

As you upgrade your first sub-production instance, go through the skipped record list (skipped list) and resolve these conflicts. The system records the changes you make during this process in update sets.

You do not need to reconcile the skipped list on any instances you later upgrade. Instead, you can apply the upgrade then import the update sets containing your changes.

For details on reconciling conflicts, see Process the skipped records list on page 1984.

Factors affecting upgrade duration

Various factors affect how long the system takes to perform an upgrade. The Upgrade Monitor can help you understand those factors and estimate how long the upgrade to your production instance takes.

Many factors can affect the duration of the upgrade process:
• The number of records in the database
• The number of customizations in the database
• The number of nodes in the instance
• The size of tables in the instance that require a schema-change in the instance.
• The number of fix scripts required and the size of the tables those fix scripts manipulate.

Upgrading a sub-production instance can help you estimate how long the upgrade takes on production, but differences between the instances can significantly affect the duration:
• When you cloned the production instance to the sub-production instance, you may have clone-excluded some tables. This reduces the size of the database and makes the sub-production instance upgrade faster than the production instance.
• The production instance may have more memory and processing power.
• The production instance may have more nodes than the sub-production instance.

After upgrading the first sub-production instance, examine the Upgrade Complete on page 1978 for data to help estimate the impact of these factors.
Monitor an upgrade to an instance

While the system is upgrading an instance, you can monitor its progress with the Upgrade Monitor. When the upgrade is done, you can view a summary of the results on the Upgrade Summary Report.

1. If necessary, navigate to System Diagnostics > Upgrade Monitor. When an upgrade is in progress, the Upgrade Progress page shows its status.
2. Monitor the progress of the upgrade. When the system finishes the upgrade, it displays the Upgrade Summary Report.

From the Upgrade Summary Report, resolve any conflicts that prevented the system from upgrading records.

*Upgrade Progress screen*

When an upgrade is underway, the Upgrade Progress screen displays progress bars and other information to help monitor the process.
**Table 479: Screen elements**

<table>
<thead>
<tr>
<th>Screen element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upgrade Progress</td>
<td>A progress bar depicting where the upgrade is in the overall process. The length of a section in the bar does not indicate the relative duration of that process.</td>
</tr>
<tr>
<td>Upgrade Progress: Upgrading Platform</td>
<td>The system is applying upgrades to elements that form the foundation of the platform.</td>
</tr>
<tr>
<td>Screen element</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Upgrade Progress: Updating Schema</td>
<td>The system is scanning the plugins to create a list of tables that require upgrading. This prevents the system from upgrading the same table multiple times.</td>
</tr>
<tr>
<td>Upgrade Progress: Loading Plugins</td>
<td>The system is loading both core and optional plugins. Some features require more than one plugin, so the number of plugins listed may not match the number of optional features installed.</td>
</tr>
<tr>
<td>Upgrade Progress: Completing</td>
<td>The system is upgrading components that need to be completed after the previous three stages are done.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> After the system finishes the Completing phase, it displays a separate screen showing Finalizing. The system tracks in update sets the changes made during the Upgrading Platform, Updating Schema, Loading Plugins, and Completing phases. It does not track changes made during Finalizing.</td>
</tr>
<tr>
<td>Details</td>
<td>Shows the current activity, a progress bar for the current activity, and the file currently being updated.</td>
</tr>
<tr>
<td>Nodes</td>
<td>The system represents the nodes to upgrade as colored squares. The color of a square shows the status of that node during this upgrade:</td>
</tr>
<tr>
<td>Started</td>
<td>Shows when the upgrade started and how long it has been running.</td>
</tr>
</tbody>
</table>

**Upgrade Complete**

The Upgrade Complete screen summarizes the actions taken, provides links to tools for resolving conflicts between customizations and the upgrade, and provides information to help estimate time for upgrades to other instances.
## Upgrade Complete

</tr>
<tr>
<td><code>usageanalytics_count</code></td>
</tr>
<tr>
<td><code>sys_user_session</code></td>
</tr>
</tbody>
</table>

Click here to review clone excluded tables

---

**Figure 533: Upgrade Summary Report: Schema Changes to Clone-excluded tables**

The Schema Changes to Clone-excluded Tables section shows a list of tables affected by the upgrade that were clone-excluded when you cloned the production instance to this instance. Because clone-excluded tables are empty, upgrading them takes less time than upgrading those same tables on the production instance. To estimate how much longer the production upgrade takes, note the size of the clone-excluded tables on the production instance.
## Top 10 Fix Scripts by Duration

[Click here to see all schema change durations]

Figure 535: Upgrade Summary Report: Top 10 Schema Changes by Duration
The Top 10 Schema Changes by Duration helps you understand which schema changes required the most time.

Process the skipped records list

If you customized a record affected by this upgrade, you must resolve the differences between the upgraded and customized versions of the record. This process is called processing the skipped record list or just processing the skipped list.

Role required: admin

1. If necessary, navigate to System Diagnostics > Upgrade Monitor.
   If the upgrade is still in progress, the system displays the Upgrade Progress screen. When the upgrade finishes, the system displays the Upgrade Summary Report.

2. After the system displays the Upgrade Summary Report, click the Click here link in the Skipped box.
   The system displays the System Upgrades form.

3. Navigate to Review Skipped Records section and – if necessary – scroll to the Upgrade Details related list (skipped list).

4. Click the row for the first record you want to reconcile.
   The system displays the Upgrade Details form for that record.

5. Evaluate how you want to resolve the conflict for this record and take the appropriate action:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leave on the skipped list for a later decision.</td>
<td>From the Resolution list, choose Not reviewed to defer the decision on how to handle this conflict. The record stays on the skipped list.</td>
</tr>
<tr>
<td>Leave on the skipped list for a later decision, but record that you have reviewed the record.</td>
<td>From the Resolution list, choose Reviewed. You can filter the list to show only Reviewed records and decide how to handle these records.</td>
</tr>
<tr>
<td>Compare the differences and manually resolve conflicts.</td>
<td>Click Resolve Conflicts to navigate to the Resolve Conflicts form on page 1988.</td>
</tr>
<tr>
<td>Leave the customized record as is and do not update it.</td>
<td>From the Resolution list, click Reviewed and Retained.</td>
</tr>
<tr>
<td>Discard the customization and update the record to match the base system for this upgrade</td>
<td>Click Revert to Base System.</td>
</tr>
</tbody>
</table>

Note: The system tracks changes to records in an update set so you can apply these changes to another instance later. However, the system does not migrate the upgrade details records from one instance to the next. These records apply to a specific upgrade of a specific instance. If you want to preserve the Comments, Resolutions, or other information from the skipped list, export it from this instance.

6. In the Comment field, write the reasons for making your decision and other information you want to document.

7. Click Update.

System Upgrades form

When an upgrade is complete, the System Upgrades form displays key statistics about the upgrade and a related list of skipped records (the skipped list).
Figure 536: System Upgrades form

Table 481: Fields

<table>
<thead>
<tr>
<th>Screen element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>The version of the instance before upgrading.</td>
</tr>
<tr>
<td>To</td>
<td>The version of the instance after upgrading.</td>
</tr>
<tr>
<td>Upgrade started</td>
<td>The time upgrade started.</td>
</tr>
<tr>
<td>Upgrade finished</td>
<td>The time the upgrade finished.</td>
</tr>
<tr>

<td>The number of customized records in the instance unchanged by the upgrade.</td>
</tr>
</tbody>
</table>
## Resolve conflicts for an individual record

Reconcile differences between your customized record and the changes associated with the upgrade.

**Role required:** admin

1. From the [Upgrade Details form](#) for the record you are reconciling, click **Resolve Conflicts**.
   
   The system displays the [Resolve Conflicts form](#), which highlights differences between the two versions of the record. The form displays information about the base system record on the left and the customized record on the right.

2. Compare the base system with the customized record for each field on this form. For non-script fields, edit the customized record on the right-hand side to include what you want from the base system and the customization.

3. If this record contains a script, check it for conflicts and resolve.
   
   a) Click inside the Script field.
      
      The system displays the Resolve Conflicts - Script form highlighting areas where the two versions of the script differ.

   b) Edit the right-hand side so that the script contains whichever content you want. To move a block of code from the left to right side, click the small arrows corresponding to that block in the middle column.

   c) Click **OK**.
      
      The system returns to the Resolve Conflicts form.

4. To save your changes to the record, click **Save Merge**.
   
   The system sets the Resolution for this record to **Reviewed and Merged**.

---

### Upgrade Details form

From the Upgrade Details form, you can review an individual record affected by the upgrade and reconcile conflicts between the upgrade and customizations.

Resolve Conflicts form
The Resolve Conflicts form you compare to the base system version with the customized version of a record and reconcile the differences.
Figure 538: Resolve Conflicts form

### Fields
The fields this form displays depend on the type of record you are reconciling.
The left column shows the records fields in the base system, including the proposed changes that are part of the upgrade. The right column shows the fields for your customized record.

### Express conversion to ServiceNow Enterprise
When a ServiceNow Express instance is converted to the ServiceNow Service Management enterprise platform, the instance is changed significantly.
The following topics help you understand what to expect during and after you convert from the ServiceNow Express platform to the ServiceNow Service Management enterprise platform. The topics provide advice and recommendations for advanced features and applications for you to consider.

It is recommended that you read the topics in the following order.

**Express conversion to Enterprise overview**

As you plan your upgrade from the ServiceNow Express platform to the ServiceNow Enterprise platform, become aware of the many features and resources that are available to you, both inside and outside of your instance.

Your upgraded instance will have significant new functionality that is part of the standard service management suite, including the following.

- **Graphical workflow**: Simplify complex service catalog requests with the highly configurable drag-and-drop workflow editor.
- **Scripting**: Extend your instance beyond standard configurations.
- **Content management**: create a custom interface for the ServiceNow platform and ServiceNow applications.

In addition to the standard service management suite, there are additional applications and suites that your organization can purchase, for example, financial and human resources applications, and the operation management suite. The ServiceNow Express platform did not offer these solutions, and it is recommended that you explore the resources available to learn about extending your ServiceNow Enterprise instance.

Where you may have been using the Express support site forums for help, a larger Enterprise community site is now available.

There are many resources available on the community site and on YouTube, but the ServiceNow Demo Center is the best resource to quickly learn about Enterprise platform functionality. The Demo Center offers on-demand videos and live presentations where you can ask questions via chat.

*Click here to access the Demo Center*. Enter email address you registered with ServiceNow as your username, and reset your password if you are attempting to access the Demo Center for the first time.

Recommended Demo Center videos for an organization that upgrades from the Express platform to the Enterprise platform include the following:

- **Skinning the self service portals via Content Management**
- **Asset management life cycle**
- **Creating automation via Workflows**

**Express conversion to Enterprise process**

The conversion process includes an opportunity for you to review and test the ServiceNow Enterprise platform with a copy of your data before your production instance is converted.

**Conversion process**

The conversion process follows this timeline

1. A sub-production instance is created from a cloned copy of your ServiceNow Express production instance. This sub-production instance is for the full Enterprise Service Management platform.
2. You receive a letter indicating that you are entering a 15-day testing phase. The purpose is to verify that your ITIL and self-service portal users continue to experience the behavior they are familiar with.
3. After you verify with the sub-production instance that the conversion completed and is acceptable, your designated Hi Administrator updates the change record advising ServiceNow support of your acceptance.

4. ServiceNow support schedules a full conversion of your Express production instance to ServiceNow Service Management. Your sub-production instance is paired to it, and is available for you to configure new features, validate them, and roll them out to production.

ESS and ITIL experience

After an Express instance is converted to the Service Management platform, users with ESS and ITIL roles experience the look, feel, and behavior they are familiar with. They can access the same sets of applications and modules, lists and forms, and they experience the same underlying behavior. All functions that were accessible to ESS and ITIL users in the Express instance look and behave the same way for all users after the conversion.

For example:

- The incident form looks and works exactly the same way as it did in the Express instance. The same is true for the Problem, Change Request, and Configuration Item forms.
- Approvals are requested the same way as in the Express instance, and the approval process is the same.
- Survey responses are generated as in the Express instance.

Administrator experience

The Service Management platform is significantly different for administrators, who have access to all of its features. It is recommended that administrators attend the ServiceNow System Administrator training.

Express conversion to Enterprise considerations

Consider four core areas of functionality when planning your upgrade from the ServiceNow Express platform to the ServiceNow Enterprise platform. In these areas, Enterprise platform capabilities are more configurable, powerful, and flexible than in the Express platform.

Approval rule to workflow

As part of your migration from the Express platform to the Enterprise platform, reconsider your approval rules.

- In the Express platform, approval rules are applied to a record based on conditions when the record is saved. Approval rules run only when requested, and always occur first for catalog requests.
- In the Enterprise platform, approvals are an activity that is generally defined within the graphical workflow. This provides enhanced flexibility as you can define approval loops, re-approvals, and approvals that are nested at the beginning or end of a workflow. Reminder tasks can be defined to remind approvers that they need to take action.
Service level agreement (SLA) engine

The Express SLA engine is also record-based. In the Enterprise platform, the SLA engine has additional features, such as the ability to schedule jobs to auto-calculate time passed or time remaining metrics. In addition, workflow can be used to configure additional SLA complexity.

Security

The Express platform uses simple security for create, read, update, delete (CRUD) access through the dictionary. The Enterprise platform uses contextual security for more robust access control, referred to as access control lists (ACLs) or access control rules. During the conversion, your CRUD settings are converted to ACLs. The conversion does not change any of your security access.

The Enterprise platform offers additional benefits in the area of security. Security-based plugins are available and provide column level encryption, edge encryption, or encryption for data at rest.

There are also a greater number of roles available in the Enterprise platform that provide more granular options for granting access to the appropriate users to take action. Going forward, you will manage security settings using ACLs. For more information, see Access control rules on page 2498 and Platform security on page 2435.

Development Instance

On the Enterprise platform, you can utilize a development instance in addition to your production instance. The development instance gives you a place to test and validate new Enterprise configurations. As you make changes to the development instance, you can use update sets to track and push the configurations to your production instance.

Scripting and other configuration options

As an administrator of a ServiceNow Enterprise instance, you have more configuration options available than in an Express instance. For example, there are additional field types on forms and an extensive list of dictionary options for fields or tables.

Administrators have access to core ServiceNow platform features such as scripted business rules, client scripts, UI actions, UI pages, UI macros, UI scripts, script includes, script actions, and so on. Administrators have access to all tables and dictionary entries, and can use scripting to accomplish any change in the instance. Examples of custom configurations include the following.

- You can use UI actions on page 734 to define custom buttons.
- You can use Client scripts on page 3900 to define client-side scripts to run calculations or change fields dynamically before the form is saved.

Revisit your Express process as regards workflow and configuration in the context of how the Enterprise platform works. Determine ways to optimize your process based on Enterprise platform flexibility.

Enterprise plugins

The ServiceNow Enterprise platform offers enhanced functionality via plugins, and new plugins become available with each new release. When you upgrade, most plugins are not enabled on your converted Enterprise instance. This is slightly different from the plugins activated by default on a new Enterprise instance.
After the conversion, the administrator can navigate to **System Definition > Plugins** and review the list of plugins that are available and active. The administrator can also choose which capabilities to **activate after the conversion**. The **List of Geneva plugins** on page 1234 lists the available plugins.

**List of plugins to consider activating after a conversion**

After the conversion is completed, review the plugins that are available and choose the capabilities to activate after. The plugins listed below are not activated on an Express to Enterprise platform conversion. Learn about the functionality these plugins provide and determine which ones to activate.

For a description of plugins not linked below, review the description in the **List of Geneva plugins** on page 1234.

1. Assessments (com.snc.assessment_core)
2. Asset Management (com.snc.asset_management)
3. Risk assessment: Best Practice - Change Risk Calculator (com.snc.bestpractice.change_risk)
4. Incident resolution and recovery: Best Practice - Incident Resolution Workflow (com.snc.bestpractice.incident)
5. Best Practice - ITIL KPI Reports (com.snc.bestpractice.itil_kpi)
6. Survey wizards: Best Practice - Task Survey Management (com.snc.bestpractice.task_survey)
7. Catalog Designer Common (com.glide.ui.ng.cc)
9. Change Management - Core (com.snc.change_management)
11. Contract Management (com.snc.contract_management)
12. Problem Management – Create knowledge: Create knowledge from problem (com.snc.problem_kb)
13. Data lookup and record matching support for Service Catalog (com.glide.data_lookup.catalog)
14. Depreciation (com.snc.depreciation) installed with Asset Management
15. Expense Line (com.snc.expense_line)
16. Create fixed assets (com.snc.fixed_asset)
17. High Security Settings (com.glide.high_security)
18. Planned Maintenance: Maintenance Schedules (com.snc.maintenance_schedules)
19. Model management (com.snc.model)
20. My Assets (com.snc.asset_myassets)
21. Organization Management (com.snc.organization_management)
22. Performance Analytics concepts (com.snc.pa)
23. Problem Tasks (com.snc.problem_task)
25. Role Delegation (com.snc.role_delegation)
27. Service Creator (com.glide.service_creator)
28. Service Level Management (com.snc.sla)
29. Software Asset Management Extensions (com.snc.sam)
30. Survey designer (com.glide.survey_designer)
31. System user guide (com.glide.user_guide)

Additional ServiceNow features and applications

There are a large number of additional ServiceNow applications available for purchase after your conversion from the Express platform is complete.

The following list include some examples of these applications. Contact your sales representative for more information.

• Service Mapping
• Password Reset
• Automated Software or Configuration Deployment
• Automated External Script Execution
• Event Management
• Security and Vulnerability Management
• Cloud management
• Advanced reporting through performance analytics
• HR Service Management
• Project and Portfolio Management

Important features in the base system

Review the features listed below for an understanding of more ways to extend platform functionality.

• Update sets
• Service level agreements
• Workflow
• Project Management
• SDLC scrum process
• Import sets
• Transform maps on page 1528
• LDAP
• Content Management System on page 2040

Additional resources

A number of additional resources are available to learn more about the Enterprise platform. As mentioned, the Enterprise community is similar to Express forums, and it provides help and support to answer all of your questions. The community includes regional user conferences that are referred to as SNUGS (ServiceNow User Groups). Joining a SNUG is a great way to network and learn from other businesses that use the ServiceNow Enterprise platform.

Since the Enterprise platform comes with functionality to download and install update sets of external configurations, it is popular for users to share applications and configurations they have built via the Share portal.

Since the Enterprise platform has a large number of additional integration points, more pre-built content is available in the ServiceNow App Store. Certified partners are members of our large technology partner
community, and through the App Store they offer popular applications and integrations to help you integrate with your 3rd party systems. The App Store is an excellent resource for acquiring additional functionality outside of ServiceNow applications and suites.

Platform performance

The perceived performance of your ServiceNow instance is made up of certain components. Troubleshooting performance by monitoring and diagnosing the following components helps to ensure system optimization.

- Application server response: Time for the application server to process a request and render the resultant page.
- Network latency and throughput: Time for the network to pass your request to the server and to pass the response back.
- Browser rendering and parsing: Time for your browser to render the HTML and parse/execute Javascript.
- Instance cache: The amount of system resources available for processing.

Instance cache effects on performance

There is a performance degradation whenever you purge and rebuild the instance cache. During core business hours, avoid or minimize any of the following actions that cause a purge and rebuild of the instance cache.

- Adding or updating system properties
- Adding or updating dictionary entries
- Committing update sets
- Adding or updating translations

Transaction log response times

The instance automatically logs the vital statistics of every transaction it processes, and that information is available to you as an administrator.

To look at the log, navigate to System Logs > Transactions.

To see the average response time of all listed transactions, right-click the column Response time. Select Configure > List Calculations, and then select the Average value check box.

It is a good practice to limit the list to those transactions that took place during the time period of interest. The default filter returns transactions from today.
Figure 539: Transaction log

For each completed transaction, the following information is available (times are in milliseconds):

- Date/time, User ID, IP address, and URL of the transaction.
- Total response time, which does not include the browser time because the server does not have that information.
- **Network time**: network transmission time, both from and to the user.
- **SQL time**: time spent executing SQL commands.
- **SQL count**: number of SQL commands executed.
- **Business rule time**: time spent processing business rules.
- **Business rule count**: number of business rules executed.
- **Output length**: how many bytes the transaction returned, after any compression.

Response time on forms

A response time indicator (clock) appears at the bottom right of many forms and lists.

This indicator provides the processing time for a completed transaction, including the total time and the time for each step. Click the icon to show and hide the response time details. Point to the icon to see a tooltip with the details. The following example shows the response time for retrieving a filtered list in a demo instance.

![Response time](image)

**Response time(ms): 1019, network: 3, server: 526, browser: 490**

Figure 540: Response time

In this example, the transaction took the following amount of processing time:

- 1019 milliseconds total time
- 3 milliseconds moving data across the network
• 526 milliseconds on the server
• 490 milliseconds in the browser, rendering the HTML and parsing and executing JavaScript

Response does not appear for simple operations, such as paging, changing a list sort order, or for the first transaction in a session.

To view a detailed breakdown of the browser processing time on forms, click browser.

![Figure 541: Browser response time details](image)

Administrators can disable the response time by setting the glide.ui.response_time property to false.

When you review response times, look for the following issues.

1. A period where all transactions took an unusually long time. For example, transactions that normally took 1 second took 15 seconds between 11:00 AM and 11:20 AM. This issue can indicate that an unusual load, such as a large report, ran on that app server during that time.

2. A specific transaction which repeatedly took an unusually long time. For example, the list of closed incidents sorted by short description took 30 seconds each time it was displayed. This issue can indicate that a particular transaction put an unusual database load on the system, such as sorting 500,000 records on an unindexed field.

Try the following actions to improve performance.

1. Look for one or more transactions that span the entire window. For example, you observe that the response was slow for six minutes and one transaction ran the entire time. You can try adding additional indexing to the database to make the transaction faster. Certain types of queries are always going to run more slowly than others, regardless of indexing.

2. Ensure that a cache flush is not being run during business hours. Cache flushes are intended to prevent older data from interfering with changes and updates, and are performed automatically when using update sets. Scheduled cache flushes, using cache.do, can affect overall performance, and degrade system response times. Do not run cache flushes during business hours, and do not trigger cache flushes automatically.

3. If you cannot find any specific issues when experiencing slow response time, contact support to see if there are global issues with the application server hardware.

**Client transaction timings**

The Client Transaction Timings plugin provides extra information about the amount of time spent on both the client and server side, and by the browser and network. This feature not only helps find long-running processes, but also provides information about where in the process the performance issue is caused.
Network response times

Troubleshooting a poor network response time can be difficult, but there are certain quick tests you can perform.

One clear indicator of a network issue is when you find that users in one location have good performance, and users in another location have poor performance. That tells you that the server and application are fine. Assuming that browser settings are identical, the only meaningful difference is the network.

Ping times

The coarsest measure of network response time is a ping. A ping measures the total time for a packet to make it from the source machine to the target and back again.

To perform a ping in Windows, bring up a command window (DOS prompt) and type:

```
ping -t <yourinstancename>.service-now.com
```

Look for a time under 100 ms if you are in the U.S., or 150 ms if you are in Europe or Asia. In practice, anything less than 250 ms is not of concern as it is not generally a major component in your perceived response time.

Traceroute

If you are seeing slow ping times, you can run a traceroute. Some networks refuse to forward ICMP, and your traceroute request may not work. If it does work, it is a great tool for identifying network bottlenecks.

To run a traceroute on Windows, bring up a command window and run the following command:

```
tracert <yourinstancename>.service-now.com
```
Sample output:

```
C:\dev\mysql5\bin>tracert mycompany.service-now.com
Tracing route to mycompany.service-now.com [70.87.98.130]
over a maximum of 30 hops:
1     1 ms     1 ms     1 ms  12.192.116.193
2     4 ms     4 ms     4 ms  12.116.227.37
3    32 ms    32 ms    32 ms  gbr1-p90.sd2ca.ip.att.net [12.123.145.178]
4    33 ms    33 ms    33 ms  tbr1-p013503.phmaz.ip.att.net [12.122.2.142]
5    34 ms    34 ms    34 ms  tbr2-cl1521.phmaz.ip.att.net [12.122.10.194]
6    32 ms    32 ms    32 ms  tbr2-cl1592.dlstx.ip.att.net [12.122.10.81]
7    31 ms    50 ms    31 ms  gar1-p370.dllrtx.ip.att.net [12.123.16.173]
8    31 ms    31 ms    31 ms  12.119.136.14
9    31 ms    31 ms    31 ms  te9-1.dsr02.dllstx3.theplanet.com
[70.87.253.22]
10    37 ms    37 ms    37 ms  vl41.dsr01.dllstx4.theplanet.com
[70.85.127.83]
11    31 ms    37 ms    31 ms  gil-0-1.car16.dllstx4.theplanet.com
[67.18.116.67]
12    32 ms    32 ms    32 ms  70.87.98.130
Trace complete.
```

Each line in the traceroute represents a network step between the source machine and the destination machine. In the sample traceroute, there were a total of 12 steps required to get the network traffic from the laptop to <yourinstancename>.service-now.com.

- The left column is the step number.
- The next three columns are latency estimates, performed three times to give an average.
- The last column is the machine you are hopping to.

For example, from rows #1 and #2 above, you can tell:

```
1     1 ms     1 ms     1 ms  12.192.116.193
2     4 ms     4 ms     4 ms  12.116.227.37
```

At the end of row 1, it was at 12.192.116.193. It then took 4 ms (on average) to get to 12.116.227.37.

Generally, with a traceroute, you are looking for individual steps that take a long time, like 500 ms for a particular hop. You are also looking for steps that show an asterisk (*) instead of a step time, for example:

```
1     100 ms   *        500ms  12.192.116.193
```

The asterisk indicates that a particular packet failed to arrive, which can indicate network problems on that particular hop. You also see an asterisk if that particular router is set to not forward ICMP. This outcome is potentially a false alarm if all three latency times for a step are asterisks.

**Browser settings and performance**

Depending on the browser you use, browser settings can affect the performance of your instance.

**Compression**

Web pages in your instance can be large, for example, over 500 kb for a long list of incidents with many columns. To speed performance, most browsers can accept compressed data from an application server so that the full 500 kb does not have to be sent over the wire. Instead, the browser indicates that it can accept compressed data if the server can send it. The app server then compresses the response, which transforms the 500 kb data to about 20 kb.
Compression is enabled by default on all ServiceNow application servers. The application server always sends compressed data if your browser accepts it. There are browser settings that control whether your browser accepts compressed responses.

In Microsoft Internet Explorer (IE), navigate to Tools > Internet Options. Ensure that the following two check boxes are selected in the Advanced tab.

- Use HTTP 1.1
- Use HTTP 1.1 through a proxy server

![Internet Options](image)

**Figure 542: Internet options**

Frequently, a proxy or edge device in the environment disables gzip compression. Enabling gzip compression also speeds up the interactions.

**Cache items from https locations**

If you enforce an IE policy to never cache items from an https location, every interaction must refetch a large amount of JavaScript and images from the server, which affects performance. The IE option is **Do not save encrypted pages to disk**, and the default is off.

**Database performance tuning tools**

To aid in performance evaluation, the Stats Tools diagnostics plugin records statistics for system activities that affect performance. System activities include execution of queries, scripts, and transactions.

**Note:** The Stats Tools plugin is activated by default. It requires the admin role to activate or upgrade, and it requires the com.glide.monitor.round_robin_database.

Stats Tools adds modules under **System Diagnostics > Stats**, including **Slow Queries**, **Slow Scripts**, and **Slow Transactions**. Each module accesses a table of activity patterns [sys_query_pattern], [sys_script_pattern], [sys_transaction_pattern]. Each pattern table represents a collection of unique activities. Each collection is an aggregation of executions of that unique activity over all time. Each record provides basic timing analysis with example identifiable details of the activity.

Activity patterns are immediately recorded to a cache and are later persisted to their pattern table. If you flush server caches, then recorded activities that have not been persisted are cleared.

Following are examples of pattern records.

- Each time a query is executed that meets the recording and persistence threshold it is aggregated and stored as a query pattern record.
- Each time a particular business rule is executed it aggregates to a script pattern record.
• Each time a particular background job runs it aggregates into a unique transaction pattern record.
• Each click of the **New** button on the Incidents list counts as a list type transaction pattern with specific form action.

**Metrics**

Metrics include total and average times of interest per unique execution pattern over the total execution count. Metrics are aggregated with each new instance of the unique activity and persisted to the pattern record.

**Metadata**

Example data from specific executions are included on each pattern to identify execution details.

**Characterizations of each activity type**

| Transactions | Any transaction type includes server-side and related client-side transactions. Metrics include **Total server load time**, which aggregates the total server-side time excluding semaphore and session wait times. It also aggregates relevant server transaction times that are found on the syslog_transaction table. Transaction types:
|              | • An HTTP Request transaction is identified by a URL, transaction type, processor, form/list action, URL query (filters), and related table name.
|              | • Any other transaction is identified by its transaction URL/page/name, transaction type, and processor or thread name. |
| Scripts      | Any script activity type includes scripts evaluated by GlideScopedEvaluator. Script Types:
|              | • A Jelly Script is identified by the sys_jelly_file table, jelly file path, line number, and script that was executed.
|              | • Any other script is identified by the table and sys_id. |
| Queries      | Any query activity includes prepared statements executed by GlideDBI Query Types:
|              | • All queries are identified by MongoDB query or insert, update, or select statements. They |
Use a slow query log

Administrators can use slow query logs to gain insight into how queries are affecting platform performance. The Slow Queries log aggregates data for similar queries. Use slow query data to evaluate the need for new indexes, changes to existing indexes, or changes to frequent queries.

Role required: admin

Queries are similar when they select from the same table and query the same field in the where clause, but search for different values in the field. For example, these queries are aggregated as similar queries.

```
SELECT * FROM sys_user WHERE name="ITIL User"
SELECT * FROM sys_user WHERE name="System Administrator"
```

Aggregating similar query data allows administrators to monitor the performance impact of slow queries and of queries that occur frequently. The log reports data for similar queries where the total execution time exceeds 5 seconds.

1. Navigate to System Diagnostics > Stats > Slow Queries

2. Open a query record for more details.
Table 483: Query record fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>An SQL statement for an individual query, before being canonicalized to aggregate it with similar queries.</td>
</tr>
<tr>
<td>Example stack trace</td>
<td>A stack trace for an individual query. Lines referencing script code (includes both custom and base system code) appear in the following format:</td>
</tr>
<tr>
<td></td>
<td><code>table name.sys_id:line number</code></td>
</tr>
<tr>
<td></td>
<td>For example, this stack trace indicates a function call from line 119 of a script include.</td>
</tr>
<tr>
<td></td>
<td><code>sys_script_include.105f70abc0a8010300d4d79ed1b93eb0:119</code></td>
</tr>
<tr>
<td></td>
<td>For more information, see stack traces.</td>
</tr>
<tr>
<td>Example URL</td>
<td>The URL for an individual query, depending on how the query was called.</td>
</tr>
<tr>
<td></td>
<td>• User transactions: lists the transaction parameters. For example, if a user navigates to the incident list, the URL is <code>/incident_list.do</code></td>
</tr>
<tr>
<td></td>
<td><code>sysparm_query=active=true</code></td>
</tr>
<tr>
<td></td>
<td>• Scheduled jobs: lists the name of the scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• Any other method: lists an empty field.</td>
</tr>
<tr>
<td>First sighting</td>
<td>The first occurrence of a similar query.</td>
</tr>
<tr>
<td>Execution Count</td>
<td>The number of similar query occurrences that are aggregated.</td>
</tr>
<tr>
<td>Total execution time</td>
<td>The sum of execution time for these similar queries.</td>
</tr>
<tr>
<td>Average execution time (ms)</td>
<td>The average duration to execute one of these similar queries.</td>
</tr>
</tbody>
</table>

3. To see what the database is doing to retrieve the data, click Explain Plan. The query plan is reported in the MySQL Explain Plan related list. Use the query plan to evaluate the need for new indexes or changes to existing indexes. For more information, see MySQL explain plan documentation.

This feature works on other supported databases, including MongoDB and Oracle.

Transaction cancellation

A user can cancel a transaction that takes longer than expected to load.
Causes of slow-loading transactions include the following scenarios.

- Sorting a large number of records by an unindexed string field.
- Grouping a large table on a field that has predominantly distinct values.
- Exporting all rows from a large table.
- Testing a poorly scripted business rule that has an infinite JavaScript loop.

**Note:** You cannot cancel an import with these controls.

### Transaction cancel timer

During a long-running transaction, a timer and a red cancellation button appear in the banner frame.

![Figure 543: Cancel request](image)  
To cancel the transaction, click the cancellation button. The timer indicates that the transaction is being canceled. When it is finished, you see a message that the transaction was canceled.

If the transaction completes successfully, the timer indicates how long it took for the transaction to complete.

![Figure 544: Transaction completed](image)

### Canceled transaction logs

Canceled transactions appear in the transaction log with **CANCELLED** appended to the URL. Transactions canceled by a user are logged differently from transactions canceled by [Transaction quotas](#) on page 2032.

### Cancel transaction properties

Administrators can configure the behavior of the transaction cancel capability using the following properties.
Geneva  ServiceNow  ServiceNow Platform

<table>
<thead>
<tr>
<th>Property</th>
<th>Definition</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.request_manager.active</td>
<td>Let users cancel long running transactions (enabled by default).</td>
<td>Open the sys_properties table.</td>
</tr>
<tr>
<td>glide.ui.transaction.long_response</td>
<td>Delay in seconds before the cancel transaction button appears for a long-running transaction.</td>
<td>Navigate to System Properties &gt; UI Properties</td>
</tr>
</tbody>
</table>

**View and kill active transactions**

Administrators can view active transactions and kill long-running transactions if necessary from the Active Transactions module.

Role required: admin

This action is intended to stop background processes, such as scheduled jobs, and not user-initiated transactions.

1. If **high security** is enabled, elevate privileges to security_admin.
2. Navigate to **User Administration > Active Transactions**.

3. Select the transaction you want to stop.
4. Perform one of the following actions.
   - Right-click the record and select **Kill**.
   - Select the check box beside the record and select **Kill** from the **Actions on selected rows** choice list at the bottom of the list.

**Import set performance**

An algorithm is used to transform import sets from their staging table into their final destination.

Importing data via an import set requires the following two phases.

1. The data is loaded from a data source into a staging table.
2. The data is transformed from the staging table into a target table.

The transform algorithm operates in blocks of 100 records at a time. This approach allows the application server to pre-fetch a variety of information relevant to each block of records. This action reduces the number of unique interactions with the database and improves throughput.
Performance is improved for all large transformations are using this algorithm. It also improves transformations with many reference or choice type columns. Transformations that with complex or unkeyed coalesce conditions experience a proportionately smaller benefit from the algorithm.

**Thread performance monitoring**

Performance of individual threads is tracked by the instance. Administrators can view thread performance information.

Thread performance can be monitored in two places as described in the following sections.

**Transaction log**

The amount of time a thread waits for an available semaphore or session synchronization is included in the **Response Time** field in the transaction log. To view the transaction log, navigate to **System Logs > Transactions**.

**Performance graph**

Every second, the system looks at all active threads (both UI and background) and places them into one of the following categories.

- **database**: waiting for information from the database.
- **network**: writing data out to the network or waiting for an outbound network buffer to flush.
- **business_rule**: the system is running a business rule (synchronous or asynchronous) and is not currently executing a query (which would be database).
- **concurrency**: cannot run because they are waiting on a semaphore or session synchronization.
- **cpu**: the thread is active, but is not executing any of the steps. This condition typically means non-business rule compute time, although a few other internal wait states are categorized as CPU in this case. Therefore a 1:1 correlation between threads in a CPU count and hardware CPU utilization is not expected.

Every minute, the system averages these transactions and records them in the database. These averages are displayed in the **System Overview** chart.

![System Overview chart of active threads](image)

**Figure 545: System Overview chart of active threads**

The **System Overview** chart can be added to any homepage. For more information, see **Add existing gauges to a homepage** on page 478.
Performance metrics

You can view a wide range of performance metrics for your instance and for the machine on which your instance is running. The information is displayed in a graphical format.

Add performance metric graphs and their controls to your homepage to monitor the performance of your instances. Some of these graphs are intended for use by ServiceNow Technical Support to troubleshoot performance issues or help you tune your system for maximum efficiency. Each graph enables you to filter the data by using different measurements, such as maximum and minimum values, means, and medians. The available graphs reflect performance in eight functional areas.

The administrator or any user who can modify a homepage can add performance metric graphs to a homepage. For more information, see Add existing gauges to a homepage on page 478 and Homepage customization on page 489.

Replication metrics

Replication is the process whereby an entire instance is replicated on a second machine for failover protection. The Replication Throughput graph measures the difference in the data (delta) between the production instance and the replicated instance as user activity changes the database. ServiceNow Technical Support uses this information to monitor the progress of replicating a customer instance.

Database graphs

Database graphs display metrics for various database operations, for example, insertions and deletions. They also display a current count of database connections for the selected ServiceNow instance.

To view the details of a database, select an instance from the CI list, and then select a database operation to view. Available database operations are listed above the graph. All the traffic listed here is specific to your cluster node/instance. If you are looking at the database graph for your discovery node, it does not include traffic for your UI node or vice versa. If you, like most customers, are running on a single node, the graph shows everything.
Figure 546: Performance metrics database graphs

- **Database Throughput**: Displays the count (per minute) for each type of database operation (inserts, deletes, and so on) over time.
- **Database Response**: Displays the response time (in milliseconds) for each type of database operation.
- **DB Connection Use**: Shows how many connections this instance has open to the database. Select to display as a maximum, a minimum, or a mean.
Check boxes above each graph allow you to control the display of available data.

![Deletes](✓) [Inserts](✓) [Selects](✓) [Updates](✓)

**Figure 547: Available metrics**

Clear a check box to remove the input from the graph.

**Discovery performance metrics**

Discovery metrics measure the performance of the probes and sensors in your instance as they collect information about CIs in the network.

**Note:** Functionality described here requires the Discovery plugin.

The available measurements to apply are **count**, **maximum**, **mean**, **median**, and **minimum**. All times in these graphs are measured in milliseconds.
Figure 548: Discovery performance metrics graphs
• **Discovery Probe Run Time**: Elapsed time, in milliseconds, that probes take to run. Use this chart to check the performance of your MID Server. Slow run times can indicate a resource problem on the MID Server machine.

• **Discovery Sensor Queue Time**: Indicates how long a sensor task sits in the scheduler queue on the instance before it runs.

• **Discovery Sensor Run Time**: Measures how long a sensor task takes to run after it is started.

### Disk partition statistics

Disk partitions let you view the input and output statistics for partitions on the server that hosts your ServiceNow instance.

The available measurements are the read and write requests per minute and the number of bytes read and written per minute.

Set: **Disk Partitions**

![](image)

**Figure 549: Disk partition performance metrics**

You can display the statistics for each partition or the cumulative totals for all partitions. To view cumulative I/O for the entire disk, select the first item in the CI choice list. Select one of the individual partitions from the list to view the statistics for that partition alone.
Figure 550: List of disk partitions

Four of the disk partitions that appear in the list are generated as business services and are used to populate the performance graphs with data. If they are deleted, the instance automatically regenerates them. They appear in the list of business services.

Linux statistics

The Linux Stats graph displays performance data for the server on which your ServiceNow instance is running.

These graphs are used as a tool to locate and resolve issues with your instance.

- **CPU Usage**: The measurement of this graph indicates the percentage of the available CPUs that are running on this machine. This aggregated data indicates what portion of the machine's resources are being used at any given time. The most useful metric on this chart is the IOWait time measurement, which can indicate performance issues.
- **Load**: The load on the Linux machine indicates the average sum of the number of processes waiting. It includes those processes executing over increments of 1 minute, 5 minutes, and 15 minutes.

Figure 552: Linux Stats performance metrics
CPU usage metrics:

The following selections are available for CPU metrics.

- **Idle**: No threads are running. This statistic indicates the percentage of the machine’s CPUs that are idle.
- **IOWait**: Indicates how long the CPU spends in a waiting state for disk or network I/O.
- **Nice**: View threads with a modified (lower) scheduling priority that configures them to be run when time permits.
- **System**: Displays the percentage of a single CPU that is being used to run system threads.
- **User**: Displays threads initiated by the application (the instance and the database).

Log activity performance graphs

The charts of logging activity display the mean error log count and the mean number of logs created per minute within the configured time period.

The error logging rate is the most important metric in this group.

![Graphs of error and log activity](image.png)

Figure 553: Logging performance metrics
MySQL overview graphs

The graphs in the MySQL Overview page are an aggregate view of all traffic going to your database server.

These graphs are distinct from the charts under the Database section, which monitor only queries originating at your particular application instance.
• **mySQL Statements**: Displays all the database activity - deletes, inserts, selects, and updates.
• **mySQL Threads**: Measures the number of connections to the database and how many active threads are running on the database.
• **mySQL Statement - writes**: Displays only the database write actions, including deletes, inserts, and updates. The select action represents a large portion of the activity, and removing this view makes it easier to analyze the write actions.
• **mySQL Table Locks waited**: Displays the number of table locks per second over the configured time period. This metric is important to monitor. The more table locks that exist, the lower the performance.

Node performance metrics

Node Metrics displays a set of baseline performance and throughput metrics for a particular application instance and/or cluster node.

Most customers are not running in a clustered configuration, but you still have node data because the system treats those instances as a cluster with only one node.

Customers who have multiple cluster nodes are able to view different metrics for each node on their cluster by changing the CI in the graph control.
Figure 555: Node performance metrics

- **Response Time**
  - Graph showing response time (ms) over time.
  - Metrics include Max, Median, and Min.

- **Events Logged**
  - Graph showing events per minute over time.
  - Metric: logs_mean.

- **Events Processed**
  - Graph showing events processed per minute over time.
  - Metric: processed_mean.

- **Transactions**
  - Graph showing transactions per minute over time.
  - Metric: Count.
• **Response Time**: Displays in milliseconds the maximum, median, and minimum response time for database queries by the selected node.

• **Events Logged**: Shows the mean number of the events queued and added to the event log in the selected time period.

• **Events Processed**: Shows the mean number of the events processed during the selected time period.

• **Transactions**: Displays the total number of database transactions per minute by the selected node.

• **Semaphore Use**: Shows the number of semaphores in use by the selected node. Semaphores control the number of user transactions that can be run in parallel. The platform manages semaphores, and they require no customer administration. The semaphore graph is used only by ServiceNow Technical Support for troubleshooting.

• **DB Connection Use**: View the maximum, median, and minimum number of database connections in use by the selected node.

**ServiceNow servlet performance metrics**

Each ServiceNow instance has a servlet, and you can monitor its performance.
Figure 5: Servlet performance metrics

- **Sessions**
  - Bosdemo01.service-now.com:demosw_16245 - 2 hours
  - Active Sessions

- **Transactions**
  - Bosdemo01.service-now.com:demosw_16245 - 2 hours
  - Count

- **Response Time**
  - Bosdemo01.service-now.com:demosw_16245 - 2 hours
  - Max, Median, Min

- **Java Memory**
  - Bosdemo01.service-now.com:demosw_16245 - 2 hours
  - In Use, Max, Total
• **Sessions**: The session data graph can display existing sessions, including those sessions initiated by the MID Server and external integrations.

• **Session Wait Queue**: Displays the number of transactions that are waiting on another transaction to finish because they share the HTTP session. Waiting sessions occur when a user submits a duplicate request before the prior request completes. Items on this list are suitable candidates for creating a transaction quota or for adding to the cancellation white list.

• **Transactions**: Displays all transactions initiated by users, the MID Server, and external integrations.

• **Response Time**: Displays the interval (in milliseconds) between the time the instance receives a transaction and the time the instance responds.

• **Java Memory**: Records memory usage and indicates when the instance is running out of memory. The Java Memory graph is a useful problem indicator.

• **CPU Usage**: Shows aggregated CPU usage for all the instances on the machine. This information is used by ServiceNow Technical Support to troubleshoot performance issues.

• **Scheduler**: Displays all scheduler activity for the selected instance, including Discovery probes. You can determine the backlog of scheduled jobs in the queue for a particular time period. You can then compare that against the rate at which the jobs are being processed during the same period.

### System diagnostics

Administrators can use the System Diagnostics page to look for root causes of platform performance issues.

This page provides an overview of useful diagnostic information about a running instance and cluster nodes.

Navigate to **System Diagnostics > Diagnostics Page**.

Cluster Nodes

If you're running a multiple-node cluster, it's useful to know the status of each of the nodes. The nodes check in every 30 seconds and display their current status in the [sys_cluster_state] table. Navigate to System Cluster > Node States.

Memory

The Cluster Node Status shows used and total memory for each node. Memory use fluctuates, and it is not uncommon for it to go up to beyond 95% usage before memory garbage collection reduces it back to normal levels.

Transactions

If you're looking for information about what a user was doing at a particular time, the transaction log is useful. The transaction log lists all transactions, the user who performed it, and the URL the user was going to. Navigate to System Logs > Transaction Log to see the information.

Email

The email log can help you determine whether emails are being sent, the recipient, and the format of the message. The email log also shows all inbound email. Navigate to System Logs > Email Log.

Configuring System Diagnostics Properties

System Diagnostics properties let you define when items appear red on the page. Navigate to System Properties > System Diagnostics.

Condition used to flag SMTP Status value:
Table rotation

Table rotation preserves instance performance and averts risk associated with querying growing data sets by using the External Communication Channel (ECC) Queue and the `sys_created_on` field to separate data sets into multiple tables based on date.

Note: Deployment of this plugin should be executed in partnership with a ServiceNow representative.

Functionality

The administrator specifies the time parameter (duration) of the process and the number of tables (rotations) within. After the rotation writes the last table in a rotation, the rotation overwrites the first table in the rotation. Please contact ServiceNow Technical Support before applying table rotation to a custom table.

Examples:

- The query `Records created between 2015/12/10 08:49 and 2015/12/09 07/34 where topic=SystemCommand` is translated to a SQL query on a single table, because the clause on `sys_created_on` targets a single shard.
- The query `Records updated between 2015/12/10 08:49 and 2015/12/09 07/34 where topic=SystemCommand, or without a date range, needs to target all shards and therefore is translated as a union query on all shards.

Advantages

- Allows deletion of old data without affecting current data (for example, to drop or truncate a table).
- Ensures tables only grow to a reasonable size.
- Reduces working set of data when date is known for query.

Disadvantages

Queries that do not use the table rotation date (for example, by using the `sys_created_on` field), force an inefficient union query to query time ranges that span multiple tables and can be extremely slow if the number of sub-tables is large.

To improve performance, it is recommended that the query includes a window of created dates.

You can use table rotation for sequentially-written tables or for insert-only tables. You cannot use table rotation for `sys_import` tables or tables that extend the Task `[task]` table.

Apply table rotation

You can apply table rotation by specifying the time parameter (duration) of the process and the number of tables (rotations) within.
Role required: admin

**Note:** Deployment of this plugin should be executed in partnership with a ServiceNow representative.

1. Navigate to **System Definition > Table Rotations**.
2. Click **New**, or select the table rotation group to modify.
3. Set the table rotation fields.

**Table 484: Table rotation group fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the table to which the action is to be applied.</td>
</tr>
<tr>
<td>Duration</td>
<td>Set the overall duration for the action.</td>
</tr>
<tr>
<td>Initialized</td>
<td>Sets table rotation as active (true) or inactive (false). [This must be checked (true) for the rotation or extension to be active.]</td>
</tr>
<tr>
<td>Type</td>
<td>Choose either Rotation or Extension.</td>
</tr>
<tr>
<td>Rotations</td>
<td>Sets the number of tables to be maintained through the duration.</td>
</tr>
<tr>
<td>Clean base rotation</td>
<td>Sets the date to clean (truncate) the base table.</td>
</tr>
</tbody>
</table>

4. Click **Submit** or **Update**.

**Note:** Deleting a rotation deletes the additional tables and all the data. Do not delete the rotation if the data is needed.

When you define a new rotation, a schedule is created and new data is subsequently written to one of the tables in the rotation group. The group includes the original table plus a number of additional tables.

### Actions on selected rows
Task table flattening

Within the ServiceNow platform, a logical table, such as the task list, represents one or more physical tables in a relational database.

Hierarchically related tables, such as Task [task], Incident [incident], Problem [problem], and Change [change_request], can be stored in one of two different extension models. The Table per class extension model stores hierarchically related tables as separate physical tables. The Table per hierarchy extension model stores hierarchically related logical tables as a single, flat, physical table and provides a performance improvement over multiple, joined tables.

The ServiceNow platform uses the table per hierarchy extension model for the Task table on MySQL databases. Other tables use the table per class extension model because there is no performance benefit to flattening them. To use table per hierarchy on an Oracle database, contact Technical Support.

Advantages of flattening a table hierarchy

The ServiceNow platform uses table joins to associate hierarchically related tables in the Table per class model. Queries against any child table, such as Incident, must join the child table to the parent table, such as Task. These table joins cause a performance bottleneck when performing queries. This bottleneck is especially noticeable when a query accesses fields from multiple child tables, such as when querying both Incident and Problem table values.

A flat table hierarchy allows the ServiceNow platform to access the data across these logical tables without first joining them because the data is stored in the same physical table.

Flattening a table hierarchy does not affect the appearance or functionality of tables as they appear in the ServiceNow platform. All table functionality, including database views, remains unchanged by flattening the table hierarchy.

View a table hierarchy and extension model

The extension model used by a table is not immediately apparent. While a hierarchy can use a single physical table, the platform displays tables as if each logical table has a unique physical table. For example, when specifying a table for a workflow, you can select Change [change_request] or Incident [incident] even though the parent table, Task [task], uses a single physical table.

Role required: admin

Administrators can view the status of flattened table hierarchies, but cannot flatten additional hierarchies. You can configure the form to add the Extension model field if necessary.

1. Navigate to System Definition > Tables.
2. Select a table record.
3. Review the Extension model field value, which indicates whether the table hierarchy uses multiple unique tables or a single flat table.

   • **None**: Indicates that the table uses the table per class model. Defines a unique physical table per logical table in a hierarchy. For example, there are separate physical tables for Task [task], Incident [incident], Problem [problem], and Change [change_request] on the MySQL database.

   • **Table per hierarchy**: Defines a single physical table per logical table hierarchy. For example, there is a single Task [task] table on the MySQL database that contains all the Task, Incident, Problem and Change records. This single physical table is represented as separate logical tables.
Add a module to test connection speed

A connection test can indicate the connection speed between your computer and your ServiceNow instance. A connection speed test (/connection_test.do) is available as a UI page.

Role required: admin

![Connection Test](image)

Connection test is used to determine the type of connect between the end computer and your Service-now.com instance.

To start the connection test, press this button:

Start Connection Test

Average time: 594ms (per 170k)
Estimated connection: T1/Cable (average download was 282K/s)

Figure 559: Connection Test page

1. Perform the appropriate action for your version of the UI:

| UI16          | 1. Navigate to **System Definition > Application Menus**.  
|              | 2. Open the application menu to which you want to add the module, for example, **System Diagnostics**. |
| UI15 or UI11 | Right-click an application menu, such as **System Diagnostics**, and select **Edit Application Menu** or click the pencil icon. |

2. Click **New** in the list of modules.
3. Complete the Module form using the following values:
   - **Title**: Unique name such as **Connection Test**.
   - **Link type**: **URL (from Arguments)**
   - **Arguments**: connection_test.do
4. Click **Submit**.

**This ServiceNow instance**

Performance graph statistics are attached to the **This ServiceNow instance** business service. These statistics are the ones you can see on the Admin homepage when you add a Performance Graph Controls widget, and then add one or more performance graphs.

Do not delete this business service, or else the instance becomes unable to track its own performance.
Figure 560: This ServiceNow Instance
Transaction quotas

Transaction quotas allow you to define a quota policy for different types of transactions. A transaction quota cancels any transaction in violation of the policy and notifies the user of the cancellation.

The Transaction Quotas plugin is active by default on all new and upgraded instances.

![Image of transaction canceled](image1)

**Figure 561: Transaction canceled**

The transaction quota also writes the cancellation message to the log file as a warning.

![Image of log entry](image2)

**Figure 562: Transaction cancelled log**

Typically, administrators set transaction quotas to prevent poorly performing queries and scripts from consuming system resources. This ensures that no transaction consumes enough resources to prevent other transactions from running. Administrators can also view cancellation log messages to identify transactions that might consume excessive resources.
How transaction quotas work

Transactions use the Quota Manager, which is a background thread that cancels transactions. The Quota Manager performs the following actions.

1. Obtains a list of active transactions, similar to the list under User Administration > Active Transactions.

2. Cycles through each transaction, and matches it to a quota rule if it does not have one assigned to it. If a transaction changes or there is a new quota rule, the Quota Manager reprocesses the transaction.

3. Cancels the transaction if it has been running longer than the specified quota maximum.

4. Logs the running transactions.

5. Sleeps until the next heartbeat, which is controlled by the glide.quota.manager.heartbeat system property.

Transaction cancellation examples

Transactions can be canceled for more than one reason. Look for the following indicators.

- maximum execution time exceeded: This message appears when the glide.quota.manager threads cancels the transaction.
- canceled by other transaction: This message appears when the transaction was canceled by the session thread that initially issued it, and not by the glide.quota.manager thread.
- canceled by user request: This message appears when the user clicked the red X button to cancel the running transaction.

If you are looking for transactions that were canceled by glide.quota.manager, Search for the [Message] [Contains] [maximum execution time exceeded] combination. For example:

Cancelling transaction /home.do - Default-thread-11.0 (maximum execution time exceeded): Thread Default-thread-11.0 (Default-thread-11.0, F530DD111B11111111FC031767DA158E), after 30000ms

Transaction quota properties

The administrator can add the following system properties to manage transaction quotas.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.quota.manager.heartbeat</td>
<td>The number of seconds between the start of each Quota Manager heartbeat. This value determines how often the Quota Manager checks for transactions that exceed a quota and how often it writes status in the log file.</td>
</tr>
</tbody>
</table>
|                              | Type: Integer
|                              | Default value: 1
<p>|                              | Location: Add to the [sys_properties] table                                                                                                    |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.quota.manager.minimum_transaction_time</td>
<td>The minimum number of seconds a transaction must run before the Quota Manager matches it to a transaction quota. ServiceNow recommends setting this value to at least 1 second to avoid performance issues. For optimal performance, set this value to the value of your most restrictive quota. For example, if your most restrictive quota cancels transactions longer than 1 minute, set the minimum transaction time to 60 seconds.</td>
</tr>
<tr>
<td></td>
<td>Type: Integer</td>
</tr>
<tr>
<td>glide.quota.manager.debug</td>
<td>Controls whether to display (true) or hide (false) additional debugging information related to the Quota Manager. Debugging information includes running transactions, canceled transactions, and what quotas are matched to transactions.</td>
</tr>
</tbody>
</table>

Enable transaction quota debugging
You can enable the logging of transaction quota debugging information by enabling the system property.

Role required: admin

1. Add the `glide.quota.manager.debug` system property, and set the value to true.
2. Navigate to System Diagnostics > Session Debug > Debug Quotas.
   The Debug Quota script runs to enable debugging.

After setting the above system property to true, go to your system log to see messages from the Quota Manager.

Default quota rules
Various transaction quota rules are available in the base system.

- **Fix Script Processor**: Allows the fix script processor to run for four hours.
- **Presence**: Cancels presence requests quickly when the system is busy.
- **REST Import Set API request timeout**: Prevents inbound REST Import Set API transactions from running for longer than 60 seconds.
- **REST Table API request timeout**: Prevents inbound REST Table API transactions from running for longer than 60 seconds.
- **AMB Transactions**: Cancels AMB transactions lasting longer than the specified maximum duration. Applies to all AMB transaction types: message send and message receive.
- **Reference Completer**: Stops the reference completer transaction after five seconds.
- **REST Aggregate API request timeout**: Prevents inbound REST Aggregate API transactions from running for longer than 60 seconds.
- **Homepage Widgets**: Prevents all homepage widgets from running longer than 30 seconds.
• **REST Attachment API request timeout**: Prevents inbound REST Import Set API transactions from running for longer than 60 seconds.

• **UA Count Persistor Quota**: Prevents UA count persistor scheduled jobs from running for more than one hour.

• **UI Transactions**: Cancels UI transactions that are two seconds away from the 5-minute server disconnect. ServiceNow datacenter load balancers display an internal server error (HTTP Error 500) to users after five minutes. This quota rule returns a transaction canceled page instead of an error. This rule includes an exception to prevent the cancellation of background scripts.

### Normal transaction activities

Before setting transaction quotas, navigate to **User Administration > Active Transactions** to review the normal transaction activities for your instance. You can **view and terminate long-running transactions** if necessary. Over time, you can determine the normal transaction load for your instance and set your quotas to match these norms.

**Configure a transaction quota rule**

Transaction quota rules allow you to define a quota policy for different types of transactions.

Role required: admin

Transaction quota rules allow you to specify the following conditions.

- The conditions under which the policy applies.
- The order in which transaction quotas apply.
- The maximum duration of a transaction before the quota manager cancels it.

**Warning**: Setting transaction quotas too low can severely impact your users and prevent normal instance operations. Test your transaction quotas rigorously before implementing them in production.

1. If necessary, activate the Transaction Quotas plugin.
2. Navigate to **System Definition > Quota Rules**.
3. Click New.
4. Complete the form.

### Table 486: Transaction quota rule fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name to identify the rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box that determines if this rule is active (selected).</td>
</tr>
<tr>
<td>Maximum Duration</td>
<td>The number of seconds a transaction has to complete before the quota cancels the transaction.</td>
</tr>
<tr>
<td>Maximum Business Rules</td>
<td>The number of business rules executions allowed.</td>
</tr>
<tr>
<td>Maximum Database Time</td>
<td>The total number of seconds for all SQL requests.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Maximum SQL Statement Time</td>
<td>The number of seconds a SQL statement can run.</td>
</tr>
<tr>
<td>Maximum Outbound Requests</td>
<td>The number of outbound HTTPs requests allowed.</td>
</tr>
<tr>
<td>Order</td>
<td>A number that represents the priority of the quota transaction in relation to other quotas. The transaction quota with the lowest order value and matching conditions determines the quota policy that is applied.</td>
</tr>
<tr>
<td>Maximum Events</td>
<td>The number of sysevent inserts allowed.</td>
</tr>
<tr>
<td>Maximum Jobs</td>
<td>The number of sys_trigger inserts allowed.</td>
</tr>
<tr>
<td>Maximum SQL Queries</td>
<td>The number of SQL queries allowed.</td>
</tr>
<tr>
<td>Maximum Outbound Request Duration</td>
<td>The number of seconds for an outbound HTTP request.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the transaction quota rule.</td>
</tr>
</tbody>
</table>

5. Set a condition to specify when the transaction quota should take effect.

The transaction quota rule condition builder displays conditions that are only applicable to transactions as listed in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>The URL of the page.</td>
</tr>
<tr>
<td>Thread Name</td>
<td>The name of the execution thread that is running the transaction. Foreground threads have names like http-bio-8080-exec-1. Background threads can have various names, and are useful where the URL is not sufficiently descriptive.</td>
</tr>
<tr>
<td>Foreground</td>
<td>Whether the transaction was completed in the foreground or background:</td>
</tr>
<tr>
<td></td>
<td>• <strong>True</strong>: a foreground transaction.</td>
</tr>
<tr>
<td></td>
<td>• <strong>False</strong>: a background transaction.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The type of transaction:</td>
</tr>
<tr>
<td></td>
<td>• <strong>List</strong>: Any list transaction, such as incident_list.do.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Form</strong>: All forms, UI pages, CMS pages, and so on.</td>
</tr>
<tr>
<td></td>
<td>• <strong>XMLHttp</strong>: Transactions that run through GlideAjax, where the URL is xmlhttp.do.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Report</strong>: The page sys_report_template.do.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SOAP</strong>: SOAP transactions.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Export</strong>: When a list is exported in a format such as XML or Excel.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Scheduler</strong>: When a scheduled job is performed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Text Search</strong>: The text search transaction or any of its related operations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Other</strong>: Any type that does not meet the qualities of another type.</td>
</tr>
</tbody>
</table>

**Note**: Match the transaction quota **Type** to the transaction type listed in the Quota Manager log entry for the transaction.

<table>
<thead>
<tr>
<th>User</th>
<th>The user performing the transaction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Homepage</td>
<td>The homepage that is running. This condition is populated only if the URL is home.do.</td>
</tr>
<tr>
<td>Homepage Widget</td>
<td>The homepage widget that is rendered in the transaction. When a homepage is rendered initially, each homepage widget is rendered in parallel.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Miscellaneous attributes that are related to the transaction.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**View a canceled transaction**

The Quota Manager logs each canceled transaction as a warning message in the system log.

Role required: admin

Use the following procedure to search for transaction warnings in the system log.

1. Navigate to **System Logs > System Log > Warnings**.
2. Edit the filter to add the condition **[Message] [starts with] [Cancel]**.
3. Click **Run**.
Example system log messages
An example of system log messages for transactions.

- At every heartbeat interval, which is one second by default, the Quota Manager prints the running transactions:

```
2012-02-13 12:34:08 (096) glide.quota.manager SYSTEM URL= /incident_list.do?
sysparm_userpref_module=b55fbec4c0a80090088e83d7ff500de&active=true&sysparm_query=active=true^EQ,
THREAD= http-bio-8080-exec-3, FG= true, TYPE= 1, STATE= 2, USER= null,
TIME= 8,807, MEM= 0, ATTRIBUTES= {}
```

- Every time the Quota Manager matches a quota to a transaction, it prints a message similar to the following example:

```
2012-02-13 13:25:31 (900) glide.quota.manager SYSTEM QuotaFinder: Assigning quota "TEST PROBLEM FORM" with filter:
type=form^urlLIKEsys_id=46fb9e31a9fe198101492060c2a4f8cb^EQ to transaction: URL= /problem.do?sys_id=46fb9e31a9fe198101492060c2a4f8cb,
THREAD= http-bio-8080-exec-1,
FG= true, TYPE= 1, STATE= 4, USER= null, TIME= 1,121, MEM= 0, ATTRIBUTES= {}
```

- Every time the Quota Manager cancels a transaction, it prints a message similar to the following example:

```
2012-02-13 13:25:33 (930) glide.quota.manager SYSTEM WARNING *** WARNING ***
Transaction: Cancelling transaction /problem.do (maximum execution time exceeded):
Thread http-bio-8080-exec-1
```

Modify the transaction cancellation page
The Quota Manager uses a UI page to control the contents of the transaction cancellation message.

Role required: admin

Knowledge of Apache Jelly is highly recommended when modifying the UI page. See Extensions to Jelly syntax on page 3937 for more information.

1. Navigate to System UI > UI Pages.
2. Open the UI page with the name transaction_canceled_quota.
3. In the HTML field, add or modify the new cancellation message.

The following table describes available variables.
Table 487: Cancellation message variables

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getURL()</td>
<td>Returns the URL for the transaction.</td>
</tr>
<tr>
<td>getReason()</td>
<td>Returns the reason for page cancellation, localized to the user’s language.</td>
</tr>
<tr>
<td>getQuotaId()</td>
<td>Returns the sys_id of the quota rule.</td>
</tr>
<tr>
<td>getQuotaName()</td>
<td>Returns the name of the quota rule.</td>
</tr>
<tr>
<td>getRunTime()</td>
<td>Returns the total run time for the page up to this point.</td>
</tr>
<tr>
<td>getType()</td>
<td>Returns the type of transaction, such as form, list, report, other.</td>
</tr>
<tr>
<td>getUser()</td>
<td>Returns the sys_id of the user.</td>
</tr>
<tr>
<td>getHomepage()</td>
<td>Returns the sys_id of the homepage.</td>
</tr>
<tr>
<td>getHomepageWidget()</td>
<td>Returns the name of the homepage widget.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

Use table extension

Table extension is a data archiving technique used to preserve instance performance and avert risk associated with querying growing data sets. To do this, table extension separates data sets into multiple tables based on date.

Role required: admin

This example outlines how to use table extension.

**Note:** Deployment of this plugin should be executed in partnership with a ServiceNow representative.

The administrator of the process is given the ability to specify time parameter (duration) of the process. Although the administrator can also specify the number of tables (rotations), this is not the best practice. After the last table in a rotation is written, new tables are added and old tables are archived. Using table extension, tables are never overwritten.

An advantage of table extension is to partition data across tables. It also allows you to archive data while ensuring that tables stay reasonably-sized. The working set of data is reduced when a date is known for the query.

The disadvantage is that table extension equires a union query when you query for a time range that spans multiple tables. Union queries are less efficient than queries against a single table.

A good practice is to use table extension when you have sequentially-written tables or insert-only type tables (there are exceptions to this parameter). Table extension is also useful in tables where data is needed for long periods of time.

The following example describes how to set table extension for the [sys_audit] table.

1. Navigate to **System Definition > Table Rotations**.
2. Click **New**.
3. Enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the table to apply the action. In this example, the table is [sys_audit].</td>
</tr>
<tr>
<td>Duration</td>
<td>Enter the overall duration for the action. 30 days is the duration in this example.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Extension.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Content Management System

The Content Management System (CMS) is a ServiceNow application that primarily enables users to create a custom interface for the ServiceNow platform and ServiceNow applications.

The CMS application is powerful and flexible, so customers have used it for a wide variety of projects from creating entire websites to integrating with other products. The Content Management application is active by default.

This video provides an overview of the CMS application.

A CMS typically requires a systems administrator or a web developer to set up and add features. Non-technical users can use the application as a website maintenance tool for updates. For more information, see CMS Planning.

Following are several CMS project ideas:

- Design a company-wide service catalog that offers a collection of services.
- Present a customized UI for a knowledge base.
- Create customized login pages, search pages, views of lists, tables, charts, or graphs.
- Design a complete website.
- Integrate ServiceNow with other company applications.
• Build a tailored self-service portal for end users that is in compliance with a corporate style guide.

**Example CMS sites**

There are two common interface approaches within the ServiceNow community:

• An image and text-based interface similar to Amazon.com
• A search-based interface similar to Google

Both approaches have been used successfully. The approach you select depends on the needs of the people using the data and how easy it is to train them. While the two design philosophies are different, both approaches share the common goal of UI simplicity.

**Content Management System design**

Before building a website in CMS, it is important to have a good understanding of what to build and who the audience is.

A high volume of content can heavily influence the look and feel of the site and the site hierarchy. When determining the content, design for ease of maintenance for the people who take care of the system.

Review website design prerequisites to help you set expectations, scope deliverables, and define reasonable time lines. Consider both the planning and execution of site design, to understand how sites are built, and to provide a working overview of the CMS.

Timing is important when considering the addition of content management. Successful deployments of the content management system usually take place after phase 1 processes (for example, Incident, Problem, Change, Catalog, and Knowledge) are in place. This is especially true if the team has limited website design experience. Waiting until phase 2 of deployment gives administrators time to work in ServiceNow and to understand how the organization uses the system and what business needs it meets.

Also consider the maturity level of data in the ServiceNow system. Depending on the ITIL processes used, content management is only useful and effective once the data within ServiceNow is established. Ensure that hierarchies, tasks, and workflows are well-defined. For example, before creating a catalog interface, confirm that the service catalog has been in place for some time, has been used, and contains data. The same is true for a knowledge management interface, particularly when high ratings or view counts define article placement on the page.

<table>
<thead>
<tr>
<th>Prerequisite</th>
<th>Ensures that</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Organize the content</strong></td>
<td>System content and CMS content is complete.</td>
</tr>
<tr>
<td><strong>Identify team members</strong></td>
<td>The process is not delayed by a lack of resources.</td>
</tr>
<tr>
<td><strong>Prepare the data within the instance</strong></td>
<td>The instance has all the data the CMS presents.</td>
</tr>
<tr>
<td><strong>Leverage the corporate style guide</strong></td>
<td>The CMS site conforms to the corporate look and feel.</td>
</tr>
<tr>
<td><strong>Use prototypes and rapid web design</strong></td>
<td>The structure of the CMS site is clear and planned out, either on paper or an electronic file.</td>
</tr>
</tbody>
</table>
Content organization

Organize your content before you begin building your website.

A site created in CMS relies on two different types of content.

- CMS site information, such as site pages, images, and menus
- System information, such as knowledge base articles and catalog items

CMS content

Begin by listing all the content you want to host on the CMS pages. Examples include help pages, My Requests, My Approvals, and specific catalog items. Think about current solutions that you can implement immediately, and note ideas for future implementation phases.

Within CMS, you group pages to define the top-down menu structure. You establish a home or starting page, and other pages in the site reference the home page in the Parent Page reference field.

