ServiceNow Platform

The ServiceNow Platform is a powerful cloud application platform that enables you to link real-time data with activities, tasks, and processes to achieve better work outcomes.

Navigation and the user interface

The user interface (UI) is the main way to interact with the applications and information in a ServiceNow instance.

The following versions of the user interface are available. Each new version is intended to provide an updated look and usability improvements.

UI16

Notable features of the UI16 interface include real-time form updates, user presence, a redesigned application navigator with tabs for favorites and history, and enhanced activity streams. UI16 is the default user interface for new instances. For upgraded instances, an administrator must activate UI16.
UI15

Features introduced in the UI15 interface included redesigned icons, the ability to specify when related lists load with a form and other new options on the system menu, and form personalization.

Figure 2: UI15 user interface

UI11

UI11 builds on the classic user interface by adding the Edge and several features including split screen, bookmarks, and flyout windows. UI11 is activated but disabled by default.
Figure 3: UI11 user interface

Table 1: User interface components

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Banner frame</td>
<td>Displays at the top of every page and contains a logo, global navigation controls, and tools. See <em>UI16 banner frame</em> on page 18, <em>UI15 banner frame</em> on page 21, or <em>UI11 banner frame</em> on page 26.</td>
</tr>
<tr>
<td>Application navigator</td>
<td>Also called the left-navigation bar. Provides links to all applications and modules. See <em>UI16 application navigator</em> on page 31, <em>UI15 application navigator</em> on page 38, or <em>UI11 application navigator</em> on page 40.</td>
</tr>
<tr>
<td>Content frame</td>
<td>Displays information such as lists, forms, homepages, and wizards.</td>
</tr>
<tr>
<td>The Edge</td>
<td>A toolbar on the left side of the UI15 and UI11 interfaces that provides quick links to commonly used features. See <em>The Edge</em> on page 27.</td>
</tr>
<tr>
<td></td>
<td>In UI16, the Edge is replaced by the <em>Favorites</em> tab of the application navigator represented by a star. The collapsed view of the UI16 application navigator is similar to the Edge.</td>
</tr>
</tbody>
</table>
Activate UI16

UI16 is the default user interface for new instances. For upgraded instances, you can activate the UI16 plugin (com.glide.ui.ui16) if you have the admin role.

Confirm that the instance upgrade completed successfully by visiting the Upgrade Monitor page.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Logging in

Each ServiceNow instance has a unique, secure web address. The base URL for each instance has the default format: https://<instancename>.service-now.com

Role required: none

Users log in to the instance from a web browser. Administrators can create a custom URL that redirects to the assigned URL, if needed.

1. Enter the base URL in any web browser.
   - If your system uses external authentication, you are automatically logged in. For example, you may log in to company services when you log in to your computer.
   - If your system does not use external authentication, the Welcome page appears.
2. Enter your user name and password.
3. Optional: Select the Remember Me check box to remain logged in until you manually log out.
   - This option can be enabled or disabled by the administrator. For more information, see Remember me login cookie on page 2457.
4. Press the Enter key or click Login.

Generally supported browsers

Browser support varies for each version of the user interface (UI). Most major browsers are supported.

Note: Some features have additional browser requirements, which are noted in the appropriate documentation.
Table 2: Browser support for each UI version

<table>
<thead>
<tr>
<th>UI version</th>
<th>Chrome support</th>
<th>Firefox support</th>
<th>Internet Explorer support</th>
<th>Microsoft Edge support</th>
<th>Safari support</th>
</tr>
</thead>
<tbody>
<tr>

<td>Latest public release of Firefox or Firefox ESR</td>
<td>9 and up • Edge mode is supported</td>
<td>Latest public release</td>
<td>6.1 and up</td>
</tr>
<tr>
<td>UI15</td>
<td>Latest public release</td>
<td>Latest public release of Firefox or Firefox ESR</td>
<td>9 and up • Edge mode is supported</td>
<td>Latest public release</td>
<td>6.1 and up</td>
</tr>
<tr>
<td>UI11</td>
<td>Latest public release</td>
<td>Latest public release of Firefox or Firefox ESR</td>
<td>7 and up • Edge mode is not supported</td>
<td>Latest public release</td>
<td>6 and up</td>
</tr>
</tbody>
</table>

**Internet Explorer notes**

- Compatibility mode is not supported.
- Setting Security Mode to High (via Internet Options > Security tab) is not supported.
- While UI16 and UI15 are supported on Internet Explorer 9, the browser may be slow when performing some operations. This does not necessarily indicate a performance degradation in the instance.
- Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

**Safari notes**

- For Safari version 5 and Internet Explorer versions 7 and 8, the user interface automatically redirects to UI11.
- There is a security issue in some versions of Safari. User credentials may be disclosed to an unexpected site via autofill. For more information, see the Apple security update.
- Starting with Safari 9.1 and future versions of Safari, the leave page / stay on page pop-up message will only display once.

**Switch between UI16 and UI15**

You can switch between the UI16 and UI15 user interface versions.

Role required: admin
After UI16 is activated, all users see the enhanced UI16 user interface. By default, administrators see a button at the top of the System Settings window that lets them switch between UI16 and UI15. The administrator can add a system property to configure other roles that see the button.

1. Click the gear icon ( ) in the banner frame to open the System Settings window.

2. Click **Switch to UI15** or **Switch to UI16**.
   The button that displays is based on which UI version you are using when you open System Settings. The application refreshes with the selected UI. Your homepage appears in the content frame. You can access your favorites on the Edge (UI15) or in the favorites tab of the application navigator (UI16).

Comparison of UI16 and UI15 styles

Review the basic style differences between UI16 and UI15 styles in the ServiceNow platform.

**Banner frame comparison**

In UI16, the banner information and controls are in different places. The search box in the UI16 header opens when you select it. The help icon is available from the banner frame, instead of being accessed from the Settings menu. Because the UI16 banner is narrower, there is no control to collapse it.

![Figure 4: Banner frame differences](image)

For more information about the UI16 changes, see **UI16 banner frame** on page 18.
Application navigator

In UI16, modules that you select are not automatically marked as favorites as illustrated by the blue stars in the UI15 image. Any menu or module can be marked as a favorite, and it appears when you click the Favorites tab represented by the star. The other tab displays items you recently accessed.

For more information, see UI16 application navigator on page 31. The navigation filter works the same in both UI versions, by entering text in the navigation filter to show matching applications, modules, and favorites.

Another difference in the UI16 navigator menu is that you can no longer right-click an application menu name to edit the application menu. You must navigate to System Definition > Application Menus to add or modify modules.

The Edge

The Edge in UI15 is replaced in UI16 by the Favorites tab, represented by the star. Any item you could place on the Edge can be marked as a favorite. When you switch to UI16, all bookmarks on the edge are migrated to favorites and are listed on the Favorites tab. For more information, see Use favorites in UI16 on page 34. The List and Form View option is no longer available in UI16.
System settings

UI16 System Settings appear in a pop-up window with subtabs to make it easier to update your settings. The Split Layout setting available in UI15 was removed. For more information, see *UI16 banner frame* on page 18.

![System Settings](image)

Figure 5: UI16 System Settings
Basic configuration and the company logo

As the banner size and color scheme has changed significantly in UI16, there is a set of system properties for UI16 to set up your logo and branding before you switch to UI16. For more information, see Configure logo, colors, and system defaults for UI16 on page 257.

The banner in which your logo appears is narrow, and your logo image is scaled based on the aspect ratio. A wider image scales better than a smaller one and is more readable, as in the following example. It is also recommended that you create a logo image with a transparent background.

![Square logo](image1)

![Wide logo](image2)

Figure 6: Square logo  
Figure 7: Wide logo

Configure roles allowed to switch between UI16 and UI15

After you enable UI16, users with the admin role see a button in the System Settings window that allows them to switch between UI16 and UI15. You can add a system property to configure other roles that are allowed to switch UI versions.

Role required: admin

You may need to allow users who develop or configure applications to view the changes in both versions of the user interface. You list the roles in the new system property, and users with one of the roles see the switch button at the top of the System Settings window.

1. Add a new system property with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.ui15_switch_roles</td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a comma-separated list of roles that are allowed to switch between UI16 and UI15. If you set the value to Public, all users will be able to switch between the UI versions.</td>
</tr>
</tbody>
</table>

2. Click Submit.

Test the new system property by impersonating a user with one of the roles and verifying that the switch button appears when the user opens the System Settings window.

Switch between UI15 and UI11

You can disable UI15, which reverts the user interface to UI11.

If UI16 is enabled, you must first switch to UI15.

Role required: admin

1. Enter `sys_properties.list` in the navigation filter and press the Enter key.
2. Locate the glide.ui.doctype property in the System Properties list. The property is set to true by default, which enables UI15.

3. Set the property Value to false.

4. Log out and back in. This disables UI15 for the instance. The interface reverts to UI11 in individual user sessions when each user logs out and logs back in.

Installed components for UI plugins

The following components are added with the user interface plugins.

Tables

Table 3: User interface tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bookmarks [sys_ui_bookmark]</td>
<td>Stores user bookmarks and preferences. To access, navigate to System Definition &gt; Bookmarks.</td>
</tr>
</tbody>
</table>

Properties

Table 4: User interface properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.allow_ie_compatibility_mode</td>
<td>In many cases, Internet Explorer is configured to use compatibility mode when viewing ServiceNow. However, UI15 does not display when compatibility mode is turned on. When this property is set to false, the system does not allow use of compatibility mode on UI15 pages. The default value for this property is false.</td>
</tr>
<tr>
<td>glide.ui.doctype</td>
<td>Enables or disables the UI15 interface. The default value for this property is true. After enabling or disabling this property, the administrator must log out and log back in to effect the change in the instance. When users log out and log back in, they see the change in their individual user sessions.</td>
</tr>
<tr>
<td>glide.ui.doctype.ie_version</td>
<td>Sets the minimum version of Internet Explorer required to use UI15. The default value for this property is 9. It is recommended that you do not change this value.</td>
</tr>
</tbody>
</table>
User preferences

Table 5: User interface user preferences

<table>
<thead>
<tr>
<th>User Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.navpage_state</td>
<td>Do not edit this preference; system record of a user's UI11 configuration.</td>
</tr>
<tr>
<td>ng.navigator_preference</td>
<td>Stores a user's selected application navigator favorites in UI15.</td>
</tr>
<tr>
<td>glide.ui.field_style_circles</td>
<td>Shows field status indicators on lists as circles instead of cell backgrounds. The system administrator can set this preference for new logins. Users can make this change by navigating to a list, clicking the personalize list icon (/modal), and selecting the Modern cell coloring check box.</td>
</tr>
</tbody>
</table>

Keyboard shortcuts

You can use keyboard shortcuts to quickly perform common actions in the user interface.

Access keys depend on the browser and operating system you are using. Available keyboard shortcuts are based on the UI version.

Table 6: UI16 keyboard shortcuts

<table>
<thead>
<tr>
<th>Action</th>

</tbody>
</table>

### UI16 banner frame

The banner frame runs across the top of every page.

The banner frame for UI16 contains a logo and the following information, controls, and tools. To configure the banner frame logo, text, and colors, see *Configure logo, colors, and system defaults for UI16* on page 257.

#### Table 8: UI16 banner frame controls

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User menu</td>
<td>Provides access to the following options:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Profile</strong>: Opens your user profile, where you can edit personal details and customize your notification preferences.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Impersonate User</strong>: Allows users with the impersonator role to switch user views without logging out; useful for testing security and role-specific setup functions.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Elevate Roles</strong>: Allows users with elevated privilege roles to elevate to a higher security role when needed and then return to their normal role.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Logout</strong>: Returns to the Welcome page for subsequent login.</td>
</tr>
<tr>
<td>Connect sidebar icon</td>
<td>Opens the Connect sidebar to begin or continue conversations.</td>
</tr>
<tr>

</table>
Figure 9: System menu
## UI11 banner frame

The banner frame runs across the top of every page. It contains a logo and the following information, controls, and tools. Administrators can customize the banner frame.

![UI11 banner frame](image)

**Figure 10: UI11 banner frame**

The UI11 banner frame contains the following information, controls, and tools.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome message</td>
<td>Shows the name of the current user and provides a link to the user’s profile.</td>
</tr>
<tr>
<td>Impersonation key icon (눈)</td>
<td>(Administrators only) Allows the administrator to switch user views without logging out. This is useful for testing security and role-specific setup functions.</td>
</tr>
<tr>
<td>Elevate privileges icon (🔒)</td>
<td>(Administrators only) Allows the user to elevate to a higher security role when needed and then return to their normal role.</td>
</tr>
<tr>
<td>Global text search icon (🔍)</td>
<td>Searches for text in multiple applications.</td>
</tr>
<tr>
<td>Collapse/expand banner icon (🔍)</td>
<td>Alters the amount of space the banner frame occupies.</td>
</tr>
<tr>
<td>Logout</td>
<td>Returns to the Welcome page for subsequent login.</td>
</tr>
<tr>
<td>Homepage icon (🏠)</td>
<td>Provides links to selectable application homepages.</td>
</tr>
<tr>
<td>Printer friendly version icon (_printer)</td>
<td>Opens a printable version of the current content frame.</td>
</tr>
<tr>
<td>Help icon (❓)</td>
<td>Opens the ServiceNow Wiki in another window or tab.</td>
</tr>
<tr>
<td>JavaScript Debugger window icon (Debugger)</td>
<td>(Administrators only) Opens the client-side JavaScript Debug window. This icon is commonly called the debug icon.</td>
</tr>
</tbody>
</table>

The **Switch UI** link may also appear in the banner next to the global text search field. This link allows switching between UI11 and the classic interface. Administrators control the appearance of the link in the banner frame with the glide.ui11.show_switch_link property. This property is set to false for new instances.
The Edge

The Edge is a toolbar on the left side of the screen which provides quick access to features such as bookmarks and flyout windows.

The Edge is available in UI15 and UI11. The collapsed view of the UI16 application navigator is similar to the Edge.

UI15 Edge buttons

In UI15, the Edge provides the following buttons.

![UI15 Edge buttons](image)

Figure 11: UI15 Edge

### Table 13: UI15 Edge buttons

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toggle navigator</td>
<td>Shows or hides the application navigator.</td>
</tr>
<tr>
<td>List and form view</td>
<td>Splits the content frame into two vertical panes, with the list pane on the left and the form pane on the right. To split the pane horizontally, click Split Layout Horizontal.</td>
</tr>
<tr>
<td>Tagged documents</td>
<td>Displays the Tagged Documents page.</td>
</tr>
<tr>
<td>All bookmarks</td>
<td>Provides a list of all bookmarks in the Edge. Users can create, customize, and delete bookmarks. For more information, see Bookmarks on page 28.</td>
</tr>
</tbody>
</table>
### UI11 Edge buttons

In UI11, the Edge provides the following buttons.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toggle navigator</td>
<td>Shows or hides the application navigator.</td>
</tr>
<tr>
<td>Toggle banner</td>
<td>Shows or hides the banner frame.</td>
</tr>
<tr>
<td>Toggle vertical split form pane</td>
<td>Splits the content frame into two panes, with the list pane on the left and the form pane on the right.</td>
</tr>
<tr>
<td>Toggle horizontal split form pane</td>
<td>Splits the content frame into two panes, with the list pane on the top and the form pane on the bottom.</td>
</tr>
<tr>
<td>All bookmarks</td>
<td>Provides a list of all bookmarks in the Edge. Users can create, customize, and delete bookmarks. For more information, see Bookmarks on page 28.</td>
</tr>
<tr>
<td>Bookmark and pane-based UI help</td>
<td>Displays the Edge help window.</td>
</tr>
</tbody>
</table>

### Bookmarks

A bookmark is a link to information in the ServiceNow system, such as a record or a module, that is stored on the Edge.

All users create and manage their own bookmarks.

Bookmarks are available in UI15 and UI11. Favorites replace bookmarks in UI16. For more information, see Use favorites in UI16 on page 34.
Create a bookmark

You can create bookmarks by dragging links to the Edge.

Role required: none

You can create a bookmark from any of the following links:

- Modules in the application navigator
- Breadcrumbs
- Links in lists (including lists displayed in flyouts)
- Reports

Note: You may not be able to create bookmarks with other types of links. To request this functionality for another type of link, you can log an enhancement request with the ServiceNow customer support system.

Drag a link to the Edge.
The bookmark for the link appears on the Edge. Each bookmark includes an image and a title, both of which can be customized.

Customize a bookmark

You can customize bookmark appearance and behavior.

Role required: none

1. Open the bookmark settings window from any of the following locations in the interface.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bookmark tooltip</strong></td>
<td>1. Point to the bookmark in the Edge.</td>
</tr>
<tr>
<td></td>
<td>2. In the tooltip window, click Edit Bookmark.</td>
</tr>
<tr>
<td><strong>Bookmarks list</strong></td>
<td>1. Point to the all bookmarks icon in the Edge.</td>
</tr>
<tr>
<td></td>
<td>- UI15: All Bookmarks</td>
</tr>
<tr>
<td></td>
<td>- UI11: Star</td>
</tr>
<tr>
<td></td>
<td>2. Point to a bookmark in the list.</td>
</tr>
<tr>
<td></td>
<td>3. Click the edit bookmark icon by the bookmark name.</td>
</tr>
<tr>
<td><strong>Bookmark flyout</strong></td>
<td>1. Open a flyout bookmark.</td>
</tr>
<tr>
<td></td>
<td>2. Click the edit bookmark icon in the corner of the flyout.</td>
</tr>
</tbody>
</table>

2. Enter a Title.
3. To open the bookmark link in a flyout window, select the **Flyout** check box and clear the **Open in form pane** check box. By default, the bookmark opens in the content pane. Selecting **Flyout** opens a window on top of the current screen without navigating away from your working panes.

   **Note:** Homepages that are set to refresh automatically should not be added as flyout bookmarks. These homepages refresh in the background, which can slow down performance for you and other users.

4. Select the **Show on edge** check box to display the bookmark as a button on the Edge. Clear the check box to remove the button from the Edge; the bookmark still appears in the bookmark list.

5. To change the bookmark image, click **Image** and then select from the list of available images.

6. Click **Update**.

---

### Open a bookmark

When you open a bookmark, it appears in the content pane or as a flyout.

Role required: none

Open a bookmark in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open the bookmark as defined in the bookmark settings</td>
<td>Click the bookmark</td>
</tr>
<tr>
<td>Open the bookmark in a flyout</td>
<td>Hold Ctrl (Windows) or Command (Mac) and click the bookmark</td>
</tr>
<tr>
<td>Open the bookmark in the content pane</td>
<td>Hold Shift and click the bookmark</td>
</tr>
</tbody>
</table>

---

### Delete a bookmark

You can delete a bookmark.

Role required: none

When you delete a bookmark, it is removed from the Edge.

Delete the bookmark from either of the following locations in the interface.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bookmark tooltip</td>
<td>1. Point to the bookmark in the Edge.</td>
</tr>
<tr>
<td></td>
<td>2. In the tooltip window, click <strong>Edit Bookmark</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. In the edit bookmark window, click <strong>Delete</strong>.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Bookmarks list</td>
<td>1. Point to the all bookmarks icon in the Edge.</td>
</tr>
<tr>
<td></td>
<td>•</td>
</tr>
<tr>
<td></td>
<td>UI15: All Bookmarks</td>
</tr>
<tr>
<td></td>
<td>1.</td>
</tr>
<tr>
<td></td>
<td>UI11: All Bookmarks</td>
</tr>
<tr>
<td></td>
<td>2. Point to a bookmark in the list.</td>
</tr>
<tr>
<td></td>
<td>3. Click the remove bookmark icon by the bookmark name.</td>
</tr>
</tbody>
</table>

### Application navigator

The application navigator, or left navigation bar, provides access to all applications and the modules they contain, enabling users to quickly find information and services.

An application is a group of modules, or pages, that provide related information and functionality in an instance. For example, the Incident application contains modules for creating and viewing incidents. The Configuration Management application contains modules for configuring servers, databases, and networks.

In UI16, the application navigator also provides access to favorites and recently viewed items.

 Administrators can customize the application navigator to provide different modules by user role, modify or define applications and modules, and change its appearance.

### UI16 application navigator

The UI16 application navigator appears at the left of the interface and provides access to all available applications and modules, favorites, and recently viewed items.

Use the application navigator to quickly find information and services.

The application navigator consists of a navigation filter and the following tabs.

#### Table 15: UI16 application navigator tabs

<table>
<thead>
<tr>
<th>Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All applications</td>
<td>Displays all application menus and modules. Each application appears as a section in the application navigator denoted by an application label. Modules are listed by name under each application label.</td>
</tr>
<tr>
<td>Favorites</td>
<td>Displays items you have added as favorites. If you upgrade to UI16 from a previous interface, any bookmarks you created are automatically converted to favorites.</td>
</tr>
<tr>
<td>History</td>
<td>Displays items you have recently accessed.</td>
</tr>
</tbody>
</table>
Figure 13: All applications tab

Figure 14: Favorites tab
Enter text in the navigation filter to show matching applications, modules, and favorites. Matching favorites appear at the top of the results. You can also use the navigation filter to quickly access a specific table. For more information, see *Navigate directly to a table* on page 44.

**Collapse or expand information in the UI16 application navigator**

You can collapse or expand information in the application navigator to display only what you want to see.

Role required: none

Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Collapse or expand an application or application section</strong></td>
<td>Click the application or application section label.</td>
</tr>
<tr>
<td><strong>Collapse or expand all applications</strong></td>
<td>Double-click the all applications tab icon ( ).</td>
</tr>
<tr>
<td><strong>Collapse or expand the application navigator</strong></td>
<td>Click the arrow icon at the bottom of the application navigator. In the collapsed view, the application navigator displays favorites only. Click the More icon ( ) to view all favorites. Click the filter icon or the arrow icon in the collapsed view to expand the application navigator.</td>
</tr>
</tbody>
</table>
Use favorites in UI16

In UI16, you can save frequently accessed items as favorites, which are stored in the application navigator.

Role required: none

Items you add as favorites appear in the favorites tab of the application navigator, which is represented by a star icon.
Favorites also appear in the collapsed view of the application navigator as icons.

**Note:** Any bookmarks you created in a previous version of the UI are automatically converted to UI16 favorites. However, UI15 favorites are not converted to UI16 favorites and must be recreated manually.

Add a favorite in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a module as a favorite</td>
<td>In the application navigator, click the star icon by a module.</td>
</tr>
<tr>
<td>Add all the modules under an application as favorites</td>
<td>In the application navigator, click the star icon by an application.</td>
</tr>
</tbody>
</table>
| Add a list as a favorite using the list context menu | 1. Open a list.  
2. Click the list context menu icon (ฎ) by the list title.  
3. Select **Create Favorite**.  
4. In the flyout, edit the name and icon as needed. |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a list as a favorite by dragging and dropping</strong></td>
<td>1. Open a list.&lt;br&gt;2. Drag a breadcrumb to the favorites tab of the application navigator.</td>
</tr>
<tr>
<td><strong>Add a record as a favorite using the form context menu</strong></td>
<td>1. Open a record.&lt;br&gt;2. Click the form context menu icon (≡) by the form title.&lt;br&gt;3. Select <strong>Create Favorite</strong>.&lt;br&gt;4. In the flyout, edit the name and icon as needed.</td>
</tr>
<tr>
<td><strong>Add a record as a favorite by dragging and dropping</strong></td>
<td>1. Open a record.&lt;br&gt;2. Drag the record title to the favorites tab of the application navigator.</td>
</tr>
<tr>
<td><strong>Add a different type of link as a favorite</strong></td>
<td>Drag a supported link type to the favorites tab of the application navigator. You can drag any of the following links:&lt;br&gt;• Breadcrumbs&lt;br&gt;• Links in lists&lt;br&gt;• Reports</td>
</tr>
</tbody>
</table>

You can add a different favorite for each view of a list or form.<br>The favorite is added to the favorites tab of the application navigator.

You can edit your favorites later.

**Edit favorites in the UI16 application navigator**

You can edit or delete favorites in the UI16 application navigator.<br>**Role required:** none

1. In the application navigator, click the favorites tab, which is represented by a star.<br>2. At the bottom of the application navigator, click **Edit Favorites**.<br>3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reorder favorites in the list</td>
<td>Drag and drop a favorite to a new location in the list.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Customize the name or icon for a favorite | 1. Click a favorite.  
2. Customize the name and icon as needed. |
| Delete a favorite                       | 1. Click a favorite.  
2. Click Remove from favorites. |

4. Click Done or Edit Favorites.

View your navigation history

In UI16, you can view your navigation history in the application navigator.

Role required: none

Items you have accessed recently appear in the history tab of the application navigator, which is represented by a clock icon. Items appear in chronological order from most to least recently accessed.

![Figure 16: History tab](image)

History entries are stored on the Navigator History [sys_ui_navigator_history] table. The system creates history entries for many types of content, including lists, records, and homepages. Some content types are not tracked in the history, such as UI pages and other non-standard interfaces.

1. In the application navigator, click the history tab, which is represented by a clock.
2. Click an item to open it.
Configure the number of history entries displayed in the application navigator

A system property sets the maximum number of history entries displayed in the history tab of the application navigator.

Role required: admin

By default, the application navigator shows 30 history entries. You can configure the property to change this value.

1. Navigate to `sys_properties.list`.
2. Locate the `glide.ui.nav.history_length` property.
3. Edit the property `Value`.

UI15 application navigator

The application navigator appears at the left of the interface and provides access to all available applications and modules.

Each application appears as a section in the application navigator denoted by an application label. Modules are listed by name under each application label. Use the application navigator to quickly find information and services.
Figure 17: UI15 application navigator

Enter text in the navigation filter to show matching applications and modules. You can also use the navigation filter to quickly access a specific table. For more information, see Navigate directly to a table on page 44.

In the UI15 application navigator, a star appears by each module. For more information, see Use favorites in UI15 on page 40.

Collapse or expand information in the UI15 application navigator

You can collapse or expand information in the application navigator to display only what you want to see.

Role required: none

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Collapse or expand an application or application section</strong></td>
<td>Click the application or application section label</td>
</tr>
<tr>
<td><strong>Collapse all applications</strong></td>
<td>Click the application menu icon and select Collapse All Applications</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Expand all applications</td>
<td>Click the application menu icon and select <strong>Expand All Applications</strong></td>
</tr>
<tr>
<td>Collapse or expand the application navigator</td>
<td>In the edge, click <strong>Toggle Navigator</strong></td>
</tr>
</tbody>
</table>

Switch perspectives in the UI15 application navigator

You can switch role perspectives to show different views of the application navigator.

A perspective filters the available applications by that role. For example, select **ITIL** to show only ITIL items such as Incidents, and filter out asset management items such as Asset Portfolio.