There are several ways to group, such as by audience or the purpose of the website. After listing the content to host, group it logically and identify a common name for each group, as shown in the following examples.

Table 489: IT environment groups

<table>
<thead>
<tr>
<th>Content built for</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>End user</td>
<td>End-User Page</td>
</tr>
<tr>
<td>IT professional</td>
<td>IT Professional Page</td>
</tr>
</tbody>
</table>

Table 490: General groups

<table>
<thead>
<tr>
<th>Purpose of site</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reports</td>
<td>Reporting Page</td>
</tr>
<tr>
<td>Help and knowledge</td>
<td>Knowledge page</td>
</tr>
</tbody>
</table>

System content

Organize the content so the interface is easy to navigate and understandable to the user. Determine the organization based on the data that you are leveraging, both in the CMS (using sites, parent pages, pages, and navigational menus) and throughout the rest of the system. For example, within the catalog you have “category,” and in the knowledge base you have “category” and “subcategory.” You can use these hierarchies with filtered lists for good search results.

Organizing CMS content logically is important for long-term maintenance of the site, however, the data typically comes from other ServiceNow applications. Communicate with the administrators for these applications, such as the knowledge base, service catalog, and business service portfolio. Work with them to offer the application data appropriately through the CMS pages you create. For example, the team that created the ServiceNow corporate website in CMS began by evaluating the naming conventions used in the corporate knowledge base.
Branding elements

Branding refers to the logo, name, colors, and symbols that identify an organization. It imposes consistency in design and use of terms. Your marketing department defines branding elements and can provide them to you as you plan your CMS pages. Consider how to incorporate the following branding elements.

- Logos
- Color palette
- Tag line
- Trademarked elements
- Graphics

Site design

During planning, consider providing a core set of features with a standard appearance throughout the site. The following web design elements are often used to create a consistent look.

- Page templates
- Navigation schemes
- Header
- Breadcrumbs
- Footer
- Forms

ServiceNow features

Analyze and organize the following ServiceNow features in your instance if you plan on using any of them with CMS pages.

- Account settings
- Email
- Workflow approvals
- Filters

Team member identification

Before starting to build a CMS, it is important to identify the members of the team and their responsibilities. Identify these resources before beginning to build the CMS website or any pages:

- The person responsible for gathering corporate style design guidelines, defining the copy (written terminology and content for the site), and defining the site flow.
- The CMS webmaster who works with the first resource, executes the designs, and makes the site work. The webmaster needs the following skills:
  - Basic ServiceNow administration skills
  - HTML
  - CSS
  - Graphic design
  - Web design
After you identify the project team members, establish who is responsible for the tasks that must be completed as the CMS website is build.

- Determine who owns each page.
- Set a page update schedule so owners do not overwrite each other.
- Formalize content management processes, including content review and page updates.

**Data preparation**

It is important that there is enough data in the ServiceNow instance before you begin to build the CMS website.

Ensure that the necessary data and content are available in the instance by taking the following actions.

- Review the ITIL processes that you intend to implement in the CMS. Ensure that the data in the instance is a mature representation of the applications being used, for example, service catalog, knowledge management, and incident management.
- Review the defined hierarchies, such as the categories and subcategories for the knowledge base or service catalog. You use these categories to design the entry page into the application.

**Corporate style guide**

When you build a CMS website, the corporate style guide dictates the look and feel of your website.

A corporate style guide provides detailed information for designing any corporate interface, including corporate websites.

- **Corporate design team**
  Many organizations have a corporate team that designed their website. Contact this team and involve the designers early in the planning. They can provide help and give their approval to the interface you design. Without approval, there is the risk of having to redesign the entire site because it does not adhere to the organizational guidelines.

- **Corporate style guide**
  A corporate style guide takes the guesswork out of designing the CMS website. The example style guide shown is defined down to the pixel. Creating a site with the style guide makes it easy to create clean CSS and HTML. Without a style guide, building the site can take a great deal of time.

- **Design considerations**
  Some modifications to the base design for forms may be necessary. The content area of any CMS design must be no smaller than 860px, or service catalog forms are clipped. The sample style guide entry specifies the content area to be 576px, which clips service catalog forms.
Columns and topics:

1. Navigation (levels 2–4)
2. Main content
3. Info snippets
Prototypes and rapid web design

Many user interface designers use prototypes and rapid web design techniques to visualize the final product before it is developed.

Design revisions are the most time consuming and expensive phase of site design. When the team analyzes and then uses prototypes to create pages, revisions to the published pages are minimal.

Develop the prototype and print it. Review the design with the appropriate team members and annotate the prototype, and annotate what to update on each page.

Define the following elements within the prototype.

- The site map for the entire site.
- A detailed prototype of every intended page, including elements such as links, link destinations, content, page names, and page descriptions.

Content Management navigation

After you design the hierarchical structure of the site, begin planning site navigation.

Consider the following as you plan site navigation.

- Placing navigation elements on every page.
- Locating navigation elements in the same place on every page.
- Using either text or images for navigation.
- Providing visitors with an easy way to understand where they are in the site, for example, with breadcrumbs or a specific color scheme.
- Adding a site map, which is a one-page, hyperlinked, hierarchical outline of the site.
- Providing a link to the home page from every site page, as visitors often enter the site on a page other than the home page.
- Designing navigation to help visitors find information quickly with as few clicks as possible.

In the CMS, navigation menus define your site navigation. Build menus as navigational blocks to create navigation paths. The menu chosen for the task depends on the size and complexity of your site. Available menu options include the following items.

- List menus
- Two types of tab menus
- Vertical, clickable list, usually placed on the left side
- Horizontal blocks
- Vertical blocks
- Super menu (a menu of menus)

System content management

Most of the content in a CMS site is managed in different locations throughout the system.

For example, if you are building a knowledge website, the pages and blocks exist in CMS, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to use. It is important to take time to understand the table structure of data to become acquainted with content.

Links to content are typically static, however, take time to look at the document tree and review how field values are formatted for use within the CMS. To understand the information provided, right-click within forms in the platform and select Show XML to view the document tree for the referenced table. To see
the table values for each field, right-click the form label and choose Show - (field name) or Configure Dictionary for reference.

Look at several internet news sites for ideas on how to format dynamic list data and also the full article detail. Research blog sites, shopping sites, and any other site you find easy to use, as layout and usability design can be time-consuming. If you find a site that inspires you, emulate it in your design.

• This New York Times example has two separate list formats.
• The CNN example has several list formats on the page.
• Several different list formats are used on the ServiceNow website.

Knowledge articles - kb_knowledge table

When you right-click and select Show XML on any form within the system, the document tree for the referenced database table becomes reference-able. Review the following selected subset of the document tree so you can acquaint yourself with the content readily available to your site design.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
    <div class = "cms_knowledge_list customer_success" >
        <g:for_each_record file = "${current}" max = "${jvar_max_entries}" >
            <br />
            <table cellspacing = "0" cellpadding = "0" border = "0" class = "background_transparent" >
                <tr><td class = "cms_knowledge_list_image"
                    <j:if test = "${current.u_logo.getDisplayValue() != ''}" >
                        <div class = "knowledge_article_logo" >
                            <a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" >
                                <img src = "${current.u_logo.getDisplayValue()}" alt = "${current.text}" width = "110px" />
                            </a>
                        </div>
                    </j:if>
                </td><td width = "100%" ><a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" target = "_top" >
                    <span class = "kb_learn_more" >
                        $\{current.short_description\}
                    </span>
                </a>
                </td></tr>
                <tr><td width = "100%" colspan = "2" class = "kb_learn_more" >
                    <a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" >Learn More</a>
                </td></tr>
            </table>
        </g:for_each_record>
    </div>
</j:jelly>
```
Activate the Content Management System

The Content Management System (CMS) application and the Service Management Portal application, which is implemented within Content Management, are automatically installed on new instances. If they are not active on your instance, administrators can activate them.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Installed with Content Management

Several types of components are installed with the Content Management application.

Demo data is available for this feature.

Tables installed with Content Management

Content Management adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Page [content_page]</td>
<td>Provides an inventory list of pages within the system</td>
</tr>
<tr>
<td>Content CSS [content_css]</td>
<td>Stores internal or external CSS for the page</td>
</tr>
<tr>
<td>Content Theme [content_theme]</td>
<td>Made up of a collection of CSS files</td>
</tr>
<tr>
<td>Content Link [content_link]</td>
<td></td>
</tr>
<tr>
<td>Content Page Rule [content_page_rule]</td>
<td></td>
</tr>
<tr>
<td>Content Block Programmatic [content_block_programmatic]</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Content Block</td>
<td>[content_block]</td>
</tr>
<tr>
<td>Content Block Detail</td>
<td>[content_block_detail]</td>
</tr>
<tr>
<td>Content Site</td>
<td>[content_site] Provides and inventory list of sites within the system</td>
</tr>
<tr>
<td>Content Block Static</td>
<td>[content_block_static]</td>
</tr>
<tr>
<td>Content Type Detail</td>
<td>[content_type_detail]</td>
</tr>
<tr>
<td>Content Page Meta</td>
<td>[content_page_meta]</td>
</tr>
<tr>
<td>Content Config</td>
<td>[content_config]</td>
</tr>
<tr>
<td>Content Type</td>
<td>[content_type]</td>
</tr>
<tr>
<td>Content Theme CSS</td>
<td>[content_theme_css]</td>
</tr>
<tr>
<td>Content Block Lists</td>
<td>[content_block_lists]</td>
</tr>
<tr>
<td>Content Block Sized</td>
<td>[content_block Sized]</td>
</tr>
</tbody>
</table>

### Role installed with Content Management

Content Management adds the following role.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content administrator [content_admin]</td>
<td>Can read, write, and configure all elements of the Content Management Application</td>
<td>none</td>
</tr>
</tbody>
</table>

### Script includes installed with Content Management

Content Management adds the following script includes.
<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMSCopyAjax</td>
<td>Support for copying CMS pages</td>
</tr>
<tr>
<td>CMSEntryPage</td>
<td>Creates an entry page</td>
</tr>
<tr>
<td>ContentPageClone</td>
<td>Copy support for CMS pages</td>
</tr>
<tr>
<td>ContentSiteClone</td>
<td>Copy support for CMS sites</td>
</tr>
<tr>
<td>CMSAjax</td>
<td>CMS Ajax utilities</td>
</tr>
</tbody>
</table>

### Client script installed with Content Management

Content Management adds the following client script.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header Color Change</td>
<td>Content Block Header</td>
<td>Changes the background color of the control to what the user selected</td>
</tr>
<tr>
<td></td>
<td>[content_block_header]</td>
<td></td>
</tr>
</tbody>
</table>

### Business rules installed with Content Management

Content Management adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace Stub</td>
<td>Content Block</td>
<td>Replaces a placeholder widget with a content widget.</td>
</tr>
<tr>
<td></td>
<td>[content_block]</td>
<td></td>
</tr>
<tr>
<td>Unload Page</td>
<td>Page</td>
<td>Unloads content from the page.</td>
</tr>
<tr>
<td></td>
<td>[content_page]</td>
<td></td>
</tr>
<tr>
<td>Bump Parent if Content</td>
<td>Portal</td>
<td>Replace content in the current page.</td>
</tr>
<tr>
<td></td>
<td>[sys_portal]</td>
<td></td>
</tr>
<tr>
<td>Remove Block from Pages</td>
<td>Content Block</td>
<td>Removes a block from pages where it is placed.</td>
</tr>
<tr>
<td></td>
<td>[content_block]</td>
<td></td>
</tr>
<tr>
<td>Validate Suffix</td>
<td>Content Page</td>
<td>Validates a suffix so that a page name or a page suffix cannot match a table name.</td>
</tr>
<tr>
<td></td>
<td>[content_page]</td>
<td></td>
</tr>
</tbody>
</table>

### Configure Content Management sites

Planning a CMS site involves obtaining resources, communicating with others about design, and gathering content.

Role required: content_admin or admin

The following steps are a high-level overview of how to set up a site.

1. Plan and design your content.
2. Create a site.
The site is the container that holds all the content. To simplify your process, you can copy an existing site and edit its components. For more information on creating a site, see Create a site on page 2052. For more information on copying a site, see Copy a site on page 2056.

3. Add pages to the site.
   Pages contain blocks of information for the site. For more information, see Create a content page on page 2058.

4. Create content blocks to customize the layout, headers, menu navigation, lists, and static and dynamic content.
   Content blocks are chunks of HTML that make up the content page. There are various content block types available to help with your customization. For more information, see Content blocks on page 2072.

5. Add style to your site using themes, style sheets, and frames.
   Content sites and content pages do not reference style sheets directly. Configure them using the Themes or Style Sheets options. For more information, see Style in Content Management on page 2105.

6. Test the site.
   After you create or modify a site, test the site to ensure that content displays properly and all links work correctly. For more information, see Test the site.

Content sites

A content site is a group of related content pages that have the same basic theme, layout, and URL suffix.

Content sites are made up of a series of basic building blocks. The Employee Self-Service site is an out-of-box sample site that is included in the CMS activation. It provides existing, working examples or each CMS component, which you can use like a template to build your own site.
Create a site

A site is a group of related content pages with a consistent look and feel, defined by a common layout, theme, and URL suffix.

Role required: content_admin or admin

Typically, all pages assigned to a site are given the attributes that are defined at the site level, such as the theme and layout. Individual pages can specify otherwise. At the least, a site needs the following fields defined: homepage, search results page, layout, URL suffix, and theme. All pages within a site can be accessed via the site URL suffix. The URL suffix is case-sensitive.

Associating a page with a site provides the following benefits:

- All pages within a site use the site default layout and theme, saving time.
- All pages within a site can be accessed using a uniform URL: customer.service-now.com/site-name/page.do.
- All pages within a site that have a search widget use the same search page.

Before creating a site for the first time, review the Content Management planning page to understand the concepts and principles of CMS.

1. Navigate to Content Management > Sites.
2. Click New.
3. Fill in the fields, as appropriate.

### Table 491: Site fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix for the site. It is incorporated into the URL as follows:</td>
</tr>
<tr>
<td></td>
<td><a href="http://instance.service-now.com/url_suffix/page.do">http://instance.service-now.com/url_suffix/page.do</a></td>
</tr>
<tr>
<td>Home page</td>
<td>The page to display when the user does not specify a page name in the URL:</td>
</tr>
<tr>
<td></td>
<td><a href="http://instance.service-now.com/url_suffix/">http://instance.service-now.com/url_suffix/</a></td>
</tr>
<tr>
<td>Search page</td>
<td>The page that displays search results when a user searches from any page within the site.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page to use for logging in to the site. If specified, users must log in to access the pages on the site. If left blank, no login is required to access the pages within the site.</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>The page that displays gauge content. When the user clicks a gauge on the new site, the gauge target page opens showing the gauge content. The gauge target page replaces the CMS page in the current tab.</td>
</tr>
<tr>
<td>Title</td>
<td>A title for the site. The title can be the same as or different from the Name.</td>
</tr>
<tr>
<td>Description</td>
<td>A full description of the site.</td>
</tr>
<tr>
<td>Default layout</td>
<td>The layout for pages to use by default. Any page in the site that has a blank Layout field uses the layout set here.</td>
</tr>
<tr>
<td>Default theme</td>
<td>The theme for pages to use by default. Any page in the site that has a blank Theme field uses the theme set here.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Simple catalog display</td>
<td>Option to simplify catalog pages in the site by hiding the search bar, breadcrumbs, and the results per page choice list. Selecting this option prevents you from adding attachments from record producers to your CMS site.</td>
</tr>
<tr>
<td></td>
<td>Clear this check box to display the search bar, breadcrumbs, and the results per page choice list in catalog pages.</td>
</tr>
<tr>
<td>Use external cart</td>
<td>Option to omit the default cart when rendering catalog pages within a site that contains catalog pages. Provide a catalog cart block somewhere on the site to allow users to make catalog requests.</td>
</tr>
<tr>
<td></td>
<td>____________________________________________________________________________________________________________________________________________________________________________________________________________</td>
</tr>
</tbody>
</table>

The following is the site record for the ESS Portal:
You can add meta tags to a site. Meta tags are special tags that contain information about the site.

A DIV-based layout option is available. Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags can:

- simplify code
- reduce the amount of code
- increase page load speed
- separate content from presentation
- help pages adapt to different device resolutions
- make pages easier for search engines to crawl
- make code more compliant with evolving web page design standards

A content theme named Administration Theme - Charcoal is included as an example of CSS-driven, DIV-based layouts.

To view the sample code in Administration Theme - Charcoal for a DIV-based layout:

1. Navigate to Content Management > Design > Layouts.
2. Click Admin 1 Column.

Copy a site

To create a site quickly, you can copy an existing site.

Role required: content_admin or admin

The site copy option creates a complete standalone copy of the site and all its resources. If you are copying a site to create a second site, it is best to use this option after the first site is complete, tested, and production ready. Copying a site includes pages, CSS, content blocks, and menus. Images are stored separately in the sys_attachments table and not included in the copy. There are various reasons why site copying is useful, such as site versioning, branding, or creating a backup.

To copy just a few pages without duplicating all the resources (CSS, blocks, menus), use the page copy option. Page copy duplicates the page but not the resources used in the page. For more information, see Copy a page.

1. Navigate to Content Management > Sites > [Site Name].
2. On the Site form, click Copy.
3. Type a name for the new site.

This name is a prefix for all the site elements duplicated. Do not use Portal or CMS in the site name.

A progress bar shows the copy process.

When the process is complete, the Site form shows information for the new site.

Content Management security

There are several methods for securing CMS sites and pages. Site security is set in the Login page field on the site record. You can control whether a page is public or private through the URL.
Every content page has its own URL that users can access outside of the platform. You can configure the URL to be public or private, based on the Login page and role definitions.

- If the content page has no defined Read role or there is no defined Login page, any internet user can navigate to the URL and view the content page.
- If there is a defined Read role, then anyone who goes to the URL is asked to log in before they can view the site.
- If there is a defined Login page on the site record, all pages in the site are private.

Site security is set in the Login page field on the site record (Content Management > Sites > [site name]). You can control whether a page is public or private through the URL.

Content Management URLs

The format for Content Management URLs is as follows.

```
<path to the instance> + /<site suffix> + /<page suffix> + .do
```

The `<site suffix>` is defined by the URL Suffix field on the site form.
The `<page suffix>` is defined by the URL Suffix field in the page form. The URL suffix is case-sensitive.

For example, the page **Austere - Site Entry** has a site URL Suffix of austere and a page URL Suffix of entry. The constructed URL looks like the following URL.

```
<instance name>.service-now.com/austere/entry.do
```

If the site URL Suffix field is left blank, the `<site suffix>` is cms, as shown in this example:

```
instance.service-now.com/cms/page.do
```

If the page URL Suffix is left blank, the name of the page is used as shown in this example:

```
instance.service-now.com/ess/Page Name.do
```

Special characters in the name of the page must be escaped.

Login pages instead of login rules

You set a login page on the site record to allow users to log in or out directly through the content site. Login rules were used in earlier versions to dictate what users saw after logging in, based on their roles or permissions. Login rules still work, but their use is deprecated.

Configure CMS sites for single sign-on (SSO)

To configure CMS to use SSO, make the view_content page private. Because public pages do not require login, and CMS sites are public by default, CMS pages do not use SSO. Use the following procedure to turn off public-facing content pages and enable SSO.

1. Navigate to Public Pages (sys_public.list).
2. For the view_content page, set Active to false.
Content pages

The core of the content management system is a page.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in pre-defined layouts. They can be used to present login pages, search pages, or ServiceNow content.

Create a content page

The core of the content management system is a page.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in pre-defined layouts. They can be used to present login pages, search pages, or ServiceNow content.

1. Navigate to **Content Management > Sites**.
2. Open the site that will contain the page.
3. In the **Pages** related list, click **New**.
4. Define the settings on the Page form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the page. As a best practice, prefix each page name with the name of the site followed by a dash and then the function of the page in the site. For example, <strong>ESS - Catalog Detail</strong>, <strong>ESS - Search Results</strong>, and <strong>ESS - Site Entry</strong> are all clear names for pages within the <strong>ESS</strong> site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>Enter the URL suffix for the page. The suffix is incorporated into the URL as follows: <a href="http://instance.service-now.com/site/url_suffix.do">http://instance.service-now.com/site/url_suffix.do</a></td>
</tr>
<tr>
<td>Parent page</td>
<td>Select the existing page that will be the parent of the current page. Parent pages keep sections within large sites sortable on the site list of pages. Parent pages are also used to dynamically create basic breadcrumb functionality. Use CSS to define menus that give the Parent page context within the user interface.</td>
</tr>
<tr>
<td>Layout</td>
<td>Select a layout to use for the page. Layouts define dropzones where content blocks can be added to the page. If this field is left blank, the page inherits the default layout of the site. If the site does not have a default layout, there is only a single dropzone for the entire page.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Content theme</td>
<td>Select a theme to use for the page. Themes bundle CSS style sheets that are applied to all content within the page.</td>
</tr>
<tr>
<td></td>
<td>If this field is left blank, the page inherits the default theme of the site. As a best practice, use the default theme unless the page requires a different set of CSS style sheets from the other pages in the site.</td>
</tr>
<tr>
<td>Frame buster</td>
<td>Select this option to remove any restrictions placed by frames that contain the page. Use this option to avoid frame-within-frame issues that can sometimes occur with improper linking.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site associated with the content page. If you created this page from a related list, this information is automatically provided. The content site also determines part of the page URL, as follows:</td>
</tr>
<tr>
<td>Read roles</td>
<td>Click the lock icon to open a list for selecting roles that can view the page.</td>
</tr>
<tr>
<td>Model document</td>
<td>A document ID of a record to display by default.</td>
</tr>
<tr>
<td>Page status</td>
<td>Select a status for the page, such as Published or Retired.</td>
</tr>
<tr>
<td>Created by</td>
<td>Specify the user who created the page. If you are logged in with a role that has higher privileges than your user name and you enter your user name, the field defaults to the role. For example, if you are logged in as an Admin and you type your name, which has lower privileges, this field displays Admin.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter a title for the page.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the page.</td>
</tr>
</tbody>
</table>

5. To add content blocks, click **Edit Page** under **Related Links** on the Page form.
6. Click **Add Content**.
7. Select a content block from the picker.
8. Select the dropzone where the content is to be added.

**Note:** You can create content blocks by adding one of the content blocks named "New [block type]" to the page.
Add content to a page

After defining the page settings, set the content of the page by adding content blocks the same way you add content to homepages.

2. Click Add Content.
3. Select a content block from the picker.
4. Select the dropzone where the content belongs.

**Note:** Create content blocks by adding one of the content blocks named "**New [block type]**" to the page.
Copy a page

Copying pages is an efficient way to avoid duplicating the same work and to create pages quickly from a guiding master template.

Role required: content_admin or admin

1. Navigate to Content Management > Sites and select the site.
2. Select the page to copy.
3. Click Copy.
4. Rename the page.

**Note:** Do not use service_catalog to rename a page. It is already a valid page in the system.

5. Edit the page fields.
6. Click Update.

Assign a page to a site

If you have created multiple sites, you can add pages from one site to another.

Role required: content_admin or admin

1. Navigate to Content Management > Sites.
2. Select a site.
3. In the Pages related list, click Edit.
4. Select other pages to include in the site.
5. Click Save.
6. Update the site.

Add a page to an application

Homepages and content pages are not added automatically to update sets and applications. They must be manually added.

Role required: content_admin or admin

1. Navigate to Content Management > Sites.
2. Right-click a content page record.

The page is added to the current application and to the current update set.

Configure a private UI page for CMS links

With single sign-on (SSO) in place, you can generate email links that take users directly to tickets and applications through the CMS interface.

Role required: content_admin or admin

You accomplish this procedure by creating a private UI page to redirect CMS links. Because the page is not public, it requires authentication and redirects to SSO appropriately.

1. Check that your CMS site is private by completing the following steps.
   a) Navigate to Content Management > Sites > [Your Site]
   b) Verify that the Login page field has a page listed.
2. Create a UI page by completing the following steps.
   a) Navigate to System UI > UI Pages.
   b) Click New.
   c) Enter a Name, for example, redirector.
   d) Enter the following Adobe Jelly code into the HTML field.

```xml
<?xml version="1.0" encoding="utf-8"?><j:jelly trim="true"
 xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
 xmlns:g2="null"><script type="script/javascript">
 window.location.href="${sysparm_uri}";</script></j:jelly>
```

The CMS supports email links with following format:

http://<path to instance>/<UI page>.do?uri=/<CMS suffix>/<record type>.do%26sys_id=<record ID>

For example:

http://<instance name>.service-now.com/redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a

**Note:** If you are using SAML 2.0 update 1 for SSO, use the UI page saml_redirector instead of creating a UI page. For example, an email link to a SAML 2.0 redirector page would use the URL format: http://<instance name>.service-now.com/saml_redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a.

### Content templates

Templates are content pages that are reused to provide consistent look and feel.

Templates are useful when creating CMS sites for the following reasons.

<table>
<thead>
<tr>
<th>Create pages rapidly without risk by copying pages</th>
<th>Using a template to create pages saves time because you do not have to keep repeating the same steps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a restore point for pages within the system</td>
<td>Have a working template available if something goes wrong in one of the blocks or in the theme CSS. It is often easier to start over from the template instead of trying to undo complex changes.</td>
</tr>
<tr>
<td>Provide a functional reference for editors on the site project</td>
<td>Having the template as a reference ensures that pages continue to conform to the style guide.</td>
</tr>
</tbody>
</table>

### Configure a master template

An easy way to create a master template is to copy the existing ESS sample site and customize it to suit your own needs. You can also configure a master template from scratch.

**Role required:** content_admin or admin

Follow these steps to create a single master page and generate all important components within the site.

1. Design a layout.
Regardless of the interface, a site can be distilled into a few simple layouts. For more information, see \textit{Layout concepts} on page 494.

2. Create a theme.
   The theme defines the structure of the layouts in CSS and the base styles, such as fonts and colors. For more information, see \textit{Content themes} on page 2106.

3. Build the common blocks.
   Pages are composed of content blocks. Most content blocks are reused on multiple pages. For the master template, build basic blocks such as a header, side navigation, and some basic content for the main content area of the page. More detailed content can be added later, but define content for reuse on many of the site pages here. For more information, see \textit{Content blocks} on page 2072.

4. Build a site entry page.
   Use the common content blocks you just created to design the first page that users see when they enter the site. For more information, see \textit{Create a content page} on page 2058.

5. Build a detail page.
   Design the detail pages to determine how pages such as knowledge articles, catalog items, and search results are displayed. You can build a detail page by copying the site entry page and adding additional content blocks. For more information, see \textit{Copy a page} on page 2064.

6. Assign the pages created to the new site.
   Create the site and apply the layout and theme to the site defaults. Then, navigate to the \textbf{All Pages} list and specify the master template site in the \textbf{Site} column for each of the master template pages. For more information, see \textit{Create a site} on page 2052.

\section*{Customize a copy of a page template}

One good source for templates is the base system sample site. It is easy to copy pages and restyle them into new page templates to meet different business requirements.

The Employee Self-Service portal is provided as a working example and design template in the following procedure.

1. Navigate to \textbf{Content Management} > \textbf{Sites} > \textbf{Employee Self-Service}.
2. Select a page.
   For example, to copy the ESS sample site homepage, select Portal.
3. Click \textbf{Copy}.
4. Rename the page.
5. Right-click in the header and select \textbf{Save}.
7. Edit the page by clicking the Edit icon \( 	ext{edit} \). For example, change the menus, alter the layout, or add a different logo.
8. Click \textbf{Update}.
9. Use the page in other sites you have created by \textit{assigning pages} to a site.

\section*{Page templates}

Every page that is part of the site needs a template. Sample page templates are listed here.
Critical page reference fields

When you build a new site, four page reference fields on the site record are critical. These pages are the first steps in understanding page templates and defining site defaults.

<table>
<thead>
<tr>
<th>Home page</th>
<th>landing page for the site. A home page is mandatory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search page</td>
<td>page that displays search results when a user searches from any page within the site. A search page is mandatory for your site to have a Search Results block.</td>
</tr>
<tr>
<td>Login page</td>
<td>a standalone login page, which is useful to force authentication for the entire CMS site.</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>page used to display the drill-through content from a gauge. When the user clicks a gauge, the gauge target page opens showing the drill-through content for that gauge.</td>
</tr>
</tbody>
</table>

Figure 565: Critical page reference fields
**Detail pages**

Depending on the data or tables you plan to use, you may need detail pages. These are pages defined by content types:

<table>
<thead>
<tr>
<th>Content Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge detail page</td>
<td>displays a full knowledge article detail (mandatory for a knowledge site).</td>
</tr>
<tr>
<td>Incident page</td>
<td>detail page for an incident record.</td>
</tr>
<tr>
<td>Catalog page</td>
<td>detail page for all items, content items, order guides, and record producers.</td>
</tr>
</tbody>
</table>

**Templates for creating sections**

There are two page templates you can use when creating sections:

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent page</td>
<td>keeps sections within large sites organized and sortable on the site list of pages. Parent pages are also used to create breadcrumbs dynamically.</td>
</tr>
<tr>
<td>Detail page</td>
<td>differs from the parent page in that the content area displays a full article or detail instead of a selection of related content. Detail pages must have a Current Document block.</td>
</tr>
</tbody>
</table>

These pages are mandatory if you plan on accessing system data. For example, if you plan on showing the service catalog in your CMS, you need the following items.

- A service catalog content type that references the [sc_cat_item table].
- A detail page that provides the full view of the item.

**New templates**

If the base system sample site pages are not suitable, you can create a template from scratch. Create a page and then use it as a template. For details, see *Create a Content Page*.

When saving a new template, include the word “template” in the page name.

**Content types**

Content types provide site-specific control of how system data defined by templates is rendered.

In the site, one page displays a list of knowledge articles, and another page displays catalog items or incidents or a combination of the two. Different themes can be used for types of content and each theme can provide different user interaction. Content types define the pages that display content from a table. Each content type corresponds to a table.

Every type of document that the CMS displays has an associated content type. Changing the content type requires knowledge of Apache Jelly scripting. However, the common content types (such as service catalog or knowledge base) come in the base system. Content types can be associated with particular sites. This association allows different sites to use different detail pages for the same content type.

Content types define three features of associated documents.
• What does a link to one of these documents look like? For example, if a list of these documents is displayed on a page, how does each entry appear?
• What does a detailed view of one of these documents look like?
• What detail page is used to display the document? This decision is important and is often an area of confusion for new CMS users.

The document content type determines the page that a list of documents points to, the list itself does not determine the page. The content from a link is displayed in a detail content block on a page. The content type determines in which detail block on a page the document content is displayed.

For example, the list block Catalog Top 5 displays the top five items in the Service Catalog table [sc_cat_item]. Because the table is [sc_cat_item], the content type sc_cat_item controls how the Catalog Top 5 list is displayed. Clicking any item in the list displays the Service Catalog Detail page with the item displayed on it according to the detail template script. These content types are applied:

• in search results to link to the correct page.
• in the Current Document block to display the current record.
• in links on lists and other places that link to record types.

Several content types are available by default for tables such as Catalog Item [sc_cat_item], Gauge [sys_gauge], and Page [content_page].

Content type defaults that are set for CMS can be overridden for individual sites. Use the Content Types related list on the site record to customize content types.

Create a content type

Users with the content_admin role can create a content type.

Role required: content_admin or admin

1. Navigate to Content Management > Content Types.
2. Click New.
3. Complete the Content Type form.

Table 492: Content Type form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the table whose content is rendered in Content Management.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site that uses this content type.</td>
</tr>
<tr>
<td>Media type</td>
<td>Enter one of the following media types to use with this content type or leave the field blank to use the UI11 interface.</td>
</tr>
<tr>
<td></td>
<td>• doctype: UI15 desktop interface only</td>
</tr>
<tr>
<td></td>
<td>• m: Smartphone interface only (not for CMS use)</td>
</tr>
<tr>
<td></td>
<td>• tablet: Tablet interface only (not for CMS use)</td>
</tr>
<tr>
<td>Default detail page</td>
<td>Select which page is loaded after a link is selected.</td>
</tr>
</tbody>
</table>
### CMS gauge support

Gauges are a graphical way to display information from an instance.

A gauge could, for example, show a bar chart breaking down all open incidents by category. Gauges are fully supported within the CMS system. This means:

1. You can put a gauge on a CMS page
2. You can control what happens when a user clicks a cell within that gauge

**Put a gauge on a CMS page**

You have control over the gauges on a CMS page.

1. Bring up the CMS page in edit mode.
2. Click **Add Content**.
3. Select the gauge you want to add.
4. Place the gauge on the page in the desired location.

**Control what happens on a click**

Since a CMS system uses multiple pages, you have to tell the system which page to use to display drill through content.

In the typical (non-CMS) ServiceNow system, when you click a bar in a bar chart or a wedge on a pie chart, you drill through and your current screen is replaced with a list of records meeting the criteria in the chart. For example, if you have a gauge of **Incidents by Category** and you click the bar labeled **Hardware**, you drill through to a list of all incidents with a category=hardware.

Within the CMS system, there is a similar drill through mechanism at work, but you must manually specify which page to display.

There are two different models of the drill through:

- use an in-place target frame which directs all content there
- specify an alternate page (gauge target page) to use to display the drill-through content

**Using an In-Place Target**

An in-place target is a named iframe on the same CMS page as the gauge. When the gauge is clicked, the drill-through content appears within that iframe rather than changing out the CMS page. The gauge (and the rest of the page other than the target) remain in place and active.

---

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gauge page</td>
<td>Select which page is used as the drill-through target for any gauge. If you display a gauge on a CMS page, then clicking the links loads the page specified here.</td>
</tr>
<tr>
<td>Summary Template</td>
<td>Write an XML script that determines how the list is displayed in the list block, if the link is displayed in a list block.</td>
</tr>
<tr>
<td>Detail Template</td>
<td>Write an XML script that determines how to display the associated information after a user clicks the link.</td>
</tr>
</tbody>
</table>
Using a Gauge Target Page

A gauge target page is a separate CMS page that is used to display the drill-through content from a gauge. When a gauge is clicked, the current CMS page is replaced with the gauge target page and the drill-through content is rendered within that second page.

- **Gauge Target Page**
  
  To set a site default, select **Gauge Target Page**, on the site configuration page. The site default is used as the drill-through target for any gauges in the system that do not have a more specific gauge page specified in their content type.

- **Gauge Page**
  
  To set a content-type specific page, you can specify a **Gauge Page**, on a content type page. Any gauges for this type of content then use that page for any drill through.

  **Note:** The gauge target on a particular content type overrides the default, site level, gauge target.

- **Gauge Target block**
  
  A gauge target page is a normal CMS page, with one special requirement. Somewhere on that page, there must be a **Gauge Target block**. This is a market block telling the system where to output the drill-through data.

View content types

The following is an example using Content Types.

This example uses the out-of-box Employee Self-Service (ESS) site as an example.

Role required: content_admin or admin

Use any out-of-box instance of a CMS site.

2. Under Get Help, click **Issue Status**.

   The Issue Status, or incident_status CMS page contains two content blocks: Common Answer and Current Issues. These content blocks both use Content Types to render results.

3. From [https://<instance name>.service-now.com](https://<instance name>.service-now.com), navigate to **Blocks > Lists > Portal - Common Answers**.

   This block matches the Common Answers section of the Issue Status page. The Table field describes the Content Type associated with Common Answers.

4. Use the link to view existing Content Types.
5. Click the Content Type to view the XML that determines how the list and record are rendered in CMS.

   The Default Detail Page field indicates a CMS page that displays a record selected from a List of Content block.

6. Click the Information icon next to the Default Detail Page, to go to that page.
7. From the Default Detail Page, under Related Links, click **Edit Page**.

   The Detail Block contains a content type formatter. When editing or viewing the page, it is looking for a URL to be passed to determine the record to display, which is why it says "Detail record could not be located".

8. Click the pencil icon to edit and view the Detailed Content block.

   The Type drop down list has "Show the page's current document" selected, which indicates that the document_id must be passed to this block from the CMS pages, then it can display the record based on the content type listed in the document_id.
9. From the Common Answers block, on the Self-Service page, select a record.

The page opens with a URL similar to: https://<instance name>.service-now.com/ess/knowledge.do?
sysparm_document_key=kb_knowledge,02255450d731310013ab49547e61038e

The table `sysparm_document_key=kb_knowledge` and `sys_id 02255450d731310013ab49547e61038e` determine the record. The associated content type, `kb_knowledge`, renders the content on the Default Detail Page, Portal - Knowledge Detail / url_suffix=knowledge.

Content blocks

A block is a defined piece of content within the system that can be reused.

A content page is constructed by arranging customized blocks of content on a page. Existing content such as reports, gauges, and record lists are automatically available as content blocks and more can be created within the CMS.

After defining content blocks, use them on any content page by adding them to dropzones. For more information, see Add content to a page on page 2061.

Create content blocks after sites and pages have been designed.

Create a content block

To create a content block, you must define it in the appropriate form.

Access the form in one of these ways:

- Navigate to Content Management > Blocks > [Block type] > New.
  The form opens for creating the selected block type.
- If you navigate to Content Management > Blocks > All > New, a wizard guides you to the appropriate form.
- Edit a page and add a stub block of the desired type (*New [block type]). Then, click the link in the stub block.
  After you save the form, add the content block to any content page.

Create a detailed content block

A detailed content block displays the content of an existing document, such as a knowledge article or a service catalog request, as a block on a content page.

Role required: content_admin or admin

The block works with content types in the Default detail page field. For more information, see Create a content type on page 2069.

If you plan to use a script to find a document, configure the form to add the Script field if it is not displayed.

1. Navigate to Content Management > Configuration > Page Detail Settings.
2. Click New.
3. Complete the Detailed Content form.

Table 493: Detailed Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Detailed Content block.</td>
</tr>
</tbody>
</table>
Create a CMS block tag

A CMS block tag is used for advanced block creation and site flexibility.

Role required: content_admin or admin

It is constructed as `&lt;g:content_block&gt; {{Jelly_Tags|Jelly}}&gt;` and can be used in either of the following ways.

- Blocks: to display a block inside a block.
- Layouts: to display a block inside a layout.

The tag appears in the format, `&lt;g:content_block type="&lt;type&gt;" id="&lt;sys_id&gt;"/&gt;`.

An example of the block tag is included in the ESS Portal sample site.

1. Navigate to Content Management > Design > Frames.
2. Click `cms_admin_home_frame`.

© 2017 ServiceNow. All rights reserved. 2073
3. View the code.

```html
<style>
DIV.cms_administration_home {
  background: url(gray_${current_page.getURLSuffix()}.pngx) no-repeat right top;
}
</style>

<div class="cms_administration_home">
${body}
<br/>
<!-- Would you like to pivot off of parent page instead? try this snippet
<j:if test="${current_page.getParentPage().getURLSuffix()=='administration'}">
  <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
</j:if>
  The defaults use the page URL suffix to define sub menus
  -->
  <j:if test="${current_page.getURLSuffix()=='administration'}">
    <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
  </j:if>
  <j:if test="${current_page.getURLSuffix()=='community_inspired'}">
    <g:requires name="ess.portal.globals.jsdbx"/>
    <g:content_block type="content_block_menu" id="ccd4b8c7efb70000914304167b22566e"/>
  </j:if>
<br/>
</div>
```

4. To see what the page looks like, navigate to the ESS Portal administration page. For example, http://instance name.service-now.com/ess/administration.do.

Configure a header block

A header block is a visual element placed at the top of pages. It provides a place for branding and other important site-wide functionality.

Some of the options that are available in headers include global search, text size toggle, menus for navigational purposes, and the user name with logout link.

1. Navigate to Content Management > Blocks > Headers.
2. Click New.
3. Complete the Header form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the header block.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Background    | Select a background for the header logo and menus. Choices are:  
|               | • None - No background is rendered  
|               | • Gradient/Image - Specify an image or gradient image to serve as the background  
|               | • Colored Bars - Specify colors for three different sections of the header (top, middle, and bottom)                                            |
| Image         | If Background is Gradient/Image, use this field to upload an image for the background of the header block. For gradients, upload a gradient image. |
| Top bar color | If Background is Colored Bars, enter a CSS color or color name to use as the background for the top menu.                                     |
| Middle bar color | If Background is Colored Bars, enter a CSS color or color name to use as the background for the logo and text.                               |
| Bottom bar color | If Background is Colored Bars, enter a CSS color or color name to use as the background for the bottom menu.                                |
| Logo          | Select an image to serve as a logo. The image is also a link to the main page.                                                               |
| Active        | Select this check box to make the block available for use.                                                                                   |
| Text          | Enter text that displays next to the logo.                                                                                                   |
| Conditional   | Enter any scripted conditions to be applied. If selected, adds a Condition script field to the form.                                           |
| Category      | Select a category to provide organization for the header block. The category also determines the detail page in which header block links open.  
|               | (Detail pages often display information in different ways). Default options include:  
|               | • None  
|               | • General  
|               | • Knowledge Base  
<p>|               | • Service Catalog                                                                                                                             |
| Top Menu      | Select a navigational menu block to use as a menu above the logo.                                                                            |
| Bottom Menu   | Select a navigational menu block to use as a menu below the logo.                                                                          |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height</td>
<td>Specify the height for the header.</td>
</tr>
<tr>
<td>Search</td>
<td>Select this check box to add a search element in the header.</td>
</tr>
<tr>
<td>Font sizer</td>
<td>Select this check box to include text sizing controls in the header.</td>
</tr>
<tr>
<td>Login</td>
<td>Select this check box to include a login link in the header. If the user is logged in, this element displays the user name and a logout link. If you specify a login page on the site record, remember to include a login link so users have a place to enter a username and password.</td>
</tr>
<tr>
<td>Chat Queue</td>
<td>Select the chat queue that users access by clicking the Help Desk Chat button in the header. Clear the field to remove the button. This field appears only if the Chat plugin is active.</td>
</tr>
</tbody>
</table>

Create a navigation menu block

Navigation menu blocks enable you to create a menu of links to different content pages.

Role required: content_admin or admin

The menu block defines the entire menu block and how it is displayed.

1. Navigate to **Content Management > Navigation Menus** and click **New**.
2. Click to select one of the CMS menu types displayed to open the Navigation Menu form.

**Note:** Older instances open the Navigation Menu form directly.
3. Fill out the Navigation Menu form to define the block.

**Table 495: Navigation Menu form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of navigation menu, which determines how the links are displayed.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the navigation menu block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, a Condition script field is added to the form, along with the Logged On check box.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the navigation menu block only if the user is logged on. This field appears only if Conditional is selected.</td>
</tr>
</tbody>
</table>
### Field
<table>
<thead>
<tr>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition Enter a script to define the conditions for the navigation menu block. This field appears only if Conditional is selected.</td>
</tr>
<tr>
<td>Active Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Category Select a category to provide organization for the navigation menu block. The category also determines the detail page in which menu links open.</td>
</tr>
<tr>
<td>Align sections with tab Select this check box to align sections with tab.</td>
</tr>
</tbody>
</table>

**Navigation menus and content links**

The methods for choosing a link target (Open in: current window, iframe, or new window) and referencing the item linked (Redirect to: page reference, attachment reference, or URL reference) are similar, so learning how to link within any of these elements is useful.

- A content page reference helps you select the desired page.
  - For example, the value home.do links to the site homepage.
- An attachment reference allows you to reference a single file attached to the menu item or section record. If there is more than one attachment, only the first is referenced.
  - Link is generated automatically and displays a browser file save prompt.
- The specified URL reference allows you to link to a full URL string that may be in the ServiceNow system or part of another system.
  - For example, com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=66c313e7c0a8016b008ee1a8e3d97f5&sysparm_nameofstack=b654d15b6f921000914304167b025 links to the Ask a Question record producer.
  - If you need to link to a page in an existing intranet system, this attribute can be useful.

**Menu sections**

Menu sections define groups of links and how the links behave. For example, link behavior determines which page opens when the link is clicked and how it opens (such as in a new page or a new frame). Use the following procedure to view a sample menu section.

1. Navigate to **Content Management** > **Blocks** > **Navigation Menus**.
2. Click **Portal - Block Menu**.
3. In **Menu Sections**, click **Order Things**.
4. Click the reference icon next to **Detail Page**.
5. In **Related Links**, click **Edit Page**.

By default, the link goes to the Order Things page that has the Portal - Order Splash Menu (Vertical Block Menu) in the content area of the page.
In the majority of the default CMS menus, the menu section serves as the menu title followed by secondary text, a separation line, and whatever links you define as menu items. The two menus primarily illustrate CMS menus. Although the design is versatile and flows well between pages, there could be questions about linking and scalability to large catalogs. This may only be a good practice for a small catalog with limited items. Look at the request catalog list / grid view demo in the code example demos menu on the ESS Portal:

1. Open your instance.
2. Add /ess/manage.do to the address in your browser address bar. The address should look similar to: https://yourinstancename.service-now.com/ess/manage.do.
3. In the Code Example Demos section, click Request Catalog List / Grid View.
4. Browse the catalog items.

Menu items and content links

Menu items can be seen as featured links from each section. There are many choices in URL definitions and link options. Links within the ESS Portal all link to content pages within the site. In turn, each page has an iFrame or set of blocks that houses the corresponding data. This method is useful for rapid prototyping, but consider where you need to create dynamic detail pages. Looking across all the menu sections, this discussion explains some of the linking options available to records within the system.

Figure 566: Menu item

Before proceeding to the links themselves, it is important to mention content links in the CMS. Menu items are similar to content links except they are called by the list block, not as part of a navigation menu block. Menu items and content links function the same as far as how they are defined and the options available for linking to items within the ServiceNow system. Content links are meant to be called through a list block that calls the Content Link [content_link] table. Content links do not have the Logged in field or the Roles option that can be very useful for controlling the UI experience for various roles defined in the system.
Figure 567: Content link

**Linking to catalog items, reports, and business services**

![Business Services](image)

![Featured Services](image)

![Reporting](image)

**Figure 568: Integration points**

**Business Services** links to a content page (CMS page referenced: Business Service Portfolio, URL: business_service_category.do) that pulls the system service catalog homepage into a frame within the content area. Each link within this section leverages the browse by category page, where you pass in the name of the category to return results.
• Target page's iFrame URL: catalog_home.do?
sysparm_nameofstack=aabdae07ef221000914304167b22567d&sysparm_view=business&sysparm_clear_stack=yes
• Target page's frame name: gsft_main
  • Desktop Computing URL: category_browse.do?category=Desktop Computing
  • Business Applications URL: category_browse.do?category=Business Applications
  • Communications Services URL: category_browse.do?category=Communications Services
  • Infrastructure Services URL: category_browse.do?category=Infrastructure Services
  • Hosting Services URL: category_browse.do?category=Hosting Services

Featured Services links to to a content page which pulls a small subset of services into an iFrame.
• iFrame URL: com.glideapp.servicecatalog_category_view.do?
sysparm_parent=d67c446ec0a8016500335aa37eafbc1&sysparm_view=
• Frame name: gsft_main
  • Install Software URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=10d69689c611227600ffe6a41c664824
  • Email Account URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=d67a86b8ce080165009386c752cd4a09
  • Electronic Messaging URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=533798810a0a0b600f1a03593e19058
  • VPN RSA Token URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=d67b099ac0a80165019d0c276b772502
  • Shared Storage (SAN) URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=cedd458a0a0b8300c3b1e32e7a3ac2

Reporting links to a content page that pulls the reports page into an iFrame. All links within this menu leverage homepages in the system, which creates an issue with the home.do URL. Notice in the links below that ../ is used to create a relative URL outside of the CMS site home.do definition. Without this, the site homepage would render within the iFrame.
• iFrame URL: report_home.do
• Frame name: gsft_main
  • Cost Management Overview URL: ../home.do?
sysparm_userid=0a81ae91c0a805c64c0942ab2e4b852b
  • Administration Overview URL: ../home.do?
sysparm_userid=0b7b11f6c611228901ff3cfb0b3cc8f
  • Portfolio Overview URL: catalog_home.do?sysparm_view=business
  • Service Availability URL: ../home.do?
sysparm_userid=0ee772000a0b0bad0c38eb7e68b93d0
  • Service Level Agreements (SLA) URL: ../home.do?
sysparm_userid=075e86a30a0006d4010a6851639498d1

View menu and list examples
Menu sections define groups of links and how the links behave.

Role required: content_admin or admin

For example, link behavior determines which page opens when the link is clicked and how it opens, such as in a new page or a new frame. Use the following procedure to view a sample menu section.

2. Click Portal - Block Menu.
3. In **Menu Sections** related list, click **Order Things**.
4. Click the reference icon next to **Detail Page** to open the page.
5. In **Related Links**, click **Edit Page**.

By default, the link goes to the Order Things page with the Portal - Order Splash Menu (Vertical Block Menu) in the page content area.

In most default CMS menus, the menu section has the menu title with secondary text, a separation line, and the links you define as menu items. Although the design is versatile and flows well between pages, there could be questions about linking and scalability to large catalogs. This practice may only be useful for a small catalog with limited items.

6. To view an example of dynamic content, follow these steps to look at the request catalog list/grid view on the ESS Portal.
   a) Add `/ess/manage.do` to your instance URL.
      For example, `https://<instance name>.service-now.com/ess/manage.do`.
   b) In the **Code Example Demos** section, click **Request Catalog List / Grid View**.
   c) Browse the catalog items.

*Menu style customization*

You can make menu style customizations in the style sheets your site uses.

Navigate to **Content Management > Design > Style Sheets** to customize style sheets.

**Supplementary page navigation menu example code**

In the example below, look at the CSS class selectors and rules. Also, note how the block containers (div.cms_menu_section_blocks) are defined based on the outer container (TD.layout_content_submenu_column). The outer container is actually a part of the site layout. This is clearer if you compare the styles to those used in the super menu further down in the example. The lesson is that there is no need to make a completely new menu system - just use CSS to change the look and feel of existing menus.

```html
/* *****************************************************************************************************/
SUB MENU VARIATIONS FOR HORIZONTAL MENUS - Section Blocks Menu
(cms_menu_section_blocks UI Macro)
*****************************************************************************************************/

TD.layout_content_submenu_column
  DIV.cms_menu_section_blocks{width:156px;height:auto;float:left;position:relative;border-style:solid;margin:0px0px0px0px;border:0pxsolid#e0e0e0;padding:0px;background:none;padding:24px12px0px12px;}

TD.layout_content_submenu_column
  DIV.sub_menu_section{width:156px;height:20px;float:left;border-style:solid;border:0pxsolid#e0e0e0;padding:0px;background:none;padding:0px12px0px12px;}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {color:#FFF;}

TD.layout_content_submenu_column IMG.menu_bullet{display:none;}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a,
  TD.cms_menu_tab_blocks_text h2 {margin:0;padding:0px;font-size:11px;text-transform:uppercase;color:#42C4DD;font-weight:normal;white-space:nowrap;}

TD.layout_content_submenu_column
  a.cms_menu_block_item{margin:0;padding:0px;font-size:11px;color:#FFF;}
```

Super menu sections example code

This menu is essentially a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class.

In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of "cms_header_bottom_menu" (note the TD.cms_header_bottom_menu CSS selector).

```html
/********************
Section Blocks Menu (cms_menu_section_blocks UI Macro)
/********************
```

```html
div.cms_menu_section_blocks{width:260px;height:260px;float:left;border-style:solid;margin:0px0px12px12px;border:1pxsolid#e0e0e0;padding:10px;background:url(blue/portal_horizontal_bkg.pngx)repeat-xcenterbottom;}
```

```html
p.cms_menu_separator{border-top:1pxdotted#ccc;margin-top:6px;margin-bottom:6px;}
```

```html
td.cms_menu_section_blocks_title h2, td.cms_menu_section_blocks_title h2 a, td.cms_menu_tab_blocks_text h2 {margin:0;padding:0px;font-size:larger;font-weight:normal;color:#444;}
a.cms_menu_block_item{margin:0;padding:0px;color:#999;font-size:inherit;}
```

```html
/********************
SUPER MENU VARIATIONS FOR HORIZONTAL MENUS - Section Blocks Menu (cms_menu_section_blocks UI Macro)
/********************
```

```html
TD.cms_menu_section_blocks_title h2, td.cms_menu_tab_blocks_text h2 {margin:0;padding:0px;font-size:larger;font-weight:normal;color:#444;}
a.cms_menu_block_item{margin:0;padding:0px;color:#999;font-size:inherit;}
```

```html
TD.cms_header_bottom_menu/*style the super menu drop down bar*/z-index:199;float:left;background:none;margin-left:44px;}
```

```html

Menu types

By changing the **Type** field on the navigation menu block, you can format the same menu in different ways.

Table 496: Menu types

<table>
<thead>
<tr>
<th>Type</th>
<th>Image</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop-Down Menu</td>
<td><img src="image" alt="Drop-Down Menu Image" /></td>
<td>The drop-down menu renders the menu sections as drop-down list. Use the mouse to hover over the menu name and view the menu items.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Tab Menu for Headers</td>
<td><img src="image1.jpg" alt="Image" /></td>
<td>The tab menu renders the menu sections as tabs. Use the mouse to click the tab and view the menu items.</td>
</tr>
<tr>
<td>Horizontal Blocks</td>
<td><img src="image2.jpg" alt="Image" /></td>
<td>The horizontal blocks menu renders the menu sections as block headings with menu items as links within the blocks. The blocks are arranged horizontally.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Tab Content Block</td>
<td><img src="image1.png" alt="Tab Content Block Image" /></td>
<td>The tab content block (horizontal) menu renders the menu sections as tabs with menu items as links within the block.</td>
</tr>
<tr>
<td>Vertical List</td>
<td><img src="image2.png" alt="Vertical List Image" /></td>
<td>The vertical list menu renders the menu sections as headings with menu items as links below them.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Vertical Blocks</td>
<td><img src="image" alt="Image" /></td>
<td>The vertical blocks menu renders the menu sections as block headings with menu items as links within the block. The blocks are arranged vertically.</td>
</tr>
<tr>
<td>Super Menu</td>
<td><img src="image" alt="Image" /></td>
<td>The super menu is a hybrid between the drop-down menu and the tabbed system that allows the user to create a menu out of any number of menus.</td>
</tr>
</tbody>
</table>

**Configure menu sections**

Menu sections define groups of links displayed within the navigation menu block.

Role required: content_admin or admin

1. Navigate to **Content Management > Blocks > Navigation Menus** and select a block.
2. In the Menu Sections related list, click **New**.
3. Complete the Menu Section form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image DB</td>
<td>Select the image database where your site images are stored.</td>
</tr>
<tr>
<td>Right image DB</td>
<td></td>
</tr>
<tr>
<td>Left image</td>
<td>Select icons to appear on the left and on the right of the name.</td>
</tr>
<tr>
<td>Right image</td>
<td></td>
</tr>
<tr>
<td>Second level text</td>
<td>Enter a description to appear beside the menu section title.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu section available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this section appears on the menu relative to other menu sections.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu section only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu section if you restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu section belongs.</td>
</tr>
<tr>
<td>Open In</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Enter the name of the iFrame where the link opens when a user clicks the menu section title and icon. Make sure that there is an iFrame on the page where the link opens. This field is available only if Open In is set to Named iFrame.</td>
</tr>
<tr>
<td>Header</td>
<td>Enter header information for the menu section.</td>
</tr>
<tr>
<td>Footer</td>
<td>Enter footer information for the menu section.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
**Menu sections**
Define each section of the menu by navigating to **Content Management > Navigation Menu**. On the Menu Sections related list, click **New**, then fill out the Menu Section form.

**Table 498: Menu Section form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image</td>
<td>Select an icon to appear on the left of the name.</td>
</tr>
<tr>
<td>Right image</td>
<td>Select an icon to appear on the right of the name.</td>
</tr>
<tr>
<td>Second level text</td>
<td>A description to appear next to the menu section title.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu section available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this section appears on the menu relative to other menu sections.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu section only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu section if you want to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu section belongs.</td>
</tr>
<tr>
<td>Open In</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Enter the name of the iFrame where the link should open when a user clicks the menu section title and icon. Make sure that there is an iFrame on the page where the link opens. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>
Configure menu items
Menu items are the links that appear within each menu section.

Role required: content_admin or admin

Not all navigation menu sections require menu items. Use menu items to link users to other pages or additional information. These steps use the ESS sample portal site as an example.

1. Navigate to **Content Management > Blocks > Navigation Menus** and select a navigation menu. For example, select the **Documentation Menu**.
2. From the **Menu Sections** related list, select a menu section. For example, select **Getting Started**.
3. From the **Menu Items** related list, click **New**.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when the menu item name and icon are clicked.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to open when the menu item title and icon are clicked. This field is available only if <strong>Redirect To</strong> is set to <strong>The specified URL</strong>.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when the name or icon is clicked. This field is available only if <strong>Redirect To</strong> is set to <strong>A content page</strong>.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu item to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu item belongs.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>iFrame</td>
<td>Type the name of the iFrame where the link opens when a user clicks the menu item name and icon. Make sure that there is an iFrame on the page. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Menu items**
Add menu items from the Menu Section form.

In the Menu items related list, click **New** and fill out the Menu Item form.

### Table 500: Menu Item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item will appear.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu item name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu item title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the name or icon.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu item if you want to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu item belongs.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of clicked links.</td>
</tr>
</tbody>
</table>
Configure dynamic blocks

Use dynamic blocks to use scripting or to pull information from the system. Dynamic blocks are where most of your content resides.

Role required: content_admin or admin

A good use of dynamic blocks is job postings. Store the postings in knowledge articles and display the postings with a dynamic block.

Several dynamic blocks are predefined, including the following items.

- **New Content**: Each of the new content blocks allows for creating blocks while editing content pages.
- **Clean Login**: The default login page requesting user name and password, which includes a "Remember Me" check box. After the user logs in, this block triggers login rules.
- **Login**: An area that allows a logged out user to log in and a logged in user to log out. This block is especially useful on publicly available content pages.
- **Search**: The global text search field. Currently, global text search is the only form of search that can be included in a content page.
- **Search Results**: An area for displaying global text search results.

For information about Apache Jelly, see *Content Management and the Apache Jelly engine* on page 2100.

1. Navigate to **Content Management > Dynamic**.
2. Click **New**.
3. Complete the Dynamic Content form.

### Table 501: Dynamic Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the dynamic content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the dynamic block. The category also determines the detail page in which dynamic block links open.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the dynamic block. For more information, see <em>Format a frame</em> on page 2108.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field to the form.</td>
</tr>
</tbody>
</table>
### Catalog cart block

The catalog cart block is a dynamic block provided in the base system.

This block provides the same cart available within the service catalog. If the site definition has the Use external cart option selected, this block needs to be included in the site so users can interact with their catalog cart.

Catalog cart block is available when the glide.sc.use_cart_layouts property is set to false.

### Customize a list block

List blocks are content blocks that dynamically generate a list of links to records within the instance. When a user clicks a link in a list block, the associated information is displayed in a detail page determined by its content type.

Role required: content_admin or admin

Make the list using a simple query on any table or by scripting a more advanced query. Lists are powerful and flexible. Here are some places that allow you to have complete control over the list display.

#### Table 502: List control

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames</td>
<td>Frames provide a method to create decorative containers for content blocks and other elements within the site. When frames are used with the Type field, the designer has complete control over list placement.</td>
</tr>
<tr>
<td>List Type</td>
<td>The List Definitions module defines the type of lists available for content pages. On the List Block form, select a list definition in the Type field.</td>
</tr>
<tr>
<td>List Filtering</td>
<td>Provides every field in the referenced table for more granular results.</td>
</tr>
<tr>
<td>Max Entries</td>
<td>Limits the results from a table to fit the design of the block.</td>
</tr>
<tr>
<td>Order and Order Direction</td>
<td>Allows sorting by any field in the referenced table, in either ascending or descending order.</td>
</tr>
</tbody>
</table>

You can also use list blocks to create a list of links to information outside your instance. Create the external links as records on the Content Link [content_link] table, and then follow the steps in this procedure.

1. To define a list block, navigate to **Content Management > Lists** and click **New**.
2. Complete the form.
# Table 503: List block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the list content block. This name is used to identify the record in ServiceNow and is not displayed on the content page. Use the Title field for that purpose.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block. Default options include:</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• General</td>
</tr>
<tr>
<td></td>
<td>• Knowledge Base</td>
</tr>
<tr>
<td></td>
<td>• Service Catalog</td>
</tr>
<tr>
<td>Type</td>
<td>Select a list definition UI Macro to format the list of links. For more information on list definitions, see <em>List Definitions</em>.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the list block. For more information, see <em>Creating a New Frame</em>.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to enable generating a list from a script, rather than a simple filtered query on a particular table.</td>
</tr>
<tr>
<td>Query</td>
<td>Filters the results using a condition builder.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the name to display at the top of the list block when it appears in a content page.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Set the maximum number of entries to be displayed in this list block.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to query for the list items. The table determines which detail page displays a user clicks a link in the list block. For more information, see <em>Configure the Content Type</em>.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same *scope* as the list block.
3. Click **Submit**.

**Configuring content type in a list block**
Content types define how a list is displayed in a list block. Each content type corresponds to a table.
Select a table in the list block Table field to make that list block use the corresponding content type.
For instructions on how to define the content type, see **Create a content type** on page 2069.

**Configure list definitions**
List definitions, similar to content management frames, are decorative containers that control the look and feel of lists.
Role required: content_admin or admin
Specifically, list definitions are UI macros that use Adobe Jelly script to define how a list is rendered inside a list block. Site design often requires multiple list styles within the layout. Lists are often the primary form of navigation within a site, so it is important to have control over their formatting.
Configuring list definitions requires a knowledge of Adobe Jelly.

1. Navigate to **Content Management > Configuration > List Definitions.**
2. Click **New.**
3. Complete the List Definition form.

**Create a static HTML block**
Use static blocks for text that does not change. For example, use a static block for a site footer with only the company or organization name. A static HTML block allows any HTML code to be run within a page.
Role required: content_admin or admin
The HTML editor in the static block has limited functionality for designers who are familiar with editing HTML, Jelly, or Javascript. The HTML editor can also add tags or formats that advanced coders find unnecessary. For more advanced options, use **dynamic blocks**.

1. To create a new static HTML block, navigate to **Content Management > Static HTML.**
2. Click **New.**
3. Complete the Static Content form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the static HTML content block.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Category       | Select a category to provide organization for the static HTML block. The category also determines the detail page in which static HTML block links open. (Detail pages often display information in different ways). Default options include:  
  - None  
  - General  
  - Knowledge Base  
  - Service Catalog                                                                                                                                 |
| Frame          | Select a border styling for the static HTML block. For more information, see Creating a New Frame.                                                                                                          |
| Active         | Select this check box to make the block available for use.                                                                                                                                                  |
| Conditional    | Enter any scripted conditions to be applied. If selected, adds a Condition script field to the form.                                                                                            |
| Static Content | Enter HTML code that determines the behavior of the static HTML block.                                                                                                                                       |

**Format an image as a static HTML block**

An easy way to add an image to a CMS page is to use a static HTML block. After the block is created, you can reuse it throughout the site.

1. Navigate to Content Management > Design > Images.
2. Click New.
3. Select a Category to help organize the images.
4. Type the file name of the image, including the extension (such as .png).
5. Upload the file by selecting Click to add and browsing for the image.
6. Click OK.
7. Click Update.
9. Paste the following code into the HTML block, substituting the image name as uploaded in the previous step.
   The "x" at the end of the filename is required for image caching.

   ```html
   <img src="<image_name>.gifx"/>
   ```

Now the image is a static HTML block and you can add it to any content page. Use standard HTML code to alter the image in the content block.

**Configure Flash movie blocks**

Use a Flash movie block to embed any Flash movie (.swf file) as an attachment or by referencing a URL in a content page.
Role required: content_admin or admin

To add streaming video or Flash video (.flv), for example, to a knowledge article, see *Adding media to HTML fields* on page 806.

1. To create a Flash movie block, navigate to **Content Management > Flash Movies**.
2. Click **New**.
3. Complete the Flash Movie form.

**Table 505: Flash movie form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Flash movie block.</td>
</tr>
<tr>
<td>Source</td>
<td>Determines where the Flash movie is found. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Attachment - If this choice is selected, <em>upload</em> the Flash movie to this record.</td>
</tr>
<tr>
<td></td>
<td>• Link to External Object - If this choice is selected, a URL field is displayed. Specify the Flash movie URL and ensure that the Flash movie is publicly accessible.</td>
</tr>
<tr>
<td>Height</td>
<td>Height, in pixels, for the Flash movie.</td>
</tr>
<tr>
<td>Width</td>
<td>Width, in pixels, for the Flash movie.</td>
</tr>
</tbody>
</table>

Configure content links

Content links are the predecessors to navigation menus. You can use content links to create navigational links to information outside of your instance.

Role required: content_admin or admin

After the content link is configured, it must be defined in a list block. List blocks use content links to reference information outside of your CMS.

1. Navigate to **Content Management > Specialty Content > Content Links**.
2. Click **New**.
3. Complete the Content Link form.

**Table 506: Content Link form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the content link</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select the location of the external link</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
URL | Click the lock icon to open the edit field, then enter the site URL to open when the link is clicked. This field is available only if Redirect to is set to The specified URL.
Open in | Select the behavior of the clicked link.
Detail page | Select the page where the link opens when it is clicked. This field is available only if Redirect to is set to A content page.
iFrame | Enter the name of the iFrame where the link opens when it is clicked. Make sure that there is an iFrame on the page where the link opens. This field is available only if Open In is set to Named iFrame.

4. Click Submit.
5. From Content Management > Blocks > Lists, create a list block that references the content links by selecting Content Link in the table field.
6. Create a query to determine which external links display on the page. For example, the query Category is Search displays any external links that have a category defined as Search.
7. Click Update.

Define an iFrame

Define an iFrame with forms created in the system and link to the page in which the iFrame resides.

Role required: content_admin or admin

Configure an iFrame with forms you create in the instance and link to the page in which the iFrame resides.

1. Navigate to Content Management > Specialty Content > iFrames.
2. Click New.
3. Complete the iFrame form fields.

Table 507: iFrame form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the iFrame block.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a name for the frame on the page. Make sure that there is an iFrame on the page where the link opens. This name allows links within the iFrame to open within the iFrame.</td>
</tr>
</tbody>
</table>
Field | Input value
--- | ---
**URL** | Enter the URL to display in the iFrame. If you use the iFrame to display ServiceNow content, start with the page name and do not include the base instance part of the URL. For example, to show the list of requested items, the URL is: `sc_req_item_list.do`
Queries can be applied to the URL. For instance, to display a list of open requested items, the URL is: `sc_req_item_list.do?sysparm_query=active=true`
For more information, see [URL schema](#) on page 53.

**Sizing** | Select an option for iFrame block size.

*Note:* The Expand to fit content choice only works with ServiceNow content. If Fixed Size is selected, height and width fields are displayed for you to enter the size in pixels.

---

**Note:** Some browsers suppress iFrames because they use an X-Frame-Options header value of SAMEORIGIN. The X-Frame-Options header was introduced in Internet Explorer 8 RC1, to help detect and prevent frame-based redressing. The SAMEORIGIN value causes the browser to render a blank page instead of the target page of the `<frame>` or `<iframe>` when the frame target is not on the same origin as the page itself. Support for this header has been implemented in Safari 4.0, Chrome 4.1.249.1042, and Firefox 3.6.9 and above.

**Integrate Live Feed with CMS**

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

The ESS Portal template includes the Portal - Live page and Live Feed dynamic block (requires the Live Feed plugin). To provide access to Live Feed from CMS pages, *add the Live Feed dynamic block* to a CMS page or include the Portal - Live page in a site.

1. Navigate to **Content Management > Specialty Content > iFrames**.
2. Click **New**.
3. Complete the iFrame block form with the following values.

**Table 508: iFrame values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name: Live Frame</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a frame name: live_frame</td>
</tr>
</tbody>
</table>
Field | Input value
--- | ---
URL | Enter `https://instance name/live_feed.do?sysparm_doctype=true`. Replace `instance name` with your instance URL, for example, `<myinstance>.service-now.com`.

Sizing | Select **Fixed Size** and enter height and width pixel dimensions according to the page on which you plan to display the feed. For example, enter a width of 1024 and height of 768.

4. Click **Submit**.
5. Complete the steps in **Add the block to a page**.

*iFrame methods*

The following examples show how system records are pulled into an iFrame that is placed on a content page.

For system lists or forms, use the frame name **gsft_main** so that links work properly.

- **Order Hardware** is an example of linking to a catalog category.
  - **URL**: `com.glideapp.servicecatalog_category_view.do?sysparm_parent=d258b953c611227a0146101fb1be7c31&sysparm_view=`
  - Frame name: **gsft_main**

- **My Approvals List** is an example of linking to a list with a view filter and a JavaScript that reference the authenticated user.
  - **URL**: `sysapproval_approver_list.do?sysparm_query=approver=javascript:getMyApprovals()&sysparm_view=ess`
  - Frame name: **gsft_main**

- **Service Catalog Home Page (system)** references the system catalog page within the Service Catalog application. If you are satisfied with the way the catalog looks, this method is an easy way to bring the page into a CMS design.
  - **URL**: `catalog_home.do?sysparm_view=catalog_default`
  - Frame name: **gsft_main**

- **Problem Management Overview** references a homepage. `../` makes the URL string relative to system homepages. Without it, the URL string resolves to the default CMS homepage reference in the site.
  - **URL**: `../home.do?sysparm_view=problem_overview`
  - Frame name: **gsft_main**

**Content Management and the Apache Jelly engine**

Apache Jelly is a Java-based and XML-based scripting and processing engine for turning XML into executable code.

The Apache Jelly engine closely resembles XML and is typically comfortable for developers familiar with JavaScript, XML, XHTML, or HTML. In the ServiceNow instance, the Apache Jelly engine renders items such as forms, lists, and UI Pages. Apache Jelly code renders well within a dynamic content block, but can
Geneva
ServiceNow
ServiceNow Platform

have issues when used in static blocks. You can use Jelly tags, calls, and statements, but HTML acts just like XHTML.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
    <j:if test = "${current_page.getName()==='Solutions'}">
        <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}">${gs.getMessage('Solutions')}</a> </b> </h1>
        <p class = "page_description" > 
            ${current_page.getDescription()}
        </p>
    </j:if>
    <j:if test = "${current_page.getName()==='IT 3.0'}">
        <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}">${gs.getMessage('Solutions')}</a> </b> | 
            ${current_page.getName()})</h1>
        <p class = "page_description" > 
            ${current_page.getDescription()}
        </p>
    </j:if>
</j:jelly>
```

Ensure that all tags are closed. If the tag is not a naturally closing tag, then place a forward slash before the end bracket. For example, a <BR /> or an <IMG src="cms.png" />.

If you are unfamiliar with Jelly, review these topics:

- **Jelly tags** on page 3931
- **Extensions to Jelly syntax** on page 3937

Include the following tag with all Apache Jelly scripts.

```xml
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
```

The tag looks complex, but keep the following information in mind.

- Apache Jelly script uses multiple namespaces.
- There are two types of prefixes in tags: j and g. The j prefix is used for tags that are natively part of Apache Jelly. The g prefix is used for tags that the ServiceNow platform created and is using for platform purposes.

The j2 and g2 prefixes are just like j and g, except that they are processed in a second phase. The Apache Jelly script parser runs through each j and g tag respectively. For example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
    <j:set var="jvar_phase1" value="Hello" />
    <j2:set var="jvar_phase2" value="World" />
    ${jvar_phase1} ${jvar_phase2}
</j:jelly>
```

In phase 1, the parser runs through all the j and g tags. It then caches the result. Before it runs the second phase, it takes the j and g namespaces and moves the namespaces to the second phase. It looks something like the following code.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="jelly:core" xmlns:g2="glide">
```
Hello $[jvar_phase2]
</j:jelly>

For subsequent calls of this script, only phase 2 is parsed.

**Note:** If you plan to use phase 2 Jelly tags (g2 and j2) on the Content Type [content_type] or Dynamic Content [content_block_programmatic] tables, select the **Two phase** option on the content form.

Another example is to create a report of all open incidents assigned to each group. For this purpose, you could use a report and save time, but it is a good example for learning Jelly. Start with the Jelly tag:

```jelly
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
</j:jelly>
```

First, you need a list of open incidents. Use a g2:evaluate tag. The evaluate tag runs the script. Anything inside the tag is parsed like a business rule, so, for example, you can call global business rules, script includes, and glide records.

```jelly
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
<g:evaluate var="jvar_groups" object="true">
 var gr = new GlideRecord("sys_user_group");
 gr.orderBy('name');
 gr.query();
 gr;
</g:evaluate>
</j:jelly>
```

This script is in phase 1 because frequent changes to incident assignment groups are not expected. Also notice the var attribute on the evaluate tag. This attribute specifies what variable is set from this block. At the end of the script, there is a gr on a line by itself. That last line is what sets the variable.

You can omit the jvar_groups variable, but then all the variables in the evaluate tag become Apache Jelly variables. The object=true specifies that the variable is not a primitive data type. If object=true is omitted, the script would break because jvar_groups would only be able to hold items like integers and strings.

After the evaluate tag, loop through these groups and find the incidents for each one.

```jelly
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
<g:evaluate var="jvar_groups" object="true">
 var gr = new GlideRecord("sys_user_group");
 gr.orderBy('name');
 gr.query();
 gr;
</g:evaluate>
<table>
<tr>
 <th>Name</th>
 <th>Incidents</th>
</tr>
<j:while test="${jvar_groups.next()}">
 <tr>
  <td>${HTML:jvar_groups.getValue('name')}</td>
  <td></td>
 </tr>
</j:while>
</table>
```
You can include normal XML in the Apache Jelly script at any time. Since there is no namespace, the Apache Jelly script does not try to parse the XML tags. Notice the \texttt{j:while} loop. It is a normal while loop and can iterate through a GlideRecord object. Also notice that you output a value with \texttt{${\text{HTML: jvar_groups.getValue('name')}}}. Here are the important elements:

- The outer brackets, \texttt{$\{$}, specify the output of the variable and the phase in which the variable is output: \texttt{$\{}$ means first phase, \texttt{$[]$} means second phase.
- HTML before the expression is for escaping the output. The expression \texttt{jvar_groups.getValue('name')} is being escaped for HTML. For other types of escaping, there are \texttt{JS} (Javascript), \texttt{NS} (No Script), and some other options.

To select only one record and not iterate through many records, the code looks like the following example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var gr = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <j:if test="${jvar_groups.next()}">
    We found ${\text{HTML: jvar_groups.getValue('name')}}
  </j:if>
</j:jelly>
```

### Content Management and Jelly code examples

#### Code examples

**Header Example Code**

This dynamic content block must be active, and the Two Phase option selected. The \texttt{g:requires} tag is including the UI script defined in the system whose name is "servicenow.website.globals." The file extension in the call is .jsdbx and is used only in the call to the UI script, not in the name of the script in the system. For JSDBX, the file being called is a JavaScript (.js) defined within the database (db) that is cached (x).

```xml
<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <g:requires name = "servicenow.website.globals.jsdbx" />
</j:jelly>
```

**Page Title and Description Example Code**

This dynamic content block must be active. There are two actions within this code snippet. First is a forward-looking string container that allows site translation, the \texttt{{$gs.getMessage('Your Text')}} string call). The second action pulls in the page title and description, \texttt{{$current_page.getName()}} and \texttt{{$current_page.getDescription()}}.

```xml
<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <j:if test = "${current_page.getName()='Solutions'}" >
    <h1 class = "page_name" > <b > <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}">${gs.getMessage('Solutions')}</a> </b> </h1>
    <p class = "page_description" >
```
List Block Pulling From Knowledge Articles Example Code

This code example contains one of the best tricks in the CMS. Use the type field with draws from several defined list definitions to make slight, or major changes, to the list display. The UI is open to configuration and innovation, and offers a good opportunity to use design skills. Anyone who can use HTML and CSS knows that a basic list can be turned into a float grid or be made inline. The combinations are limited only by what the designer can imagine and code.

In the code example, there is a custom logo field (u_logo) added to the Knowledge form. The custom field displays customer logos, partner logos, and award images on the awards page. There are several different sections that use this list definition so efficient reuse is taking place.

- div class="cms_knowledge_list customer_success" - Begin by creating an outer container with a unique class name that can be used as a basis for CSS style selectors and rules. From the outer container, many of the child elements can be accessed for theming.
- <g:for_each_record file="${current}" max="${jvar_max_entries}" > - Loop for list creation that calls the selected table record and the entries set on the list form.
- <img src="${current.u_logo.getDisplayValue()}
alt="${current.text}" width="110px"
/> - Defines linking to the article detail in the knowledge base. For further reference, look at content types within the site definition and notice some similarities. The knowledge.do? portion of the URL points to the knowledge detail page which is mandatory if you plan to call the knowledge base in your CMS site. The rest of the URL represents the syntax for calling a knowledge article by its sys_id. Each item housed within the system has a unique sys_id.
- <ttt>${SP}-
 ${SP}${current.author.first_name}${SP}${current.author.last_name}</ttt> - This line is commented out in the example. It has a jelly call ${SP} and pulls the author of the knowledge article by first and last name.
Style in Content Management

Content pages can be styled with CSS, just like any HTML website.

Three elements control CSS styles:

- **Style Sheets** are records containing CSS declarations.
- **Themes** are groups of style sheets that can be invoked together.
- **Frames** are UI macros that define the outer border of individual content blocks as they appear on a content page by calling on particular definitions in the style sheets.

Style sheets

Styles sheets are standard Cascading Style Sheets (CSS) that define the look and feel of all elements within the interface.

Cascading Style Sheets (CSS) can either be internal (stored in the database) or external (hosted on the server), based on organizational needs. To define an internal style sheet, use standard CSS in the style field. Using external CSS allows the Content Management System to use the same CSS as a corporate website or other online resource.

Use an external style sheet by defining a URL that points to the .cssx file. If you upload a .cssx file to the platform, the .cssx file can then be referenced using a URL.

Content pages do not reference style sheets directly. To invoke a style sheet, you must assign the style sheet to a content theme using the related list on the Content Theme form.
Content themes

Content themes are the convergence of structure and styling, making them a critical tool for creating a powerful user interface.

Understanding corporate design guidelines and maintaining communication with the art team responsible for the corporate website are important to the success of the project. If the organization has an art or design department that maintains branding, include it in this process.

A content theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages. In most environments, many pages share a few themes, usually one. Multiple themes can be used together within a site to create stylistic differentiators between site areas. A single content theme can create a unified look and feel for the site.
Note: Content themes are different from the color themes you can apply to your own system in System Settings.

Figure 570: Content Theme form

Customize a content theme
A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages.

Role required: content_admin or admin
Themes can be invoked in any of the following ways.

- Directly by content pages.
- As the default theme of a content site.
- On the configuration page as a global default.

1. Navigate to Content Management > Design > Themes.
2. Click New.
3. Type a name for the theme and mark it as Active.
4. Right-click the form header and click Save. The Style Sheet related list appears.
5. Use the Style Sheet related list to add style sheets to the theme.

Doctypes

The view_content html page template (on which all CMS is based) defaults to doctype=html. The code looks like the following HTML source code.

```html
<!DOCTYPE HTML>
```

If your CMS site does not render properly, remove the doctype from the page by setting the following property:

- glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse

The following is the default for this property.

- glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse, view_content

Setting this doctype offers these benefits for building new sites:

- Incorporating common practice: Use a practice that is becoming widely adopted across the Internet and can prevent certain browsers from running in quirks mode.
- Cleaner CSS and markup: Write more standards-based CSS and markup to promote code sharing.
- A step towards browser compatibility: Find solutions that work across browsers and avoid browser-specific workarounds.

Format a frame

Frames provide a way to manage decorative containers for content blocks and any other elements within the site. For example, a frame can be a container (made of div or span tags) styled with rounded corners.

Role required: content_admin or admin

Individual content blocks use a frame UI macro to define the frames. When viewing a content block form, the Frame field offers a choice between the different frame UI macros. The frame UI macro does not, however, have the definition for the frame within its Jelly script. Instead, it references a particular frame as defined in a style sheet.

Configuring a new frame is a two-step process.

1. Define the frame in a style sheet.
2. Create the frame UI macro to invoke the frame definition.

Configure a frame in a style sheet

Role required: content_admin or admin

1. Navigate to Content Management > Design > Style Sheets.
2. Select a style sheet to contain the frame definition.
   Base system themes use a separate Frames style sheet.
3. Add the following code, substituting the desired frame name and style:

   ```html
   div.FRAMENAME{border:STYLE;}
   ```

4. Click **Update**.

   **Configure a frame UI macro**

   Role required: content_admin or admin

   1. Navigate to **Content Management > Design > Frames** and select one of the existing frame UI macros.
   2. Change the name to match the FRAMENAME you used in the style sheet.
   3. Right-click the header bar and select **Insert and Stay**.
   4. Update the frame name in the XML field as shown:

   ```xml
   <div class="FRAMENAME">
   ```

5. Click **Submit**.

   In any content block form, select the UI macro.

   **Content Management meta tags**

   Meta tags are special tags added to web pages that contain information about the page rather than being part of the page.

   Meta tags are not rendered and are not noticeable to a page visitor unless the visitor looks at the page source code. Web search engines read meta tags as they "crawl" the web, identifying and organizing content. Modern website designers often use meta tags to embed "hints" to search engines about how to index or otherwise crawl the site in question.

   You can define custom meta tags for content pages.

   Structurally, a meta tag consists of a tag a name/content pair and looks similar to this example.

   ```html
   <meta name="generator" content="MediaWiki 1.16wmf4" />
   ```

   CMS allows you to define both site level and page level tags.

   **Configure a page level meta tag**

   A page level tag is a meta tag defined on a specific page and included on only that page.

   Role required: content_admin or admin

   If an individual page has a specific tag with the same name as the site, the page tag takes precedence.

   1. Navigate to **Content Management > Pages**.
   2. Open the page.
   3. If not already included, add the **Meta Tags** related list to the form.
   4. In the **Meta Tags** related list, click **New**.
   5. Type a **Name** and **Content** for the tag.
   6. Click **Submit**.
Configure a site level meta tag

A site level tag is a meta tag defined on a site and included on every page within that site. If an individual page has a specific tag with the same name, the page tag takes precedence.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site tag, the page tag takes precedence.

1. Navigate to **Content Management > Sites**.
2. Open the site.
3. If not already included, add the **Meta Tags** related list to the form.
4. In the **Meta Tags** related list, click **New**.
5. Enter a **Name** and **Content** for the tag.
6. Click **Submit**.

Configure DIV-based layouts

After you create your site, you can change the site layout with DIV tags.

Role required: content_admin or admin

Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags help in the following ways:

- simplify code
- reduce the amount of code
- increase page load speed
- separate content from presentation
- help pages adapt to different device resolutions
- make pages easier for search engines to crawl
- make code more compliant with evolving web page design standards

A theme named **Administration Theme - Charcoal** is included as an example of CSS-driven, DIV-based layouts. To view the **Administration Theme - Charcoal** DIV-based layout, complete the following steps.

1. Navigate to **Content Management > Design > Layouts**.
2. Click **Admin 1 Column**
3. Review the code.

Content meta tag hierarchy

Page and site level meta tags are included in a content meta tag hierarchy.

**Site and page level tags**

CMS supports page level and site level tags. The system behavior is to show the sum of all page level and site level tags. For example, if you have two tags on the site and one tag on the page, all with different names, you see three tags on the page. Two are from the site and one is from the page. If both the site and the page have a tag of the same name, only the page tag is used.
Note: The Content Management System does not support some commonly used meta tags. For example, you cannot use the X-UA-Compatible meta tag, which allows you to specify the version of Internet Explorer for rendering a page.

**Example: all tags have unique names**

<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>oatmeal</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>dinner</td>
<td>spaghetti</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>oatmeal</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
<tr>
<td>dinner</td>
<td>spaghetti</td>
</tr>
</tbody>
</table>

**Example: page level tag overrides site level tag**

<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>oatmeal</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>lunch</td>
<td>salad &lt;--- overrides site level</td>
</tr>
<tr>
<td>dinner</td>
<td>spaghetti</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>oatmeal</td>
</tr>
<tr>
<td>lunch</td>
<td>salad</td>
</tr>
<tr>
<td>dinner</td>
<td>spaghetti</td>
</tr>
</tbody>
</table>

**Content Management integration points**

Integration points use content blocks in CMS to link different applications together using static and dynamic methods.

By using integration points, users can connect to different systems from a single page. The power of the CMS is that it can display any data within the ServiceNow platform. The ESS portal, for example, connects users to a service catalog, a knowledge base, and a help and incident reporting site. Each section contains a set of links to additional content. List blocks offer the easiest way to display data dynamically. Content types define how lists link to the detailed data they reference.

Generating lists from the ServiceNow platform is straightforward, especially with filtering. When the CMS was first introduced, lists were the only method available to create navigational systems for sites. Content types define system record links using specific templates to define the list and the details.

- Summary template: defines the list
• Detail template: defines the detail as it is rendered in a page.

The templates work together to pass data attributes or *unique record identifiers* (sysid) into a single detail page that manages the data. Any attribute variations use the URL sent to the page.

Understanding how content types work can mean the difference between a site with 20 pages versus a site with 200 pages. There is a time for both types of data calls. Depending on the task, there are appropriate times to use static content and times for dynamic methods.

**View links between system elements and URLs**

You can view the links between your system elements and their URLs to render more specific content within your site.

Role required: content_admin or admin

See the *URL schema* on page 53 page for an overview of URL syntax in ServiceNow.

**Firefox Developer Tools:**

To understand what is being passed via the URL address bars between the system frame sets, use some available tools. For example, the Firefox browser has developer tools and an easy way to view records that render within the main content frame (gsft_main) of the ServiceNow system. Also, Firefox is good for quickly building menus and linking to records within the system. This Firefox functionality is useful when stepping through the *menu items* section on this page.

![Firefox Developer Tools](image)

**Figure 571: Frame view**

The Incidents list offers a quick example of viewing a form within its own tab. This viewing method illustrates how to append the URL string to render more specific content within your site.

1. Navigate to *Incident > All*.
2. Right-click in a blank area within the content frame and select *Open Frame in New Window* or *Open Frame in New Tab*.

The URL returned looks similar to this example.
<instance_name>/incident_list.do?
sysparm_userpref_module=b55b4ab0c0a80009007a9c0f03fb4da9

The URL comprises the following elements.

- **incident_list.do?** is the call to the list with no parameters passed into it. Explore context menu options and list filtering variations to see how the URL string is appended with each action.
- **incident_list.do?sysparm_query=&sysparm_view=ess** is an example of how the view is passed in the URL string.
- **incident_list.do?sysparm_query=GROUPBYactive&sysparm_view=** is how the URL looks when the **group by** option is chosen from the context menu.
- **incident_list.do?sysparm_query=category%3Dsoftware** is the result of applying a **category is software** filter to the list.

Explore all the options available within the right-click menu. Click through to the Incident form itself (incident.do) to see what the URL string does when parameters are passed into it.

**Element link examples**

View examples that show how to create a site pointing to various system data in several different data tables.

The examples illustrate setting up access to the following system data.

- Knowledge: building a versatile user interface for a knowledge base, from overview page to variations on the list definitions used in the site.
- Catalog: ideas for a business-to-consumer shopping experience that pulls various items and forms from your service catalog.
- Service Portfolio: using the business service portfolio to contain all defined services offered by your organization.
- Featured reports: methods for linking to the most important reports.
Figure 572: Example links to system data

Page source view

Use the tools available in your browser to view the frame source page and understand what URL address bars pass between system frame sets.

The Firefox browser, for example, has the developer tools option. This option provides an easy way to view records that render within the main content frame (gsft_main) of the ServiceNow platform. Also, Firefox quickly builds menus and links to records within the system.

This Firefox functionality is useful when stepping through the menu items section.
Static methods

In the CMS application shown, note the items highlighted in gray.

These CMS modules were created for ease of use. Form-based menu management and WYSIWYG code editing can be useful to both advanced and entry-levels users. The technical ability of subject matter experts (SMEs) managing the language of your site can vary considerably. Allowing SMEs to write the content and a technical resource to manage the linking is a good option. This division of labor can expedite menu and link creation within the system.
Navigation Menu Links are a great way to group similar links and are some of the most powerful interface components available to site designers using the CMS. They are base system templates used to group content links for placement on the page. Though the terminology is a bit different (menu sections and menu items), this type of linking behaves the same way as content links. For more information, see "Navigation menus and content links."

Static HTML Details are sometimes present on a page to which a link points. These content blocks are only useful for areas whose administrators are unfamiliar with HTML or markup. Administrators familiar with markup use dynamic blocks because they are extendable. For more information, see the section about static HTML on the "Using Content Blocks" page.

Content Links are the predecessors to navigation menus and were used when the CMS was first introduced. Use content links to make navigational links by defining several content links under the same category. Then, call the links as a list referencing the Content Link [content_link] table.

iFrame Details are used both dynamically and statically throughout the system. Using them can be an easy way to bring any form or list into your CMS pages. For more information, see the section about iFrames on the "Using Content Blocks" page.
Dynamic methods

While static methods are a powerful navigational tool, you have more control over data rendering using the dynamic methods.

Reference common code in the system to make long-term maintenance of the site easier. Coding skills are useful when implementing dynamic methods.

Figure 575: Static and dynamic methods

**Dynamic Blocks**

These blocks are where most of your work resides. For more information, see *Configure dynamic blocks* on page 2092.

**Frames**

Frames are meant to be decorative wrappers around any block in the system. They are mentioned with dynamic blocks because frames are essentially UI macros with the category of Frame. Frames apply the ${body} variable to a block and define where the block is inserted when rendered on the page.
Lists

Lists generate links to records based on the filtering rules you define. Lists can be sorted for presentation by any field in the corresponding record. Lists help supplement navigation and pull data from outside the CMS. For more information, see Customize a list block on page 2093.

Content Types

Content types provide site-specific control of how system data defined as templates is rendered. The rendering of lists is considered first (summary templates). The next consideration is the detail template, which allows control over the record rendering.

List Definitions

List definitions enable you to extend the summary template defaults defined on the site level. Used with frames, list definitions render the same data differently based on the placement on the page or site. For more information, see Configure list definitions on page 2095.

Detailed Content

Detailed content in page detail settings) are blocks that display the content of an existing document as a block on a content page. For more information, see Create a detailed content block on page 2072.

Example integration points

Each element on the page links to a specific URL point.

Figure 576: Integration points
**Business Services** links to a content page (CMS page referenced: Business Service Portfolio, URL: `business_service_category.do`) that pulls the system service catalog homepage into a frame within the content area. Each link within this section uses the browse by category page, where you pass in the name of the category to return results.

- **Target page iFrame URL**: `catalog_home.do?sysparm_nameofstack=aabdae07ef221000914304167b22567d&sysparm_view=business&sysparm_clear_stack=yes`  
  - **Target page frame name**: gsft_main
  - **Desktop Computing URL**: `category_browse.do?category=Desktop Computing`  
  - **Business Applications URL**: `category_browse.do?category=Business Applications`  
  - **Communications Services URL**: `category_browse.do?category=Communications Services`  
  - **Infrastructure Services URL**: `category_browse.do?category=Infrastructure Services`  
  - **Hosting Services URL**: `category_browse.do?category=Hosting Services`

**Featured Services** links to a content page which pulls a small subset of services into an iFrame.

- **iFrame URL**: `com.glideapp.servicecatalog_category_view.do?sysparm_parent=d67c446ec0a80165000335aa37eafbc1&sysparm_view=`  
  - **Frame name**: gsft_main
  - **Install Software URL**: `catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=10d69689c611227600ffeba41c664824`  
  - **Email Account URL**: `catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=d67a86b6c0a80165009386c752cd4a09`  
  - **Electronic Messaging URL**: `catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=533798810a0a0b2600f1a03593e19058`  
  - **VPN RSA Token URL**: `catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=d67b099ac0a80165019d0c276b772502`  
  - **Shared Storage (SAN) URL**: `catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=cedd458a0a0b8300c3b1e32e7a3ac2`

**Reporting** links to a content page that pulls the reports page into an iFrame. All links within this menu refer to homepages in the system, which creates an issue with the home.do URL. Notice in the following links that `../` is used to create a relative URL outside of the CMS site home.do definition. Without this path, the site homepage would render within the iFrame.

- **iFrame URL**: `report_home.do`  
  - **Frame name**: gsft_main
  - **Cost Management Overview URL**: `../home.do?sysparm_userpref_homepage=fa81ae91c0a805c64c0942ab2e4b852b`  
  - **Administration Overview URL**: `../home.do?sysparm_userpref_homepage=8b7b11f6c611228901ff3fcfbd3cc8f`  
  - **Portfolio Overview URL**: `catalog_home.do?sysparm_view=business`  
  - **Service Availability URL**: `../home.do?sysparm_userpref_homepage=8ee772000a0abad00c38eb7e68b93d0`
• **Service Level Agreements (SLA)**
  URL: .../home.do?
sysparm_userpref_homepage=757e86a30a0006d4010a6851639498d1

Content Management testing

Test your site to ensure that all pages display correctly, links go to the specified address, and images are not broken. It is important to test the site as you build it. Do not wait until just before launch to begin testing.

Also, test templates as you create them so any issues are resolved before creating other content based on the templates. Recruit as many people as possible to help you test.

Here are some general site testing guidelines:

- Test on the browsers and platforms your site visitors use
- Test on various monitors (for example, LCD and CRT)
- View pages using different screen resolutions
- View pages using different color settings
- Test all navigation and links
- Test items that can be downloaded (for example, PDF files)
- Test the search functionality
- Test site security
- If necessary, test for accessibility (for guidelines, see the [W3C Website Accessibility Initiative](http://www.w3.org/))

Content Management administration

The Content Management System (CMS) is a tool for creating customized web pages and extending the look and feel of the ServiceNow platform.

Content Management administrators can use the **Content Management > Configuration** module to configure the CMS. Users with the content_admin role can configure CMS sites. Configuration options include setting a login page, selecting a default layout, and selecting a default theme. Page detail settings, content types, and macros can also be modified.

**Content configuration page**

Administrators set all global CMS defaults on the **Content Management > Configuration Page**. The options set on the configuration page can be overridden at a site level.

**Note:** The Content Management page cannot be domain separated.

**Table 509: Configuration page fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login page</td>
<td>Specifies a content page to use as the login page (if a login page is not set at the site level). Include fields on the login page where users can enter a user name and password to view the site.</td>
</tr>
</tbody>
</table>
### Field | Input value
--- | ---
Search page | Specifies a content page for displaying search results (if a search results page is not set at the site level).
Default layout | Specifies a default layout for content pages to use. For more information on layouts, see *Homepage and content page layouts* on page 494.
Default content theme | Specifies a default content theme for content pages to use. For more information, see *Content themes* on page 2106.

## Global search in Content Management

When you add global search to a CMS site, two different search result blocks can display, depending on the user role: global or no global.

Roles are defined at *System Properties > Global Text Search*.

- **Search Results (Global):** For users with permission to use the global search within the normal frame set. The normal frame set is defined as the default, non-CMS user interface with the set of frames.
- **Search Results (No Global):** For users without permission to use the global search. Searches only the knowledge base and the catalog.

The header search bar and the Search dynamic block in the base system both automatically handle the permissions and direct the user to the appropriate search results. In the base system, the search result blocks are deployed on the same Search Results content page.

In order for the global search to work properly, it is important to ensure that the DEFAULT directs users to a working content page. If not, the results from the global search link back to the frame set, not to pages within the CMS site.

**Note:** The global search is similar to the normal frame set user interface and ties to the same roles (set in *global text search properties*).

### Search Results (Global)

Before you use the **Search Results (Global)** dynamic block, define *content types* to control the behavior a search result is clicked. If no content type is defined for a table, selecting a link on that table renders the results according to the **DEFAULT** content type. It is good practice to point the **DEFAULT** content type to a page with a normal "Current Document" detailed block. Set the content type detail (**Detail Template** field) to have just an iFrame.

The **Search Results (No Global)** dynamic block does not require any additional configuration.

### CMS translation

You can translate CMS sites by activating internationalization plugins and manually translating custom interface strings.

Two tables support the translation of a CMS site into other languages.
• Translated Name / Field [sys_translated]: Stores strings that are shared or commonly used within a site. These include menu section names, menu item names, site breadcrumb names, link names, and footer menu links. Internationalization plugins typically provide translations for these strings. See Internationalization support on page 965.

• Translated Text [sys_translated_text]: Stores unique string translations which you create when you manually translate interface elements. See Translate the interface on page 991.

View a translated CMS site example

Activating an internationalization plugin provides a quick way to see translated strings for CMS menus, breadcrumbs, and links. For a full translation, you must translate the instance manually.

The following example explains how to view a translated site in Japanese.

1. Navigate to System Definition > Plugins.
2. In the Go to filter, select Name, enter I18N, and then press the Enter key.
3. Activate both the I18N - Japanese Translations and the I18N: Knowledge Management Internationalization Plugin v2 plugins.
4. Refresh the browser.
5. In the Language picker on the system toolbar, select Japanese.
6. Browse the site to see the translated language strings.

8. Browse the site to see the translated language strings.
Knowledge Management

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.

Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users. For this task, you must be an administrator with the admin role.

Requirements

Role required
admin

Before you begin

Meet with the following stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>Responsibilities</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

**With stakeholders, determine the following requirements**

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do knowledge articles need to be translated into other languages?

**What to do**

**Assign knowledge roles to users and groups**
Determine which Knowledge Management roles on page 2128 are appropriate for each user, and then assign those roles.

**Create custom Knowledge workflows**
If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for knowledge bases, create custom workflows for those knowledge bases.

**Configure Knowledge properties**
If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

**Activate support for other languages besides English**
If languages other than English must be supported, activate the Knowledge Management Internationalization plugin.

**Coordinate with knowledge managers for knowledge base setup**
Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers on page 2126.
Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Multiple knowledge bases can be created for different groups within your organization to share information within and between those groups.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required

knowledge_administrator, knowledge_manager, or admin

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

• Who are the knowledge base managers that are responsible for approving articles?
• Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
• What are the categories to be used to classify articles? Will users be able to create categories?
• Will users of the knowledge base be able to create new content?
• Will Social Q&A be leveraged for this knowledge base?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.

5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A on page 2132.

6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users on page 2127.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager on page 2143.

Knowledge Management guide for users

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.

Requirements

Role required
None. All users can read, create, and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to it.

If you need these permissions, contact the knowledge manager for the knowledge base.

What to do

Create knowledge articles
If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents.
You can also create knowledge articles from incidents and problems.

Search for knowledge articles
From the Knowledge homepage on page 2129, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.
You can also search knowledge from within an incident.
Access to knowledge using your mobile device is supported.

**Ask and answer questions**

If Social Q&A on page 2132 was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

**Next steps**

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- Move a knowledge article on page 2140
- Retire a knowledge article on page 2141
- Request a knowledge base on page 2138

**Knowledge Management roles**

Certain roles are required to use Knowledge Management functionality.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any role</td>
<td>All users with at least one ServiceNow role can read, create, and edit knowledge articles. However, the knowledge manager of a knowledge base can select criteria to restrict this access.</td>
</tr>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create knowledge bases and manage the default knowledge base.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
</tbody>
</table>

Administrators assign these roles to the users and groups who maintain the knowledge content.
Knowledge homepage

The Knowledge homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage navigate to **Self-Service > Knowledge**.

**Note:** The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.

![Knowledge homepage screenshot](image)

**Figure 577: The Knowledge homepage**

If you access knowledge from a service management application, the knowledge homepage for the associated application opens.

From the homepage, you can import a Word document to a knowledge base using the **Import** button. You can also and create a new article, or ask a question using the **Create new** button.
• Import a Word document
• Create a new article
• Ask a question

Note: You must have user criteria “Can contribute” permission for at least one active knowledge base, otherwise the Import and Create new buttons do not appear. See Knowledge Management v3 migration on page 2169 and Knowledge manager on page 2143.

You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Figure 578: Browsing articles by category

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories) to true.
Knowledge search

You can search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar at the top of the page.

Search results include only articles and questions you are authorized to read. Documents that are attached to articles are also listed in the search results (for those articles to which you have access).

**Note:** To change how the attachments are displayed in the search results, set the *How to display attachments in Knowledge Search Results* property. Attachments can be displayed with a snippet, link only, or not at all.

You can sort knowledge content by relevancy, most recent update, or number of views.

You can filter results using the check boxes that appear. Filtering options appear depending on the search text.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Knowledge Bases</td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar.</td>
</tr>
<tr>
<td>Categories</td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td>Authors</td>
<td>Select one or more authors.</td>
</tr>
</tbody>
</table>
Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.

Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

**Note:** Social Q&A is not compatible with Internet Explorer 9 or earlier. If you navigate to a Social Q&A page with one of these browsers, a browser support warning appears on the page.
Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

All Social Q&A questions and answers are associated with a knowledge base. The **Enable social questions and answers** check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions. A user must meet the criteria defined in the knowledge base **Can Read** related list to view or contribute to Social Q&A questions, answers, and comments associated with that knowledge base.

**Note:** The **Can Contribute** related list does not control the ability to contribute to Social Q&A. Users that meet the **Can Read** criteria for a knowledge base can also contribute questions, answers, and comments.

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. Select the **Enable social questions and answers** check box.
   - This check box only appears if the Social Q&A plugin has been activated.
4. Click **Update**.

You can disable Q&A for a knowledge base by clearing the **Enable social questions and answers** check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

Social Q&A questions

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (**Self-Service > Knowledge**). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details.

Ask a question

As a Social Q&A user, you can ask questions that other users can respond to.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Click **Create new**.
3. Click **Question**.
4. Enter a value for the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Question details | Enter additional details about the question that may help other users provide an answer.
Knowledge base | Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&A.
Category | Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.
Tags | Enter one or more tags that describe the question.

5. Click **Post Question**.

To accept the answer, click the **Accept** link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking **Unaccept**.

**Note:** You must be the owner of the question or the knowledge manager to accept an answer.

### Answer a question

As a user, you can answer a question another used has asked. The owner of the question or the knowledge manager can then accept the answer.

**Role required:** none

As a knowledge manager or the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Enter an answer in the **Your answer** field.
4. Click **Submit**.

### Comment on a question or answer

You can comment on a question or an answer to provide additional information relevant to that question or answer.

**Role required:** none

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question or answer you want to comment on, click the **Comment** link.
4. Enter the comment text.
   - Comments have a maximum length of 140 characters.
5. Click **Post comment** or press the Enter key.
Edit a question, answer, or comment

You can edit questions, answers, and comments that you submit, or in knowledge bases you manage.

Role required: none

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click Edit.
4. Edit the details as needed.
5. Optional: When editing a question, click Advanced to modify the question record.
6. Click Update.
   Click Undo to discard the changes and close the editor.

Vote on a question or answer

As a Social Q&A user, you can vote on a question or answer to promote it.

Role required: none

Vote on questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

   Note: You cannot vote for your own questions or answers.

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.

Subscribe to a question

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another use, you can manually subscribe to the question.

Role required: none

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Click the subscribe icon.

If you want later to stop receiving notifications about this question, click the unsubscribe icon.

Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.
You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click **Delete**.

Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.

Share a question

You can generate a URL directly to a question and related answers.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Select the question that you want to share.
3. Click **Share**.

Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the window that appears.

Distribute the URL to share the question.

Social Q&A internationalization support

The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

**Note:** For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.

Social Q&A search

Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags

Tags organize questions and provide information about the question subject matter.
Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags [label] table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Knowledge feedback

You can view and contribute to feedback on knowledge articles.

Feedback options

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge > Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form when creating a knowledge base. Administrators can configure feedback options using knowledge properties.

Flagging articles

You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

Suggestions you make when flagging an article do not appear in the public comments for that article.

Rating articles

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments.
Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

1. Navigate to Self-Service > Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage (pin) articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

Users with at least one role can create and edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. Navigate to Self-Service > Knowledge.
2. Click Create new, then click Article.

Note: You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise the Create new button does not appear. See Knowledge Management v3 migration on page 2169 and Knowledge manager on page 2143.

3. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Published</td>
<td>When this knowledge article was published. This value is set when the article is created, and updated when the article is published.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid to</td>
<td>When this knowledge article expires. Articles do not appear in search results after the valid to date, or if the valid to date is empty.</td>
</tr>
<tr>
<td>Image</td>
<td>An image that appears beside the article when searching from the legacy knowledge portal.</td>
</tr>
<tr>
<td>Workflow</td>
<td>[Read-Only] The publication state of the article, such as Draft or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option. <strong>Note:</strong> You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td>Text</td>
<td>Content for the article. Use the WYSIWYG HTML editor to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
</tbody>
</table>

4. Click **Submit** to create the article.

After saving the article record, you can add tags to further organize the article. Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.
Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the **Category** field to open the Category picker.

![Category picker](image)

2. Select an existing category, or click the add category icon (+) to add a new category.

   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   **Note:** Clicking **Cancel** while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. Click **OK**.

Move a knowledge article

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the **Knowledge Base** field value.

   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.

3. Click **OK** to overwrite fields with the default values, or **Cancel** to leave all fields unchanged.

   A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.
Retire a knowledge article

Retired knowledge articles are no longer available for users to view.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click Retire to launch the retirement workflow associated with that article.

Create knowledge from an incident or problem

To create knowledge from an incident or problem, select the Knowledge check box on the incident or problem form and close the incident or problem record.

The short description from the incident or problem becomes the knowledge article title. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

Depending on the value of the glide.knowman.submission.workflow property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

Approving a submission creates a new knowledge article using the submission content.

1. Navigate to Knowledge > Open Submissions.
2. Select a submission record.
3. Review the submission to ensure the content and settings are correct.
4. Click Create Article.

A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

You can edit the new knowledge article before publishing it, such as to select a category.

Import a Word document to a knowledge base

Import a Microsoft Word document to create a new knowledge article.

Role required: None. You must have user criteria “Can contribute” permission for at least one active knowledge base. If you cannot contribute, the Import button does not appear.

Note: An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.

Importing documents to knowledge is available only from a computer browser. You cannot import documents from a mobile device.

You can import Microsoft Word .doc and .docx files.

Note: The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. All HTML supported by the TinyMCE editor such as tables, lists, and links, as well as styling such as bold and
italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

**Note:** You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images
- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
- Tables

**Note:** Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to **Self-Service > Knowledge**.
2. Perform one of the following actions.
   - Click **Import** and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Enter a **Short description** for each knowledge article.
   The default value is the document filename without the file extension.
4. Select the **Knowledge base** to add the new article to.
   You can select only knowledge bases you can contribute to.
5. Optional: Select a **Category** from within that knowledge base.
6. Optional: Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.
   This check box applies only when importing to v3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.
   Knowledge v2 articles go into **Draft** state. Knowledge v3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).
7. Click **Import**.

A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

If any errors occur during the upload, a popup window appears to display the error.
Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. All managers of a knowledge base, including the owner, automatically receive the knowledge_manager role.

Pin a knowledge article

You can pin an article to appear at the top of knowledge search results and in the Featured content section of the knowledge homepage.

Pinning associates an article to specific keywords. Searching for a keyword causes articles with that keyword to appear at the top of search results. You can pin articles that need to be distributed broadly, such as a maintenance notice or new HR policy.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Featured content related list, click New.
4. Select a Knowledge article
5. Click the lock icon to expand the Keywords field.
6. Select or create knowledge keywords using the reference lookup icon.

**Note:** Only articles with the keyword homepage are shown in the Featured Content section of the knowledge homepage.

7. After adding all keywords, click Submit.

Select user criteria for a knowledge base

You can specify user criteria to control which users can create, read, write, and retire knowledge articles.

User criteria refers to knowledge base records that determine the users who can read or contribute to a knowledge base. User criteria definitions:

- **canRead** users who can read all knowledge base articles
- **cantRead** users who cannot read, create, or modify articles in the knowledge base
- **canContribute** users who can read, create, and modify articles in the knowledge base
- **cantContribute** users who cannot create or modify articles in the knowledge base

**No User Criteria**

If a knowledge base has no user criteria, all users can read its articles. Any user having at least one role can create and edit articles, unless they are members of the cantContribute user criteria. If a knowledge base has canRead user criteria, but no canContribute user criteria, all users with at least one role can
access and modify the knowledge base. This video demonstrates how to control Knowledge Management access through user criteria.

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. Access one of these related lists, and then select or create user criteria records.

<table>
<thead>
<tr>

**Note:** In the tables of rules, an implicit last rule is: All Users -> Denied Create, Read.
Define a knowledge article category

Each knowledge base has a hierarchy of categories that organize the articles.

A category can be a top-level category or a child category. The parent of a child category can be a top-level category or another child category. By making a category the child of another child category you can create a category structure with any number of levels.

You can create and edit categories separately for each knowledge base.

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Select a knowledge base you manage.
3. Choose an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a top-level category.</td>
<td>Navigate to the Knowledge Categories related list and click New.</td>
</tr>
<tr>
<td>Create a child category.</td>
<td>Expand an existing category and click New within the expanded section.</td>
</tr>
</tbody>
</table>
4. Enter a **Label** for the category. The label appears as the name of the category.
5. Optional: Enter a **Value** you can use when referencing the category in scripts.

6. Click **Submit**.

   In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

**Assign a knowledge base manager**

You can assign users as managers of a knowledge base.

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. In the **Managers** field, click the unlock icon.
4. Add one or more users.
5. Click **Update**.

   After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the **Managers** field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

**Knowledge administration**

As an administrator, you are responsible for setting up knowledge bases, configuring knowledge workflows, and customizing knowledge homepages. Most day-to-day management functions are performed by knowledge managers.

The following podcast offers additional information on using the Knowledge Base Application.

**Create a knowledge base**

An administrator can set knowledge base field values when creating a knowledge base. Knowledge managers can set field values for knowledge bases they manage.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The name of the knowledge base.</td>
</tr>
<tr>
<td>Icon</td>
<td>The image that is displayed next to an article from this knowledge base on the search and browse result pages.</td>
</tr>
<tr>
<td>Disable commenting</td>
<td>A check box for preventing users from commenting on articles in the knowledge base. You can override this setting for specific articles using the <strong>Disable commenting</strong> check box on the Knowledge form.</td>
</tr>
<tr>
<td>Disable suggesting</td>
<td>A check box for preventing users from suggesting edits to articles in the knowledge base. You can override this setting for specific articles using the <strong>Disable suggesting</strong> check box on the Knowledge form.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>A check box for preventing contributors from creating and editing categories when selecting a category. When this check box is selected, only knowledge managers can define knowledge categories.</td>
</tr>
<tr>
<td>Owner</td>
<td>The user responsible for the knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Knowledge managers cannot change the <strong>Owner</strong> field value.</td>
</tr>
<tr>
<td>Managers</td>
<td>A list of knowledge base managers.</td>
</tr>
<tr>
<td>Publish workflow</td>
<td>The publishing workflow for articles within the knowledge base.</td>
</tr>
<tr>
<td>Retire workflow</td>
<td>The retiring workflow for articles within the knowledge base.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicates whether the knowledge base is active. When the box is not checked, only users with the admin role can create or view its articles.</td>
</tr>
<tr>
<td>Enable social questions and answers</td>
<td>A check box indicates whether the knowledge base allows Social Q&amp;A questions.</td>
</tr>
<tr>
<td>Description</td>
<td>A text description of the knowledge base.</td>
</tr>
<tr>
<td>Set default knowledge field values</td>
<td>Default values for knowledge articles in this publication. To define a default value, select a field in the left column, then use the right column to enter the data to automatically populate the selected field. Knowledge contributors can choose to apply default field values when selecting a knowledge base for an article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot set a default value for the <strong>Author</strong> field.</td>
</tr>
</tbody>
</table>

**Knowledge workflows**

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the `getApprovers()` function in the `KBWorkflow` script include.
# Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the published state. The workflow is canceled and the article remains in the draft state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

## Knowledge properties

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to **Knowledge > Properties**.

## Knowledge portal properties

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns on Knowledge portal pages.</td>
<td>Set the number of columns for arranging topics on the knowledge portal.</td>
</tr>
</tbody>
</table>

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of articles per content block on the home page (glide.knowman.content_block_limit)</td>
<td>Enter the maximum number of articles to display in the <strong>Most Useful</strong> and <strong>Most Viewed</strong> sections of the knowledge homepage.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Omit empty Knowledge topics and categories.</td>
<td>Select the Yes check box to display topic sections only if there are articles for the topic. Clear the check box to show all topic sections, even those with no assigned articles.</td>
</tr>
<tr>
<td>(glide.knowman.show_only_populated)</td>
<td><strong>Note:</strong> This property does not apply to the <strong>News</strong> category.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This property applies only to the default knowledge base and the legacy knowledge portal. Knowledge v3 articles do not specify a topic. Therefore, this property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Show Knowledge section descriptions.</td>
<td>Select the Yes check box to display topic descriptions in the knowledge portal. To enter these descriptions:</td>
</tr>
<tr>
<td>(glide.knowman.show_descriptions)</td>
<td>1. Edit an existing knowledge article.</td>
</tr>
<tr>
<td></td>
<td>2. Right-click the <strong>Topic</strong> field label and choose <strong>Show Choice List</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. Open the record for the topic name and enter the description into the <strong>Hint</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Clear the check box to omit section descriptions from the knowledge portal.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Number of Knowledge Base items to preview in a section.</td>
<td>Set the maximum number of articles per topic for the knowledge portal. The specific articles shown depends on the <strong>Knowledge section sort field</strong> property setting.</td>
</tr>
<tr>
<td>(glide.knowman.section_limit)</td>
<td><strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
</tbody>
</table>
| **Knowledge section sort field.** *(glide.knowman.section_sort)* | Select the default order for articles within each topic section on the knowledge portal.  
- **Published:** uses the date published.  
- **View count:** uses the number of times articles have been viewed during the period specified in the **Number of days used when summing article views** property.  
- **Alphabetically:** uses the first letter of the article title *(Short description field)*.  

*Note:* This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
| **Knowledge section sort direction.** *(glide.knowman.section_sort_direction)* | Select the order, **ascending** or **descending**, in which articles are listed within each topic section on the knowledge portal. The value used for sorting is set in the **Knowledge section sort field** property.  

*Note:* This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
<p>| <strong>Show unpublished articles in Knowledge Base portal and topic lists.</strong> <em>(glide.knowman.show_unpublished)</em> | Select the <strong>Yes</strong> check box to allow users to see unpublished articles in the knowledge portal and knowledge search results. Use the subsequent <strong>List of roles...</strong> properties to designated which users can see articles in various unpublished states. If this is not selected, users with appropriate roles can access unpublished articles through other modules of the <strong>Knowledge Base</strong> application. |
| <strong>List of roles (comma separated) that can see articles in the Review workflow state in the Knowledge portal and Topic list.</strong> <em>(glide.knowman.section.view_roles.review)</em> | Enter role names exactly as they appear in <strong>User Administration &gt; Roles</strong>. If <strong>Show unpublished articles in Knowledge Base portal and topic lists</strong> is selected, users with these roles see articles in the Review workflow state in the knowledge portal, in the topic list that appears when they click a topic title on the portal, and in knowledge search results. |
| <strong>List of roles (comma separated) that can see articles in the Draft workflow state in the Knowledge portal and Topic list.</strong> <em>(glide.knowman.section.view_roles.draft)</em> | Enter role names exactly as they appear in <strong>User Administration &gt; Roles</strong>. If <strong>Show unpublished articles in Knowledge Base portal and topic lists</strong> is selected, users with these roles see articles in the Draft workflow state in the knowledge portal, in the topic list that appears when they click a topic title on the portal, and in knowledge search results. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define roles that can view articles in other/custon workflow states. Do not include Draft and Review states, as they are already defined in other properties. (Format - stage:[roles];) For example:</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, define the custom field and role as workflow state:[roles];. The users with these roles see articles in the custom workflow state on the knowledge portal.</td>
</tr>
<tr>
<td>The number of articles that are asynchronously loaded when scrolling down in the new search results page. (glide.knowman.search.articles_per_page)</td>
<td>Enter the number of articles to be displayed during a search.</td>
</tr>
<tr>
<td>Show only Knowledge topic titles on portal page (no article links). (glide.knowman.home_titlesonly)</td>
<td>Select the Yes check box to omit all article titles from the knowledge portal and show only the topic names. Users can click the topic title to see the list of related articles.</td>
</tr>
<tr>
<td>Number of days (integer, default 30) used when summing article views. Views older than this are not considered when sorting articles based on view count. 0 means consider all views. (glide.knowman.view_age.days)</td>
<td>Enter a number of days to consider when calculating view count. This is used only when the Knowledge section sort field property is set to View count. Enter 0 to have ServiceNowServiceNow consider all views, regardless of date.</td>
</tr>
<tr>
<td>Automatically place cursor in Knowledge portal search box. (glide.knowman.portal_search_focus)</td>
<td>Select the Yes check box to have ServiceNowServiceNow place the cursor in the search field when a user opens the knowledge portal. Clear the check box to have users click in the search field before entering a search term.</td>
</tr>
</tbody>
</table>

**Knowledge search properties**

Knowledge search properties give you control over the search options available to users and the presentation of search results.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge search result order.  
( glide.knowman.order.search ) | Select the order for displaying search results:  
- **Number of Views**: orders search results based on the **Number of days used when summing article views** property.  
- **Relevancy**: orders search results based on content that is similar to the search term.  
- **Last Modified**: orders search results based on modification date. |
| Search method used when searching Knowledge from a task or directly in the Knowledge Base.  
( glide.knowman.search.operator ) | Select the search approach to use when the search term includes multiple words.  
- **OR query**: returns articles that contain at least one word from the search term.  
- **AND then OR query**: first searches for articles that include all words in the search term (an AND query). If no matches are found, an OR query is performed. |
| Show author in knowledge search results.  
( glide.knowman.search.show_author ) | Select this check box to include the author of each article in knowledge search results. |
| Show last modified date and time in knowledge search results.  
( glide.knowman.search.show_last_modified ) | Select this check box to include the date and time each article was last edited in knowledge search results. |
| Show publish date in knowledge search results.  
( glide.knowman.search.show_published ) | Select this check box to include the date each article was published in knowledge search results. |
| Show category in knowledge search results.  
( glide.knowman.search.show_category ) | Select this check box to include the category breadcrumbs of each article in knowledge search results. |
| Show number of views in knowledge search results.  
( glide.knowman.search.show_view_count ) | Select this check box to include the number of times each article was viewed in knowledge search results. |
| How to display attachments in Knowledge Search Results.  
( glide.knowman.search.attachment ) | Select the behavior of how the attachments are shown in the search results:  
- **Do not show attachment**  
- **Show only link for attachment**  
- **Show attachment with text snippet** (default)  
  For best performance, select **Do not show attachment**, or **Show only link for attachment**. |
| Show relevancy in knowledge search results.  
( glide.knowman.search.show_relevancy ) | Select this check box to show how relevant each search result is based on the search string.  
Relevancy value is only shown when Knowledge search result order property is set to Relevancy. |
### Property view properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable instant search results for knowledge. (glide.knowman.search.instant_results)</td>
<td>Select this check box to enable instant search for search results. The default is No.</td>
</tr>
</tbody>
</table>
| Show article number in knowledge search results. (glide.knowman.search.show_article_number) | Select this check box to display the article number for each article in the search result.  
**Note:** This property does not apply to contextual search results. |

### Knowledge article view properties

Article view properties give you control over the meta data and rating options that appear with articles. They also enable you to grant access to individual feedback options based on user role.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show tasks to which an article has been recently attached. (glide.knowman.recent_tasks.display)</td>
<td>Select the <strong>Yes</strong> check box to have article view include a list of tasks associated with the article. Knowledge articles can be attached to a task by clicking the <strong>Attach to Task</strong> button after searching from a form.</td>
</tr>
<tr>
<td>Number of attached tasks to display when viewing an article. (glide.knowman.recent_tasks)</td>
<td>Specify the maximum number of tasks to list in article view.</td>
</tr>
</tbody>
</table>
| Show article rating section, which may optionally include yes/no rating, star rating, and flagging options. (glide.knowman.show_rating_options) | Select the **Yes** check box to display the rating options for users with specific roles. Clear this check box to omit the rating section for all users, regardless of role.  
**The Feedback** field is always displayed for all users. |
| List of roles (comma separated) that can see an article's rating section, which may optionally include yes/no rating, star rating, and flagging option. (glide.knowman.show_rating_options.roles) | Enter role names exactly as they appear in **User Administration > Roles**. If **Show article rating section...** is selected, users with the roles listed here see the yes/no rating, star rating, and flagging options, according to related property settings.  
Be sure to include all roles that should be permitted to see any of these rating options. Separate properties enable you to identify specific roles for each option separately. All roles in those properties must also be listed here. |
<p>| Show the &quot;Was this article helpful?&quot; yes/no rating option. (glide.knowman.show_yn_rating) | Select the <strong>Yes</strong> check box to display the &quot;Was this article helpful?&quot; rating to users with roles set in the associated property. This appears only if the <strong>Show article rating section...</strong> property is selected. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List of roles (comma separated) that can see yes/no &quot;Was this article helpful?&quot; rating option.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show the &quot;Was this article helpful?&quot; properties are selected, users with the roles listed here see the “Was this article helpful?” rating in article view. All roles listed here must also be listed in the List of roles that can see an article’s rating section...&quot;property.</td>
</tr>
<tr>
<td>Show &quot;Create Incident&quot; link after a Knowledge article is rated not helpful.</td>
<td>Select the Yes check box to display the Create Incident link after a user rates an article as not helpful.</td>
</tr>
<tr>
<td>URL used for the &quot;Create Incident&quot; link after rating a Knowledge article not helpful.</td>
<td>Enter the URL for the page where users can create an incident only if the Show &quot;Create Incident&quot; link...&quot; property is selected.</td>
</tr>
<tr>
<td></td>
<td>To find the URL, open the appropriate page, then right-click the header bar and choose Copy URL. Highlight the URL that appears and use the browser’s copy and paste feature to place it into this property field.</td>
</tr>
<tr>
<td>Show five-star rating option.</td>
<td>Select the Yes check box to display the five-star rating to users with roles set in the associated property. This appears only if the Show article rating section... property is selected.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see five-star rating option.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show five-star rating option properties are selected, users with the roles listed here see the five-star rating option in article view. All roles listed here must also be listed in the List of roles that can see an article’s rating section...&quot;property.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can flag incomplete/inaccurate articles.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show &quot;Flag Article&quot; option properties are selected, users with the roles listed here see the flag article option in article view. All roles listed here must also be listed in the List of roles that can see an article’s rating section...&quot;property.</td>
</tr>
<tr>
<td>Show user comments on knowledge articles.</td>
<td>Select an option for showing user comments When article loads, When user clicks link to show comments, or Never for users with roles set in the associated property:</td>
</tr>
</tbody>
</table>
### Knowledge homepage properties

Knowledge homepage properties control the featured content on the knowledge homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default keyword for getting pinned articles.</td>
<td>Enter a default keyword for pinned articles. Articles pinned with the specified keyword appear in the Featured Content section of the knowledge homepage.</td>
</tr>
<tr>
<td>Default header title for the pinned articles section on knowledge home pages.</td>
<td>Enter a title for the Featured Content section of the knowledge homepage.</td>
</tr>
<tr>
<td>Display or hide the count of articles and questions in the category and child categories</td>
<td>Select to display the count of articles and questions within each category, including subcategories, when browsing or searching knowledge bases.</td>
</tr>
</tbody>
</table>

### Other knowledge properties

Additional knowledge properties let you control general knowledge management features.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When attaching an article to an incident, copy the content into this field.</td>
<td>When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the <strong>Attach to Task</strong> button for an article, the system copies the article number and content into the field specified here. You can specify a separate field for each table you want to attach articles to as a comma-separated list. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Knowledge Management logo to display if running out of the ServiceNow frames. (glide.knowman.frameless_logo)</td>
<td>Click the reference lookup icon (🔍) and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the Name of an image stored in the database to use that image. <strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Hide the 'Import' functionality (button and drag-n-drop) for all users. (glide.knowman.import.hide_import_functionality)</td>
<td>Select Yes to hide the Import Articles button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the Import Articles button to prevent users from importing articles to knowledge bases.</td>
</tr>
<tr>
<td>Show publish check box on the knowledge import pop-up. (glide.knowman.import.show_publish_checkbox)</td>
<td>Select No to remove the Publish check box on the knowledge import form so that an article cannot be published as part of the import process. Default is yes.</td>
</tr>
<tr>
<td>Use submission workflow. (glide.knowman.submission.workflow)</td>
<td>Select the Yes check box to use the knowledge submission workflow instead of the standard knowledge workflow. If this option is selected, each time a user creates knowledge from an incident or problem, the content is placed into a submission record instead of a draft article. Transforming knowledge submissions into articles follows a specific workflow.</td>
</tr>
<tr>
<td>The sys_id of the knowledge base when creating knowledge from task records. (glide.knowman.task_kb)</td>
<td>Enter the sys_id of the knowledge base to put new knowledge articles created from tasks in.</td>
</tr>
<tr>
<td>Before displaying an article's text in search results or the article view, check field-level ACLs on appropriate field: kb_knowledge.text (HTML article) or kb_knowledge.wiki (wiki text article). (glide.knowman.text.check_can_read)</td>
<td>Select this check box if users must have ACL-based permission to view text fields on the Knowledge [kb_knowledge] table to read article previews in knowledge search results.</td>
</tr>
</tbody>
</table>

Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.
Role required: admin

1. Right-click the application label in the application navigator and select **Edit Application**.
2. In the **Modules** related list click **New**.
3. Enter a **Title** for the module.
4. In the **Link type** field, select **URL (from Arguments)**.
5. In the **Arguments** field, append one or more of the following values to `$knowledge.do#/search?`.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_kb=&lt;knowledge base sys_id&gt;</td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default. If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module. Note: The category passed in this parameter must belong to the knowledge base passed in the sysparm_kb parameter.</td>
</tr>
<tr>
<td>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</td>
<td>Enter the default sort order for articles to appear in.</td>
</tr>
</tbody>
</table>

To create a homepage for a **Facilities** knowledge base with a **sys_id** of d582764047022100158b949b6c9a7145 and sorting by last modified date, enter `$knowledge.do#/search?sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified` in the **Arguments** field on the Module form.

**I18N - Knowledge internationalization**

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.
**Note:** To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the `glide.knowman.search.default_language` system property.

For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles.

If no language is specified in the system property, articles default to the logged in language of the user.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user's selected language is French.

**Activate the knowledge management internationalization plugin**

To enable translation of knowledge articles, you must activate multiple plugins.

- **I18N:Knowledge Management Internationalization v2 plugin**
- Internationalization plugins for each appropriate language (for example, I18N: French Translations and I18N: Korean Translations)

*Activate a plugin* on page 1233

**Installed Components**

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user's selected language.
- A UI macro named kb languages.
- Two fields, named Language and Parent, in the Knowledge table and the Knowledge form.

**Knowledge Form Changes**

Activating knowledge management internationalization adds these fields to the Knowledge form.

- **Language:** select the language for the article.
- **Parent:** enter the number of the article that represents the base language. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

**Create a translation for a knowledge article**

Create a translation for an article from the Translated Versions related list on the knowledge article record. Before creating a translation, activate the internationalization plugin for the desired
language which, in turn, activates the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2).

1. Open the knowledge article record.
2. In the Translated Versions related list, click New.
3. Select the desired language for the translation in the Language field.
4. Provide a description in the Short Description field.
5. Click Submit.

The translation is created and added to the Translated Versions related list.

Use knowledge on mobile devices

All ServiceNow ITSA Suite users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

Browse knowledge on mobile devices

You can browse knowledge bases using a mobile device.

Navigate to SELF-SERVICE > Knowledge Base.
Browse Knowledge by tapping on a category and browsing articles or subcategories.

View knowledge articles and questions on mobile devices
You can read knowledge content using a mobile device.
Tap a title to view the article or question.

**Note:** You cannot edit or add comments to knowledge articles on the mobile interface. If using Social Q&A on page 2132, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.
Search knowledge on mobile devices

Find a specific article or question by searching on a particular term.
Knowledge Management v3 migration

Knowledge management is significantly changed with knowledge v3, which is enabled by default for all instances starting with the Fuji release.

Knowledge v3 has several key differences from the version of knowledge management available with the Eureka release, knowledge v2.

When upgrading from Eureka or earlier, you must migrate legacy knowledge content and any customizations you have made in the Knowledge Base application in order to use the full range of new functionality.

This video demonstrates how to migrate from Knowledge Management v2 to v3.

Table 518: Key differences

<td>unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base using user criteria.</td>
</tr>
</tbody>
</table>

### Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.
2. Migrate knowledge content to use the knowledge v3 enhancements with your existing knowledge articles.

### After migration to Knowledge v3

These items are relevant to getting the full range of new functionality after you migrate.

- If you have not upgraded to Geneva Patch 3, you must create a category structure in the destination knowledge bases for existing articles. Since knowledge v3 supports multiple knowledge bases, **Topic** and **Category** fields are deprecated and searching is only supported on the new **Category** and **Subcategory** fields. For usability and display purposes, we recommend limiting your category levels to five deep (or fewer).
- If you have not upgraded to Geneva Patch 3 and the Knowledge article form was customized in knowledge v2, you must open the article form and add the Knowledge Base field to allow creation of new articles. The Knowledge Base field is mandatory in knowledge v3.
- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
- If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.

### Automatic changes after KMv3 migration

Upgrading to Knowledge v3 automatically changes knowledge functionality including the knowledge user interface and security model.

### Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.
Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

Knowledge search changes

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

Knowledge security changes

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs. Existing ACLs on the Knowledge [kb_knowledge] table are preserved, but with the following changes.

- A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
- A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge [kb_knowledge] records where this field value is 2.

**Note:** These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge [kb_knowledge] table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

Because Knowledge v3 introduces ACLs for the Knowledge [kb_knowledge] table, if you do not have high security enabled, you may notice differences in default behavior. See KB0549970 for information about configuring Knowledge v3 without high security.

Knowledge article view changes

The Knowledge application uses the kb_view UI page to display knowledge articles.

**UI page**

The following changes apply automatically when you upgrade from Eureka or earlier:

- The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.
- A new kb_view page is used. This becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.

- URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
- Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
- Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.
**Feedback**

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback [kb_feedback] table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is true by default.

**Knowledge portal changes**

The legacy knowledge portal, kb_home, is preserved in knowledge v3.

**UI page**

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

**Search**

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

**Knowledge submissions**

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the **Topic** and **Category** fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page.

To enable knowledge submissions, set this property to true on the System Properties [sys_properties] table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

**Migrating Knowledge access controls**

Access to knowledge articles is controlled based on the user criteria for the specific knowledge base.

**Important:** If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving
existing content to these knowledge bases, depending on your security model. For a detailed explanation
and migration examples, refer to KB0550924 Understanding User Criteria and ACLs in Knowledge v3.

This video demonstrates how to manage article-level access controls during migration from Knowledge
Management v2 to v3.

**Knowledge functionality migration**

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

**Replaced knowledge modules**

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the enablev3anddisablev2menus.txt backup script to enable knowledge v3 menus and disable knowledge v2 menus.

#### Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the **Publish workflow** and **Retire workflow** for the new knowledge bases.

#### Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.
Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message [live_message] table to ensure previously submitted feedback is available for knowledge v3 articles.

Dependency Views

Dependency Views graphically displays an infrastructure view for a configuration item and the business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to the CI's related alerts, incidents, problems, changes, and business services.

What's new

- Dependency Views release notes

Administer

- Create or modify Dependency Views map indicators on page 2189
- Create or modify Dependency Views map icons on page 2193
- Create or modify Map Related Items on page 2191
- Create or modify Dependency Views menu actions on page 2193

Use

- Dependency Views map on page 2180
- Dependency Views map menus and controls on page 2181
- Access Dependency Views map on page 2185
- Change the layout of Dependency Views map on page 2186
- Filter the view of a Dependency Views map on page 2186
- Perform actions on nodes in a Dependency Views map on page 2187

Develop

- Properties installed with Dependency Views on page 2176
- Tables installed with Dependency Views on page 2176

Troubleshoot and get help

- Supported browsers for Dependency Views on page 2184
- Search the HI knowledge base for known error articles
- Contact ServiceNow Support
- ServiceNow Community

Installed with Dependency Views

Dependency Views plugin adds tables and system properties.
Tables installed with Dependency Views

Dependency Views adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available CI icons</td>
<td>Stores all available CI class icons.</td>
</tr>
<tr>
<td>[ngbsm_ci_icons]</td>
<td></td>
</tr>
<tr>
<td>Icons for CI types</td>
<td>Maps icons to CI class names.</td>
</tr>
<tr>
<td>[ngbsm_ci_type_icon]</td>
<td></td>
</tr>
<tr>
<td>Map View</td>
<td>Serialized map views saved by users.</td>
</tr>
<tr>
<td>[ngbsm_view]</td>
<td></td>
</tr>
<tr>
<td>Map Filter</td>
<td>Filters saved by users.</td>
</tr>
<tr>
<td>[ngbsm_filter]</td>
<td></td>
</tr>
<tr>
<td>Menu Action</td>
<td>Default and custom context menu actions that appear when users right click a map.</td>
</tr>
<tr>
<td>[ngbsm_context_menu]</td>
<td></td>
</tr>
<tr>
<td>Related Item</td>
<td>Stores which reference fields should be treated as relationships when building the map. This allows users to include CI's that are related via a reference field instead of a relationship.</td>
</tr>
<tr>
<td>[ngbsm_related_item]</td>
<td></td>
</tr>
<tr>
<td>Edge Colors</td>
<td>Color definitions to use when drawing the relationships between nodes based on relationship type.</td>

## Dependency Views map

Dependency Views maps graphically display configuration items that support business services and the relationships between the configuration items.

A ServiceNow business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the map icon (🔍) on a CI record or on a task record that identifies a CI, the map opens.

Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

The Dependency Views module is active in all instances, and includes demo data.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ngbsm.show_class_labels</td>
<td>When available, the map should display the class labels for each CI. When available, the map should display the class labels for each CI. • <strong>Type</strong>: Yes</td>
</tr>
</tbody>
</table>
When you click the map icon ( on a CI record or on a task records that identify a CI, a map opens. You can change the **Link to the Eureka BSM when navigating via CI Reference Field or Related Items** property to have the Legacy BSM map application open instead.

### Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the **Saved Filters** module.

### Dependency Views map menus and controls

Dependency Views maps contain the following menus and controls.

### Map options

The following options are available across the top of the map.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Menu" /></td>
<td>Menu to save, load and export views of the map.</td>
</tr>
<tr>
<td><code>&lt;Root CI&gt;</code></td>
<td>Next to the menu icon is the name of the current root node (CI) of the map.</td>
</tr>
<tr>
<td><img src="image" alt="Search for CI" /></td>
<td>Enter the name of a CI or a business service to load into the map. Alternatively, you can start typing to have the auto-complete feature present a list of CIs and businesses service that match your partial value.</td>
</tr>
<tr>
<td>Vertical</td>
<td>Display the map in vertical view.</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>Horizontal</td>
<td>Display the map in horizontal view.</td>
</tr>
<tr>
<td>Radial</td>
<td>Display the map in radial view.</td>
</tr>
<tr>
<td>Force</td>
<td>Centers the elements around the parent CI, regardless of upstream or downstream relationships.</td>
</tr>
<tr>
<td>Group</td>
<td>Groups the elements according to their CI type.</td>
</tr>
<tr>
<td>Details</td>
<td>Displays related lists such as Problems, Changes and Related Business Services that are associated with the selected CI. If the Event Management plugin is active, then events and alerts are also displayed.</td>
</tr>
<tr>
<td>Filters</td>
<td>View and create filters for the map.</td>
</tr>
</tbody>
</table>

Map menu

The following options are available if you right-click the map background.

<table>
<thead>
<tr>
<th>Run Layout</th>
<th>Redraws the map with the current layout option.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fit To Screen</td>
<td>Resizes the map to fit all the nodes in the map window.</td>
</tr>
<tr>
<td>Reset Filters</td>
<td>Performs the same action as the Filters &gt; Reset option.</td>
</tr>
</tbody>
</table>

Node menu

The following options are available if you right-click a node.

<p>| View Form     | Displays the CMDB record of the selected CI in a new tab of the browser. |</p>
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Map</td>
<td>Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record's Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a clustered node, a collapsed node, or logical groups (visual nodes that appear when glide.bsm.too_many_children is reached). This option appears only if the node is a collapsed or cluster node.</td>
</tr>
<tr>
<td></td>
<td>The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
<tr>
<td>Collapse</td>
<td>Collapses all CIs and components within a cluster node or a collapsed node back to a single node. It does not collapse logical groups that were expanded. This option only appears if the node has been expanded using the Expand menu item.</td>
</tr>
<tr>
<td>Run Layout From Here</td>
<td>This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.</td>
</tr>
<tr>
<td>Load More</td>
<td>Starting at the selected icon, loads the next level of the map, past the setting of Max Levels. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
</tbody>
</table>
Relationship menu

The following options are available if you right-click a relationship link.