**Note:** Administrators can customize which perspectives are available and who can access them. For more information, see *Create or modify a menu list* on page 44.

1. In the application navigator, click the menu icon (▲).
2. Select **Roles**.
   - This option is available only if you have access to more than one role perspective.
3. Select a perspective.

Use favorites in UI15

In UI15 you can select modules as favorites to quickly filter out modules you do not use often.

Role required: none

Each module in the application navigator has a star icon to the left of the module name that can be selected (★) or deselected (☆).

**Note:** If you upgrade to UI16, you must recreate any UI15 favorites manually.

1. Click the star icons to select and deselect modules as favorites.
2. Click the filter favorites icon (★) next to the navigation filter to toggle between showing only the favorite modules and showing all modules.

By default, a module is automatically selected as a favorite when you open the module. To disable this setting, click the menu icon (▲) in the application navigator header and select **Automatically Add Favorites**.

UI11 application navigator

The application navigator appears at the left of the interface and provides access to all available applications and modules.

Each application appears as a section in the application navigator denoted by an application label. Modules are listed by name under each application label. Use the application navigator to quickly find information and services.
Enter text in the navigation filter to show matching applications and modules. You can also use the navigation filter to quickly access a specific table. For more information, see Navigate directly to a table on page 44.

In the UI11 application navigator, an icon appears by each module. Administrators can customize the icons.

Collapse or expand information in the UI11 application navigator

You can collapse or expand information in the application navigator to display only what you want to see.

Role required: none

You can collapse or expand information in the application navigator to display only what you want to see.

Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collapse or expand an application or application section</td>
<td>Click the application or application section label</td>
</tr>
<tr>
<td>Collapse all applications</td>
<td>Click the collapse all applications icon ( - )</td>
</tr>
<tr>
<td>Expand all applications</td>
<td>Click the expand all applications icon ( + )</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Collapse or expand the application navigator</td>
<td>In the Edge, click the toggle navigator icon</td>
</tr>
</tbody>
</table>

Switch perspectives in the UI11 application navigator

You can switch role perspectives to show different views of the application navigator.

A perspective filters the available applications by that role. For example, select **ITIL** to show only ITIL items such as Incidents, and filter out asset management items such as Asset Portfolio.

**Note:** Administrators can customize which perspectives are available and who can access them. For more information, see *Create or modify a menu list* on page 44.

1. In the application navigator, click the switch perspectives icon (▲). This icon is available only if you have access to more than one perspective.

2. Select a perspective.

Module icons

Modules in the UI11 application navigator have icons in addition to names. Administrators can modify the icons for existing modules and define icons for new modules.
Modify a module icon  
You can modify the icon that represents a module in UI11.

Role required: admin

**Note:** If you change the icon for a base system module, your change is preserved during software updates.

1. Navigate to **System Definition > Modules**.
2. Select the module for which you wish to modify the icon.
3. In the **Image** field, click the reference lookup icon (🔍).
4. Select the desired image file from the existing images.
5. Click **Update**.

Create a new module icon  
You create your own image and use it as a module icon in UI11.

Role required: admin

1. Use a graphics software program to create an icon file with the following specifications.

<table>
<thead>
<tr>
<th>Size</th>
<th>16 x 16</th>
</tr>
</thead>
<tbody>
<tr>
<td>File type</td>
<td>.png,.gif,.jpg</td>
</tr>
</tbody>
</table>

2. **Upload** the new icon to the database.
3. In the application navigator, right-click the application name and select **Edit Application**.
4. **Personalize** the **Modules** related list to add the **Image** field.
5. Use the list editor to enter the file name (example, **my_image.png**).
Navigate directly to a table

You can use commands in the navigation filter to navigate directly to the list or form view of a table.

Role required: none

The commands work only for tables you are permitted to access.

1. In the navigation filter of the application navigator, enter one of the following commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;table name&gt;.list</td>
<td>Opens the list view of the table in the same window or tab.</td>
</tr>
<tr>
<td>&lt;table name&gt;.LIST</td>
<td>Opens the list view of the table in a new window or tab.</td>
</tr>
<tr>
<td>&lt;table name&gt;.form or &lt;table name&gt;.do</td>
<td>Opens the form view of the table in the same window or tab.</td>
</tr>
<tr>
<td>&lt;table name&gt;.FORM</td>
<td>Opens the form view of the table in a new window or tab.</td>
</tr>
</tbody>
</table>

For example, enter `change_request.form` to open a new change request.

2. In UI16, press the Enter key.

Create or modify a menu list

In UI15 and UI11, it is possible to switch menu lists, providing different perspectives of the applications and modules. You can create or edit these menu lists using the Menu List table.

Role required: admin

Menu lists are not used in UI16.

1. Navigate to System UI > Menu Lists.
2. Select a menu list to modify, or click New to create a new menu list.
   
   The applications that appear on the form are listed in the Applications field, one per line. Note that applications use the name of the application record, not the human-readable record that appears in the left navigation bar.

   The roles that are able to see the form are listed in the Roles field.
   
   • Specifying no roles will create a global menu list.
   • A menu list will display only the applications and modules the role has permissions to see.
   • If a role is specified to see a menu list, but role cannot view any of the applications within it, they will not see the menu list.

3. Adjust the information in the menu list as desired.
4. Click Update.

Enable or disable an application menu or module

You can enable (show) or disable (hide) an application menu or module in the application navigator.

Role required: admin

1. Navigate to System Definition > Application Menus.
2. If you are enabling an application menu, click **All** in the breadcrumbs to display both active and inactive application menus (remove the default filter condition).

3. Click the desired title. The application menu record opens and the **Modules** related list shows the modules that appear in the application navigator.

4. Enable or disable the application menu and modules as desired.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable or disable a specific module in the application | 1. Double-click the **Active** field beside the module name in the **Modules** related list.  
2. Set **Active** to **true** (show) or **false** (hide). |

| Enable or disable multiple modules at the same time | 1. Select the check boxes next to the module names.  
2. Select **Change active state** from the **Actions** choice list. |

| Enable or disable the entire application menu (for example, Incident or Service Catalog) | Select or clear the **Active** check box. |

| Restrict the application menu to specific roles | Use the **Roles** field. |

5. Click **Update**.

When you change application menus or modules, the application navigator automatically refreshes to display the changes.

### Define a menu category in UI15

Menu categories allow administrators to change the appearance of application menu labels. Use menu categories to make certain application menus stand out.

Role required: admin

1. **Add a property** with the following specifications.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui14.navigator.use_border_color</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

2. Navigate to **System Definition > Menu Categories**.

3. Click **New** or open an existing menu category.

4. In the **Style** field, define the border-color using an HTML **color name**, **hexadecimal (hex) value**, or **RGB color value**. For example, enter `border-color: blue`.

5. Optional: Enter a **Default order**.

If you create an application without specifying an order, the default order of the category is used to determine the relative position in the application navigator.

**Note:** You may need to clear the instance cache and refresh the page after saving the menu category to see CSS changes.
Define a menu category in UI11

Menu categories allow administrators to change the appearance of application menu labels with CSS styles. Use styles to make certain application menus stand out.

Role required: admin

1. Navigate to System Definition > Menu Categories.
2. Click New or open an existing menu category.
3. In the Style field, define CSS styles such as border-color, text color, and background-color. For example, enter `border-color: blue; background-color: #e3f3ff; color: white`.
4. Optional: Enter a Default order.
   If you create an application without specifying an order, the default order of the category is used to determine the relative position in the application navigator.

   **Note:** You may need to clear the instance cache and refresh the page after saving the menu category to see CSS changes.

Add an application menu to a category

There are two methods for adding an application menu to a category.

Role required: admin

   **Note:** Menu categories are deprecated in UI16. The following procedure has no effect in UI16.

Use one of the following methods to add an application menu to a menu category.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| In the menu category record, add the application menu to the Application Menus related list. | 1. Navigate to System Definition > Menu Categories.  
2. Open a menu category.  
3. In the Application Menus related list, click Edit.  
4. Use the slushbucket to add the application menu to the category.  
5. Click Save. |
| In the application menu record, enter the menu category in the Category field. | 1. Navigate to System Definition > Application Menus.  
2. Open an application menu.  
3. In the Category field, select the menu category.  
4. Click Submit. |
Create an application menu

You can create an application menu.

Role required: admin

1. Navigate to **System Definition > Application Menus**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Defines the display name of the application menu.</td>
</tr>
<tr>
<td>Roles</td>
<td>Restricts access to the specified roles. All users can view the application menu when it is active.</td>
</tr>
<tr>
<td>Category</td>
<td>Specifies the menu category that defines the navigation menu style (default value is <strong>Custom Applications</strong>).</td>
</tr>
<tr>
<td>Hint</td>
<td>Defines the text that appears in a tooltip when a user points to this application menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate the application menu. Only active application menus appear in the application navigator.</td>
</tr>
<tr>
<td>Description</td>
<td>Provide a more detailed explanation of what this application does.</td>
</tr>
<tr>
<td>Other fields</td>
<td></td>
</tr>
<tr>
<td>Order</td>
<td>Defines the relative position of the application menu in the application navigator. If you do not specify an order, the default order of the menu category is used.</td>
</tr>
<tr>
<td>Default device type</td>
<td>This field is not used. You can define application menus for mobile devices in a separate table. See <strong>Define a new smartphone application menu</strong>.</td>
</tr>
</tbody>
</table>

**Note:** You may need to configure the form to see all fields.

4. Click **Submit**.
5. **Create modules** to appear in the application menu.

Only application menus that contain modules appear in the application navigator.

**Note:** You might need to configure the form to see all fields.

Create a module

You can create a module.
Role required: admin

1. Open the application menu record using one of the following methods.
   - Navigate to System Definition > Application Menus and select the application menu from the list.
   - Right-click the application label in the application navigator and select Edit Application. This is possible in UI15 and UI11 only.

2. Scroll down to the Modules related list and click New.

3. Define the module by completing the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Defines the module name. Choose a title that clearly identifies the module.</td>
</tr>
<tr>
<td>Application menu</td>
<td>Specifies the name of the application menu under which the module appears.</td>
</tr>
<tr>
<td>Image</td>
<td>Specifies an icon to appear next to the module title in the navigator. Module images are supported in UI11 only. Favorites replace module images in UI16 and UI15.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hint</td>
<td>Defines the tool tip that appears when a user points to the module name.</td>
</tr>
<tr>
<td>Visibility</td>
<td></td>
</tr>
<tr>
<td>Roles</td>
<td>Restricts module access to the specified roles. If this field is left blank, the module is visible to all users who have access to the application menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Defines whether the module appears in the application navigator.</td>
</tr>
<tr>
<td>Override application menu roles</td>
<td>Allows users to access this module even if they do not have permission to view the containing application menu. Users must still meet the role requirements for this module.</td>
</tr>
<tr>
<td>Link Type</td>
<td></td>
</tr>
<tr>
<td>Link type</td>
<td>Specifies what type of link this module opens. You must specify additional information based on the link type. See Module link types.</td>
</tr>
<tr>
<td>Table</td>
<td>Specifies the table used by the module.</td>
</tr>
<tr>
<td>Order</td>
<td>Specifies the order in which the modules appear under the application.</td>
</tr>
</tbody>
</table>

**Module link types**

The **Link type** field on the Module form specifies what type of link the module opens.

**Table 17: Module link types**

<table>
<thead>
<tr>
<th>Link Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Links to the assessment-based survey you select in the Assessment reference field. See Create a survey module.</td>
</tr>
<tr>
<td>Content Page</td>
<td>Displays the content page you select in the Content page reference field. See Create a content page.</td>
</tr>
<tr>
<td>Homepage</td>
<td>Displays the homepage you select in the Homepage reference field.</td>
</tr>
<tr>
<td>Link Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTML (from Arguments)</td>
<td>Places HTML in the application navigator. This link type is used for more complicated links, where a flat URL is not customizable enough.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• The HTML (from Arguments) link type is supported in UI15 and UI11 only. In UI16, use the URL (from Arguments) link type instead.</td>
</tr>
<tr>
<td></td>
<td>• You must enter a value for the Arguments field.</td>
</tr>
<tr>
<td>List Filter</td>
<td>Displays an unpopulated list view for the table you select in the Table field. Allows users to specify a filter without loading the list first. Use the Filter field to define the default filter for the list. Use the View name field to specify a view.</td>
</tr>
<tr>
<td>List of Records</td>
<td>Displays the list view for the table you select in the Table field. Use the Filter field to define the default filter for the list. Use the View name field to specify a view.</td>
</tr>
<tr>
<td>Map Page</td>
<td>Displays the map page you select in the Map page reference field.</td>
</tr>
<tr>
<td>New Record</td>
<td>Displays a form for creating a new record in the table you select in the Table field. Use the View name field to specify a view. Use the Arguments field to apply a template. See Create a module for a template on page 733.</td>
</tr>
<tr>
<td>Run a Report</td>
<td>Runs the saved report you select in the Report field.</td>
</tr>
<tr>
<td>Script (from Arguments)</td>
<td>Runs a script, as defined in the Arguments field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You must enter a value for the Arguments field.</td>
</tr>
<tr>
<td>Link Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Search Screen</td>
<td>Link that displays a blank form for searching records in the table. Use the <strong>View name</strong> field to specify a view.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Use the parameter &amp;sysparm_result_view=view_name to define the view the results are rendered in.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> All searches use a [starts with] query to search for matching text. Other query types are not supported in search screens.</td>
</tr>
<tr>
<td>Separator</td>
<td>Creates a division between modules. Enter a name in the <strong>Title</strong> field to add a section name that users can collapse or expand.</td>
</tr>
<tr>
<td>Single Record</td>
<td>Displays a form for a single record on the table. Use the <strong>View name</strong> field to specify a view.</td>
</tr>
<tr>
<td>Survey</td>
<td>Links to the legacy survey you select in the <strong>Survey</strong> reference field. Use the <strong>Survey overwrite</strong> check box to determine whether the survey can be taken multiple times.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <strong>Survey</strong> link type is for use with legacy surveys only, which assessment-based surveys replace. Select the <strong>Assessment</strong> link type to link the module to an assessment-based survey.</td>
</tr>
<tr>
<td>Timeline Page</td>
<td>Displays the timeline page you select in the <strong>Timeline Page</strong> reference field. See <strong>Timeline pages</strong> on page 1024.</td>
</tr>
<tr>
<td>Link Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>URL (from Arguments)</td>
<td>Opens any URL, as defined in the <strong>Arguments</strong> field. <strong>[Optional]</strong> Use the <strong>Window name</strong> field to define a link that opens in a new window.</td>
</tr>
</tbody>
</table>

**Note:**
- For internal links, always use a relative link such as
  ./catalog_home.do?sysparm_view=catalog_default or catalog_home.do?sysparm_view=catalog_default. Do not use an absolute link to a ServiceNow instance. It creates problems when you move an update set from a development instance to a production instance because the URL still references the development instance.
- You must enter a value for the **Arguments** field.

**Additional queries**
For **List of Records** module link types, you can append additional queries to the module to further define the filter for the returned list.

For example, to filter active incidents that are assigned to the currently logged in user, use the following argument query:

```
active=true^assigned_to=javascript:gs.user_id()
```

**Example URL module that opens in a new window**
You can configure a module to open an external URL in a new browser window.

Role required: **admin**

1. Open the application menu record using one of the following methods.
   - Navigate to **System Definition > Application Menus** and select the application menu from the list.
   - Right-click the application label in the application navigator and select **Edit Application**. This is possible in UI15 and UI11 only.

2. Scroll down to the **Modules** related list and click **New**.
3. If the **Window name** field is not displayed, **configure the form** and add this field.
4. Select **URL (from Arguments)** from the **Link type** list.
5. Add the complete web address to the **Arguments** field.
6. Select an icon for the module in the **Image** field.
7. Enter _blank in the **Window name** field.
   - If this field is empty, the page opens in the content frame, which is the default behavior.
Example URL module that opens a list with a custom filter URL

To create a module that opens a list with a custom filter, sort order, and grouping, use a link type of URL (from Arguments) and create a link to a custom URL.

Role required: admin

Use the following shortcut to determine the arguments for your custom URL.

1. Navigate to the list by URL, without loading it in the standard interface  
   For example, navigate to the Incident list by entering `<base URL>/incident_list.do`.
2. Apply the desired filter, sort order, and grouping.
3. Copy the resulting URL from the browser address bar.
   For example, if you apply a filter of `active=true` with an ascending sort on `priority`, a descending sort on `opened_on`, and grouped by `assignment_group`, the address bar reads: `incident_list.do?sysparm_query=active=true^EQ^ORDERBYpriority^ORDERBYDESCopened_at^GROUPBYassignment_group`

   Note: Do not copy the base URL (the portion). Always use a relative link to prevent problems when you move an update set from a development instance to a production instance.

4. Define a module with a Link type of URL (from Arguments).
5. Paste the custom URL from step 3 into the Arguments field.
6. Click Submit.
   The module now opens the custom list in the content frame.

URL schema

Users can navigate to a record or module directly by using a URL. This topic explains the URL schema by which the system renders pages.

The basic schema for a system URL is:

The URL schema consists of the following elements.

- **base URL**: unique, secure Web address for each instance. The default format is: https://<instancename>.service-now.com.

To display a custom base URL in email notifications, you can set the glide.email.override.url property. For more information, see [Additional email properties](#) on page 2737.

- **nav_to.do?uri=** (optional): loads the page in the standard interface, with the banner frame on top and the application navigator on the left.
- **<page name>.do?:** where the page name is the form, list, UI page, or other page to open. To view a list, use <table name>_list.do.
- **sys_id=<sys_id>** (optional): where <sys_id> is the sys_id of the record to open in form view. To create a new record, specify a sys_id of -1.
- **<page parameters>** (optional): may specify a query, view, redirection page, and more. Sample parameters include the following.
  - `sysparm_view=ess`: specifies a view (ess).
  - `sysparm_query=number=INC00040`: specifies a query (number is INC00040).
  - `sysparm_query=priority=2^active=true`: specifies a complex query with two terms (priority is 2 and active is true).
  - `sysparm_query=priority=2^active=true^EQ^GROUPBYcategory`: groups query results (by category).
  - `sysparm_order=number`: specifies the field by which to sort (number).
  - `sysparm_order_direction=desc`: specifies a sort order (descending).
  - `sysparm_force_row_count=5`: limits the maximum number of results (5 records).
  - `sysparm_result_view=viewname`: specifies the view for search results.

- `%26CSV`: specifies a file format, can be CSV, XML, PDF, or UNL (Unload).
- `&`: separates page parameters.
- `^` (carat): builds multiple term queries or specifies multiple field values.

### Forms vs. lists (sysparm_query)

The sysparm_query page parameter behaves differently for a list versus a form.

- **List**: returns records that match the query conditions.
- **Form** (with sys_id=-1 specified): applies the values to the new record.

**Note**: If you are using the default table templates where the template name matches the table name, such as change_request or incident, using sysparm_query for that form does not work.

### Enable tiny URL support

The default URLs by which the system renders pages may exceed the character limit of Microsoft Internet Explorer, resulting in an error message. To prevent this error, you can enable tiny URL support, which generates shortened internal URLs.

**Role required**: admin

The Tiny URL Support plugin is activated automatically but is not enabled. Activate this plugin if Microsoft Internet Explorer displays failure to open page errors during routine operations in the ServiceNow platform.
Note: The system does not convert all URLs to tiny URLs. Only some URLs the system generates as redirects are converted. For example, a URL the browser generates when a user opens a record is not converted to a tiny URL.

1. Navigate to **System Properties > System**.
2. Select the **Use tiny URLs when a redirect URL becomes too large.** This ensures that URLs that are too large for IE (greater than 2083) are not used. Instead, they are converted to a tiny URL to work around the IE issue. (glide.use_tiny_urls property).
3. Optional: Update the value in the **Minimum length of a redirect URL that is turned into a tiny URL (default=1024)** (glide.tiny_url_min_length property), if desired.
4. Click **Save**.

**Examples of navigating by URL**

A list of example URLs that demonstrate ways to open pages in the ServiceNow application.

**Open a form with preset values**

**Schema:** https://<baseURL>/nav_to.do?uri=<table name>.do?
sys_id=-1%26sysparm_query=<field=value>

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opens a new Incident form in the standard interface with a priority of 1 and an incident state of <em>Awaiting Problem</em>.</td>
<td>https://&lt;instance name&gt;.service-now.com/nav_to.do?uri=incident.do?sys_id=-1%26sysparm_query=priority=1^incident_state=3</td>
</tr>
<tr>
<td>You can also use JavaScript to access GlideSystem methods. The following example creates the same type of incident as above, and also populates the caller ID with the current user ID.</td>
<td>https://&lt;instance name&gt;.service-now.com/nav_to.do?uri=incident.do?sys_id=-1%26sysparm_query=priority=1^incident_state=3^caller_id=javascript:gs.getUserID()</td>
</tr>
</tbody>
</table>

**View a list of incidents**

Schemas for the following examples:

- https://<baseURL>/nav_to.do?uri=<table name>_list.do
- https://<baseURL>/<table name>_list.do

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opens a list of all incidents with (example 1) the navigation frame.</td>
<td>https://&lt;instance name&gt;.service-now.com/nav_to.do?uri=incident_list.do</td>
</tr>
<tr>
<td>Opens a list of all incidents without the navigation frame.</td>
<td>https://&lt;instance name&gt;.service-now.com/incident_list.do</td>
</tr>
</tbody>
</table>
View a list of attachments

Schema: https://<baseURL>/nav_to.do?uri=<table name>_list.do

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opens the Attachments table in list view.</td>
<td>https://&lt;instance name&gt;.service-now.com/sys_attachment_list.do</td>
</tr>
</tbody>
</table>

View a filtered list

Schema: https://<baseURL>/nav_to.do?uri=<table name>_list.do?sysparm_query=<field=value>

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns a list of active incidents with high escalation in the standard interface.</td>
<td>https://&lt;instance name&gt;.service-now.com/nav_to.do?uri=incident_list.do?sysparm_query=active=true^escalation=2</td>
</tr>
</tbody>
</table>

Return a file

Schema: https://<baseURL>/nav_to.do?uri=<table name>_list.do?sysparm_<sysparmTypeOrField=value>%26CSV

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns a comma-separated value file of records in the Incident table that meet the query conditions.</td>
<td>https://&lt;instance name&gt;.service-now.com/nav_to.do?uri=incident_list.do?sysparm_query=active=false%26CSV</td>
</tr>
</tbody>
</table>

Lists

A list displays a set of records from a table. Users can search, sort, filter, and edit data in lists. Lists can be embedded in forms and may be hierarchical (have sublists).

The list interface consists of a title bar, filters and breadcrumbs, and columns of data. Each column in a list corresponds to a field on the table.

A response time indicator (in UI16 and UI15, in UI11) appears at the bottom right of some lists to indicate the time that it took to display the list.
### Figure 20: Record list

#### List features and actions

The list interface consists of a title bar, filters and breadcrumbs, and columns of data. Each of these components provides features and lets you take action on the list and the displayed records.
Figure 21: List view features, menus, and actions

The following topics provide more information about list components and the features and actions you can perform.

List title bar

The title bar displays the name of the list and provides access to several controls.

List title menu

You can click the title of the list or the menu icon ( ) to the left to access options related to viewing and filtering the list. Administrators can customise the options that appear in the list title menu.
Table 18: List title menu options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>Changes the view of the list by presenting different information.</td>
</tr>
<tr>
<td>Filters</td>
<td>Changes the values in the filter. Some of the choices are: None, Active, and Edit personal filters.</td>
</tr>
<tr>
<td>Group by</td>
<td>Groups records in a list by the values in a selected field from that table. Any field from the table can be used as a group filter, whether or not it appears in the list.</td>
</tr>
<tr>
<td>Show</td>
<td>Changes the number of rows shown on each page of the list.</td>
</tr>
<tr>
<td>Refresh List</td>
<td>Refreshes the list to show changes immediately.</td>
</tr>
<tr>
<td>Create Favorite</td>
<td>Adds a link to this list to your favorites.</td>
</tr>
</tbody>
</table>

Other list title bar controls

- **New** button: Opens a blank form that allows users to create a record.

  Clicking the New button in a filtered list automatically applies the same filter to the new record. For example, in a list filtered for active, priority 1 incidents, clicking New opens a new record preset with Active selected and Priority set to 1 - Critical. You can change the preset values. If you do not want to populate a field in this way, add the following dictionary attribute to the field: ignore_filter_on_new=true.

- **Go to** (UI16 and UI15) or **Search**: Finds information in the current list.
List activity stream (✓): Shows recent record activity for all records displayed on a list.

Column headings

Column headings appear at the top of each column. These headings display column names and provide some list controls.

Column headings are stationary at the top of the list and do not scroll with list content in UI16 or UI15.

Note: Some of the options displayed on the list context menu depend on the user role and the installed applications.

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sorting</td>
<td>Click the column name to sort the list in ascending order. Click again to sort in descending order. An arrow by the column name indicates the column currently being sorted as well as the sort direction. A downward pointing arrow indicates that the column is sorted in descending order.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>List context menu</td>
<td>Access this menu, also called a right-click menu, by clicking the menu icon (≡) at the top of a list column (UI16/UI15) or by right-clicking the column heading (UI11). The list context menu offers the following controls.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Sort (a to z) and (z to a)</strong>: Sort in ascending and descending order. <strong>Show Visual Task Board</strong>: Create a visual task board based on the current list. <strong>Group By</strong>: Aggregate records by a field. For more information, see <em>Use a grouped list</em> on page 89. <strong>Bar Chart</strong> and <strong>Pie Chart</strong>: Create quick bar and pie chart reports based on the filter criteria of the list. Users can then modify these reports or create gauges (depending on access rights). <strong>Configure</strong> (requires access rights): Provides administrative functions related to the information displayed and how it is controlled. <strong>Import</strong> (administrators only): Import data from an Excel template file. <strong>Export</strong>: Exports data to Excel, CSV, XML (administrators only), or PDF. For more information, see <em>Export data</em> on page 1494. <strong>Update Selected</strong> and <strong>Update All</strong> (administrators only): Change applicable field values. <strong>Create Application Files</strong> (administrators only): Creates demo data from the current list of records that can be included when you install or update the application on another instance. Used with custom application development. <strong>Import XML</strong> (administrators only): Imports a set of records that were exported from a source instance, for example, a developer instance. For more information, see <em>Import a single XML file containing one or more records</em> on page 1495.</td>
</tr>
<tr>
<td>Personalize List (燔)</td>
<td>Customizes the list layout for the current user. For more information, see <em>Personal lists</em> on page 93.</td>
</tr>
<tr>
<td>Search ( in UI16/UI15)</td>
<td>Enables the column search in UI16 and UI15. For more information, see <em>Search by one or more columns in a list</em> on page 86.</td>
</tr>
</tbody>
</table>
List fields

Fields display data and provide certain functions.