<table>
<thead>
<tr>
<th>View Relationship Form</th>
<th>Opens the CI Relationship form. You can modify the Parent, Type, and Child of the relationship from this form.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify Relationship</td>
<td>Searches for and selects a new relationship for this link.</td>
</tr>
<tr>
<td>Delete Relationship</td>
<td>Deletes a relationship. The relationship is deleted after prompting for confirmation.</td>
</tr>
</tbody>
</table>

Supported browsers for Dependency Views

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox version 20 or later (latest version recommended)
- Chrome version 25 or later (latest version recommended)
- Safari version 6 or later
- Microsoft Internet Explorer (IE), with these requirements and limitations:
  - Dependency Views requires IE version 9 or later.
  - If you are using Internet Explorer 7 or 8, use the Legacy BSM map with Adobe Flash Player 10.1 or later.
  - Exporting images from a Dependency Views map using Internet Explorer as the browser is supported only for Internet Explorer version 11, and for Geneva Patch 9 releases and later.
  - When you save a map view, Dependency Views will not make a thumbnail image. You may navigate to the saved map view using the version number.

Collapsed nodes in a Dependency Views map

Dependency Views can display clusters and child nodes alongside individual CI nodes.

Aspects of the map can differ when cluster nodes are on the map. For example the nodes can display in a collapsed format to avoid unnecessary clutter in large maps. By default, the Dependency Views collapses all node clusters in the view. Menu options for a clustered node include Collapse and Expand which allow you to control the density on the map.

A cluster is an organized set of computer CIs that work together as a single system. Each node in the cluster represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters. Clusters are CIs in the Cluster [cmdb_ci_cluster] table and can have tasks assigned to them.

A collapsed node collects all the children of a CI that are in the same class into a single node when the number of children in that class exceeds a configurable threshold. Collapsed nodes contain CIs but are not CIs themselves and cannot have tasks assigned to them.
Annotation

Icons for clusters and collapsed nodes are noted by the string "Cluster" and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.

Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don't want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

Access Dependency Views map

When you access a Dependency Views map from one of the view options, the view is centered on the root CI, and displays the layout and number of levels defined in the map properties.

The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

The maps that Service Mapping provides are for business services, including comprehensive maps from the perspective of business services. For more information, see Service Mapping.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

1. Navigate to Dependency Views and open one of these modules:
   - View Map in New Tab: Opens the map in a new, full screen tab without the application navigator.
   - View Map: Opens the map in the content pane of the current tab.
   - Saved Views: Opens a view of a map that you previously saved.

2. Click a number in the Version column, and then click the map icon.

Save or load a Dependency Views map

In the View Map module, use the menu icon to save and load Dependency Views maps.

1. Navigate to Dependency Views > View Map.
2. Click the menu icon.
3. Select Save View, Load View, or Last View.

Delete a saved Dependency Views map view

Use the Saved Views module to delete a previously saved view.

1. Navigate to Dependency Views > Saved Views.
2. Use the checkbox in the first column of the table to select the map view that you wish to delete.
3. Select **Delete** from the **Actions on selected rows** drop-down menu.

**Change the layout of Dependency Views map**

You can select from different layout options for your Dependency Views map.

1. Navigate to **Dependency Views > View Map**.
2. Select one of the following layout options from the menu across the top of the view.
   - **Vertical**: displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   - **Horizontal**: displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   - **Radial**: displays the elements in a radial pattern according to their upstream and downstream relationships.
   - **Force**: centers the elements around the parent CI, regardless of upstream or downstream relationships.
   - **Group**: groups the elements according to their CI type.
   - **Details**: displays related alerts, incidents, problems, and business services.

**Filter the view of a Dependency Views map**

You can filter a Dependency Views map to display specific types or categories of configuration items.

Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.

1. Navigate to **Dependency Views > View Map**.
2. Click the **Filters** button in the map's header bar to open the filter panel. Filter groups and controls in the filter panel are contained within collapsible strips. Click a strip to expand or collapse it. Within each strip, you can select individual items.

<table>
<thead>
<tr>
<th>Filter panel strips and options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create New Filter</td>
<td>Configure the desired filter settings and enter a name for the filter in this text box. Click <strong>Save</strong> and the filter will be available from the <strong>Load Saved Filter</strong> option.</td>
</tr>
<tr>
<td>Load Saved Filter</td>
<td>Apply a previously saved filter to the current map.</td>
</tr>
<tr>
<td>Max Levels</td>
<td>Designate how many levels from the root CI display on the map.</td>
</tr>
<tr>
<td>Filter CIs by Depth</td>
<td>Designate which levels of CI display on the map.</td>
</tr>
<tr>
<td>Filter CIs by CI Type</td>
<td>Designate what CI types display in the map.</td>
</tr>
<tr>
<td>Filter CIs By Location</td>
<td>Designate what CI locations display in the map.</td>
</tr>
<tr>
<td>Filter CIs By CI Manufacturer</td>
<td>Designate what CI manufacturers display in the map.</td>
</tr>
</tbody>
</table>
Perform actions on nodes in a Dependency Views map

You can view various related items for the nodes in a Dependency Views map.

If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

1. Navigate to Dependency Views > View Map.
2. Click the down arrow icon (▼) next to a node or right-click a node on the map, to access the following menu items:

Table 521: Node Menu

<table>
<thead>
<tr>
<th>View Form</th>
<th>Displays the CMDB record of the selected CI in a new tab of the browser.</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Map</td>
<td>Reloads the view using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the view from the view icon in a task record's Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a cluster node or a collapsed node. This option only appears if the node is a collapsed or cluster node. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
<tr>
<td>Collapse</td>
<td>Collapses all CIs and components within a cluster node or a collapsed node back to a single node. This option only appears if the node has been expanded using the Expand menu item.</td>
</tr>
<tr>
<td>Run Layout From Here</td>
<td>This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.</td>
</tr>
<tr>
<td>Load More</td>
<td>Starting at the selected icon, loads the next level of the map, past the setting of Max Levels. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
</tbody>
</table>

### Export a Dependency Views map

You can export a Dependency Views map to an image in PNG format.

1. Navigate to **Dependency Views > View Map**.
2. Configure the map view as you want the image to appear. The exported image displays the current view of the map.
3. Click the menu icon ().
4. Click **Export Image**.
5. Right-click the image and select **Save Image As**, **Print**, or any other menu option.
6. Click the "X" button to close the Export Image window.

View collapsed nodes in a Dependency Views map

Nodes can display in a collapsed format to avoid unnecessary clutter in large maps.

1. To expand a cluster or collapsed node, right-click the CI and select Expand from the context menu.
2. To collapse a cluster or a node with children, right-click the CI and select Collapse from the context menu.

Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.

Create or modify Dependency Views map indicators

Dependency Views maps use various icons next to a CI to indicate that the CI has related records such as alerts, outages, incidents and problems. These icons are called map indicators.

The default configuration includes map indicators for the following record types:

- Open incident.
- Unplanned current outage.
- Planned current outage, or an open problem.
- Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the Filters menu. Also, you can create a map indicator to define additional record types, such as trouble sources for business service CIs. You can also modify an existing map indicator, for example to use a different color scheme or to alter the priority of a task. Affected CIs are based on the cmdb_ci field in the Task table and its extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, the calculation of affected CIs is affected.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see Collapsed nodes in a Dependency Views map on page 2184.

1. Navigate to Dependency Views > Map Indicators.
2. Click New to create a new map indicator, or click the name of an indicator from the Table column to modify an existing map indicator.
3. Fill in the fields on the form, as appropriate.
Table 522: Map Indicator form

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

4. Click **Submit** to enter a new map indicator. Click **Update** to modify an existing map indicator.

#### Create or modify Map Related Items

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

The base system configuration includes the following tables and relates them to items in the Computer [cmdb_ci_computer] and Server [cmdb_ci_server] tables.

- Disk [cmdb_ci_disk]
- Network Adapter [cmdb_ci_network_adapter]
- Database [cmdb_ci_database]

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the Configuration Item field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

![Network Adapter](image)

The Dependency Views map for the *JEMPLOYEE-IBM computer shows the network adapter attached to the computer.
You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

1. Navigate to **Dependency Views > Map Related Items**.
2. Click **New** to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. Fill in the fields on the form, as appropriate.
   
   See the Related Items form table.

4. Click **Submit** to enter a new map related item. Click **Update** to modify an existing map related item.

**Table 523: Related Items form**

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer [cmdb_ci_computer], which includes all types of workstations and servers.</td>
</tr>
<tr>
<td>Related item</td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td>Related field</td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
</tbody>
</table>

Create or modify Dependency Views map icons

You can upload new icons or modify existing icons to customize the icon displayed for a CI in Dependency Views maps.

Users with the admin or ecmdb_admin role can access the records in this table [ngbsm_icon] to upload new icons.

The icons used in Dependency Views maps are listed in the Map Icons module. Records in the Map Icons list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/app.ngbsm/<image name.png>.

1. Navigate to Dependency Views > Map Icons.
2. Click New to create a new map icon, or click the name of an existing icon from the Name column to modify an existing icon.
3. Fill in the fields on the form, as appropriate.
   See the Map Icons form table.
4. Click Submit to enter a new icon. Click Update to modify an existing icon.

Table 524: Map Icons form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Label or the informal name of the CI table that this icon represents in the view.</td>

<td>Path to the icon image using the following format: /image name.png Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>

Create or modify Dependency Views menu actions

Best practices dictates that you modify a copy of the original menu action.

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy. This ensures that ServiceNow can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

1. To create a new menu option, navigate to Dependency Views > Map Menu Actions and click New.
   Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to Dependency Views > Map Menu Actions.
3. Open the menu action you want to edit.
4. Right-click in the header and click Insert and Stay.
   This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the Active check box.

### Table 525: Menu Action form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition that triggers the display of this menu option. If the condition evaluates to false the menu option does not display. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do. For details on available parameters, see Condition Parameters.</td>
</tr>
</tbody>
</table>
| Item    | Map element for which the menu option displays. Valid values are:  
  • Canvas for the menu on the map background.  
  • Node for the menu on a CI.  
  • Relationship for the menu on a relationship link. |
| Order   | Physical location of the option in the menu. The option with the lowest order number appears first in the menu. All editable and custom options appear below the permanent menu options. |
| Script  | Script that is executed in the browser when the menu option is selected. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do. |
| Type    | Menu action type being created, either a menu option or a menu separator. The menu separator is a single line. When the type is a separator, the Script field is ignored. |

---

**Legacy Business Service Management Map**

Legacy BSM is built on keyline technology.

To use the Legacy BSM application menu items, the bsm_legacy, admin, or the bsm_legacy_admin roles are required.
A ServiceNow business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user's account. A business service management (BSM) map graphically displays the configuration items (CI) that support a business service and the relationships between the configuration items.

**Internet Browser Requirements and Limitations**

Microsoft Internet Explorer has these limitations and requirements when used with ServiceNow BSM maps:

- To access the BSM map using Internet Explorer 7 and 8, you must install Adobe Flash Player 10.1 or higher.

  **Note:** Geneva is the last release in which Internet Explorer 7 and 8 are supported for BSM maps.

- You cannot export images from the map with Internet Explorer 7.
- Map view images saved in a browser other than Internet Explorer 8 might not display properly in Internet Explorer 8.
- Internet Explorer 7 can only display the version numbers of saved views and not the images.

To use Firefox ESR - the latest version is required.

**Business service maps**

Many of the relationships in a BSM map are created through the discovery process.

You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB. Nodes on the map may represent one configuration item or a collection of configuration items grouped into a single icon. The following figure displays an overview of the actions that are available for BSM maps.
Roles

Users with the itil and ecmdb_admin roles can view BSM maps and perform all actions in the map, which includes accessing the map views and filters they have saved, both from the lists in the map and from the Map Filters module.

Installed with Legacy Business Service Management Map

What components are installed with BSM maps.

The following components are installed with BSM Maps:

Tables

Legacy BSM Maps includes the following tables.

**Table 526: Business Service Management Map tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BSM Map Filter [bsm_map_filter]</td>
<td>Contains all saved BSM map filters.</td>
</tr>
<tr>
<td>BSM Map Icon [bsm_map_icon]</td>
<td>Contains the paths to all icon images used in a BSM map.</td>
</tr>
<tr>
<td>BSM Saved View [bsm_chart]</td>
<td>Contains the data for saved BSM snapshots.</td>
</tr>
<tr>
<td>BSM Related Item [bsm_related_item]</td>
<td>Stores which reference fields should be treated as relationships when building the map. This allows users to include CI's that are related via a reference field instead of a relationship.</td>
</tr>
</tbody>
</table>
Properties

To customize your map properties, navigate to BSM Map > Map Properties.
For properties with the type Color, use one of the following options:
- A valid HTML4 color name. The color names are case-insensitive.

The extended color set (X11 color keywords) typically work, as well.
- A RGB hex code, such as #003366
- A RGB decimal code, such as rgb(0,51,102)

Table 527: Business Service Management Map properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.bsm.map.style.text_color</td>
<td>The color of the text that appears under an unselected CI node. See above for color selection guidelines.</td>
</tr>
<tr>
<td>glide.bsm.map.style.selection_text_color</td>
<td>The color of the text that appears under a selected CI node. See above for color selection guidelines.</td>
</tr>
<tr>
<td>glide.bsm.map.style.font_size</td>
<td>The font size of the text that appears with a CI node. The default size is magnified for nodes with more connections and reduced for downstream nodes.</td>
</tr>
<tr>
<td>glide.bsm.map.style.selection_background_color</td>
<td>The background color of a selected CI node. This color is also used with a node’s Highlight Hierarchy option. See above for color selection guidelines.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| glide.bsm.max_levels          | Maximum level depth from the root CI that can be initially displayed in Business Service Maps. Level depth is the graph distance between the root CI and a node. This value must be an integer.  
   • Type: Integer, valid values 1 to 10  
   • Default value: 5                                                                 |
| glide.bsm.map.style.font_family | The font family name used in the map text. If you designate a font that is not on your users' system, the browser substitutes another font and the text may not render as you expect.  
   • Type: Font name  
   • Default value: Arial                                                                 |
| glide.bsm.new_node_color      | The color for nodes that became viewable from the last expand operation. See above for color selection guidelines.  
   • Type: Color  
   • Default value: PaleGreen                                                                 |
| glide.bsm.too_many_children   | The maximum number of child nodes to display. Nodes are collapsed for the map to meet this limit.  
   • Type: Integer, valid values 1 or greater  
   • Default value: 10                                                                 |
| glide.bsm.color.affect_neighbors | The color of an affected neighbor node. When a node has a service issue, all the nodes that are dependent on that node are considered affected nodes. In the map, the affected nodes are parents or grandparents of the node with the service issue. See above for color selection guidelines.  
   • Type: Color  
   • Default value: Beige                                                                 |
| glide.bsm.max_nodes           | The maximum number of downstream nodes to retrieve from the database for a CI. If more nodes exist in the database, they are not displayed in the map.  
   • Type: Integer  
   • Default value: 1000                                                                 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide bsm task_threshold</td>
<td>Change the CI's glyph color from orange to red when the number of tasks reaches this threshold.</td>

<td>Validate BSM Maps tasks threshold</td>
<td>System Properties [sys_properties]</td>
<td>This rule determines the threshold limit to change the task glyph from orange to red.</td>
</tr>
<tr>
<td>Increment view version</td>
<td>BSM Saved View [bsm_chart]</td>
<td>This rule determines the next version number for this saved BSM map.</td>
</tr>
<tr>
<td>Update Version</td>
<td>BSM Saved View [bsm_chart]</td>
<td>This rule verifies that a saved version of a BSM chart does not already exist.</td>
</tr>
</tbody>
</table>

**Administering Legacy Business Service Management maps**

ServiceNow Business Service Maps use color highlights to direct focus to a node, such as to indicate that a node has an outage. These highlights are called map indicators. Users with the admin role can control the appearance and behavior of business service management (BSM) maps by configuring map indicators, map related items, and map icons.

You can also edit or create options that appear on right-click menus in the map.

**Map Indicators**

The default configuration uses map indicators to differentiate between different types of tasks or outages. For example, a CI that has an open incident is highlighted in yellow.
Create or modify map indicators in a Legacy BSM map

You can create a map indicator to define additional record types, such as trouble sources for business service CIs. You can also modify an existing map indicator, for example to use a different color scheme or to alter the priority of a task.

To create or modify a map indicator:

1. Navigate to **Dependency Views > Legacy BSM > Map Indicators**.
2. Click **New** to create a new map indicator, or click the name of an indicator from the **Table** column to modify an existing map indicator.
3. Fill in the fields on the form, as appropriate.

---

**Table 530: Map Indicator Color Descriptions**

<table>
<thead>
<tr>
<th>Color</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yellow</td>
<td>CIs that have an open incident and all affected upstream CIs.</td>
</tr>
<tr>
<td>Red</td>
<td>CIs that have an open problem or a current, planned, or past outage.</td>
</tr>
<tr>
<td>Khaki</td>
<td>CIs that have open tasks.</td>
</tr>
<tr>
<td>Light Blue</td>
<td>CIs with a current, planned, or past change request.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>Conditions</td>
<td>Condition builder that specifies when to apply this indicator. For example, a CI that has a past outage is highlighted in red. You can configure a condition to designate that the red highlight no longer appears on the map one week after the outage is fixed.</td>
</tr>
</tbody>
</table>
4. Click **Submit** to enter a new map indicator or click **Update** to modify an existing map indicator.

Map related items module in Legacy BSM

The **Map Related Items** module relates referenced CIs to one another, which allows them to be displayed in BSM maps.

The base system configuration includes the following tables and relates them to items in the Computer [cmdb_ci_computer] and Server [cmdb_ci_server] tables.

- Disk [cmdb_ci_disk]
- Network Adapter [cmdb_ci_network_adapter]
- Database [cmdb_ci_database]

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in a BSM map are related to network adapter nodes if the **Configuration Item** field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

![Network Adapter](image)

**Figure 586: BSM Related Items Example**

The BSM map for the *JEMPLOYEE-IBM* computer shows the network adapter attached to the computer.
Create or modify map related items in Legacy BSM

You can configure BSM maps to display CIs that have no relationship record, but are related to other CIs by reference fields.

To create or modify map related items:

1. Navigate to Dependency Views > Legacy BSM > Map Related Items.
2. Click New to create a new related item, or click the name of an existing CI from the Configuration Item column to modify an existing map related item.
3. Fill in the fields on the form, as appropriate.

Table 532: BSM Related Items form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item</td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer [cmdb_ci_computer], which includes all types of workstations and servers.</td>
</tr>
<tr>
<td>Related Item</td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td>Related Field</td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
</tbody>
</table>

4. Click **Submit** to enter a new map related item or click **Update** to modify an existing map related item.

Map icons in Legacy BSM

The icons used in the BSM maps are listed in the Map Icons module. Users with the admin or ecmdb_admin role can access the records in this table [bsm_map_icon] to upload new icons.

Records in the BSM Map Icons list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/keylines_bsm_map/<image name.png>.
Create or modify map icons in Legacy BSM
You can upload new icons or modify existing icons to customize the icon displayed for a CI.

To create or modify a map icon:

1. Navigate to **Dependency Views > Legacy BSM > Map Icons**.
2. Click **New** to create a new map icon, or click the name of an existing icon from the **Name** column to modify an existing icon.

3. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the icon.</td>
</tr>
<tr>
<td>Type</td>
<td>Label or friendly name of the CI table this icon represents on the map.</td>
</tr>
<tr>
<td>Icon Path</td>
<td>Path to the icon image using the following format: <code>images/keylines_bsm_map/&lt;image name&gt;.png</code> Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>

4. Click **Submit** to enter a new icon or click **Update** to modify an existing icon.
   The system creates or updates the record.

Menu actions in Legacy BSM
Menu actions are options that appear in the context menu that displays when you right-click a map node or relationship link in a BSM map. The actions that appear in the menu differ depending on pre-defined conditions. The Menu Actions module allows you to customize some of the menu options that are provided with the application, or you can create new menu options.

**Note:** Creating and modifying menu actions is an advanced procedure that requires scripting knowledge.
Protected Menu Options

Some right-click menu options are essential to the application and cannot be customized. Permanent options appear above the editable or custom options in the menu.

![Protected Menu Options](image)

Figure 588: Protected Menu Options

Node Menus

The following menu options on CI nodes are not editable:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>Opens the record for the selected CI.</td>
</tr>
<tr>
<td>Redraw layout</td>
<td>Redraws the map with the selected CI as the focus.</td>
</tr>
<tr>
<td>Highlight hierarchy</td>
<td>Highlights the CIs that depend on the selected CI, including those CIs on which the selected CI is dependent.</td>
</tr>
<tr>
<td>Expand this node</td>
<td>Displays all CIs and components within a cluster node or a collapsed node. This option only appears if the node is a collapsed or cluster node.</td>
</tr>
<tr>
<td>Set as CI</td>
<td>Replaces the value in the original task's reference field with the name of the selected CI. This action only appears for maps accessed from task records.</td>
</tr>
</tbody>
</table>

Relationship Menus

The following menu options on a relationship line are not editable:
### Table 535: Relationship Menu Option Descriptions

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit connection</td>
<td>Opens the Edit Link Configuration dialog box. Select a new relationship for this link from the choice list.</td>
</tr>
<tr>
<td>Remove connection</td>
<td>Deletes a relationship. The system deletes the relationship without prompting for confirmation.</td>
</tr>
<tr>
<td>Redraw layout</td>
<td>Returns the focus to the most recently selected CI.</td>
</tr>
</tbody>
</table>

*Create or modify menu actions in Legacy BSM*

To change an existing menu option, copy the original menu action record, and then modify the copy. This ensures that ServiceNow can update the record normally during the upgrade process and allows you to restore the original menu option quickly, if necessary.

To create a new menu option:

1. Navigate to **Dependency Views > Legacy BSM > Menu Actions** and click **New**.
2. Fill in the fields on the form, as appropriate.

Table 536: BSM Menu Action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>
<td>Item</td>
<td>Map element for which the menu option displays. Valid values are <strong>Node</strong> for the menu on a CI and <strong>Relationship</strong> for the menu on a relationship link.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Menu action type being created, either a menu option or a menu separator. The menu separator is a single line. When the type is a separator, the <strong>Script</strong> field is ignored.</td>
</tr>
<tr>
<td>Order</td>
<td>Physical location of the option in the menu. The option with the lowest order number appears first in the menu. All editable and custom options appear below the permanent menu options.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition that triggers the display of this menu option. If the condition evaluates to false the menu option does not display.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that is executed in the browser when the menu option is selected.</td>
</tr>
</tbody>
</table>

3. **To change an existing menu option:**
   a) Navigate to **BSM Maps > Menu Actions** and open the menu action you want to edit.
   b) Right-click in the header and click **Insert and Stay**. This creates a duplicate copy of the menu action and leaves it open for editing.
   c) Change the name of the copied record to avoid confusion.
   d) Modify the form fields as necessary and save the record.
   e) Open the original record and disable it by clearing the **Active** check box.

**Condition parameters in Legacy BSM**

The **Condition** field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.

---

**Note:** The usual regular expression conventions are valid in the condition field, such as `!` for NOT, `&&` for AND, and `||` for OR.

---

![Figure 589: Condition field](image)
### Table 537: Common Elements for Building a Condition

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.d</td>
<td>Node or reference link's data on which you performed the right-click action.</td>
</tr>
<tr>
<td>item.d.label</td>
<td>Label of the node.</td>
</tr>
<tr>
<td>item.d.ci_type</td>
<td>CI's type (table), such as <code>cmdb_ci_service</code>.</td>
</tr>
<tr>
<td>item.d.name</td>
<td>Name of CIs or relationships.</td>
</tr>
<tr>
<td></td>
<td>• <strong>CIs</strong> CI's type name or the table label, such as <code>Business Service</code>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Relationships</strong> Relationship's type name, such as <code>Depends on::Used by</code>.</td>
</tr>
<tr>
<td>item.c.status.tablename</td>
<td>Status of the node in the table <code>tablename</code>. Replace <code>tablename</code> with the name of a map indicator table, as listed in the Map Indicators module.</td>
</tr>
<tr>
<td>item.d.parent_relationship</td>
<td>Parent relationship on a relationship link.</td>
</tr>
<tr>
<td>item.d.child_relationship</td>
<td>Child relationship on a relationship link.</td>
</tr>
<tr>
<td>item.d.location</td>
<td>Location of the CI, such as New York.</td>
</tr>
<tr>
<td>item.d.manufacturer_name</td>
<td>Name of the CI's manufacturer, such as Dell Inc.</td>
</tr>
</tbody>
</table>

The following table provides examples of valid conditions.

### Table 538: Valid Conditions for Condition Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>

<td>The CMDB has an incident for that CI in the incident table.</td>
</tr>
<tr>
<td>item.d.status.cmdb_ci_outage</td>
<td>The CMDB has an outage for that CI in the <code>cmdb_ci_outage</code> table.</td>
</tr>
<tr>
<td>item.d.parent_relationship == &quot;Depends on&quot;</td>
<td>This relationship link is a depends on relationship.</td>
</tr>
</tbody>
</table>

*Script parameters in Legacy BSM*

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators.

These are some additional, useful expressions for scripts:
Table 539: Script Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.id</td>
<td>The sys_id of the CI node or relationship link.</td>
</tr>
<tr>
<td>item.d.source</td>
<td>The sys_id of the relationship's parent or child.</td>
</tr>
<tr>
<td>item.d.target</td>
<td>The sys_id of the relationship's parent or child.</td>
</tr>
<tr>
<td>item.d.label</td>
<td>The name of the CI node, such as IronMail-SD-02.</td>
</tr>
<tr>
<td>item.d.location</td>
<td>The sys_id of the CI node's location.</td>
</tr>
<tr>
<td>item.d.location_name</td>
<td>The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.</td>
</tr>
<tr>
<td>item.d.manufacturer_id</td>
<td>The sys_id of the CI's manufacturer.</td>
</tr>
</tbody>
</table>

Use a Legacy BSM map

How to use a Legacy Business Service Management (BSM) map.

A business service management (BSM) map has one starting point, called the root CI or root node of the map. The root CI is highlighted with a circle around it. The maps can show both upstream and downstream dependencies for the root CI. By default the BSM map displays 3 levels, both upstream and downstream relationships, and collapses all clusters. Administrators can configure the number of levels displayed.

Use the layout controls to display map elements in different configurations for easier management. Use the filter panel to display fewer levels or to filter out elements you don’t want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

In a BSM map, icons and glyphs indicate if a CI has an active, pending issue. You can investigate the tasks that are connected to a CI to get more details. The map collapses and expands clusters to make them easier to view.

Access a Legacy BSM map

When you access a Legacy BSM map from one of the view options, the map is centered on the root CI, and displays the layout and number of levels defined in Map Properties.

Administrators can configure these settings.

When you access the map from a saved view, the map opens using the saved properties.

To access a BSM map, navigate to Dependency Views Legacy BSM and open one of these modules:

Table 540: BSM map modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Map in New Tab</td>
<td>Opens the map in a new, full screen tab without the application navigator.</td>
</tr>
<tr>
<td>View Map</td>
<td>Opens the map in the content pane of the current tab.</td>
</tr>
</tbody>
</table>
### Saved Views

Opens a view of a map that you previously saved. Click a number in the Version column, and then click the BSM map icon ( ![BSM map icon](link) ).

**Note:** Adobe Flash Player is required to access BSM maps using Microsoft Internet Explorer versions 7 and 8.

---

**Manage a Legacy BSM map**

You can manage the map using controls on the map and controls on the CI.

#### Table 541: Map controls

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Search Field</td>
<td>Select a CI from the search field above the map. Alternatively, you can start typing to have the auto-complete feature present a list of CIs that match your partial value. The search field displays the name of the root CI shown in the map and not the currently focused node. When you return to the map from another node, the system restores the last map viewed, using the default filter and layout settings.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Magnifier</td>
<td>Use the zoom control to magnify the map. Use the direction arrows to move the entire map, or the selection tool to move one or more elements. Click the selection tool again to change it into the grab tool for moving the entire map. Click the circle in the center of the direction arrows to center the image.</td>
</tr>
</tbody>
</table>
Control | Description
--- | ---
Layout | Select a layout for the map elements from the choice list. You can set a default layout through a *map property*.  

<table>
<thead>
<tr>
<th>Choice</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hierarchy</td>
<td>Displays elements in a tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.</td>
</tr>
<tr>
<td>Radial</td>
<td>Displays elements in a radial pattern according to their upstream and downstream relationships.</td>
</tr>
<tr>
<td>Grouping</td>
<td>Groups elements according to their CI type.</td>
</tr>
<tr>
<td>Force</td>
<td>Centers elements around the parent CI, regardless of upstream or downstream relationships.</td>
</tr>
</tbody>
</table>

Collapse | Collapse an expanded node. The Collapse button is visible when an expand command adds new nodes to the graph.  
If you expand multiple times in a row, the Collapse button only goes back one collapse action. Collapse memory is not saved to the database, and therefore is available in the current session only. |

Export Image | *Save a copy* of the current map in the PNG format. |

Print Map | Print the current map or save the map as a PDF file. |
<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save View</td>
<td>Save the current map view in the database. The saved view preserves node placement and filter conditions at the point in time of the save command. Each view is assigned an automatically incrementing version number in the thumbnail view. In addition, all saved views are available from the Saved Views module. A message notifies the user that the current view has been saved. Views and versions are saved based on the current root CI.</td>
</tr>
<tr>
<td>Load View</td>
<td>Load a previously saved view of the BSM map. The selections available are thumbnail views of your saved map configuration for the root node. Selecting a thumbnail will load both the node placement and the filter conditions that were previously saved. The root node is highlighted with a circle around it. Saved views are loaded from the database.</td>
</tr>
<tr>
<td>Full Screen</td>
<td>Toggle the display of the map in and out of full screen mode. The full screen view is not supported on Internet Explorer. This option is available in the View Map in New Tab view.</td>
</tr>
<tr>
<td>Filter Panel</td>
<td>Toggle between opening and closing the filter panel.</td>
</tr>
</tbody>
</table>

Right-click a CI node to access these controls.
Table 543: CI node controls

<table>
<thead>
<tr>
<th>Control</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>View CI name</td>
<td>Displays the record of the selected CI in a pop-up window. You can also double-click the CI to open this window.</td>
</tr>
<tr>
<td>Redraw layout</td>
<td>Redraws the map using the selected CI as the new root node, using the currently defined layout setting.</td>
</tr>
<tr>
<td>Expand this node</td>
<td>Expands the collapsed nodes in the map that are associated with the selected CI. The CI type, manufacturer, location, and relationship filters are updated to reflect the nodes on the expanded map.</td>
</tr>
</tbody>
</table>
| Highlight hierarchy   | Highlights related nodes upstream and downstream from the node with the color designated in the map property. The highlight appears as the node background color. The highlight also appears on nodes that are dimmed due to selected filters. The node is related if it meets these criteria:  
  • It is an ancestor, or a direct ancestor of an ancestor, of the node.  
  • It is a child, or a direct child of a child, of the node.  
  The children of ancestors and the ancestors of children are not included. |
| Show related tasks    | Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. |
| Show related outages  | Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI.               |
| Add affected CI       | Adds the selected CI to the Affected CI related list in an incident, problem, or change request. This option is only visible when you access the map from the map icon in a task record's Configuration item field. You might need to configure the incident, problem, or change form to display the Affected CI related list. |

Filter a Legacy BSM map

Use the filter to control which elements of the map are highlighted and to save versions of a filter for later use.

Open or close the filter panel with the Filter Panel button in the map's header bar.
Filter groups and controls in the filter panel are contained within collapsible strips. Click a strip to expand or collapse it. Within each strip, you can select individual items or use the All check box to select all items in that strip.

Figure 590: BSM filter panel
Table 544: BSM filter panel

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save Filter</td>
<td>Saves the current filter settings. The system asks you to provide a unique name for the filter and saves it to the BSM Map Filter [bsm_map_filter] table. ServiceNow overwrites an existing filter if it has the same name as the one you are saving. To view saved filters, navigate to <strong>BSM Map &gt; Map Filters</strong>.</td>
</tr>
<tr>
<td>Load Filter</td>
<td>Allows you to select from a list of saved filters. When you select a saved filter, the system applies the settings to the map as appropriate for the filter groups and subgroups that are present.</td>
</tr>
<tr>
<td>Reset Filter</td>
<td>Resets the filter to its default state. This action selects all check boxes in the group strips and resets the Stream direction and Level depth options to their default values.</td>
</tr>
</tbody>
</table>

Direction and level in Legacy BSM maps

By default the Legacy BSM map displays three levels of upstream and downstream relationships.

To change the number of levels that are displayed by default, navigate to **Dependency Views > Legacy BSM > Map Properties** and edit the Maximum level depth from the root CI that can be initially displayed in Business Service Maps property.

When you load a new CI or expand a node, the system resets the map to the configured level depth.

Use these map controls to change the view of the levels as appropriate:

Table 545: Map controls

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream direction</td>
<td>Direction of relationships to display. Select from Upstream, Downstream, or Both directions. The default map displays nodes in both directions.</td>
</tr>
</tbody>
</table>
### Control

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
</table>
| Level depth | Number of relationship levels to highlight for the current node. Select **Show all** to set the depth to the number of levels that are in your CI configuration. When you perform one of the following tasks, the system isolates that node and displays the selected number of levels in the specified direction from that node:  
  - Click a node  
  - Load a new node  
  - Change CIs using the search box  
  - Expand a node |

### CI filters by group in Legacy BSM maps

Expand a filter group strip to display the subgroups. For example, the CI by Type group contains subgroups such as Database, UNIX Servers, and Network Gear.

Select a check box to filter the map to show CIs from that subgroup and their relationships in the map. Clear a check box to dim that subgroup of CIs in the map. Scroll long lists of subgroups.

By default all options in each group are selected. If no manufacturer or location is defined in the database, the Other check box is the only option and is selected. Clear a check box to dim those CIs or relationships. Select the All check box to highlight all CI subgroups or clear the check box to dim all subgroups. For example, you might want to clear all check boxes in a long list and then reselect only one or two subgroups to highlight. The All control only works for the current group. Make sure a group filter shows the desired view before you switch groups, since this can affect what you see in subsequent views. For example, if you dim database servers in the CI by Type group and then change to the Location group, you cannot highlight database servers in any location.

### Tasks by type and date in Legacy BSM maps

Click the Tasks by Type & Date strip to show the tasks by type for the CIs on the map.

Click the **Tasks by Type & Date** strip to show the tasks by type for the CIs on the map. Clear the check box for a task type to subtract those tasks from the total displayed in the glyph. When the last task on the CI is hidden, the glyph disappears.

Select from these task types:

- Open Incidents
- Open Problems
- Open Changes
- Open Requests
- Audit Tasks

Select a time period for the task filter from the Date opened field:

- All times
- In last 7 days
- In last 30 days
- In last 90 days
By default, an orange task glyph on a CI indicates the number of open tasks that are associated with that CI. A red glyph indicates that the CI has reached its task threshold. These properties are configurable.

View map information glyphs in a Legacy BSM map

When a CI has a service incident or a task associated with it, a glyph appears on the map. You can change the displayed data point for a class of icons in the Map Properties page.

Incidents, or troubles, and tasks share one glyph in the lower left corner of the CI. Each glyph has a color and a symbol. The symbol may be a number that represents a metric or count from other information. The following rules apply:

- If there are tasks but no troubles, the glyph color is orange. The glyph color turns red if the number of tasks reaches the configured threshold (default is 3).
- If there are troubles, with or without tasks, the glyph uses the color set in the Map Indicator module.
- If there are troubles with no tasks, the symbol is an exclamation mark (!).

You can change the color of the glyph in the Map Indicators module.

**Note:** For information on how glyphs and color highlighting are used with clusters and collapsed nodes, see Collapsed Elements in a BSM Map.

The glyphs that appear on the CI icons provide the following information.

<table>
<thead>
<tr>
<th>Glyph</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Cluster node" /></td>
<td>Cluster node</td>
<td>Shows the number of elements in a collapsed cluster node. To expand the node, right-click the CI and select <strong>Expand this</strong> from the context menu.</td>
</tr>
<tr>
<td><img src="image" alt="Collapsed node" /></td>
<td>Collapsed node</td>
<td>Shows the number of CIs in a collapsed node. To expand the node, right-click the CI and select <strong>Expand this</strong> from the context menu.</td>
</tr>
<tr>
<td><img src="image" alt="Task threshold exceeded" /></td>
<td>Task threshold exceeded</td>
<td>Appears when the configured threshold for number of tasks is reached. Indicates the total number of tasks associated with the CI. To view the tasks associated with this CI in a pop-up window, right-click the CI and select <strong>Show Related Tasks</strong> from the context menu.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><img src="image" alt="2" /></td>
<td>Task count</td>
<td>Shows the number of open tasks associated with this node. To view the tasks associated with this CI in a pop-up window, right-click the CI and select <strong>Show Related Tasks</strong> from the context menu. Alternatively, point to the glyph to display a pop-up window with detailed information about tasks associated with this CI.</td>
</tr>
<tr>
<td>![!]</td>
<td>Trouble with no tasks</td>
<td>Indicates that there are troubles but no tasks. To view the incidents associated with this CI in a pop-up window, right-click the CI and select <strong>Show Related Outages</strong> from the context menu.</td>
</tr>
<tr>
<td>![+]</td>
<td>Add relationship</td>
<td>Creates relationships between CIs.</td>
</tr>
</tbody>
</table>

**Export a Legacy BSM map**

You can export a Legacy BSM map to an image in the PNG format.

1. In the Legacy BSM map page, click **Export Image**. A thumbnail image of the map appears.
2. Right-click the thumbnail and select **Save Image As**.
3. Save the PNG image to the local drive or to a location on the network.

Manage relationships in a Legacy BSM map

You can create new relationships between CIs in the BSM map. You can also edit or delete existing relationships. All changes to relationships are automatically updated in the CMDB.

View a relationship in a Legacy BSM map

To identify a current relationship, point to the relationship link to activate the label.

To make connectors more visible in congested areas of the map:

1. Select the connector.
2. Click and drag the blue spot that appears to make the line curve.
Create a relationship in a Legacy BSM map

How to create a relationship.

The following rules apply to creating a relationship between nodes on the map:

• You cannot add a relationship to or from a CI if the node is collapsed.
• You cannot create a relationship from a CI to itself.
• You cannot create a relationship between an active node and a dimmed node.
• You can add a relationship to or from a cluster node.

**Note:** The BSM map only displays the upstream and downstream relationships from the root node selected as the focus of the map. It does not show any direct relationships between a child of the root node and a parent of the root node. If you add such a relationship and redraw the map with the same root node, the relationship line does not appear on the map. However, if you focus the map on a different root node directly upstream or downstream of the new relationship, the connector appears where you created it.

1. Select the CI you want to use as the parent in the relationship.
   The green plus glyph appears on the icon for the CI.

2. Click the plus glyph and drag a new connector to the child CI.
   A link configuration dialog box appears.
3. Select a relationship from the choice list and click **OK**.
   The map displays the new connector and label.

![Image of relationship between web application and application]

**View a change to a relationship in a Legacy BSM map**

Changes that involve relationships between CIs are automatically recorded in the configuration record for each CI.

You can view the changes in the Audit Records section as relationship removed or relationship added. You may need to configure the form to display the audit records.

![Image of audit records showing relationship changes]

**Figure 591: BSM relationship changes**

1. Right-click the CI node.
2. Select the **View** option on the context menu to open the configuration record for the CI.

**Edit a relationship in a Legacy BSM map**

You cannot right-click to edit the relationship link if the relationship type is not defined in the CI Relationship Type \[cmdb_rel_type\] table.

To edit the type of relationship between two CI nodes if the relationship type is defined in the cmdb_rel_type table:

1. Right-click the connector.
2. Select **Edit connection** from the context menu.
   The Edit Link Configuration dialog box appears. The current relationship is selected.
3. Select a new relationship from the choice list.
4. Click **OK**.

**Delete a relationship in a Legacy BSM map**

How to delete a relationship.

Note: When you delete a relationship between two nodes, the application does not require confirmation. The relationship is immediately removed from the CMDB.

To delete a relationship, right-click the connector and select **Remove connection** from the context menu.

You cannot delete the relationship if the relationship type is not defined in the CI Relationship Type [cmdb_rel_type] table.

**Collapsed elements in a Legacy BSM map**

The ServiceNow BSM map can display clusters and child nodes alongside individual CI nodes.

Aspects of the map can differ in these cases, for example the nodes can display in a collapsed format to avoid unnecessary clutter in large maps.

A cluster is an organized set of computer CIs that work together as a single system. Each node in the cluster represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters. Clusters are CIs in the Cluster [cmdb_ci_cluster] table and can have tasks assigned to them. ServiceNow automatically collapses all clusters it encounters when it creates a BSM map.

A collapsed node collects all the children of a CI that are in the same class into a single node when the number of children in that class exceeds a configurable threshold. Collapsed nodes contain CIs but are not CIs themselves and cannot have tasks assigned to them.

**Annotation in a Legacy BSM map**

Icons for clusters and collapsed nodes are highlighted in blue and display a counter glyph in the upper left that indicates the number of nodes contained in the collection.

The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram. A glyph appears on the lower left edge of the icon if any tasks, incidents, or outages are associated with nodes in the collection. This glyph displays the number of tasks assigned to nodes within the collection and appears in the color of the highest priority task.

Note: All incidents, problems, changes, and tasks are displayed in a single list. The system uses map indicators to establish a priority (order number) that determines which task indicator colors are displayed in task glyphs. Outages are displayed in a different list.
By default, the system automatically updates the map every 30 seconds. To change the refresh interval, navigate to **BSM Maps > Map Properties** and edit the **Seconds between each automatic reloading of troubles and tasks** property. The system also updates changes to the CIs in the map when the map is reloaded.

**View a collapsed object in a Legacy BSM map**

- To expand a cluster or collapsed node, right-click the icon and select **Expand this** from the context menu.
- To collapse a cluster or a node with children, click **Collapse** in the map header bar.

The following behaviors apply to collapsible nodes:

- The collapse option only collapses the most recently expanded node.
- The map view retains the last filter settings when the collection is collapsed.
- If the cluster itself contains tasks, the count that displays in the task glyph includes the total count for tasks on the cluster CI. The color of the glyph is the color of the highest priority task in the cluster.
- When a cluster is expanded, the counter glyph disappears.
- If the cluster CI has no tasks associated with it, the task glyph disappears.
- When a collapsed node is expanded, the icon disappears until you collapse the nodes again.

![Figure 592: Collapsed Cluster Node with Tasks](image)
You can configure the color and order number for tasks, outages, and troubles, such as incidents, in the Map Indicators module. The order number establishes priority when the system displays indicators for multiple tasks.

**Tasks**

A collapsed collection with tasks assigned to its nodes displays an orange glyph. If the total number of tasks within the collection meets or exceeds the configured maximum in the threshold property, the glyph color is red. These colors are not configurable.

**Outages**

A collapsed collection indicates when its nodes have current, planned, or past outages. In the default configuration, the color for any outage is red, and current and planned outages have the highest priority. Next in priority are incidents and problems, which means their configured color displays over past outages. Outages are not included in the activity count shown in the task glyph.

**Troubles**

If the collapsed collection contains one node with trouble, the system displays a glyph in the color defined for that map indicator. If there are multiple trouble records, the glyph shows the color of the indicator with the lowest order number. For example, in a default configuration, if there are incidents and problems within the collection, the glyph uses the map indicator color for incidents, which has a lower order number than problems. If the nodes in the collection have a problem, a change request, and some tasks, the glyph shows the color of the problem, which has a lower order number than the others.
Managing when past outages appear

To manage when past outages appear for a CI:

1. Navigate to **Dependency Views > Legacy BSM > Map Indicators**.
2. Click the reference icon for the **outage_past** indicator.
3. In the outage record, configure one of the following:
   - Clear the **Active** check box. This prevents past outages from displaying on the BSM map at any time.
   - Edit the condition statement to limit the length of time past outages display on the map.
4. Click **Update**.
Component nodes

An expanded collection shows all nodes that satisfy the level depth configured for the map.

Node icons show glyphs for tasks, trouble, or outages associated with them, and neighbor nodes affected by trouble are highlighted in the appropriate affected node color. The cluster node itself is not displayed after you expand it.

Figure 595: Expanded Cluster With Trouble in Nodes
Figure 596: Expanded Nodes With an Outage

**Visual Task Boards**

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

Visual Task Boards allow you to view and update multiple task records, which appear as *cards* that can be moved between *lanes*. An *activity stream* on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLs) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

This video demonstrates how Visual Task Boards work.

**Note:** UI16 or UI15 is required to use Visual Task Boards.

The following podcast offers additional information on the use of Visual Task Boards.
Supported browsers for Visual Task Boards

The system supports Visual Task Boards on the latest version or service pack of the following browsers.

- Firefox version 31 and up
- The latest public release of Chrome
- Safari version 6.1 and up
- Internet Explorer version 10 and up
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

Scripting support

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.

Board structure

There are different types of task boards for different kinds of task management. All types of boards share the same overall structure.

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeform boards</td>
<td>Display any kind of task record, including personal tasks. Members of freeform boards can add and remove task cards and lanes.</td>
</tr>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match the configured filter against a particular table. Members of flexible boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
<tr>
<td>Guided boards</td>
<td>Display tasks that match the configured filter against a particular table, like flexible boards. Members of guided boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Guided board lanes correspond to field values and cannot be edited in most cases.</td>
</tr>
</tbody>
</table>

The icon beside the board name on the My Task Boards page identifies the type of board. Freeform boards appear with a grid of four squares ( ); flexible boards appear with a vertical line beside two squares ( ); guided boards appear with two vertical lines ( ).
Figure 597: My Task Boards screen

All boards have these elements:
<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick panel</td>
<td>Displays labels and users associated with the board. Board members can use the quick panel to filter cards or to quickly label or assign tasks. Members can also configure what appears in the quick panel.</td>
</tr>
<tr>
<td>Lanes</td>
<td>Organize cards on a board into vertical groups. These groups often represent the status of the task, such as To Do, Doing, and Done. Each board is composed of one or more lanes. When using a guided board, each lane represents a possible field value. For example, a board on the Incident table can display one lane for each State value such as New, Active, or Resolved. Users can move cards from one lane to another to update the task that card represents.</td>
</tr>
<tr>
<td>Cards</td>
<td>Represent individual tasks. Users can add comments, attachments, and labels to cards and assign users to cards. Each card is tied to a task record; updating one immediately updates the other. For freeform boards, each card represents a personal task. For flexible and guided boards, each card represents a record from the list that board was created from.</td>
</tr>
<tr>
<td>Activity stream</td>
<td>Displays a history of changes to cards on the current board, as well as tabs for member and label administration.</td>
</tr>
</tbody>
</table>
Activate Visual Task Boards

Visual Task Boards are active by default on new instances. For instances upgrading from a previous version, the Visual Task Boards plugin (com.glide.ui.vtb) must be activated.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Installed with Visual Task Boards

Several types of components are installed with Visual Task Boards.

Tables installed with Visual Task Boards

Visual Task Boards add the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Member [vtb_board_member]</td>
<td>Stores a record for each member of each task board.</td>
</tr>
<tr>
<td>Private Task [vtb_task]</td>
<td>Stores a record for each personal task on each freeform board.</td>
</tr>
<tr>
<td>Visual Task Board [vtb_board]</td>
<td>Stores a record for each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card [vtb_card]</td>
<td>Stores a record for each task card on each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card History [vtb_card_history]</td>
<td>Stores records for certain task card changes, such as lane or assignee changes. Each record indicates the previous value and the new value.</td>
</tr>
<tr>
<td>Visual Task Board Lane [vtb_lane]</td>
<td>Stores a record for each lane on each task board.</td>
</tr>
</tbody>
</table>

Properties installed with Visual Task Boards

Visual Task Boards add the following properties.
Note: To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.board.upload_limit</td>
<td>Sets the maximum file size in megabytes allowed for each task card attachment.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 10</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Property [sys_properties] table</td>
</tr>
</tbody>
</table>

Script includes installed with Visual Task Boards

Visual Task Boards add the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VisualTaskBoards</td>
<td>Provides general utilities for Visual Task Boards.</td>
</tr>
<tr>
<td>VTBBoardSecurity</td>
<td>Provides security utilities to control board access.</td>
</tr>
<tr>
<td>VTBTaskSecurity</td>
<td>Provides security utilities to control task access.</td>
</tr>
</tbody>
</table>

Client scripts installed with Visual Task Boards

Visual Task Boards add the following client scripts.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Kanban Choice</td>
<td>Visual Task Board [vtb_board]</td>
<td>Adds the <strong>Kanban Board</strong> option to the Lane field. This option indicates that the task board is a flexible board.</td>
</tr>
</tbody>
</table>

Business rules installed with Visual Task Boards

Visual Task Boards add the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to live group</td>
<td>Board Member [vtb_board_member]</td>
<td>If a Connect Chat conversation is created for a task board, this business rule adds the board members as conversation members.</td>
</tr>
</tbody>
</table>
### Business rule

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sync Members With VTB</td>
<td>Live Group Member</td>
<td>If a Connect Chat conversation exists for a task board and a member is added to the conversation, this business rule adds the conversation member as a board member.</td>
</tr>
<tr>
<td>Update Board on Card Change</td>
<td>Visual Task Board Card</td>
<td>Triggers the system to update the task board when changes occur to the cards.</td>
</tr>
<tr>
<td>Update Board on Lane Change</td>
<td>Visual Task Board Lane</td>
<td>Triggers the system to update the task board when changes occur to the lanes.</td>
</tr>
<tr>
<td>update board on lane change</td>
<td>Board Member</td>
<td>Triggers the system to update the task board when changes occur to the board members.</td>
</tr>
<tr>
<td>VTB Previous Additional Assignees</td>
<td>Private Task</td>
<td>Triggers the system to send an email notification to users when they are designated as additional assignees for cards.</td>
</tr>
</tbody>
</table>

### Notifications installed with Visual Task Boards

Visual Task Boards add the following notifications.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB additional assignee notification</td>
<td>Sends an email notification to users when they are designated as additional assignees for tasks.</td>
</tr>
<tr>
<td>VTB assignee notification</td>
<td>Sends an email notification to users when they are designated as the primary assignees for personal tasks.</td>
</tr>
<tr>
<td>VTB lane change notification</td>
<td>Sends an email notification to a task's assignees when the task changes lanes.</td>
</tr>
</tbody>
</table>

### Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.

#### Create a freeform board

You can create new freeform task boards for tracking any kind of task or project.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards.**
2. Under **Boards you own**, click **Create Freeform Board**.
   A new task board opens with the default freeform lanes, **To Do**, **Doing**, and **Done**.
3. Click the board name and enter a new name.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

### Create a flexible or guided board

You can create a flexible or guided task board for any table that extends Task, such as Incident or Change.

Role required: none

1. Navigate to the list for any table that extends Task, such as **Incident > All**.
2. Optional: **Create a filter** to show only the records you want to work with.
   For example, you might filter out incidents that are not assigned to you.
3. Right-click a column header and select **Show Visual Task Board**.
   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a **guided board**. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the **State** column, the board shows one lane for each incident state, such as **New** or **Closed**. If you select a column that is not a reference or choice, the board is a **flexible board** and the board shows the default lanes, **To Do**, **Doing**, and **Done**, with all cards in the **To Do** lane.
4. Optional: Click the board name and enter a new name.

   **Note**: For guided boards created from choice fields, such as **State**, the system creates a lane for each possible choice value. For guided boards created from reference fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

### Delete a task board

You can delete any task board you own.

Role required: none

Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.

1. Navigate to **Self-Service > Visual Task Boards**.
2. Under **Boards you own**, point to a board and click **Delete Board**.
Add or modify a lane

When you create a new freeform or flexible task board, it includes the default lanes **To Do**, **Doing**, and **Done**. Any board member can change the names and add new lanes to accommodate the task workflow you want to track.

Role required: none

Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

**Note:** You cannot remove lanes from guided boards.

1. Open a task board.
2. To create a new lane, scroll past all the existing lanes and click **Add Lane**.
   This option is available for guided boards only if the lanes are based on a reference field, such as **Assigned to**.
   A new, empty lane appears to the right of the existing lanes.
3. Enter a title for the lane, then press the Enter key.
4. To change the order of lanes, click the left and right arrows at the bottom of the lanes.
5. To delete a lane, click **Delete Lane** at the bottom of the lane.
   **Delete Lane** appears only if the lane does not contain any task cards. If you want to delete a lane that contains task cards, drag the task cards to another lane or archive the cards first.

Task cards

A Visual Task Board task card can represent a personal task or a record on a table.

You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.

**Note:** Each freeform board can display up to 300 cards by default. Flexible and guided boards can display up to 100 cards. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure different maximum card values.

Freeform board tasks

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.

**Add a personal task to a freeform board**

You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task [vtb_task] table.

Role required: none

1. On a freeform board, click the add card icon (+) beside the lane title. Alternatively, click **Add Task** in a lane that contains at least one card.
   A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press **Enter**.

**Add a task to a freeform board from a form**

You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.
Role required: none
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Open a task record, such as an incident.
2. Click the menu icon ( ) or right-click the form header to show the form context menu.
3. Select Add to Visual Task Board.
   A pop-up window appears with a list of freeform task boards.

4. Click the name of the board you want to add the card to.
   A confirmation message appears.
5. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.

Add a task to a freeform board from a list
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Role required: none
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Navigate to a list of task records, such as Incident > Open.
2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.
3. Click the name of the board you want to add the card to.
   A confirmation message appears.

4. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.

Add a task to a flexible or guided board

You can add cards directly to a flexible or guided board lane. These cards represent records on whichever table the board is associated with.

Role required: none

1. On a flexible or guided board, click the add card icon (+) beside the lane title. Alternatively, click Add Task in a lane that contains at least one card.
   A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.
   Consider the example of a guided board that shows incidents with the Software category, with a lane for each assignee. If you add a card to the ITIL User lane, the new incident record Category and Assigned to fields are automatically set to Software and ITIL User.

2. Complete the form and click Submit.
   A new task card appears in the lane.

Edit card details

When you click a card on a Visual Task Board, a pop-up window appears with additional details.

Role required: none

You can edit certain values from the card details. Updating these values also updates the underlying task record.

1. Click a card.
   The details for that card appear in a pop-up window.

2. Alternatively, you can click an entry in the activity stream to view the details for the associated card.

3. From the card details you can:
   - Click the card title to rename the card.
   - Modify the short description.
   - Add comments or work notes in the activity stream.
   - Edit the assignees.
- Click one or more of the available labels to add a label to the card.
- Add or remove file attachments.
- Create a checklist.
- Archive the card (freeform boards only).
- Move the card to a different board (freeform boards only).

Label a task card

Labels help categorize tasks and visually distinguish them on the task board.

Enable labels for the board.
Role required: none

You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.

![Image of task card labels](image)

Figure 599: Task card labels

You can add one or more labels to a task card. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a label to a card from the quick panel</strong></td>
<td>1. Drag a label from the quick panel directly to a task card.</td>
</tr>
<tr>
<td></td>
<td>2. Drop the label in the drop zone.</td>
</tr>
<tr>
<td><strong>Add a label to a card from the card details</strong></td>
<td>1. Open the card details for a task.</td>
</tr>
<tr>
<td></td>
<td>2. Click the details tab (i).</td>
</tr>
<tr>
<td></td>
<td>3. Under <strong>Labels</strong>, select one or more labels.</td>
</tr>
<tr>
<td></td>
<td>Point to a label to display its name.</td>
</tr>
<tr>
<td></td>
<td>4. Close the card detail pop-up window.</td>
</tr>
</tbody>
</table>

You can use configuration options to *rename* or *disable* labels or to *hide* labels altogether.

**Assign a task to a user**

Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.

You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.
When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task's **Assigned to** field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place. There is no restriction on who you can add as an additional assignee.

---

**Note:** Assignees are not automatically granted access to the board. Only members can access the board.

---

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add an assignee from the quick panel</strong></td>
<td>1. Drag a user's avatar from the quick panel directly to the task card.</td>
</tr>
<tr>
<td></td>
<td>2. Drop the avatar in the <strong>Primary</strong> or <strong>Additional</strong> drop zone.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Add an assignee from the card details       | 1. Open the card details for a task.  
  2. Click the assignees tab (👤).  
  3. Click **Add Primary Assignee** or **Add Additional Assignee**. The **Add Primary Assignee** option is not available if there is already a primary assignee.  
  4. Select a user.  
  5. Close the card detail pop-up window. |

The system sends an email notification to inform the new assignee of the change.

Visual Task Board checklists

Checklists help you track the progress of tasks on your Visual Task Board.

Checklists are available as a tab in the card details.
Figure 601: Sample checklist

You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see Checklists on page 130.

Create a new checklist for a card
You can create a unique checklist for each Visual Task Board card.

Role required: none

1. Open the card details for a task.

2. Click the checklist tab (✓).

3. Click Add Item.

4. Enter text for the checklist item.

5. Press the Enter key to add the checklist item.

6. Create as many additional checklist items as desired.

7. Optional: To delete a checklist item, click the minus (-) icon.

8. Optional: To reorder checklist items, click the drag icon (_drag) and drag a checklist item to a different position in the list.

9. Optional: Save the checklist as a template for easy reuse.

   a) Click the more icon (•) beside the Checklist formatter.
b) Select **Save as Template**.
A dialog box appears.

c) Enter a descriptive template name to identify the checklist.
When a user creates a checklist from a template, all templates are listed in alphabetical order and there is no way to filter which templates appear. To provide a better user experience, consider implementing a naming system for checklist templates. For example, include the name of the table or another identifier to clarify how the checklist should be used.

d) Click **Save**.

10. Optional: To create a task from a checklist item:
   a) Point to a checklist item and click the create task icon (_drag_icon_).
   b) Select the type of task you want to create.
   An administrator can configure which task types are available.
   The new task record appears in a pop-up window. The short description is automatically populated with the checklist item text.
   c) Fill in the form with additional detail as necessary.
   d) Click **Update**.

**Create a checklist from a checklist template**
In a Visual Task Board card, you can quickly create a checklist from a checklist template you previously created.

Create at least one checklist template.
Role required: none
A template saves time by creating checklist items automatically. You can add, edit, or remove checklist items without impacting the template.

1. Open a task card that does not already contain a checklist.
2. Click the checklist tab (checkmark).
3. Click the more icon (arrow).
   The more icon does not display unless you have added an item to the checklist, or if you have a pre-existing checklist template.
4. Under **Copy items from**, select a template.
   The checklist items appear automatically.

**Delete a checklist from a card**
You can remove a checklist from a Visual Task Board card.
Role required: none

1. Open a task card that contains a checklist.
2. Click the checklist tab (checkmark).
3. Click the more icon (arrow).
4. Select **Remove Checklist**.
A confirmation dialog box appears.

5. Click **Delete**.

Configure which types of tasks can be created from checklist items

A system property controls which types of tasks you can create from a Visual Task Board checklist item.

Role required: admin

You might want to add custom tables or remove tables you do not use.

1. Navigate to `sys_properties.list`.
2. Locate the `glide.ui.create_task_type_option_list` property.
3. Edit the **Value** to add or remove tables.

You can add any table that extends Task [task]. Use the table name, not the label. For example, you would enter `change_request`, not Change Request. Ensure the tables listed are separated by commas, with no spaces.

The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

![Add Item](image)

Archive a card

Archiving a card is a non-destructive way to remove a card from a freeform board.

Role required: none

You can archive cards you are no longer working on to reduce visual clutter. Note that it is only possible to archive cards on a freeform board.

1. To archive a card, view the card details and click **Archive Card**.
2. To see a list of archived cards for the current board, open the board configuration menu (gear) in the top-right corner of the board and click **View Archived Tasks**.
3. From the **Archived Tasks** pop-up window, you can restore cards to the board.
Access a task record

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

Role required: none

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access the record from the task card</td>
<td>Click the record number on the task card.</td>
</tr>
<tr>
<td>Access the record from the card details</td>
<td>1. Open the card details for a task.</td>
</tr>
<tr>
<td></td>
<td>2. Click the record number in the header.</td>
</tr>
</tbody>
</table>

Move a card to a different lane

You can move a card from one lane to another.

Role required: none

When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

1. Open a Visual Task Board.
2. Select a card and drag it to a different lane.
   All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident [incident] table, with a lane for each State. The Close code and Close notes fields become mandatory when the State changes to Closed. If you attempt to move an incident card from the New lane to the Closed lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.

Move a card to a different board

You can move a card from one freeform board to another.

1. Open the card details.
2. In the details tab (i), click Move Card.
3. In the pop-up window that appears, select the board and lane to move the card to.
   The board selection list displays freeform boards only.

Add or remove a task board member

You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.

Role required: none

Only members of a task board can access the board. Any board member can add or remove other members.

1. On a Visual Task Board, open the activity stream.
2. Click the members tab.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. In the Members section, click the plus icon.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a user's name or select a user from the drop-down menu.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. In the Members section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click Remove.</td>
</tr>
<tr>
<td>Promote an assignee to a member</td>
<td>1. In the Assignees section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click Make Member.</td>
</tr>
<tr>
<td>Promote all assignees to members</td>
<td>In the Assignees section, click the promote all icon ( ).</td>
</tr>
</tbody>
</table>

View board information

You can display key information about any task board.

Role required: none

To view information about a visual task board, click the board information icon ( ) by the board name.

A flyout appears and displays the following information about the board:

- Name
- Board type
- Filter conditions (flexible and guided boards only)
- Owner
- Number of lanes
- Number of cards
- URL
Toggle the list view

For flexible and guided boards, you can switch to a list view of the tasks on the board.

Role required: none
<table>

</table>
A list of records appears in place of lanes and cards.

2. Use the list like any other list.

   Note: You cannot use breadcrumbs.

3. Click Lanes by the board filter to switch back to the lane view of the tasks.

Visual Task Board SLA indicators

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.

SLA: 111%
Assigned to: Boris Catino
Urgency: 1 - High
Priority: 1 - Critical
Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards**.
2. Drag and drop a task board to a Connect mini window.
   
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Note that only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. Adding or removing users from the board members list automatically adds or removes them from the conversation. However, adding or removing users from the conversation does not add or remove them from the board members list.

1. Navigate to **Self-Service > Visual Task Boards**.
2. Open a task board.
3. In the board header, click the connect with board members icon ($$$\text{_BOARD}$$$).
   
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Configure the task board

The board configuration menu provides several options that affect the look and feel of the board.

Role required: none

1. Click the menu icon ($$$\text{_CONFIG}$$$) in the top-right corner of the board.
   
   The **Quick Panel** and **Configure Cards** sections provide several options that affect the look and feel of the board. These options are enabled when the switch appears green and is toggled to the right.

2. Select a background color from the palette.
The background color surrounds the lane area of a board. It also appears as the color for the board on the My Task Boards page. Changes to the background color apply to all users.

3. Configure quick panel options, as necessary.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>When enabled, the quick panel is visible. This setting applies to the current user only.</td>
</tr>
<tr>
<td>User Names</td>
<td>When enabled, user names appear by user avatars in the quick panel. This setting applies to the current user only.</td>
</tr>
<tr>
<td>Show Labels</td>
<td>When enabled, labels appear on cards and in the quick panel. This setting applies to all users.</td>
</tr>
<tr>
<td>Label Names</td>
<td>When enabled, the label name appears beside the colored icon for that label in the quick panel. This setting applies to the current user only and is available only when Show Labels is enabled.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like this:

![Quick panel](image)

4. Configure card options, as necessary.

Changes to the cards apply to the current user only.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Cards</td>
<td>When enabled, the lane width is decreased and card information and thumbnails do not appear on the card.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show Card Info</td>
<td>When enabled, card information appears on each card. Card information typically includes details like the task state, date opened, and last user to update it. This setting is available only when <strong>Compact Cards</strong> is disabled.</td>
</tr>
<tr>
<td>Show Card Thumbnail</td>
<td>When enabled, cards display the first image attached to that card as a thumbnail. This setting is available only when <strong>Compact Cards</strong> is disabled.</td>
</tr>
<tr>
<td>Show SLAs</td>
<td>When enabled, SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when <strong>Compact Cards</strong> is enabled. This setting is available only when there are SLAs associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

5. Show or hide lanes by selecting or clearing the check box for each lane, listed under **Configure Lanes**.

**Configure Visual Task Board labels**

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

Role required: none

You can use up to five labels per board. Any board member can edit the labels on a board.

1. Open the activity stream.
2. Click the labels tab.
3. Toggle the **Show Labels** switch to the enabled position if it is not already enabled.
4. To change a label name, click the label text and enter a new value.
5. To disable or enable a specific label, toggle the switch by the label.

When a label is disabled, members cannot add that label to cards on the board. Cards that are already labeled are not affected.
Configure the card limit for freeform boards

Freeform boards can display up to 300 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.freeform_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the **Value** to the maximum number of cards allowed for each freeform board.

Configure the card limit for flexible and guided boards

Flexible and guided boards can display up to 100 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.board_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the **Value** to the maximum number of cards allowed for each flexible or guided board.

Connect

ServiceNow Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, HR Service Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

- Connect Chat: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.
- Connect Support: Enables support agents to provide real-time assistance to end users, using queues. Requires the Connect Support plugin.

UI16 or UI15 is required to use Connect.

**Note:**

- Connect does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.
• Connect is called Collaboration in versions prior to Geneva.

---

**Supported browsers for Connect**

The system supports Connect Chat and Connect Support on most modern browsers.

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 6.1 and later
- Internet Explorer version 10 and later
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

**Activate Connect**

Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Role required: admin

If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

**Installed with Connect**

Several types of components are installed with Connect.

**Tables installed with Connect**

Connect adds the following tables.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collaborator</td>
<td>Stores a record for each conversation, for each conversation member.</td>
</tr>
<tr>
<td>[collaborator]</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> The Collaborator table is left over from the Collaborator plugin in Fuji. It is not used in Connect or Live Feed.</td>
<td></td>
</tr>
<tr>
<td>Connect Action</td>
<td>Stores a record for each Connect action. This table is also used in Connect Support.</td>
</tr>
<tr>
<td>[connect_action]</td>
<td></td>
</tr>
</tbody>
</table>

Properties installed with Connect

Connect adds the following system properties.

**Note:** All of the properties are located on the System Property [sys_properties] table. To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collaboration.email_interval</td>
<td>Sets the number of minutes the system waits before sending a Connect notification email to an inactive user.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 3</td>
</tr>
<tr>
<td></td>
<td>• <strong>More information:</strong> Configure the email notification interval</td>
</tr>
<tr>
<td>collaboration.frameset</td>
<td>Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> true</td>
</tr>
<tr>
<td></td>
<td>• <strong>More information:</strong> Disable the Connect overlay on page 2283</td>
</tr>
<tr>
<td>collaboration.polling_interval</td>
<td>Sets the number of seconds the system waits between polling for new Connect messages. This property also impacts Connect Support.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 10</td>
</tr>
</tbody>
</table>
### Name: glide.connect.enabled

**Description:** Hides the Create or Join Chat Room related link, which appears on the Incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified.

- **Type:** true | false
- **Default value:** true

### Name: glide.live_feed.task_header_button

**Description:** Determines whether the show live feed icon (_follow_ button) are available in the form header of tables that have the live_feed=true dictionary attribute. The available choices are both, live_feed, collaboration, and none.

- **Type:** choice list
- **Default value:** collaboration
- **More information:** Configure record conversations

---

## Business rules installed with Connect

Connect adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add message to conversations</td>
<td>Visual Task Board Card [vtb_card]</td>
<td>Generates system messages for conversations created from Visual Task Boards. The messages provide updates when cards are added to the board or moved between lanes.</td>
</tr>
<tr>
<td>Broadcast Chat APNS</td>
<td>Live Feed Message [live_message]</td>
<td>Generates push notifications when new messages are received in a conversation.</td>
</tr>
<tr>
<td>Broadcast Chat APNS</td>
<td>Live Mention [live_mention]</td>
<td>Generates push notifications when a user is mentioned in a conversation.</td>
</tr>
<tr>
<td>Sync Board Members With Group Members</td>
<td>Live Group Member [live_group_member]</td>
<td>Adds Visual Task Board members as conversation members when you create a conversation from the board.</td>
</tr>
</tbody>
</table>

## Notifications installed with Connect

Connect adds the following notifications.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collaboration Offline Group Message(s)</td>
<td>Sends an email notification to offline users when there are new messages in group chats they are members of. Contains a link to open the conversation and a summary of the messages.</td>
</tr>
<tr>
<td>Collaboration Offline Message Bundle</td>
<td>Sends an email notification to offline users when there are new messages in direct chats. Contains a link to open the conversation and a summary of the messages.</td>
</tr>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Sends push notifications to users according to their notification preferences. This notification also impacts Connect Support.</td>
</tr>
</tbody>
</table>

### Activate Connect Support

You can activate the Connect Support plugin (com.glide.connect.support) if you have the admin role. This plugin includes demo data. If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support cannot be used concurrently. Starting with Geneva Patch 8, when you activate Connect Support, the system automatically sets the state of all Chat Queue Entry [chat_queue_entry] records to Closed Complete. This ends any open help desk chats.

**Role required:** admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

### Installed with Connect Support

Several types of components are installed with Connect Support.

**Note:** Connect Support also utilizes many of the components installed with Connect.

### Tables installed with Connect Support

Connect Support adds the following tables for system use.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue Entry Transfer [chat_queue_entry_transfer]</td>
<td>Stores a record each time an agent transfers a support conversation to another agent.</td>
</tr>
</tbody>
</table>
Properties installed with Connect Support

Connect Support adds the following system properties.

**Note:** All of the properties are located on the System Property [sys_properties] table. To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type:</th>
<th>Default value:</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect.support.conversation_limit</td>
<td>Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.</td>
<td>integer</td>
<td>-1</td>
</tr>
<tr>
<td>connect.support.show_agent_avatar</td>
<td>Determines whether an agent's avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent's name only.</td>
<td>true</td>
<td>false</td>
</tr>
<tr>
<td>connect.support.user.closed.conversation_limit</td>
<td>Determines how many closed conversations appear in a user's support conversation history. When the value is set to 0, all previous conversations appear in the history.</td>
<td>integer</td>
<td>0</td>
</tr>
<tr>
<td>glide.connect.support.enabled</td>
<td>Disables or enables Connect Support. When the property is enabled, all help desk conversations are opened in Connect Support, rather than legacy chat. Additionally, the support tab appears in the Connect sidebar. This property is for system use only and should not be modified.</td>
<td>true</td>
<td>false</td>
</tr>
<tr>
<td>connect.support.idle.count_down</td>
<td>Number of seconds to count down from before marking end-user as having left their support session.</td>
<td>integer</td>
<td>60</td>
</tr>
</tbody>
</table>

Available starting with Geneva Patch 2.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect.support.idle.delay</td>
<td>Number of seconds to wait (without user interaction), before presenting end-users with an idle countdown timer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 120</td>
</tr>
</tbody>
</table>

Business rules installed with Connect Support

Connect Support adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry [chat_queue_entry]</td>
<td>Populates the <strong>Average wait time</strong> field on the Chat Queue table with a calculated value when a support conversation is accepted. The calculation is based on the last 20 support conversations for the queue.</td>
</tr>
<tr>
<td>SNC - Chat Queue Entry Duration</td>
<td>Chat Queue Entry [chat_queue_entry]</td>
<td>Populates the <strong>Duration</strong> field on the Chat Queue Entry table with a calculated value, based on the amount of time the support conversation was open.</td>
</tr>
</tbody>
</table>

Connect interface

Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

Connect overlay

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar and any Connect mini windows that are open.
Note: An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

Connect sidebar

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create new conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon ( ) in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

Connect Chat

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create new conversations.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the x icon to remove the conversation from the sidebar.

**Connect Support**

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays **Queues** to which you belong. It also displays your open support conversations under **Cases**.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

Figure 606: Support view of the Connect sidebar

Connect mini windows

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field. Several icons appear in the mini window header and by the message field.

Note: The icons you see for each conversation depend on the conversation type and other conditions.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>👤+</td>
<td>Add user</td>
<td>Add a user to the conversation. This icon is visible for group and record conversations only.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>View document</td>
<td>View the record associated with the conversation. This icon is visible for record and support conversations only.</td>
</tr>
<tr>
<td></td>
<td>New window</td>
<td>Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.</td>
</tr>
<tr>
<td></td>
<td>Collapse/Expand conversation</td>
<td>Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.</td>
</tr>
<tr>
<td></td>
<td>Close window</td>
<td>Close the mini window. The conversation remains in the Connect sidebar and the history is preserved when you reopen the conversation.</td>
</tr>
<tr>
<td></td>
<td>Connect actions</td>
<td>Open the Connect actions menu, which contains options like Transfer and Create Incident. This icon is visible only when Connect actions are available for the conversation. By default, this icon is visible for support conversations only. Administrators can add options to this menu by creating new Connect actions.</td>
</tr>
<tr>
<td></td>
<td>Message type</td>
<td>Choose whether messages are added to the associated record as comments or work notes. This icon is visible only for record and support conversations.</td>
</tr>
<tr>
<td></td>
<td>Attach file</td>
<td>Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.</td>
</tr>
</tbody>
</table>

**Connect workspace**

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It provides additional tools to help keep track of important information in conversations.

To open the Connect workspace, navigate to **Collaborate > Connect Chat** or click the new window icon ( ) in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.
The Connect workspace is composed of the following elements.

Table 552: Connect workspace elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sidebar</td>
<td>Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see <a href="#">Connect sidebar</a>.</td>
</tr>
<tr>
<td>Conversation pane</td>
<td>Displays the currently selected conversation.</td>
</tr>
<tr>
<td>Conversation tools</td>
<td>Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.</td>
</tr>
</tbody>
</table>
Figure 607: Connect workspace
Conversation pane

The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.

The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

Connect conversation tools

The conversation tools area in the Connect workspace contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.
<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Info](image) | Info | Contains the following sections, each of which appears only if it contains information.  
  - **Record**: Lists details about the record the current conversation follows, such as record number, state, assignee, and short description. The fields displayed in this section vary by the type of record. This section is available only for record conversations.  
  - **Related Records**: Lists task records that have been referenced in the conversation, such as incidents, problems, or changes. When you send a record number as a message or drag and drop a record in a conversation, it appears as a link. The list displays the short description for each task. Click a task to open the record in a new browser tab. Note that only conversation members who have rights to view the tasks can access them.  
  - **Links**: Lists URLs that have been referenced in the conversation. Click a link to open the destination page in a new browser tab.  
  - **Visual Task Boards**: Lists Visual Task Boards that have been referenced in the conversation. Click a Visual Task Board name to open the board in a new browser tab. |

This tab is not available for support conversations.
<table>

</tr>
</tbody>
</table>

### Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, or email notifications for all your Connect Chat and Connect Support conversations.

**Role required:** none

By default, Connect mobile and email notifications are enabled globally. You must enable desktop notifications.

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. In the banner frame, click the gear icon (⚙️) to open the system settings.
2. In the system settings window, click the **Notifications** tab.
3. Enable or disable Connect mobile, desktop, or email notifications.
Edit which notifications you receive for a specific conversation.

**Connect notification browser support**

The following browsers support Connect chat notifications.

<table>
<thead>
<tr>
<th>Browser</th>
<th>Enable notification steps</th>
</tr>
</thead>
</table>
| Chrome                         | 1. From a Chrome window, click the Chrome menu in the upper right corner.  
|                                | 2. Go to **Settings > Show advanced settings... > Privacy > Content settings**.  
|                                | 3. In the Content settings window, from the notifications section, select your notification settings. |
| Mozilla Firefox (starting with version 44) | Manage browser notification settings using the information icon next to the URL. |
| Safari (starting with OS X Mavericks) | 1. From a Safari window, open **Preferences**.  
|                                | 2. Select the notifications tab.  
|                                | 3. Select **Allow** or **Deny** to control which websites have access to notifications. |
| Microsoft Edge                 | Notifications are enabled by default on Windows 10 PCs and tablets starting with EdgeHTML 14. For more information, see [https://blogs.windows.com/msedgedev/2016/05/16/web-notifications-microsoft-edge/#pVkwubg7uvROayyl97](https://blogs.windows.com/msedgedev/2016/05/16/web-notifications-microsoft-edge/#pVkwubg7uvROayyl97). |

**Note:** Internet Explorer does not support Connect notifications out of box.

**Edit which notifications you receive for a conversation**

You can control which types of Connect notifications you receive for each conversation and when you receive them.

Ensure Connect notifications are **enabled globally**.

Role required: **none**

Connect can send mobile, desktop, and email notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile and email notifications for all activity, and desktop notifications only when someone mentions you. You might also want to disable a certain type of notification entirely for a conversation.
Audio notifications are unavailable for Connect in Geneva.

By default, you receive mobile and email notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see Connect notification browser support on page 2278.

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab ( ).
3. Edit the following settings according to your preferences.

**Note:** If a notification type is disabled globally, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.

![Notification type disabled globally](image)

**Figure 608: Notification type disabled globally**

<table>

Upload a profile picture

You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.

Role required: none

Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

1. Navigate to Self-Service > Live Feed.
2. Click the tile with your picture or initials and title.

3. Use one of the following actions to add your photo.
   - Locate the photo file you want to use and drag it over the existing photo.
   - Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.
Drag and drop a file in a Connect conversation

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

Role required: none

You can drag and drop several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

Drag and drop an item in a Connect mini window.

To drag and drop a record from a list, drag the reference icon ( ), the record number, or a reference column value.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

1. Navigate to **Self-Service** > **Visual Task Boards**.
2. Drag and drop a task board to a Connect mini window.

A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Note that only conversation members who are members of the board can access it. If you share a task board in a *record conversation*, it appears as a URL in the record activity stream.

Mention a user in a Connect conversation

You can get someone's attention in a group conversation by mentioning them.

Role required: none

Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.
1. Open a Connect group conversation.
2. In the message field, type the @ character. A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

Connect administration

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

**Note:** There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration on page 2288 and Connect Support administration on page 2296.

Configure the polling interval

The polling interval determines how frequently the system polls for new Connect messages.

Role required: admin

The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.
Note: This setting impacts Connect Chat and Connect Support.

1. Navigate to `sys_properties.list`.
2. Locate the `collaboration.polling_interval` property.
3. Set the Value to a different number of seconds.

   Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

Enable the Connect overlay

The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.

Role required: admin

To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the `collaboration.frameset` property to `false`.

1. Navigate to `sys_properties.list`.
2. Locate the `collaboration.frameset` property.
3. Set the Value to `false`.

Administer Connect actions

You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.

Role required: admin

The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.

1. Navigate to `connect_action.list` to access the Connect Action table.
   
   If Connect Support is enabled, you can also navigate to Collaborate > Administration > Actions.
2. Click New or open an existing Connect action.
3. Complete the Connect Action form, as appropriate.

Table 555: Connect Action form

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
|              |     response.newRecord("incident", { short_description: conversation.document.short_description || ",
caller_id: conversation.document.opened_by }); |
|              | For information about the response object, see the ConnectActionResponse API reference documentation.                                        |
| Shortcut     | Text that triggers the action when entered after the "/" character in a conversation.                                                        |
| Title        | Text that appears in the Connect action menu. The title for each Connect action should be unique.                                             |
Connect Chat

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:

- Direct conversations between two users.
- Group conversations between three or more users.
• Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
• Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Chat.
This video demonstrates how to use Connect Chat.
This video demonstrates how to use Connect Support.

Note:
• Connect Chat does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

Connect Chat use

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

Start a direct or group conversation

You can start a conversation with one or more users in Connect Chat.

Role required: none

A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

1. In the chat view of the Connect sidebar, click the plus icon (+) by the filter.
   A Connect mini window appears.
2. In the To field, enter the name of the user you want to chat with.
   Suggestions appear as you type.
3. Optional: Enter additional names to create a group conversation.
   You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.
4. Press the Enter key to shift focus to the message field.
5. Send a message to create the conversation.
   The conversation is added to the Connect sidebar for quick access.

Follow a record in Connect

You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

Role required: whichever role is required to access the record you want to follow in Connect

Any record conversation you create in Connect becomes a record feed in live feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

Note: By default, record conversations are enabled for all tables that extend Task [task]. Administrators can enable record conversations for additional tables or disable them if desired.

1. Navigate to a task record.
2. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Follow the record</strong></td>
<td>1. In the form header, click <strong>Follow</strong>.</td>
</tr>
<tr>
<td></td>
<td>The system adds you as a member of the record conversation, but does not open the conversation. You can open the conversation from the Connect sidebar.</td>
</tr>
<tr>
<td><strong>Follow the record and open a chat mini window</strong></td>
<td>1. In the form header, click the down arrow in the <strong>Follow</strong> button.</td>
</tr>
<tr>
<td></td>
<td>2. Select <strong>Open Connect Mini</strong>.</td>
</tr>
<tr>
<td></td>
<td>The system adds you as a member of the record conversation and opens it in a Connect mini window.</td>
</tr>
<tr>
<td><strong>Follow the record and open the Connect workspace</strong></td>
<td>1. In the form header, click the down arrow in the <strong>Follow</strong> button.</td>
</tr>
<tr>
<td></td>
<td>2. Select <strong>Open Connect Full</strong>.</td>
</tr>
<tr>
<td></td>
<td>The system adds you as a member of the record conversation and opens it in the Connect workspace, the full-screen view.</td>
</tr>
</tbody>
</table>

The **Follow** button is relabeled **Following**.

3. Add comments or work notes to the record directly from Connect.

Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.

a) In the record conversation, by the text entry field, click the message type icon (_comments). |

b) Select **Comment** or **Work Note**.

c) Enter a message.

By default, record conversation messages are added as comments.

**Note:** If you add an attachment to a record conversation, it is not attached to the record. The file name appears in the comment or work note on the record.

*Edit your notification settings* for the record conversation.

**Edit basic conversation details**

In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.

Role required: none

These details are not editable for direct conversations.
Note: The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

1. Open the a group or record conversation in the Connect workspace.
2. Click anywhere in the conversation header to the left of the icons.
   A pop-up appears to edit conversation details.
3. Edit the conversation image, name, and description as needed.
4. Click Save.

Add or remove conversation members

In Connect Chat, any member of a group or record conversation can add or remove other conversation members.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab ( ).
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>2. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>2. Click the minus icon ( - ).</td>
</tr>
</tbody>
</table>

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. Adding or removing users from the board members list automatically adds or removes them from the conversation. However, adding or removing users from the conversation does not add or remove them from the board members list.

2. Open a task board.
3. In the board header, click the connect with board members icon ( ).
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.
Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Role required: admin

The default interval is 3 minutes. You can change this value.

1. Navigate to `sys_properties.list`.
2. Locate the `collaboration.email_interval` property.
3. Set the Value to a different number of minutes.

Enable record conversations for a table

Record conversations are enabled for all tables that extend Task [task] by default. You can configure record conversations for additional tables.

Role required: admin

To create record conversations, users must have access to the Follow button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

- The `live_feed` dictionary attribute must be set to `true` for the table.
  - By default, `live_feed=true` for all tables that extend Task [task].
- The `glide.live_feed.task_header_button` property must be set to `both` or `collaboration`.
  - By default, `glide.live_feed.task_header_button` is set to `collaboration`.

1. Navigate to the list view of a table for which you want to enable record conversations.
2. Right-click any column header.
   The list of dictionary entries for the table appears.
4. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
5. In the Attributes related list, click New.
   The Dictionary Attribute form appears.
6. In the Attribute field, enter Live feed.
7. In the Value field, enter true.
8. Click Submit.
9. Navigate to `sys_properties.list`.
10. Locate the `glide.live_feed.task_header_button` property.
11. Ensure the Value is set to both or collaboration.

The `glide.live_feed.task_header_button` property also controls whether the show live feed icon (_Show Live Feed_) appears. If the property Value is collaboration, the show live feed icon does not appear on form headers.
Prevent users from following records in Connect for all tables

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for all tables.

Role required: admin

To disable record conversations for all tables, prevent the Follow button from appearing in all form headers by editing the glide.live_feed.task_header_button property.

1. Navigate to sys_properties.list.
2. Locate the glide.live_feed.task_header_button property.
3. Set the Value to live_feed.

Prevent users from following records in Connect for a specific table

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for a specific table.

Role required: admin

To disable record conversations for a specific table, prevent the Follow button from appearing in form headers for the table. To do so, set the live_feed dictionary attribute to false for the table.

1. Navigate to the list view of a table for which you want to disable record conversations.
2. Right-click any column header.
   The list of dictionary entries for the table appears.
4. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
5. In the Attributes related list, locate the Live feed dictionary attribute.
6. Set the Value to false.

Note that setting the dictionary attribute to false also removes the show live feed icon ( ) for the table.

Connect Support

Connect Support is a real-time messaging tool that enables support agents to easily keep track of their support cases, quickly find solutions, and resolve problems quickly.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect on page 2261. When Connect Support is enabled, users designated as support agents have access to the support tab of the Connect sidebar.

Features include:

- Administrators can create chat queues and enable users to access live support.
- Support agents can monitor the queues to provide instant support.
- Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Support.

Note:
Monitor incoming Connect Support conversations

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.

Role required: none

**Note:** The support tab is visible only if you are an agent for one or more queues.

1. Navigate to **Collaborate > Connect Support**. The Connect workspace opens in a new tab.

2. Click the support tab of the Connect sidebar, indicated by a headset icon (📢). The support tab displays **Queues** to which you belong. It also displays your open support conversations under **Cases**. When a user starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue has the option to accept the conversation. An agent can also request to transfer a conversation directly to you.
3. Accept a conversation in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept a conversation from a queue</td>
<td>Under Queues, click Accept by the queue. The conversation opens in the</td>
</tr>
<tr>
<td></td>
<td>conversation pane and an entry appears in the Cases section of the sidebar.</td>
</tr>
<tr>
<td>Accept a transfer request</td>
<td>Under Cases, click Accept by a transfer request.</td>
</tr>
</tbody>
</table>

4. Respond to the user and help resolve the issue.

By default, your messages are added to the conversation record as comments and are visible to the user.

Share knowledge in a Connect Support conversation

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

Role required: none

Use the knowledge tool to research user questions and provide solutions quickly and easily.

1. Open a support conversation in the Connect workspace.
   The knowledge tool is not available in Connect mini windows.

2. In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.

The knowledge homepage appears in the conversation tools pane.
3. Search for articles related to the user's issue.
   For more information about finding knowledge, see Knowledge search on page 2131.

4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.

Transfer a Connect Support conversation to a different agent or queue

You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Role required: none

1. Open a Connect Support conversation.

2. At the bottom of the conversation, click the menu icon (Ξ) to open the Connect actions menu.
3. In the Connect actions menu, select **Transfer**. A transfer dialog box opens.

4. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer the conversation to an agent</td>
<td>1. To start the transfer request, click Transfer by an agent's name. Be sure to choose an agent who is online, which is indicated by a green dot on their avatar. You can cancel the transfer any time before it is accepted.</td>
</tr>
<tr>
<td></td>
<td>2. When the transfer is accepted, select one of the following options in the dialog box that appears. • Stay: Remain in the conversation. This is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent. • Leave: Exit the conversation. This is also known as a cold transfer.</td>
</tr>
<tr>
<td>Transfer the conversation to a queue</td>
<td>Click Transfer by a queue. The system automatically removes you from the conversation and the conversation enters the queue you selected.</td>
</tr>
</tbody>
</table>

**Escalate a Connect Support conversation**

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

Define an escalation path for the queue, using the Escalate to field on the Chat Queue [chat_queue] table. For more information, see Administer Connect Support queues on page 2297.

Role required: none

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.

3. In the Connect actions menu, select Escalate.
   A confirmation dialog box appears.

4. In the dialog box, click Escalate.
   The system automatically removes you from the conversation and the conversation enters the escalated queue.

Create an incident from a Connect Support conversation

You can use a shortcut to create an incident on behalf of a user, directly from a Connect Support conversation.

Role required: none

You might want to create an incident if you cannot resolve the user's issue over chat or if you want to create a record of the conversation to share with the user. When you create an incident from a support conversation, the system copies the conversation history to the incident activity stream as comments and work notes. Future messages are tracked in the incident as well.

---

**Note:** Administrators can customize the behavior of the Create Incident Connect action. For more information, see Administer Connect actions on page 2283.

---

1. Open a Connect Support conversation.

2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.

3. In the Connect actions menu, select Create Incident.
   In the conversation tools area to the right of the conversation, a new incident form opens in a record tab. The system automatically sets the Caller field to the user who opened the support conversation.

4. Complete the form as necessary and click Submit.
   Any comments or work notes in the record conversation appear as comments on the incident form.
   Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.
   a) In the record conversation, by the text entry field, click the message type icon.

   ![Message Type Icon](image)

   b) Select Comment or Work Note.
   c) Enter a message.

   By default, record conversation messages are added as comments.

   **Note:** If you add an attachment to a record conversation, it is attached to the underlying record as well.

The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry [chat_queue_entry] table. Any new journal fields added to the record do not appear in the chat.

Connect Support administration

Administrators can configure various performance settings and features of Connect Support.
Note: There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration on page 2282.

Legacy chat to Connect Support transition

Use these basic steps to transition from legacy chat to Connect Support.

Context

Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Connect Support should not be used concurrently with legacy chat.

Before you activate Connect Support

Inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is built into the Connect Support plugin in Geneva patch 8 that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats your metrics and chat queue won't work accurately.

Activate the Connect Support plugin

When you activate the Connect Support plugin, the glide.connect.support.enabled property redirects the legacy chat URL to Connect Support.

For more information, see Activate Connect Support on page 2265.

Hide the Social IT application

Activating Connect Support doesn’t completely eliminate the legacy chat module. To prevent users from using it, hide the Social IT application menu. For more information, see Enable or disable an application menu or module on page 44.

Administer Connect Support queues

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

Role required: admin

Note: Both Connect Support queues and legacy chat queues are stored on the Chat Queue [chat_queue] table. Connect and legacy chat should not be used concurrently.

1. Navigate to Collaborate > Administration > Queues.
2. Click New or open an existing queue from the list.
3. Complete the Chat Queue form, as appropriate.
### Table 556: Chat Queue form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated and should not be edited manually.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there might be a queue for high priority support chats. When a queue is defined in this field, agents can access the Escalate option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, Thank you for contacting support. We are looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the queue’s defined Schedule. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, How can I help you?</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>

4. To review conversations associated with the queue, scroll to the Chat Queue Entries related list and review the records for the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How long the user waited and the result</td>
<td>Review information in the Action and Wait time columns. Abandoned in the Action column indicates the chat was completed.</td>
</tr>
<tr>
<td>Who is actively helping employees in the queue</td>
<td>Review the names of HR agents in the Assigned to column.</td>
</tr>
</tbody>
</table>
Make a Connect Support queue accessible to end users

To make a Connect Support queue accessible to end users, use the accepted URL format.
Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.
Role required: admin
For example you might create a module or add a link to a portal. The accepted URL format is https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>.

1. Navigate to Collaborate > Administration > Queues.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select Copy sys_id.
4. Copy the sys_id.
5. Preview the support queue by navigating to https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>.
6. Create a module or other link to the queue using the URL.

Configure Connect Support chat timeout

Use system properties to determine when support sessions time out after being idle.
Role required: admin
1. Navigate to the sys_properties table.
2. Search for the following properties and edit the number in the Values field.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect.support.idle.count_down</td>
<td>Number of seconds to count down from before marking end-user as having left their support session.</td>
</tr>
<tr>
<td>connect.support.idle.delay</td>
<td>Number of seconds to wait without user interaction, before presenting end-users with an idle countdown timer.</td>
</tr>
</tbody>
</table>

Legacy chat

Legacy chat provides real-time communication via instant messaging between users in a ServiceNow instance.

**Note:** The Connect on page 2261 feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.

Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.

Figure 610: Chat Desktop

Get started with the legacy chat feature

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.
2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the ServiceNow ITSA Suite. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
   - Chat rooms may be Public (any user can join) or Private (only invited users can join).
   - Administrators can limit who can read chat messages on tasks and who can create chat rooms.

Activate legacy chat

You can activate the Chat plugin within the instance if you have the admin role.

Role required: admin

Before activating the Chat plugin, consider the installed components, dependencies, and impact.

- Installed Components: Include tables, a field, business rules, a script include, an application, a user role, properties, an event, and an email notification. For more information, review the components that are installed with chat.
- Dependencies (installed automatically): Social IT Infrastructure.
- Impact: The plugin installs new features; it does not overwrite or impact current configurations. It has minimal impact on the system. However, when the system is configured to use short polling (see the Properties in Installed with legacy chat on page 2301) and the client is in debug mode, users may experience a performance impact. Polling also keeps the session alive when the chat desktop is open.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Installed with legacy chat

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see Set Up Chat Queues for Help Desk Chat.

Other:
- Event: A new event called chat.invite is registered to trigger an email notification when users are invited into a chat room.
- Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.
Fields installed with legacy chat

Legacy chat adds the following fields.

<table>
<thead>
<tr>
<th>Display name [Table name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header [content_block_header]</td>
<td>Adds the Help Desk Chat link to the ESS portal page.</td>
</tr>
</tbody>
</table>

Properties installed with legacy chat

Legacy chat adds the following properties. Making changes to legacy chat properties does not affect Connect Chat.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.chat.invite_fields | Comma-separated list of fields used to generate the invites when creating a chat room from a task. The user is presented with check boxes for each of the specified fields to select the invites for the chat room. The fields should be references or glide_lists of sys_user or sys_user_group.  
  - **Type**: string  
  - **Default value**: assignment_group,watch_list  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat.show_emoticons | Setting that determines whether to display emoticons in conversations.  
  - **Type**: true | false  
  - **Default value**: true  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat.sound.message_received.mp3 | Sound played when a message is received in chat (mp3).  
  - **Type**: string  
  - **Default value**: media/rcvmsg.mp3x  
  - **Location**: Social IT > Chat Administration > Properties |
| glide.chat.sound.message_received.ogg | Sound played when a message is received in chat (ogg).  
  - **Type**: string  
  - **Default value**: media/rcvmsg.oggx  
  - **Location**: Social IT > Chat Administration > Properties |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.chat.sound.queue_beep.mp3 | Sound played when a new user enters the chat queue (mp3). Both this property and glide.chat.sound.queue_beep.ogg must be defined for either property to work.  
  • **Type**: string  
  • **Default value**: media/button_toggle_on.mp3x  
  • **Location**: Social IT > Chat Administration > Properties |
| glide.chat.sound.queue_beep.ogg | Sound played when a new user enters the chat queue (ogg).  
  • **Type**: string  
  • **Default value**: media/button_toggle_on.oggx  
  • **Location**: Social IT > Chat Administration > Properties |
| glide.chat_room.create_roles | Comma-separated list of roles that are allowed to create chat rooms.  
  • **Type**: string  
  • **Default value**: itil  
  • **Location**: Social IT > Chat Administration > Properties |
| glide.short_poll_delay | Short polling delay for XMPP requests. Enter a value in milliseconds. The minimum value is 250. With short polling, the browser sends a request to the server in fixed intervals defined by the property. To minimize performance impact, it is recommended that this value is set greater than or equal to the default value.  
  • **Type**: integer  
  • **Default value**: 1000 (one second)  
  • **Location**: Social IT > Chat Administration > Properties |

### Script includes installed with legacy chat

Legacy chat adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChatUtils</td>
<td>Provides utilities for chat conversations.</td>
</tr>
</tbody>
</table>

### Tables installed with legacy chat

Legacy chat adds the following tables.
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Actions</td>
<td>Defines additional chat window menu items. Access at Social IT &gt; Chat Administration &gt; Actions (administrator and chat_admin).</td>
</tr>
<tr>
<td>[chat_actions]</td>
<td></td>
</tr>
<tr>
<td>Chat Channel</td>
<td>Stores chat channels, which are chats between members. This table is extended by Chat thread [chat_thread] (a one-to-one chat) and chat_room (a multi-user chat). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_channel]</td>
<td></td>
</tr>
<tr>
<td>Chat Channel Member</td>
<td>Relationship table that associates channels and members. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_channel_member]</td>
<td></td>
</tr>
<tr>
<td>Chat Message</td>
<td>Stores instant messages sent from any chat window. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_message]</td>
<td></td>
</tr>
<tr>
<td>Chat Presence</td>
<td>Stores presence (status) information for a user. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_presence]</td>
<td></td>
</tr>
<tr>
<td>Chat Queue</td>
<td>Stores the groups and schedules for providing support via instant message. Defined at Social IT &gt; Chat Administration &gt; Queues (administrator and chat_admin).</td>
</tr>
<tr>
<td>[chat_queue]</td>
<td></td>
</tr>
<tr>
<td>Chat Queue Entry</td>
<td>Stores user requests for live support. Extends Task [task]. On a chat queue record, the Chat queue entries related list displays the entries that are associated with that chat queue. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_queue_entry]</td>
<td></td>
</tr>
<tr>
<td>Chat Room</td>
<td>Stores chat rooms (multi-user chat). Extends Chat channel [chat_channel]. Can be modified if necessary (such as to change a chat room from public to private), but should almost always be managed by system functionality.</td>
</tr>
<tr>
<td>[chat_room]</td>
<td></td>
</tr>
<tr>
<td>Chat Roster</td>
<td>Maintains users that are associated with a user’s My Friends list. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_roster]</td>
<td></td>
</tr>
<tr>
<td>Chat Roster Member</td>
<td>Tracks users that are members of a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_roster_member]</td>
<td></td>
</tr>
<tr>
<td>Chat Thread</td>
<td>Stores one-to-one chats. Extends Chat channel [chat_channel]. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[chat_thread]</td>
<td></td>
</tr>
<tr>
<td>Live Headline</td>
<td>Sends system messages. For example, the system may send a message when a user enters or leaves a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>[live_headline]</td>
<td></td>
</tr>
</tbody>
</table>
## Live Poll Message
**[sys_live_message]**
System table that stores and manages chat messages. Extending or modifying data in this table is not recommended.

## Live User
**[sys_live_user]**
System table that stores and maintains chat users. Extending or modifying data in this table is not recommended.

## Stores the last live sequence number
**[sys_live_last_sequence]**
Stores the last sequence ID. Extending or modifying data in this table is not recommended.

### Business rules installed with legacy chat

Legacy chat adds the following business rules.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue [Task.active] Updater</td>
<td>Chat Queue Entry [chat_queue_entry]</td>
<td>Sets the chat queue entry Action field to Waiting when the action changes.</td>
</tr>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry [chat_queue_entry]</td>
<td>When a chat queue entry is accepted, calculates the average wait time for the queue by averaging the last 20 chat queue entries.</td>
</tr>
</tbody>
</table>

### Legacy chat administration

Users with the chat_admin role can administer various aspects of legacy chat.

#### Define chat room access rights

Role required: chat_admin

To define the access rights for creating chat rooms:

1. Navigate to **Social IT > Chat Administration > Properties**.
2. Locate the property **Comma-separated list of roles that are allowed to create chat rooms**.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

#### Change chat room message read access

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a **Chat Activity** journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
• The user is a member of the room

To change chat room message read access:
  Modify the Chat message access control rule or create a new rule.
  Read access to the messages displayed is handled by the access control list security operation chat_messages_read on the Chat room [chat_room] table.

View a legacy chat message as a journal field

Chat rooms can be linked to any task record in the following ways:
• Create a room from the record.
• Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:
  Configure the task record form to select the Chat Activity field.
  The maximum number of chat messages that are displayed by this field is 1000.

![Chat Activity](image)

Delete a chat room

You can delete chat rooms in legacy chat.
Role required: chat_admin
Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter chat_room.list.
2. Delete multiple chat rooms from the list or open a chat room record and click Delete.

Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.

Add actions to the legacy chat window menu

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as Show User Type and opens a popup window that indicates a current user of queue_agent.

- **Action Name**: Show User Type
- **Active**: Select the check box.
- **Order**: 100
• **Client Show Condition:**

```javascript
answer = g_chat.getChatType() == 'queue_agent';
```

• **OnClick Action Script:**

```javascript
alert('The current user is: ' + g_chat.getChatType());
```
Chat action details

Chat action details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
</tbody>
</table>
Available methods associated with the g_chat variable

The g_chat variable is a legacy chat window object that is available in the **Client Show Condition** and **OnClick Action Script** of a chat action definition.

The following table defines the available methods associated with this object.

**Method Summary**

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td><code>getActiveUsers()</code>&lt;br&gt;Returns the active users.&lt;br&gt;Returns:&lt;br&gt;Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td><code>getChannelJID()</code>&lt;br&gt;Returns the channel JID, which is a sys_id for a record chat_channel table.&lt;br&gt;Returns:&lt;br&gt;String - Returns the channel JID.</td>
</tr>
<tr>
<td>String</td>
<td><code>getChatType()</code>&lt;br&gt;Determines the chat window type.&lt;br&gt;Returns:&lt;br&gt;String - Returns one of the following values that specifies the type of user:&lt;br&gt;• queue_agent: Help Desk Chat support agent&lt;br&gt;• queue_user: Help Desk Chat end user&lt;br&gt;• group_chat: The individual is a member of a chat room (multiple users)&lt;br&gt;• conversation: The individual is a member in a private chat with another user</td>
</tr>
<tr>
<td>String</td>
<td><code>getChatQueueAgent()</code>&lt;br&gt;Returns the sys_id for agent that is administering this thread.&lt;br&gt;Returns:&lt;br&gt;String - Returns the sys_id of the chat queue agent.</td>
</tr>
<tr>
<td>String</td>
<td><code>getChatQueueUser()</code>&lt;br&gt;Returns the sys_id for end user of the chat queue.</td>
</tr>
</tbody>
</table>
### Legacy chat use

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:

- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to **Social IT > Chat**.

---

**Note:** Service desk staff may also provide live support to other users via help desk chat.
Figure 613: Chat desktop

Update your profile

Your profile identifies your contributions to legacy chat conversations.

Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
</tbody>
</table>
To update your profile picture:

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click **Open**.

**Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

---

**Figure 614: Chat profile picture**

---

**Update your status**

In legacy chat, your status lets other users know whether you are available to chat.

Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:

1. Click the status icon beside your name.
2. Select a status (see table).
Table 558: Change status

<table>
<thead>
<tr>

</tbody>
</table>

**Use your favorites list**

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.
Table 559: Favorites list

- Users:
  - *Add another user* in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking **Online** or **Offline**.

- Rooms:
  - See the list of *your favorite chat rooms*.
  - Join a chat room by double-clicking its name.

- Favorites list toolbar:
  - Options ( ): access a menu with options to *add a favorite user*, *view online users*, *create a chat room*, and *view chat rooms*.
  - Add User ( ): *add a favorite user*.
  - Create Room ( ): *create a chat room*.
  - Invitations ( ): respond to invitations to *join chat rooms*.
To expand or collapse a section in the favorites list, click the section header or click the arrows
(▲)

on the section header.

Add a favorite user

How to add a user to your favorite users list in legacy chat.

1. Click the **Add User** button.

![Add friend](image)

**Figure 626: Add friend**

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

![Search icon](image)

**Figure 627: Search icon**

3. Click **OK**.

Remove a favorite user

How to remove a favorite user in legacy chat.

To remove a user from your favorite users list, right-click the user's name and select **Remove From List**.

View an online user

How to view a list of all users who are available to chat (status of Online) in legacy chat.

1. Right-click the Users section header or click **Options** on the toolbar.

![Chat window menu](image)

**Figure 628: Chat window menu**

2. Select **Show Online Users**.

- Start a one-to-one chat with a user on the list by double-clicking a name.
- **Send Message** or **Add To Friend List** by right-clicking a name.
View a room

How to view a list of all public chat rooms in legacy chat.

1. Right-click the **Rooms** section header or click **Options** on the toolbar.

   ![Chat window menu](image)

   **Figure 630: Chat window menu**

2. Select **Public Rooms**.
   - To join a room, double-click a name or right-click and select **Join Room**. See *Joining Chat Rooms*. 
Start a one-to-one chat

How to start a one-to-one chat in legacy chat.

- To start a chat with one user in your favorites list, double-click the user's name or right-click and select **Send Message**.
- To start a chat with one available user, double-click the user's name on the online users list. See **Viewing Online Users**.

  *Send a message* to start a conversation.

Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click **Create Room** on the favorites list toolbar.

   ![Figure 632: Add room](image)

2. Enter the room details (see table).

3. Click **Create Room**. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.
Create Room

Room name: Chat Room for INC000003

Description: Wireless access not available on floor 3

Password: ********

Room avatar: ![Warning]

Features:
- **Public**: A room that can be found by any user through normal means such as searching and service discovery.
- **Members Only**: A room that a user cannot enter without being on the member list or invited.
- **Temporary**: A room that is destroyed if the last occupant exits.

Invite:
- Fred Luddy
- Beth Anglin
- ITIL User

Select these options:
- Assignment group
- Watch list

Create Room  Cancel

Figure 633: Chat task create
<table>
<thead>

<td>• Assignment group: invite all users in the assignment group for the task.</td>
</tr>
<tr>
<td></td>
<td>• Watch list: invite all users on the watch list for the task.</td>
</tr>
</tbody>
</table>

Create a chat room for a task

How to start a legacy chat with multiple users from a task record.
Note: This procedure is not possible if the Connect on page 2261 feature is enabled.

1. Open the record (example, an incident on which you are working).

![Incident record](image)

2. Click the Create or Join Chat Room related link.

3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

![Chat task open](image)

4. Click the create link at the bottom of the window.

5. Enter the room details as you would for a chat room.

6. Click Create Room. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).
7. In the New Room Created message, click **Join Room**.
   - A new chat window opens on your chat desktop.
   - All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

Join one-to-one chats

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

Join a chat room

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

   ![Chat invitation](image)

   **Figure 637: Chat invitation**

2. To respond, click the invitation.
   A window opens that displays the room name, room description, and the name of the user who invited you.
   - To join the chat, click **Join**. When the chat window opens on your chat desktop, click the window.
   - To ignore the invitation, click **Decline**.

   ![View invitations](image)

   **Figure 638: View invitations**

To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

To join a public chat room without an invitation, right-click the Rooms section header and select **Public Rooms**. Double-click a room name on the list.
Join a chat room for a task

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.

Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

**Note:** This procedure is not possible if the Connect on page 2261 feature is enabled.

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press Enter. The message appears in the other users’ chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:)'). When the message is sent, a smiley face 😊 appears in place of the text. For more emoticons, see Sending Emoticons in Messages (Smileys).

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
• When a user joins or leaves a room, a message appears in the other room members’ chat windows.

Send emoticons in legacy chat messages (smileys)

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (:) and a smiley face 😊 appears in your message.

<table>
<thead>
<tr>
<th>Text</th>

Change the display

How to change the display of legacy chat.
To view the chat window menu, click the gear button ()

Figure 654: Chat window menu

To show or hide timestamps, select **Show Timestamps** from the chat window menu or press **F2**.
To show or hide the chat member list, select **Show Members** from the chat window menu or press **F4**.

To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.
To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.
To close a chat window, click the X in the upper right corner.

Invite a user into a chat

How to invite another user into a chat in legacy chat.

1. Select **Invite User** from the chat window menu.

Figure 655: Chat window menu

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

Figure 656: Search icon

3. Click **OK**.
   An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.

Add a favorite room

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select **Add To Favorites** from the chat window menu.

Figure 657: Chat window menu
Remove a favorite room

How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select Remove From List.

Set your chat preferences

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in Changing the Display.

To view your chat preferences, click your name in the upper left corner of the chat desktop and select Chat Preferences.

![Chat Window Preferences](image)

Help desk chat

Communicate with service desk staff using instant messaging.

**Note:** The Connect Support on page 2290 feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

Use help desk chat to get support

You can contact service desk staff.

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the **Service Desk Chat** button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press **Enter**.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.

service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.
Use help desk chat to provide support

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

To provide users with live support using chat:

1. Navigate to Social IT > Chat to open your chat desktop.
   - A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.
   - The chat queue agent window displays the number of users in the queue and how long they have been waiting.
   - Every member of the assignment group sees the associated chat queue agent window.

2. Click Answer Next User to answer the next user or click Answer beside a specific user in the queue. A chat window opens.
   - Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:

- **Invite User**: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.
- **Create Incident from Chat**: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the Create or Join Chat Room related link on the Incident form).
Geneva  ServiceNow  ServiceNow Platform

Note: Administrators can edit this action or add additional actions to the chat window menu.

Figure 660: Chat Queue Agent

Set up chat queues for help desk chat

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.

Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat

How to define a chat queue for legacy chat.

Note:

The Chat Queue [chat_queue] table is also used by Connect Support on page 2290. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.
### Table 563: Chat queue details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Active</td>

</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see <a href="#">Assign Service Desk Staff to a Chat Queue</a>.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see <a href="#">Use Schedules</a>). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>

---

**Assign service desk staff to a chat queue**

Chat queue agents are Service Desk staff that are members of a chat queue's assignment group.

To assign agents to a chat queue:

1. Navigate to **User Administration > Groups**.
2. Select an existing assignment group or click **New**.
3. Enter or modify the group details (see [Create a Group](#)).
4. Right-click the header and select **Save**.
5. In the Group members related list, click **Edit**.
6. Using the **slushbucket**, add support staff to the group.
7. Navigate to **Social IT > Chat Administration > Queues**.
8. Select the chat queue for which the group provides support.
9. In the Assignment Group field, select the group.

![Chat queue group](image)

Make help desk chat accessible to an end user

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the **Content Management Plugin**).

To change the default link in the ESS header:

1. Navigate to **Content Management > Headers**.
2. Open **Portal - Header**.
3. In the Chat queue field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click **Update**.
Add a custom link elsewhere on the ESS portal
How to add a custom help desk chat link on the ESS portal.

1. Navigate to Content Management > Static HTML.
2. Click New.
3. Enter a Name.
4. In the Static content field, click Toggle HTML Source to edit the field in HTML source mode.

Figure 663: HTML editor button

5. Create a link to the desired Help Desk Chat queue (see Link Syntax).
6. Click Submit.
7. Add the new content block to the desired location on the portal (see Adding Content to the Page).

Link syntax
To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the CustomEvent.fire method using appropriate arguments.

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the CustomEvent.fire method using appropriate arguments. Details of the API call and an example that generates an anchor link are provided below.

API Call:

```javascript
CustomEvent.fire(LiveEvents.LIVE_EVENT,
    LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID,
    CHAT_QUEUE_SYS_NAME);
```

where the variables are:

- CHAT_QUEUE_SYS_ID: Specifies the sys_id for the chat queue.
• **CHAT_QUEUE_SYS_NAME**: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).

Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT,
    LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
    'c54f0abf0a0b452db84664f409c79c',
    'Help Desk Chat'); return false;">
    Help Desk Chat
</a>
```

**Monitor chat queues**

Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

- **Queue Wait Time**: amount of time a user waits in the queue before a help desk agent accepts the request.
- **Percentage of Chats Abandoned**: users that exit the queue before an agent responds (user stopped waiting).
- **Percentage of Chats Accepted**: requests that are answered by an agent.

---

**Note**: This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

**Monitor help desk chat tasks**

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

---

**Live Feed**

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.

Live feed includes different types of feeds.
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features. Refer to Legacy: Live Feed for more information about Live Feed v1.

Administer Live Feed

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

Activate Live Feed

Live Feed is active for all instances. For instances upgrading from a version prior to Fuji, an administrator can activate the Live Feed v2 plugin.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Document feeds

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
- Improving visibility into progress for end users.
- Providing a single place to see updates on multiple records.
- Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use Live Feed to work on records on page 2379 to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

- Is unlisted; it does not appear when users view all groups on live feed.
- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted to live feed on the record, if the record has a journal field for comments.
  If the record has a standard text field for comments, each live post overwrites the field value.
• Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

*Add a live feed UI action on a table*
You can add UI actions on a table to allow users to follow records in live feed.

Role required: `ui_action_admin` or `admin`

1. Navigate to **System Definition > UI Actions**.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the `Table` field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

*Add the Show Live Feed button in the form header*
You can add the Show Live Feed button in the form header for a table.

Role required: `personalize_dictionary` or `admin`

1. Navigate to **System Definition > Tables**.
2. Open the table record.
3. Select the **Live feed** check box.
4. Click **Update**.

If the check box is selected and the live feed functionality is not active, open the dictionary entry for the table and add `live_feed=true` in the `Attributes` field. Click **Update**.

*Security configuration for document feeds*
Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.

• If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.

• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note**: Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

*Disable a record feed*
You can disable live feed functionality from the form of any table.

Role required: `personalize_dictionary` or `admin`

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the `Attributes` field.
4. Click **Update**.
Note: If the Collaboration feature is activated, you can remove the show live feed icon ( ) from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Disable a document feed
You can disable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Tables.
2. Open the table record.
3. Clear the Live feed check box.
4. Click Update.

Business rule installed with live feed document
This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

Record feeds
A record feed is a live feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:
- Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.
Activate live feed document
The Live Feed Document plugin is active by default. Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

Configure record feeds
Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.
Add live feed to a form header

Add the **Show Live Feed** button in the form header for a table.

1. Navigate to **System Definition > Tables**.
2. Open the table record.
3. Select the **Live feed** check box.
4. Click **Update**.
   Alternatively, you can add `live_feed=true` to the **Attributes** field in the dictionary entry for the table.

Add live feed to a context menu

Add live feed UI actions on a table.

1. Navigate to **System Definition > UI Actions**.
2. Open one of the live feed UI actions, for example, **Follow on Live Feed**.
3. In the **Table** field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Add a live feed UI action on a table

You can add UI actions on a table to allow users to follow records in live feed.

Role required: `ui_action_admin` or `admin`

1. Navigate to **System Definition > UI Actions**.
2. Open one of the live feed UI actions, for example, the **Follow on Live Feed** list UI action.
3. In the **Table** field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

**Disable a record feed**

You can disable live feed functionality from the form of any table.

Role required: `personalize_dictionary` or `admin`

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

**Note:** If the Collaboration feature is activated, you can remove the show live feed icon (ー) from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

**Configure record feed security**

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

Live feed functionality is not active for the table

What to do if the check box is already selected and the live feed functionality is not active for the table.

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add `live_feed=true` in the Attributes field.
4. Click Update.

Live feed functionality still exists

What to do if the check box is already cleared and the live feed functionality still exists for the table.

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the Attributes field.
4. Click Update.

User preferences available in Live Feed

The following preferences are available in live feed.

**Table 564: User preferences available in live feed**

<table>
<thead>
<tr>
<th>User Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>live_tag.feed.order</td>
<td>Tracks user's choice of tag display sorting.</td>
</tr>
<tr>
<td>live_message.feed.last_display</td>
<td>Tracks last feed user has viewed. The last viewed feed is displayed the next time the user opens live feed. The first time a user opens live feed, the Company Feed is displayed.</td>
</tr>
</tbody>
</table>

Components installed with Live Feed

Several types of components are installed with Live Feed.

Demo data is available with Live Feed.

Plugin installed with Live Feed

The Live Feed application uses the following plugin:

Scripted web services installed with Live Feed

The Live Feed plugin installs the following scripted web services.

Table 568: Scripted web services installed with live feed

<table>
<thead>
<tr>
<th>Scripted Web Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PostToLiveFeed</td>
<td>Performs the following functions:</td>
</tr>
<tr>
<td></td>
<td>• Defines the user or profile to use; otherwise, the message posts from the authenticated soap user.</td>
</tr>
<tr>
<td></td>
<td>• Defines the group (using the groupid); otherwise the message posts to the company feed.</td>
</tr>
<tr>
<td></td>
<td>• Includes a link in the post.</td>
</tr>
</tbody>
</table>

Sample SOAP envelope

```xml
<SOAP-ENV:Envelope xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:m="http://www.service-now.com"
xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
  <SOAP-ENV:Body>
    <m:execute>
      <message xsi:type="xsd:string">Post this message to the Live Feed</message>
      <!-- optional sys_id of a sys_user record to use to get a live profile -->
      <user xsi:type="xsd:string"></user>
      <!-- optional sys_id of a live profile to post as -->
      <profile xsi:type="xsd:string"></profile>
      <!-- optional sys_id of a live group to post the message in-->
      <group xsi:type="xsd:string"></group>
      <!-- optional URL of a link to include in the message-->
      <linkurl xsi:type="xsd:string"></linkurl>
      <!-- optional name for the linkurl parameter--> 
      <linkname xsi:type="xsd:string"></linkname>
    </m:execute>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
Business rules installed with Live Feed

The Live Feed plugin installs the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Group Creator Becomes Admin</td>
<td>Live Group Profile [live_group_profile]</td>
<td>Designates the group creator as the group administrator.</td>
</tr>
<tr>
<td>live feed events</td>
<td>Task [task]</td>
<td>Runs on task insert, update, and delete. Triggers event associated with the Live Feed Update Script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live feed member update events</td>
<td>Live Group Member [live_group_member]</td>
<td>Generates a notification event when member state changes (invited, accepted, declined, left, rejected, request, request_accepted).</td>
</tr>
<tr>
<td>Live feed integration</td>
<td>Journal Entry [sys_journal_field]</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
<tr>
<td>Live feed new member events</td>
<td>Live Group Member [live_group_member]</td>
<td>Generates a notification event when new members are added.</td>
</tr>
<tr>
<td>live feed profile events</td>
<td>Live Profile [live_profile]</td>
<td>Runs on live_profile insert/update/delete, triggers event associated with the Live Feed Update script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live Feed message events</td>
<td>Live Feed Message [live_message]</td>
<td>Runs on live_message, notification event trigger for new live messages.</td>
</tr>
<tr>
<td>Live message like events</td>
<td>Message Liked by [live_message_like]</td>
<td>Runs on live_message_like, notification event trigger for new like records.</td>
</tr>
<tr>
<td>LiveFeed Group Member Visibility 2.0</td>
<td>Live Group Member [live_group_member]</td>
<td>Ensures users can only see the members list for public groups and groups they belong to.</td>
</tr>
<tr>
<td>LiveFeed Group Profile Validation</td>
<td>Live Group Profile [live_group_profile]</td>
<td>Ensures that a public group is visible.</td>
</tr>
<tr>
<td>LiveFeed Group Profile Visibility 2.0</td>
<td>Live Group Profile [live_group_profile]</td>
<td>Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LiveFeed Membership Changes</td>
<td>Live Group Member [live_group_member]</td>
<td>Enforces that only the group administrator and users with live_feed_admin role can manage membership for a group.</td>
</tr>
<tr>
<td>LiveFeed Single Group Membership</td>
<td>Live Group Member [live_group_member]</td>
<td>Ensures that a user is not added multiple times to the same group.</td>
</tr>
<tr>
<td>Live Message Likes</td>
<td>Live Message Like [live_message_like]</td>
<td>Updates the number of likes for a message.</td>
</tr>
<tr>
<td>LiveFeed Join Group Check</td>
<td>Live Group Member [live_group_member]</td>
<td>Ensures that users can not automatically join private visible groups.</td>
</tr>
<tr>
<td>Update Follow/Follower Counts</td>
<td>Live Follow [live_follow]</td>
<td>Updates the following/followers counts.</td>
</tr>
<tr>
<td>Live Feed Group</td>
<td>Assessable Record [asmt_assessable_record]</td>
<td>Creates/Deletes a live feed group for an assessable record</td>
</tr>
<tr>
<td>Live Feed Message Visibility</td>
<td>Live Feed Message [live_message]</td>
<td>Ensures user's access to live feed messages</td>
</tr>
</tbody>
</table>

**Events registered by Live Feed**

The following events are registered by Live Feed.

Table 569: Events registered by Live Feed

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>live_feed.feed_member.left</td>
<td>Triggers an email notification to administrators when a user has left a feed.</td>
</tr>
<tr>
<td>live_feed.feed_member.request_accepted</td>
<td>Triggers an email notification to a user when the user's request to join a feed has been accepted.</td>
</tr>
<tr>
<td>live_feed.feed_member.accepted</td>
<td>Triggers an email notification when a user accepts an invitation to join a feed.</td>
</tr>
<tr>
<td>live_feed.feed_member.request</td>
<td>Triggers an email notification to administrators when a user requests to join a feed.</td>
</tr>
<tr>
<td>live_feed.feed_member.declined</td>
<td>Triggers an email notification when an administrator has declined a user's request to join a feed.</td>
</tr>
<tr>
<td>live_feed.feed_member.removed</td>
<td>Triggers an email notification when an administrator has removed a user from a feed.</td>
</tr>
<tr>
<td>live_feed.feed_member.invited</td>
<td>Triggers an email notification when an administrator has invited a user to join a feed.</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>live_feed.feed_member.rejected</td>
<td>Triggers an email notification to a user when the user's request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>live_message.mentioned</td>
<td>Triggers an email notification when a user is mentioned in a message.</td>
</tr>
<tr>
<td>live_message_like.inserted</td>
<td>Triggers an email notification when another user likes a message that a user posts.</td>
</tr>
<tr>
<td>live_message.replied</td>
<td>Triggers an email notification to all users in a thread when a user posts a reply.</td>
</tr>
<tr>
<td>live_message.inserted</td>
<td>Triggers an email notification to subscribed users when a new message is posted.</td>
</tr>
<tr>
<td>live_message.group_inserted</td>
<td>Triggers an email notification to subscribed users when a new message is posted to a feed.</td>
</tr>
<tr>
<td>live_feed.team_member.invited</td>
<td>Triggers an email notification when a user is invited to join a team.</td>
</tr>
<tr>
<td>live_feed.team_member.accepted</td>
<td>Triggers an email notification when an user accepted to join a team.</td>
</tr>
<tr>
<td>live_feed.team_member.declined</td>
<td>Triggers an email notification when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>live_feed.team_member.request</td>
<td>Triggers an email notification to administrators when a user requests to join a team.</td>
</tr>
<tr>
<td>live_feed.team_member.request_accepted</td>
<td>Triggers an email notification when an administrator has accepted a user's request to join a team.</td>
</tr>
<tr>
<td>live_feed.team_member.rejected</td>
<td>Triggers an email notification to a user when the user's request to join a team is rejected.</td>
</tr>
<tr>
<td>live_feed.team_member.left</td>
<td>Triggers an email notification when a user leaves a team.</td>
</tr>
<tr>
<td>live_feed.team_member.removed</td>
<td>Triggers an email notification when a user has been removed from a team.</td>
</tr>
<tr>
<td>live_message.group_replied</td>
<td>Triggers an email notification to subscribed users when a reply to a message in a feed has been posted.</td>
</tr>
<tr>
<td>live_feed.update</td>
<td>Triggers the Live Feed Update script action.</td>
</tr>
</tbody>
</table>

**Email notifications installed with Live Feed**

The Live Feed plugin installs the following email notifications..

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request Accepted</td>
<td>Sends an email when a user's request to join a team is accepted.</td>
</tr>
<tr>
<td>Live Team Member Request Rejected</td>
<td>Sends an email when a user's request to join a team is rejected.</td>
</tr>
<tr>
<td>Live Message All Subscription</td>
<td>Sends an email to subscribed users when any message (new or reply) is posted.</td>
</tr>
<tr>
<td>Live Message Feed Subscription</td>
<td>Sends an email when a new message is inserted into a feed.</td>
</tr>
<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

Security rules (ACL) installed with Live Feed

The Live Feed plugin installs the following security rules on existing tables.

**Table 570: Security rules installed with live feed**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_attachment</td>
<td>Allows users to read and write live feed profile attachments.</td>
</tr>
</tbody>
</table>

Live Feed security

Administrators and users with the live_feed_admin role can configure live feed security.

Live Feed security and table access

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

- Live Table Notification [live_table_notification]: set up automatic messages that are generated when specific records are updated throughout the system.
- Live Feed Message [live_message]: modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

*Domain separation in Live Feed*

Using domain separation with the Live Feed application allows administrators to keep user content within a specific domain.

Parent and child domains define the live feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.

Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.
Show or hide the live feed application for a domain

The administrator can live feed visibility for a domain. This includes:

• Displaying live feed in the application navigator.
• Following a document feed for a record.
• Viewing live feed from a record.

Use live feed with domain separation

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

• Posting and sharing content
  • Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  • Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

• Viewing content
  • Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  • Users in a parent domain can view content that resides within their domain and within any child domains.
  • My Feed shows messages, teams, and hashtags based on the user’s domain. Showing another user’s feed only shows posts visible in the current user’s domain.

• Using hashtags
  • Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  • Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

• Using teams
  • Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  • Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

• Exceptions to teams
  • New teams are created in the user’s domain. However, if the team has a record associated with it, the team is created in record’s domain.
  • New threads in an existing team are created in the domain of the existing team.
  • When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document’s domain.
  • For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

• Subscribing to email notifications
- Users can subscribe to email notifications from users and teams within their domain only.

*Limit Live Feed access by role*
All active users in the instance have access to Live Feed by default.
Role required: live_feed_admin, admin

1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a) Perform the appropriate action for your version of the UI:
      - UI16: Navigate to System Definition > Application Menus > Collaborate and select Live Feed.
      - UI15 or UI11: Right-click the icon beside the Live Feed module and select Edit Module.
   b) Enter the roles that have access in the Roles field.
   c) Click Update.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a) Navigate to System Definition > Applications (Mobile).
   b) Click Live Feed.
   c) Enter the roles that have access in the Roles field.
   d) Click Update.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   - **Type**: ui page
   - **Operation**: read
   - **Name**: create one access control rule record for each of the following pages
     - live_feed
     - live_feed_small
     - $live_feed
     - $live_feed_small
   - **Requires role**: in this related list, add roles to define who can access the live feed pages. Users who do not have these roles cannot access live feed.

*Manage Live Feed message content*
Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.
Role required: live_feed_admin, admin

For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

1. Navigate to Collaborate > Feed Administration > Messages.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.

*Live Feed team security*
You can restrict who can create teams by modifying an access control rule.
Modify the following access control rule.

- **Table**: Live Group Profile [live_group_profile]
- **Operation**: create

*Restrict hashtag renaming in Live Feed*

You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:

- **Table**: Live Tag [live_tag]
- **Operation**: write

*Provide access to Live Feed from CMS pages*

You can provide access to live feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

The ESS Portal template includes the Portal - Live page and Live Feed dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include Portal - Live page in a site.

To add live feed in an iFrame:

1. Navigate to **Content Management > iFrames**.
2. Click **New**.
3. Enter the iFrame block details.

### Table 571: iFrame block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as Live Frame.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as live_frame.</td>
</tr>
</tbody>
</table>
| URL            | https://INSTANCE/live_feed.do? sysparm_doctype=true  
|                | where INSTANCE is your instance URL (example, [instance name].service-now.com) |
| Application    | Displays scoping information.                                               |
| Sizing         | Select **Fixed Size** and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768). |

4. Click **Submit**.
5. Add the block to a page.

Live Feed table notifications

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the live_feed_admin or chat_admin roles can set up table notifications for any table in an instance.

Table notifications used by Live Feed

The following table notifications are used by Live Feed.

<table>
<thead>
<tr>
<th>Table notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User joined live feed</td>
<td>Active by default.</td>
</tr>
<tr>
<td>High priority incident opened</td>
<td>Not active by default.</td>
</tr>
</tbody>
</table>
Set up table notifications for task tables

You can set up a table notification for a task table to enable automatic live feed messages.

Role required: live_feed_admin or chat_admin

1. Navigate to Collaborate > Feed Administration > Table Notifications.
2. Click New or select a notification to open it.
3. Complete the form.

Table 572: Live Table Notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record. This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Post to live feed</td>
<td>Select the check box to generate the notification on live feed. If record feeds are not set up and the Feed group field is blank, the notification is posted to the company feed.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>Select the fields to post for record feeds. This field is available only if Post to live feed is selected.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the notification.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select the check box to generate the notification when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select the check box to generate the notification when a record is updated.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Feed</td>
<td>Select the live feed team to which you want to post messages. This field is available only if <strong>Post to live feed</strong> is selected. Clear the field to post notifications on the company feed.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Create the condition that must be met to generate the notification. If you add a condition statement, the system evaluates the condition first and parses the <strong>Before script</strong> field only if the condition is met. You may choose to leave this field blank and include conditions in the script.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the table notification.</td>
</tr>
</tbody>
</table>
| Message    | Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the **Select variables** field. To add a link to the record, enter `${URI}` in the message text as shown in the following example. 

```
High priority incident opened: 
${URI}
Short description: 
${short_description}
```

**Note:** For security reasons, any HTML code is automatically stripped out of a message before it is posted.
4. Click Submit or Update.

Set up table notifications for non-task tables

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

Role required: live_feed_admin or chat_admin

1. Navigate to System Definition > Business Rules.
2. Open the live feed events business rule.
3. In the Advanced section, select and copy the text in the Script field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click New.
6. Enter the following values at the top of the form.
   • Name: Enter a name, such as live_feed events for my table.
   • Table: Select the table for which you are setting up a notification.
   • Active and Advanced: Select these check boxes.
7. In the When to run section, enter the following values.
   • When: Select before.
   • Insert, Update, and Delete: Select the check boxes.
8. In the Advanced section, paste the script from the live feed events business rule into the script box.
9. Click Submit.
The live feed events business rule runs on the non-task table. It fires the live_feed.update event, which is associated with the Live Feed Update script action. The script action sets up variables and processes the table notifications.

After saving the business rule, create a live feed table notification record for the new table as you would for a task table.

Live feed table notification examples

The following examples illustrate different scenarios of table notification usage in live feed.

**Example 1: workaround posted**

This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: State is Open
- **Description**: Workaround Posted
- **Message**:

```plaintext
${sys_updated_by} posted a workaround for ${URI}.
Short description: ${short_description}
```

- **Before script**:

```plaintext
// only post to live feed when the Workaround field changes
answer = changedFields.contains("work_around");
```
Example 2: problem resolved (advanced)

This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed. It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: Problem State is Closed/Resolved
- **Description**: Problem Resolved
- **Message**: Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}

- **Before script**:

```java
//cancel if we didn't just change the problem state if ( !changedFields.contains ( "problem_state" ) )
answer = false ;
```
//if we have an assigned_to value add a comment about who it was
//create a new variable fixedByMsg that we can access from the message
fixedByMsg = "" ; if ( !current. assigned_to. nil () )
fixedByMsg = " Thank you " + current. assigned_to. getDisplayValue () ;

//make the message appear to come from the assignment group if we have one if ( !current. assignment_group. nil () )
profileSource = current. assignment_group. getRefRecord () ; //need GlideRecord object

---

Figure 667: Problem resolved (advanced) example
**Example 3: opportunity won (non-task)**

This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won (requires the Sales Force Automation plugin).

Create a business rule on the Opportunity [sales_opportunity] table that matches the live feed events business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity [sales_opportunity]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: State is Closed Won
- **Description**: Opportunity won
- **Message**:

  ```
  ${owner} closed a sale with ${account}!
  ```

- **Before script**:

  ```
  //make the message appear to come from the assigned salesperson if there is one if (!current. owner. nil ( ) )
  profileSource = current. owner. getRefRecord ( ) ; //need GlideRecord object
  ```
**Example 4: table notification for related feeds**

This example demonstrates table notifications to be sent out to related feeds. For this example, a table notification is set up so that whenever the status of a story changes to Complete, a message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

Create a table notification with the following values:

- **Table**: Story [rm_story]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Record feeds**: move Sprint, Release, and Epic to the **Selected** column.
- **Conditions**: State changes to Complete
- **Description**: Story is done; message to Epic, Release, and Sprint
- **Message**:

  ```
  ${URI} status changed to ${state}
  ```
Workaround posted
This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: [State] [is] [Open]
- **Description**: Workaround Posted
- **Message**:

  ```
  ${sys_updated_by} posted a workaround for ${URI}.
  Short description: ${short_description}
  ```

- **Before script**:

  ```
  // only post to live feed when the Workaround field changes
  answer = changedFields. contains ( "work_around" ) ;
  ```

Figure 669: Example workaround message

Problem resolved (advanced)
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.
It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table:** Problem [problem]
- **Active:** Select the check box.
- **Update:** Select the check box.
- **Post to live feed:** Select the check box.
- **Conditions:** [Problem State] [is] [Closed/Resolved]
- **Description:** Problem Resolved
- **Message:**

  Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}

- **Before script:**

  ```java
  //cancel if we didn't just change the problem state if ( !changedFields.
  contains ( "problem_state" ) )
  answer  = false ;
  //if we have an assigned_to value add a comment about who it was //create
  a new variable fixedByMsg that we can access from the message
  fixedByMsg  = "" ; if ( !current. assigned_to. nil ( ) )
  fixedByMsg  = " Thank you " + current. assigned_to. getDisplayValue ( ) ;
  //make the message appear to come from the assignment group if we have
  one if ( !current. assignment_group. nil ( ) )
  profileSource  = current. assignment_group. getRefRecord ( ) ; //need
  GlideRecord object
  ```
Figure 670: Example problem resolved message

**Opportunity won (non-task)**

This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.

Create a **business rule** on the Opportunity [sales_opportunity] table that matches the **live feed events** business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity [sales_opportunity]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions:** [State] [is] [Closed Won]
- **Description:** Opportunity won
- **Message:**

```
${owner} closed a sale with ${account}!
```

- **Before script:**

```
//make the message appear to come from the assigned salesperson if there is one
if (!current.owner.nil())
profileSource = current.owner.getRefRecord(); //need GlideRecord object
```

---

**Figure 671: Example opportunity won message**

*Related feeds table notification*

This example demonstrates table notifications to be sent out to related feeds.

For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table:** Story [rm_story]
- **Active:** Select the check box.
- **Update:** Select the check box.
- **Post to live feed:** Select the check box.
- **Record feeds:** Move **Sprint**, **Release**, and **Epic** to the **Selected** column.
• **Conditions:** [State] [changes to] [Complete]
• **Description:** Story is done; message to Epic, Release, and Sprint
• **Message:**

${URI} status changed to ${state}

---

**Use Live Feed**

Live Feed provides many methods you can use to share content with others in your organization.

Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
**Note:** Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.
Live Feed browser support

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

---

**Note:** Many of these features are part of live feed v2.

---

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

- Limit the number of hashtags per message (no more than 3 is a good guideline).
- Use hashtags only in messages that are relevant to the tagged topic.
- Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
- Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
Figure 673: Tag

View an available hashtag

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
   Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

Rename and merge hashtags

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Hashtags** in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag icon appears.

5. Click the edit tag icon.

<table>
<thead>
<tr>
<th>Hashtags</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Competitive</td>
</tr>
<tr>
<td>2 Lync</td>
</tr>
<tr>
<td>1 MacBook</td>
</tr>
</tbody>
</table>

6. Enter a new hashtag name.
7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

   **Note:** If a hashtag is removed from the message, renaming that hashtag does not change the message text.

Add an image to a hashtag

You can add an image at the domain level of already defined hashtags if you have the admin role.

1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

   #VPN Feed -

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon.
   - Click the add an image icon, select the image file, and click Open.

4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.
When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.
A confirmation message appears.

5. Click X to dismiss the message.
   To unfollow a hashtag, repeat the same steps and click Unfollow.

Bookmark a hashtag

The Live Feed interface uses the standard bookmarking functionality for hashtags.

In UI15 and UI11, the live feed interface uses the standard bookmarking functionality for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Figure 674: Bookmark hashtag

Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click Hashtags in the message posting.

The hashtags associated with the message are displayed, along with the removal icon.
3. Click the removal icon.

Use Live Feed to work on records

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

• Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
• View live feed from records.
• Work on multiple records from My Feed.
• Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
How Document Feeds Work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select **View all groups** on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

**Document Group Creation**

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

**Control how live feed is enabled for records**

A property called glide.ui.show_live_feed_activity controls whether live feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live_feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks **Show Live Feed**.

**View the activity stream in record feeds**

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Figure 676: Live feed activity stream

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.

The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the Show Live Feed button in the form header. This displays the live feed pop-up.
- Right-click the form header and select Show Live Feed. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - **Live Feed**: click to show a text box to type in the feed.
  - **Activity**: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Go to System Definition > Tables, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds live feed to the activity formatter.
• Go to Collaborate > Feed Administration > Properties and enable the following property: **Toggle the display of the live feed tab in the activity formatter**

**Working with record feeds**

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

• View the record feed from live feed.
• View a list of group members (other users who are following the record).
• Invite another user to join the group. Only users who have access to the record have access to the record feed.
• Subscribe to email notifications.
• Leave the team to stop following the record.

**How record feeds work**

A record feed is associated with a record. The ServiceNow system automatically creates a record feed when a user follows or shows a record on live feed. The system also creates a record feed when a user creates a new record on a table that has Live Feed enabled.

The record feed:

• Is unlisted, it does not appear when users view all feeds on live feed.
• Automatically approves membership for every user who can access the record.
• Uses the record short description as the feed name, and the concatenation of the record number and record short description as the feed description. If the record short description is blank, then the record number is used as the feed name.
• Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
• Maintains all messages posted on the record in live feed, if the record has a journal field for comments. When the feed is created, existing messages are added to the record feed.

**Follow a record feed from a form**

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record form.
2. Click the **Show live feed** icon in the form header.
A Live Feed window is displayed.

3. Add a post to the record feed to start seeing the feed in your stream.

*Follow a record feed from a list*

You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, **Assigned to me**).
2. Select the **Action** check box beside each record to follow.
3. In the **Actions** choice list, select **Follow on Live Feed**.
The selected records appear in the record feeds and the activity stream.