**Note:** Some of the options displayed on the field context menu depend on the user role and the installed applications.

### Table 20: Field functions

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
<td>Open the associated record in form view. Click the reference icon or first column field to open the current record. You can also click a link to a related record in other columns to go to that related record.</td>
</tr>
<tr>
<td>Editing</td>
<td>Changes the information in one or more records. For more information, see <em>Methods for list edits</em> on page 90.</td>
</tr>
<tr>
<td>Reference icon ( in UI16 and UI15, in UI11)</td>
<td>Provides detailed information about the record. Point to the reference icon to open a pop-up window, or click it to open the record in form view. For more information, see <em>Reference Icon.</em></td>
</tr>
</tbody>
</table>
| Context menu                  | Also called a right-click menu, offers the following options:  
  - **Show Matching** and **Filter Out:** Provide *quick filter* options.  
  - **Copy URL to Clipboard:** Copies the URL for the form view of the record to the clipboard. Follow browser instructions if browser security measures restrict this function.  
  - **Copy sys_id** (administrators only): Copies the sys_id of the record to the clipboard. Follow browser instructions if browser security measures restrict this function.  
  - **Assign Tag** (UI16 and UI15): Allows the user to assign a new or existing tag or label to a record, which provides quick access to frequently referenced or urgent information. When a tag is assigned to a record in UI16 or UI15, the record is displayed on the Tagged Documents page. In UI11, a link to the record is displayed in the application navigator under the assigned tag.  
  - **Assign to me, Approve,** and **Reject:** Provide *quick edit* options.  
  - **Add to Visual Task Board:** Allows users to add the selected record to *Visual Task Boards* they own. |
**Detail rows**

When detail rows are enabled, they appear below the field row for each record and display the value of a specified field. For example, the detail row can display the short description for each incident in a list.

Detail rows support the same functionality as fields, including links, editing capabilities, and access to the context menu.

![Figure 23: Detail rows](image)

Administrators can enable detail rows and add them to lists (UI15 or later required). For more information, see *Administer detail rows* on page 688.

---

**Note:** When a field is designated as the source for the list detail rows, the system hides the list column for that field.

**Configure list field status indicators**

Field status indicators are used to highlight certain fields on lists and to provide status information.

Role required: none

- In UI16 and UI15, field status indicators on lists are displayed with modern cell coloring, as a colored circle on the left side of the field. You can revert to using a field background color by personalizing the list and disabling modern cell coloring.

![Figure 24: Modern cell coloring on](image)

- In UI11, field status indicators on lists are displayed using a field background color.

![Figure 25: Modern cell coloring off](image)

All UI versions display field status indicators for mandatory fields only.
You can select the style of the field status indicator in UI16 or UI15.

1. Click the personalize list icon (でしょうか) in the upper left corner of a list.
2. Select the **Modern cell coloring** check box to use the UI16/UI15 style field status indicator. Clear this check box to use the UI11 style.
3. Click **OK**.

For more information, see *Personal lists* on page 93.

**Pop-up forms**

Pop-up forms enable you to edit records without leaving the list in UI16 or UI15.

To display a pop-up form, press the Shift key and click a field link or point to the reference icon for a record. You can edit the pop-up form like any other form.

![Pop-up form for editing records](image-url)

**Figure 26: Pop-up form for editing records**
Action check boxes

Action check boxes enable you to perform actions on selected items in a list.
Role required: none

Figure 27: Action check boxes and action choice list

1. Select the check boxes beside the records you want to affect. To select all records on the page, select the check box beside the action choice list at the bottom of the list.
2. Apply the desired action.
   • In the column context menu, select Update Selected to update all the selected records.
   • UI11: in the column context menu, Update Selected records using an editing form.
   • In the action choice list, select an action such as Delete (administrators only), Show on Live Feed, or Assign Tag. The available actions vary depending on the list and which plugins are activated.

Hierarchical lists

Hierarchical lists allow users to view records from related lists directly from a list of records without navigating to a form.

Lists can have sublists in a hierarchy that can also be accessed in list view. To expand or collapse the related lists on a record in a hierarchical list, click the arrow (_above) beside the reference icon.
Use embedded lists

Some lists are embedded in forms.

Role required: none

Changes to embedded lists are saved when the form is saved. For more information, see *Edit a form* on page 121.

Use the following controls to work with an embedded list.

- To expand or collapse an embedded list, click the expand (.expand) or collapse (collapse) icon in the list header.
- To add a row, double-click **Insert a new row**.
- To edit a row, double-click in an empty area of the field. See *Use the list editor* on page 90.
- To delete a row, click the delete icon (delete) beside the row.

New rows are removed immediately and existing rows are designated for deletion when the record is saved. To clear this designation, click the delete icon again.
Customize the number of list rows per page

You can customize the number of records, or rows, to display on each page of a list. The default is 20 rows per page.

Role required: none

When you customize the number of rows, it applies to all lists that you can access.

For information about the performance impact of displaying more rows, see the blog post *Improve performance by displaying “just enough” data* by a ServiceNow employee in the ServiceNow Community.

[edit]

1. Open a list.
2. Click the list title menu and select **Show**, and then select the number of rows to show on a page. The list refreshes to display the number of records selected, or the total number of records if there are fewer than the number of rows you are displaying. The page control is updated to show your selected number of records (1 to 50 of 59).

**Activity streams in list view**

You can stream live activity information for all records on the current list in UI16 or UI15.
**Figure 30: Activity stream window**

<table>
<thead>

</tbody>
</table>
To view this information, click the list activity stream icon in the list title bar. This icon appears in the title bar for all task tables.

The activity stream information appears in a flyout window, and is the same information that appears in the activity formatter for a record. The information in the flyout window updates automatically with audit and journal entries. Click the >> icon at the top to close the activity stream.

You can add a comment to any item in the activity stream. When you point to the item with your cursor, a Comment button appears.

Switch between list views

A view defines the elements that appear when a user opens a list.

Role required: none

You can switch between list views to which you have access. For example, you can select the Mobile view where it is available and adjust the size of the browser window to see how it looks on a mobile device.

1. Open the list.
2. Right-click the form header and select View, and then select the view from the list.
   The page refreshes with the selected view.

Filters and breadcrumbs

A filter is a set of conditions applied to a table to help you find and work with a subset of the data in that table.

You can apply, modify, create, and save filters. A hierarchical list of conditions at the top of the table—breadcrumbs—indicates the current filter.

Breadcrumbs offer a quick form of filter navigation. The left condition is the most general, and the right condition is the most specific. Clicking a breadcrumb removes all the conditions to its right. Clicking the condition separator (>) before a condition removes only that condition.

![Breadcrumbs](image)

**Figure 31: Breadcrumbs**

- Clicking **Priority = 2** removes the condition **Category = Software** and returns all active incidents with a priority of 2.
- Clicking the condition separator (>) before **Priority = 2** removes the condition **Priority = 2** and returns all active incidents in the software category.
• Clicking **All** removes all conditions and returns all incidents in the system.

Click a breadcrumb to refresh the list of records and show the latest information from the database for those records.

---

**Note:** Clicking the **New** button in a filtered list automatically applies the same filter to the new record. For example, in a list filtered for active, priority 1 incidents, clicking **New** opens a new record preset with **Active** selected and **Priority** set to **1 - Critical**. You can change the preset values on the form as needed. If there is a field you do not want to have populated in this way, you can add the following dictionary attribute to the field: `ignore_filter_on_new=true`.

Additional navigational functions are available when you right-click a breadcrumb.

### Table 21: Breadcrumb right-click options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open new window</td>
<td>Opens the results list for the breadcrumb in a new tab or window.</td>
</tr>
<tr>
<td>Copy URL</td>
<td>Copies the URL to the clipboard for the results list of the breadcrumb. Follow browser instructions if browser security restricts this function.</td>
</tr>
<tr>
<td>Copy query</td>
<td>Copies the encoded query to the clipboard for the breadcrumb. You can use this query in the URL of an instance or in the reference qualifier field of a dictionary entry. For example, if you are viewing a list of all active incidents with a high or medium impact, right-click the breadcrumb and copy the query <code>active=true^impact=1^ORimpact=2</code>. You can append this query to the end of the instance URL as follows: <code>https://{instance_name}/incident_list.do?sysparm_query=active=true^impact=1^ORimpact=2</code> This selection is not available for the <strong>All</strong> breadcrumb.</td>
</tr>
</tbody>
</table>

---

**Quick filters**

To quickly filter a list using a value in a field, right-click in the field and select **Show Matching** or **Filter Out**. For date fields, choose from **Show Before**, **Show After**, and **Filter Out**.

These functions add a condition to the right in the breadcrumb of the current filter.
In this example, right-clicking Active and selecting Show Matching adds the condition Incident state = Active as the most specific condition of the filter. By contrast, right-clicking Active and selecting Filter Out adds the condition Incident state != Active as the most specific condition of the filter.

For date and date-time fields you can also use Show After or Show Before to define a time-based filter.

Create filters

A filter restricts what records appear in a list by providing a set of conditions each record must meet to be included in the list.

Role required: none

A condition consists of the following parts.

- **Field**: Each field contains data from a particular column in the table. Selecting a reference field allows you to dot-walk to data from other tables.
- **Operator**: Each field type has its own set of valid operators. The operator determines if a value is needed.
- **Value**: Each field has its own set of valid values determined by the field type. Reference fields have access to auto-complete, and choice lists provide a list of options.
- **Grouping**: Each condition line is grouped with either an AND or OR connector. The filter requires all condition lines linked with an AND connector to be met. The filter separately evaluates each condition line linked with an OR connector.

Create filters on a list using the condition builder. To make the condition builder appear every time you open the list, click the pin/unpin filter icon ( in UI16 and UI15, and  in UI11).

1. Open the condition builder in one of the following ways.
   - Click the show / hide filter icon ( ) beside the breadcrumbs in UI16 or UI15.
   - Click the arrow ( ) beside the breadcrumbs in UI11.
2. Select a field from the list.
The field type determines the available operators and values. For example, the **Active** field can have a value of **true**, **false**, or **empty**, while a text field can have many different values. Similarly, the **greater than** operator does not apply to the **Active** field, but it does apply to the **Priority** field. For more information, see *Condition builder* on page 157.

3. Select an **operator** from the list.
4. Select or enter a **value**, if appropriate.
5. Add or remove conditions to construct the desired filter by completing one or more of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add a top-level condition</td>
<td>Click <strong>AND</strong> or <strong>OR</strong> on the condition builder toolbar above the conditions.</td>
</tr>
<tr>
<td>To add a dependent condition</td>
<td>Click <strong>AND</strong> or <strong>OR</strong> beside the condition.</td>
</tr>
<tr>
<td>To remove a condition</td>
<td>Click the delete icon (X) beside the condition.</td>
</tr>
</tbody>
</table>

6. To specify the sort order of the results, click **Add Sort**, and then select a field to sort by and a sort order.
7. Optional: Click **Save** to keep the filter for future use.
8. Click **Run** to apply the filter.

**Note:** To find all records that do not contain the specified value, create a filter with two conditions: `[field] [is not] [value] OR [field] [is] [empty].`

**OR conditions**
The condition builder uses two different types of OR conditions, top-level and dependent.

Using a dependent OR condition, you can specify alternative criteria to a single operation. Dependent OR conditions work in the manner A and (B or C).

For example, to return a list of all unassigned problem and incident records from the Task table, create a filter with a dependent OR on the **Number** field.

- [Assigned to] [is] [empty] AND [Number] [begins with] [PRB] OR [Number] [begins with] [INC].
Figure 33: Dependent OR

A top-level OR condition allows you to display the results of multiple filter criteria in a single list. Top level OR conditions work in the manner (A and B) or (C and D).

For example, to return a single list of all active incidents with a category of hardware, and all inactive incidents with a category of software, create two condition sets separated by a top-level OR condition.

- [Active] [is] [true] AND [Category] [is] [Hardware]
- Top level OR condition
- [Active] [is] [false] AND [Category] [is] [Software]
Figure 34: Top level OR

Top-level and dependent OR conditions can be used together. Filters using both types of OR conditions work in the manner (A or B) or (C or D). By mixing AND conditions with top-level and dependent OR conditions, you can create very specific filters.

Filter on multiple string values
For a string field, you can create a filter that searches for multiple values by creating a comma-delimited list.

This feature enables administrators to copy and paste search criteria from a Microsoft Excel spreadsheet into a filter, for example.

**Note:** Do not use the `[is one of]` operator on fields that contain commas, as the query does not return the expected set of records. Instead, create a filter using multiple `[or]` statements.

1. Create the filter with the `[is one of]` or `[is not one of]` operator.
   Depending on the selected field, a choice list or a text box appear.
2. Select one or more of the options by using multiple selection key commands.
   The choice list remains visible.
Alternatively, for text or number fields, type your search options. Separate the options by commas or put each option on a separate line, and do not enclose the selections in brackets.

3. Click **Run** to filter the list.
The filter conditions appear as a comma-delimited string at the top of the results list.
Figure 35: Comma-delimited filter string

Dynamic operators
The dynamic operator, **is (dynamic)**, lists predefined dynamic filter options where the condition value is computed from a value in a reference field.

The following dynamic filter options are available by default.

**Note**: Administrators can create new dynamic filter options.

<table>
<thead>
<tr>
<th>Target table of reference field</th>
<th>Option label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User [sys_user]</td>
<td>Me</td>
<td>The reference field contains the current user.</td>
</tr>
<tr>
<td></td>
<td>One of My Assignments</td>
<td>The reference field contains the current user or someone for whom the current user is a delegate for assignments.</td>
</tr>
<tr>
<td></td>
<td>One of My Approvals</td>
<td>The reference field contains the current user or someone for whom the current user is a delegate for approvals.</td>
</tr>
<tr>
<td>Target table of reference field</td>
<td>Option label</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------</td>
</tr>
<tr>
<td>Users With Roles</td>
<td>Users With Roles</td>
<td>The reference field contains users that have any role.</td>
</tr>
<tr>
<td>Group [sys_user_group]</td>
<td>One of My Groups</td>
<td>The reference field contains a group to which the current user belongs.</td>
</tr>
</tbody>
</table>

The following table contains examples and descriptions of dynamic filter conditions.

**Table 23: Example of using the dynamic operator**

<table>
<thead>
<tr>
<th>Field</th>
<th>Operator</th>
<th>Dynamic filter option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller</td>
<td>is (dynamic)</td>
<td>Me</td>
<td>Computes the value of Caller based on the current user viewing the list.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>is (dynamic)</td>
<td>One of My Groups</td>
<td>Computes the value of Assignment group based on the current user viewing the list.</td>
</tr>
</tbody>
</table>

Save and use filters in a list view

Depending on your access rights, you may save filters for everyone, a user group, or yourself. You can apply saved filters and edit or delete them.

Role required: varies depending on action. See procedure.

1. Create or modify a filter in the filter interface.
2. Click **Save**.
3. Enter a name for the filter.
4. Select one of the following visibility options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Me</td>
<td>Creates a personal filter, which only you can access. This option is available to all users.</td>
</tr>
<tr>
<td>Everyone</td>
<td>Creates a global filter, which all users can access. This option is available to users with the filter_global role.</td>
</tr>
<tr>
<td>Group</td>
<td>Creates a group filter, which only members of the user group you select can access. This option is available to users with the filter_group role.</td>
</tr>
</tbody>
</table>

5. Click **Save**.
6. To use a saved filter, select the filter name in the list title menu. The filter runs and the breadcrumbs appear.
7. To edit a filter, select **Edit personal filters** from the list title menu and complete the following steps.
   a) Click the title of the filter to edit.
   b) Update the filter title or add or remove conditions.
   c) Optional: To delete the filter, click **Delete** and confirm deletion.
   d) If you edited the filter, click **Update**.

**Filter admin functions**

Administrators can work with filters in the Filters table [sys_filter], including creating, editing, and deleting filters.

Administrators can also create scripted filters that cannot be created in the condition builder. Scripted filters required a knowledge of JavaScript. Scripted filters can be used to create additional *dynamic filter options*.

*Create and edit filters*

You can create a filter and edit any saved filter.

Role required: admin

1. Navigate to **System Definition > Filters**.
2. To create a filter, complete the following steps.
   a) Enter a **Title** and select the **Table**.
   b) Add filter conditions.
   c) Click **Submit**.
3. To edit a saved filter, select the filter to edit and complete the following steps.
   a) Modify the **Filter** conditions as necessary.
   b) Click **Update**.
Delete filters
You can delete any saved filter, including global, group, or personal filters.

Role required: admin

1. Navigate to System Definition > Filters.
2. Optional: To see who created the filter and when, personalize the list to add the created_by and created fields to the list.
3. Optional: To see who has access to the filter, configure the list to add the user, group, or domain fields.
   Filters that are not assigned to a user or group are global.
4. Select the filter to delete.
5. Click Delete and confirm the deletion.

Create scripted filters
The condition builder alone cannot create some filters, such as displaying a record set that is dependent on an unrelated table. You can create JavaScript functions for use in advanced filters if you have a knowledge of JavaScript.

Role required: admin

1. Create a new script include.
2. In the Script field of the script include, create a JavaScript function that returns an array of sys_ids.
   • Ensure that the function uses the same name as the script include.
   • Ensure that the script include is Active and Client callable.
3. Call the JavaScript function from the condition builder.
   For more information, see GlideRecord on page 3960 queries and Script includes on page 3862.

A company provides intensive care for a group of customers. To track these services, the service manager needs a high-level journal and links to all incidents that the customers raise.

The company creates a new application, Intensive Care, and a table, [u_intensive_care]. While the table contains a reference field for the customer name, there is no direct link to the user table. Thus, the manager cannot set up an incident list filter using the condition builder for customers who are under intensive care.

The solution is to write a JavaScript function that uses a GlideRecord query to build an array of user sys_ids in the [u_intensive_care] table, as shown in the sample code below. Call the function from the condition builder in the Incident table ([Caller] [is] [javascript:myFunction()]).

```javascript
function myFunction() {
  var arrUsers = [ ];
  gr = new GlideRecord ( 'u_intensive_care' );
  gr. query ( );
  while (gr. next ( ) ) {
    arrUsers. push (gr. u_customer. toString ( ) );
  }
  return arrUsers;
}
```

Create a dynamic filter option
Dynamic filter options enhance filters by allowing users to run a set query against a reference field without having to enter JavaScript code in the condition builder.
Role required: admin

All dynamic filter options use the **is (dynamic)** operator and call a particular scripted filter.

**Note:** Dynamic filters are not supported in scoped applications.

---

**Figure 37: Dynamic operands**

For more information about using dynamic operators, see *Dynamic operators* on page 77.

1. Create a scripted filter as a client-callable script include or business rule.
2. Navigate to **System Definition > Dynamic Filter Options**.
3. Click **New**.
4. Complete the form.

**Table 24: Dynamic filter options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter the text you want to appear as an option when a user selects the <strong>is (dynamic)</strong> operator.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the name of the function you created.</td>
</tr>
<tr>
<td>Field type</td>
<td>Select <strong>Reference</strong>.</td>
</tr>
<tr>
<td>Referenced table</td>
<td>Select the table this filter option applies to.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to designate the placement of this option in the filter option choice list.</td>
</tr>
<tr>
<td>Roles</td>
<td>Select the role a user must have to see this option.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable the option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reference script</td>
<td>Select the client-callable script include or business rule you created for the scripted filter.</td>
</tr>
<tr>
<td>Available for filter</td>
<td>Select this option to display the option as a filter breadcrumb.</td>
</tr>
<tr>
<td>Available for default</td>
<td>Select this option to allow it to be a default in a dictionary entry.</td>
</tr>
<tr>
<td>Available for ref qual</td>
<td>Select this option to allow it to be selected as a reference qualifier in a dictionary entry.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Encoded query strings**

An encoded query string represents a complex filter on a list of records.

Use encoded query strings to include a filter as part of a URL parameter, such as the `sysparm_query` URL parameter, or as a reference qualifier to restrict the data that is selectable for a reference field.

You can create encoded query strings manually or copy them from list filters.

**Table 25: Encoded query string examples**

<table>
<thead>
<tr>
<th>Title</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Referring to Boolean or string values</td>
<td>To create a query string on Boolean fields, use this syntax: field=true or field=false. For example, to return only active records in a table, use:</td>
</tr>
<tr>
<td></td>
<td>active=true</td>
</tr>
<tr>
<td></td>
<td>To create a query string with a field that has a specific string value, use this syntax: field=value. For example, to return incident records where the category is network, use:</td>
</tr>
<tr>
<td></td>
<td>category=network</td>
</tr>
<tr>
<td>Referring to reference fields</td>
<td>To create a query string that refers to a reference field in another table, use this syntax: field_in_referenced_table=value. For example, to return users with the itil role in the <strong>Assigned to</strong> reference field on the Incident form, use:</td>
</tr>
<tr>
<td></td>
<td>roles=itil</td>
</tr>
<tr>
<td>Title</td>
<td>Example</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Referring to choice list values           | To create a query string that refers to a choice list option, use the value of the choice list, not the label, with this syntax: choice list field=value. For example, to return configuration items (CIs) with the status **Installed**, which has a value of 1 in the choice list, use:  

`install_status=1`

See *Values to associate with choice labels for scripting* on page 848 to find the options for the values. |
| Using multiple conditions                 | To use two conditions joined together by an AND operator, use the carat ^ symbol in this syntax: field1=value1^field2=value2. For example, to return all active users with the "itil" role, use:  

`active=true^roles=itil`

To use two conditions joined together by an OR operator, use the carat symbol with OR with this syntax: field1=value1^ORfield1=value2. For example, to return all users with either the "itil" or "admin" roles, use:  

`roles=itil^ORroles=admin`

To add multiple conditions where one condition is a JavaScript function, use this syntax: javascript:'field=value^' + function(). The function must return a string that can be concatenated with the first string to produce a valid query string. For example, to return all active users and meet the conditions of the getGroupQualifier() function, use:  

`javascript:'active=true'' + getGroupQualifier()` |
<table>
<thead>
<tr>
<th>Title</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Listing values in order</td>
<td>To sort data by a specific field, use the ORDERBY condition with the following syntax: field1=value^ORDERBYfield2. For example, to return the days of the week in order from the Day of the Week [sys_cal_unit] table, use: unit_name=day^ORDERBYvalue In the Day of the Week table, unit_name is the field that specifies day, week, or month, and value is a numerical value for each day from 1 (Monday) to 7 (Sunday). The query string returns a list of the days of the week in order from the lowest value, which represents Monday, to the largest value, which represents Sunday.</td>
</tr>
</tbody>
</table>

**Note:** Reference qualifiers do not support the ORDERBY condition. In reference qualifiers, you can sort the reference lookup list by using standard list controls. To specify the order of an auto-complete list for a reference field, use the ref_ac_order_by dictionary attribute.

Generate an encoded query string through a filter

You can generate an encoded query string through a filter on any list and paste the string into a URL query or a reference qualifier.

Role required: none

1. Open a list of records.
2. **Construct the filter.**
3. Click **Run**.
4. Right-click the end of the filter breadcrumb and select **Copy query** from the context menu.
5. Copy the query to your system clipboard.
6. Use the query string to construct a URL or an advanced reference qualifier.
   When you use the CONTAINS operator on a list filter, the system translates the filter to a LIKE query. For example, if you filter for active records with numbers that contain 123, the URL is https://InstanceName.service-now.com/incident_list.do?sysparm_query=active%3Dtrue%5EGOTOnumberLIKE123.

Search a list

You can search a list to find information quickly.

Role required: none

The list title bar includes options for searching the list. Administrators can enable text searches for any list.

There are two options for searching the list.

- The Go to option sorts the list by the selected field and returns records where the field value is equal to or greater than the search term. For the Number field, which is a string type field, finds the records that have a number ending with the number that you enter. For example, searching a list of incidents by selecting Number and entering 4 shows records with numbers like INC0000004 and INC0000014.
- The Search option appears when you select for text. It returns records that contain the search term in any field.

**Note:** In UI11, the Go to and Search options are displayed side-by-side in the header.

1. Navigate to a list of records.
2. If necessary, personalize the list to add the desired fields.
3. Select a field or select for text.
4. Enter the search text. Use wildcards to further refine list searches.
5. Press Enter to execute the search.

In UI11, you can press Enter or click the search icon (🔍).

Search by one or more columns in a list

In addition to searching by field or for text, you can search by one or more individual columns in a UI16 or UI15 list.

Role required: none

---

**Figure 39: Column search**

This search supports queries that include AND, but does not support OR.

1. Click the search icon (🔍) to expand the column headers and add a search field to each column.
2. To search a single column, enter the search text in the desired column search field and press the Enter key.
   Use wildcards to further refine column searches. For example, use the * to define a contains search.
3. To search multiple columns, perform one of the following actions.
   - Enter the search text in each of the desired column search fields and press the Enter key.
• Search an individual column and then search additional columns based on the results of the first search.

The search returns records that match the search term.

To clear a column search, complete one of the following actions.
• Delete the text in the search field for the desired column and press the Enter key. This returns results for any remaining column search criteria.
• Delete the text in all the column search fields to return all records in the list.

Available list search wildcards

The platform supports several wildcard characters to expand and refine search results.

<table>
<thead>
<tr>
<th>Wildcard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*search-term</td>
<td>Search for values that contain search-term.</td>
</tr>
<tr>
<td>%search-term%</td>
<td></td>
</tr>
<tr>
<td>%search-term</td>
<td>Search for values that end with search-term.</td>
</tr>
<tr>
<td>search-term%</td>
<td>Search for values that start with search-term.</td>
</tr>
<tr>
<td>=search-term</td>
<td>Search for values that equal search-term.</td>
</tr>
<tr>
<td>!*searchterm</td>
<td>Search for values that do not contain search-term.</td>
</tr>
<tr>
<td>!=searchterm</td>
<td>Search for values that do not equal searchterm.</td>
</tr>
</tbody>
</table>

Searching without wildcard characters

If you enter text in the search box without using a wildcard, the search is performed for values greater than or equal to the value you enter. For text data-type-fields, this means that the search first sorts the records on the selected field, then finds the first record that starts with the text and all following records. For numeric data-type-fields, this means that the search finds all records where the number field ends with the entered number.

Note: The system treats some string fields that contain record numbers as numeric fields. Any field named number or u_number is treated as a numeric field.

Setting default search behavior

Administrators can add a property to perform a default contains search instead of a greater than search. To make this change, Add the property glide.ui.goto_use_contains and set the property Value to true.
Sort a list

You can quickly find information in a list by sorting the list. The method that the system uses to sort a list depends on the type of record in the sort column.