**Post a message to a record feed**

1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in live feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the **Live Feed** pop-up window
   - From the **Live Feed** tab on the activity formatter
   - Click the **Show Live Feed** icon (●) in the form header.

2. Compose the message and add images and links.

3. [My Live Feed only] In the To list, select the record where you want to post the message.

4. [Optional] Select the **Work Notes** check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.

5. Click **Post**.

**Note:** If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the activity formatter, each live post overwrites the field value. Comments added through live feed start with #LiveFeed on the activity formatter.
Use groups in Live Feed

Groups allow users to create focused discussions in live feed.

Users can view or join groups based on the access level of the group:

- **Public**: any user can see the name on the list of all groups, see the feed, and join. Messages appear on the company feed with a link to the group feed.
- **Private**: any user can see the name on the list of all groups, but only invited members can see the feed and join. Messages do not appear on the company feed.
- **Unlisted**: only invited users can see the name on the list of all groups, see the feed, and join. Messages do not appear on the company feed. Private groups may be listed or unlisted.

The group access level is configured by the user who creates the group. The group creator is also the group administrator. Any user can create a group; however, ServiceNow administrators can restrict the ability to create groups.

Automatic group creation

If you create records on tables that have live feed enabled, such as the Incident table, a live feed group is automatically created at the same time.

Automatic group participation

Users who view records on tables that have live feed enabled, such as the Incident table, automatically join the document group.

If the user creates a record on a table with live feed enabled, the user becomes the document group administrator. Document groups like these are not public. Any user who has access to the record also has access to the document group associated with that record.

Create a group (group administrators)

When you create a group, you become the group administrator.

Group administrators can:

- Modify group properties
- Accept or reject membership requests
- Delete the group
- Perform all group member functions

1. Navigate to **Collaborate > Live Feed**.
2. Click **Create Group**.
3. Enter a **Name** to appear at the top of the group feed and in messages posted to the group (links to the group feed).
4. Enter a **Description** to appear at the top of the group feed and under the group name in the list of all groups.
5. Configure the access level for the group:
   - For a public group, select **Public**.
   - For a private group, select **Private** and select the **Show this group when viewing all groups** check box.
   - For an unlisted group, select **Private** and clear the **Show this group when viewing all groups** check box.
6. Optional: Select a picture for the group.
   1. Click the picture beside the group name.
   2. Browse to the desired picture file and click Open.

7. Click Create. The group is created with you as the group administrator.

Delete a group

1. Navigate to Collaborate > Live Feed.
2. Click Groups (/groups) and select the group name.
3. Click Delete Group (/groups_delete).
4. Click Yes to confirm deletion. The group is deleted from live feed. Messages posted to a private group are deleted; messages posted to a public group remain on the company feed without a group link.

If you delete a group that is associated with an active record, such as an incident that has not yet been closed, the group becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the group administrator. The previous messages that existed as part of the document feed are not deleted.

Invite new members

Any group member can invite another user to join a group.

1. Navigate to Collaborate > Live Feed.
2. Click Groups (groups) and select the group name.
3. Click Invite Member (invite_member).
4. Begin entering a user name and select a user from the list, or click the reference lookup icon (reference_lookup) and select a user from the table.
5. Click OK. The invited user receives an email notification.
Join a group (group members)

When you join a group, you become a group member.

Group members can:

• View messages posted to the group (group feed). Non-members can also view the feed for a public group.
• View a list of group members.
• Invite another user to join the group.
• Subscribe to group email notifications.
• Leave the group.

1. Navigate to Collaborate > Live Feed.
2. Click Groups ( ) and select View all groups.
   • If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the group.
   • If the group is public, click Join.
   • If the group is private, click Request. The group administrator receives an email notification and must accept your request before you can join the group.

Leave a group

1. Navigate to Collaborate > Live Feed.
2. Click Groups ( ) and select the group name.
3. Click Leave.

Note:
If you leave a document group associated with a record, such as an incident, you automatically rejoin that group if you modify the associated record again.

Manage membership requests

When a user requests membership for a private group, the group administrator receives an email.

1. Navigate to Collaborate > Live Feed.
2. Click Groups ( ) and select the group name.
3. Click Members ( ).
4. In the Pending Members section, click Accept or Reject for each membership request.
   The user receives an email notification to confirm whether the request was accepted or rejected.
Modify a group

1. Navigate to Collaborate > Live Feed.
2. Click Groups ( ) and select the group name.
3. Click Modify Group ( ).
4. Modify the group properties or picture.
5. Click Update.

Subscribe to email notifications

1. Navigate to Collaborate > Live Feed.
2. Click Groups ( ) and select the group name.
3. Click Subscribe.

You can click Unsubscribe from a group to stop receiving email notifications.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

View a group feed

1. Navigate to Collaborate > Live Feed.
2. Click Groups ( ). A list of groups you belong to and an option to view all groups appear.
   - To view a group you belong to, select the group name.
   - To view a public group you do not belong to, select View all groups and then click the group name. You must be a member to view the feed for a private group.
View group members

1. Navigate to Collaborate > Live Feed.
2. Click Groups and select the group name.
3. Click Members. The list of group members appears, organized by group administrators, group members, and pending members.
Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed. Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note**: The concept of groups has changed in live feed v2 (starting with the Fuji release).

Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Group Feeds** and click **All Feeds**.
3. Click **Create Group Feed**.

4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.

   When **Private Feed** is selected, the **Show this feed for anyone to find and request to join** check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click **Create**.
Create a record feed

When a user views a record on a table that has live feed enabled, such as the Incident [incident] table, the user can click the **Show live feed** button at the top of the form to automatically create a record feed.

When a user who has write access to a record’s work_notes journal field clicks the **Show live feed** button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks **Show live feed** on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Participate in a feed

When you join a feed, you become a feed member.

Feed members can:

- **View messages** posted to the feed. Non-members can also view the messages for a public feed.
- **View a list of feed members**.
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- **Leave the feed**.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
• If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the feed.
• If the feed is public, click **Join**.
• If the feed is private, click **Request**. The feed administrator receives an email notification and must accept your request before you can join the feed.

**Mark a feed as a favorite**

Top-level messages in feeds can be marked as favorites on a per user basis only.

You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.

3. In the list of feeds, click the star icon (⭐) adjacent to the feed name you want to mark as a favorite.

   To unfavorite a message, click the star icon (⭐) of a message that is already a favorite.

---

**View a feed**

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select **Show All** and then click the feed name. You must be a member to view the feed for a private feed.

---

**Note:** If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

---

**View a feed member**

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

---

**Invite a new member to a group feed**

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.
   The invited user or team members receive an email notification.

---

**Invite a new member to a record feed**

The feed administrator can invite another user or a team to join a record feed.

When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.
When users are invited, their membership state is initially Invited. When they accept the invitation, the system checks their access to the work_notes journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to Collaborate > Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.
   - If you invite a team, the individual members of the team are invited.
   - The invited users receive an email notification.

Remove a member from a feed

The feed administrator can remove any member from the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click Remove.
Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification’s subject will be Live Feed IT Support.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the subscribe icon (✉).

You can click the unsubscribe icon (✉) to stop receiving email notifications.

Note: If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

Navigate between live feed and other modules

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

Leave a feed

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Leave.

Note: If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

Delete a feed

If you are a feed administrator, you can delete the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click **Delete**.
4. Click **Yes** to confirm deletion.

   The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

**Live Feed searches**

Two types of searches can be performed in live feed.

Two types of searches can be performed in live feed:

- Simple keyword searches.
- Advanced searches that return content that is relevant to the action you are performing in live feed.

---

**Note:** Many of these features are part of live feed v2, which is available starting with the Fuji release.

---

**Perform a simple search in Live Feed**

All pages have simple keyword search where the keywords apply to the appropriate fields of the entity.

For example:

- When you do a keyword search on feeds, the search is performed on the **Message** field.
- When you search feeds or teams, the search is performed on the **Name** and **Description** fields.
- When you search users you are following or your followers, the search is performed on the **User** field.
- When you are searching for hashtags, the search is performed on the **Hashtag name** field.

To perform a keyword search:

1. Type a word in the **Search messages** field.
2. Click the search icon ( ) to initiate the search.

   All entities that contain the keyword are found.

   Notice that the search results are highlighted below.
Perform an advanced search in Live Feed

If you are working in a feed, you can perform a more advanced search.

To perform an advanced search:

1. Click the down-arrow icon in the **Search messages** field. This displays various filter conditions that are applicable to the entity being searched.
2. Fill in any combination of the fields displayed, and click **Search**.
Note: When you are viewing another user's profile, advanced search is not available.

Notice that the search results are highlighted below.

Remove a Live Feed search filter

When searches are performed, many pages display results that are filtered to provide the most logical information. For example, if you search feeds, the results are filtered to include only feeds of which you are a member. When this occurs, a Filtering is on message is shown.
To remove the filter so you can see the results for all feeds you have access to:

Click the X in the filtering message.

Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

**Note:** The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

1. Navigate to **Self-Service > Live Feed**.
2. Click your name or title displayed below your picture.

The profile record opens.
3. Click the pencil icon next to About Me and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:
   - Locate the photo file you want to use, and drag-and-drop it over the existing photo.
   - Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.
Note: Your profile picture is used by the Connect and legacy chat features as well if they are activated.

Work with Live Feed messages

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
### Table 573: Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>• My Live Feeds: These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>• Company Feed: This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>• Group Feeds: These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>• Record feeds: These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>• People: This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>• Teams: This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>• Hashtags: Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

**View another Live Feed user**

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user's picture, information for the user appears from the Business Card view of the User [sys_user] table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
If you click a user's name or title, the user's profile appears. Click the tabs to view different types of information for the user.
Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture. A Follow link appears in the user's profile.
3. Click **Follow**.
4. To stop following the user, navigate to **People > Following**.
5. Click **Unfollow**.
6. To view people who are following you, navigate to **People > Followers**.

**Select feeds**

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the **Search** field to locate any type of feed. As you type in the **Search** field, the results are dynamically displayed. For example, if you type INC, records that are incidents are forced to the top of the results list.
You can also select the following types of feed information.

**Table 574: Feeds types**

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>• messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>• messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
Follow feeds

You can view users who are following you or other users you are following.

To view users who are following you or other users you are following, click **People** in the sidebar.

The system shows 10 most recent followers or users you are following.

If either list contains more than 10 users, a Show More link appears.

**Note:** If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

Bookmark feeds and hashtags

The live feed interface uses the standard bookmarking functionality for feeds and hashtags.

In UI15 and UI11, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Add Live Feed to your homepage

You can add live feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon in the top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Geneva  ServiceNow  ServiceNow Platform

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. Users with any role can add live feed to their homepage; however, administrators can restrict this ability.

Use Live Feed with UI11

Using Live Feed with UI11 requires the UI11-Navpage layout with multiple panes plugin.

1. If you do not see a gray toolbar on the left side of the screen (called your edge), click the Switch to the new UI link in the banner.
2. Navigate to Collaborate > Live Feed.
3. Drag the Live Feed module to the edge.
4. Point to the bookmark on your edge. When the tip window appears, click Edit Bookmark.
5. Select the Flyout check box.
6. Click Update.

- You can now access live feed in a flyout window without navigating away from your working panes.
- Notifications appear on the edge when new messages are posted in your My Feed.

- When you open the bookmark, a blue circle appears beside new messages.
Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds.

Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

*Note:* Many of these features are part of live feed v2.

Create a team

When you create a team, you become the team administrator.

As team administrator, you can:

- Modify team properties
- Accept or reject membership requests
- Remove members from the team
- Delete the team

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.

3. Click **Create Team**.

4. Enter a **Name** to appear at the top of the feed and in messages posted to the team. This name links to the team feed.

5. Enter a **Description** to appear at the top of the feed and under the team name in the list of all teams.

6. Select the access level for the team:
• **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.

• **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.

The team is created with you as the team administrator.

---

**Note**: A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.

---

**Automatic team creation**

If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

**Join a team**

As a team member, you can:

- View messages posted to the team (team feed). Non-members can also view the feed for a public team.
• View a list of team members.
• Invite another team to join the team.
• Subscribe to team email notifications.
• Leave the team.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and click All Teams.
   • If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the team.
   • If the team is public, click Join.
   • If the team is private, click Request. The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
   • To view a team you belong to, select the team name.
   • To view a public team you do not belong to, select All Teams and then click the team name.
     You must be a member to view the feed for a private team.

View a team member

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
   You must be a member of the team to view the members.
4. Click Members.
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Pending members tab.
5. In the Add User field, enter the name of the user you want to invite. The invited member’s picture appears.
Remove a member

If you are team administrator, you can remove any member from the team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Members** tab.
5. Click **Remove** below the member name.
6. Click **Remove** again in the confirmation box that opens.

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

**Subscribe to team and email notification**

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the subscribe icon (ıc).

© 2017 ServiceNow. All rights reserved. 2420
You can click the unsubscribe icon (:Event:EmailAddress) to stop receiving email notifications.

Subscribe a team to a feed notification

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click Feeds.
4. Click the subscribe icon (:Event:EmailAddress) beside the feed name.

You can click the unsubscribe icon (:Event:EmailAddress) to stop receiving email notifications.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team

You can give up membership to a team by leaving that team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Leave beside the team name.

Modify a team

If you are team administrator, you can modify an existing team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon (:Event:EmailAddress).
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request

When a user requests membership to a private team, the team administrator receives an email.

If you are the team administrator, you can manage membership requests.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
If one or more users have been invited to the team, the **Pending members** tab shows the number of invitations sent.

4. Click **Pending members**.
   
   This shows the users who have received invitations, but who have not yet accepted.
5. You can cancel a user’s invitation by clicking **Remove**.
6. You can invite another user to the team by entering their name in the **Add user** field and clicking the Invite member icon (/actions addUser).  

**Delete a team**

If you are the team administrator, you can delete a team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon (actions edit).
5. Click **Delete**.
6. Click **Yes** to confirm deletion.
The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a message

You can post a message to open a new feed.

1. Navigate to Collaborate > Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

1. Navigate to Collaborate > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
Geneva  ServiceNow  ServiceNow Platform

Message Thread

Navakanth Reddy #suggestion(s) A common black vertical line just before the bars would help with this. Also, line spacing between two options should be more than single-spaced.

Also, the bar says 5 people voted and it shows up 5 people and 1 more. Is this a #bug?

8 days ago • in reply to Nirupam Biswas • Like (1) • Reply • Share • Tags (2)

Nirupam Biswas I guess we need some visual distinction between the poll question and the options. After voting, I got confused for some moments why there are four options in result. See screenshot.

8 days ago • Like (1) • Reply • Share • Tags

Shouvik Goswami We have enabled polls in Live Feed. Please review and provide #suggestions and #feedbacks

How do you like the poll in Live Feed?

- Exactly what I was looking for
- Wanted something more
- Did not visualize it this way

Vote

8 days ago • Like (1) • Reply • Share • Tags (2)
Attach a file to a post or reply

There are two methods that can be used to attach files to posts, drag-and-drop and using the paperclip icon ( ). Additionally, you can paste images into a post or reply from the clipboard.

1. Do one of the following:
   - While composing a post or reply (see Post a live feed message or Reply to a live feed message), locate one or more images or other supported types of files, and drag them into the message box.
   - Click the paperclip icon ( ) in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.

4. When you have finished entering your message, click Post or Reply.

5. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.

6. Click the link to download the files.
Copy an image from the clipboard

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the Comment box and add a comment.

2. Click the Add an image button. The Screenshots dialog box opens.

3. Right-click the Paste an image here box and select Paste to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click Done.
6. To change the link text, click Pasted Image and enter a new label.
7. When you finish, click Post or Reply.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon (📝).

Note: The copy/paste functionality is supported in Chrome, Firefox, and Internet Explorer 11.
Add a link to a post or reply

1. Click into the Comment box. The Add a link button appears.
2. Click the Add a link button. The URL and Link text fields appear.

![Comment box with Add a link button](image)

3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the URL field.
5. When you have finished entering your message, click Post or Reply.

![Comment box with links](image)

---

**Note:** To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit icon ( ).
Add a knowledge article link to a post or reply

1. While composing a post or reply, type the ID of the knowledge article you want to link to. It is not necessary to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click Post or Reply.

Add a poll to a message

When you are posting a message, you have the option of creating a poll in order to record your viewers' opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll icon ( ).
4. In the **Question** field, enter the question on which you are soliciting opinions.  
5. In the **Option** fields, enter possible responses to the query.  
6. To add more response options, click **Add more options**.  
7. Click **Post**.  
   After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

**Note:** Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

Add mentions to a message

An @mention is any posted update that contains @username anywhere in the body of the message. The user’s name, with a link to that user’s feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user’s My Feed.

**Note:** If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.
2. Click the user you want to add.
That user’s name is inserted into the @mention in the body of the message.

Note: My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message

1. Navigate to Collaborate > Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.
   If the message has previously been liked, the number of likes for a message displays next to the Like link.
   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed.
   Any additional users who liked the message can be viewed by hovering over the # more link. If the logged-in user has liked the message, that user’s image will appear first, followed by the image of the user who last liked the message.
   For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

   Note: After a message has been liked, it cannot be unliked.

Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.
1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
   The message disappears from the feed.

Platform security

Security is built into all levels of functionality. Implement the security features that are most appropriate for your organization, from managing failed logins and encrypted password protection, to roles and access control rules, to audit logs of user interactions.

General platform security

General security refers to the properties, settings, and options that you can use to better secure your instance.

General security settings properties

Security settings provides several properties to control the level of security on your instance.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Escaping and embedded script support</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>glide.ui.security.allow_codetag</td>
<td>Allow support for embedding HTML code by using the [code] tag.</td>
<td>True</td>
</tr>
<tr>
<td>glide.ui.security.codetag.allow_script</td>
<td>Allow embedded HTML (using [code] tags) to contain Javascript tags</td>
<td></td>
</tr>
<tr>
<td>glide.ui.escape_all_script</td>
<td>Forces all expressions within Jelly <code>&lt;script&gt;</code> tags to be escaped by default.</td>
<td></td>
</tr>
<tr>
<td><strong>Attachment Limits and Behavior</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>com.glide.attachment.max_size</td>
<td>Maximum file attachment size in megabytes:</td>

<tr>
<td>glide.script.secure.ajaxgliderecord</td>
<td>Apply standard security ACLs to AJAXGlideRecord calls</td>
<td></td>
</tr>
<tr>
<td>com.glide.communications.trustmanager_trust_all</td>
<td>By default, the instance trusts a certificate's Certificate Authority (CA). This ensures the instance accepts self-issued certificates. If you want to validate a certificate's CA, set the system property to false.</td>
<td></td>
</tr>
<tr>
<td>glide.outbound.sslv3.disabled</td>
<td>When active, outbound connections from an instance will be forced to use TLS instead of SSL.</td>
<td></td>
</tr>
</tbody>
</table>

**High Security Settings**

High Security Settings provide advanced security options for your instance.
These features are available:

- **Default property values**: to harden security on your platform by centralizing all critical security settings to one location for management and auditing.
- **Default deny property**: provides a security manager property to control the default security behavior for table access.
- **Security Administrator role**: provides a role to prevent modification of key security settings and resources. The Security Administrator role is not inherited by the admin role and must be explicitly assigned.
- **Elevated privilege**: allows users with the security admin role to operate in the context of a normal user and elevate to higher security role when needed.
- **Property access control**: allows security administrators to set the roles required to read and write properties.
- **Transaction and system logs**: are read only.
- **Access control rules**: control what data users can access and how they can access it.

High Security Settings automatically activates the Contextual Security plugin if it is not already active. In addition, Platform Security Settings - High delivers the following settings and features in the context of increasing the security of your instance.

### Property access control

Two additional columns are created in the Properties [sys_properties] table.

- **read_roles**: a comma-separated list of role names that are allowed to read all fields of this property
- **write_roles**: a comma-separated list of role names that are allowed to write/modify all fields of this property

Properties listed in the Properties table have **read_roles** of admin, and **write_roles** of security_admin. This means that users with the admin role can view and read the property values, but must elevate to the security_admin role to modify them.

### Notifications

Activation of high security settings also activates security warning messages. The following is an example of a message that appears after an approval.
Figure 679: Security Warning notification

High Security Settings properties

High Security Settings provides several properties to control the level of security on your instance.

Table 576: High Security Settings properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.escape_text</td>
<td>Escape XML values at the parser level for the user interface. This will prevent reflected and stored cross site scripting attacks. Default: Yes</td>
</tr>
<tr>
<td>glide.ui.escape_all_script</td>
<td>Forces all expressions within Jelly <code>&lt;script&gt;</code> tags to be escaped by default. Default: No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.ui.rotate_sessions</td>
<td>Rotate HTTP session identifiers to reduce security vulnerabilities. See: <a href="http://www.owasp.org/index.php/Session_Management#Rotate_Session_Identifiers">http://www.owasp.org/index.php/Session_Management#Rotate_Session_Identifiers</a>.</td>
</tr>
<tr>
<td></td>
<td>If you are using the SAML 2.0 plugin for Single Sign-on authentication, set this feature to false. Otherwise, it interferes with the session information sharing that takes place between the instance and the Identity Provider.</td>
</tr>
<tr>
<td>glide.ui.secure_cookies</td>
<td>Enable secure session cookies: Enable additional cookie security. If selected, strict session cookie validation is enforced.</td>
</tr>
<tr>
<td>glide.security.strict.updates</td>
<td>Double check security on inbound transactions during form submission (rights are always checked on form generation).</td>
</tr>
<tr>
<td>glide.security.strict.actions</td>
<td>Check conditions on UI actions before execution; normally the conditions are only checked during form rendering.</td>
</tr>
<tr>
<td>glide.security.use_csrf_token</td>
<td>Enable usage of a secure token to identify and validate incoming requests. This token is used to prevent cross site request forgery attacks.</td>
</tr>
<tr>
<td>glide.ui.escape_html_list_field</td>
<td>Escape HTML for HTML fields in a list view.</td>
</tr>
<tr>
<td>glide.html.escape_script</td>
<td>Escape JavaScript tags in HTML fields.</td>
</tr>
<tr>
<td>glide.ui.forgetme</td>
<td>Remove Remember me check box from login page.</td>
</tr>
<tr>
<td>glide.smtp.auth</td>
<td>Authenticate with the SMTP server by the user name and password properties.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.script.use.sandbox</td>
<td>Run client generated scripts (AJAXEvaluate and query conditions) inside of a reduced rights &quot;sandbox&quot;. If enabled, only those business rules and script includes with the Client callable checkbox set to true are available and certain back-end API calls are disallowed.</td>
</tr>
<tr>
<td>glide.soap.strict_security</td>
<td>Enforce strict security on incoming SOAP requests. Checking this requires incoming SOAP requests to go through the security manager for table and field access and checks SOAP users for the correct roles for using the web service.</td>
</tr>
<tr>
<td>glide.basicauth.required.wsdl</td>
<td>Require authorization for incoming WSDL requests.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you choose not to require authorization for incoming WSDL requests, you will need to modify the Access Control (ACL) rules to allow guest users to access the WSDL content.</td>
</tr>
<tr>
<td>glide.basicauth.required.csv</td>
<td>Require basic authorization for incoming CSV requests.</td>
</tr>
<tr>
<td>glide.basicauth.required.excel</td>
<td>Require basic authorization for incoming Excel requests.</td>
</tr>
<tr>
<td>glide.basicauth.required.importprocessor</td>
<td>Require basic authorization for incoming import requests.</td>
</tr>
<tr>
<td>glide.basicauth.required.pdf</td>
<td>Require basic authorization for incoming PDF requests.</td>
</tr>
<tr>
<td>glide.basicauth.required.rss</td>
<td>Require basic authorization for incoming RSS requests.</td>
</tr>
<tr>
<td>glide.basicauth.required.scriptedprocessor</td>
<td>Require basic authorization for incoming script requests.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.basicauth.required.soap</td>
<td>Require basic authorization for incoming SOAP requests.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>glide.basicauth.required.unl</td>
<td>Require basic authorization for incoming unload requests.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>glide.basicauth.required.xml</td>
<td>Require basic authorization for incoming XML requests.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>glide.basicauth.required.xsd</td>
<td>Require basic authorization for incoming XSD requests.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>glide.cms.catalog_uri_relative</td>
<td>Enforce relative links from the URI parameter on /ess/catalog.do. If checked, then only relative URLs are permitted through the /ess/catalog.do page using the parameter 'uri'. If unchecked, all URLs are permitted, which may permit linking to external unauthorized content.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>glide.set_x_frame_options</td>
<td>Enable this property to set the X-Frame-Options response header to SAMEORIGIN for all UI pages. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page in a &lt;frame&gt; or &lt;iframe&gt;. Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into other sites. <a href="https://developer.mozilla.org/en/the_x-frame-options_response_header">https://developer.mozilla.org/en/the_x-frame-options_response_header</a></td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>glide.ui.attachment.download_mime_types</td>
<td>A list of comma separated attachment mime types that do not render inline in the browser. This will prevent cross site scripting attacks. For example, text/html forces HTML files to be downloaded to the client as attachments rather than viewed inline in the browser.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong></td>
</tr>
<tr>
<td>glide.security.groupby_acl_check</td>
<td>When this property is enabled, for GroupBy operations ACL checks are performed for the &quot;group&quot; names based on the actual data from the groups.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> Yes</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>glide.security.diag_txns_acl</td>
<td>If it is set to true, only admin user or user from allowed ip address can access stats.do, threads.do and replication.do. Default: Yes</td>
</tr>
<tr>
<td>glide.ui.security.allow_codetag</td>
<td>Allow support for embedding HTML code by using the [code] tag. Default: Yes</td>
</tr>
<tr>
<td>glide.ui.security.codetag.allow_script</td>
<td>Allow embedded HTML (using [code] tags) to contain JavaScript tags. Default: No</td>
</tr>
<tr>
<td>glide.script.allow.ajaxevaluate</td>
<td>Enable the AJAXEvaluate processor. Default: No</td>
</tr>
<tr>
<td>glide.login.autocomplete</td>
<td>Allow browsers to use auto-complete on password fields on login forms. Default: No</td>
</tr>
<tr>
<td>glide.security.csrf_previous.allow</td>
<td>Allow usage of an expired secure token to identify and validate incoming requests. This token is used to prevent cross site request forgery attacks. Default: No</td>
</tr>
<tr>
<td>glide.security.csrf_previous.time_limit</td>
<td>Time in seconds for a secure token to expire. It allows control over the length of time that the previous CSRF token is valid. When the user session expires, the secure token expires with it unless the &quot;allowing reuse of expired tokens are allowed&quot; property is enabled and it's within the time frame described by this property. This token is used to prevent cross-site request forgery attacks. Default: 86400 seconds or 1 day</td>
</tr>
<tr>
<td>glide.security.csrf.strict.validation.mode</td>
<td>This property enforces strict validation on CSRF tokens so that users cannot resubmit a request if the CSRF token does not match. Default: false</td>
</tr>
<tr>
<td>glide.basicauth.required.schema</td>
<td>Require basic authentication for inbound table schema requests. Default: true</td>
</tr>
</tbody>
</table>

These are defined in the sys_properties table, but are not visible on the High Security Settings page.
Default deny property

Activating the High Security plugin creates the glide.sm.default_mode security property, which controls the security manager default behavior when the only matching ACL rules are the wildcard table ACL rules.

The High Security application also includes a set of wildcard table ACL rules for the most common record-based operations: read, write, create, and delete as well as a significant number of ACLs to provide role-based access to system tables. For example, there are ACLs that grant sys_script access to the business_rule_admin role because that role is documented as being able to manage business rules.

The choices for the glide.sm.default_mode property are:

- **Deny Access**: The wildcard table ACL rules restrict the read, write, create, and delete operations on all tables unless the user has the admin role or meets the requirements of another table ACL rule. Other operations, such as report_on and personalize_choices, are unaffected by this setting.

- **Allow Access**: The wildcard table ACL rules allow the read, write, create, and delete operations on all tables unless there are specific table ACL rules in place to restrict such operations.

  **Note**: By default, the wildcard table ACL rules are the only ACL rules that check for the value of the glide.sm.default_mode property. If you want to control other operations with this setting, create your own ACL rules to check for this property value.

Security Administrator role

When the High Security plugin is activated, a new role called security_admin is created and added to the default System Administrator user.

This role is a peer to the admin role and, therefore, is not inherited by users who are assigned the admin role by default (base system System Administrator, for example). This new role is marked as an elevated privilege, which means the user who is assigned the role will need to be manually elevated to the role during an interactive session. The security_admin role protects resources in the platform such as ACL, properties, and records, that require security to bar access by the normal admin user.

Elevated privilege

A role that requires elevated privilege prevents the system from assigning it to a user at login. Instead, a user must manually elevate privileges to receive the elevated role.

In the base system, only the security_admin role requires elevated privilege.
Figure 680: The security administrator role

**Note:** The record for the system_admin role is only visible to users who elevate privileges to the security_admin role.

An elevated privilege role only lasts for the duration of the user session. Session timeout or log-out removes the role. To use an elevated role, all these conditions must be met:

- The role must be assigned to the user.
- The user must manually elevate roles.

User who do not have an elevated privilege role do not see an option to elevate roles. For example in the base system, only the System Administrator user has the security_admin role.
Figure 681: Roles assigned to the System Administrator user

Therefore in the base system, only the System Administrator user has the option to **Elevate Roles**.
**Elevate to a privileged role**

The out-of-box admin can elevate to a privileged role to have access to the features of High Security Settings.

Role required: admin

Note: If you grant additional users the admin role, they cannot elevate to a privileged role. Only the out-of-box admin can elevate.

1. Do the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>1. In the banner frame, click your user name.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2. Select <strong>Elevate Roles</strong>.</td>
</tr>
<tr>
<td>UI15 or UI11</td>
<td>In the banner frame, click the lock icon (🔒) by your user name.</td>
</tr>
</tbody>
</table>

A dialog box appears.

![Activate an Elevated Privilege](image)

2. Select an elevated role and click **OK**. This grants the user elevated privileges to all resources controlled by the role for the remainder of the session. When the user logs out, the elevated privileges are terminated and must be reestablished at the next login. When elevated privileges are activated, the icon has an unlocked appearance.
Force administrators to manually elevate
A property is available to force all users with the administrator role to manually select the role that they want to elevate to.

Role required: security_admin

1. Login as a user with the security_admin role.
2. Elevate roles to security_admin.
3. Navigate to sys_properties.list.
4. Find the glide.security.strict_elevate_privilege property.
5. Set the property to true.

Activate High Security Settings
The High Security Settings plugin is active by default on all new instances.

Role required: security_admin

If it is not active on your instance, you can request the plugin.

1. In the HI Service Portal, click Service Catalog > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

Reason/Comments

Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.

3. Click Submit.

Certificates

The instance uses certificates to establish secure connections and validate signatures.

Certificates are used for features such as:

- **LDAPS**
- **Mutual authentication**
- **Web services security**
- **MID Server**

In order to use a certificate, you need to generate or purchase a certificate for the secured server or client and upload it to an instance.

**LDAP certificates**

Uploading an SSL certificate allows the instance to establish an LDAP over SSL (LDAPS protocol) connection with an LDAP server.

The instance accepts two types of LDAP certificates:

<table>
<thead>
<tr>
<th>Certificate</th>
<th>Type</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP server certificate</td>
<td>Any supported type</td>
<td>All LDAP configurations</td>
</tr>
<tr>
<td>LDAP client certificate</td>
<td>Java keystore type</td>
<td>Mutual authentication</td>
</tr>
</tbody>
</table>

If there are multiple server certificates, ServiceNow tries each server certificate in turn until the LDAP server allows the connection. If you use multiple LDAP servers, be sure to include the SSL certificate for each LDAP server.

If your LDAP server requires **mutual authentication** (requires the client to present a certificate in addition to the server), you must also provide your LDAP server’s client certificate in a Java keystore type certificate.
Upload a certificate to an instance

Administrators can add a certificate to the instance from the Certificates module.

Role required: admin

Note: When a certificate is updated on the ADFS server, you also need to upload an updated certificate to the instance.

1. Navigate to System Definition > Certificates.
2. Click New.
3. Fill in the following fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the certificate.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>[Optional] Select whether you want to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Active</td>
<td>Select whether the instance should use this certificate for secure communications and signing requests.</td>
</tr>
<tr>
<td>Short Description</td>
<td>[Optional] Enter a text description of the certificate such as the requester or server name.</td>
</tr>
<tr>
<td>Format</td>
<td>Select the certificate format. The instance supports the PEM and DER formats. See Certificates.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the certificate container. The instance recognizes certificates from trust stores, Java keystore, and PKCS#12 keystores.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Enter the base-64 encoded PEM-formatted text containing the DER certificate. The instance decodes the certificate to populate the Valid from, Expires, Expires in days, Issuer, and Subject fields.</td>
</tr>
</tbody>
</table>

4. Click Submit.

During the upload, the module extracts and displays the certificate's read-only properties in these fields:
- Valid from date
- Expiration date
- Issuer
- Subject of the certificate

5. Validate the certificate or keystore.
Certificate criteria
Certificates must meet several criteria.

A valid certificate must meet these criteria:

- The certificate can have a key size up to 2048 bits.
- The certificate must have one of these file extensions:

<table>
<thead>
<tr>
<th>Extension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DER</td>
<td>The Distinguished Encoding Rules format is a binary message transfer syntax. This format also supports the .CER and .CRT file extensions.</td>
</tr>
</tbody>
</table>
### Certificate trust

By default, ServiceNow trusts a certificate's Certificate Authority (CA).

This ensures the instance accepts self-issued certificates. You must set the system property `com.glide.communications.trustmanager_trust_all` to `false`. If you do not set the property false, the instance trusts any certificate.

#### Generate an LDAP client certificate

Generate an LDAP client certificate for mutual authentication using OpenSSL. The final output is a PKCS#12 certificate stored within a Java keystore.

Role required: admin

See the [OpenSSL documentation](https://www.openssl.org) for more information about generating certificates.

These steps assume you have access to OpenSSL.

Enter these commands in a command line interface.

1. **Generate a self-signed client certificate.**

   For example, this command creates a client certificate `test1-cert.crt` based on the `test1-key.key` private key.

   ```bash
   openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout test1-key.key -out test1-cert.crt
   ```

2. **Convert both the certificate file and private key to PKCS#12 (a file with a .pfx or .p12 extension).**

   For example, this command converts the client certificate and private key to a PKCS#12 certificate called `test1-certificate.pfx`.

   ```bash
   openssl pkcs12 -export -out test1-certificate.pfx -inkey test1-key.key -in test1-cert.crt
   ```

3. **Generate the Java Key Store and import the pkcs12 file into it.**

   For example, this command imports the certificate to the `test1.jks` Java keystore.

   ```bash
   keytool -importkeystore -srckeystore test1-certificate.pfx -srcstoretype PKCS12 -destkeystore test1.jks
   ```

4. **Upload the certificate** in the keystore file (`test1.jks`) to the instance.

#### Generate a server certificate

You can use keytool to generate a new Java keystore file, create a certificate signing request (CSR), and import the private key, public certificate pair, and signed certificates into the keystore.

Role required: admin

<table>
<thead>
<tr>
<th>Extension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CER</td>
<td>A certificate file extensions for certificates using the Distinguished Encoding Rules format.</td>
</tr>
<tr>
<td>CRT</td>
<td>A certificate file extensions for certificates using the Distinguished Encoding Rules format.</td>
</tr>
<tr>
<td>PEM</td>
<td>The <em>Privacy Enhanced Mail</em> format is a base-64 encoded DER certificate enclosed between &quot;-----BEGIN CERTIFICATE-----&quot; and &quot;-----END CERTIFICATE-----&quot; text strings.</td>
</tr>
</tbody>
</table>
See the Java keytool documentation for more information on generating keys and CSRs.

Enter these commands in a command line interface:

1. Generate a Java keystore and key pair.
   For example, this command creates a keystore called my.keystore and generates a private key called mydomain within the keystore.

   ```
   keytool -genkey -alias mydomain -keyalg RSA -keystore my.keystore
   ```

2. Generate a CSR for an existing Java keystore.
   For example, this command generates a CSR called mydomain.csr or the mydomain key.

   ```
   keytool -certreq -alias mydomain -keystore my.keystore -file mydomain.csr
   ```

3. Import a root or intermediate certificate authority, or CA, certificate to the Java keystore.
   For example, this command imports the CA certificate for Thawte. This command assumes that Thawte was the CA that signed the CSR.

   ```
   keytool -import -trustcacerts -alias root -file Thawte.crt -keystore my.keystore
   ```

4. Import a signed primary certificate to the Java keystore.
   For example, this command imports the signed certificate mydomain.crt into the keystore.

   ```
   keytool -import -trustcacerts -alias mydomain -file mydomain.crt -keystore my.keystore
   ```

5. Upload the certificate in the keystore file (my.keystore) to the instance.

   **Upload a trusted server certificate**
   By uploading the service provider’s trusted server certificate, the instance ensures it is connecting to a valid and secure service.

   Role required: admin

   The instance validates outbound Web Service calls by using the certificate provided by the service provider.

   1. Create a new Certificate record with the type “Trust Store Cert”.
   2. Do one of the following actions:
      - Attach the service provider’s DER formatted certificate.
      - Copy and paste the service provider’s PEM format certificate into the **PEM Certificate** field.
Validate a certificate or a keystore
Administrators should validate certificates and keystores after uploading them to determine if there are any issues to resolve.

Role required: admin

If the instance encounters any errors with the certificate or keystore, it displays an error message.

1. Navigate to System Definition > Certificates.
2. Select the certificate or keystore you want to validate.
3. From the X.509 Certificate form, click the Validate Stores/Certificates related link.
   For example, this certificate fails validation because it is expired.
Extended table security

Most ITIL tables are part of a table hierarchy which enables similar tables to share a common set of fields in a parental table.

For example, the Task table is the parent of both Incident and Problem (and many others).

When you are securing a system, it's important to understand how the security model interacts with the table hierarchy. It's also important to know which security manager you are running.
Determine the current security manager

Most ITIL tables are part of a table hierarchy which enables similar tables to share a common set of fields in a parental table.

Role required: security_admin or admin

For example, the task table is the parent of both incident and problem (and many others).

When you're securing a system, it's important to understand how the security model interacts with the table hierarchy. It's also important to know which security manager you are running.

2. Look at the property labeled Security Manager.
   - If it reads com.glide.sys.security.ContextualSecurityManager, you are running the Contextual Security Manager.
   - If it is blank, you are running the Simple Security Manager.

Simple security manager

The simple security manager protects fields via their dictionary entries.

**Note:** Functionality described here requires the Admin role.

To secure a field, bring up that field's dictionary entry and add read/write/delete roles to the field. Row level operations (like insert or delete) are implemented by putting roles on the table's sys_dictionary entry.

Since the simple security manager is based on fields themselves, it has no concept of, or interaction with, the system's table hierarchy. If a field is defined on task, it will be secured identically whether that field is actually part of an incident, a change, or a problem.

Contextual security manager

Unlike the simple security manager, the contextual security manager is aware of the system's table hierarchy, which means you can potentially have different security rules for a field based on where in the hierarchy it is displayed.

**Note:** Functionality described here requires the Admin role.

**Note:** This section assumes you are familiar with the contextual security manager and its ACL base functionality.

The basic rules to remember with the contextual security manager is that it looks up the table hierarchy for rules until it finds one, then stops looking. So in the case of a task field like short_description, the system would look for rules in different ways based on where that field was being used.

When looking at an incident, the system would look for rules in the following order:

incident.short_description, task.short_description, *.short_description

When looking at a change_request, the system would look for rules in the following order:

change_request.short_description, task.short_description, *.short_description
What this means is that a rule at a lower level in the hierarchy can override a rule on a base table. Perhaps I am allowed to change the `short_description` on incidents, but not on change requests. This lends itself to a number of best practices.

**Contextual Security Manager Best Practices**

Secure as high in the hierarchy as you can

It's easier to secure `short_description` on task than it is to secure it on incident, and change_request, and problem, and sc_request, etc. There's only one rule to write for one thing, and if you have to change it, there is only one rule to change. You don't lose any flexibility here, since if you end up needing to secure incident differently, you can still put a specific rule on `incident.short_description` and still have all the other extensions use the rule on `task.short_description`

Use as few rules as possible

This is a corollary to the previous suggestion, but fewer rules are easier to manage. There's no real efficiency difference in terms of processing time between having a rule in incident, another one on problem, and third one on change_request vs. having a single rule on task, but there is a big efficiency different in terms of human time in creating and maintaining the rule base.

But not too few

If you do find yourself needing different security constants for `incident.short_description` vs. `task.short_description`, you could conceivably handle the difference with a scripted rule on `task.short_description` that checked the class name of the current record and responded differently in each case. While such an approach will work, it usually results in fairly large and complicated script rules (especially after they've gone through multiple revisions). You'll usually have an easier-to-manage rule base if you put one simple rule on task and a second simple rule on incident.

**Additional security options**

The application has a wide variety of security options to choose from.

Depending on the security requirements of your particular deployment, it might make sense to run the system with all of its security options enabled. Some of the options make the system more secure, but can offer additional complexity from an implementation standpoint.

All security settings in this page are configured in **System Properties > Security**.

**Remember me login cookie**

When you log on to the instance, you have the option to select the Remember me check box on the login screen, which stores a cookie on your browser.

This cookie contains information that the application server can use to authenticate your user credentials automatically the next time you visit the instance. For most users, this is a highly convenient feature.

In some deployments, however, it is desirable to have users authenticate with the system every time they connect. To support this, the system lets you disable the Remember me functionality by removing the corresponding check box (and its resultant cookie) from the login screen.

The default value for the Remember me check box can also be changed.

<table>
<thead>
<tr>
<th>Property</th>
<th>Property</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove Remember me* checkbox from login page</td>
<td>glide.ui.forgetme</td>
<td>Property disabled (Remember me check box is visible)</td>
</tr>
</tbody>
</table>
You can also modify the session timeout, forcing users to reauthenticate if they do not continue interacting with the instance. Session timeout only works if the Remember me check box in the login screen is not selected.

**Double-check form submission**

When the system determines that a particular field (such as task.number) should not be written to by the current user, the system renders that field in a read-only mode, which is why the number field is not writable on most incidents.

If you set the system to double-check the values of any incoming fields for writability, then the system will apply the same set of security rules to the inbound leg of a transaction. When you submit an incident, for example, the system double-checks to determine if the number field can be written to before posting any changes.

If you tell the system not to double-check inbound transactions, then the system will allow you to write to a nominally read-only field if that is the transaction the client sends back. In many deployments this is actually a desirable behavior if, for example, you are using client scripts to set nominally read-only fields in response to user selections in other, writable fields.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Double check security on inbound transactions during form submission (rights are always checked on form generation)</td>

**Script sandboxing**

There are two cases within the system that allow the client to send scripts to the server for evaluation.

- Filters and/or queries: It is legal to send a filter to the server which reads something like this - assigned_to=javascript:getMyGroups().
- System API: The API call AJAXEvaluate allows the client to run arbitrary scripts on the server and receive a response.

If you enable script sandboxing, the script being evaluated via either of these two entry points runs within a reduced rights sandbox with the following characteristics:

- Only those business rules marked client callable are available within the sandbox.
- Only those script includes marked client callable are available within the sandbox.
- Certain API calls (largely but not entirely limited to those dealing with direct DB access) are not allowed.
- Data cannot be inserted, updated, or deleted from within the sandbox. Any calls to current.update(), for example, are ignored.

If you run the system without script sandboxing enabled, then none of these restrictions apply.

**Note:** This property is activated by default when you activate the High Security Settings plugin. Do not activate this property outside of the plugin.
<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run client generated scripts <em>(AJAXEvaluate and query conditions)</em> inside of a reduced rights &quot;sandbox&quot;. If enabled, only those business rules and script includes with the <strong>Client callable</strong> checkbox set to true are available and certain back-end API calls are disallowed.</td>
<td>Enabled (sandbox in use)</td>
</tr>
</tbody>
</table>

Enable the AJAXEvaluate processor

As was mentioned in the section on script sandboxing, the **AJAXEvaluate** API call allows the client to send, and execute, arbitrary script on the server.

For an additional level of security, over and above that offered by the script sandbox, it is possible to entirely disable the **AJAXEvaluate** processor, in which case any API calls made to that processor are ignored.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable the <strong>AJAXEvaluate</strong> processor.</td>
<td>Disabled (API is disabled)</td>
</tr>
</tbody>
</table>

Apply ACLs to AJAXGlideRecord (client side Glide record)

From within client scripts, it is possible to query arbitrary data from the server via the **AJAXGlideRecord** (renamed to GlideAjax) API, by using a syntax similar to a server-side glide record. This is an extremely powerful and useful tool in many deployments.

If you choose to apply access control lists (ACL) to GlideAjax API calls, then you can only query data to which the currently connected user has rights to access. For example, if the user is logged in as an ESS user who has no rights to read the **cmn_location** table, then any GlideAjax API call on his behalf would fail.

If you run the system without an ACL checking on GlideAjax calls, then the API can return information that the currently logged in user could not otherwise access via the UI.

Mutual authentication

Mutual Authentication establishes trust by exchanging secure sockets layer (SSL) certificates.

Before connecting to a server, the client requests an SSL certificate. The server responds by requesting that the client send its own certificate. Both respond by validating the certificates and sending acknowledgments before initiating an HTTPS connection.

Administrators do the preliminary work of setting up a keystore and generating certificates before certification requests are fulfilled.

**Warning:** This feature only enables mutual authentication on outbound https connections. The instance does not support mutual authentication on inbound requests.
Creating the Key Store

The instance currently supports uploading a Java keystore file to contain the private key, public certificate pair, and its signed certificates.

The following steps use commands that allow you to generate a new Java Keytool keystore file, create a certificate signing request (CSR), and import certificates. Any root or intermediate certificates need to be imported before importing the primary certificate for your domain. Type these commands in a command line interface.

1. Generate a Java keystore and key pair.
   
   ```
   keytool -genkey -alias mydomain -keyalg RSA -keystore my.keystore
   ```

2. Generate a CSR for an existing Java keystore.
   
   ```
   keytool -certreq -alias mydomain -keystore my.keystore -file mydomain.csr
   ```

3. Import a root or intermediate certificate authority CA certificate to an existing Java keystore.
   
   ```
   keytool -import -trustcacerts -alias root -file Thawte.crt -keystore my.keystore
   ```

4. Import a signed primary certificate to an existing Java keystore.
   
   ```
   keytool -import -trustcacerts -alias mydomain -file mydomain.crt -keystore my.keystore
   ```

Setting up the Key Store

Now that the key store has been created, it can be uploaded to the Certificates table. On the System Definition > Certificates page, click New and set the following fields:

- Enter a certificate Name.
- Store the key store as Active.
- Set Type = Java Key Store.
- Provide a Key store password. This is the password that was used to create the keystore.

Click Submit to create the Java Key Store entry.

![Keystore Table](image)

Figure 683: Keystore
Specifying a Trusted Server Certificate

During an outbound SSL connection, which is an HTTPS Web Service call, it is possible to specify a certificate provided by the service provider that ensures the validity of the service provider during the SSL connection. For example, a browser attempting to connect to a secure service which identifies itself by a certificate.

By uploading the trusted server certificate, ServiceNow ensures that the service it is connecting to is valid and secure.

Create a new Certificate entry with the type of "Trust Store Cert" and attach a DER formatted certificate, or copy and paste its PEM format into the PEM Certificate field.

![Certificate Entry](image)

**Figure 684: Trusted Certificate**
### Processing Mutual Authentication Requests

**Figure 685: Certificate Exchange**

- When a client requests the server certificate for authentication, a certificate signing request (CSR) is generated.
- To respond to a CSR, the server generates two unique cryptographic keys: A public key, which is used to encrypt messages to the server and a private key, which is used to decrypt messages. Both keys are kept in the Key Store.
- Keys are used to decrypt the client secure messages so they can be read by the server. Any outgoing connection that is going to be HTTPS verifies the certification by checking the Key Store, offering its public certification, and uses the trust store certificates to verify mutual trust back.
- To complete the secure link between the client and the server, the server matches the certificate to the corresponding private key. Because only the server has access to the private key, the server can decrypt the data from the client.

Here is an example of a command that registers MYHTTPS with the `com.glide.certificates.DBKeyStoreSocketFactory` socket factory on port 443. The database key store factory is used during the SSL exchange process to offer a client certificate for mutual authentication.

```java
import com.glide.certificates.DBKeyStoreSocketFactory;
glide.httpclient.protocol.myhttps.class = "com.glide.certificates.DBKeyStoreSocketFactory"
glide.httpclient.protocol.myhttps.port = "4433"
```

Having the above configuration will affect any outbound `myhttps://host.domain.com/target` URL to use the custom socket factory and exchange certificates during SSL.

**Note:** if you override the default 'https' protocol socket factory, you will be doing that on a global scale and it will affect every outbound https connection. This is usually undesirable.

The server responds by sending a certificate. Is this a certificate that the client accepts? If yes, a message is sent to the server accepting the certificate and a secure channel is initiated. If the certificate is not accepted, it may mean that the root authority is needed for certification.
Web service security

Web service security is enforced using the combination of basic authentication challenge/response for the HTTP protocol, as well as system level access control using the Contextual Security Manager. Additionally, there is a set of web service specific roles that may be granted to the web service user.

Basic Authentication

To enforce basic authentication on each request for a WSDL document or posting of SOAP messages, you may set the property glide.basicauth.required to `true`. If you do so, each WSDL or SOAP request would have to contain the "Authorization" header as specified in the Basic Authentication protocol. Because the request is non-interactive, we always require the Authorization header during a request.

Supplying basic authentication information whether or not it is required has the added advantage that the data created or updated as a result of the Web Service invocation is done on behalf of the user supplied in the basic authentication credentials. As an example, when creating an Incident record, the journal fields will have the user id of the basic authenticated user, instead of the default Guest user.

To make the authorization header ignore the capitalization rules, use the glide.security.script.include.name.case.insensitive.list property. You can modify this property in the System Properties [sys_properties] table and add the script includes that are necessary to process the authentication. By default, this property has these values: BasicAuth,CustomAuth for those two script includes. Add other script includes as needed. This property is available starting with the Geneva release.

To supply basic authentication when using Perl and the SOAP::Lite libraries, you can implement the following function:

```perl
sub SOAP :: Transport :: HTTP :: Client :: get_basic_credentials { return 'user_name' => 'password'; }
```

• When using C# .NET VS 2005 or older, you can take advantage of the Credentials object, for example:

```csharp

service . ServiceNow proxy = new service . ServiceNow ( ) ;
service . get getService = newservice . get ( ) ;
service . getResponse getServiceResponse = new service . getResponse ( ) ;

try {
    proxy . Credentials = cred ;
    getService . sys_id = "bf522c350a0a140701972dbf876f1610" ;
    getServiceResponse = proxy . get (getService ) ;
    catch (Exception ex) {
}
```

• When using C# .NET VS 2008, you can take advantage of the ClientCredentials object, for example:

```csharp
Demo_Incident. ServiceNowSoapClient client = new Test08WebService . Demo_Incident . ServiceNowSoapClient ( ) ;
client . ClientCredentials . UserName . UserName = "admin" ;
client . ClientCredentials . UserName . Password = "admin" ;
```

Then in your app.config file look for the following and change "None" to "Basic":

```xml
<transport clientCredentialType= "None" proxyCredentialType= "None" realm= "" />
```
• When using VB .NET taking advantage of the Credentials object would look like the following:

```vbnet
Sub Main()
    Dim cred As New System.Net.NetworkCredential( "user_name", "password"")
    Dim proxy As New VB_Democm.incident.ServiceNow
    Dim getIncident As New VB_Democm.incident.get
    Dim getResponse As New VB_Democm.incident.getResponse
    proxy.Credentials = cred
    getIncident.sys_id = "[your sysID here]"
    getResponse = proxy.get(getIncident)
End Sub
```

The resulting response when Basic Authentication is turned on and no credentials are supplied looks like this:

```html
<html> <head> <title>Apache Tomcat/5.0.28 - Error report </title> </head> <body> <h1>HTTP Status 401 - </h1> <p><b>type</b> Status report </p> <p><b>message</b> <u>This request requires HTTP authentication ().</u> </p> <p><b>description</b> <u>This request requires HTTP authentication ().</u> </p> <p><b>headers</b> </p> <h3>Apache Tomcat/5.0.28</h3> </body> </html>
```

WS-security

Support for WS-Security 1.1 in the form of WSS X.509 Token Profile and WSS Username Token Profile is available for incoming SOAP requests.

The configuration to use WS-Security is separate from the requirement to enforce Basic Authentication, and is enforced when the SOAP envelope contains the WS-Security headers. The following **WS Security Profiles** module contains configurations for using this feature.
The **WS Security Profile** module lists the WS-Security profiles that are currently in effect. The **Order** of the profiles indicate the order of authentication that will be checked, all profiles will be checked during the incoming SOAP request, when a profile fails authentication, it will not execute the next one in order. The **Bind session** checkbox indicates which profile to use to assume the session's identity, there can only be one "bound" session.

![WS Security Profiles Table]

**Figure 687: WS Security List**

**WSS X.509 Token Profile**

Use the X.509 authentication framework as defined by the Web Services Security: SOAP Message Security specification. An X.509 certificate specifies a binding between a public key and a set of attributes that includes (at least) a subject name, issuer name, serial number and validity interval. An X.509 certificate is used to validate a public key that is used to sign the incoming SOAP message. Upload the
certificate in the **Certificate** module and reference it in the **X509 Certificate** field. If this is a bound session, select the user to impersonate when the WS-Security authentication succeeds.

See the following document: [http://www.oasis-open.org/committees/download.php/16785/wss-v1.1-spec-os-x509TokenProfile.pdf](http://www.oasis-open.org/committees/download.php/16785/wss-v1.1-spec-os-x509TokenProfile.pdf)

Figure 688: WS x509

**WSS Username Token Profile**

In addition to specifying the X.509 Token Profile, a UsernameToken can also be supplied in the SOAP request. A UsernameToken is used as a means of identifying the requester by "username", and optionally using a password (or shared secret, or password equivalent) to authenticate that identity to the instance. The UsernameToken profile cannot be used independent of the X.509 Token Profile currently.

1. **Authenticate using the Username of the incoming SOAP request to lookup a User by the specified User field to match UserName** value. The password value in the incoming Username Token is used to authenticate the request. When the **Bind session** option is selected, the user that authenticates successfully will be used for the session.

   ![WS Security Profile](image)

   **Figure 689: Selecting Bind session**

2. **Authenticate using a separate pair of user name / password that is unrelated to users in the User table.** When the **Bind session** option is selected, the user that is specified in the **Run as user** field will be used for the session.

**Example WS-Security SOAP Envelope Headers**

---

```
Set security for items and categories

Administrators can control access to content in the service catalog by creating and applying user criteria records.

Catalog managers and catalog editors can apply existing user criteria for items and categories to which they are assigned. However, catalog managers and catalog editors cannot create or edit user criteria directly.

You can **create user criteria records** that define conditions for user information. Then apply these criteria records to catalog items and categories, controlling access to these items and categories.

For example, create a **USA Sales** user criteria record matching users who are both in the sales team and based in the USA. Then apply this record to the **USA IT Hardware** catalog category, so only users matching the record can access that category.

The feature is active by default in new Fuji instances and upgraded instances that do not use entitlement-based access controls. If you upgrade an instance that uses entitlements, you can **migrate to user criteria** to take advantage of the improved control, flexibility, and reuse.

Access controls allow you to:

- Manage access to multiple items and categories in one user criteria record. For example, create a single **UK Employees** user criteria record and apply it to multiple items and categories that are available to employees in the UK.

© 2017 ServiceNow. All rights reserved. 2468
• Allow access if one condition matches, or if all conditions match. For example, define that only users who are both in a specific location and who belong to a specific department can have access.

• Use **Available For** and **Not Available For** lists to allow or prohibit access to users matching the conditions in a criteria record. For example, specify that a US-based catalog category is available for the users located in the USA but is not available for users belonging to the Sales department (whether in the US or not).

• **Extend matching** to create conditions matching additional fields in the User [sys_user] table, without having to use a script. For example, you can add a condition to match items against the **Cost center** field in user records.

**Note:** For changes in User [sys_user] table records to be effective, you should log out and log in.

Create a user criteria record

User criteria records define conditions that are evaluated against user records.

You can apply several user criteria records to a single catalog item or category. In this situation, users need to match only one of these criteria records to have access.

**Note:** When a change is made to the end user profile such as their location so that it affects their ability to view items, then those changes will not take effect till the end user has relaunched their session.

1. Navigate to **Service Catalog > Catalog Definition > User Criteria** and create a record.

2. Fill in the fields on the form, as appropriate.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>A check box to display or hide the <strong>Script</strong> field.</td>
</tr>
<tr>
<td>Script</td>
<td>A <em>script</em> to define any additional criteria, and return <strong>true</strong> or <strong>false</strong>. This field is available only if <strong>Advanced</strong> is selected.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.</td>
</tr>
<tr>
<td>Check box</td>
<td>For check boxes, describe the selected condition. For example: &quot;Check box for enabling the feature&quot; or &quot;Select the check box to enable the feature.&quot; Describe the cleared condition only when it is not obvious.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box to activate or deactivate this criteria record.</td>
</tr>
<tr>
<td>Companies</td>
<td>The companies to match.</td>
</tr>
<tr>
<td>Locations</td>
<td>The locations to match.</td>
</tr>
<tr>
<td>Departments</td>
<td>The departments to match.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Match All** | A check box to determine whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access.

By default, this check box is cleared so that any condition met provides a match.

For example, consider a user criteria record for the following:
- Locations A or B
- Company C or D

With **Match All** selected, only users meeting all of these conditions are matched. For example, a user with a location A and a company C.

With **Match All** cleared, users meeting any of these conditions are matched. For example, a user with a location B.

**Note:** If you select **Match All**, ensure that you do not create contradictory conditions which can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.

### Apply user criteria to items and categories

You can apply a user criteria record to items and categories, either from the item or category form or from the user criteria form.

**Note:** The user criteria restriction applies only within Service Catalog for the specific item it is applied for. However, the user criteria restriction is not applied outside the Service Catalog where the user has access to the item via the table.

To apply criteria directly to an item or category, use the **Available For** or **Not Available For** related lists in the Item or Category form.

**Note:**
- When a change is made to the end-user profile, such as location, and it affects their ability to view items, those changes do not take effect until the end user has relaunched the session.
- The user criteria restrictions of a category do not automatically apply to the catalog items within the category. If required, you should apply the user criteria restrictions to the individual catalog items.
To apply criteria directly from the User Criteria form, add items to the **Available For Catalog Items** and **Not Available For Catalog Items** related lists, and add categories to the **Available For Categories** and **Not Available For Categories** related lists. You may need to configure the User Criteria form to add these lists.

**Note:**
The **Not Available For** settings override **Available For** settings. A user on the **Not Available For** list for an item cannot access that item, even if that user is also on the **Available For** list for that item.

---

**Implement user criteria best practice**

When creating user criteria for your system, consider the following good practice recommendations.

- **Design Criteria for Reuse:**
  Ensure that you design user criteria for maximum reuse. Create user criteria records with common sets of conditions matching your organization’s requirements. Allow them to be shared across as many items and categories as possible, rather than creating multiple similar criteria records for individual items and categories.

- **Naming conventions:** Give each user criteria record a meaningful name, to help you determine the function for that record. For example,
  - Users in company Cloud Dimensions AND in London
  - Users in company Cloud Dimensions OR in London
  - Users belonging to the Group Development, IT, or Sales
  - Users with role itil, asset_manager, or catalog_admin

- **Test user criteria on a non-production instance:** Consider testing user criteria on a development or test instance, and then transferring the records from the **user criteria tables** and catalog records to your production instance using **update sets**.

---

**Extend user criteria**

Service catalog enables you to extend user criteria to match against additional reference fields in the User [sys_user] table, such as hidden or custom fields, without using a script.

You can then add a matching field in the User Criteria [user_criteria] table, allowing you to define conditions based on this field in user criteria records.

**Note:** The column on the User table must be a reference field, and the matching column on the User Criteria table must be a glide_list type field. Also, both columns must have matching names. Columns with a “U” prefix are catered for, so, for example, “cost_center” and “u_cost_center” are considered as matching.

1. Navigate to **System Definition > Tables**.
2. Locate and open the **User Criteria** record.
3. In the **Columns** section, insert a row for the new field.
4. Set the type to **List** and select the appropriate reference field. For example, select **cmn_cost_center** to set criteria based on cost centers.
   You have a step with a list, note, and image.
5. Navigate to **Service Catalog > Catalog Definition > User Criteria**.
6. Select or create a new user criteria record, and see that you can now use the new field.
You can further extend the User Criteria table to match against any columns in other tables. In the User [sys_user] table, add a new reference field to the other table, then extend the user criteria table to refer to that reference field, as described above.

Useful security scripts

There are several useful scripts you can use to secure your instance.

For an easy-to-navigate version, visit the Useful Scripts portal.

Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Set Write Role for All Catalog Variables

This script sets a write role of Admin for all catalog variables in the system.

Name: Set Write Role for All Catalog Variables

Type: 

Table: 

Description: This script sets a write role of Admin for all catalog variables in the system.

Parameters: 

Script:

```javascript
function pat () {
    var gr = new GlideRecord ( 'item_option_new' ) ; var count = 0 ;
    gr. query () ; while (gr. next ( ) ) {
        count = count + 1 ;
        gr. setValue ( 'write_roles' , 'admin' ) ;
        gr. update ( ) ;
        gs. print ( "UPDATED ROLE # " + count ) ;
    }
}
```

Make a page public

Administrators can make pages public.

Role required: admin

⚠️ Warning: Several base-system public pages are required for the functionality of many features. Do not disable base-system public pages.

**Note:** Most pages are only viewable by logged in users. A limited number of pages are public so that users do not have to log in to view them, such as the welcome page, the front page, and the login and logout pages.

1. Navigate to **System Definition > Public Pages**.
2. Click **New**.
3. Specify the name of the page and click **Save**.

Make a public page private

Administrators can remove pages from public view.

Role required: admin

⚠️ Warning: Several base-system public pages are required for the functionality of many features. Do not disable base-system public pages.
1. Navigate to System Definition > Public Pages.
2. Locate the page name on the list.
3. Set the Active value to false. Users must now log in to access the page.

Activate the public pages module

The Public Pages module can be activated in the System Definition application.
Role required: admin

Warning: Several base-system public pages are required for the functionality of many features. Do not disable base-system public pages.

Note: Most pages are only viewable by logged in users. A limited number of pages are public so that users do not have to log in to view them, such as the welcome page, the front page, and the login and logout pages.

If the application menu does not show the Public Pages module in the System Definition application, you must activate it.

1. Navigate to System Definition > Application Menus.
2. Open the System Definition record.
3. In the Modules related list, click Public Pages.
4. In the Visibility section, click Active.
5. Click Update.

Login security

Login security refers to the security settings you can configure to control access to your instance.

Specify a login landing page

By default, users see their homepage upon login. You can specify a different login landing page by using a system property or the content management system.
Role required: admin

To specify a login landing page for all users, change the property value on the sys_properties table.

1. Type sys_properties.list in the navigation filter.
2. Locate the glide.login.home system property.
3. In the Value field, enter the name of the page that all users will see upon login.

Use <page name>.do; you may omit the http://''instance''.service-now.com/ portion of the URL. To determine the page name or the URL of a page in the system, you can point to a link. Some possible pages are welcome.do and incident.do.

Note: This property is system-wide, so setting it affects all users.
Enable the logout confirmation prompt

You can enable a logout confirmation prompt to prevent users from inadvertently logging themselves out.

Role required: admin

**Note:** The following procedure does not work in UI16.

1. Navigate to **System Properties > System**.
2. Locate the **Prompt user to confirm a logout request** property and select the check box.
3. When the user clicks the **Logout** button, a confirmation dialog box displays.

![Confirmation dialog box](image)

Remove the Logout button

You can remove the **Logout** button to prevent inadvertent logouts.

Role required: admin

**Note:** The following procedure does not work in UI16.

1. Navigate to **User Administration > User Preferences**.
2. Delete the system preference user.can.logout.

IP range based authentication

One way to secure a web-based application is to restrict access based on the IP address.

You can block access to a specific address or range of addresses that you suspect belong to malicious individuals. The instance allows you to control access by IP address.

Notes and Limitations:

- The system won't let you lock yourself out, so if you try to add a rule such that your current address would be locked out, the system will warn you and refuse your insert.
- If you're inside of a corporate intranet, be very careful about setting up your IP rules. The IP address you see on your own computer (like 10.10.10.25) generally bears no relationship to the IP address you'll actually appear as out on the internet. Your company will likely proxy and/or NAT your address into a predictable set of outbound addresses which you'll likely need to ask your network team about.
- A user whose access is restricted based on an access rule will get a 403 error on their browser.
- Restricted users don't use transactions, semaphores or count towards any server resource counts.
• This feature doesn't supersede or override your existing access control rules if, for example, you're running a VPN to our data center. It's an additional check that must be met in addition to any access controls we may have set up on your PIX.
• Allow rules always supersede deny rules. So if my address is both allowed (by one rule) and denied (by a second rule) it is, in fact, allowed.
• Asterisks and CIDR blocks are not currently supported.
• Regarding forwarded proxy addresses, the allow rules are applied to each address in the chain and then the deny rules are applied to each address in the chain if none of the allow rules matched.

Access control

By default the list is empty, meaning that there are no particular restrictions on access to your instance.

Role required: admin

Navigate to System Security > IP Address Access Control to see a list of your IP access controls. You may need to activate this module.

You can add these types of rules:
• Allow: any IP address in this range is allowed to connect to this instance.
• Deny: any IP address in this range is not allowed to connect to this instance unless it is listed in an allow rule.

Note: These rules also affect transferring update sets. To ensure that IP Address Access Control does not cause update sets to fail, add the target instance as an exception on the source instance.

Example 1: Block a particular range

An example of how to block a particular range.

Let's say we want to block a particular range of IPs, say 64.236.16.0 -> 64.236.16.255. Click "new" to add a new rule. Then fill it in as follows. Range Start and Range End must be specific IP addresses as seen in the examples, without asterisks or CIDR blocks.

![Access Control](image)

**Figure 690: Deny range**

Example 2: Block everyone except a particular range

An example of how to block everyone except a particular range.

Let's turn the problem around. So if an address is between 64.236.16.0 -> 64.236.16.255 we want to allow it connect, but we want to deny everybody else. To do this we're going to need two rules, one to allow that range, and a second to deny everybody else.

Click **New** and add a new rule. Then fill it in as follows.
Now let's add the deny rule.

Find denied IP addresses

Denied IP addresses are by default not viewable from the system logs. However, you can still find them in the instance's node log files.

Role required: admin

Log entries for blocked IP address appear as follows:

2. Browse the logs by criteria, such as time period and message.
3. You can also download log files when you know which log you are looking for, by navigating to System Logs > Utilities > Node Log File Download.

Implementing a nonce

You can implement a nonce to be used with single sign-on digest authentication.

To use a nonce with the unencrypted token or encrypted token methods of single sign on, the steps in this article will still apply with only a few minor changes.

Note: The nonce is used only for login requests, not for any other type of request. If the system receives a nonce value after login, the nonce is not consumed.
Benefits

The usage of a nonce prohibits a malicious user from performing a replay attack in order to log into your system.

Nonce process flow

When a customer has implemented the digested token Single Sign-on and wishes to add the security of a nonce, they follow a certain process flow.

1. A user logs into the customer's portal.
2. The customer generates the required SSO parameters and appends a random nonce to the end. For example, if the customer were forwarding the authentication response via the query string, it may look something like this:

   \[\text{SM\_USER=itil}\&\text{DE\_USER=V1QuWMmxSfBgfRS099X0cAjo5Q}\&\text{NONCE=1407743018}\]

The instance receives this request and retrieves the authentication variables. Before attempting to verify the integrity of the authentication response, the instance checks the nonce against an internal table (u_authentication_nonce) to verify that it does not yet exist. If the nonce does not exist within that table, the nonce is then added to the table and the authentication process is allowed to continue. However, if that nonce value already exists within the table, the authentication attempt is cancelled and an error code of failed_missing_requirement is returned, which will typically take the user back to the login page.

Implement a nonce

Implementing a nonce is fairly straightforward when these steps are followed:

- Create a system property called glide.authenticate.header.nonce_key and set its value to whatever variable name you're using for the nonce, such as NONCE or NCE.
- Create a new table called u_authentication_nonce. Add a field to the table called u_nonce.
- Go to System Properties > Installation Exits and create a new item called DigestSingleSignOnNonce which overrides ExternalAuthentication (see image below).

![Installation Exit](image)

- Add the following code to the script portion of the newly created DigestSingleSignOnNonce.

    ```javascript
    gs.include("PrototypeServer");
    ```
var DigestSingleSignOnNonce = Class.create();

DigestSingleSignOnNonce.prototype = {

  process : function() {

    var headerKey = GlideProperties.get("glide.authenticate.header.key", "SM_USER");
    var headerDigestKey = GlideProperties.get("glide.authenticate.header.encrypted_key", "DIGEST");
    var headerNonceKey = GlideProperties.get("glide.authenticate.header.nonce_key", "NCE");
    var fieldName = GlideProperties.get("glide.authenticate.header.value", "user_name");
    var fkey = GlideProperties.get("glide.authenticate.secret_key");

    // Look in the Headers
    var data = request.getHeader(headerKey);
    var encdata = request.getHeader(headerDigestKey);
    var nonce = request.getHeader(headerNonceKey);

    // If not, then check the URL Parameters
    if (data == null || encdata == null || nonce == null) {
      data = request.getParameter(headerKey);
      encdata = request.getParameter(headerDigestKey);
      nonce = request.getParameter(headerNonceKey);
    }

    // then maybe its a cookie
    if (data == null || encdata == null || nonce == null) {
      var cookies = request.getCookies();
      data = GlideCookieMan.getCookieValue(cookies, headerKey);
      encdata = GlideCookieMan.getCookieValue(cookies, headerDigestKey);
      nonce = GlideCookieMan.getCookieValue(cookies, headerNonceKey);
    }

    // if found run encryption
    if (data != null && encdata != null && nonce != null) {
      try {

        // Replace all spaces with plus(+)’s, converted in url
        encdata = encdata.replaceAll(' ', '+');

        // ----- Encrypt the username|nonce
        var key = this.getDigest(data + '|' + nonce, fkey);

        // Check for match of received encoded data
        // and your encoding of user name
        if (encdata == key) {
          var ugr = new GlideRecord("sys_user");
          ugr.initialize();
          if (!ugr.isValidField(fieldName)) {
            GlideLog.warn("External authorization is set to use field: ‘" + fieldName + "’ which doesn't exist");
            return "failed_missing_requirement";
          }
          ugr.addQuery(fieldName, data);
          ugr.query();
          if (!ugr.next()) {
            var userLoad = GlideUser.getUser(data);
            if (userLoad == null)
              return "failed_authentication";
          }
          ugr.initialize();
          ugr.addQuery(fieldName, data);

      } catch (e) {
        return "failed_encryption";
      }
    }
  }
}
ugr.query();
    if (!ugr.next())
        return "failed_authentication";
    }
    if (this.processNonce(nonce)){
        var userName = ugr.getValue("user_name");
        return userName;
    }
    else return "failed_missing_requirement";
    }
    else {
    return "failed_authentication";
    }
    }
    catch(e) {
    gs.log(e);
    return "failed_authentication";
    }
    // Encoded data didn't match recieved Encoded data
    }
    else {
    return "failed_missing_requirement";
    }
    }

    getDigest : function( data, fkey ) {
    try {
    // default to something JDK 1.4 has
    var MAC_ALG = "HmacSHA1";
    return SncAuthentication.encode(data, fkey, MAC_ALG);
    } catch (e) {
    gs.log(e.toString());
    throw 'failed_missing_requirement';
    }
    },

    processNonce : function( sentNonce ) {
    var ngr = new GlideRecord("u_authentication_nonce");
    ngr.addQuery("u_nonce", sentNonce);
    ngr.query();
    if (ngr.next()) {
    gs.log("This SSO entry has already been processed! (Nonce: " +
    sentNonce + ")");
    return false;
    }
    var ngrNew = new GlideRecord("u_authentication_nonce");
    ngrNew.initialize();
    ngrNew.u_nonce = sentNonce;
    ngrNew.insert();
    gs.log("Inserted new nonce: " + sentNonce);
    return true;
    };

    • Once you’ve saved your new installation exit, go to the DigestSingleSignOn installation exit and make
    sure that it is set Active=false.

    Your instance should now be configured to implement a nonce.
Installation exits

Installation exits are customizations that exit from Java to call a script before returning back to Java.

Note: Functionality described here requires the Admin role.

Available installation exits

Navigate to System Definition > Installation Exits. Some installation exit names (Login, Logout, ValidatePassword, ExternalAuthentication) are reserved and cannot be changed. Other installation exits can override these with custom script that replaces the script in the default installation exit.

The following installation exits are available in the base system:

<table>
<thead>
<tr>
<th>Installation Exit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login</td>
<td>Takes a username and password pair and authenticates with the user object</td>
</tr>
<tr>
<td>Logout</td>
<td>Takes the user to the welcome page upon signing out; can be overridden by LogoutRedirect</td>
</tr>
<tr>
<td>LogoutRedirect</td>
<td>Takes the user to a specified URL upon signing out</td>
</tr>
<tr>
<td>ExternalAuthentication</td>
<td>Authenticates using header, parameter, or cookie; can be overridden by DigestSingleSignOn and PGPSingleSignOn</td>
</tr>
<tr>
<td>DigestSingleSignOn</td>
<td>Authenticates using header, parameter, or cookie and decrypts Digest encryption</td>
</tr>
<tr>
<td>PGPSingleSignOn</td>
<td>Authenticates using header, parameter, or cookie and decrypts PGP encryption</td>
</tr>
<tr>
<td>ValidatePassword</td>
<td>Inactive by default; allows customers to define their own password validation; can be overridden by ValidatePasswordStronger</td>
</tr>
<tr>
<td>ValidatePasswordStronger</td>
<td>Requires passwords be at least 8 characters long and contain a digit, an uppercase letter, and a lowercase letter</td>
</tr>
</tbody>
</table>

Login modifications

The following modification to the Login installation exit sets each user’s session timeout value as the user is logging in. In this particular example, if the user name is admin, the session is set to timeout in 30 seconds.

gs.include("PrototypeServer");
var Login = Class.create();
Login.prototype = {
    initialize : function() {
    },
}
process : function() {
    // the request is passed in as a global
    var userName = request.getParameter("user_name");
    var userPassword = request.getParameter("user_password");

    var authed = GlideUser.authenticate(userName, userPassword);
    if (authed) {
        // *********************************************************
        // customization - if the userName == admin, set the session
        // timeout to be 30 seconds. You can implement your own
        // session timeout algorithm here by checking to see if a user
        // belongs to a certain group or has a certain role.

        if (userName == "admin") {
            request.getSession().setMaxInactiveInterval(30);
        }
        // *********************************************************

        return GlideUser.getUser(userName);
    }

    this.loginFailed();
    return "login.failed";
},

loginFailed : function() {
    var message = GlideSysMessage.format("login_invalid");
    var gSession = GlideSession.get();
    gSession.addErrorMessage(message);
    var userName = request.getParameter("user_name");
    EventManager.queue("login.failed", ",", userName, ",");
}
}

Session timeout can also be set according to IP address.

gs.include("PrototypeServer");

var Login = Class.create();
Login.prototype = {
    initialize : function() {
    },

    process : function() {
        // the request is passed in as a global
        var userName = request.getParameter("user_name");
        var userPassword = request.getParameter("user_password");

        var authed = GlideUser.authenticate(userName, userPassword);
        if (authed) {

            // customization - if the user is logging in from a particular IP
            // range starting with XXX.XXX you can implement your own
            // session timeout algorithm here by checking the login IP

            var clientIP = gs.getSession().getClientIP().toString();
            // ...
        }
    }
}
// if client IP starts with specified range
if (clientIP.indexOf('XXX.XXX') == 0) {
    // set to 10 hours
    request.getSession().setMaxInactiveInterval(60 * 60 * 10);
}
// ***************************************************************
return GlideUser.getUser(userName);
}

this.loginFailed();

return "login.failed";
);

loginFailed : function() {
    var message = GlideSysMessage.format("login_invalid");
    var gSession = GlideSession.get();
    gSession.addErrorMessage(message);

    var userName = request.getParameter("user_name");
    EventManager.queue("login.failed", "", userName, "");

}

Strengthening password validation rules

You can customize password strength validation rules for the change password screen by overriding the installation exit associated with password validation.

1. Navigate to **System Definition > Installation Exits**.
2. Locate **ValidatePassword** and **ValidatePasswordStronger**. Both of these are inactive.
3. The **ValidatePasswordStronger** script (below) is a sample script that overrides the **ValidatePassword** script by using regular expressions to require that passwords be a minimum of 8 characters long, contain a numeric digit, and contain mixed-case letters.

```javascript
gs.include("PrototypeServer");
var ValidatePasswordStronger = Class.create();
ValidatePasswordStronger.prototype = {
    process : function() {
        var user_password = request.getParameter("user_password");
        var min_len = 8;
        var rules = "Password must be at least " + min_len + " characters long and contain a digit, an uppercase letter, and a lowercase letter.";
        if (user_password.length() < min_len) {
            gs.addErrorMessage("TOO SHORT: " + rules);
            return false;
        }
        var digit_pattern = new RegExp("[0-9]", "g");
        if (!digit_pattern.test(user_password)) {
            gs.addErrorMessage("DIGIT MISSING: " + rules);
            return false;
        }
        var upper_pattern = new RegExp("[A-Z]", "g");
        if (!upper_pattern.test(user_password)) {
            gs.addErrorMessage("UPPERCASE MISSING: " + rules);
            return false;
        }
        var lower_pattern = new RegExp("[a-z]", "g");
```

© 2017 ServiceNow. All rights reserved. 2487
The script variable created by `Class.create()` must have the same name as the installation exit itself – "ValidatePasswordStronger" in this example. The script implements the `process()` function which returns true if the password is acceptable and false if the password must be revised. The `gs.addErrorMessage` function can be used to return error messages on the change password screen. You can try this Installation Exit in your instance by checking the active flag and updating the record. Be sure and clear the cache after doing this so the change is recognized.

Also, keep in mind that modifying these scripts will not change the default ServiceNow behavior: Blank passwords are still prohibited by default and the password and verify password fields must match.

To test, check the **Password needs reset** box on a user record then login with that user. Validation will occur at the point that the user attempts to set the password. Validation does not apply when an admin user updates the password in the user record directly (the admin can put anything in the password field).

---

**Note:** The change password screen only applies to customers who do not use single sign on and are not integrated with their local LDAP.

---

### Login scenarios

Describes different login scenarios.

**Role required:** admin

When users log on to an instance directly, such as going to `http://{instance_name}.service-now.com/`, the system does the following:

1. Accesses the value in the property `glide.entry.page.script`. The default value of the property is derived from a script include named `CMSEntryPage`.
2. Directs the user to the instance login page if the entry page requires a login.
3. Applies login rules, if any, to the user.

To force the system to direct all users to the same page after login:

1. Navigate to **Content Management > Configuration > Configuration Page**.
2. Select a value for the Login page field, or create a new page as desired. If this page is not the site default page, it always redirects here. If it is a site default page, it applies login rules. If this value is null, the system uses `navpage.do` as the entry page. Do not enter a login page here; otherwise, users will need to log in twice.

**Logging Into an Instance to Access a Record:**

When users log into an instance to access a record by its globally unique identifier (sys_id), such as `http://{instance}.service-now.com/incident.do?sys_id={sys_id}`, then the system does the following:

1. Directs the user to a login page if not already logged in.
2. Directs the user to the appropriate record if they are allowed to access it. If the user does not have access rights to the record, a denial of access message appears.

**Logging Into a CMS Site:**
When users log on to a CMS site, such as http://<instance>.service-now.com/site-name/page.do, the system does the following:

- If there is a value in the Login page field on the CMS site form, it directs the user to that login page and applies login rules, if any, to the user.
- If there is no login page specified, it directs the user to the value in the Home page field on the CMS site form.

Logging Into a CMS Site to Access a Record:

When users log on to a CMS site to access a record, such as http://{instance}.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,{sys_id}, the system follows the same procedure and finally takes the user to the record. If the user does not have access rights to the record, a denial of access message appears.

Logins and the employee self-service portal

The system keeps track of the first starting page that a user is trying to access even if the user wants to log in to the Employee Self-Service Portal.

Consider the following scenarios.

Example 1:
1. A user is not logged in, and then tries to access a record using a specific SYS ID in the URL.
2. The system redirects the user to the login page.
3. Rather than logging in, the user tries to access another site, such as the Employee Self-Service (/ess) Portal.
4. The system redirects the user to the login page again.
5. The user logs in and is redirected to the record that the user was first trying to access rather than the Employee Self-Service Portal.

Example 2:
1. A user is not logged in, and then tries to access a record using a specific SYS ID in the URL through the Employee Self-Service (/ess) Portal.
2. The system redirects the user to the login page.
3. Rather than logging in, the user tries to access another record through the Employee Self-Service Portal.
4. The system redirects the user to the login page again.
5. The user logs in and is redirected to the first record rather than the second.

Failed login attempts

Two inactive script actions are provided that allow a site to manage the number of times a user can fail to provide the correct password before getting locked out of the system.

From the left navigation pane, select System Policy > Script Actions to see/activate these script actions.

- SNC User Clear - updates the user record upon a successful login, resetting the number of failed attempts and updating the date of the last login
- SNC User Lockout Check - keeps track of the number of failed login attempts and will lock the user out after 5 failed attempts (change the number as desired)
Failed login attempts log

Attempts to log in are captured in event logs, and you can view the failed login attempts.

To view event logs, navigate to **System Policy** → **Event Logs**. You can filter for `login.failed` in the name field, and view the attempted login name, date, and IP address logged from the attempt.

![Failed login log](image)

**Figure 694: Failed login log**

Change settings for the Remember Me checkbox and cookie

When the **Remember me** check box is selected at login, a cookie is stored on the user's computer. This cookie automatically authenticates the user upon subsequent visits.

If the user logs out, the cookie is destroyed. The default value of the **Remember me** check box is controlled by one property, and whether or not the check box appears on the login page is controlled by a different property.

Change the default value of the Remember Me check box

You can change the default value of the **Remember Me** check box.

**Role required: admin**

1. Navigate to **System Properties** → **UI Properties**.
2. Locate the Default value of "Remember me" checkbox on login page property (glide.ui.remember.me.default).
3. To set the default value of the **Remember me** check box to No, clear the property check box.
4. To restore the default value of the **Remember me** check box to Yes, select the property check box.

Remove the Remember Me check box

You can remove the **Remember Me** check box so users do not have access to this feature.
Role required: security_admin

1. Click the lock icon (🔒) by the user name and activate elevated privileges for the security_admin role.

3. Locate the Remove "Remember me" checkbox from login page property (glide.ui.forgetme).

4. Select the property check box.
   This setting removes the Remember me check box, invalidates existing cookies, and disables Remember me functionality entirely.

5. To restore the Remember me check box to the login page, clear the property check box.

Self service password reset

The Self Service Password Reset plugin enables end users who are locally authenticated to reset their own passwords.

By default there is a new message and link on the login page to access the reset page. Users are prompted for their username and email address. If the system locates an active record, it generates a temporary password and sends an email to the user with the details. Users who reset their passwords receive a message with the results of the reset request.

Note: This feature works only for locally authenticated users. Users logging in via an SSO solution or an LDAP integration cannot reset their passwords in this fashion since the instance does not know these passwords.

The following functionality is updated with the installation of the Self Service Password Reset plugin:

- **Script include**
  PasswordResetAJAX - AJAX Script to process a password reset from a UI Page as guest. You can customize it to perform different user validation logic.

- **UI page**
  reset_password - Page to prompt for password reset information.

- **Event**
  password.reset - Event fired by PasswordResetAJAX script include to trigger the Password Reset Notification.

- **Email notification**
  Email sent to the user notifying the user of the reset and their temporary password.

- **Welcome page content**
  Message on the welcome page to link users to the password reset page.

- **Public page**
  Enabled the reset_password UI Page to be viewed by guests.

The components are fully customizable to meet individual needs:

- Password reset message in the login screen
- Contents of the Reset My Password form
- Password reset validation and processing
- Subject line and message in the email notification
Resetting a password

The Self Service Password Reset plugin creates a link on the login page that invites users who have forgotten their credentials to reset their password.

The user clicks the link on the login page to begin the password reset process.

- **Forgot your login credentials?**
- **If you cannot remember your login credentials, you can reset your password here.**

Figure 695: Password reset link on login page

The link from the login page opens the Reset My Password form.

- **Reset My Password**
- **Enter your User Name:**
- **Enter your Email Address:**

![Reset Password button](image)

- **Click here to return to the login page**

Figure 696: Password reset form

After the user completes the form and clicks **Reset Password**, the user_id and email address are validated. If they match, a temporary password is generated for that user and notification is sent to the email address.

Figure 697: Example of the out-of-box notification
Hello Steve,

A password reset was requested for your user account on the following Service-now.com system. [https://demosw.service-now.com/](https://demosw.service-now.com/)
The password has been reset and you can now log in with the following credentials:

User ID: sward
Password: KTpKvsvo

If you did not request this password reset, please let us know.

Best Regards,
Customer Support

Ref: MSG000033

The user logs in to the instance using the temporary password. The user is required to create a new, permanent password before continuing.

Figure 698: Change temporary password page

When the user clicks **Submit**, a session is established.

Add a password reset message

Add a custom message to a password reset screen to give users additional information or instructions.
Role required: admin

For example, security policies change and everyone is flagged for a password reset so they must create a new password following stronger rules. A user attempts to login, receives a message stating their
password must be changed, and is taken to a new page. You can add a custom message on the new
page.

1. Navigate to System UI > Messages.
2. For the Invalid Password, find the key login_invalid and update the message field.
3. For the Enter New Password, find the key System administrator requires you to change your
password and update the message field. (If that key is not available, create the key with Key =
System administrator requires you to change your password.)

ServiceNow access control

This SNC Access Control plugin (com.snc.snc_access_control) enables customers to control which
ServiceNow employees may access their instance, and when.

When the plugin is first activated, ServiceNow employees cannot log into the customer's instance. Any
currently logged-in ServiceNow employees remain logged in. The customer creates records in the SNC
Access Control table that grant access to specific SNC employees or all employees.

Login security

Security for authorized ServiceNow employee logins to customer instances employs encrypted tokens
generated by a secure server. Only properly authenticated ServiceNow employees are granted access
to a customer instances. Without the SNC Access Control plugin, the security server ensures that access
rights are enforced on hi.service-now.com. When the plugin is enabled, the encrypted login tokens must
match names in the plugin-provided access list, using the criteria defined in those records. This method of
authentication enables our customers to determine precisely which ServiceNow employees may access
their instances, and when these employees may do so.

The architecture chosen for this system has several features designed to enhance security for our
customer's instances:

- **Security server:** The security server is a locked-down, Linux host that can only be accessed by
  ServiceNow security personnel. This server is the only system that has access to the critical private
  encryption key necessary to produce the login tokens. By using this compartmentalization (a standard
  security practice), the private key is protected, even in the unlikely event that the HI instance is
  compromised by an attacker.

- **Synthetic users:** The facility on customer instances that enables authorized ServiceNow employees to
  log into their instance does not require an account to be provisioned on that instance. There is no user
  record provisioned, and no permanent or persisted credentials. Instead, a synthetic user is created for
  each ServiceNow employee logon. This user exists only in memory and provides no ongoing privileges.
  ServiceNow can deauthorize any ServiceNow employee at any time, and if the SNC Access Control
  plugin is enabled, our customers can also deauthorize any ServiceNow employee at any time.

- **Tokens:** The security tokens are specific to a customer instance and a particular ServiceNow
  employee. In addition, the mechanism that generates the tokens only works with actual ServiceNow
  employee logins to HI, not impersonated users. Once a security token is generated, it may only be used
  by a specific ServiceNow employee to log into a particular customer instance.

- **Time limit:** Security tokens expire four hours after they are generated. This limits the utility of hijacked
  tokens, which can only be used during this short window.

- **Logging:** Logins by ServiceNow employees to customer instances are recorded as a login event,
  and every action taken by the logged-in ServiceNow employee is added to both the transaction log
  (in the database) and the instance log (on the file system, which is inaccessible to most ServiceNow
  employees). ServiceNow employee logins and actions are readily identifiable, since the user names
  all end in @snc (like frodo.baggins@snc). This provides our customers with easy-to-use, robust, and
  reliable security logging for non-employee access.
When a ServiceNow employee wants to log into a customer instance, the security processing flow is as follows:

1. A ServiceNow Support technician requests a login for the customer's instance through hi.service-now.com.
2. HI checks that the technician has the proper role authorizing access to customer instances.
3. If the user has the proper role, HI sends the request for access to the Security Server.
4. The Security Server verifies that the request came from HI's IP address, and evaluates the request (user, role, and IP address of the requestor). If the request is valid, the Security Server approves it and constructs a token. This token contains the user name, roles on the customer instance, the instance ID, and the time (the start of the 4 hour token life span). Finally, the Security Server encrypts the token with the private encryption key.
5. The Security Server sends the encrypted token to HI.
6. HI sends the token to the Support technician's browser.
7. The Support technician's browser initiates a login into the customers instance, using the special user name ending with @snc.
8. The customer's instance uses the public key to decrypt the token. To verify the token, the instance matches it to the user name supplied in the previous step, the instance ID, and the authorized time window. If the SNC Access Control plugin is enabled, the instance verifies that the user is:
   - Listed
   - Active
   - Configured to access the instance in the current time window
9. If the user is authenticated, the customer instance creates a synthetic user in memory with the given roles. This user does not persist after the time limit expires, the user logs off, or the instance is restarted.
Audit logging

The following logging tracks logins and activity by ServiceNow employees:

- **Event logs:** The event logs show all ServiceNow logins to a customer instance.
- **Transaction logs:** The transaction logs show all activity on the instance, including any efforts to delete logs.

Request ServiceNow access control

Customers must request the SNC Access Control plugin (com.snc.snc_access_control) from HI.

Role required: admin

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

**Configure ServiceNow access control**

Configure an access control record to specify one or more ServiceNow employees who have permission to log into your instance.

Role required: admin

1. Navigate to **System Security > SNC Access Control**.
2. Click **New**.
3. Fill in the form fields (see table).
4. Click **Submit**.

**Table 580: SNC Access Control form fields**

<table>
<thead>
<tr>
<th>Form fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Names one or more ServiceNow employees who have permission to log into this instance. The names must have user records in <strong>hi.servicenow.com</strong> and are expressed as first name/last name in lower case letters separated by a dot. If this field contains an asterisk (*) anywhere within it, then all ServiceNow employees with customer logon rights are given access rights by this record. Otherwise, this field is treated as a comma-separated list of ServiceNow user names. For example, if this field contains <strong>beth.anglin,don.goodliffe,gregg.guevarra</strong>, then this record grants login permission to Beth Anglin, Don Goodliffe, and Gregg Guevarra. This is a mandatory field.</td>
</tr>
</tbody>
</table>
Form fields | Description
--- | ---
Reason | Human-readable field that describes why permission is being granted. This field is optional.
Start | Specifies the start date and time of the period during which the specified ServiceNow employees have login access. This field is mandatory.
End | Specifies the ending date and time of the period during which the specified ServiceNow employees have login access. This field is mandatory.
Active | Controls whether this permission record is active. The default is active.

Audit logging
The following logging tracks logins and activity by ServiceNow employees.

| Event logs | The event logs show all ServiceNow logins to a customer instance. |
| Transaction logs | The transaction logs show all activity on the instance, including any efforts to delete logs. |

Access control rules
Access control rules, also known as access control lists (ACL) or access controls, restrict access to data by requiring users to pass a set of requirements before they can interact with it.

All access control rules specify:
- The object and operation being secured
- The permissions required to access the object

Objects
Each object consists of a type and name that uniquely identifies a particular table, field, or record. For example, all these entries specify an object.

Table 581: Sample access control objects

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Object secured</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>[incident],[-- None --]</td>
<td>The Incident table.</td>
</tr>
<tr>
<td>record</td>
<td>[incident],[active]</td>
<td>The Active field in the Incident table.</td>
</tr>
</tbody>
</table>
### Operations

Each operation describes a valid action the system can take on the specified object. Some objects such as records support multiple operations, while other objects such as a REST_Endpoint only support one operation. For example, all these entries specify an operation.

#### Table 582: Sample access control operations

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Operation</th>
<th>Operation secured</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>[incident].[-- None --]</td>
<td>create</td>
<td>Creating records in the Incident table.</td>
</tr>
<tr>
<td>record</td>
<td>[incident].[active]</td>
<td>write</td>
<td>Updating the Active field in the Incident table.</td>
</tr>
<tr>
<td>REST_Endpoint</td>
<td>user_role_inheritance</td>
<td>execute</td>
<td>Running the user_role_inheritance Scripted REST API.</td>
</tr>
</tbody>
</table>

### Permissions

The permissions specify when someone can access the named object and operation. Security administrators can specify permission requirements by adding:

- One or more user roles to the Requires role list.
- One or more conditions.
- A script that evaluates to true or false or sets the answer variable to true or false.

To gain access to an object and operation, a user must pass all permissions listed in an access control. For example, this access control restricts access to write operations on the incident table.
### Access Control Incident

<table>
<thead>
<tr>
<th>Type</th>
<th>Application</th>
<th>Active</th>
<th>Advanced</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>Global</td>
<td></td>
<td></td>
</tr>
<tr>
<td>write</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Definition**

Access Control Rules allow access to the specified resource if all three of these checks evaluate to true:

1. The user has one of the roles specified in the Role list, or the list is empty.
2. Conditions in the Condition field evaluate to true, or conditions are empty.
3. The script in the Script field (advanced) evaluates to true, or sets the variable “answer” to true, or is empty.

The three checks are evaluated independently in the order displayed above.

**More Info**

<table>
<thead>
<tr>
<th>Requires role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Condition**

30 records match condition

<table>
<thead>
<tr>
<th>Add Filter Condition</th>
<th>Add &quot;OR&quot; Clause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident state</td>
<td>is not Closed</td>
</tr>
</tbody>
</table>

**Update**  **Delete**
To update a record in the incident table, a user must have the listed role and the record must meet the condition.

Table 583: Permissions required to write to the incident table

<table>
<thead>
<tr>
<th>Permission type</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires role</td>
<td>Requires role: itil</td>
<td>Only allow users with the itil role to update incidents.</td>
</tr>
<tr>
<td>Condition</td>
<td>[Incident state] [is not] [Closed]</td>
<td>Only allow updates to active incident records.</td>
</tr>
</tbody>
</table>

Granting or denying access

The system evaluates access controls using this process.

Figure 701: Process to grant or deny access
Whenever a session requests data, the system searches for access control rules that match the requested object and operation. If there is a matching access control rule, then the system evaluates if the user has the permissions required to access the object and operation. If an access control rule specifies more than one permission, then the user must meet all permissions to gain access to the object and operation. Failing any one permission check prevents the user from accessing the matching object and operation.

If a user does not meet the permissions of the first matching rule, the system evaluates the permissions of the next matching access control rule as specified by the access control processing order. If the user fails to meet the permissions of any matching access control rule, the system denies access to the requested object and operation.

Note: If there are no matching access control rules for the requested object and operation, then the system grants the user access to it. In practice, it is rare for the system to find no matching rules because the system has a set of default access control rules that protect all record operations.

Roles

Normal admin users can view and debug access control rules. However, to create or update existing access control rules, administrators must elevate privileges to the security_admin role.

Process order for record ACL rules

Record ACL rules are processed in a certain order.

Record ACL rules are processed in the following order:

• Match the object against field ACL rules.
• Match the object against table ACL rules.

This processing order ensures that users gain access to more specific objects before gaining access to less specific ones.

A user must pass both field and table ACL rules in order to access a record object.

• If a user fails a field ACL rule but passes a table ACL rule, the user is denied access to the field described by the field ACL rule.
• If a user fails a table ACL rule, the user is denied access to all fields in the table even if the user previously passed a field ACL rule.
Figure 702: ACL matching

Start

User requests access to a record object

Find ACL rules matching object

Find first matching FIELD ACL Rule

1. ACL name matches table.field?
2. ACL name matches parent table.field?
3. ACL name matches *.field?
4. ACL name matches table.*?
5. ACL name matches parent table.*?
6. ACL name matches *.*?

No matches

Match found

Evaluate ACL Permissions

Pass

Find first matching TABLE ACL Rule

1. ACL name matches table?
2. ACL name matches parent table?
3. ACL name matches *?

No matches

Match found

Evaluate ACL Permissions

Pass

Grant user access to the record object

Fail

Deny user access to the record object

End
Processor ACL rules

ACL rules can secure access to the execute operation of all or specific processors.

Processor ACL rules specify the processor you want to secure. Use the asterisk character as a wildcard to search for any processor. For a list of available processors, navigate to System Definition > Processors.

By default, an ACL rule for the EmailClientProcessor is included to restrict the email client to users with the itil role.

Field ACL rules

Field ACL rules are processed in a certain order.

Field ACL rules are processed in the following order:

1. Match the table and field name. For example, incident.number.
2. Match the parent table and field name. For example, task.number.
3. Match any table (wildcard) and field name. For example, *.number.
4. Match the table and any field (wildcard). For example, incident.*.
5. Match the parent table and any field (wildcard). For example, task.*.
6. Match any table (wildcard) and any field (wildcard). For example, *.*.

The first successful evaluation stops ACL rule processing at the field level. This means that when a user passes a field ACL rule, the system stops searching for matching field ACL rules. The user must also pass the table ACL rules to be granted access to the record object. For example, if a user passes the field ACL rule for incident.number, the system stops searching for rules that secure the Number field. The user must then pass the table ACL rules on incident to see the Number field.

Record ACL rules

Record ACL rules consist of table and field names.

- Table name: the table being secured. If other tables extend from this table, then the table is considered a parent table. ACL rules for parent tables apply to any table that extends the parent table.
- Field name: the field being secured. Some fields are part of multiple tables because of table extension. ACL rules for fields in a parent table apply to any table that extends the parent table.

ACL rules can secure the following record operations:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execute</td>
<td>Allows users to run an application or script.</td>
</tr>
<tr>
<td>create</td>
<td>Allows users to insert new records (rows) into a table.</td>
</tr>
<tr>
<td>read</td>
<td>Allows users to display records from a table.</td>
</tr>
<tr>
<td>write</td>
<td>Allows users to update records in a table.</td>
</tr>
<tr>
<td>delete</td>
<td>Allows users to remove records from a table or drop a table.</td>
</tr>
<tr>
<td>edit_task_relations</td>
<td>Allows users to extend the Task table.</td>
</tr>
<tr>
<td>Operation</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>edit_ci_relations</td>
<td>Allows users to extend the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>save_as_template</td>
<td>Allows users to save a record as a template.</td>
</tr>
<tr>
<td>add_to_list</td>
<td>Allows users to insert records (rows) into a table from a list.</td>
</tr>
<tr>
<td>list_edit</td>
<td>Allows users to update records (rows) from a list.</td>
</tr>
<tr>
<td>report_on</td>
<td>Allows users to create reports on tables. This operation is not valid for field ACL rules.</td>
</tr>
<tr>
<td>personalize_choices</td>
<td>Allows users to configure the table or field.</td>
</tr>
</tbody>
</table>

Table ACL rules

In most cases there is not an individual field ACL rule for every field in the table the users is trying to access.

If no field ACL rule matches the record object, the user must pass the table ACL rule. Since the base system includes wildcard table ACL rules that match every table, the user must always pass at least one table ACL rule. The base system provides additional table ACL rules to control access to specific tables.

Table ACL rules are processed in the following order:
1. Match the table name. For example, incident.
2. Match the parent table name. For example, task.
3. Match any table name (wildcard). For example, *.

Just like with field ACL rules, the system grants the user access to the record object secured by the ACL rule and stops searching for matching ACL rules the first time a user passes a table ACL rule's permissions. A user who passes the table ACL rule for incident has access to all fields in the Incident table. A user who passes the table ACL rule for task has access to all fields in the Task table as well as the fields in extended tables. A user who passes the table ACL rule for any table has access to all fields in all tables.

UI page ACL rules

UI page ACL rules specify the UI page to be secured.

For a list of available UI pages, navigate to System UI > UI Pages. When defining an ACL rule for a UI page, use the fully scoped page name. For example, x_myapp_mypage.

**Note:** Starting with the Geneva release, you can use the wildcard * character in the Name field on ui_page type ACLs to match any UI pages. Prior to Geneva, the wildcard character was not supported for UI page ACLs.

ACL rules can secure the following UI page operations:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execute</td>
<td>Allows users to run an application or script.</td>
</tr>
<tr>
<td>create</td>
<td>Allows users to insert new UI page records.</td>
</tr>
<tr>
<td>read</td>
<td>Allows users to display the UI page.</td>
</tr>
<tr>
<td>Operation</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>write</td>
<td>Allows users to update UI page records.</td>
</tr>
<tr>
<td>delete</td>
<td>Allows users to remove UI page records.</td>
</tr>
<tr>
<td>edit_task_relations</td>
<td>Allows users to extend the Task table.</td>
</tr>
<tr>
<td>edit_ci_relations</td>
<td>Allows users to extend the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>save_as_template</td>
<td>Allows users to save a UI page record as a template.</td>
</tr>
<tr>
<td>add_to_list</td>
<td>Allows users to insert UI page records from a list.</td>
</tr>
<tr>
<td>list_edit</td>
<td>Allows users to update UI page records from a list.</td>
</tr>
<tr>
<td>report_on</td>
<td>Allows users to create reports on UI page records.</td>
</tr>
<tr>
<td>personalize_choices</td>
<td>Allows users to configure UI page records.</td>
</tr>
</tbody>
</table>

Since UI pages typically only display read-only information, the most common UI page ACL rule is for the "read" operation.

**ACL rules in scoped applications**

You can create ACL rules for objects in the same scope as the ACL rule and for tables with at least one field that is in the same scope as the ACL rule.

You can create ACL rules for objects in the same scope as the ACL rule and for tables with at least one field that is in the same scope as the ACL rule. For tables that are in a different scope than the ACL rule record, the types of rules are limited.

- You can create an ACL rule for any table, UI page, or other object that is in the same scope as the ACL rule.
- You can create an ACL for a field that is in the same scope as the ACL rule.
  - If the table is in the same scope, you can use a script to evaluate permissions.
  - If the table is in a different scope, you cannot use a script to evaluate permissions.
- You cannot create or modify ACL rules for objects that are in a different scope than the application you have selected in the application picker, including adding a role to an ACL in a different scope.
- You can create wildcard table rules (*) only in the global scope.
- You can create wildcard field rules (*) only for tables in the same scope as the ACL rule.

**Client-callable script include ACL rules**

ACL rules can secure access to the execute operation of all or specific client-callable scripts.

Script include ACL rules specify the client-callable script include to be secured. Use the asterisk character as a wildcard to search for any client-callable script include. For a list of available script includes, navigate to System Definition > Script Includes. You can personalize the list to show the Client callable column.

The base system does not include any ACL rules for client-callable script includes.
Evaluate the admin override at the access level

If you want to force ACL evaluation for admin overrides at the access level, you can add a system property. Role required: security_admin

ACLs are evaluated cumulatively. If there are number of ACLs on any given field and the Admin Overrides option is false (not selected) on one of them, then the effective admin overrides for all the ACLs are considered to be false. This causes admins to be unable to pass even the ACL where the override should be in effect.

- Add the following property to the system properties table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
</table>
| glide.security.admin.override.accessterm | Evaluates the admin override condition at the access term level. | Type: true | false
| Default value: true for new instances, false for upgrades. Location: Add to the System Properties [sys_properties] table |

Contextual security

The contextual security manager provides incredible flexibility and power to protect information by controlling read/write/create/delete authorization.

Key advantages

- **Contextual security**: Secure a record based on its contents
- **Hierarchical security**: Can apply security rules to any level in our object hierarchy

Everything you can do with the simple security manager you can also do with the contextual security manager. Likewise, after conversion to the contextual security manager, you should not see any behavior changes in your instance.

Securing Fields and Tables

Under the simple security manager, you could secure fields and tables by adding roles to the appropriate dictionary entry. After installing the contextual security manager, these dictionary roles are no longer tested. Instead the system looks for ACL rules on fields and or tables.

**Warning**: After you install the Contextual Security Manager you must secure fields and tables via ACL rules. Even if you configure the dictionary form and add roles to a dictionary entry, no change in rights will occur.
Granting Roles to Users

Roles can still be granted to users or groups using the same logic as under the simple security manager. The one noteworthy exception is that the "roles" field on the user record is no longer checked under the contextual security manager (and should be, in fact, removed from your user and group forms upon installation).

**Note:** To add roles to a user or group record under Contextual Security you must add them to the Roles related list instead of to the user or group record itself.

Applications and Modules

Applications and modules both contain lists of roles under which they can be viewed. For example, the System Definition application requires the admin role to be viewed.

Security rights for Applications and Modules are still defined via these role arrays although they may be transitioned to ACLs at some future date.

Catalog Items and Variables

Both catalog items and catalog variables contain lists of roles under which they can be viewed.

Security rights for these entities are still defined via these role arrays although they may be transitioned to ACLs at some future date.

Inheritability of Group Roles

Under the contextual security manager, a group still automatically inherits any role granted to the group.

**Note:** The role's inherits flag is set to true.

Plugins

These plugins are automatically installed on new instances and can be activated for upgrades:

- **Contextual Security:** Provides contextual security functionality.
- **Contextual Security: Role Management Enhancements:** Eliminates duplicate inherited entries in the User Roles [sys_user_has_role] table (starting with the Geneva release) by tracking the number of times a role is inherited from another role or group. Once activated, inherited entries in the User Roles table are automatically managed and cannot be deleted directly. Instead, a containing role or group is expected to be removed from the user.

Contextual Security: Role Management Enhancements

Contextual Security: Role Management Enhancements prevents duplicate entries in the User Roles [sys_user_has_role] table.

Contextual Security: Role Management Enhancements is automatically installed on new instances starting with the Geneva release and can be activated for upgrades. When activated, Contextual Security: Role Management Enhancements replaces the legacy version.
Eliminate duplicate entries through inheritance count

The Contextual Security: Role Management Enhancements uses the inheritance count (inh_count) column to track the number of times a role is inherited from another role or group. In the User Roles [sys_user_has_role] table, a user can inherit a specific role only one time, eliminating duplicate entries. The inheritance count (inh_count) column is read-only and is calculated by the number of times the role is inherited by the user. If the inh_count value is 0, the inherited role is removed from the user.

When Contextual Security: Role Management Enhancements is activated, the following columns are deprecated, but remain in the User Roles table for backward compatibility:

- granted_by
- included_in_role
- included_in_role_instance

Visualize role inheritance through the Role Inheritance Map

The Role Inheritance Map displays a visual representation of inherited roles. To view the Role Inheritance Map, configure the User Roles [sys_user_has_role] table to display the Role Inheritance Map column.

Figure 703: Role Inheritance Map

Upgrade to Contextual Security: Role Management Enhancements
Contextual Security: Role Management Enhancements is automatically installed on new instances starting with the Geneva release. You can upgrade from the legacy Contextual Security plugin to Contextual Security: Role Management Enhancements.

Role required: admin

The contextual security plugins are active on new instances.
### Table 587: Plugins for Contextual Security: Role Management Enhancements

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contextual Security: Role Management Enhancements</td>
<td>Prevents duplicate entries in the User Roles [sys_user_has_role] table.</td>
</tr>
<tr>
<td>[com.glide.role_management.inh_count]</td>
<td></td>
</tr>
<tr>
<td>Contextual Security: Role Management Enhancements REST API</td>
<td>Enables API functionality for role management. If not already active, this plugin activates Contextual Security: Role Management Enhancements.</td>
</tr>
<tr>
<td>[com.glide.role_management.inh_count.rest_api]</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to **System Definition > Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.
4. Click **Activate**.

*Enable role auditing with Contextual Security: Role Management Enhancements*

Set a system property to allow the Audit Roles table to create audit records related to user roles.

Role required: admin

The Audit Roles [sys_audit_role] table automatically maintains changes to user records. If the Contextual Security: Role Management Enhancements [com.glide.role_management.inh_count] plugin is installed, you must set a system property to true to enable role auditing.

2. Set the following property to true.

<table>
<thead>
<tr>
<th>System property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.role_management.v2.audit_roles</td>
<td>If the Contextual Security: Role Management Enhancements [com.glide.role_management.inh_count] plugin is installed, setting this property to true allows the Audit Roles [sys_audit_role] table to create records when user roles change. This property is available in Geneva Patch 9 Hot Fix 3.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Options</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default</strong>: false</td>
</tr>
<tr>
<td></td>
<td>- <strong>Learn more</strong>: <a href="#">Audit user roles</a> on page 1744</td>
</tr>
</tbody>
</table>

### ACL configuration watcher

The ACL configuration watcher lets you know what related ACLs exist on a table when you insert, update, or delete an ACL on the same table.

The ACL configuration watcher is an interceptor window that displays every time you make important changes on the Access Control [sys_security_acl] table. It displays a security rules summary window.
where you can view ACLs related to the one you are modifying. You can not modify any ACLs from the security rules window. To make any modifications, close the watcher window and go to those ACLs.

The ACL configuration watcher is available with the Geneva release.

The ACL configuration watcher does not appear in the following situations:

• If you save or update an ACL record without actually making any changes.
• If you make minor updates (not an insert or delete), such as updating scripts, conditions, and the admin-overrides option.
• If the ACL record is not active.

**ACL Security Rules window**

The configuration watcher shows the *ACL execution plan*. The execution plan is displayed in the security rules pop-up window. You can view this kind of information:

Table 588: ACL configuration window elements

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>red highlight</td>
<td>An ACL that is deleted or deactivated.</td>
</tr>
<tr>
<td>blue highlight</td>
<td>An ACL that is modified.</td>
</tr>
<tr>
<td>green highlight</td>
<td>An ACL that is added or becomes active.</td>
</tr>
<tr>
<td>Masked</td>
<td>An ACL that was effective until you made a change.</td>
</tr>
<tr>
<td>Unmasked</td>
<td>An ACL that was just made effective when you made a change.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
Show ACL execution plan

Administrators can view how ACLs relate to each other by viewing an execution plan for any ACL in the instance.

Role required: security_admin

1.  *Elevate to a privileged role* on page 2447.
2.  Open an ACL that is a record-type ACL.
3.  Click *Show ACL Execution Plan*.

   The security rules window appears for the ACL.
Security Rules for "vtb_task.description"

Table 589: ACL execution plan window

<table>
<thead>
<tr>
<th>UI item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The name of the ACL.</td>
</tr>
<tr>
<td>Tab name</td>
<td>If the ACL is create, read, write, or delete.</td>
</tr>
<tr>
<td>Row level</td>
<td>Row-level ACLs that run on this table.</td>
</tr>
<tr>
<td>Field level</td>
<td>Field-level ACLs that run only on this field (or column in the table).</td>
</tr>
</tbody>
</table>

4. Click **Show all** to show all related ACLs, including those that are overridden and generic ACLs that apply to all records. Overridden ACLs have a line through the name and generic ACLs have the wildcard character asterisk (*) for the name.

5. Click **Show Effective** to show only the immediate ACLs related to the one you are viewing, not the ACLs that are on tables from which the ACL table is extended, nor the generic wildcard (*) ACLs.

Use the ACL configuration watcher

Use the ACL configuration watcher after you elevate to security administrator.

Role required: security_admin

_Elevate to a privileged role_ on page 2447

1. Open an ACL that is a record-type ACL.
2. Perform an action on the ACL, such as modifying it, or selecting an option from the context menu like **Insert**.

3. If you modified any values on the Access Control form, right-click the header and select **Save** or click **Update** or **Delete**.

The Security Rules window appears. The system did not yet perform the database action on the ACL, so the changes are not yet saved.

These are examples of security rules on the Visual Task Board application's Private Task [vtb_task] table. See **ACL configuration watcher** on page 2510 for a description of the items on this window.

---

### Verify Security Rules for "vtb_task.short_description"

<table>
<thead>
<tr>
<th>Row level</th>
<th>Field level</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb_task</td>

4. Just as with the execution plan, you can click **Show all** to show all related ACLs, including those that are overridden and generic ACLs that apply to all records, or click **Show Effective** to show only the immediate ACLs related to the one you are viewing.

5. Hover your mouse over any of the ACLs to see a description.

---

Create an ACL rule

Create custom ACL rules to secure access to new objects or to change the default security behavior.

**Role required:** security_admin

To create new ACL rules, you must elevate privileges to the security_admin role. For tables that are in a different scope than the ACL rule record, the types of rules are limited.

1. Elevate privileges to the security_admin role.
2. Navigate to **System Security > Access Control (ACL).**
3. Click **New.**
4. Define the object the ACL rule secures and the permissions required to access the object.
5. Right-click the form header and select **Save.**
Access Control Rules allow access to the specified resource if all three of these checks evaluate to true:

1. The user has one of the roles specified in the Role list, or the list is empty.
2. Conditions in the Condition field (advanced) evaluate to true, or return the variable "answer" to true, or is empty.
3. The three checks are evaluated independently in the order displayed above.

### Definition

<table>
<thead>
<tr>
<th>Type</th>
<th>Operation</th>
<th>Action Status</th>
<th>Active</th>
<th>Admin overrides</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>read</td>
<td>Global</td>
<td></td>
<td></td>
<td>Incident</td>
<td>Information required to read incident records</td>
</tr>
</tbody>
</table>

### Conditions

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>- choose field -</td>
<td>- open -</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Select what kind of object this ACL rule secures. The type of object determines how the object is named and what operations are available. This field becomes read only after the ACL rule is created (starting with the Geneva release). If you want to change the type, you must delete the ACL and create a new one with the correct type.</td>
</tr>
<tr>
<td><strong>Operation</strong></td>
<td>Select the operation this ACL rule secures. Each object type has its own list of operations. An ACL rule can only secure one operation. To secure multiple operations, create a separate ACL rule for each. For a list of operations and descriptions, see <a href="#">Record ACL rules</a> on page 2504.</td>
</tr>
<tr>
<td><strong>Admin Overrides</strong></td>
<td>Select this check box to have users with the admin role automatically pass the permissions check for this ACL rule. Admin users pass regardless of what script or role restrictions apply. However, the <strong>nobody</strong> role takes precedence over the admin override option. If an ACL is assigned the <strong>nobody</strong> role, admin users cannot access the resource even when <strong>Admin overrides</strong> is selected. See <a href="#">Base system roles</a> on page 1724.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Select this check box to enforce this ACL rule.</td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
<td>Select this check box to display the <strong>Script</strong> field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Name       | Enter the name of the object being secured, either the record name or the table and field names. The more specific the name is, the more specific the ACL rule is. You can use the wildcard character asterisk (*) in place of a record name, table name, or field name to select all objects that match a particular record type, all tables, or all fields. You cannot combine a wildcard character and a text search. For example, inc* is not a valid ACL rule name, but incident.* and *.number are valid ACL rule names.  
**Note:** Click the blue triangle to manually enter the record name or the table and field names of the object being secured. Use this option to secure an object that does not appear in the dropdown. |
| Description| [Optional] Enter a description of the object or permissions this ACL rule secures.                                                           |
| Requires role | Use this list to specify the roles a user must have in order to access the object. If you list multiple roles, a user with any one of the listed roles can access the object. The Requires role list appears as a related list.  
**Note:** Users with the admin role will always pass this permissions check because the admin role automatically grants users all other roles. |
| Condition  | Use this condition builder to select the fields and values that must be true for users to access the object. xl |
Enter a custom script describing the permissions required to access the object. The script can use the values of the current and previous global variables as well as system properties. The script must generate a true or false response in one of two ways:

- return an answer variable set to a value of true or false
- evaluate to true or false

In either case, users only gain access to the object when the script evaluates to true and the user meets any conditions the ACL rule has. Both the conditions and the script must evaluate to true for a user to access the object.

**Note:** If the item you are evaluating the ACL for is in a related list, current points to the item the related list is on instead of the current item the ACL is for. However, if the item you are evaluating the ACL for is not in a related list, current points to the actual item.

---

Grant or deny access

When a user attempts to access a particular object, the system searches for ACL rules that match the requested object's type, operation, and name.

If an ACL rule matches the requested object type, operation, or name, then the user must meet the permissions described in this rule to access the secured object.

If the user fails to meet the permissions required by the first rule, the system searches for the next matching ACL rule. For each matching ACL rule, the user has a chance to meet the required permissions in order to access the object. The system stops searching for matching ACL rules if the user ever meets a matching ACL rule's permissions. If the user cannot meet the permissions of any matching ACL rules, the system denies the user access to the object.

The effects of being denied access to an object depend on the ACL rule that the user failed. For example, failing a read operation ACL rule prevents the user from seeing the object. Depending on the object secured, the ACL rule could hide a field on a form, hide rows from a list, or prevent a user from accessing a particular UI page. See the table for a complete list of results of failing an ACL rule for a given operation and object type.

**Table 591: ACL rule table**

<table>
<thead>
<tr>
<th>Operation</th>
<th>Results of Failing an ACL Rule on Object</th>

</tbody>
</table>

**Match ACL rules to objects**

Each object type has its own matching requirements.
### Table 592: Object type

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Matching ACL Rules Required to Access Object</th>
<th>Existing Wildcard ACL Rules</th>
</tr>
</thead>
</table>
| Client-callable script includes | Users must meet the permissions of two ACL rules:  
1. All wildcard ACL rules for the object (if any ACL rule exists for the operation).  
2. The first ACL rule that matches the object's name (if any ACL rule exists for the operation). | By default, there are no wildcard (*) rules for these object types. If you create a wildcard ACL rule for one of these objects, then the ACL rule applies to all objects of this type. |
| Processors                |                                                                                                                 |                                                                                                |
| UI pages                  | Users must meet the permissions of two ACL rules:  
1. The first ACL rule that matches the record's field (if any ACL rule exists for the operation).  
2. The first ACL rule that matches the record's table (if any ACL rule exists for the operation). | By default, there are wildcard table rules (*) for the create, read, write, and delete operations and wildcard field rules (*.*) for the personalize_choices, create, and save_as_template operations. When you create a new table, create new ACL rules for the table unless you want to use the provided wildcard ACL rules. |
| Record                    |                                                                                                                 |                                                                                                |

**Note:** The high security property Security manager default behavior (glide.sm.default_mode) determines whether users can access objects that only match against wildcard table ACL rules. When this property is set to Deny access, only administrators can access objects that match the wildcard table ACL rules.

**Note:** The wildcard field ACL rule (.*') for the create operation reuses the same permissions as the write operation. This means that the create permissions are the same as the write permissions unless you define an explicit create operation ACL rule.

Evaluate ACL rule permission requirements

An ACL rule only grants a user access to an object if the user meets all of the permissions required by the matching ACL rule.

- The condition must evaluate to true.
- The script must evaluate to true or return an answer variable with the value of true.
- The user must have one of the roles in the required roles list. If the list is empty, this condition evaluates to true.
- [Record ACL rules only] The matching table-level and field-level ACL rules must both evaluate to true.
Figure 705: ACL evaluate permissions
Control whether script conditions apply to reference fields

If you want to enable script conditions for reference fields, you can add a system property. The default behavior is intended to improve instance performance. If you want to enable script conditions for reference fields, add the following system property.

Table 593: System property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.sys_reference_row_check</td>
<td>Controls whether the script conditions of Access Control Rules apply to a table’s reference fields.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• Location: [sys_properties] table</td>
</tr>
</tbody>
</table>

Multiple ACL rules at the same point in the processing order

If two or more rules match at the same point in the processing order, the user must pass any one of the ACL rules permissions to access the object.

For example, if you create two field ACL rules for incident.number, then a user who passes one rule has access to the number field regardless of whether the user failed any other field ACL rule at the same point in the processing order.

ACL rule output messages

ACL debugging displays ACL rule output messages at the bottom of each list and form. The output message does the following:

• Improve readability
• Include context information
• Show the results of each type of ACL test
• To provide hyperlinks to the ACLs that run on the list or form.

Each message displays the following information:

Table 594: Message information

<table>
<thead>
<tr>
<th>Message element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIME</td>
<td>The total time used to process this ACL rule.</td>
</tr>
<tr>
<td>PATH</td>
<td>Information that uniquely identifies each ACL rule in the format: &lt;ACL rule type&gt;/&lt;ACL rule name&gt;/&lt;Operation&gt;.</td>
</tr>
<tr>
<td>CONTEXT</td>
<td>The object being evaluated by the ACL rule.</td>
</tr>
<tr>
<td>RC</td>
<td>The return code of the ACL rule. A true value passes the ACL rule. A false value fails the ACL rule.</td>
</tr>
<tr>
<td>Message element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| RULE            | A brief summary of processors and scripts, followed by ACL results for each table-level and field-level ACL evaluation. Most ACL evaluations show an overall pass or fail result followed by a breakdown of the results for each type of ACL criteria:  
  • Role  
  • Condition  
  • Script |

The icons that appear show how the ACL was evaluated:

**Table 595: Evaluation icons**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A green checkmark (✅ #)</td>
<td>Indicates the table or field passed the criteria.</td>
</tr>
<tr>
<td>A red x icon (❌)</td>
<td>Indicates the table or field did not pass.</td>
</tr>
<tr>
<td>An empty gray circle icon (⊙ #)</td>
<td>Indicates the ACL evaluation did not need to be performed.</td>
</tr>
<tr>
<td>A blue checkmark, x, or empty circle</td>
<td>Indicates that the ACL was taken from a cached result of a previous ACL check. The icons mean the same as the above.</td>
</tr>
</tbody>
</table>

Click the name of the ACL next to any of the output messages to open that ACL record.
Access control rules debug

ACL rule debugging tools are available.

The following ACL rule debugging tools are available:

- Field level debugging
- ACL rule output messages

To enable ACL rule debugging, navigate to **System Security > Debug Security Rules**.

**Note:** Impersonation can simplify debugging ACL rules. First enable ACL debugging, then impersonate another user to see what ACL rules the user passes and fails.

Field level debugging

When debugging is enabled, a small bug icon appears beside each field with an ACL rule.

When debugging is enabled, a small bug icon (_bug_#) appears beside each field with an ACL rule. Clicking the icon lists the ACL rules that apply for the field and the evaluation results.
Impersonate users to debug ACLs

Impersonation can simplify debugging ACL rules.

After enabling ACL debugging, you can impersonate another user to see what ACL rules the user passes and fails. When you impersonate a user, you can only see what that user is allowed to see. For example, you cannot view a record that an ACL prevents the user from seeing.

To make debugging easier, read-only access to certain ACL-related tables is enabled by default, even when impersonating a user that does not have read access to the tables. To change this functionality, set the following property to false.

<table>
<thead>
<tr>
<th>System property</th>
<th>Description</th>
<th>Default setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.security.access_acl_as_impersonator</td>
<td>Allows read access to the following tables while impersonating a user: sys_security_acl, sys_security_operation, sys_security_type, and sys_user_role. As a result, the impersonating user can read data that the impersonated user cannot read.</td>
<td>true</td>
</tr>
</tbody>
</table>

**Note:** When the property is set to false, the impersonated user might be prevented from reading ACL-related data. In this case, a second session logged in as admin or security_admin might be required to debug ACLs.

ACL troubleshooting reference

A list of common ACL rule errors and their solutions.

Enable debugging to help troubleshoot an issue.
Table 596: Troubleshoot

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot access records from a custom table.</td>
<td>Create a table ACL rule for the custom table granting users access to the table. Without an explicit table ACL rule, users must pass the permissions in the table wildcard (*) ACL rule, which by default restricts access to administrators only. Enable debugging and determine what ACL rules are evaluated for the custom table.</td>
</tr>
<tr>
<td>You create a custom ACL rule that does not work properly.</td>
<td>The most likely problems are that another rule takes precedence over your custom rule in the processing order or that the user does not meet all the permission requirements for the object type. Enable debugging and verify that the ACL rule is being evaluated.</td>
</tr>
<tr>
<td>Your field ACL rule does not work properly.</td>
<td>There is likely a table ACL rule that the user has not met. Enable debugging and determine what ACL rules are evaluated for the field. Verify that there is not a conflicting table ACL rule or duplicate field ACL rule.</td>
</tr>
<tr>
<td>Your table ACL rule does not work properly.</td>
<td>There is either an ACL rule higher in the processing order or a duplicate table ACL rule interfering with the table ACL rule. Enable debugging and determine what ACL rules are evaluated for the table.</td>
</tr>
<tr>
<td>You can see a field in a list but not in form.</td>
<td>It is possible that the ACL rule conditions or script are being triggered in the list but not in the form. Enable debugging and determine when the ACL rules evaluate to true. Update the conditions or script to have the same behavior on the list and form.</td>
</tr>
<tr>
<td>You receive an error message when trying to execute a processor or client-callable script include.</td>
<td>There is an ACL rule for the processor or client-callable script include that the user has not met. If the user should have access to the object, enable debugging and determine what ACL rules are evaluated for the processor or script include. Update the ACL rule or the user roles as needed to access the object.</td>
</tr>
</tbody>
</table>

Mandatory roles

You can give both internal users and external users access to your instance. However, you might not want both types of users to have the same level of access. To provide added security, every user must have at least one role so the instance can distinguish between the users that are internal and the users that are external.

Prior to the Geneva release, ESS users had no role, but were still considered part of your organization and could access basic system resources by default, such as an ESS home page. Starting with the Geneva
release, ESS users can obtain the **snc_internal** role and still retain the same level of access they had prior to Geneva.

External users must obtain, at minimum, the **snc_external** role. This role indicates that the user is external to your organization and should not have any access to resources unless you explicitly allow access through ACLs for the **snc_external** role, or you explicitly grant them additional roles. By default, users with the **snc_external** role are unable to access non-record type resources as well, such as processors and UI pages.

You should not mark the **snc_internal** role as elevated. Otherwise, internal users could not access the instance.

---

**Note:** You can use encryption contexts with the **snc_internal** and **snc_external** roles.

---

**The Explicit Roles plugin**

The Explicit Roles (**com.glide.explicit_roles**) plugin provides the **snc_external** and **snc_internal** roles. This plugin is activated automatically when you activate the Customer Service Portal.

When this plugin is activated:

- All existing users are automatically assigned the **snc_internal** role. This role does not change existing access levels or system behavior. Rather, it provides a category to differentiate internal users from external users. All internal users maintain the same level of access as before the plugin was activated.
- All existing ACLs that do not have a role requirement are automatically assigned the **snc_internal** role. Because both existing ACLs and roles are assigned the **snc_internal** role, existing access levels do not change.
- External users must obtain, at minimum, the **snc_external** role to access the instance. This role is automatically assigned to external Customer Service Portal contacts. If the Customer Service Portal is not activated, this role must be manually granted to external users. Access to records is granted through ACLs.

**Providing access to external users**

You can grant external users access to tables be creating a set of ACLs for the table. See **Provide external users access to a table** on page 2529.

Another approach you can take is to give all external users access to all tables, and then restrict access to specific tables. You can do this by adding the **snc_internal** role to the *ACL that is of Type ui_page.

**The hasRoles() method**

The **hasRoles()** method is still available, but is deprecated in the Geneva release. Use the **hasRole(role name)** method instead.

If you use the **hasRoles()** method, note these changes:

- This method automatically excludes the default **snc_internal** role when it checks for roles. This means that if a user has only the **snc_internal** role, the **hasRoles()** method still returns **false**.
- If the user has the **snc_external** role, **false** is returned because the instance considers external users as without a role.
Activate the Explicit Roles plugin

Request activation of the Explicit Roles plugin on HI.
Role required: none
Request the plugin through the HI Service Portal.
1. In the HI Service Portal, click Service Catalog > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
| Specify the date and time you would like this plugin to be enabled | Date and time must be at least 2 business days from the current time. **Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

Provide external users access to a table

To enable users with only the snc_external role to access the list view of a table, you must create a series of ACLs.
Role required: security_admin
1. Elevate to the security_admin role.
2. Create a new ACL with the following settings:
   - **Type:** ui_page
   - **Operation:** read
   - **Name:** `{table_name}_list`
   - **Required role:** snc_external
3. On the default read ACL for the table, add snc_external in the Required role list. Create the ACL if it does not already exist.
4. Use these settings to create another ACL:
   - **Type:** ui_page
   - **Operation:** read
   - **Name:** `{table_name}`
   - **Required role:** snc_external
5. Use these settings to create another ACL to give the user write access to a field in the table:

- **Type**: record
- **Operation**: create
- **Name**: `{table_name} {column_name}
- **Required role**: snc_external

Repeat this step for every field that you want to give the user write access to. Use an asterisk * instead of the column name to provide access to all fields at once.

### Access control analytic data

Usage Analytics measures how often access control rules allow or deny users to see database query results.

The system evaluates access control rules that use script-based permissions after fetching records from the database. If a user passes the script-based permissions, the system allows the user to see the records. If a user fails the script-based permissions, the system denies the user access by discarding any records from the results that match the access control rule.

To help determine how often the system is performing such unneeded database queries, Usage Analytics collects information about each row-level access control transaction:

- The table name.
- The results of the permission check as the value **allowed** or **denied**.
- The number of times row record access was allowed or denied.

Administrators can enable or disable the system collecting this data by setting a Usage Analytics **property**.

### ACL information sent to Usage Analytics

A property is available to control the sending of information to Usage Analytics.

When a user tries to access records that are restricted by ACLs, the discarded records can be sent to Usage Analytics. Administrators can add and enable a property to control the sending of this information to Usage Analytics. The property must be added to the System Properties [sys_properties] table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.security.event.acl_db_eval.send</td>
<td>When enabled, this property sends lists of restricted records to Usage Analytics.</td>
<td>false</td>
</tr>
</tbody>
</table>

### Encryption support

Encryption is a process that scrambles information into a format that unauthorized parties cannot decode or use.

Users who have access to the encryption context can see data encrypted with that particular encryption context. The encryption process requires an administrator to grant an encryption context to users by granting the user an associated role.
**Note:** Impersonation does not change the encryption contexts available to a user. Even while impersonating, you have only the encryption contexts available to you originally.

After encryption, text fields and attachments are no longer accessible by database tools and cannot be indexed. In addition, users cannot add encrypted fields to a filter. You can encrypt all String fields, including fields provided by default in the system and new fields that you create in the dictionary.

Users with the admin role can activate the Encryption Support plugin.

**Encryption context setup**

Administrators can create an encryption context that uses an encryption key.

Your instance can generate an encryption key, or you can generate your own key with a certificate authority. See your certificate authority documentation for information on creating an encryption key.

1. Navigate to **System Security > Encryption Contexts**.
2. Click **New**.
3. Enter the following:
   - **Name**: enter the text users see when selecting an encryption context.
   - **Encryption key**: do not change this field If you want the instance to randomly generate a key. Otherwise, enter the desired key (exactly 24-characters for Triple DES, or exactly 16-characters for AES 128-bit, or 32-characters for AES 256-bit).
   - **Type**: select **AES 128-bit** for Advanced Encryption Standard, **Triple DES** for Triple Data Encryption Standard, or **AES 256-bit** if your system is configured for it.

   **Warning:** You cannot retrieve this key from the instance, so save it elsewhere before clicking **Submit** if you will need it.

4. Click **Submit**.

   The encryption key itself is encrypted with a key that is stored in the program, not in the database. This prevents other users from copying the key and using it to decrypt data.

5. Navigate to **System Security > Roles** and open the role to associate with the encryption context.

6. Configure the Roles form to add the Encryption context field.

7. Select the encryption context to associate with the role (there can be only one encryption context per role).

8. Click **Update**.

   Users must log out of the instance and log in again to use the encryption context.

**Add an encrypted text field to a form**

Only a user with configuration rights, such as an administrator, can add an encrypted text field to a form. Encrypted text fields are installed with the Encryption Support plugin.

**Note:** When you convert an existing field to an encrypted field, make sure the field length matches the max length of the encrypted field type.

1. Configure a form.
2. Create a new field and set the Type to **Encrypted Text**.
3. Place the field where it should appear on the form.
4. Click **Save**.
Add an encryption context selector

The encryption context selector enables users who have multiple encryption contexts to select a context when entering data.

Only a user with the admin role can activate the encryption context selector.

1. Click System UI > UI Macros.
2. Open the encryption_select UI macro.
3. Select the Active check box.
4. Click Update.
5. Reload the page to see the choice list (if you have more than one encryption context).

The encryption context selector appears in the welcome banner only for users who have multiple roles with different encryption contexts.

Note: The selector appears only for users who have two or more encryption contexts to choose from. Users with either one or no encryption contexts do not see the selector.

Use an encrypted text field

Encrypted text fields operate differently depending on the number of encryption contexts available to the user.

- User with no encryption contexts: The form hides the encrypted field.
- User with one encryption context: The user automatically uses their encryption context with encrypted text fields.

Figure 708: Encrypted text fields 03
• There is no data in the field: The form displays the encrypted field (assuming UI policy does not prevent it). Users with any encryption context can see empty encrypted fields. Entering data in the field causes the encrypted fields to use the currently selected encryption context to encrypt the data.

Figure 709: Encrypted text fields 01
Figure 710: Encrypted text fields 01a

- There is data in the field: If the user has access to the matching encryption context, the form displays the encrypted field.

Figure 711: Encrypted text fields 02
• User with two or more encryption contexts: The user can select an encryption context from the selector in the welcome bar.

• There is no data in the field: The form displays the encrypted field (assuming UI policy does not prevent it). Users with any encryption context can see empty encrypted fields. Entering data in the field causes the encrypted fields to use the currently selected encryption context to encrypt the data.

• There is data in the field: If the user has access to the matching encryption context, the form displays the encrypted field. The encrypted field always uses the original encryption context to encrypt changes to the field. This prevents users with multiple encryption contexts from changing the encryption context of a field.

Note: A lock icon appears next to the field label to indicate an encrypted field. Pointing to the icon displays the name of the context used to encrypt the field.

Figure 712: Encrypted text fields 02a

Figure 713: Encrypted text fields lock icon

Note: Users cannot use encrypted fields in a filter.
Use attachment encryption

You can encrypt attachments that are already attached to records.

1. Log in as a user with at least one encryption context.
2. If more than one encryption context is available, select the encryption context for this session from the selector.
3. Navigate to a form which needs an attachment added, such as the Incident or Problem form, and click the attachment icon to open the Attachments dialog box.
4. Select the file to be attached.
   Only users with one or more encryption contexts see the Encrypt file check box below the file name.
5. Select the **Encrypt file** check box.
   Users with more than one encryption context are asked to confirm the encryption context. If you select a different encryption context, the encryption context selector updates to reflect the change.
6. Click **Attach** to upload the file attachment.
   The file appears in the Current file attachments section of the form with a special icon indicating that it is encrypted. Pointing to the icon shows the name of the encryption context.
7. Click **Done**.
   Attached files are listed across the top of the form. A special icon identifies encrypted files. Note that you can only see the encrypted files for which you have the encryption context.

Encrypt MID Server login credentials

The MID Server login credentials appear in the config.xml file in clear text. If access to the MID Server host machine is not secure, store the login credentials in this file in encrypted form.

Role required: admin

**Note:** Any field in this file can be encrypted, but once encrypted, a field can be managed only from within the instance. The best practice is to encrypt password fields only (for the MID Server and any proxy server specified).

1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.
   The instance credentials section of the config.xml file looks like this:

   ```xml
   <!-- If your instance has authentication enabled (the normal case), set these parameters to define the user name and password the MID Server will use to log into the instance. -->
   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" value="securepassw0rd"/>
   ```

2. Add the encrypt="true" attribute to the password tag.

   ```xml
   <parameter name="mid.instance.username" value="midsrvadmin" />
   <parameter name="mid.instance.password" encrypt="true" value="securepassw0rd"/>
   ```

3. Save the config.xml file, and then restart the MID Server service.
The password is now encrypted.

The password cannot be decrypted (or displayed in clear text again) by changing the encryption attribute to false or by deleting the attribute. If the password is changed in the config.xml file and the MID Server restarted, the new password is encrypted.

Encryption Scripting

There are several example scripts for you to use with encryption.

Encrypt Unencrypted Attachments with Script

The following sample script encrypts unencrypted attachments, such as in the incident table.