Role required: none

Consider the example record: Label=Requested Item; Value=sc_req_item. Field types other than choice list types are sorted based on the label. The example record label, Requested Item, would be sorted with records whose labels start with "r."

A choice list field lets the user select from a pre-defined set of choices. Choice list fields are sorted by the underlying dictionary entry value of the field, not by the label. The example record value, sc_req_item would be sorted with records whose values start with "s."

Sorting by value can be useful. For example, choices for the State of tasks are ordered New > Work in Progress > Closed. Based on the label, the sort would be Closed > New > Work in Progress.

The current sort order is indicated by an arrow next to the column name. A downward pointing arrow indicates the column is sorted in descending order. Only the primary sort order is indicated.

**Note:** The following sorting rules apply to lists:
- In a translated instance, only translated_text, translated_field, and translated_html type columns support sorting.
- The column label should be created in English first then translated accordingly.
- You cannot sort a list by an array-based field, such as a Glide list.

To sort a list, use one of the following methods:
- Click a column name to sort the list in ascending order. Click again to sort in reverse order.
- Right-click a column name and select Sort (a to z) or Sort (z to a) to sort in ascending or descending order, respectively.
- Specify a sort order with a filter. Filters provide for sorting by more than one column (for example, by Category and then Subcategory).

Grouped lists

Grouping aggregates a list by a field and displays the record count per group. Grouping can help you find data quickly by organizing and providing a summary of search or filter results.

For example, this picture shows active incidents grouped by caller.
Use a grouped list

You can quickly find information in a list by grouping the list. There are many ways you can use a list after you group the records in it.

Role required: none

1. To group items in a list, use one of the following methods.
   - On the title bar, click the context menu and select Group By. Select the field by which to group the list. To remove a grouping, select -- None --.
   - Right-click the column name and select Group By. To remove a grouping, select Ungroup.

2. Use any of the following actions to expand the groups.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To expand or collapse a group</td>
<td>Click the arrow (↑) next to the group name.</td>
</tr>
<tr>
<td>To expand or collapse all groups</td>
<td>Click the arrow at the top of the list.</td>
</tr>
<tr>
<td>To open the full list for a group</td>
<td>Click the group name.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td><strong>To see all records for a given group</strong></td>
<td>Open the full list.</td>
</tr>
</tbody>
</table>

3. To change the number of records per page, click the title menu and select **Show**.

The maximum number of records shown per group is the *number of records per page* in list view.

**Methods for list edits**

Users can edit data in lists using various methods.

**Quick edit functions**

To edit a record in a list using quick edit functions, right-click a field and select the appropriate function.

- **Assign to me**: For records that use assignments, places the logged-in user's name into the **Assigned to** field.
- **Approve**: For records that use approvals, changes the record's approval state to **Approved**.
- **Reject**: For records that use approvals, changes the record's approval state to **Rejected**.
- **Assign tag**: For records you want to track based on a user-defined label, lets you select an existing tag or add a tag.

**List editor**

The list editor lets you edit field values in a list without opening a form. Administrators can configure the list editor. By default, list editing is disabled for some tables. Fields of *certain types* cannot be edited from lists.

**Multiple record edits**

You can edit more than one record at the same time using the list editor or an editing form.

**Use the list editor**

The list editor allows users to edit field values directly from a list without navigating to a form.

Role required: none

The list editor lets you edit field values in a list without opening a form. Administrators can configure the list editor. By default, list editing is disabled for some tables. Fields of *certain types* cannot be edited from lists.

Before the list editor opens, access rights to edit the field are verified. A loading indicator appears if this process takes longer than expected. If the field has a dependency relationship (for example, **Category** and **Subcategory**), then a composite editor opens to allow editing of all dependent fields. You must have rights to edit all dependent fields to use the list editor.

1. Double-click in an empty area of the field. The appropriate editor for the field type opens.
2. Enter the appropriate values and click Save (✓), or click Cancel (✗) to retain the original value.

3. To use keyboard navigation, press the Tab key until the first field in the list is selected, and then select the field to edit in one of the following ways.
   • Move right: Tab or the Right Arrow key.
   • Move left: Shift + Tab or the Left Arrow key.
   • Move down: the Down Arrow key.
   • Move up: the Up Arrow key.

   To select multiple fields in the same column, hold Shift and press the Down Arrow or the Up Arrow key.

4. Press the Enter key to open the list editor.

5. Enter a new value. To add another line in a multi-line text field, press Shift + Enter.

6. Save or cancel your changes in one of the following ways:
   • Press the Enter key. The new value is saved and the field below the edited field becomes selected.
   • Press the Tab key. If the list is configured to save immediately, the new value is saved. If the list is configured to save data by rows, an indicator appears beside the value and the list editor opens for the next field. The row is saved only when you navigate away from the row or click the check mark icon beside the row.
   • Press Ctrl + Enter keys. If the list is configured to save immediately, the new value is saved. If the list is configured to save data by rows, an indicator appears beside the value and the current field remains selected.
   • Press the Esc key. The list editor closes without saving changes and the field remains selected.

---

**Note:** Certain browsers use different key combinations to edit certain field values. For example, to edit a choice list using Chrome, press the Spacebar.

---

*Create a new record*

Users can create new records in list view. Administrators can configure the list editor to enable this feature for lists.
Roler required: none

1. Navigate to the empty row at the bottom of the list.
2. Open the list editor for a field in the row and enter a value.
3. Save or cancel your changes.

Figure 42: Insert a new row (record)

Configure the list editor
You can personalize how the list editor behaves.

Role required: none
1. Open the list.
2. Click the personalize list icon (⚙️) in the upper left corner.
   • To allow the list editor to open for the list, select the Enable list edit check box. Clear the check box to prevent the list editor from opening for the list.
   • To open the list editor with a double-click, select the Double click to edit check box. Clear the check box to open the list editor using a single click.
3. Click OK.

Edit multiple records in a list using the list editor
You can edit multiple records at the same time using the list editor. If you want to update a single field on multiple records to have the same value, the list editor is the quickest method.

Role required: none
1. Select the records you want to edit by performing one of the following actions.
   • To select multiple consecutive fields, hold Shift and drag in the desired fields, or select a cell and then press Shift + Up Arrow or Shift + Down Arrow.
   • To select multiple non-consecutive fields, press Shift and click in one of the desired fields, then hold Shift + Ctrl (Shift + Command on Mac), and click in the desired fields.
2. Open the list editor by double-clicking (or clicking, depending on setup) in an empty area of the field.
   The number of selected rows that you are editing is indicated. If any rows cannot be edited due to security constraints, that is indicated.
3. Enter the appropriate values and click Save.

**Edit multiple records in a list using an editing form**

You can edit multiple records at the same time using an editing form. If you want to edit multiple fields or fields that do not appear in the list view, use an editing form.

Role required: list_updater or admin

1. Select the records you want to edit by performing one of the following actions.
   - Select the check boxes in the record rows.
   - Select a field in the record rows.
   - Filter the list to show only the rows you want to edit.

2. Right-click the column header and select Update Selected or, if you filtered the data, select Update All.
   - An editing form opens.

3. Enter appropriate values in any of the fields and click Update to save your changes in all selected records.

**Personal lists**

Personal lists modify a specific list view according to individual preferences.

Personal list customizations do not affect what other users see in their lists. Administrators can manage the personal lists function.

Users can create personal lists and define the following layout options.

- Column selection and order
- Row spacing
• Text wrapping
• List editing
• List highlighting

Figure 44: UI16/UI15 personalize list
Personalize a list

You can personalize a specific list view based on individual preferences.

1. Open the list.
2. Click the personalize list icon (⚙️) in the upper left corner.
3. Use the slushbucket to select the columns and the desired order.

Figure 45: UI11 personalize list
The first non-reference field automatically links to the form view of the record. For this reason, consider using the record number as the first column in your personal list layout.

4. Select display options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display long text on more than one line</td>
<td>Select the <strong>Wrap column text</strong> check box. Clear the check box to display text on one line.</td>
</tr>
<tr>
<td>Condense the vertical space between rows</td>
<td>Select the <strong>Compact rows</strong> check box. Clear the check box to use standard row spacing.</td>
</tr>
<tr>
<td>Highlight list rows as the cursor passes over them</td>
<td>Select the <strong>Active row highlighting</strong> check box. Clear the check box to restore the static, alternate row highlighting.</td>
</tr>
<tr>
<td>Use updated field status indicators available in UI15 and UI16</td>
<td>Select the <strong>Modern cell coloring</strong> check box. Clear the check box to use field status indicators available in UI11.</td>
</tr>
</tbody>
</table>

5. Select list editing options (requires you to configure the list editor).

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow the list editor to open for the list</td>
<td>Select the <strong>Enable list edit</strong> check box. Clear the check box to prevent the list editor from opening for the list.</td>
</tr>
<tr>
<td>Open the list editor with a double-click</td>
<td>Select the <strong>Double click to edit</strong> check box. Clear the check box to open the list editor using a single click.</td>
</tr>
</tbody>
</table>

6. Click OK.

If a list is personalized, an indicator (☁️) appears in the upper left corner.

To reset a list to the default layout, click the personalize list icon and select the **Reset to column defaults** check box.

**Forms**

A form displays information from one record in a data table.

The specific information depends on the type of record displayed. Users can view and edit records in forms. Administrators can configure what appears on forms.

</tbody>
</table>

### Form headers for UI versions

Each UI version, UI16, UI15, and UI11, has a different form header that offers different navigation icons.

To learn about form header navigation, select the form header topic that corresponds to the UI version your organization uses.

**UI16 form header** on page 98

![UI16 form header](image)

**UI15 form header** on page 100

![UI15 form header](image)

**UI11 form header** on page 101

The UI11 form header can have a blue background, but the icons are as pictured in this image.

![UI11 form header](image)

**UI16 form header**

The form header displays the title of the form (table) and provides a number of controls.
The UI16 form header includes the following controls.

**Figure 47: Form header UI16**

<table>
<thead>
<tr>
<th>Control</th>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

**Form context menu**

The form context menu provides controls based on the table and user access rights. Administrators can customize some of the options available on a context menu using UI actions.

Access the form context menu by clicking an icon beside the form title or by right-clicking the form header.

- UI16 and UI15 menu icon (_gateway_global_icon_0009)
- UI11 arrow icon
Figure 50: UI16 form context menu

The form context menu includes the following options.

**Note:** Some of the options displayed on the form context menu depend on the user role, installed applications, and version of the UI.

### Table 31: Form context menu options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save</td>
<td>Saves changes without leaving the form view.</td>
</tr>
<tr>
<td>Related actions</td>
<td>Provides standard actions in the form context menu for some tables, such as Add to Visual Task Board or Create Change in incident.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Insert</td>
<td>Saves the data as a new record and returns to the previously viewed page. For more information, see <em>Insert a record</em> on page 123.</td>
</tr>
<tr>
<td>Insert and Stay</td>
<td>Saves and displays the new record. For more information, see <em>Insert a record</em> on page 123.</td>
</tr>
<tr>
<td>Configure</td>
<td>Provides administrative functions, such as configuring forms.</td>
</tr>
<tr>
<td>Templates</td>
<td>(UI11 only) Provides administrative functions, such as creating templates. For more information, see <em>Save a form as a template in UI11</em> on page 730.</td>
</tr>
<tr>
<td>Toggle Template Bar</td>
<td>(UI15 only) Shows or hides the template bar. For more information, see <em>Toggle the template bar</em> on page 726.</td>
</tr>
<tr>
<td>Export</td>
<td>Exports data to PDF. Administrators can also export to XML. For more information, see <em>Export data</em> on page 1494.</td>
</tr>
<tr>
<td>View</td>
<td>Changes fields to a predefined layout. Note that switching views submits the form, which saves all changes. Administrators can customize views.</td>
</tr>
<tr>
<td>Assign Tag</td>
<td>Allows the user to assign a new or existing tag to a record, which provides quick access to frequently referenced or urgent information. When tag is assigned to a record, the record is displayed on the Tagged Documents page. For more information, see <em>Tags</em> on page 166.</td>
</tr>
<tr>
<td>Copy URL</td>
<td>Copies to the clipboard the URL for the form view of the record. Follow browser instructions if browser security measures restrict this function.</td>
</tr>
<tr>
<td>Copy sys_id</td>
<td>Administrators only. Copies to the clipboard the sys_id of the record. Follow browser instructions if browser security measures restrict this function.</td>
</tr>
<tr>
<td>Show XML</td>
<td>Administrators only. Displays record data in XML format.</td>
</tr>
<tr>
<td>History</td>
<td>Administrators only. Displays audit history for the record, which must be enabled for the table. For more information, see <em>Enable auditing for a table</em> on page 2563.</td>
</tr>
<tr>
<td>Reload Form</td>
<td>Reloads information from the database to refresh the form view.</td>
</tr>
</tbody>
</table>

Form fields

A field represents an individual item of data on a record.
Users can view and modify field data on a form.

**UI16 and UI15 field status indicators**

Indicators are used on some fields to denote a special field type.

A field status indicator is a colored asterisk that may appear to the left of mandatory fields. Field status indicators change colors to represent different states of mandatory fields.

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unpopulated</td>
<td>Required field is empty. The user must enter a value to save the form. Default color is red.</td>
</tr>
<tr>
<td>Populated - saved</td>
<td>Required field contains a value that was saved or needs to be saved. Default color is grey.</td>
</tr>
<tr>
<td>Populated - unsaved</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 51: UI16/UI15 field status indicators**

**Note:** Tabs containing required fields have black asterisks.

**UI11 field status indicators**

A field status indicator is a colored bar that may appear to the left of form elements.

These indicators convey the following statuses.

<table>
<thead>
<tr>
<th>Field status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory</td>
<td>Required field that is empty. The user must enter a value to save the form. Default color is red.</td>
</tr>
<tr>
<td>Populated mandatory</td>
<td>Required field for which a value has already been saved. Default color is light red. If the user enters a new value, the field status indicator changes to modified (default green).</td>
</tr>
</tbody>
</table>
Field status | Description
-------|-------
Modified | Contains data that has not been saved. Default color is green.
Read-only | User cannot edit on the form. Default color is orange.

Figure 52: UI11 field status indicators

An administrator can customize the color of these field status indicators by navigating to System Properties > CSS:

![System Properties](image)

Figure 53: Customize UI11 field status indicator colors

Configure the activity filter

The activity formatter header contains a filter that lets users select which of the available fields to show in the activity list.

Role required: none

All fields on the activity list display in alphabetical order.

Configure the activity filter in UI16 and UI15

1. Open the filter by clicking the activity filter icon (🔍) in the Activity header.
2. Select the fields for which you want to display activity.
Fields are added or removed dynamically as the selection is made. In UI16 the All option does not display.

3. Click the activity filter icon again to close the filter.

Configure the activity filter in UI11

1. Open the filter by clicking the show/hide filter icon (AsStream) in the Activity header.
2. Select the fields for which you want to display activity. Fields are added or removed dynamically as the selection is made.
3. Click the show/hide filter icon again to close the filter.
   A filter icon appears on the Activity header to indicate that a filter is in effect.
4. Click the filter icon to toggle the filter on (display only the selected fields) or off (display all fields).
   When the activity filter is on, the filter icon has a blue border. The activities list shows the history of only those fields selected in the filter and the Activity header indicates how many of the available fields are selected, such as (4 of 5).
   When the activity filter is off, the blue highlight is removed from the filter icon and the form shows all available fields. If all fields are checked, the filter icon is not displayed.

Form sections

Form sections provide headers for a group of related fields.

Use these icons to work with form sections.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>(UI15) (previous Ul)</td>
<td>Expands a form section.</td>
</tr>
<tr>
<td>(UI15) (previous Ul)</td>
<td>Collapses a form section.</td>
</tr>
<tr>
<td>(UI11)</td>
<td>Toggles between a tabbed and sequential arrangement of sections.</td>
</tr>
</tbody>
</table>

**Note:** This icon is removed from the form header in UI15 and UI16. To enable or disable form tabs, click the gear icon in the form header and toggle the Tabbed forms option.

Embedded lists

Some forms may show related lists as embedded. Changes to embedded lists are saved when the form is saved.

Use these controls to work with an embedded list. For more information, see Edit a form on page 121.
### Table 34: Working with embedded lists

<table>
<thead>
<tr>
<th>Task</th>
<th>Icon</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expand an embedded list</td>
<td>![+]</td>
<td>Click the expand icon in the list header.</td>
</tr>
<tr>
<td>Collapse an embedded list</td>
<td>![−]</td>
<td>Click the collapse icon in the list header.</td>
</tr>
<tr>
<td>Insert a new row</td>
<td>![ ]</td>
<td>Double-click <strong>Insert a new row...</strong></td>
</tr>
<tr>
<td>Edit a row</td>
<td>![ ]</td>
<td>Double-click in an empty area of that field. See <em>Use the list editor</em> on page 90.</td>
</tr>
<tr>
<td>Delete a row</td>
<td>![X]</td>
<td>Click the delete icon beside the row. New rows are removed immediately. Existing rows are designated for deletion when the record is saved. To clear this designation, click the delete icon again.</td>
</tr>
</tbody>
</table>
Related lists

Related lists appear on forms and show records in tables that have a relationship to the current record. Users can view and modify information in related lists like any other list. Administrators can configure related lists to appear on forms and in hierarchical lists. Related lists do not have a size limit.

Select related records

You can select records for a related list.

Role required: none

1. Open the record for which you are selecting related records, such as a problem record.
2. Locate the related list, for example, Incidents.
3. Click Edit.
4. Using the slushbucket, select the records to associate with the current record. When you select a record, information about it appears below the Collection list to help you identify the record to select.
5. Click **Save**.

### Create a new related record

You can add a new record to the database from a related list.

**Role required:** You must have at least one role that lets you create a record in the related table.

1. Open the record to which you are adding a related record, for example, a change request.
2. Locate the related list, for example, **Change Tasks**.
3. Click **New**. A new form for the related table opens, for example, the Change Task form.
4. Complete the form and click **Submit**. The new record is added to the related table and to the related list of the record.

### Configure when a related list loads

If there are many related lists on a form or many records in the related lists, the form may load slowly. In UI16 and UI15, you can improve form response times by configuring related lists to load manually on demand or automatically after the rest of the form loads.

**Role required:** none

1. Click the settings icon (⚙️) in the banner frame to open the system settings menu.
2. Select one of the following options under **Related List Loading**.
   - **With the Form**: Related lists load as soon as you open the form. This is the default setting.
   - **After Form Loads**: Related lists load after the rest of the form loads.
   - **On-demand**: Related lists load on demand. When this option is selected, a **Load Related Lists** button appears at the bottom of each form that contains related lists. You must click the button to load related lists.
3. Close the system settings menu.

### Create a default filter

You can create a default filter that is applied to a related list when a form loads.

**Role required:** admin

1. Navigate to the related list (example, **Incidents** on a problem record).
2. Create the desired filter using the condition builder (example, `[Active] [is] [true]`).
3. Click **Set as Default Filter**.

Configure the edit option

You can configure the edit option that allows users to add records to related lists in forms.

Role required: admin

The **Edit** button is available for related lists that represent many-to-many and one-to-many relationships. Defined related lists may not have an **Edit** button as related records are added to these lists automatically based on the relationship between the records.

1. Navigate to the related list, such as the **Incidents** related list on a problem record.
2. Right-click any column heading and select **Configure > List Control**.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show the Edit option</td>
<td>Clear the <strong>Omit edit button</strong> check box.</td>
</tr>
<tr>
<td>Hide the Edit option</td>
<td>Select the <strong>Omit edit button</strong> check box.</td>
</tr>
<tr>
<td>Show the Edit option if the check box is cleared and</td>
<td>Click <strong>Enable Edit</strong>.</td>
</tr>
<tr>
<td>the button does not appear</td>
<td></td>
</tr>
</tbody>
</table>

4. If the list represents a one-to-many relationship (example, incidents can be associated with only one problem, but problems can be associated with many incidents), complete the following steps.
   a) Open a record in the target table (example, Incident).
   b) Right-click the header and select **Configure > Dictionary**.
   c) Open the dictionary entry for the reference field (example, **Problem ID** on **Incident**).
   d) In the Reference Specification section, select the **Reference floats** check box.
5. Click **Update**.

Create defined related lists

You can add default related lists to the form for all users to see when viewing records.

Role required: admin

For example, you may include a list of related incidents at the bottom of a problem record, or a list of members at the bottom of a group record. This functionality is dependent on reference fields or many-to-many table relationships. If two tables are related via the system dictionary, one can appear as a related list on the other.

Defined related lists allow relationships between arbitrary tables to be expressed as a related list. Any two tables that can have a logical relationship can appear as a parent/child pair via a related list. The following are some examples.

- On an incident record, show all incidents opened by the same caller.
- On a user record, show the last 20 transactions that user has made.
- On an incident record, show all problems opened on the reported CI.
These relationships are beyond the relationships normally defined in the system dictionary through reference fields and many-to-many relationships.

Every related list requires a relationship record. Before creating a new relationship, verify that there is not an existing relationship record that already provides the needed information. Use the following steps to create a new relationship record.

1. Click System Definition > Relationships.
2. Click New.
3. Specify the relationship record fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type the name of the related list. The form configuration page displays this name in the list of available lists.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript in place of the Applies to table and Queries from table fields.</td>
</tr>
<tr>
<td>Applies to table</td>
<td>Select the table on which the related list appears. This field is hidden in Advanced relationship records.</td>
</tr>
<tr>
<td>Queries from table</td>
<td>Select the table from which this related list retrieves data. This field is hidden in Advanced relationship records.</td>
</tr>
<tr>
<td>Apply to</td>
<td>Type a script to specify the table on which the related list appears. This field is only visible with the Advanced check box selected.</td>
</tr>
<tr>
<td>Query from</td>
<td>Type a script to specify the table from which this related list retrieves data. This field is only visible with the Advanced check box selected.</td>
</tr>
<tr>
<td>Query with</td>
<td>Type a script to specify the records to include from the table the relationship queries.</td>
</tr>
<tr>
<td>Insert Callback</td>
<td>Type a script to run after a successful insert action. This field is only visible with the Advanced check box selected.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Add incidents by same caller related list
This example adds the existing relationship, Incidents by Same Caller, to incident forms.

- **Applies to table**: This list appears as an available related list when viewing an incident record.
- **Queries from table**: This list displays a list of incidents.
- **Query with**: This script selects records where the caller_id matches the caller_id of the parent record (the incident you are viewing).  

© 2017 ServiceNow. All rights reserved. 114
1. Open an incident.
2. Right-click the header and select **Configure > Related Lists**.
   The name of the existing relationships appear in your list of available lists.
3. Move the **Incidents by Same Caller** list to the **Selected** list.
4. Click **Save**.
| Number  | INC0000052          | Caller       | Bud Richman | Category | Software | Subcategory | -- None -- | Affected CI | SAP Financial Accounting | Impact   | 1 - High                  | Urgency   | 1 - High                  | Priority   | 1 - Critical               | Assigned to | Fred Lundy                  | Assigned group | Software |
|---------|---------------------|--------------|-------------|----------|----------|-------------|------------|-------------|-------------------------|----------|--------------------------|-----------|--------------------------|------------|---------------------------|-------------|---------------------------|
| Short description | SAP Financial Accounting application appears to be down | **Incidents by Same Caller** (4) | **New** | Go to | Number | Search | < | < | < | < | < | < | < | < | < | < | < | < | < | < |
| INC0000052 | Bud Richman | SAP Financial Accounting application appears to be down | Software | 1 - Critical | Active | Software |
| INC0000046 | Bud Richman | Can't access SFA software | Software | 3 - Moderate | New | Software |
| INC0000049 | Bud Richman | JavaScript error on hiring page of corporate website | Inquiry / Help | 3 - Moderate | Awaiting | Problem |
Notes and limitations:

• If you click the **New** button on one of these new relationships, the system attempts to ensure that the new record matches the list conditions. For example, clicking **New** on our example list results in an incident where the **caller_id** is pre-populated with **Bud Richman**.

• When scripting your condition, **current** is the record to which you want to add queries while **parent** is the main record being displayed.

• These relationships do not refresh until you update a form. In the example, if you changed the caller from **Bud Richman** to **Fred Luddy**, the list at the bottom of the screen still displays Bud Richman's incidents until you save the incident.

• You are not limited to a single query condition. It is, for example, possible to have a related list of all incidents opened by the same caller in the last week, or all open incidents opened by the same caller.

• The **current** and **parent** objects cannot be used with the **Queries from** field. Instead, the **gs** object is available for GlideSystem calls.

• The **Edit** button is not available on defined relationships, as the relationship is completely scripted.

---

**Add transactions by user related list**

This example adds a new relationship, Last 20 transactions, to the user form.

Role required: admin

The new relationship creates a list of task records opened by the current user.

1. Navigate to **System Definition > Relationships**.
2. Click **New**.
3. Create a new relationship with the following values.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Last 20 transactions</td>
</tr>
<tr>
<td>Applies to table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Queries from table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Queries with</td>
<td><code>current.addQuery('opened_by', parent.sys_id);</code></td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Navigate to **User Administration > Users**.
6. Select any user.
   For example, select David Loo.
7. Configure the related lists for the user form and add the related list **Last 20 transactions**.
8. Navigate to **User Administration > Users**.
9. Select any user.
   For example, select David Loo.
10. The **Last 20 transactions** related list displays all task records opened by the current user.

Notes and limitations:

• This query returns all task records opened by the user. The related list defaults to displaying 20 task records per page.

• The parent variable refers to the **Applies to table**. In this case, it applies to the User [sys_user] table.

• Querying against a record sys_id is a common query method for relationships.
Add fields to selections in a related list

When you click Edit in a related list and select an item, information about the item appears below the list. You can expand the fields that appear for the item to provide more information.

Role required: admin
Figure 55: Fields listed for selected record
To add fields to selections in a related list, record the exact field name, or element, not the label name. This example demonstrates adding fields to the Groups related list [sys_user_group] as illustrated.

1. Navigate to System UI > Views.
2. Select sys_ref_list.
3. To add fields from the Group table, in the Lists related list, select sys_user_group.
4. In the List Elements related list, click New.
5. Enter the field name and its relative position when it appears in the description.
   Fields appear from top to bottom, lowest to highest number.
6. Click Submit.

Create default filter for a related list

You can create a default filter or reference qualifier to filter the available options for related lists.

Role required: personalize_list

A filter is used to restrict the records that are listed in the slushbucket that displays when a user clicks Edit in a related list.
Figure 56: Unfiltered list of records

1. Right-click a related list column header and click Configure > List Control
2. Configure the form to add the Edit default filter field, if necessary.
3. Using the condition builder, create a default filter.
4. Click Update.
   When users click the Edit button in the related list, the list of records they can select is filtered according to the default filter.