```javascript
bulkEncryption();

function bulkEncryption() {
  gs.log("*********** BULK ENCRYPTION RUN BY " + gs.getUserName());
  encryptAttachments("incident", "testContext");
  gs.log("*********** BULK ENCRYPTION COMPLETED");
}

// Note that whomever runs this script must have access to use the
// specified encryption context or nothing will happen when
// "changeEncryptionContext" is called except that a warning will appear
// in the log: WARNING *** WARNING *** Attempt to get
// cipher for encryption context 'contextName' without authorization
function encryptAttachments(table, encryptionContextName) {
  var contextGR = new GlideRecord("sys_encryption_context");
  contextGR.addQuery("name", encryptionContextName);
  contextGR.query();
  if (!contextGR.next()) {
    gs.log("*********** No such encryption context " + encryptionContextName);
    return 0;
  }
  var encryptionId = contextGR.getUniqueValue();
  gs.log("*********** BEGIN ENCRYPTING ATTACHMENTS FOR " + table + " TABLE");
  var attachmentGR = new GlideRecord("sys_attachment");
  attachmentGR.addQuery("table_name", table); // only attachments for the
  specified table
  attachmentGR.addNullQuery("encryption_context"); // only attachments not
  yet encrypted
  attachmentGR.query();
  var count = 0;
  while (attachmentGR.next()) {
    var sysAttachment = new GlideSysAttachment();
    sysAttachment.changeEncryptionContext(attachmentGR.getValue("table_name"),
      attachmentGR.getValue("table_sys_id"),
      attachmentGR.sys_id, encryptionId);
    gs.log("*********** ENCRYPTED [" + attachmentGR.sys_id + "] " +
      attachmentGR.getValue("file_name"));
    count++;
  }
  gs.log("*********** ENCRYPTED " + count + " ATTACHMENTS FOR " + table + " TABLE");
}
To write a script changing the encryption context from one context to another, access to both contexts is required.

Set the Encryption Context ID in Script

A function, `setContextID`, is provided to set the encryption context ID of an encrypted field in script. The argument to the function is the `sys_id` of the encryption context you wish to use. The following example creates records with an encrypted field, `u_subspecies`, encrypted by the "Species Security" encryption context.

```javascript
Note: The user who runs this script must have access to the encryption context.
```

```javascript
encrypt();

function encrypt() {
    var encryptionID = getEncryptionID("Species Security");
    if (encryptionID == "")
        return;

    createEncryptedRecord("Sumatran tiger", "Panthera", "tigris", "sumatrae", encryptionID);
    createEncryptedRecord("Bengal tiger", "Panthera", "tigris", "tigris", encryptionID);
    createEncryptedRecord("Siberian tiger", "Panthera", "tigris", "altaica", encryptionID);
}

function getEncryptionID(encryptionName) {
    var contextGR = new GlideRecord("sys_encryption_context");
    contextGR.addQuery("name", encryptionName);
    contextGR.query();
    if (!contextGR.next()) {
        gs.log("*********** No such encryption context " + encryptionContextName);
        return "";
    }
    return contextGR.getUniqueValue();
}

function createEncryptedRecord(commonName, genus, species, subspecies, encryptionID) {
    var newRecord = new GlideRecord("u_species_encrypted");
    newRecord.u_common_name = commonName;
    newRecord.u_genus = genus;
    newRecord.u_species = species;

    // We have one encrypted field, u_subspecies.
    newRecord.u_subspecies.setDisplayValue(subspecies);
    newRecord.u_subspecies.setContextID(encryptionID); // use our encryption context for the field
    newRecord.insert();
}
```

Remove Encryption Contexts

These functions remove an encryption context, or all encryption contexts, from those available to the user session.
This can be used by customers in a script to further limit the encryption contexts that are available to a user under certain conditions. For example, a synchronous Script Action triggered by the `session.established` event could remove all encryption contexts if a user was not connecting from an IP in a certain range.

```javascript
if (some condition) {
    var contexts = gs.getSession().getEncryptionContext();
    contexts.removeAllContexts();
}
```

Individual encryption contexts can be removed as well using the `sys_id` of the encryption context.

```javascript
if (some condition) {
    var contexts = gs.getSession().getEncryptionContext();
    contexts.removeContext("077d9b3307211000e2bb5720e1021e61");
}
```

**Return a Decrypted Field Value**

You can return the field value for an encrypted field by using the `getDisplayValue` method.

**Async business rules**

Async Business Rules actually operate via impersonation and impersonation does not give you the impersonated user's encryption contexts.

Therefore, you will not want to use async Business Rules when you want to encrypt fields.

**Encryption Demo plugin**

A demo plugin (`com.snc.task_encryption.demo`) is available which demonstrates how the encrypted fields and files behavior can be customized using Business Rules, UI Actions, and UI Policy.

The demo forces these forms to use only one security context per record. The first person to add encrypted information to a record "claims" the record for that context. A button is provided to change the context of the record to another one if the user has more than one context.

To try the demo on a demonstration system (not recommended for production instances since it modifies the task table among other things), activate the plugin `com.snc.task_encryption.demo` then add the "social security numbers", "credit cards", and "encryption context fields" to the incident form. If encryption contexts have not been created and allocated to users, follow the set up instructions above.

UI Action button **Add Secure Info** (actually two buttons) appears on records without encrypted data and ask which context to use (if the user has more than one) and unhide the social security numbers and credit card fields.

UI Action button **Change Encryption** appears on records that do have encrypted data for users with more than one context.

The business rule "Form Single Encryption Context" enforces the one context per form rule.

The business rule "Update on New Encrypted Attachment" causes the context of encrypted files to be noted on the corresponding owning record.

UI Policies show the encrypted fields as appropriate.

**Encryption support FAQ**

These are general security FAQs for encryption. For information about MID Server credential encryption.
**What prevents an admin with privileged access from accessing the key?**

A user with access to the encryption context record could access it. The key itself is stored encrypted.

**Where does encryption/decryption occur?**

Encryption and decryption occurs on the server not in the user interface.

**Is the key loaded into memory only when required to encrypt/decrypt?**

Yes, first the user’s access to the key is validated and then created in memory to do the encryption/decryption and then disposed of after the operation is complete.

**Is the key stored in clear-text on the server anywhere? If it is encrypted where is that encryption key stored and how is it protected?**

The encryption context key is stored encrypted in the database. The encryption key for that encryption context key is built into the program and is not visible through the user interface at any time.

**What stops an admin with privileged access from giving themselves the role that is allowed to encrypt/decrypt?**

A user with admin access could grant himself or other users the role associated with the encryption context as this is how encryption contexts are assigned. If desired, additional measures could be added by the customer or professional services such as sending an email to an appointed “encryption manager” whenever a role associated with an encryption context is granted to a user, etc.

**What level of logging is there to detect changes to a role that allows encrypt/decrypt?**

There is no extraordinary logging for changes to roles aside from the logging of the transaction. This certainly could be added via business rules by the customer or ServiceNow professional services in a wide variety of ways depending on the needs of the customer.

**What stops an admin with privileged access from tampering with the logs?**

The product keeps two sets of logs. One is visible within the instance as the “system log”. An administrative user can, in theory, manipulate this log, although the security manager can be configured to make such tampering extremely difficult. A second log exists on the file system of the application server and cannot be manipulated directly from within the App server. In the event of a forensic situation wherein an administrator has deliberately tampered with the application’s own internal auditing and logging capabilities, the file system based log can be used to reconstruct a user’s transactional history.

**Can I encrypt Import Sets?**

*Import Sets* run as user System. Therefore, import sets cannot add data to encrypted fields.
Can I encrypt fields in Inbound Email Actions?

*Inbound email actions* on page 2822 work via impersonation, but impersonation does not have access to users’ encryption contexts. Carefully consider the safety of mailing data worthy of encryption through email routers.

Do templates support encrypted fields?

Templates do not support encrypted fields. Applying a template does not apply data to an encrypted field. Saving a template from a form does not save encrypted values.

Sample Java digest algorithm for encryption

This Java algorithm illustrates creating a digest token from an HTTP header.

This sample assumes:

- The web server supports Java
- The hash computation method is SHA1
- The secret key value is abc123
- The unencrypted HTTP header name is user_name

Change the Java code to use another hash computation mechanism (such as MD5), change the secret key value, or HTTP header name.

```java
import javax.crypto.Mac ; import javax.crypto.spec.SecretKeySpec ; import 
sun.misc.BASE64Encoder ; // public class DigestTest  { private static final 
String MAC_ALG  = "HmacSHA1" ; // default to something JDK 1.4 has String 
fKey  = "abc123" ; public byte [ ] getDigest ( String acct ) { try { byte [ ] bkey  = fKey. getBytes ( ) ; byte [ ] data  = acct. getBytes ( ) ;
Mac mac  = null ; try {
    mac  = Mac. getInstance (MAC_ALG ) ;
    mac. init ( new SecretKeySpec (bkey, MAC_ALG ) ) ;
} catch ( Exception e ) {
    e. printStackTrace ( ) ;
} byte [ ] sig  = mac. doFinal
(data ) ; String signature  = new String (sig ) ; System. out. println
("value:" + acct ) ; System. out. println ( "digested value: "+ signature ) ; return sig ; } catch ( IllegalStateException e ) {
    e. printStackTrace ( ) ;
} catch ( IllegalStateException e ) {
    return null ;
} public static void main
(String [ ] args ) { 
    BASE64Encoder encoder  = new BASE64Encoder ( ) ;
    DigestTest test  = new DigestTest ( ) ; String userName  = "user_name"
; System. out. println ( "base 64 digest username: " + encoder. encode (test.
getDigest (userName ) ) ) ;
}
```

Demonstration plugin

The instance provides a demonstration plugin called Encryption Support - Single Context Task Encryption Demo (com.snc.task_encryption.demo).

The demonstration plugin is meant to illustrate how to use business rules, *UI actions*, and UI policy to support encrypted fields. The plugin enforces a limit of one security context per record. The first person to add encrypted information to a record sets the context.

You should test the demonstration plugin on a sub-production instance since it modifies the Task table and adds business rules and a UI policy. After activating the plugin:
1. Create one or more encryption contexts.
2. Configure the Incident form to add the Social security number, Credit card, and Encryption context fields.

The plugin UI actions are:

- Add Secure Info: appears on records without encrypted data and allows the user to display the social security numbers and credit card fields.
- Add Secure Info: appears on records without encrypted data and prompts the user to select an encryption context (if the user has more than one).
- Change Encryption: appears on records with encrypted data and prompts the user to select an encryption context (if the user has more than one).

The plugin business rules are:

- Form Single Encryption Context: ensures that each form only has one security context.
- Update on New Encrypted Attachment: ensures that each attachment has the same security context as the parent incident.

The plugin UI policies show the encrypted fields when appropriate.

Encrypt a password in system properties

The Encrypt SysProperty Password business rule automatically encrypts the value of any system property with the type password or password2.

The business rule encrypts passwords when you add a new value or update an existing one. After encrypting the password, the instance always stores and displays the encrypted password value. The instance only decrypts the password in memory and never saves a clear-text version.

After upgrading from an earlier version, encrypt existing properties that contain passwords by updating the value.

1. In the Type filter text, enter `sys_properties.list`.
2. Select the system property you want to encrypt.
3. Enter or update the Value to change the password.
4. Click **Update**.

The business rule encrypts the password.
Add an encryption context selector

The encryption context selector enables users who have multiple encryption contexts to select a context when entering data.

Only a user with the admin role can activate the encryption context selector.

1. Click **System UI > UI Macros**.
2. Open the encryption_select UI macro.
3. Select the **Active** check box.
4. Click **Update**.
5. Reload the page to see the choice list (if you have more than one encryption context).

The encryption context selector appears in the welcome banner only for users who have multiple roles with different encryption contexts.

---

**Note:** The selector appears only for users who have two or more encryption contexts to choose from. Users with either one or no encryption contexts do not see the selector.

---

VPN setup to integrate datacenters

Your instance supports direct integrations with any number of data sources over the Internet.

When configuring an integration that uses an encrypted protocol, such as Lightweight Directory Access Protocol (LDAP) or HTTPS, it is good practice to use the Internet as a transport mechanism.

However, there may be security or network architecture requirements that dictate the use of a site-to-site Internet Protocol Security (IPSEC) Virtual Private Network (VPN) connection between the datacenters and your business networks. The VPN supports the necessary encrypted communication between the instance and your network.
This video describes how to locate the IP addresses for each of your company's instances.

Create an address for VPN communication

To prevent conflict or overlap with internal ServiceNow networks or with another customer's internal IP address schemes, the instance requires that all tunneled traffic in the encryption domain use non-RFC-1918 addresses on both sides of the tunnel.

The instance provides a single IP address for the source of queries into your network.

- Provide Network Address Translation (NAT), non-RFC-1918 addresses for each host that is integrating with the instance.

Alternatives to using a VPN

There are alternatives to using a VPN that you might want to consider.

These alternatives provide a simpler way to connect your instance to the resources in the ServiceNow data centers and provide better encryption. Additionally, you can avoid any issues that VPN downtime might cause, such as making your instance unavailable to users if there is an issue with the VPN tunnel.

Single sign-on and MID server

Consider using a combination of Single Sign-On (SSO) for authentication and the MID Server for user data synchronization, rather than using a VPN to connect your LDAP server to your instance. For integrations other than LDAP, consider using certificate-based encryption.

Starting with the Eureka release, you can use:

- The Okta for single sign-on (see OKTA SSO integration on page 1945) for more information.
- The LDAP listener on a MID server to synchronize your user table in near real time.

The advantage of this approach is that there are no firewall holes, routes, VPN tunnels, or other special network settings to configure and maintain. The SSO/MID-Server solution is the most flexible, secure and cost-effective method to achieve the complete LDAP integration.

LDAP over SSL

Another alternative to using a VPN tunnel is to configure LDAP Over SSL (LDAPS) directly over the Internet. You can configure a read-only domain controller and lock the instance down in your DMZ using only the instance's source addresses and the destination ports of your choice. Since the ports for LDAP are configurable in your instance, you can perform a port address translation (PAT) if desired. With LDAPS, you control the certificate that is uploaded over an encrypted channel to the instance, (see Upload a certificate to an instance on page 2450). The packets cannot be encrypted or decrypted without the certificate.

The advantage of this approach is that it provides a stronger encryption and decryption mechanism. A VPN can only encrypt and decrypt the traffic between the two peers sitting on the Internet with a coordinated pre-shared key, similar to a password. LDAPS provides a longer encrypted path, end-to-end, at the application layer and with a certificate that is far more complicated than a pre-shared key that the IPSec tunnel uses.
Addresses for VPN communication

To prevent conflict or overlap with internal ServiceNow networks or with another internal IP address schemes in your network, all tunneled traffic in the encryption domain must use non-RFC-1918 addresses on both sides of the tunnel.

ServiceNow provides a single IP address for the source of queries into your network. You must provide Network Address Translation (NAT), non-RFC-1918 addresses for each host that is integrating with your instance. These public addresses need to be owned by your organization. Third party addresses cannot be used inside tunnels. Additionally, the encryption domain must not contain the IP address of the VPN peer.

Redundant tunnels

If you are using a VPN, you can create redundant tunnels.

There are two ways to build redundancy for your tunnels:

- Using the same encryption domain behind both of your peers. This is the preferred method.
- Using a different encryption domain behind each peer.

With the first method, you need to provide the same NAT address behind each of your peers to create a connection path using that address to your server. The path to your server could be the same physical machine or a mirror which provides identical services. With this method, your instance would use the same IP address to connect to your servers regardless of whether your primary or secondary tunnel is active. If you have more than one server, follow this same scheme for your additional servers. This method provides the most transparency to your users and is recommended.

The second method requires configuration in your instance to provide the redundancy. When the tunnel is used for LDAP, for example, you could provide redundant LDAP servers in your instance. Note that this method requires the connection to the first configured LDAP server to timeout before the instance attempts to connect to the secondary server. Because of this additional time delay, this solution should only be implemented if the first option is unattainable. Also note that not all services can be configured for redundantly in your instance. If you are using a VPN tunnel for something other than LDAP and redundancy is required, check that your configuration can support multiple addresses, or see the first option above.

ServiceNow VPN connections

The ServiceNow VPN infrastructure uses pairs of Cisco adaptive security appliance (ASA) devices that serve as VPN termination points.

The VPN between the instance and your network utilizes your existing networking hardware to support communications. It is not necessary to install a piece of hardware. Because each customer has a unique configuration, the instance has a flexible VPN solution. the instance has built tunnels to Checkpoint, Juniper, Nortel, and other IPSEC VPN-capable devices.

The VPN connections between the instance and your network are created to support the encrypted flow of traffic into your network. Frequently, integrations that use the VPN do not have encryption as part of the underlying protocol. For example, LDAP over the VPN versus LDAPS over the Internet and HTTP over the VPN versus HTTPS over the Internet.

The network does not allow any inbound-to-ServiceNow integration or end-user-to-ServiceNow traffic to traverse a VPN connection. This restricted communication includes end-user access to the platform, administration of the platform, web services integrations, and other integrations that are configured to use a MID Server. All such inbound communication to the instance must be performed over the Internet using HTTPS. This configuration provides an encrypted communication channel. The encryption channel, along with IP access control, meets the security requirements for this traffic flow.
VPN setup

From the time that a VPN request is submitted, it typically takes one week or less to complete the VPN build.

To support the redundancy requirements of your instance and your organization, a minimum of two and a maximum of four VPNs are provisioned (from the active site to your active site or the active site to your DR site, and so on).

It is good practice for the encryption domain to be as specific as possible. Ideally, the encryption domain would include only the specific hosts that are required for the integrations. A large encryption domain can create opportunities for routing discrepancies (VPN versus Internet).

To create the VPN, the instance does the following:

- Provides the VPN peer and host addresses from each datacenter.
- Builds the necessary VPN connectivity from two datacenters into your network. To support redundancy and disaster recovery (DR) requirements, the VPNs can be provisioned from two datacenters into two networks.

The instance does not support building multiple VPN tunnels into a customer network for the purpose of connecting to multiple geographic regions or subsidiaries. You should perform any inter-site routing, traffic distribution, or traffic shaping within your own internal network, rather than having multiple VPN tunnels.

Request a VPN service

For all VPN requests, including provisioning, modifications, or general questions, use the Service Catalog VPN Request form.

1. Open HI.
2. Navigate to Self-Service > Service Requests > VPN Requests.
3. Select the appropriate VPN request type.
4. Answer the questions.
   - Questions vary depending on the request type selected.
5. Click Submit.

Once your request is submitted, ServiceNow will work with your network engineer(s) to test and validate that the VPN is successfully passing traffic. To ensure that your questions are answered in a timely manner, please address VPN-related questions during this process.

HTML sanitizer

The HTML sanitizer automatically cleans up HTML markup in HTML fields and translated HTML fields to remove unwanted code and protect against security concerns such as cross-site scripting attacks.

The HTML sanitizer works by checking the built-in white list for markup that you always want to preserve. The sanitizer provides the HTMLSanitizerConfig script include that administrators can use to modify the built-in white list. Items can also be added to the black list, which overrides the white list, to remove HTML markup.

The following types of items can be added to white and black lists:

- Global attributes
- Any HTML elements

**Note:** By default, URL attributes like `href` and `src` support only these protocols:
• http
• https
• mailto

For example:

<a href="https://community.servicenow.com/welcome">Community</a>

The Default White List

BUILTIN_HTML_WHITELIST :

    globalAttributes: { attribute: ["id","class","lang","title","style"],
                        attributeValuePattern: {}},

    label: { attribute: ["for"],

    font: { attribute: ["color","face","size"],

    a: { attribute: ["href","nohref","name","shape"],

    img: { attribute: ["src","name","alt","border","hspace","vspace","align","height","width"],

    table: { attribute: ["border","cellpadding","cellspacing","bgcolor","background","align","noresize","height","width","summary","frame","rules"],

    th: { attribute: ["background","bicolor","abbr","axis","headers","scope","nowrap","height","width","align","char off","char","colspan","rowspan"],

    td: { attribute: ["background","bicolor","abbr","axis","headers","scope","nowrap","height","width","align","char off","char","colspan","rowspan"],

    tr: { attribute: ["background","height","width","align","valign","char off","char"]},

    thead: { attribute: ["align","valign","char off","char"]},

    tbody: { attribute: ["align","valign","char off","char"]},

    tfoot: { attribute: ["align","valign","char off","char"]},

    colgroup: { attribute: ["align","valign","char off","char","span","width"]},

    col: { attribute: ["align","valign","char off","char","span","width"]},

    p: { attribute: ["align"]},

    style: { attributeValuePattern: {"type":"text/css"} }

    canvas: { attribute: ["height","width"]},

    details: { attribute: ["open"]},

© 2017 ServiceNow. All rights reserved.  2549
Activate HTML sanitizer

The HTML sanitizer provides a property to enable or disable the sanitizer for all HTML fields in the system.

Role required: admin

By default, the property is set to true for new instances.

1. In the navigation filter, enter `sys_properties.list`. 
2. Set the properties glide.html.sanitize_all_fields and glide.translated_html.sanitize_all_fields to true. If the properties do not exist in the System Properties table, you can add them.

**Configure HTML sanitizer**

You must modify a script include to make configuration changes to the HTML sanitizer.

Role required: admin

1. Navigate to **System Definition > Script Includes**.
2. Open **HTMLSanitizerConfig**.
3. To add items to the black list, use the HTML_BLACKLIST class. To add items to the white list, use the HTML_WHITELIST class.

Use this format:

```
HTML_XXXXLIST :{
  globalAttributes :{
    attribute: [attribute-name1,...],
    attributeValuePattern: {attribute-name2:attribute-value-regex-pattern,...}
  },
  <html-element-name> : {// Same as Above}, ----
}
```

- **globalAttributes** contains attribute or attributeValuePattern items that are applicable globally for all the HTML elements.
- **attribute** is a comma-separated list of attributes.
- **attributeValuePattern** is a dictionary of attribute to attribute-value-regex-pattern pairs. The attribute-value-regex-pattern is a regular expression which has to match the attribute value.

Consider the following example:

```
HTML_WHITELIST :{
  globalAttributes :{
    attribute: ["id","name"],
    img :{
      attribute: ["style","align"],
      attributeValuePattern : {src:".*jpeg"},
      iframe : {}},
}
```

It adds the following items to the white list:

- The global attributes id and name. This is a list of strings that can be applied globally to all the elements.
- The img element where the attributes are style and align.
- The img element where the source attribute of the image is a file with the .jpeg extension. This is an example of a regular expression pattern that matches an attribute value.
- The iframe element.

**Enable sanitization on individual fields**

You can use field attributes to enable or disable the sanitizer on individual fields.
Role required: admin

You need to first set the sanitizer property to false, and then enable the sanitizer on a per-field basis for any form.

1. Navigate to the sys_properties table and set the glide.html.sanitize_all_fields to false. This disables the sanitizer for all HTML fields in the system.
2. Navigate to the form that contains the HTML field.
3. Right-click the HTML field label, and select Configure Dictionary. The Dictionary Entry form opens for the HTML field.
4. Enter one of the following in the Attributes field:
   - To disable sanitization enter html_sanitize=false
   - To enable sanitization enter html_sanitize=true
5. Click Update.
6. To enable the HTML sanitizer for translated HTML fields, set the glide.translated_html.sanitize_all_fields property is true.

Enable HTML Sanitizer logging

When the HTML sanitizer removes elements or attributes, they are added to the system log.

Role required: admin

You can review these sanitized elements by adding /syslog_list.do?sysparm_query=source %3DHTMLSanitizer to your instance URL.

1. To review these sanitized elements add /syslog_list.do?sysparm_query=source %3DHTMLSanitizer to your instance URL.
2. To enable or disable logging, add the glide.html_sanitize.discarded_log.enable property to the system properties and set the value to true (enabled) or false (disabled). This property is true by default.

System logs

System logs display warnings and errors within the instance processes and records, and non-critical events such as memory usage on the server machine.

This list view displays the log entries for the current day only. To view other log files, use the log file browser.

This log provides the following information for all occurrences:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the logging activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. The levels are Debug, Error, Warning, and Information. A warning is an error that has been handled and recovered. An error is something that must be fixed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated message regarding the nature of the occurrence.</td>
</tr>
<tr>
<td>Source</td>
<td>Name of the process or area affected by the occurrence. For example, the source of the occurrence might be EMAIL or Memory.</td>
</tr>
</tbody>
</table>

**Transaction logs**

The transaction log records all browser activity for an instance. This log provides the following information for all activities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the browser action for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created this activity.</td>
</tr>
<tr>
<td>Response time</td>
<td>Round trip response time for the browser request, in milliseconds.</td>
</tr>
<tr>
<td>Network time</td>
<td>Latency time of the network response after the browser request is made, in milliseconds.</td>
</tr>
<tr>
<td>Output length</td>
<td>Size of the output string sent by the instance to the browser, in bytes.</td>
</tr>
<tr>
<td>SQL count</td>
<td>Number of SQL server commands executed for this activity.</td>
</tr>
<tr>
<td>Business rule count</td>
<td>Number of business rules executed for this activity.</td>
</tr>
<tr>
<td>Business rule time</td>
<td>Elapsed time for the execution of the business rules for this activity.</td>
</tr>
<tr>
<td>URL</td>
<td>The application or module connected to by the client browser.</td>
</tr>
<tr>
<td>System ID</td>
<td>System generated identifier of the client instance making the request. This ID is used for cluster environments in which several instances (nodes) communicate with the database.</td>
</tr>
<tr>
<td>IP address</td>
<td>IP address of the client making the request.</td>
</tr>
<tr>
<td>GZipped</td>
<td>Indication of whether a compressed Web page was requested by the browser.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The HTTP protocol used by the browser for this instance.</td>
</tr>
</tbody>
</table>

The **System Scheduler > Slow Job Log** module provides a transaction log filtered to show only slow transactions.
Client transaction timings

The Client Transaction Timings plugin enhances the system logs by providing more information on the durations of transactions between the client and the server.

By providing information on how time was spent during the transaction, performance issues can be tracked down to the source by seeing where the time is being consumed.

This plugin requires the Response Time Indicator to be enabled, and collects information from the following browsers:

- Firefox
- Internet Explorer
- Chrome

Client Transactions Information

Installing the plugin adds the module Client Transactions to the System Logs application, which provides a list of every logged transaction between client and server within the last day. The following information is tracked:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>The moment the transaction was recorded.</td>
</tr>
<tr>
<td>Response Time</td>
<td>The number of ms spent by the server in fulfilling the transaction.</td>
</tr>
<tr>
<td>Business Rule Time</td>
<td>The number of ms spent by business rules triggered by the transaction.</td>
</tr>
<tr>
<td>SQL Time</td>
<td>The number of ms spent by the SQL database.</td>
</tr>
<tr>
<td>Client Response Time</td>
<td>(Load_completion_time) - (start_time). It is inclusive of server time.</td>
</tr>
<tr>
<td>Client Network Time</td>
<td>The number of ms spent by the network the client is connecting through.</td>
</tr>
<tr>
<td>Browser Time</td>
<td>The number of ms spent by the browser during the transaction.</td>
</tr>
<tr>
<td>Client Script Time</td>
<td>The number of ms spent executing client scripts</td>
</tr>
<tr>
<td>UI Policy Time</td>
<td>The number of ms spent executing ui policy</td>
</tr>
<tr>
<td>Type</td>
<td>Type of transaction (one of Form, List, Other)</td>
</tr>
<tr>
<td>Table</td>
<td>The table that was displayed e.g. incident, change_request</td>
</tr>
<tr>
<td>View</td>
<td>The view for this form/list</td>
</tr>
</tbody>
</table>

Client Detailed Information

A more detailed breakdown of the client timings for all Form rendering (but not list rendering) is also tracked. To see details, drill into a particular client transaction record and observe the related list at the base of the screen.
Table 601: Client Detailed Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>The order during the load that this operation occurred</td>
</tr>
<tr>
<td>Type</td>
<td>The type of operation</td>
</tr>
<tr>
<td>Name</td>
<td>Descriptive name of this particular operation</td>
</tr>
<tr>
<td>Duration</td>
<td>Number of ms this particular operation took to complete</td>
</tr>
</tbody>
</table>

Email logs

The email log records all email notifications sent from all instances within the system.
This is a verbose and unfiltered view of email. For a more detailed view, see the System Mailbox application.
This log provides the following information for all notifications.

Table 602: Email log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox to use for filtering the email notifications displayed.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the notification (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email notification (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The status of the email notification. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• received: The server received this email.</td>
</tr>
<tr>
<td></td>
<td>• received - ignored: The server received this email, but it was ignored by</td>
</tr>
<tr>
<td></td>
<td>the instance for inbound email action purposes. Typically, these emails are</td>
</tr>
<tr>
<td></td>
<td>either spam or auto-replies. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - failed: The server has attempted to send the email and failed. See</td>
</tr>
<tr>
<td></td>
<td>the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ignored: The server skipped sending this email. Typically, this is</td>
</tr>
<tr>
<td></td>
<td>for an email which was generated but lacked a recipient email address or is</td>
</tr>
<tr>
<td></td>
<td>a duplicate email. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ready: The email is ready to be sent, but has not been sent out by</td>
</tr>
<tr>
<td></td>
<td>the mail server. Typically, an email remains in this state for only a short</td>
</tr>
<tr>
<td></td>
<td>time.</td>
</tr>
<tr>
<td></td>
<td>• sent: The email was sent by the instance without any errors or issues.</td>
</tr>
<tr>
<td>Target</td>
<td>A Document ID reference to the record if the email is generated by an insert,</td>
</tr>
<tr>
<td></td>
<td>update, or delete of a particular record.</td>
</tr>
<tr>
<td>User</td>
<td>The name of the user, from the user record, of the instance from which the</td>
</tr>
<tr>
<td></td>
<td>email notification was sent.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This is a string field.</td>
</tr>
<tr>
<td>Notification Type</td>
<td>The type of notification. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• SMS</td>
</tr>
<tr>
<td></td>
<td>• SMTP</td>
</tr>
<tr>
<td>UID</td>
<td>The unique ID for the server.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time of the email activity for the locale of the machine running</td>
</tr>
<tr>
<td></td>
<td>the instance.</td>
</tr>
<tr>
<td>Deleted</td>
<td>An indication of whether the email was deleted from an instance mailbox.</td>
</tr>
<tr>
<td>Weight</td>
<td>The weight of the email, which determines the sending priority relative to</td>
</tr>
<tr>
<td></td>
<td>other notifications on the same table.</td>
</tr>
<tr>
<td>Importance</td>
<td>An indication that the email was sent with a changed level of importance,</td>
</tr>
<tr>
<td></td>
<td>such as Urgent.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Originating Event and Notification</td>
<td>An embedded list that stores the event and notification that initiated the email notification. For more information, see <em>Events</em> on page 2996.</td>
</tr>
<tr>
<td>Subject</td>
<td>A configured description of the action that generated the email notification. You create the subject text for notifications in <em>System Notification &gt; Email &gt; Notifications</em>.</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email address of the recipient of each notification.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

Invalid email addresses that the instance strips out of outbound email messages are logged, starting with the Geneva release.

**Outbound email notification recipients**

For outbound notifications, the email system log provides reasons that recipients were included or excluded.

Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.

A series of system properties can be used to fine-tune the information to be logged. Two master switch properties, `glide.notification.recipient.include_logging` and `glide.notification.recipient.exclude_logging`, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.
Event logs

The event log records all system events that occur within the system.

This log provides the following information for all events that occur:

Table 603: Event log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the event for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the event. You configure events in <strong>System Definition</strong> &gt; <strong>Business Rules</strong>.</td>
</tr>
<tr>
<td>Parm1</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Parm2</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Table</td>
<td>Database table acted on for this event.</td>
</tr>
<tr>
<td>Processed</td>
<td>Date and time the event was processed This time reflects the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Processing time</td>
<td>Time taken to process this event, in milliseconds.</td>
</tr>
<tr>
<td>Queue</td>
<td>Processor queue name.</td>
</tr>
</tbody>
</table>

Import logs

The import log displays information in a verbose format about any data import activity within the platform.

For a more detailed view of the import sets that produced a particular log, see **Import Sets** > **Transform History**.

This log provides the following information for all imports:
Table 604: Import log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the import for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. For import files, the level is Information.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated message regarding the status of the import.</td>
</tr>
<tr>
<td>Source</td>
<td>Name of the external source of the import, such as an integration.</td>
</tr>
</tbody>
</table>

**Workflow logging**

Certain workflow information is tracked in the system logs.

- Each activity executed, including:
  - Date and time started
  - Date and time ended
  - State, for example, Finished, Cancelled, Timed Out, Error
  - Result
  - Fault description, if there was an error

- Transition history, including:
  - Time of transition
  - Activity transitioned from
  - Activity transitioned to
  - Which transition was triggered

- Workflow log, including any log statements added to the workflow

**Configuration logging**

Certain configuration changes are tracked in the system logs.

- Action taken, including insert, update, and delete
- Category of change
- Comments recorded with the change
- Name of the change
- XML difference of the change
- Update set the change is associated to
- Date and time of the change
- User who made the change
- Table where the change was made
- Name of the object being changed
- Type of object being changed
- View the change was made in, for changes to forms or lists
Log utilities

The instance provides the utilities log file browser and log file download.

Use **System Logs > Log File Browser** to view any system log entry. You can search for log files by using the following filters:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start time</td>
<td>Start date and time of the range you want to search, for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Session ID</td>
<td>System-generated hexadecimal string that identifies the session that generated the log entry.</td>
</tr>
<tr>
<td>End time</td>
<td>End date and time of the range you want to search, for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated description of the occurrence.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. The levels are Debug, Error, Warning, and Information. A warning is an error that has been handled and recovered. An error is something that must be fixed.</td>
</tr>
<tr>
<td>Thread name</td>
<td>System-generated identifier of the thread that created the log file.</td>
</tr>
<tr>
<td>Max rows</td>
<td>Maximum number of records returned for a particular filter.</td>
</tr>
</tbody>
</table>

The instance creates compressed archives of system logs every two days and purges log archives after 21 days. You can download log file archives and view them with **System Logs > Log File Download**. Select a log archive from the list, and then click **Download log** under Related Links to open or save the archive.

**Note:** Log files are only available for the node you are currently logged into. To see the currently logged into node, navigate to **System Diagnostics > Stats**.

Log history

The system uses table rotation and table extension to archive older logs.

By default, the system uses the following schedule to archive common logs:

<table>
<thead>
<tr>
<th>Table</th>
<th>Archive schedule</th>
<th>Rotations</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event [ecc_event]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Queue [ecc_queue]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
</tbody>
</table>
## System diagnostics application

The System Diagnostics application provides logs that relate to the platform.

These logs are available:

- **Upgrade History**: tracks every upgrade to an instance.
- **Slow Queries**: provides insight into how queries affect platform performance. See *Slow Query Logs*.

## Customer updates table

Every change that is made in the system is recorded on the Customer Updates [sys_update_xml] table chronologically.

To navigate to this table, enter `sys_update_xml.list` into the navigation filter.

The following information is stored about each update:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name that identifies the updated record.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time the customer update record was created.</td>
</tr>
<tr>
<td>Created By</td>
<td>The user who performed the change.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the update.</td>
</tr>
<tr>
<td>Updated</td>
<td>The date and time the customer update record was updated.</td>
</tr>
<tr>
<td>Updated By</td>
<td>The user who performed the update.</td>
</tr>
<tr>
<td>Updates</td>
<td>The number of times the record has been updated.</td>
</tr>
<tr>
<td>Target Name</td>
<td>The name of the element that was altered.</td>
</tr>
<tr>
<td>View</td>
<td>The view of the form that was altered if it was a form layout change.</td>
</tr>
<tr>
<td>Payload</td>
<td>The XML contents of the record after the change.</td>
</tr>
<tr>
<td>Remote Update Set</td>
<td>A reference to that update set if the change was performed by a remote update set.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Local Update Set</td>
<td>The update set the change is associated with.</td>
</tr>
</tbody>
</table>

### Email logs

The Emails module links to all of the mail received or sent by the platform.

For more information, see *System Mailboxes*.

### Audited tables

If a field on a particular table is audited, all changes to that field are tracked.

For more information, see *Turning on Auditing (History) for a Table*.

This information is kept in two places:

- The *History sets* on page 2564 table.
- The *Audit table*.

### Understanding the Sys Audit table

The system tracks inserts and changes to audited records in the *Sys Audit* table.

The system audits tables where the *Audit* check box is selected on the Dictionary record. By default, the system does not audit records from system tables, such as update set tables.

**Note:** To prevent performance issues and infinite loops, the system skips any business rule or workflow triggered by inserts to the Sys Audit table.

### Sys audit record information

Information about a change is stored in a Sys Audit record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablename</td>
<td>Table that the audit record is for (for example, &quot;incident&quot;)</td>
</tr>
<tr>
<td>fieldname</td>
<td>Column in the table that the audit record is for (for example, &quot;assigned_to&quot;)</td>
</tr>
<tr>
<td>documentkey</td>
<td>sys_id (Unique Record Identifier) of the record the audit record is for.</td>
</tr>
<tr>
<td>oldvalue</td>
<td>Old value of the field change represented by this sys_audit record.</td>
</tr>
<tr>
<td></td>
<td>- Reference fields: Displays the unique sys_id value of the changed record.</td>
</tr>
<tr>
<td></td>
<td>- Date and time fields: Displays the value in Coordinated Universal Time (UTC) as stored in the database.</td>
</tr>
<tr>
<td>newvalue</td>
<td>New value of the field change represented by this sys_audit record.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
| | • Reference fields: Displays the unique sys_id value of the changed record.
| | • Date and time fields: Displays the value in Coordinated Universal Time (UTC) as stored in the database.

View the structure of the sys audit table
You can view the sys audit table from the system definition.

1. From the left navigation pane, select **System Definition > Tables and Columns**.
2. Scroll to **Sys Audit**.
3. Click the table name.
   The Column names and Column attributes are displayed in the second and third pane.

Enable auditing for a table
You can enable table auditing to track all changes to the table's fields.

Role required: admin

1. Navigate to **System Definition > Dictionary**.
2. Select the table to audit. For example, [cmdb_ci_computer].
3. Select the dictionary entry for the table. The table name always has an empty column name and the type of collection.
4. Check the **Audit** check box.
5. Click **Update**.

   **Note:** By default, the system does not audit records from system tables. To audit a system table, add it to the list of tables in the glide.ui.audit_deleted_tables property list.

Tables do not inherit the audit flags from parent or child audited tables. For example, if you enable auditing for the [cmdb_ci] table, only CIs which are stored in that base table will be audited. Likewise, if you enable auditing for the [cmdb_ci_computer] table, only the computer CI records will be audited, including any fields on the [cmdb_ci_computer] table that are inherited from [cmdb_ci] table.

Deletion of an individual record from a form is audited by default. To prevent auditing, set the table's dictionary attribute **no_audit_delete**.

Deletes from a list are audited when **audit** is checked on the table dictionary and the table is not listed in the property glide.db.audit.ignore.delete.

**Audited table information**
Auditing tracks the following record changes.

- The Unique Record Identifier (sys_id) of the record that changed
- The field that changed
- The new field value
- The old field value
- The number of times this record and field have been updated
- The date and time when the change occurred
- The user who made the change
- The reason for the change (if any reason is associated with the change)
- The record's internal checkpoint ID (if the record has multiple versions)
**Exempted table information**

Some updates are not audited despite enabling auditing on a table. This is why you may see 132 updates in a record's history, but only seven audited ones.

Auditing excludes the following information:

- Any updates made by an upgrade.
- Any updates made through import sets.
- Any records in parent or child tables.
- Any field with the `no_audit` dictionary attribute.
- Any system tables not listed in the `glide.ui.audit_deleted_tables` property list.
- Any field that begins with the `sys_` prefix (system fields) except the `sys_class_name` and `sys_domain_id` columns.
- Any time an inactivity monitor touches a record (this prevents you seeing possibly hundreds of updates listed against an incident, with the noise drowning out the useful data).

**Exclude a field from being audited**

You can prevent a field from being audited by adding the `no_audit` dictionary attribute.

Role required: admin

1. Navigate to **System Definition > Dictionary**.
2. Select the table containing the field you want to exclude from auditing. For example, `cmdb_ci_computer`.
3. Select the dictionary entry for the field you want to exclude from auditing. For example, `hardware_status`.
4. In the Attributes field, enter `noAudit`.

**Table auditing history**

The system tracks incident, change, and problem history in the `[sys_audit]` table.

Enabling auditing tracks the creation, update, and deletion of audited records. In addition, auditing activates the History context menu entry. It is not possible to audit individual fields without auditing the entire table. It is possible, however, to hide certain fields from the audit using a dictionary attribute. Auditing certain system tables that receive a large amount of traffic, such as Workflow Contexts `[wf_context]`, can impact performance and is not recommended.

**History sets**

History sets provide a table for tracking an audited record's history.

Each record's History Set will be generated when the record is inserted, if the record is on an audited table. A user must view a record for the system to create or update a history set for that record.

Several fields of information are captured in the History Set record, displayed in the list view.

### Table 608: List View Record Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>An Document ID for the record whose history is being recorded.</td>
</tr>
<tr>
<td>Table</td>
<td>The audited table for the record whose history is being recorded.</td>
</tr>
</tbody>
</table>
Table 609: Audit History Record Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load Time</td>
<td>The amount of time it took to generate the history set.</td>
</tr>
</tbody>
</table>

Field | Input Value |
------|-------------|
Label | The label of the field which was changed.                                  |
Old   | The value before the change.                                               |
New   | The value after the change.                                                |
Type  | Indicates if the entry is for a normal field, an email record, or a relationship change record. |
Update Number | The number of times this field has been changed.                           |
Update Time | The date and time of the change                                           |
User Name | The name of the user who created the change.                               |

History Sets in a Calendar View

Once History Sets are active, the context menu choice History will populate using information from the History Set, rather than from the sys_audit table.

From the user's perspective, the same historical data is available in the same user interface, but the way the information is stored is different.

The History view includes a calendar view, but does not use the normal list interface to filter and interact with the history records. This allows:

• Searching and filtering historic data.
• Exporting historic data.

Viewing history sets

There are two ways of viewing the history set, accessible through the Context Menu action History.

Differences Between Audit and History Sets

The Audit [sys_audit], History Sets [sys_history_set], and History [sys_history_line] tables store the same data, but they serve different purposes and manage data differently.

The Audit [sys_audit] table is where the system stores historical information for all records. These records are intended to be kept forever so that administrators can always track the history of audited records. As the number of auditing records grows over time it becomes more and more inefficient to directly query the Audit table for historical information. It is much more efficient to run queries only on the smaller subset records you actually want to view historical information for.

The History Set [sys_history_set] table identifies which particular records from an audited table have historical information. The History [sys_history_line] table stores the actual changes to field values that
occurred. The system automatically generates History Set and History records as needed from the Audit table when a user either creates a record or requests its history. Rather than containing a complete history of all changes in the system, History Set and History records only contain a recent subset of historical information for records where users have created or requested such information.

The system limits History Set and History records by:

- Having the table cleaner delete History Set records that have not been updated in 30 days.
- Using table rotation to rotate between four History tables every seven days. This means the system drops History records that are older than 28 days.

Should someone need historical information again at a later date, the system can regenerate it from auditing source records.

After the system generates History Set records, the context menu choice History uses the History Set rather than Audit records. From the user's perspective, the same historical data is available in the same user interface, but the way the information is stored is different.

**Tracking changes to reference fields**

Administrators can track changes to reference field display values.

Since reference fields only store an ID value, the system can normally only audit changes when the ID value changes. By default, the system does not audit changes when a reference field display value changes.

Consider the following situation. A user changes her name from Jane Smith to Jane Miller. Since the user name is the display value for the User table, any previous reference to Jane Smith instead refers to Jane Miller. If the administrator just updates the name of the existing user record, audit and history records will only display the new name Jane Miller. By default, the system does not provide a way to distinguish between changes made under the original user name versus those made with the new user name.

If your auditing policy requires tracking user name changes, you can:

- Create a new user record for the new name and deactivate the previous user record. The system preserves audit records for the old user name and creates future audit records with the new user name.
- Create custom fields and a business rule to save the previous name and the date of the name change. The system can use this information to construct the proper names in audit and history records.

**Tracking inserts**

By default, the system does not create Audit records for inserts because in a typical instance, inserts can account for over 80% of the size of the Audit table.

Not tracking inserts allows for better performance and a much smaller Audit table. Administrators can enable auditing of inserts by setting the glide.sys.audit_inserts property to true.

**View history of a CI**

When auditing is enabled for a table that you have access to, you can see a full history of changes for any record in the table. You can view the history of changes in a calendar or list format. For a CI, you can also view its history in a timeline format.

Role required: admin

1. Right-click the form header, and then click History.
2. Select a format for the history.
   
   You can select Calendar or List. On a CI form, you also have the Timeline option.
CI Relationships and History

Changes to a CI relationship (CI Relations, CI/User Relations, or CI/Group Relations) appear in the history of the items on both sides of the changed relationship regardless of whether the change was manual or a result of Discovery.

For example, if the computer alpha has a used by CI Relation with the computer beta, then the history for alpha will have a record of when the relationship with beta was established, and likewise, the history for beta will have a record of when the relationship with alpha was established. The screenshot below shows an example of the history displayed when some CI Relations are established, and when one of them is removed:

![Figure 716: CI Relationship History](image)

The created bullet indicates the date that the CI, user, or group was created. The last activity bullet refers to when the relationships were last changed. If you don't want to show CI relationship history for any or all CI relationship types, you can turn it off by disabling auditing on the CI relationship tables (CI Relationship [cmdb_rel_ci], CI/User Relationship Type [cmdb_rel_user_type], or Group Relationship [cmdb_rel_group]).

Control access to history

You can give a role access to view audit history by setting a system property.
Role required: admin

1. Navigate to **System Properties > System**.
2. In the property List of roles (comma-separated) that can access the history of a record, enter the user roles you want to access history.
3. Click **Save**.

Any changes to a field are omitted if a user without read-access views the history of a record.

**History List**

The history list displays each change as its own row in the change list.
Figure 717: View History List

Click on a row item to view additional details about the change.
To view a history list, the following requirements must be met.

- **Auditing**: Auditing for the table must be enabled to view a history list.
- **ACLs**: By default, the List history option is only available to users with the admin user role. To enable this option to non-admins, create a custom ACL rule granting read access to the Record History [sys_history_set] table.
- **Roles**: At least one of the roles that the user has must be included in the glide.history.role property, which includes the itil role by default.

**Change the number of history entries**

By default, the history displays a maximum of 250 history entries, but you can change this value.
Role required: admin

1. Navigate to System Properties > System.
2. In the property Maximum number of field entries displayed in record history, default is 250, enter a new maximum number of entries.

History Calendar

The history calendar shows you the days where the record was changed, who made the change, and when.

Each user is assigned a color so you can tell at a glance the times a record was changed by a particular person. For example:

Figure 719: Changes Made by Sys Admin

Figure 720: Changes Made by ITIL User

To highlight changes to a particular field, select the field from the Highlight changes to field selection box. Picking a field from this selection box changes the calendar to highlight the times that field was changed. Hover over the text of one of a highlighted change to see the change in value.

</table>
You can click on the day number to get a view of the changes for that day. You can also click on the week number to the left to get a the week view. You can scroll to and from month to month to see changes.

Timeline of CI changes

You can view a timeline of changes for a CI and its relationships, and proposed changes for the CI. Timelines are available for CIs in the Configuration Item [cmdb_ci] table or a descendant of this table, if auditing is enabled for the tables.

Role required: The ACL for this view is based on the roles defined in the glide.history.role system property, which by default is set to util. Also, the user must have read access to the History Set [sys_history_set] table, which by default is granted to admin.

You can open a timeline when you view the history of a CI. You can specify the time period, time range, and properties that are displayed in the timeline. You can view either what has changed in a particular change set, or view the entire CI to better troubleshoot any issues. You can also export and compare snapshots of the CI at any point in time.

CI changes are represented by bubbles in different shapes and colors along the timeline. The shape of each bubble represents a different type of change and the color of each bubble specifies whether the change is valid or invalid. Click the ? icon to display bubble shape and color definitions, and point to a bubble to display details about the change set.

A change to a relationship is considered valid only if it was applied through change management. If the change was applied via the Proposed Changes framework - then it is valid.

---

**Figure 723: History Timeline view**
Figure 724: Timeline bubbles

Note: Proposed changes that do not have a planned start date are placed at future points of time.

Timeline navigator

Use the handles on both ends of the timeline navigator to extend or to shorten the time period that is shown.

You can scroll to a different period of time by clicking on the bottom part of the timeline navigator and then dragging the navigator to the left or right.

Zoom

By default, the timeline for the last month is shown. Next to the Zoom label above the timeline, you can select another time interval. You can select intervals from a minute to the entire period of data.

If there are many changes of the CI during the time period, the bubbles displayed might get too crowded. You can zoom in or out to spread the bubbles in either method:

- Change the time interval on the timeline. As you shorten the time interval, you zoom in, and as you lengthen the time interval, you zoom out.
- Select the section of the timeline that you want to zoom into.

Property filter

You can filter the bubbles that are displayed. By default, all bubbles are displayed, representing changes to all of the CI's properties. You can limit the view to display only the bubbles in which selected properties have changed and exclude bubbles in which only unselected properties changed.

The Detail and Summary views highlight properties within your filter scope that have changed. The changed properties are highlighted in light blue.

In the Summary view, you can choose to include all the properties of the CI, or only properties that have changed. If you choose to display all properties in the summary view, then changed properties are listed before unchanged properties.
Summary view

The **Summary** view displays snapshots of the CI's represented by each bubble. Each snapshot displays the changes to the CI's fields and relationships according to the change set. It displays old and new values before and after the change, and any relationships that were added or deleted.

Use the > and < buttons on both sides of the snapshot display to scroll through the next and previous change set records in a chronological order.

Detail view

The **Detail** view displays snapshots of the CI that correspond with the bubbles. Each snapshot includes the fields that are within the property filter scope, displaying the properties that have changed with a light blue background. Click on a bubble to display its corresponding snapshot of the CI. The data that is displayed is read-only.

Use the > and < buttons on both sides to scroll through the next and previous change set records in a chronological order.

**View timeline of changes to related records**

On the timeline of changes for a CI view, you can also view a timeline of changes to the CI's related records.

The CI must be in the Configuration Item [cmdb_ci] table or a descendant of this table. Auditing must be enabled for the table containing the CI.

Role required: admin

1. Open the timeline for the CI.
2. Click the Related Records icon and select related records from the List of Related Records to view. Click the Related Records icon again to display the related records timeline.

The timeline of changes to the CI's related records is displayed above the CI's timeline. If you uncheck all related records, the related records timeline is hidden.

Hover over a change bubble on the related records timeline to display details about the change, such as date and number of changed properties. As you change the time interval in focus, or zoom in or out, it affects both the CI timeline and the related records timeline simultaneously.

**Export a snapshot of a CI**

You can export a snapshot of a CI from its timeline.

The CI must be in the Configuration Item [cmdb_ci] table or a descendant of this table. Auditing must be enabled for the table containing the CI.

Role required: admin

You can export a snapshot of the CI to an XML, PDF (Portal), or PDF (Landscape) format.

1. Open the timeline for the CI.
2. Select the bubble representing the time for which you want to export a snapshot of the CI.
3. Click the export icon ( ).
4. Select the file format to use for the export. You can download the file to your system for viewing.

**Compare CI snapshots**

You can compare the properties and relationships of a CI at two different points in its timeline.
The CI must be in the Configuration Item [cmdb_ci] table or a descendant of this table. Auditing must be enabled for the table containing the CI.

Role required: admin
1. Open the timeline for the CI.
2. Click **Compare**.
3. Select a **Start** date and an **End** date.
4. Click **Compare**.

**Restore deleted records**

In some cases, administrators can restore deleted records and references to those records.

For example, if a user inadvertently deletes a user record that was referenced in the **Caller ID** field on several incident records, you may be able to restore the user record as well as the incident field values. You may also be able to restore records that were deleted as a result of a cascade delete action.

There are several methods for restoring deleted records:

- Restore **data records without references** on tables that audit deletions.
- Restore data records and references on tables that audit deletions (requires the Restore Deleted Records plugin).
- Restore configuration records with the app creator.

**Restore deleted records**

You can restore data records without references on tables that audit deletions.

Role required: admin
1. Navigate to **System Definition > Deleted Records**.
2. Select the check boxes beside the records you want to restore.
3. In the **Actions** choice list below the list, select **Undelete Records**.

![Actions on selected rows](image)

**Restore data records with deletion audits**

You can restore deleted data records on tables that audit deletions.

You can restore deleted data records on tables that audit deletions. Limitations for restoring data records include:

- Record deletions are not tracked for tables with the `no_audit_delete=true` dictionary attribute.
• **Attachments** are not restored when the record is restored.
• Deletions from tables with a sys prefix are not audited by default. You can use the app creator to restore configuration records, such as Business Rules [sys_script]. You can also configure specific system tables to audit deletions.
• References are restored only if the reference field is on an audited table and the Restore Deleted Records plugin is activated.
• References that use an Image field type are not restored.

**Configure a system table for a deletion audit**

Deletions from tables with a sys prefix are not audited by default. To track deletions from these tables, add the table name to the glide.ui.audit_deleted_tables property.

Role required: admin

Enabling the Restore Deleted Records plugin adds several default values to this property.

1. Navigate to System Properties > UI Properties.
2. Locate the List of system tables (beginning with "sys", comma separated) that will have the delete audited property.
3. Add or remove table names. Table names should be separated by commas, without any spaces.
4. Click Save.

**Note:** For more information about auditing, see Understanding the sys audit Table.

**Restore a deleted configuration record**

You can use the app creator to restore deleted configuration records with related records and references.

Role required: admin

Limitations for restoring configuration records include:

• You cannot restore a record if its parent record is deleted. For example, you cannot restore a field on a deleted table. You must restore the parent record first.
• When a record is deleted, the application file stores a reference to the current record version. You can only restore records when this reference and version record exist.

To restore a configuration record:

1. Navigate to System Applications > Deleted Application Files.
2. Locate the configuration record you want to restore. For example:
   • For an application, filter on Table name is Custom Application and look for the application name.
   • For a table, filter on Table name is Table and look for the table name.
   • For a field, filter on Table name is Dictionary Entry and look for the field name.
3. Open the record.
4. Review the related records and references that will be restored with the selected record. These related lists display any applicable records.
Geneva  ServiceNow  ServiceNow Platform

• Deleted Files - Descendants: configuration records that were deleted with the application, table, or field. For example, restoring a table also restores all the fields and labels that were deleted with the table.
• Deleted Files - References: configuration records that referenced the record and were deleted because of a cascade delete rule.
• Deleted Data: data records on audited tables that referenced the record and were deleted because of a cascade delete rule.
• Cleared References: reference field values that were cleared in data and configuration records.

5. Click Restore File.
6. In the confirmation dialog, click OK.
   The record and all restorable related records and references are restored.

Domain separation

Domain separation (also known as multi-tenancy) is a way to separate data into logically-defined domains. Domain separation is best for those customers who:
• Need to enforce absolute data segregation between business entities (data separation).
• Customize business process definitions and user interfaces for each domain (delegated administration).
• Maintain some global processes and global reporting in a single instance.
• Separate data between customers or sub-organizations.
• Have minor or moderate process differences only among customers or sub-organizations.

Alternatives to domain separation include:
• Before business rules
• Access control list rules (ACLs)
• Filters
• Security on related record
• Custom views
• Form layouts
• Notifications
• UI action conditions
• Advanced reference qualifiers

Warning: Before activating domain separation, consult your representative to verify that it is suitable for your environment. Domain separation adds a level of administration overhead. Although it can be disabled, it cannot be removed from an instance.

Data separation

Members of a domain only see the data contained within their domain or the child domains that are lower in the domain hierarchy. By default, all users and all records are members of the global domain unless an administrator assigns them to a particular domain. Once you assign a user or a record to a domain, the instance compares the user's domain to the record's domain to determine whether the user can view the record. For example, consider the following domain hierarchy:
Geneva    ServiceNow    ServiceNow Platform

Figure 725: Sample domain hierarchy

Domain: Global

Domain: Database

- MIL User
- Beth Anglin
- Fred Luddy

Domain: Database

- Atlanta
  - Bow Ruggeri

Domain: Database

- San Diego
  - Don Goodliffe

Domain: NY DB

- David Loo

Records in the global domain are visible to all users.

Users in a parent domain can see and manage records in child domains.

Users in a child domain cannot see or manage records in a parent domain.
In this domain hierarchy:

- Bow Ruggeri can see any records in the Database Atlanta or the global domain.
- Don Goodliffe can see any records in the Database San Diego or the global domain.
- David Loo can see any records in the NY DB or the global domain.
- Fred Luddy, ITIL User, Beth Anglin can see any records in the Database, Database Atlanta, Database San Diego, NY DB, or the global domain.

Users in the global domain can see all records, regardless of the record's domain settings. If a user is a member of another domain, then there is no single visibility setting that allows users to see across domains or allows users to see records at a higher level in the hierarchy.

**Note:** Guest users must be part of the global domain.

### Exceptions to data separation

In general, data defined at a higher level in the domain hierarchy is not visible at lower levels in the hierarchy. However, the following records behave like policies:

- Form sections
- Options in a choice list

When defined at a higher level in the hierarchy, these records are visible in child domains.

### Request domain separation

All domain support features are activated with one plugin called Domain Support - Domain Extensions. Administrator can request activation of this plugin.

Role required: admin

The plugin replaces these plugins from previous releases:

- Domain Support (version 2.0)
- Domain Support - Common
- Domain Support - MSP Extensions

1. In the HI Service Portal, click **Service Catalog** > **Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
3. Click **Submit**.

### Domain assignment

By default, domain separation adds a domain field to the Task [task] and Configuration Item [cmdb_ci] tables and their extensions.

You can also extend domain separation to any new tables you create by adding a **sys_domain** field to the table's dictionary definition. By default, the system only domain separates platform and baseline application tables where appropriate.

**Warning:** ServiceNow does not recommend domain separating platform tables (any table with the sys_ prefix such as the Dictionary Entry [sys_dictionary] and Dictionary Entry Override [sys_dictionary_override] tables) because it can produce unexpected results.

The value of the **sys_domain** field contains the domain assigned to the record by any of the following:

- Company to which the user belongs
- Business rule when creating record
- Module used when creating record
- Form template used when creating record
- Domain of the parent record
- Domain assigned to User record
- Domain of the user who creates it

**Domain separation restrictions:**

The system prevents the following tables from being domain separated:

- **Access Control** [sys_security_acl]
- **Script Include** [sys_script_include]
- **System Property** [sys_properties]
- **Security Black/Whitelist Entities** [sys_security_restricted_list]
- **Dictionary Entry** [sys_dictionary]
- **Dictionary Entry Override** [sys_dictionary_override]

### User-based assignment

Administrators can quickly assign users to a domain by assigning them to a company. After users are assigned to a domain, records automatically inherit the user's domain.

Administrators can automatically assign users to domains:

- Based on a company record
- Based on a default domain
For example, assigning Bow Ruggeri to the ACME company automatically assigns him to the ACME domain. Assigning Don Goodliffe to the Initech company automatically assigns him to the Initech domain. Any records they create are automatically added to the appropriate domain.

Figure 726: Adding a user to a domain by setting the company

**Business-rule-based assignment**

Administrators can use a business rule to automatically set a domain value when creating a record. The business rule must set a value in the `sys_domain` field. Administrators must ensure there is a `sys_domain` column available for the record's table.

**Module-based assignment**

Administrators can use the `sysparm_domain` URL parameter to automatically assign new records to a particular domain from a module. Administrators must create a module with an **Argument** value of: `sysparm_domain=sys_ID of domain`.

**Template-based assignment**

Administrators can use a form template to automatically assign new records to a particular domain. Administrators must add the `sys_domain` field to the form and select a domain value. For example, setting the `sys_domain` field to **TOP/ACME domain** automatically assigns all records from this template to the TOP/ACME domain.

**Table-class-based assignment**

By default, related records inherit the domain of the parent record. For example:

- A change task record inherits the domain of the parent change request record.
- A problem record inherits the domain of the parent incident record.
Record-based assignment

If no other domain conditions apply, a record automatically inherits the domain of the user who creates it.

Domain visibility

Domain visibility determines whether users from one domain can access records from another domain. For example, if Don Goodliffe is in the Database domain, and Bow Ruggeri is in the Network domain, and no incidents are in the global domain, then Don Goodliffe cannot access Bow Ruggeri’s incidents since data separation prevents this.

Note: While visibility is one method to allow users to access records, it is recommended that you use **Contains** for more robust control.

Figure 727: A sample set of domain separated incident records

Figure 728: Bow Ruggeri’s incident list
You can add the Database domain as a Visibility Domain to the Bow Ruggeri's user record (Visibility Domains is a related list on the user record). Then, Bow Ruggeri can access Don Goodliffe's incidents since he now has visibility to the Database domain. If you remove the visibility domain, then Bow Ruggeri can no longer access incidents in the Database domain.

Users can also inherit visibility domains based on their group membership if you set the domain table to the Group [sys_user_group] table. For example, as a member of the Database group, Don Goodliffe also automatically gains the Database domain as a visibility domain. Group membership grants visibility to any matching domain name.
Contains domains

Normally parent-child relationships define the domain hierarchy. A **Contains** domain allows you to relate domains on an as-needed basis, independent of parent-child relationships.

However, contains domains only grant visibility to domain data. Processes remain unaffected by contains relationships.

**Note:** Visibility controls what a particular user can see, while **Contains** controls what an entire domain of users can see.
Contains domains versus visibility domains

Contains domains and visibility domains differ in several respects.

A **contains** domain:

- Is a many-to-many, domain-to-domain relationship.
- Is hierarchical. When a domain is selected, you can see the data from that domain and its children.
- Is controlled by the selection in the domain picker.

A **visibility** domain:

- Is a user-to-domain relationship and is explicitly granted.
- Is not hierarchical.
- Is not controlled by the selection in the domain picker. Once the user is granted access to a visibility domain, they always see data in that domain and its children.

For example, there is a user who has access to domain A (the user's home domain) and is granted visibility to domains B and C. The user selects domain A in the domain picker. In this case, the user has access to domains A, B, and C. If the user changes the domain picker to domain B, B and C are visible. C is still visible because the user still has visibility to it. A is not visible, because it is not selected in the domain picker and it is not a visibility domain.

Using visibility domains excessively is not recommended.

Domain scope

Domain scope defines what users can and cannot have access to.

Every user has two domain scopes when establishing a session in a domain separated instance.

- Session scope is set upon session establishment to the domain listed in the user's user record. Users can manually change their session domain scope from the domain picker.
- Record scope uses the domain of the record and is active when viewing the form of any record.

By default, the record scope takes precedence over the session scope so that fulfillers in higher level domains adhere to each record's data and process constraints. However, these fulfillers can choose to expand or collapse the domain scope to show or hide data from other domains. For example, a user in the MSP domain also has visibility into child domains such as the ACME domain. When looking at an incident record from the ACME domain, the user can choose to expand the domain scope to show values from the MSP domain or collapse the domain scope to only show record values that match the record's ACME domain.

| Note: | Users always have access to data from domains that have been explicitly granted to them by domain visibility. |

Users with the domain expand scope user role can select the domain scope from the **Toggle Domain Scope** UI action on the form. When record scope is in effect, click the UI action to expand to session scope and display all data available based to the user's domain and child domains. When session scope is in effect, click the UI action to collapse to record scope and display only data that matches the current record's domain.

| Note: | A record will not display the UI action to toggle the domain scope if the record is in the global domain or if the user's domain matches the record's domain. |
Record value selection from other domains

Users who can see multiple domains have the option to select record values from a domain that is different than the record's domain.

For example, service desk agents working for a managed service provider might want to assign certain incidents to themselves to resolve issues on behalf of their customers. When they do this, the incident Assigned to field might contain a user from the MSP domain, even though the incident record itself is associated with a child domain such as ACME.

Selecting a record value from another domain does not change the record's domain. The record retains its original domain. When a user views a record with values from multiple domains, the user's domain visibility determines what they see.

<table>
<thead>
<tr>
<th>When these conditions are met</th>
<th>The user has access to these UI elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>The user has access to the domain of the current record referenced in a field.</td>
<td>The user can:</td>
</tr>
<tr>
<td></td>
<td>• See reference field display value. For example, sees the user name in the Assigned to field.</td>
</tr>
<tr>
<td></td>
<td>• See the related record from reference icon. For example, sees the user record for the user in the Assigned to field.</td>
</tr>
<tr>
<td></td>
<td>• Select values from any visible domain. For example, can select users from either the MSP and ACME domains.</td>
</tr>
<tr>
<td>The user does not have access to the domain of the current record referenced in a field.</td>
<td>The user can:</td>
</tr>
<tr>
<td></td>
<td>• See the reference field display value. For example, sees the user name in the Assigned to field.</td>
</tr>
<tr>
<td></td>
<td>• Only select values from the record's domain. For example, can only select users from the ACME domain.</td>
</tr>
</tbody>
</table>

Delegated administration

Delegated administration allows administrators to set domain-specific policies.

The policies set lower in the domain hierarchy override policies set higher in the domain hierarchy. While in a domain, administrators can set domain-specific versions of these global policies and settings:

- Client scripts
- System policies
- Application and module names
- Application roles
- Module filters
**Warning:** All users with the admin role have special access to all system features, functions, and data because administrators can override ACL rules and pass all role checks. Grant this privilege carefully.

When users have the **admin** role, then all policies in the instance are available to them regardless of the assigned domain. They can enter a specific domain, and then only policies in that domain or higher are visible and processed during a relevant transaction. When an administrator modifies a policy that is in a higher domain or the global domain, the system automatically creates a new record for that administrator's current domain. It does not modify the original policy, application, or module record. This new record overrides the original.

**Note:** To make changes to a policy in a lower-level domain, go into that domain and modify the policy. This approach creates the new policy record in your domain that overrides the original, higher-level policy record.

Do not make changes on the higher-level policy and then change the **Domain** field on that policy. This approach does not create a new policy record in your lower-level domain, nor does it keep the policy record for the higher-level domain.

The **sys_overrides** field indicates that a policy, application, or module at a lower level in the hierarchy overrides a record at a higher level. The system automatically sets this field when an administrator attempts to modify a policy, application, or module that belongs to another domain higher in the hierarchy. Again, rather than actually changing the higher level record, the attempted update is changed into an insert, and the **sys_overrides** field is set to indicate the higher level policy, application, or module that is being overridden. Later when the records for a relevant transaction are loaded, the overriding domain-specific policy, application, or module is used instead of the original.

**Domains for delegated administration**

By default, delegated administration always uses the record's domain to determine what policies to apply. The record's domain takes precedence over the user's domain. If there are no policies in the record's domain, delegated administration checks for policies in the next highest level of the domain hierarchy. The search for domain policies continues up the domain hierarchy until reaching the global domain. If there are no domain policies lower in the domain hierarchy, delegated administration uses the policies for the global domain.

For example, Fred Luddy is a user in the Database domain who can see records in the Database: Atlanta, Database: San Diego, and NY DB child domains. When he opens a record in the Database: San Diego domain, delegated administration first checks for policies in the Database: San Diego domain. If there are no policies at this level of the domain hierarchy, delegated administration checks for policies from the Database domain. If there are no policies in the Database domain, delegated administration uses the global domain policies as there are no other domains higher in the domain hierarchy.

**Example delegated administration with domain specific applications and modules**

The following example illustrates delegated administration with domain-specific applications and modules. As the administrator of the Database domain, David Loo decides to customize the Configuration application. To start with, David reviews the modules available in the Configuration application module.
Figure 732: Starting view of the Configuration application

David decides to rename the Configuration application to CMDB and to allow the inventory_admin role to see the application.

Figure 733: Sample domain-specific changes to the Configuration application
Next, David decides to change the Incident application by activating the **Open - in "New" State** module and adding a new filter item to show open incidents in the Database category.

![Sample domain-specific changes to the Open - "New" State module](image)

This creates a new module entry in the application rather than overwriting the existing module in the global domain.

**Figure 734: Sample domain-specific changes to the Open - "New" State module**
Figure 735: Domain-specific view of the Incident application
If another administrator from another domain, such as Fred Luddy, logs in and looks at the Configuration application, he see the settings from the global domain.

Figure 736: David Loo's view of applications
Example delegated administration with domain specific policies

The following example illustrates delegated administration with domain-specific policies. In this hierarchy David Loo is in the Database domain and Don Goodliffe is in the Database/Database San Diego domain. To begin, David Loo makes a change to the global assignment policy.

Then Don Goodliffe also makes a change to the same policy. Initially, all assignment rules have a global domain as shown below:
Figure 738: Global domain rules

If David Loo updates the assignment rule for **Database or Software**, the following list appears:

Figure 739: Database domain-specific rules
The following policy changes occur:

- When the policy is chosen and updated, the system detects that David Loo is not at the right level of the hierarchy to change this record. Therefore, the update is changed into an insert, and a new record is created.
- The new policy has the same name (Database or Software).

Notice that this policy is in the Database domain and overrides the policy that previously applied (Database or Software). Notice that there are now two policy entries with the same name. Because this is not desirable, David opens the record and changes the name to something appropriate. After the update, the list appears as follows.

Figure 740: Renamed database or software to database specific policy