Edit a form

You can edit a record in the form view.
Role required: none

1. Navigate to the form.

   If another user is looking at the same record, you see their avatar with a green dot in the form header. If more than one user is viewing the record, the avatar is a number, and you can point your cursor to it to see the names.

2. Enter appropriate data.

   **Note:** Depending on system setup, the data entered in a form can affect other options on the form or change its appearance. For example, if you select a status of **Closed** for an incident, a required **Close Notes** field may appear. Administrators can create custom form effects in various ways, including UI policies and client scripts.

3. Save the record using one of these methods:
   - Click **Submit** or **Update** to save changes and return to the previously viewed page.
   - Right-click the form header and select **Save** to save changes without leaving form view.
   - Right-click the form header and select **Insert** or **Insert and Stay** to save the data to a new record instead of updating the current record. For more information, see **Insert a record** on page 123.

On UI16 forms, fields update dynamically and display a field update icon (短板) to indicate changes made by other users. You can point to the field update icon to see which user made the update. This dynamic indication helps to prevent users from accidentally overwriting each other’s work.

**Note:** If you entered a different value from the value saved by the other user, the system does not update the field automatically. Change your value manually to match value entered by the other user. Otherwise, you overwrite the change when you save the record.

---

© 2017 ServiceNow. All rights reserved.
Insert a record

Insert provides a method for creating multiple similar items, such as email notifications, users, groups, or business rules.

Role required: none

Administrators can enable the Insert function for task records. For more information, see Configure task record insert options on page 705.

1. Open a similar item.
2. Edit the item and give it a new Name.
3. Right-click the form header and select one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Insert</strong></td>
<td>Saves the item as a new record and returns to the previously viewed page.</td>
</tr>
<tr>
<td><strong>Insert and Stay</strong></td>
<td>Saves and views the new record.</td>
</tr>
</tbody>
</table>

Apply a template in a form

Your organization may use templates to help with frequently requested tasks. A template contains prepopulated fields that default when the template is selected.

Role required: none

This option is not available in UI11.

1. Navigate to the form.
2. Do the appropriate action for your version of the UI.

<table>
<thead>
<tr>
<th>UI16</th>
<th>1. Click the more options icon (○○○) in the form header.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2. Select <strong>Toggle Template Bar</strong>.</td>
</tr>
<tr>
<td>UI15</td>
<td>1. Right-click the form header.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
3. Select the template to apply.
   If there is a conflict between the selected template and the form, a conflict message appears with a link to view the details of the conflict. For example, if a field that does not appear on the form is populated in the template, the conflict message details identify the missing field and the value is not set. If you have a conflict message, review the details and notify your administrator if necessary.

Specific fields are populated with values from the template.

4. Complete the form.
   You can change any value that was populated from the template.

5. Click **Submit** to create the record.

### Cancel changes to a form

Cancel changes to a form by navigating away from the form without saving.

**Role required:** none

1. Navigate away from the form view without saving the record.

2. If a message appears, click **Leave this Page** to confirm cancellation.

   **Note:** Administrators can disable the confirmation message by setting the glide.ui.dirty_form_support property to false.

### Use form pane tabs

When using the split screen feature, you can open multiple forms in the form pane. Form pane tabs are available in UI15 only.

Form pane tabs appear above the form header. The current tab is highlighted.
1. View a list in the content frame, for example, the Incident list.
2. Click the List and Form View button on the Edge to split the screen. The list is displayed in the list pane on the left and an empty form pane with a new highlighted tab is displayed on the right.
3. Select an incident record in the list pane to display the incident in the highlighted tab. The incident number appears in the tab at the top of the form pane.
4. Click the + tab to add a tab to the form pane. The new tab is added to the right of the current tabs and has the generic name New Tab until you select another incident from the list pane.
5. To remove a tab, select the tab to be deleted and click the x.

Form personalization

When the form personalization feature is activated, users can personalize fields to appear on a specific form view according to individual preferences. Form personalization is available in UI16 and UI15.

Personal form customizations do not affect what other users see on their forms.

In contrast to configuring a form, personalizing a form does not enable users to perform the following actions:

- Change the order of fields on the form.
- Add fields that are not configured to appear on the form.
- Hide mandatory fields.

**Note:** Personalizing a form in this way modifies the form for you only. To make changes to a form that are visible to all users, you must configure the form.
Personalize a form

You can personalize fields to appear on a specific form view.

Role required: itil, personalize_form, or admin

1. Open any record.
2. In the form header, click the gear icon (⚙).
   The Personalize Form menu appears and hide field icons appear on the form.

   Fields you previously hid are indicated by a cleared gray check box.

   **Note:** Only the fields that the form is configured to display are available in the Personalize Form menu. To add fields to the form, you must configure the form layout.

3. Clear a check box or click the hide field icon (숨기기) by a field.
   Some check boxes are gray and selected. These check boxes indicate fields that cannot be hidden because they are required or are already hidden by UI policies or client scripts.
4. Click outside the Personalize Form menu to save your changes.
   If you navigate away from the form, the next time you personalize the form you must reset your customizations to show fields that you have hidden.
5. To restore the default form view, personalize the form and click **Reset**.
Add attachments

You can upload a file as an attachment to an incident, a knowledge article, a change request, or to another type of record.

Attachment file size is not limited by default. However, uploading large attachments can cause issues with the user's active session on the instance. Empty attachments (file size of 0 kb) are not supported.

Note: Do not use the Upload File module in the System Definition application. It is not compatible with multi-node instances.

1. Navigate to the record (example, an incident record).
2. Click the attachments icon ( ).
3. Click Choose Files or Browse, depending on your browser, and navigate to a file.
4. Optional: Upload multiple files in one of the following ways.
   - Select multiple files at the same time in the file browser. This feature is not supported by Internet Explorer.
   - Add each file on a separate line by clicking Add Another Attachment, and then clicking Choose Files on the next line. Repeat until all desired files are selected. This feature is available in all supported browsers.
5. Click Attach.

Attached files appear in the Current file attachments list and at the top of the form. A message appears if a file is not attached because it is too large or is a restricted file type. Administrators can configure these limits.
6. Close the pop-up window to return to the form.

Manage attachments

You can view, rename, and remove the attachments on a record, and add additional attachments.

1. Navigate to the record (example, an incident record).

2. Click the attachments icon (🔗) or the Manage Attachments link if files are already attached. The number of attachments is listed on the Manage Attachments link.
3. To rename an attachment, complete the following steps.
   a) Click [rename] beside the file name at the top of the form or in the pop-up window.
      a) Edit the file name and press the Enter key.

      **Note:** Press the Esc key instead of the Enter key to undo your changes and cancel rename.

4. To remove attachments, click the **Manage Attachments** link and complete the following steps.
   a) Select the check boxes next to the attachments to delete.
   b) Click **Remove**.
      The attachment disappears and the pop-up window remains open.

5. To add additional attachments, complete the following steps.
   a) Click **Choose Files**.
   b) Select the file to attach and click **Open**.
   c) Click **Attach**.

6. Close the pop-up window to return to the form.

**Attach files with drag-and-drop**

You can drag files from your computer to a form and to upload them.
This functionality is supported in Firefox 3.6 or later and Chrome. Support will be added for other web browsers as they implement the HTML5 specification.

1. Navigate to the record.
2. On your computer, browse to the files to attach.
3. Select the files in the file browser, and then drag them over the header bar on the form.
4. When the attachments header appears orange, release the mouse button to begin the upload.

When the upload is complete, the file name is added to the attachments header. Upload speed depends on the file size and the speed of your network connection.

**Warning:** Do not navigate away from the record while an upload is in progress. The upload must be completed for the file to be attached.

Checklists

Checklists provide a simple way to track the progress of tasks without creating additional records. Checklists can be added to the form view of any table that extends Task [task].

For example, if a support agent is assigned an incident task to investigate a wireless issue, a checklist can be used to document the individual steps taken.

Checklists are added to records after they are submitted. You cannot add a checklist as you create a record.
Figure 57: Sample checklist

Enabling checklists in forms

To enable checklists, navigate to the form and add the Checklist formatter. For instructions, see Add a formatter on page 714.
Using checklists

You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other records. Any user can create or edit a checklist and check off completed items.

Activate checklists

Checklists are active by default on new instances. For instances upgrading from a previous version, the Checklist plugin must be activated.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Create a new checklist

You can create a unique checklist for each task record.

Have a user with the personalize_form role enable checklists for the form.

Role required: none

1. Navigate to a record that does not already contain a checklist.
2. Click the down arrow beside the Checklist formatter.
3. Select Create new.
4. Click Add Item.
5. Enter text for the checklist item.
6. Press the Enter key to add the checklist item.
7. Create as many additional checklist items as desired.
8. Optional: Click the minus (-) icon to delete a checklist item.
9. Optional: Click the drag icon ( ) and drag a checklist item to a different position in the list.
10. Optional: Save the checklist as a template for easy reuse.
   a) Click the down arrow beside the Checklist formatter.
   b) Select Save as Template.
      A dialog box appears.
   c) Enter a descriptive template name to identify the checklist.
      When a user creates a checklist from a template, all templates are listed in alphabetical order and there is no way to filter which templates appear. To provide a better user experience, consider implementing a naming system for checklist templates. For example, include the name of the table or another identifier to clarify how the checklist should be used.
   d) Click Save.
11. Save the form.

Create a checklist from a template

You can quickly create a checklist from a previously created template.

The Checklist formatter must be added to the form by a user with the personalize_form role.

Role required: none

A template saves time by creating checklist items automatically. You can add, edit, or remove checklist items without impacting the template. You can use any checklist template, even if it was created on a different table.

1. Navigate to a record that does not already contain a checklist.
2. Click the down arrow beside the Checklist formatter.
Figure 58: Checklist with a template selection

Delete a checklist

You can remove a checklist from a record.

Role required: none

1. Navigate to a record that contains a checklist.
2. Click the down arrow beside the **Checklist** formatter.
3. Select **Remove Checklist**.
   A confirmation dialog box appears.
4. Click **Delete**.

Delete a checklist template

You can delete checklist templates you no longer need.

Role required: none

Deleting a checklist template has no effect on checklists created from that template.

1. In the navigation filter, enter `checklist_template.list`.
2. Select the check box by the checklist template you want to delete.
3. In the actions choice list, select **Delete**.
4. In the confirmation dialog box, click **Delete**.

User presence

User presence is a UI16 feature that lets you see who is online when you are working in an instance.

Your avatar appears in the form header next to your name, and in multiple other places such as in activity streams, Visual Task Boards, live feeds, and Connect conversations. Online status is represented by a dot on the user's avatar.

- Green dot if the user is logged in.
- No dot if the user is not logged in.
- Orange dot if the user recently logged out.

The user avatar is the image uploaded to the user record `[sys_user]`. If no image is uploaded, the avatar is the user's initials.

---

**Note:** Users can add an avatar image to their live feed profile. The system uses the live feed avatar if no image is uploaded to the user record.

---

When you are viewing a record in a form, such as an incident, you can see if other users are viewing the same record.
Figure 59: User presence in a form

If multiple users are viewing the record, the avatar is represented by the number of users. Point your cursor to the number to see the names and avatars of the users.

When you are in a Connect conversation or entering comments in an activity stream, you can see information about the other participant’s activity, for example if they are viewing or typing.
An administrator can disable user presence globally.

Disable user presence

You can disable user presence globally by enabling a system property.

Role required: admin

Enabling the property turns off all user presence features. The property is available starting with the Geneva Patch 2 release.

1. Navigate to `sys_properties.list`.
2. Locate the property named `glide.ui.presence.disabled`.
3. Set the Value to true.
Common UI elements

This page lists common UI elements for the standard user interface.

Dot-walking

Dot-walking provides access to fields on related tables from a form, list, or script.

If the current table contains a reference to another table, any field on the referenced table can be accessed using dot-walking.

Dot-walking references a field by building a chain of field names separated by dots (periods). For instance, incident.assigned_to.company references the company of the user assigned to an incident. The recommended limit for chain length is three levels.

Dot-walking in tree pickers

The tree picker interface presents an expandable, hierarchical view that may be used when selecting fields.

For example, this **Users** glide list field has a select fields icon ( ):

![Figure 61: List field](image)

Clicking this icon presents a list of fields available on the current record:
Reference fields have + icons next to their name. Clicking the + expands a list of the fields on that referenced field. In this example, expanding the **Assigned To** field shows the **User** fields for that record:
Selecting the Manager field adds the variable ${assigned_to.manager}:

Dot-walking in choice list fields

Users can dot-walk to related fields in a choice list, such as the field list in a filter. This example demonstrates how to filter the incident table by the company of the caller who registered the incident.

First, open the choice list of fields to filter by. This presents a list of the fields that are present on the Incident [incident] table. Reference fields are followed by related fields, which are presented in blue. For instance: Caller is followed by Caller > User fields. This means that Caller is a reference field, and the related fields are User fields on the Caller record. If the blue related fields are not present in the list, select Show Related Fields in blue at the bottom of the list:
Figure 65: Show related fields

When the related fields are present, select a set of related fields.
Figure 66: Related fields

After the related field is selected, the menu reloads with the related table's fields.
Figure 67: Related table fields

The new field is: `caller.company`.

When looking at the list, it is easy to see where in the dot-walk the user currently is. Each selected reference is stored at the top, and the number of dots in front indicate how many dots from the initial record the user has reached.
In this picture, the user is currently at `incident.caller.company`. It is possible to return to higher levels in the hierarchy by selecting the blue records. For instance, selecting `Incident fields` returns to the list of incident fields.

The related fields can be dismissed by selecting `Remove Related Fields` in blue at the bottom of the list:
Dot-walking in list collectors

When selecting a list of fields from a list collector (for example, when you are configuring a form), it is also possible to dot-walk to fields from other forms.

To see which fields are reference fields and can be dot-walked, look for green fields with a plus symbol.
Figure 70: Reference fields for dot-walking

Once a reference field is highlighted, the expand icon appears above the add icon.
Figure 71: Expand icon

Selecting the expand icon opens the list of fields from the related list in the Available pane. In this picture, the user has opened the Assigned to fields. As in other examples, the previous lists of fields appear at the top of the list in blue.
Figure 72: Lists of fields

Once the field is added to the Selected pane, it appears with its full dot-walked syntax. In the next picture, the user has selected **Assigned_to.active**.
Dot-walking in scripts

You can dot-walk within a script by invoking the dot-walk syntax.

This functionality requires a knowledge of JavaScript.

For scripts that run on the server side, such as business rules, it is necessary to add `current`.

The following script, for example, is a scripted approval rule that requests an approval from the manager of the user who opened the ticket.

```javascript
try {
    current.opened_by.manager;
} catch (err) { }
```

For scripts that run on the client side, such as client scripts, `current` is not necessary. For instance, the following Highlight VIP Caller script runs on the client side.

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    // wait until there is a valid record in the field if (newValue) {
        // get the caller object so we can access fields
        var caller = g_form.getReference('caller_id');
    }
}
```
Geneva  ServiceNow  ServiceNow Platform

```javascript
var callerLabel = document.getElementById('label.incident.caller_id');
var callerField = document.getElementById('sys_display.incident.caller_id');

// check for VIP status if (caller.vip == 'true') {

  // change the caller label to red background //style object
  if (callerLabel)
    document.getElementById('label.incident.caller_id').style.backgroundColor = 'red';

  // change the caller's name field to red text if (callerField)
  if (callerField)
    document.getElementById('sys_display.incident.caller_id').style.color = 'red';

  // not a VIP, remove temporary styles if
  else {
    if (callerLabel)
      document.getElementById('label.incident.caller_id').style.backgroundColor = '';
    if (callerField)
      document.getElementById('sys_display.incident.caller_id').style.color = '';
  }

} }
```

**Dot-walking in variables**

Often, you can add variables into templates, notifications, or other forms where a value is being called from the form.

For example, `{$assigned_to}` is the variable for the **Assigned to** field.

As illustrated above, it is possible to dot-walk to fields on any reference field's original record. In the case above, it is possible to dot-walk to any field on the `assigned_to` record, for example, `{$assigned_to.manager}`.

As is always the case with dot-walking, this can be a longer chain if needed, as in this example: `{$assigned_to.department.manager.mobile_phone}`.

Sometimes this variable can be selected from a tree picker.

**Reference icon**

The reference icon (.circle in UI16 and UI15, in other UIs) appears to the left of a record on a list, or to the right of a reference field on a form populated with a record.

Pointing to the icon presents a read-only pop-up window with the record's information.
Figure 74: Popup window

Note: Users who are using the Windows Live toolbar must disable the toolbar to use reference lookups.

To navigate to the referenced record, click the reference icon. Clicking through a reference icon automatically saves the current record.

To freeze a pop-up window, press the Shift key when pointing to the reference icon, and then move the mouse cursor. The pop-up window remains on the screen until it is closed or another pop-up is displayed.

Note: On some UK keyboards, this behavior is achieved with the Alt key.

Use a slushbucket

Slushbuckets allow you to select multiple items from a list of available items and to remove items from a list of selected items.

Slushbuckets are used in many operations, such as personalizing lists, adding items to related lists, and Service Catalog list collector variables.

The slushbucket interface has two columns: the available items on the left and the selected items on the right.

- To add items to the selection, double-click an available item (on the left), or select an item and click the add icon (>). The new item is added at the bottom of the selected items column on the right.
- To remove items from the selection, double-click the item on the right, or select the item and click the remove icon (<).
- To select multiple consecutive items, hold the Shift key and click the first and last item.
- To select multiple non-consecutive items, hold the Ctrl key (Command key on Mac) and click the desired items.

Arrange slushbucket selections

Some slushbuckets allow users to customize the order of selections, such as when you are configuring a form or list.
Follow one of the two methods below to move an item.

- To move items one position, select the items and click the up or down icon.
- To move an item multiple positions, select consecutive items above or below the item then click the up or down icon. In this example, to move **Assigned to** to the top of the selections order, complete the following steps.
  a) Hold the Shift key and click **Short description** then **Number**.
  b) Click the down icon.

### Personalizing

Find available slushbucket items

Some slushbuckets provide filter and search controls for available items, such as adding items to related lists.

Information fields for the highlighted available item appear beneath some slushbuckets. The information fields are the same as the reference lookup for a reference field on a form. To modify which fields appear, configure the reference lookup list.

- To filter available items, create conditions using the condition builder and click **Run filter**.
- To search available items, enter text in the **Search** field. The list of available items is filtered as you type.
Set the number of slushbucket items visible in the available column

You can modify the glide.xmlhttp.excessive property to change the number of items that appear in the Available column of the slushbucket.

Role required: admin

1. Add the property to the System Properties [sys_properties] table.
2. Change the Type to Integer.
3. Enter a number in the Value field. The default value is 100.
4. Save the property.

Warning: Selecting a number significantly higher than 100 can lead to performance issues on your instance as the data is loaded into the slushbucket.

Tree picker

The tree picker is a special reference lookup for the following items.

• Configuration Items (CIs) for a field that is dependent on another CI field.
• Reference elements for any hierarchical table. A hierarchical table is any table that has a parent field pointing back at itself.
Geneva    ServiceNow    ServiceNow Platform

• Values for a user reference that is dependent on the group.

Add the tree picker attribute

A limit of 1000 has been placed on the number of nodes returned to the tree picker. This limit is configurable with the glide.ui.group heirarchy.max_nodes property.

Role required: personalize_dictionary

1. Modify the dictionary entry for the field.
2. Add tree_picker=true to the Attributes field.
   If there are multiple attributes, use a comma to separate them without any spaces between.

   Attributes: [tree_picker=true]

Tree picker examples

Assignment Group

By default, the Assignment group field uses the tree picker attribute.
This presents a hierarchical tree view of the reference field's options, which in this case is groups. If a group has sub-groups, they appear in the tree structure. It is possible to expand a group to see its members, but members cannot be selected.

**Note:** You cannot customize the label names used in the tree picker. The label names are taken from the values in the table. For example, the Assignment group choices come from the group names in the Name column of the Groups table.

**Simple dependent fields**

It is also possible to add the tree-picker attribute on a reference field that is dependent on a reference field of a different type. For example, if Assigned to is dependent on Assignment group, it is possible to add the tree picker attribute on Assigned to. The result is a one-node tree for the group and its members.
Figure 76: Tree picker on a reference field

**Dependent fields**

In this example, there are two CI reference fields, and one is dependent on the other. The dependent one has the tree_picker attribute:

For this example, the configuration item is Bond Trading. The tree picker for the **Dependent CI** field shows all downstream and upstream relationships for that CI. The small orange square icon above a relationship
indicates that the CI, **lawson**, already has an open task against it. Pointing to the orange square displays a pop-up window with information about the open task.

**Note:** Dependencies for CIs are enforced only when the dictionary entry for the reference field has `tree_picker=true` in the **Attributes** field.

### Condition builder

A condition builder constructs a condition statement with a series of contextually generated fields. Condition builders are used in many operations, such as creating filters, administering surveys, and administering access control.

### Condition builder format

A condition consists of three parts:

- **Field:** a choice list based on the table and user access rights. The choice list can include fields on related tables by dot-walking.
- **Operator:** a choice list based on the field type. For example, in the Incident [incident] table, the `>` operator does not apply to the **Active** field but it does apply to the **Priority** field.
- **Value:** a text entry field or a choice list, depending on field type. For example, in the Incident [incident] table, the **Active** field offers a choice list with the values **true, false, and empty**, while the **Short Description** field offers a text entry field.

### Condition builder actions

You can add a dependent condition by clicking **AND** or **OR** next to the condition. You can add a top-level condition by clicking **AND** or **OR** on the condition builder toolbar above the conditions.

You can remove a condition by clicking the delete icon (X) next to the condition.

![Figure 78: Example AND condition](image-url)

© 2017 ServiceNow. All rights reserved. 157
Filtering on empty fields

Most filter operations do not return empty fields in their result set. You can create a filter that displays records with an empty field value in addition to records that match the initial filter conditions.

For example, when viewing all records that are assigned to the Hardware group, to include records with an empty Assignment group field, complete the following steps.

1. Create the filter condition [Assignment group] [is] [Hardware].
   
   Note: This condition does not return those records where the Assignment group field is empty.

2. Click OR next to the original filter condition.

3. Create an additional filter condition of [Assignment group] [is empty].

4. Run the filter.

Values for date/time fields

When you filter on fields of type date/time, such as the Created field on any task record, several time-related options are available, such as Today, This week, Last 3 months, and so on.

For example, at 12 P.M. on June 1st, a user in New York filters a list of incidents using the Created on Today condition. The resulting list shows all incidents created during the last six hours: between midnight (00:00:00) and the user’s current time, noon (12:00:00), on June 1st. A filter for This week returns incidents created between the previous Monday at midnight to the current day and time.

A filter for Last 3 months returns incidents between midnight on the 1st of the month three full months ago and the current day and time. For example, if you choose the Last 3 months filter on April 15th, the results show records created since January 1st up until April 15. A filter for Last 12 months returns records created from midnight on the first of the month twelve months ago and the current day and time.

For the at or before and at or after filters, use midnight as a start or end point. For example, if you filter a list of incidents created [at or after] [Yesterday], the resulting list shows all incidents created at midnight yesterday or later. If it is Thursday, August 7, and you filter a list of incidents created [at or before] [Last week], the resulting list shows all incidents created at and before midnight on Sunday August 3, which is the end of last week.
Operators available for filters and queries

The system provides a set of operators for use with filters, condition builders, and encoded queries. A field's data type determines what operators are available for it.

### Table 36: Operators available for condition builders

<table>
<thead>
<tr>
<th>Operator label</th>

### Response time indicator

A response time indicator may appear at the bottom right of forms and lists. This indicator provides the processing time, including the total time and the time for each step, for a completed transaction. The following example shows the response time for retrieving a filtered list in a demo instance.

![Response time indicator](image)

**Figure 80: Response time**

The response time text is:

```
Response time(ms): 968, Network: 3, server: 548, browser: 417
```

In this example, the transaction took the following amount of processing time.

- 499 milliseconds total time
- 155 milliseconds on the server
- 172 milliseconds moving data across the network
- 172 milliseconds in the browser, rendering the HTML and parsing and executing JavaScript

Response time appears on most pages. However, it does not appear for simple operations, such as paging through a set of records or changing the sort order of a list, or for the first transaction in a session.

To hide the response time, click the clock ( ). Click the clock again to show the response time.
Point to the clock to view a tool tip with the response time.

To view a detailed breakdown of the browser processing time on forms, click browser.

![Figure 81: Detailed response time information]

Administrators can disable the response time by setting the glide.ui.response_time property to false.

Tags

Tags allow the grouping and organizing of records.
Tags can be visible to any user (global), visible only to specific groups or users, or visible to a single user.

Tag assignment

There are several ways to assign tags to records.

Assign a tag from the list view using inline field editing

You can assign one or more tags to a record directly from the list view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign an existing tag</td>
<td>Begin typing the tag name, select the tag from the drop-down choices, and press the Enter key.</td>
</tr>
<tr>
<td>Create a new tag</td>
<td>Enter a new tag name and press the Enter key.</td>
</tr>
</tbody>
</table>

The tag is added to the record.
Assign a tag from a list using the action menu

You can assign one or more tags to a record using the action menu in a list.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to a list.
2. Select the check box beside one or more records.
3. Click **Actions on selected rows** and scroll to the **Assign tag** listing.
4. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign an existing tag</td>
<td>Select the tag listed.</td>
</tr>
<tr>
<td>Create a new tag</td>
<td>1. Select <strong>New</strong>. 2. Enter a new tag name and select the appropriate sharing level. 3. Click <strong>Save</strong>.</td>
</tr>
</tbody>
</table>

The tag is added to the record.

Assign a tag from the list context menu

You can assign one or more tags from the list context menu.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to a list.
2. Right-click a record.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign an existing tag</td>
<td>Select <strong>Assign Tag &gt; [Tag Name]</strong>.</td>
</tr>
<tr>
<td>Create a new tag</td>
<td>1. Select <strong>Assign Tag &gt; New Tag</strong>. 2. Enter a new tag name and select the appropriate sharing level. 3. Click <strong>Save</strong>.</td>
</tr>
</tbody>
</table>

Assign a tag using the edit tags icon

You can assign one or more tags to a record using the edit tags icon in the form header.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to a form.
2. Perform the appropriate action for your version of the UI.
1. Click the more options icon (•••) in the form header.
2. Select Add Tag.

3. Click in the Add Tag field.
4. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign an existing tag</td>
<td>Begin typing the tag name and select the tag.</td>
</tr>
<tr>
<td>Create a new tag</td>
<td>Enter a new tag name and press the Enter key.</td>
</tr>
</tbody>
</table>

The tag is added to the record.

**Configure tags to assign automatically**

You can configure the system to automatically assign a tag to records that match conditions defined in the tag record.

Role required: tags_admin

For example, you can create tags that group high urgency incidents, overdue incidents, canceled changes, or any other set of records. The system automatically assigns the tag to records that match the criteria and removes the tag from records that no longer match the criteria.

1. Navigate to System Definition > Tags.
2. Open the tag that you want to assign automatically.
3. Configure the form to add the Conditions for Tags embedded list.
4. Create a new row in the Conditions for Tags list.
5. Click the reference icon in the Table column.
   The Label Table list opens in a pop-up window.
6. Click New.
7. Enter a Name, select a Table, and add conditions for the automatic assignment of the tag.
8. Click Submit.
9. Click the check mark icon to save the new row.
10. Click Update.

**Edit tags from the list view**

In the list view, you can edit tags that you created.

Personalize the list to display the Tags column.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to a list that contains records you have previously tagged.
2. Click the edit tag audience icon (•••) beside the tag name.
   The Tag Details dialog box opens.
3. Edit the **Name** field as necessary.
4. Select an option for the **Viewable by** field to set the sharing level.
5. Click **Save**.
   All records associated with the tag are updated to reflect the change.

---

## Edit tags from the form view

From the form view, you can edit tags that you created.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to a record you have tagged.
2. Perform the appropriate action for your version of the UI.

| UI16 | 1. Click the more options icon (●) in the form header.  
|      | 2. Click the edit tag audience icon (●) beside the tag name. |
| UI15 | 1. Click the edit tags icon (●).  
|      | 2. Click the edit tag audience icon (●) beside the tag name. |

The Tag Details dialog box opens.

3. Edit the **Name** field as necessary.
4. Edit the **Viewable by** field to set the sharing level.
5. Click **Save**.
   All records associated with the tag are updated to reflect the change.

---

## Edit tags from the My Tags module

From the My Tags module, you can edit tags you created.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to **Self-Service > My Tags**.
2. Open a tag.
3. Make the necessary changes.
4. Click **Update**.
   All records associated with the tag are updated to reflect the change.
Edit tags from the Tags module

From the Tags module, you can edit all tags.
Role required: tags_admin

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to **System Definition > Tags**.
2. Open a tag.
3. Make the necessary changes.
4. Click **Update**.

Edit tags from the Tagged Documents page

You can edit tags from the Tagged Documents page.

**Note:** Tag names are case-insensitive and must not include punctuation.

1. Navigate to **Self-Service > My Tagged Documents**.
   Alternatively, in UI15 you can click **Tagged Documents** in the Edge.
2. Click **Edit Tags**.
   A list of tags you have created appears.
3. Open a tag.
4. Make the necessary changes.
5. Click **Update**.
   All records associated with the tag are updated to reflect the change.

Tag sharing levels

You can set the tag sharing level so other users can use the tag.

The **Viewable by** field that appears when you edit a tag controls the sharing level. The following sharing levels are available.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Me</td>
<td>Private tag, visible only to the owner.</td>
</tr>
<tr>
<td>Groups and Users</td>
<td>Shared tag, visible to the owner and specific groups or users.</td>
</tr>
<tr>
<td>Everyone</td>
<td>Shared tag, visible to everyone. This option is available to users with the admin or tags_admin role.</td>
</tr>
</tbody>
</table>

Tag name conflict

Conflicts can occur if multiple tags have the same name.
If a private tag and a shared tag have the same name, the system appends [private] to the name of the private tag. For example, Sample tag [private]. For definitions of private and shared tags, see Tag sharing levels on page 170.

There cannot be more than one shared tag with the same name. If a user attempts to create a shared tag with a name that is already in use, an error message appears and the system prevents the tag from being saved.

Filter records by tag

You can filter records by tags you have access to.

Filter records by tag in any of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter from the form view</td>
<td>Perform the appropriate action for your version of the UI.</td>
</tr>
<tr>
<td></td>
<td>• UI16: Click the more options icon ( ), and then click the tag in the menu that opens.</td>
</tr>
<tr>
<td></td>
<td>• UI15: Click the edit tags icon ( ), and then click the tag.</td>
</tr>
<tr>
<td>Filter from the list view using the Tags column</td>
<td>With the Tags column visible, click the tag name. Clicking two or more tags filters the tags together with the AND operator and shows records containing all of the selected tags.</td>
</tr>
<tr>
<td>Filter from the list view using the list filter</td>
<td>Click the show/hide filter icon ( ), select Tags from the Choose field choice list, and select or enter the tag name.</td>
</tr>
</tbody>
</table>

View tagged documents

The Tagged Documents page displays recently viewed documents or user-tagged documents in the content frame.

Role required: none

An administrator can configure the fields that appear on the tagged document cards by configuring the mobile view of the task, for example, the mobile view of the Incident form. If there is not a mobile view available for the page, the record reverts to the default view. For more information, see Create a view on page 237.

A sidebar displays all the tags you have access to. A preview area displays tagged documents.

2. Optional: Click **Show Global Tags** to display global tags.

3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display most recently viewed documents</td>
<td>Click <strong>Most Recent</strong> in the sidebar.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display documents associated with a tag</td>
<td>Click the tag name in the sidebar.</td>
</tr>
<tr>
<td>Remove a tag from a record</td>
<td>Click the X in the corner of the document preview.</td>
</tr>
<tr>
<td>Open the form for a tagged document</td>
<td>Click the title of the document preview.</td>
</tr>
</tbody>
</table>

### Remove a tag from a record

There are many ways to remove a tag from a record.

Perform any of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove a tag from a record in the list view using the Tags column</td>
<td>Ensure that the Tags column is visible and click the remove tag icon (X) beside the tag name.</td>
</tr>
<tr>
<td>Remove a tag from one or more records in the list view using the action menu</td>
<td>Select the check box for one or more records, then click <strong>Actions on selected rows &gt; Remove Tag: [Tag name]</strong>.</td>
</tr>
<tr>
<td>Remove a tag from a record in the form view</td>
<td>Perform the appropriate action for your version of the UI.</td>
</tr>
<tr>
<td></td>
<td>• UI16: Click the more options icon (⋮) in the form header, and then click the remove tag icon (X).</td>
</tr>
<tr>
<td></td>
<td>• UI15: Click the edit tags icon (ставил), and then click the remove tag icon (X).</td>
</tr>
<tr>
<td>Remove a tag from a record in the Tagged Documents page</td>
<td>Click the remove tag icon in the corner of the document preview.</td>
</tr>
</tbody>
</table>

If a tag is automatically applied to a record based on specific conditions, the tag is automatically removed when those conditions no longer apply. For more information, see *Configure tags to assign automatically* on page 168.

### Merge tags

You can merge one or more tags with another tag. For example, when you merge Tag A with Tag B, Tag A is deleted and all associated records are reassigned Tag B.

Role required: A user with the admin or tags_admin role can merge any tag into any other tag. All other users can merge tags they created into tags that are visible to them.

1. Navigate to **Self-Service > My Tags**.
2. Select the check box for each tag you want to merge with another tag.
3. Select **Actions on selected rows > Merge Tags**.
4. Enter the tag to merge other tags with.
5. Click **OK**.
Create a tag from the Tags list

You can create a tag directly from the Tags list.

Role required: tags_admin

1. Navigate to **System Definition > Tags** or **Self-Service > My Tags**.
2. Click **New**.
3. Enter a name for the tag in the **Name** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Specifies the owner of the tag. Users are allowed to change the ownership of the tag to someone else.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of tag.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Standard</strong>: is controlled by users who have access to the tag. These users can add or remove records from the tag.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Most Active</strong>: displays the most frequently accessed modules and is automatically maintained by the system. There is no maximum duration a module can remain as most active.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Most Recent</strong>: displays the most recently accessed modules and is automatically maintained by the system.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Most Active Record</strong>: displays the most frequently viewed records and is automatically maintained by the system. There is no maximum duration a record can remain as most active.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Most Recent Record</strong>: displays the most recently viewed records and is automatically maintained by the system.</td>
</tr>
</tbody>
</table>

Only tags of the **Standard** or **Most Recent Record** types appear on the Tagged Documents page. You can view other types of tags by adding them to a homepage. For more information, see **Add a tag to a homepage** on page 175.

<table>
<thead>
<tr>
<th>Viewable by</th>
<th>Specifies the sharing level. By default tags are visible only to the user (<strong>Me</strong>), but you can share tags with <strong>Groups and Users</strong>. Users with the tags_admin role are the only users who can create global tags shared with <strong>Everyone</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Specifies whether the tag is enabled or disabled.</td>
</tr>
</tbody>
</table>

Configure Zing tag indexing for text search

Zing text indexing is available for tags on records.
Role required: admin

No tags are indexed by default. You can enable text indexing of tags on a table-by-table basis. Private tags are never indexed.

1. Navigate to the dictionary entry for the table you want to turn on indexing for. For more information, see Modify Dictionary Entries from the Dictionary module on page 1445.
2. In the Attribute related list, click New.
3. Click the reference icon to see available attributes.
4. Select the Text Index Tags attribute (text_index_tags).
5. For the attribute value, enter one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>everyone_only</td>
<td>Only tags shared with everyone will be indexed.</td>
</tr>
<tr>
<td>all_shared</td>
<td>All shared tags (Everyone, Groups and Users) will be indexed.</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. Under Related Links, click Generate Text Index to reindex the table.

After you turn on text indexing for tags on records, records are reindexed when any of the following actions occurs.
• When you add or remove tags.
• When you modify a tag, provided that fewer than 100 records are affected. If there are more records, you must manually reindex.
• When you manually reindex an entire table (required after initial tag indexing setup).

Configure notifications for tagged records

You can enable the system to send a notification when a record with a certain tag is updated.

Role required: tags_admin

1. Navigate to System Definition > Tags.
2. Open a tag.
3. In the Label Entries related list, open the record for which you want notifications.
4. Select the Notify onchange check box to be notified any time the record is modified.
5. Use the Notify when condition builder to specify the conditions that must be true to trigger the notification.
6. Select a business rule in the Notify script field.
7. Save the record.

Add a tag to a homepage

You can add a tag to a homepage to view records to which the tag has recently been assigned.

You might want to do this for tags of a Type other than Standard or Most Recent Record, as they do not appear on the Tagged Documents page.

1. Open a homepage to which you have permission to add content.
2. Click the add content icon (+).
3. Select Labels in the left column of the Add content window.
4. Select the tag you want to show on the homepage.
5. Click the appropriate Add here button.
6. Close the Add content window.

History of recently-viewed records

In UI11, the system offers a viewable history of an ITIL user's recently-viewed records, and it can display an ITIL user's most viewed items.

The system offers a viewable history of an ITIL user's recently-viewed records, and it can display an ITIL user's most viewed items. Both are implemented as tags, and once activated they will appear in the application navigator in UI11.

Figure 82: View history

Note: In UI16, a similar feature is available. For more information, see View your navigation history on page 37.

Activate Most Active and Most Recent tags

To activate Most Active and Most Recent tags in UI11, you must first have viewed some records within the platform.

Role required: itil

After this has happened, perform the following steps to activate Most Active and Most Recent tags.

1. Navigate to your homepage.
2. Click Add content.
3. Select Labels from the first pane.
4. Select Most Recent from the second pane to activate that tag. It is not necessary to click Add.
5. Select Most Active from the second pane to activate that tag. It is not necessary to click Add.
6. After selecting the tags you want to activate, refresh your browser (F5).
The tags should now be visible in the application navigator. Items in the Most Recent tag are listed chronologically in reverse order, as you would expect from a history list.

Deactivate Most Active and Most Recent tags

If you do not wish to see the Most Active and Most Recent tags after they have activated them, they can be deactivated.

Role required: itil

1. Click Most Active or Most Recent in the application navigator.
   The Tag form appears.
2. Clear the Active check box.
3. Click Update.
   Upon browser refresh, the tag will no longer be displayed.

Remove the Most Active and Most Recent tags

Role required: tags_admin

1. From the left navigation pane, select System Definition > Tags.
2. Delete everything with a name of Most Active or Most Recent.
3. From the left navigation pane, select System UI > Widgets, and deactivate the Labels widget.
   This prevents it from showing up in the Add Content part of homepages.

User interface configuration

Change appearance, navigation menus, CSS, and utilize cutting edge interface tools.

Navigation stack

The navigation stack is the portion of the ServiceNow suite of applications that determines where a user will be redirected after the update of a record.

It is also possible to cause page references to be manually inserted into the the Navigation Stack when a link in the Navigation Page is clicked. This is done by modifying a module definition to include an

argument of $sysparm_stack$ with a string value equal to the URL reference to the page that should be inserted into the stack. Finally it is also possible to override the redirection determined by the stack entirely by creating a business rule or editing an existing one to include gs.setRedirect("http://redirect_page.com").

### Operating parameters of the Navigation Stack

The Navigation Stack can be thought of a user’s navigation history in the ServiceNow system. It is updated every time a user views a new page. The Navigation Stack is referenced when users press the ServiceNow back button. It is also referenced when a user updates a record, at which point the user is redirected to their last page in the Navigation Stack.

![Figure 83: Back and Update](image)

**Inserting pages to the Navigation Stack**

It is also possible to cause page references to be manually inserted into the Navigation Stack when a link in the Navigation Page is clicked. This is done by modifying a module definition to include an argument of $sysparm_stack$ with a string value equal to the URL reference to the page that should be inserted into the stack. The following screen shot shows the out of the box definition for the Create New Incident Module. By passing an argument of "sysparm_stack=incident_list.do" we are adding the page "incident_list.do" (the list view of incidents) to the stack so that after creating a new incident this will be the page that a user is redirected to.
Overriding the redirection behaviors of the Navigation Stack with onEvent business rules

The redirection behaviors that occur as a result of Navigation Stack behaviors can be overridden using onEvent business rules. This is done using the Glide System function `gs.setRedirect`. Doing so will override the redirection as determined by the **Navigation Stack**, when the particular even specified occurs. The function `gs.setRedirect` takes a string argument that is a URL for the page that it is desired that the user be redirected to. This can be an external URL such as http://www.Google.com.
The Request Manager allows users to cancel any navigation action they select from the application navigator by clicking another application navigator link. This allows users to cancel slow loading transactions without having to wait for the previous transaction to complete.

One of the following conditions must be true for the Request Manager to cancel a transaction.

- Both the original transaction and new transaction are cancelable (both transactions have the setting `sysparm_cancelable=true`).
- The original transaction is a member of the always cancelable white list (the module is listed in the `glide.request_manager.always_cancel` system property) and the new transaction is cancelable (has the setting `sysparm_cancelable=true`).
- Both the original and new transaction produce an auto-completer query in a reference field.
Cancellation workflow

The Request Manager uses the following workflow to determine whether to cancel a transaction.
Add sites to the always cancel white list

You can add UI pages or other links to the always cancel white list so that users can cancel actions on these pages by navigating to another module or link.

Role required: admin

Items on the white list can always be canceled by user actions. It is recommended that you only add items to the white list that provide read-only data to the user, such as a homepage or a report.

1. Enter `sys_properties.list` in the navigation filter and press the Enter key.
2. In the Go to field, select Name, enter `glide.request_manager.always_cancel`, and click Go.
3. Click the property name to open it.
4. In the Value field, add a comma-separated list of URIs you want to allow users to cancel.
5. Click Update.

Prevent users from canceling module transactions

You can explicitly prevent users from canceling a module’s activity by updating the module definition.

Role required: admin

1. Perform the appropriate action for your version of the UI:

| UI16       | 1. Navigate to System Definition > Application Menus.  
|           | 2. Open the application menu to which you want to add the survey module. |
| UI15 or UI11 | Right-click the application menu you want to add the module to and select Edit Application Menu. |

2. In the Modules related list, click the module you want to prevent users from canceling.
3. Configure the form layout and add the field Uncancellable by Other Modules.
4. Select the check box for Uncancellable by Other Modules.

5. Click Update.
Navigation cancellation system properties

Administrators can control automatic cancellation behaviors with the following system properties.

**Table 46: System Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.request_manager.cancel_other_transaction | Enables or disables automatic cancellation behaviors. When true, users can cancel one navigation action with another navigation action.  
  **Type:** true | false  
  **Default value:** true  
  **Location:** sys_properties table |
| glide.request_manager.always_cancel           | A comma-separated list of URIs that users can always cancel by clicking another navigation action. Typically items on this list are modules that provide read-only data such as homepages, reports, or knowledge articles.  
  **Type:** string  
  **Default value:** home,sys_report_template  
  **Location:** sys_properties table |
| glide.request_manager.cancel_reference_complete | Cancels a user query in a reference field when the user enters more information. For example, if the user starts an AJAX search in the Problem number field by entering PRB and then enters PRB000, the second query cancels the first query.  
  **Type:** true | false  
  **Default value:** true  
  **Location:** sys_properties table |

**Use cases**

There are three use cases where administrators can control user cancellation actions.

1. A user clicks on a module, such as the homepage (`home.do`), and while waiting for the module to load decides to navigate to another module, such as the list of open incidents (`incident_list.do`). The system property `glide.request_manager.cancel_other_transaction` controls this use case.

2. A user clicks on a module that displays read-only data, such as a report (`sys_report_template.do?sysparm=sysid`), and while waiting for the module to load decides to navigate to another module, such as the list of open incidents (`incident_list.do`). The system properties `glide.request_manager.cancel_other_transaction` and `glide.request_manager.always_cancel` control this use case.

3. A user starts typing a query in a reference field, such as entering PRB in the related Problem field and while waiting for the auto-completer to display results, decides to enter more information,
such as PRB000. The system properties glide.request_manager.cancel_other_transaction and glide.request_manager.cancel_reference_completer control this use case.

Context-sensitive help

By default, the help link available in the product opens the welcome page of the help system, allowing you to enter search criteria for the information you want to find. The ServiceNow system provides a number of preconfigured help contexts connected to this link that display the exact information you need for the current list, form, or record. You can define your own help topics and configure them to appear when you click the help icon in a ServiceNow record.

Watch Introducing Context-Sensitive Help:

Access context-sensitive help

The location of the help icon depends on the user interface version you are using.

**UI 15**

Click the gear icon in the banner frame to open the menu containing the help icon. The appearance of the menu and icons might be different, depending on the UI scheme you have configured for your instance.

![Context help access in UI 15](image)

**Figure 88: Context help access in UI 15**

**UI 16**

Click the help icon in the right corner of the header bar and select **Search Product Documentation** from the menu.
Administer context-sensitive help

Context-sensitive help can be used in its default configuration with no customizations.

Users click the help icon to open the default help pages provided in the base system. For any page that does not have context-sensitive help defined, the instance displays the help system welcome page. Users can use the search feature or the index to find the correct help topic.

Alternatively, administrators can create custom context-sensitive help to suit the needs of their organizations. Create a new help context that links the help icon to a topic describing a list, form, or specific record. You may initially want to set a base URL to direct to a help system other than the default ServiceNow help system.

This video demonstrates how to set up custom help.

Create a new help context

You can create new help contexts to supplement or replace the default help contexts. For example, if your organization has heavily customized a form, you might create a new help context for that form. The customized help context could link to more relevant information, such as a company knowledge base article.

1. Navigate to System UI > Help Contexts.
2. Click New.
3. Complete the Help Context form from the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Form, List, or Record. If you select Record, the Table name field is replaced by the Document field.</td>
</tr>
<tr>

</tr>
<tr>
<td>Document</td>
<td>Click the reference lookup icon (🔍) to open the document selection dialog box (pictured). Select the table and document (record) for this help context. This field is only visible if you have selected <strong>Record</strong> as the <strong>Type</strong>.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language of the help page to which you are linking. The choices available depend on the <strong>internationalization plugins</strong> active on your instance. This field allows you to create multiple help contexts for the same form, list, or record, each directing to a help page in a different language. For example, you might have two help contexts for Form X: one for English and the other for Spanish. If a user whose language is set to Spanish clicks the help icon while viewing Form X, the help page defined in the Spanish help context opens.</td>
</tr>
</tbody>
</table>
Geneva    ServiceNow    ServiceNow Platform

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select this check box to have the system use the help context. This check box is selected by default for new help contexts.</td>
</tr>
<tr>
<td>ServiceNow Wiki</td>
<td>Indicates if this help was created by a customer or was provided by ServiceNow. Clear this check box to create custom help for your organization. Do not attempt to modify existing help topics provided by ServiceNow for your own use. The system is configured to use your custom records rather than the default help contexts, even when they are created on the same table.</td>
</tr>
<tr>
<td>URL or page name</td>
<td>Identifies the topic to display when a user clicks the help icon while viewing a form, list, or record. You can enter the complete URL of the help page or just the target file name if you set a base URL in the help.base.default system property.</td>
</tr>
</tbody>
</table>

**Note:** If you reconfigure the fields on the form, you see the available fields Plugin ID and System Property Base URL. Do not use these fields. They are for internal use only.

4. Click **Submit**.

**Context-sensitive help properties**

The context-sensitive system properties define the base URLs for the default and custom help systems. To access the context-sensitive help properties, navigate to **sys_properties.list** and filter by **Name**. You can edit a property value from the list or by opening the property record.

**Table 48: Context-sensitive help properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.help.default.page</td>
<td>The default URL the help icon directs to when no help context is specified. This is the base URL of the ServiceNow help system and opens to the welcome page. Do not change this value.</td>
<td><a href="http://geneva-docs.servicenow.com/?context=">http://geneva-docs.servicenow.com/?context=</a></td>
</tr>
<tr>
<td>Property Name</td>
<td>Description</td>
<td>Default Value</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>help.base.default</td>
<td>The base URL for custom help contexts in which the ServiceNow Wiki check box is cleared, and an absolute URL is not specified. When the base URL is set, the system creates the address of a help context record by appending the target page or file name to the base URL. Custom help contexts using this base URL overwrite the help provided by default in your instance for the same table. For details, see Set Base URLs.</td>
<td><a href="http://geneva-docs.servicenow.com/?context=">http://geneva-docs.servicenow.com/?context=</a></td>
</tr>
<tr>
<td>help.base.servicenow</td>
<td>The base URL for help contexts in which the ServiceNow Wiki check box is selected. This is the base URL for the help provided in your instance by default. Do not change this value. For details, see Create a new help context on page 187.</td>
<td><a href="http://geneva-docs.servicenow.com/?context=">http://geneva-docs.servicenow.com/?context=</a></td>
</tr>
</tbody>
</table>

Set base URLs

With context-sensitive help, you can set a base URL for an external help system.

If you want to create numerous help contexts that direct to a single server other than the ServiceNow help system, enter the base URL in the help.base.default property.
Figure 90: Base URL for custom help contexts

On the Help Context form, when the ServiceNow Wiki check box is cleared and you enter a value in the URL or page name field that does not contain the string ://, that value is appended to the base URL defined by help.base.default property.

**Note:** When the ServiceNow Wiki check box is cleared and the URL or page name field contains an absolute URL (distinguished by the string :// in the value), the value in the help.base.default property is ignored. This allows you to create help contexts that link to a variety of different servers.

Help context types

You can create a help context with the type Form, List, or Record, and link it to a particular table in your ServiceNow instance.

When a user clicks the help icon, the system analyzes the relevant help contexts to determine which help page to display.

- Record-level help applies to only one specific record, not the list or form for that table.
For example, if a Record type help context exists for the Validate Number record in the Business Rule table, the help icon only directs to the page specified when a user views that record.

- List-level help applies to the list for a table. If no form-level help is defined, list-level help also applies to the form for the same table.

For example, if a List type but not a Form type help context exists for the Business Rule table, the help icon directs to the page specified by the List type help context when a user views any list or record (if record-level help is not defined for it) in the Business Rule table.

- Form-level help applies to the form for a table. If no list-level help is defined, the form-level help also applies to the list for the same table.

For example, if a Form type but not a List type help context exists for the Business Rule table, the help icon directs to the page specified by the Form type help context when you view any record (if record-level help is not defined for it) in the Business Rule table.

- If both list- and form-level help are defined for a table, the appropriate help is displayed for the list and the form.

For example, if a List type and a Form type help context exist for the Business Rule table, the help icon directs to the page specified by the List type help context when a user views the Business Rules list. The help icon directs to the page specified by the Form type help context when a user views any record (if record-level help is not defined for it) in the Business Rule table.

Help context prioritization

Sometimes multiple help contexts may apply to what a user views.

When there are several matching help context records, the following rules determine which help context is used, in descending order of priority.

1. A customer-created help context is used instead of a default help context provided in the instance for the same table.

2. A help context that matches the user's language setting is used instead of a help context in the default language of the instance. See the Language field on the Help Context form.

3. A help context for a closer table in an extended table hierarchy is used instead of a help context for a further table.

Consider the case of the Linux Server [cmdb_ci_linux_server] table, which has the following parentage: cmdb_ci > cmdb_ci_hardware > cmdb_ci_computer > cmdb_ci_server > cmdb_ci_linux_server. If help contexts exist for both the cmdb_ci_server table and the cmdb_ci table, the help icon directs to the page specified by the cmdb_ci_server help context when you view a record in the cmdb_ci_linux_server table.

System user guide

The system user guide enables you to create end user help documentation that is specific to the policies and procedures of your organization. A default help page is provided in the base system that displays UI16 help documents for system navigation and other basic operations.

The user guide provides the tools for designing help portal pages containing feature-specific help documents. You can create custom help pages and deploy them in various ways using controls in the system. User guide documents are grouped in relevant sections on a help page, using a two column format. Configuration allows you to display the sections and the documents within them in any order. You can display a section on more than one help page. The user guide is supported in UI16, UI15, and UI11.
A default help page is provided in the base system that displays help documents for system navigation and other basic operations. This page is accessible from the help icon in the header bar for UI16 users. To make this page available to users of other supported UI versions, you must create a *programmatic entry point*.

![Figure 91: Basic user guide help page](image)
Activate the system user guide on an upgraded instance

The User Guide (com.glide.user_guide) plugin is active by default for all new instances, but must be activated by a system administrator on upgraded instances.

Role required: admin

Before you activate the User Guide plugin on an upgraded instance, you must also activate the UI16 (com.glide.ui.ui16) plugin. Use this procedure to activate each plugin.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Tables installed with the system user guide

These tables are installed with the User Guide plugin (com.glide.user_guide).

These tables extend the Application File [sys_metadata] table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Help Page [sys_product_help_page]</td>
<td>Stores all the help documents and their section assignments.</td>
</tr>
<tr>
<td>Help Section [sys_product_help_section]</td>
<td>Stores all the help sections for the user guide.</td>
</tr>
<tr>
<td>Help [sys_product_help]</td>
<td>Identifies a help page and provides the entry point for linking to it.</td>
</tr>
<tr>
<td>Page to Section [sys_product_help_p2s]</td>
<td>Stores the relationship of the sections in a page to one another.</td>
</tr>
</tbody>
</table>

Create a user guide help page

A user guide help page is a portal displayed to the end user that contains links to related help documents.

Role required: admin

2. Complete the form.
Table 50: Help page field definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Page identification used by the system to create a help URL.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this help page. This field is read-only and defaults to the Global scope.</td>
</tr>
<tr>
<td>Title</td>
<td>Display title for this page.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

Create a user guide section

The sections in a system user guide page are the category containers for the individual help documents.

Role required: admin

Create your help page sections separately and then associate them to the page you created.

1. Navigate to **System User Guide > Administration > Help Page Sections** and click **New**.
2. Give your section a unique and concise title, and then click **Submit**. The view returns to the list of sections.
3. Create additional sections for your help page.

### Create user guide help documents

User guide help documents are grouped in appropriate sections on the page and listed in a configurable order.

Create all your help documents from within the section record. This allows you to refine their titles, adjust their placement, and decide if they are appropriate for the section.

Role required: **admin**

1. Navigate to **System User Guide > Administration > Help Page Sections**.
2. Open a section record you created.
3. In the **Help** related list, click **New** to create a help document for that section.
4. Complete the form.

### Table 51: Help document field definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Document number generated automatically by the system.</td>
</tr>
<tr>
<td>Section</td>
<td>Section in which this document appears.</td>
</tr>
<tr>
<td>Order</td>
<td>Listing order for this document in the selected section.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Published</td>
<td>Date this document was created.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date this document was last updated.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of the content of this document. This description is used as the title for the document on the help page.</td>
</tr>
<tr>
<td>Text</td>
<td>Document content, including graphics and tables. You can format your entry, create bulleted or numbered lists, and attach images.</td>
</tr>
</tbody>
</table>
To view your queue and take a survey:

1. Navigate to Self-Service > My Assessments & Surveys.
2. Click Take Survey on a survey card to open the questionnaire.

My Assessments and Surveys

Groups
- Assigned to: [name]
- State: [progress]
- Due Date: [date]

Vendor
- Assigned to: [name]
- State: [progress]
- Due Date: [date]

Service Desk Satisfaction
- Assigned to: [name]
- State: [progress]
- Due Date: [date]
5. Click **Submit**.  
The view returns to the section record.

6. Repeat the process to create the necessary help documents for that section.

---

### Configure the help page

After creating the sections and help documents for your user guide, arrange the sections on the help page.

**Role required:** admin

1. Navigate to **System User Guide > Administration > Help Pages** and open your new page.

2. In the **Page to Sections** related list, click **New**.

3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>Column location on the page for this section. The first column is designated as 0 and the second column is designated as 1. There must be at least one entry for column 0 for the sections to display.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order in which the sections display in the columns on the page. If no order number is defined, the system lists the sections in alphabetical order.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this record. This field is read-only and defaults to the <strong>Global</strong> scope.</td>
</tr>
<tr>
<td>Page</td>
<td>Help page on which this section appears. You can use the lookup field to change the page on which a section appears.</td>
</tr>
<tr>
<td>Section</td>
<td>Name of the section to display on the selected page.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. The view returns to the Help Page form.
6. Continue adding the sections to the help page.

**User guide page entry points**

You can create entry points in your instance for help generated with the system user guide by providing the correct address parameters in the target URL.

Help pages generated with the user guide can be displayed to end users from configurable entry points in the system, including **application modules** and **UI actions**. To create these entry points, you must express a target URL using these parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Provides</th>
</tr>
</thead>
<tbody>
<tr>
<td>$h.do</td>
<td>Processor that renders the banner frame at the top of the page.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Provides</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>$sys_product_help.do</td>
<td>Displays a page containing links to all the help in the user guide. This includes the basic help system and any custom help pages you have created. An example URL would be <a href="https://myinstance.service-now.com/$sys_product_help.do">https://myinstance.service-now.com/$sys_product_help.do</a>.</td>
</tr>
<tr>
<td>$h.do?sysparm_id=basics</td>
<td>Displays the basic help page included with the system. To create a target for a custom user guide, replace id=basic with the ID for your custom page, such as id=surveys. An example of this would be <a href="https://myinstance.service-now.com/$h.do?sysparm_id=surveys">https://myinstance.service-now.com/$h.do?sysparm_id=surveys</a>.</td>
</tr>
</tbody>
</table>

Creating a change password module

To allow users to change their own password, you can create a simple module in Self-Service.

**Prerequisites**

Role required: admin

Create a module in the Self-Service application called Change Password, give it a **Type** of **URL**, and give it an **Argument** of login_cpw.do. The module will present the user with a password change form and have them validate the new password by typing it twice.
Define locations

Locations are used by various applications to locate users, facilities, or configuration items (CI).

You can configure different levels of location in a parent-child hierarchy. For example, an email server might be associated with a location of Second Floor, whereas the email business service might be associated with New York City.

Each level of this hierarchy contains a separate location record, with the next higher level specified as a parent. In this example each location is selectable as a hierarchy from reference fields:
The location is also used to generate a full identifier in the **Full name** field, which is available by configuring the form as follows.

![Figure 95: Location Full name](image)

Locations are stored in the Location [cmn_location] table.

### Define a location

To create a location, navigate to **User Administration > Locations** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the location. This is the display value that the system uses when referencing this location on a form.</td>
</tr>
<tr>
<td>Street</td>
<td>The street address of the location.</td>
</tr>
<tr>
<td>City</td>
<td>The city of the location.</td>
</tr>
<tr>
<td>State / Province</td>
<td>State or province of the location.</td>
</tr>
<tr>
<td>Zip / Postal Code</td>
<td>The zip or postal code of the location.</td>
</tr>
<tr>
<td>Country</td>
<td>The country of the location.</td>
</tr>
<tr>
<td>Contact</td>
<td>Name of a user who is the contact for this location.</td>
</tr>
<tr>
<td>Phone</td>
<td>The phone number for the location.</td>
</tr>
<tr>
<td>Fax phone</td>
<td>The fax number for the location.</td>
</tr>
<tr>
<td>Parent</td>
<td>Name of the parent location for this location. Location hierarchies are described above.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Latitude</td>
<td>The latitude of the location. This field and the Longitude field described below are populated automatically by the get_lat_long business rule when the form contains enough information, such as an address or city name and a postal code. Deactivate this business rule to prevent the system from overwriting any values entered manually into these fields.</td>
</tr>
<tr>
<td>Longitude</td>
<td>The longitude of the location.</td>
</tr>
<tr>
<td>Company</td>
<td>A reference field to the Company [cmn_company] table.</td>
</tr>
<tr>
<td>Full name</td>
<td>A read-only, calculated field that assembles the parent hierarchy of the location into a full name.</td>
</tr>
<tr>
<td>Stock room</td>
<td>A boolean field that identifies whether the location is being used as a stock room.</td>
</tr>
<tr>
<td>Time zone</td>
<td>The location’s time zone. By default, the location uses the system time zone.</td>
</tr>
</tbody>
</table>

**Map location**

The latitude and longitude fields are populated by a business rule (get_lat_long) which queries the Google Map service. The more specific the location is, the more accurate the latitude and longitude are.

After the latitude and longitude are populated, Map Pages can be defined that display locations in an interactive map. For more information, see Map pages on page 246.

- Latitude and longitude are expressed as a floating point data type. Previous releases expressed this information as a string. During an upgrade, the system converts the data where possible.

**Database storage for audio files**

Administrators and users with the image_admin role can upload and store audio files in the database. These audio files can then be referenced in HTML.

An administrator must activate this feature.

**Activate database storage for audio files**

You can activate the Database Storage for Audio Files (com.glide.db_audio) plugin.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the **Load demo data** check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click **Activate**.

---

### Upload an audio file

You can upload `.mp3` or `.ogg` audio files.

**Role required:** image_admin

1. Navigate to **System UI > Audio Files**.
2. Click **New**.
3. Enter a **Name** for the audio file, including the file extension.
4. Add the **Audio** file.
5. Save the record.

---

### Audio file references in HTML

You can use HTML to reference audio files you have uploaded.

Use the `<audio>` HTML tag and set the `src` attribute to the name of the file as set by the **Name** field of the Audio record. You must use the `controls` attribute to display the audio controls. For example, use the following HTML.

```html
<audio src="Beep.mp3" title="Beep" control="control"/>
```

---

### Storing images in the database

Administrators and users with the image_admin or content_admin role can upload and store images in the database.

These images are saved in the Images `[db_image]` table. Uploading an image to the database allows it to be referenced from HTML fields and by appending the name of the image to the URL of the instance.

#### Images vs attachments

If you want to access an image from a record, or if you want to prevent users from appending the image name to the URL of the instance, upload it as an attachment instead. When you upload an image as an attachment, the image is saved in the Attachments `[sys_attachment]` table. See **Attachment administration** on page 749 and **Manage attachments** on page 128 for more information.

---

### Uploading Images

Navigate to **System UI > Images** to see the list of images stored in the database. Click **New** to add a new image.
The following fields are available:

- **Name**: enter the file name by which to reference the image in HTML.
- **Active**: select the check box to allow the image to be referenced in HTML.
- **Category**: select a category in which to organize the image file.
- **Image**: select **Click to add...** to upload an image. If an image is already uploaded, click [Update] to upload a new version of the image or [Delete] to remove the image.
- **Format, Size bytes, Height, and Width**: view current image metadata; this information is automatically populated when the image is uploaded.

**Figure 96: Upload image**
Acceptable image file types

Upload image files with the following extensions:

- .gif
- .jpg
- .png
- .bmp

**Note:** The system does not support uploading zip files that contain .bmp images.

If you upload an image that may not be supported in Internet Explorer browsers, a warning message appears. For example, Internet Explorer does not support JPEG images that are encoded in CMYK format.

![Image warning](https://via.placeholder.com/150)

Figure 97: Image warning

The system does not support uploading images in the .ico format through this interface. The .ico format is required by Microsoft Internet Explorer for favorite icons. To upload an .ico image, attach the .ico image to a record instead of using the standard image upload interface.

To understand how to insert an image into a form record, see the *Insert an image into your article, incident, or other form record* blog post in the ServiceNow Community.

Referencing an image in HTML

To reference an image in HTML, append an "x" to the file extension.

For example:

- browser_controls.gifx
- browser_controls.jpgx
Updating an existing image

You can change an existing image to an updated version.

Role required: image_admin or content_admin

1. Navigate to System UI > Images.
2. In the Images list, click the name of the image to be replaced.
3. In the Image field, click the [Update] link.
4. Click Browse and navigate to the desired image file.
5. Click Open, and then click OK.

The new file is uploaded into the instance database, replacing the previous file. It will be used in all locations that reference the file name.

[Note:] If the new image does not appear as expected, clear the browser cache.

Upload multiple images

You can upload multiple images at one time.

Role required: image_admin or content_admin

1. Create a .zip file that contains only acceptable image file types.

[Note:] The system does not support uploading zip files that contain .bmp images.

3. Click Choose File then select the file.
4. Click Upload.
A message indicates that the files are uploaded to the database, and the images list is sorted by updated date in descending order (the uploaded images appear first).

**Note:**
- If the .zip file contains a folder structure, the resulting image names are the path name with underscores in place of the slashes. For example, if the .zip contains `myimages/image1.gif` then the resulting image is named `myimages_image1.gif`. 
• Image names cannot exceed 100 characters in length, including folder structure. Files with excessively long names are rejected.
• Uploads are logged in the system. View system logs to see whether files are uploaded or rejected.

User preferences

Individual users can configure many UI features, such as the number of rows per page in a list or whether the response time displays at the bottom of a list or form.

These user customizations are stored as records in the User Preference [sys_user_preference] table, and are updated each time the user changes the setting.

The UI displays according to each user's preferences.

For example, by default the response time may appear at the bottom of lists and forms. If a user hides the response time, a user preference record is created showing the response time indicator as hidden. During the user's future sessions, the response time indicator is hidden. If the same user subsequently displays the response time, the user preference record is updated appropriately and future sessions open with the response time indicator visible.

Navigate to User Administration > User Preferences for a list of user preference records. Click a preference name to display that preference in form view.

![User Preference form](image)

Figure 98: User Preferences form

Each user preference record includes these fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the feature or functionality.</td>
</tr>
<tr>
<td>Description</td>
<td>An optional short description of the feature or functionality.</td>
</tr>
<tr>
<td>System</td>
<td>Shows whether this record indicates the system-wide default (TRUE), or not (FALSE).</td>
</tr>
<tr>
<td>Type</td>
<td>Shows the data type of entry accepted for the Value. For example, you can select string or integer.</td>
</tr>
<tr>
<td>User</td>
<td>Shows the name of the user for whom the setting is customized. If User is blank, the record is for a system-wide default.</td>
</tr>
<tr>
<td>Value</td>
<td>The current setting for this record. Compare this to the User field and System field to determine whether the value shown is a system-wide default or a specific user’s preference.</td>
</tr>
</tbody>
</table>

Records for the system-wide value, which applies to users who have not customized the feature, have these values: **System=True** and **User=blank**. For each user who customizes the features, a separate record is created with these values: **System=False** and **User=<username>**. As a result, the same customizable UI feature may have multiple user preference records.

For some features, the system-wide record does not appear in the User Preferences module initially. The system-wide record may be added to the User Preferences list when a user record is created for the same feature.

When an administrator manually changes a user’s preference value through this module, the user’s next session uses the administrator’s setting. However, the user can customize the features again through the UI, which updates their user preference record. If the administrator deletes the user preference record for a particular user, the user’s next session uses the system-wide value for that feature. When the user subsequently customizes the feature, the system creates a new user preference record for the user.

**User preference settings**

User preferences primarily track the way individual users interact with various features so that new sessions activate the user’s last settings. For example, user preferences track whether the user activates the tabbed or scrolling interface for multi-section forms. Other user preference records allow administrators to adjust certain feature settings.

**View settings**

To view the user preference settings, navigate to **User Administration > User Preferences**.

**User preference list**

This list describes user preference records in the base system. It provides the default value and a description for each. The Updated By column indicates how the preference is set.
<table>
<thead>
<tr>
<th>User preference record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Only</td>
<td>The value is set and updated by user action. Manual changes through the User Preference record do not affect the user experience.</td>
</tr>
<tr>
<td>Admin Only</td>
<td>The administrator can change the value through the User Preference record to modify the user experience.</td>
</tr>
<tr>
<td>Admin or User</td>
<td>The value is set and updated by user action, but the administrator can change the user experience by manually updating the User Preference record.</td>
</tr>
<tr>
<td>System Only</td>
<td>The value is set and updated by the system. Administrators should not modify these records.</td>
</tr>
</tbody>
</table>

**Table 55: User preferences**

<table>
<thead>

User preferences and update sets

User preference records for system-wide values, also called the default or global values, are stored in update sets.

Any changes are implemented when you import the update set and affect all users who have not customized the feature. User preference records for specific users are not stored in update sets, so user customizations are retained when you import an update set.

Troubleshooting user-specific UI differences

If an individual user encounters an unexplained behavior in the user interface, you can check their user preferences.

Role required: admin

1. Navigate to **User Administration > User Preferences**.
2. Search for the user name to find all that user's records.
3. Delete the record that affects the behavior in question.

   The system-wide preference is active during the user's next session. If the user customizes the behavior, a new user preference record is created and used for subsequent sessions.

View management

A view defines the elements that appear when a user opens a form or a list.

Administrators and users with the personalize role can define views for any list and form, which view should be visible by default, and which views pertain to specific user roles. Users with the admin or view_changer roles can change views.

For example, this is the Incident form in the **Self-Service View**:
Figure 99: Self service view

This is the Incident form in the **Metrics View**:
Figure 100: Metrics view

**Note:** Views can be used to define base views. UI Policies can modify those views based on context. For more information, see *Create a UI policy* on page 753.

**Administer views**

Several views are included with the base system, including the Default view and Advanced view.

**Warning:** Do not delete any of the base system views.

All view records are saved in the UI View [sys_ui_view] table. Every list and form either has a view associated with it or uses the Default view if no other view is assigned. Administrators can create additional views or modify the base system views.

**Switch views**

You can switch the view from the default for lists and forms.
To switch between list views, click the table name at the top left corner of the list, and then select Views > [Desired View]:

![List view dropdown](image)

Figure 101: List view dropdown

To switch between form views, click the table name at the left side of the form header, and then select Views > [Desired View]:

![Form view dropdown](image)

Figure 102: Form view dropdown

Switching views submits the form, which saves all changes and triggers any onSubmit client scripts that apply. You cannot switch form views on a new form that has not been saved yet.

When a user switches views, the selected view is saved as a user preference so the user sees the same view by default when the form opens. When a user has a view saved as a user preference and then opens a URL to a record that specifies another view, the form displays in the view saved in the user preference, not the URL. For example, if a user selects the Mobile view on an Incident record and then tries to open the following link, which specifies the visual task board view, the form still opens in the Mobile view:

https://{instance}/nav_to.do?uri=incident.do?sys_id={sys_ID}sysparm_view=vtb

The sysparm_view parameter specifies the view to be used for a list or a form, and can be overwritten by a user’s stored preference for a view. You can override this behavior by setting the sysparm_view_forced parameter to true.

**Create a view**

You can create views to force all users to use a certain view, despite the view specified by the user’s preference.

Role required: admin

1. Navigate to the list or form that you want to create the view for.
2. Right click the header and select Configure > List Layout or Configure > Form Layout.
3. Under the List View section, select the view on which you want to base your new view.
   The fields visible for that view appear in the Selected list.
4. From the choice list, select New.
   The Create New View form appears.
5. Enter the descriptive name of the view. View names cannot use special characters or spaces, only the characters A-Z, a-z, 0-9 and _.

6. Click OK. The fields in the Available column are the same as the first view you based the new view on.

7. Select the fields to appear in this view by adding or removing the fields from the Selected column. You can also adjust the order they appear on the form by moving the fields up or down. If you are creating a view for a form, you can select a form section and configure the fields for that section. You can also create views in the same manner when you configure a related list.

Delete a view
You can delete any view that you created.
Role required: admin
Do not delete the base system views.

1. Navigate to System UI > Views.
2. Click the view to delete.
3. Click Delete on the form header.

Create a view rule
When a user switches views, the selected view is saved as a user preference so the user sees the same view by default when the form opens. You can override this functionality to force a specified view to be used.
Role required: admin
View rules do not apply to users who have no role.

1. Navigate to System UI > View Rules.
2. Click New.
3. Complete the form.

### Table 56: View rule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify an identifying name for the rule. This field is case-sensitive and must match exactly the view name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this option to apply the view rule according to the conditions you specified. If unchecked, the view rule is not be applied.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this option to specify a code-based condition instead of using the condition builder. Selecting this option displays the Script field and hides the Match conditions, Conditions, and View fields.</td>
</tr>
<tr>
<td>Match Conditions</td>
<td>Select whether Any or All of the conditions need to be met. The system hides this field when you create an advanced View Rule.</td>
</tr>
</tbody>
</table>
### View rule form

The View Rule [sysrule_view] table contains the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Use the condition builder to determine when the view is applied. The system hides this field when you create an advanced View Rule.</td>
</tr>
<tr>
<td>Application</td>
<td>Displays the application to which the View Rule record belongs.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table on which this view rule will be applied. The list shows only tables and database views that are in the same scope as the view rule</td>
</tr>
<tr>
<td>Device type</td>
<td>Select which interface this view rule applies to.</td>
</tr>
<tr>
<td>View</td>
<td>Select the view that is automatically applied if the conditions match. The system hides this field when you create an advanced View Rule.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter a script to determine when to display a particular view. The system only displays this field when you create an advanced View Rule.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

---

### Field | Input value
--- | ---
Conditions | Use the condition builder to determine when the view is applied. The system hides this field when you create an advanced View Rule.
Application | Displays the application to which the View Rule record belongs.
Table | Select the table on which this view rule will be applied. The list shows only tables and database views that are in the same scope as the view rule.
Device type | Select which interface this view rule applies to.
View | Select the view that is automatically applied if the conditions match. The system hides this field when you create an advanced View Rule.
Script | Enter a script to determine when to display a particular view. The system only displays this field when you create an advanced View Rule.

---

Restrict view by role

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Name:** Restrict View by Role

**Type:** System UI > View Rules

**Table:** Any

**Description:** Generally the view used on a form is controlled by either specifying the sysparm_view parameter in the url or module properties, or by inheriting the view from the previous form or list. In some cases this does not apply, such as opening a referenced field form from a record producer. In this case you may want to control the view of the form based on roles. This script assumes there is a view called ess available to the current table.

**Parameters:**
- view - A string containing the name of the current view.
- is_list - A Boolean value indicating whether this is a list view.

**Script:**

```javascript
(function overrideView(view, is_list) {
    // Force non-itil users to use the ess view
    if (gs.hasRole("itil")) {
        return;
    }
    if (view.startsWith("ess")) {
        return;
    }
    // do not change view if it starts with sys_ (e.g. sys_ref_list)
    if (view.startsWith("sys_")) {
        return;
    }
});
```
Navigation Handler

A Navigation Handler is essentially a scripted View Rule and runs each time data from the specified table is requested in the form view.

The following script, which is a navigation handler included with the HR plugin, forces the ESS view for users with no roles, and uses the default view for all other users.

```javascript
var gr = new GlideRecord(hr.TABLE_CASE);
if (gr.get(g_uri.get('sys_id'))) {
    if (!gs.getUser().hasRoles())
        g_uri.set('sysparm_view', 'ess');
    else
        g_uri.set('sysparm_view', '');
}
answer = g_uri.toString('hr_case.do');
```

Use the glide.ui.view_rule.check_after_nav_handler system property to control the order in which View Rules and Navigation Handlers are applied. Set the property value to True to process view rules after navigation handlers. If the system property does not exist in your instance, the navigation handler always takes precedence.

The system property only overrides the Navigation Handler if the Navigation Handler scripted function does not return an answer. In the example script above, the property will have no effect as the Navigation Handler will always return an answer due to the answer line being outside of the if statement.

To force the Navigation Handler Script above to honor View Rules for the table, add the property above, set it to true, and update the code to only return an answer when the view needs to be changed or forced.

```javascript
var gr = new GlideRecord(hr.TABLE_CASE);
if (gr.get(g_url.get('sys_id'))) {
    if (!gs.getUser().hasRoles()) {
        g_url.set('sysparm_view', 'ess');
        answer = g_url.toString('hr_case.do');
    }
}
```

Welcome page content

The ServiceNow ITSA Suite login page content is completely customizable by the administrator of the system.

The login page should contain instructions and any other important information you would like to convey to your customers each time they use the system.

Login language selection

Users can select their language on the login page.

This enables them to start their user session in the language of their choice.
Create company-specific welcome page content

You can create company-specific welcome page content.

Role required: admin

1. Navigate to System UI > Welcome Page Content.
2. To create a new section, click New.
3. Enter the following in the Condition field, where Company is the name of the company whose users see this section.
   
   \[ \text{gs.getUser().getCompanyRecord().name.toString() == "Company"} \]

4. Complete the form.
5. Click Submit.
Sections

To view and configure the welcome page elements, navigate to System UI > Welcome Page Content. You may need to enable the module if it is not visible. If any of the sections are not needed, they may be removed. You can edit any item by clicking its short description.

- **Demonstration**: Information about logging in to a ServiceNow ITSA Suite demo system
- **Welcome**: General information
- **Using**: Some tips and tricks for using the system
- **More Information**: A link to the ServiceNow wiki
- **Login**: Login information

Google Maps integration

Map pages enable you to graphically display data on a Google map page based on location data. Maps can be generated using basic JavaScript, but are flexible enough to display even the most complicated of queries. The maps you generate use standard Google Maps API mapping features, including a variety of link types to records in your instance. This feature requires the Google Maps plugin.

![Google Maps integration](image)

Figure 104: Map page

Google Maps setup

Before using the Google Maps API, users may need to enter a Google license key in system properties, and configure other options.

You may need to obtain a Google Maps for Work license key to cover development use of the Google Maps API. Please see the [Getting Started Guide](#) on the Google web site for details on obtaining a key, using the API, and relevant terms of service.

When you receive your key, enter it in the System Properties > Google Maps property form, and configure your maps using the configuration options in this screen.
After you complete the configuration, you can create new map pages or use the default pages included with the plugin. Map pages define what data is displayed on the map and the appearance of the links. When you have the map pages you need, you can create new modules in your application navigator to display your maps.

For a tutorial on how to display all markers that link to your records, see the Display Map Markers on Google Maps blog post on the ServiceNow Community.

Google Maps plugin

The Google Maps Plugin provides the following configurable properties in System Properties > Google Maps.

Table 58: Google Maps system properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>google.maps.auto_close</td>
<td>If true, automatically closes a map information window before opening a new one.</td>
</tr>
<tr>
<td></td>
<td>• Type: true/false</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.client</td>
<td>Client ID for Google Maps API for Work.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: gme-servicenow</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.private.key</td>
<td>Private key for Google Maps API for Work. This key activates the geolocation feature, which locates users in the system precisely, using data from their mobile devices.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: empty</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.version</td>
<td>Version number of the current installation of Google Maps API.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: current version number</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>google.maps.key</td>
<td>The Google Maps API key that is tied to the URL of the server. This key authorizes development use of Google Maps API.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: empty</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.latitude</td>
<td>Starting latitude of the map. This value determines the starting position displayed in Google Maps.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: 36.008522</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.longitude</td>
<td>Starting longitude of the map. This value determines the starting position displayed in Google Maps pages.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: -95.221764</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.max_items</td>
<td>Maximum number of items to display on the map.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 500</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>

</tr>
<tr>
<td></td>
<td>• Default value: cmn_location</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
<tr>
<td>google.maps.zoom</td>
<td>Starting zoom level of the map (1 is the lowest)</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: 4</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties &gt; Google Maps</td>
</tr>
</tbody>
</table>
Map pages

Map pages display ServiceNow data graphically on a Google map page based on location data that you provide.

You can create as many map pages as needed to define the types of data to display, the links to show, and the appearance of the map. After creating the map pages, you can create new modules to display the map pages.

**Note:** Map pages are subject to the non-production access limitations. See *Google Maps integration* on page 243.

Create a map page

Your ServiceNow instance provides several default map pages. You can also create custom map pages with the script examples described in this page.

Role required: admin

The default map page record displays critical incidents on a Google map page.
1. Navigate to **System UI > Map Pages**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name to identify the map.</td>
</tr>
<tr>
<td>Center map on</td>
<td>Enter the location for centering the map using the decimal form of latitude and longitude. For example, to center the map on the statue of liberty, enter 40.689865, -74.045235.</td>
</tr>
<tr>
<td>Initial zoom</td>
<td>Set the map’s zoom level on opening.</td>
</tr>
<tr>
<td>Controls size</td>
<td>Select whether the Google navigation icons on the map should be large or small.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a map background style: <strong>Satellite</strong>, <strong>Hybrid</strong>, <strong>Normal</strong>, or <strong>Terrain</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type selection</td>
<td>Select which type of Google icons to display on the map: <strong>Buttons</strong> or <strong>Menu</strong>.</td>
</tr>
<tr>
<td>Map overview</td>
<td>Enable or disable a wide view map window for navigation.</td>
</tr>
<tr>
<td>Script</td>
<td>Create a script to define the type of data to display on this map. For more information, see <em>Scripting for map pages</em> on page 252.</td>
</tr>
</tbody>
</table>

Fields you can add by configuring the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Center latitude</td>
<td>The latitude the map page will center on. This field is populated by the business rule Geocode Address.</td>
</tr>
<tr>
<td>Center longitude</td>
<td>The longitude the map page will center on. This field is populated by the business rule Geocode Address.</td>
</tr>
</tbody>
</table>

4. Save the record.

**Map page modules**

You can create a new application module for desktop or smartphone users to display a Google map page.

You can create a desktop application module for a Google map page using either of the following methods.

- Map page link
- URL link

**Create a desktop map page module using a map page link**

You can create a custom desktop application module that links directly to a map page.

Role required: admin

1. Select the appropriate application for the module.
   
   For example, if you are planning to display critical incidents, add a module to the Incident application menu.

2. Perform the appropriate action for your version of the UI:

   **UI16**
   
   1. Navigate to **System Definition > Application Menus**.
   2. Open the application menu to which you want to add the module.

   **UI15 or UI11**
   
   Right-click the application menu in the application navigator and select **Edit Application Menu**.

3. In the **Modules** related list, click **New**.

4. Complete the form, as appropriate.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter a name for the module in the application navigator.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to define the sequence this condition should be evaluated if more than one matching condition exists. The order is evaluated from the lowest value to the highest value.</td>
</tr>
<tr>
<td>Application menu</td>
<td>Select the application menu where you want this module to appear. By default, this field displays the application menu that you opened to create the module.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a brief description to display when a user points to the module name in the application navigator.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate this module. Only active modules appear in the application menu.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to display with this module in the application navigator. If this field is blank, a default icon is used.</td>
</tr>
<tr>
<td>Link type</td>
<td>Select Map Page from the list. This selection changes the available fields in the form.</td>
</tr>
<tr>
<td>Map page</td>
<td>Select the pre-configured map page to use for this module. For example, Critical Incidents.</td>
</tr>
<tr>
<td>Roles</td>
<td>Select the roles that are permitted to access this module. If this field is blank, all roles can access the module.</td>
</tr>
</tbody>
</table>
Create a desktop map page module using a URL link

You can create a desktop module that links to a map page via a URL.

Role required: admin

1. Select the appropriate application for the module.
   
   For example, if you are planning to display critical incidents, add a module to the Incident application menu.

2. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>UI15 or UI11</th>
</tr>
</thead>
</table>
   | 1. Navigate to **System Definition > Application Menus**.  
     2. Open the application menu to which you want to add the module. |
   | Right-click the application menu in the application navigator and select **Edit Application Menu**. |

3. In the **Modules** related list, click **New**.

4. Select a **Link type** of **URL (from Arguments:)**. This selection displays the Arguments field.

5. Enter the URL in this format: `map_page.do?sysparm_name=<map page name>`.

**Note:** If the map page title has a space in it, replace the space with `%20` for the correct syntax. For example, a map page called Critical Incidents becomes `Critical%20Incidents%20` in a URL.
6. Click Submit.

Create a smartphone map page module

You can create a custom smartphone module that links directly to a map page.

Role required: admin

1. Obtain the sys_id of the map page.
   The sys_id is required when you create the module.
2. Navigate to System Mobile UI > Navigator Apps.
3. Open the application menu where you want the new module to appear.
4. In the Modules related list, click New.
5. Complete the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the module.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to specify the order of the module within the application menu. For example, an entry of 100 would place this module before one with an Order entry of 200.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application menu</td>
<td>Select the application menu where you want this module to appear. By default, this field displays the application menu that you opened to create the module.</td>
</tr>
<tr>
<td>Table</td>
<td>Do not select a table.</td>
</tr>
<tr>
<td>Updated</td>
<td>Displays the date and time when the module record is updated.</td>
</tr>
<tr>
<td>Roles</td>
<td>Select the roles that are permitted to access this module. If this field is blank, all roles can access the module.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate this module. Only active modules appear in the application menu.</td>
</tr>
<tr>
<td>Filter</td>
<td>Do not add a filter condition.</td>
</tr>
<tr>
<td>Path</td>
<td>Enter map/ followed by the sys_id of the map page. For example: map/c86c5feac0a80a6600706f0102968196</td>
</tr>
</tbody>
</table>

6. Click Submit.

Scripting for map pages

In the Script field on the Map Page form, you can use the available attributes or custom code to define map characteristics, such as marker appearance for items on the map, what information to display when someone clicks a marker, and more.

You can use the isMobile variable to set custom behavior for the smartphone view of the map.

To create an item on the map, use the `map.addItem(glideRecord)` method. You must pass a valid GlideRecord to addItem().

The following attributes are available.

Table 59: Scripting map item attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name used for identification.</td>
</tr>
<tr>
<td>latitude</td>
<td>Latitude is not necessary if you define an address.</td>
</tr>
<tr>
<td>longitude</td>
<td>Longitude is not necessary if you define an address.</td>
</tr>
<tr>
<td>icon</td>
<td>URL of the icon to display for the marker. The default Google marker is used if a custom icon is not specified.</td>
</tr>
<tr>
<td>icon_width</td>
<td>Width of the icon. The default is 32.</td>
</tr>
<tr>
<td>icon_height</td>
<td>Height of the icon. The default is 32.</td>
</tr>
</tbody>
</table>
### Attribute Description

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Table whose records display when the marker icon is clicked. Used in conjunction with the sys_id attribute.</td>
</tr>
<tr>
<td>sys_id</td>
<td>Sys_id of the record that will display when the marker icon is clicked. Used in conjunction with the table_name attribute.</td>
</tr>
<tr>
<td>view</td>
<td>View of the form displayed in the dialog box when the marker icon is clicked.</td>
</tr>
<tr>
<td>dialog_title</td>
<td>Title of the dialog box containing the record information.</td>
</tr>
<tr>
<td>html</td>
<td>Arbitrary HTML code for the pop-up window. If used, this value overrides the dialog box.</td>
</tr>
<tr>
<td>marker_label</td>
<td>Optional marker icon label text. For an example, see Map page marker label script on page 255.</td>
</tr>
<tr>
<td>label_offset_left</td>
<td>Optional attribute that is used with marker_label to define the horizontal position of the marker label. The default is 0.</td>
</tr>
<tr>
<td>label_offset_top</td>
<td>Optional attribute that is used with marker_label to define the vertical position of the marker label. The default is 0.</td>
</tr>
</tbody>
</table>

**Scripting custom map page behavior for smartphone interfaces**

If you plan to access the map page from a smartphone, you may want to set custom smartphone interface behavior using the isMobile variable.

For example, you might set different values for the icon_width and icon_height attributes when isMobile is true.

**Basic map page script**

This script is used to display all active, critical incident locations.

```javascript
//setup new GlideRecord query on the incident table
var gr = new GlideRecord("incident");
//add condition for priority 1
gr.addQuery('priority', '1');
//add condition for active incidents
gr.addActiveQuery();
//execute the query
gr.query();

//loop through the list of incidents returned by the query
while (gr.next()) {

    //create a new map item to display - linked to the current incident record
    var item = map.addItem(gr);
    //add the latitude value from the incident's location
    item.latitude = gr.location.latitude;
    //add the longitude value from the incident's location
    item.longitude = gr.location.longitude;
    //add the incident number to the dialog title
    item.dialog_title = gr.getDisplayValue();
}
```

© 2017 ServiceNow. All rights reserved. 253
isMobile map page script

This script is used to display all active, critical incident locations with custom settings for smartphone users.

```javascript
//setup new GlideRecord query on the incident table
var gr = new GlideRecord("incident");
//add condition for priority 1
gr.addQuery('priority', '1');
//add condition for active incidents
gr.addActiveQuery();
//execute the query
gr.query();

//loop through the list of incidents returned by the query
while (gr.next()) {
    //create a new map item to display - linked to the current incident record
    var item = map.addItem(gr);
    //add the latitude value from the incident's location
    item.latitude = gr.location.latitude;
    //add the longitude value from the incident's location
    item.longitude = gr.location.longitude;
    //add the incident number to the dialog title
    item.dialog_title = gr.getDisplayValue();
    //link to the icon image
    item.icon = "http://maps.google.com/mapfiles/kml/pal3/icon51.png";

    //set the icon size (use smaller icons for smartphone users)
    if (isMobile) {
        item.icon_width = "12";
        item.icon_height = "12";
    } else {
        item.icon_width = "16";
        item.icon_height = "16";
    }
}
```

Advanced map page script

This script is used to display the number of open incidents by location.

This script varies the size of the icon based on the number of open incidents for the location. Using the `html` parameter, it also displays the location name and number of incidents, as well as a link to the list of related incidents.

```javascript
//get the instances url so we can link back to it
var uri = gs.getProperty("glide.servlet.uri");
//create an aggregate query on the incident table
var count = new GlideAggregate('incident');
//set condition for active incidents
count.addQuery('active', 'true');
//set aggregate field to location to get count by location
count.addAggregate('COUNT', 'location');
//execute the query
```
count.query();

//loop through the results
while (count.next()) {

    //get the current record's location
    var loc = count.location;
    //get the count of incidents for this location
    var locCount = count.getAggregate('COUNT', 'location');
    //only display location is there are active incidents
    if (locCount > 0) {
        //create new new map item for this location
        var item = map.addItem(count);
        //set lat/long from the location record
        item.latitude = loc.latitude;
        item.longitude = loc.longitude;
        //build the link to the list of incidents for the location
        var link = 'href=' + uri + 'incident_list.do?sysparm_query=active%3Dtrue^location%3D' + loc;
        //build the html value to be displayed when you click the map icon
        item.html='&lt;a ' + link + '>'+ loc.getDisplayValue() + ' (' + locCount + ')&lt;/a&gt;';
        //link to the icon image
        item.icon = "http://maps.google.com/mapfiles/kml/pal3/icon51.png";
        //set the size of the icon based on the number of active incidents
        if (locCount < 5) {
            item.icon_width = "12";
            item.icon_height = "12";
        } else if (locCount < 15) {
            item.icon_width = "16";
            item.icon_height = "16";
        } else {
            item.icon_width = "32";
            item.icon_height = "32";
        }
    }
}

Map page marker label script

Marker labels allow you to add dynamic text to markers.

This example displays the active incident count at each location.
//get the instances url so we can link back to it
var uri = gs.getProperty("glide.servlet.uri");
//create an aggregate query on the incident table
var count = new GlideAggregate('incident');
//set condition for active incidents
count.addQuery('active', 'true');
//set aggregate field to location to get count by location
count.addAggregate('COUNT', 'location');
//execute the query
count.query();

//loop through the results
while (count.next()) {

//get the current record's location
var loc = count.location;
//get the count of incidents for this location
var locCount = count.getAggregate('COUNT', 'location');
//only display location is there are active incidents
if (locCount > 0) {

//create new new map item for this location
var item = map.addItem(count);
//set lat/long from the location record
item.latitude = loc.latitude;
item.longitude = loc.longitude;

//create a marker label with the count
item.marker_label = locCount;
//define label offset for proper position
item.label_offset_left = -4;
item.label_offset_top = -20;

//option to define table and record for label hyperlink
//setting table and sys_id will override the use of html parameter
//item.table = 'cmn_location';
//item.sys_id = loc;

//build the link to the list of incidents for the location
var link = 'href=' + uri + 'incident_list.do?sysparm_query=active%3Dtrue^location%3D' + loc;
//build the html value to be displayed when you click the map icon
item.html= '<a ' + link + '>' + loc.getDisplayValue() + ' (' + locCount + ')</a>';
Theming an instance

An administrator may want to change the styles throughout the instance to change the look and feel of the usual instance interface.

This can be done in a number of different places, often using global CSS or system properties.

Other sources for information on theming include the following.

- To create a themed front-end for users, see Content Management System on page 2040.
- To find out how to modify the banner image and text, see Modify the banner on page 279.
- For styles of individual fields, see Define field styles on page 851.

Beyond theme controls, it is also possible to customize the UI using customized scripts.

Configure logo, colors, and system defaults for UI16

You can use the Basic Configuration UI16 module to brand your instance with your company logo and colors and set basic system defaults. This is the best place to start if you are setting up your instance for the first time or if you have recently enabled UI16.

To prepare for completing basic configuration, gather the following information.

- Obtain the company banner image to use in the header. The image can be high resolution, but when it displays it is scaled based on the aspect ratio. It scales to a maximum of 20px high.
- Get your company's brand color hex or RGB numbers, typically from your marketing department. Use them to decide how to configure the UI background colors.

Role required: admin

Each color selection option provides a color picker to select a color. The text box beside the color picker lets you enter the value of the color as any of the following CSS formats.

- Name: predefined color names, such as red, green, blue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

Refer to HTML Color Names (W3CSchools) for information about HTML color names.

1. Navigate to System Properties > Basic Configuration UI16
2. Complete the configuration by changing any of the following settings.

<table>
<thead>
<tr>

Configure logo, colors, and system defaults

You can use the Basic Configuration module to brand your instance with your company logo and colors and set basic system defaults. This is the best place to start if you are setting up your instance for the first time.

To prepare for completing basic configuration, gather the following information.

- Obtain the company banner image to use in the header. The image can be high resolution, but when it displays it is scaled based on the aspect ratio. It scales to a maximum of 50px high.
- Decide whether to change the banner and list header background color, and the banner text color. If you plan to do so, obtain your company’s brand color hex or RGB numbers. Typically, these come from your marketing department.

Role required: admin

This procedure applies to configuring UI15 and UI11.

1. Navigate to System Properties > Basic Configuration
2. Complete the configuration by changing any of the following settings.

Table 61: Basic system configuration properties

<table>
<thead>
<tr>
<th>Label</th>

<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Banner and list caption background color</td>
<td>css.base.color</td>
<td>Click the color picker and select the color to use. You can also enter the name, RGB decimal, or RGB hex number of the color. Refer to <a href="https://www.w3schools.com/html/html_color_names.asp">HTML Color Names (W3CSchools)</a> for information about HTML color names.</td>
</tr>
<tr>
<td>Browser tab title</td>
<td>glide.product.name</td>
<td>Change the text that appears on the browser tab.</td>
</tr>
<tr>
<td>Banner image</td>
<td>glide.product.image</td>
<td>Click + next to the image and upload your logo.</td>
</tr>
<tr>
<td>System timezone for all users unless overridden in the user's record</td>
<td>glide.sys.default.tz</td>
<td>Select the timezone in the choice list. Click <a href="https://www.w3schools.com/html/html_timezones.asp">Configure available time zones</a> to select the time zones that your users can select from in user preferences.</td>
</tr>
<tr>
<td>Date format</td>
<td>glide.sys.date_format</td>
<td>Select the date and time formats from the choice lists.</td>
</tr>
<tr>
<td>Time format</td>
<td>glide.sys.time_format</td>
<td></td>
</tr>
<tr>
<td>Banner text color</td>
<td>css.banner.description.color</td>
<td>Click the color picker and select the color to use. You can also enter the name, RGB decimal, or RGB hex number of the color.</td>
</tr>
</tbody>
</table>

As you make changes, the page refreshes with a preview of the change. Only you see these changes.

3. Click **Save** at the top or bottom of the page.

After you save the configuration changes, all users who select the **System** theme in their UI personalization options see the new configuration colors.

**Menu categories**

Menu categories let you put CSS styles on application labels to make them stand out from other applications.

You navigate to **System Definition > Menu Categories** to view existing menu categories. This CSS style can include border color, text color, background color, and other options.

The base system menu categories include the following.

**Administration**

Applications in this category have a light blue background.
Custom Applications

Applications in this category have a light grey background.
border: 1px solid #96bcdc; background-color: #FBFBFB;

Label

Applications in this category have a blue background.
border-color: blue; background-color: rgb(102, 153, 204); color: white

Maint

Applications in this category have a blue background.
Style: border-color: blue; background-color: rgb(102, 153, 204); color: white

SocialIT

Applications in this category have a blue background.
border-color: blue; background-color: rgb(102, 153, 204); color: white

To add an application to a category, add it in the related list of applications at the bottom of the category record, or else you can specify the category on the application record.

Business service map properties

Administrators can edit the Business Service Map look and feel in the module BSM Map > Properties.
The following properties can be changed.

• How many child nodes to display when too many children exist for parent CI.
• Color used for the collapsed node when too many children exist for parent CI.
• Text style used for collapsed node when too many children exist for parent CI.
• The color of any of the following items.
  • Affect neighbor node
  • Node with an open change request
  • Node with an outage
  • Node with an open incident
  • Recently expanded nodes

Change survey question header colors

All of the lists and forms draw the color of their headers from the base color, which allows theming from the CSS properties.

One notable exception is the survey, which has its own CSS. It is possible to change the CSS by adding a property.

1. Enter sys_properties.form into the navigation filter and press the Enter key.
   A new Property form displays.
2. Name the new property css.list.row.survey.background.color.
3. Enter the hexadecimal value of the desired color into the **Value** field.
4. Click **Submit**. 
   The survey should now use the desired color.

**CSS properties**

Some theming properties may be customized by navigating to **System Properties > CSS**.

Colors are specified using predefined **color names**, RGB decimals, or RGB hexidecimals. The following properties are available through CSS Properties.

- Banner text color
- Banner and list caption background color
- Font used in forms and lists (this is a global font setting)
- Base font size (UI11)
- Button styles (background color, border color, border width, text color)
- Field status indicator colors (including those for Changed, Mandatory Populated, Mandatory Unpopulated, and Read-only)
- List cell vertical alignment
- Navigator menu styles (text font size, background color, text color)
- Header font name and size
- List and form caption color override
- Global text search background color (both for catalog results and knowledge base results)

**CSS theme support**

Themes give the user interface a specific look and feel by using different color combinations.

System administrators can create new themes or customize the existing themes for an instance. To see existing themes, navigate to **System UI > Themes**.

**Activating CSS theme support**

There are different plugins that activate CSS themes support.

Activate one of the following plugins to use themes, based on the version of the UI you use.

- **UI16**: CSS Theme support - UI15 is activated automatically with UI16
- **UI15**: CSS Theme support - UI14 is activated automatically with UI15
- **UI11**: CSS Theme support

See **Activate a plugin** on page 1233.

**Enable the theme picker**

The theme picker adds a field to the system menu (UI16 or UI15) or the banner frame (UI11) that allows the user to quickly switch between CSS themes during the current browser session.

Role required: admin

You can enable the theme picker by activating the ui_theme_changer UI macro.

1. Navigate to **System UI > UI Macros**.
2. Locate the ui_theme_changer UI macro.
3. Set the **Active** field to **true**.
Select a theme

You can switch between different themes for the user interface. Themes are user specific. Each user can select a different theme and the selection is stored as a user preference.

Select a theme by performing the appropriate action for your version of the UI.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Click the gear icon (ー) in the banner frame to access the System Settings window. Select the Theme tab, and then select the theme.</td>
</tr>
<tr>
<td>UI15</td>
<td>Click the gear icon (ー) in the banner frame to access the system menu. Then select a theme from the Theme picker.</td>
</tr>
<tr>
<td>UI11</td>
<td>Select a theme from the Theme picker in the banner frame.</td>
</tr>
</tbody>
</table>

Configure a company theme

You can configure a default CSS theme for a particular company in UI15. The theme appears for all users associated with the company unless they select a different theme.

Role required: personalize_form

Specify a company theme on the company record.

Note: In UI16, the basic configuration is used instead of the theme selected in the company record.

1. Navigate to System Properties > My Company.
2. Configure the form and add the Theme field.
3. In the Theme field, select a theme.
4. Click Update. Users in this company will see the selected theme the next time they log in, unless they have selected a different theme.

Create or customize a theme

You can create new themes or customize existing themes.

Role required: admin

1. Navigate to System UI > Themes.
2. To create a new theme, click New. To customize an existing theme, click the theme name.
3. Enter a name for the theme in the Name field.
4. Add any of the default CSS styles in the CSS field.

In some cases the default style is not the only style definition for an object. In such cases, you can use the CSS important rule format to override any other style definitions with the default definition. For example, this definition overrides the mandatory text color:

```
label.mandatory.text.color: #FF0000 !important.
```
5. Select the **Active** check box.
6. Select one of the following from the **Device** choice list to identify the user interface version for the theme.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Browser</td>
<td>Identifies a UI11 theme.</td>
</tr>
<tr>
<td>Doctype</td>
<td>Identifies a UI15 theme.</td>
</tr>
<tr>
<td>Concourse</td>
<td>Identifies a UI16 theme.</td>
</tr>
</tbody>
</table>

7. Click **Submit**.

You must refresh the page to see the new theme in the theme picker. The theme picker displays only themes that are compatible with the current version of the UI.

**Default CSS styles**

You can use CSS styles to control the appearance of elements in a theme.

Your version of the UI determines which CSS styles you can use.

**Default CSS styles for UI16**

```css
$search-text-color: #e7e9eb
$navpage-header-bg: #303a46
$navpage-header-color: #ffffff

UI properties

You can customize the following theming properties by navigating to **System Properties > UI Properties**.

- Icons used in the activity formatter
- Background colors for Additional Comments and Work Notes
- Button placement on forms
- Icons used in the Task Activity formatter
- Background colors for Incident Additional Comments and Work Notes

Create a company profile

To customize the ServiceNow® instance for your company, you can enter information such as contact phone numbers, street address, and additional notes. You can also customize the company logo and banner text your end users see at the top of each page.

Role required: admin

Much of the company information that you enter is reference information that administrators can view. All users see the company logo and banner text. To see all company information, verify that you are in the **My Company** view.
1. Navigate to System Properties > My Company.
2. To change the banner text, update the Banner text field.
3. Select the Primary check box to indicate if this company is the primary company.
   If needed, configure the form to add the Primary check box. Designate only one company in your system as the primary company.
4. To upload your company logo, complete one of the following steps for your version of the UI.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Click Click to add or Update beside UI16 Banner Image.</td>
</tr>
<tr>
<td>UI15 or UI11</td>
<td>Click Click to add or Update below the Banner image field.</td>
</tr>
</tbody>
</table>

If you leave the banner image blank for either UI16 or UI15, the system uses the image used in System Properties > Basic Configuration > Banner image [glide.product.image] as the default.
5. Click Choose file and select the file, and then click OK.
   To use an image URL instead of a file on your hard drive, enter the URL in the file upload window.
6. Complete the form with remaining company information.
7. Click Update.
Define the company profile Apple icon

When viewing an instance on an Apple device, users can save a bookmark to the home screen that navigates directly to the instance. The icon that the bookmark uses can be defined in the company profile.
1. Navigate to System Properties > My Company.
2. If necessary, *Configure the form* and add the **Apple Icon** field.

3. Use the **Apple Icon** field to upload the desired image.
   - This should be a 57x57 px image in `.png` format:
   - When users save the bookmark to the home screen, it will display the new icon.
Banner logo link

Properties are available to control the URL and target frame used when clicking the banner logo.

- glide.banner.image.url: URL used when clicking the banner image
- glide.banner.image.url_target: Target frame used when clicking the banner image
  - gsft_main for the main frame
  - _top to replace the current browser window
  - _blank for a new window/tab

Customize the logo in system properties

The banner text and banner image defined for the company that a user is assigned to may be used to override the glide.product.image and glide.product.description.

Role required: admin

The banner text, if specified, is used instead of the glide.product.description property. The banner image, if specified, is used instead of the glide.product.image property.

To update the banner image in the System Properties > System page, you must first upload the image.

Note: Setting a banner image in the company profile overrides the image selected in System Properties > System.

1. To upload the image, complete the following steps.
   a) Navigate to System UI > Images and click New.
   b) Enter a Name for your image.
      Valid names must end in .gif, .png, .jpg, or .bmp.
   c) Click the Click to add link in the Image field, and select and upload the image.
   d) Click Update.

2. To set the uploaded image to the banner image, complete the following steps.
   a) Navigate to System Properties > System.
   b) In the Banner image field, enter the file name of the uploaded image.
   c) Click Save.

Note: The system limits banner images to 50px.

Customize the favicon

Use the glide.product.icon property to change the icon that appears in bookmarks and the browser address bar.

Before you can update the favicon, you need to upload the image into the database.

Role required: admin

1. To upload the image, complete the following steps.
   a) Navigate to System UI > Images and click New.
b) Enter a **Name** for your image. Valid names must end in .gif, .png, .jpg, .ico or .bmp.

c) Click the **Click to add** link in the **Image** field, then select and upload the image.

d) Click **Update**.

2. To set the uploaded image to the favicon, complete the following steps.

   a) Navigate to **System Properties > System**.

   b) In the **Icon image displayed in the bookmarks and browser address bar** field, enter the file name of the uploaded image.

   c) Click **Save**.

The favicon appears in the bookmarks and browser address bar for the platform or the Content Management System (CMS).

**Examples of how to modify the banner**

There are various ways that you can modify the banner on your instances.

**Label multiple instances differently**

- On all instances, leave glide.product.description <blank>
- On PROD instance, set glide.product.name to <My Company>
- On DEV instance, set glide.product.name to <My Company - DEV>

**Control the window title**

Since the window title is composed of glide.product.name and glide.product.description, the following gives you complete control over the banner and the window title.

- glide.product.name set to <Window Title that you want>
- glide.product.name.style set to <display: none>
- glide.product.description set to <blank>

The company record **Banner Image** and **Banner Text** are used to set the banner image and text since the company banner text is not used in the window title.

**Use HTML in the banner text**

- glide.product.name set to <My Company>
- glide.product.name.style set to <display: none>
- glide.product.description set to <Some text <a href="some_url">Click here</a>>

**Position banner text over the banner image**

- glide.product.name set to <My Company>
Apply a background image to the banner

Often corporate guidelines require more in-depth branding of the ServiceNow interface. Using the tiling technique, you can modify your logo image to have a transparent background, so that you can apply another image to the banner beneath the logo.

Upload an image to the image manager and then create a new property named css.banner.background.image, so that you can call the image. The value should look like this.

- css.banner.background.image value url('./images/MasterBG.jpgx')

Write CSS rules that apply this change

```css
/** BACKGROUND - These properties allow you to add a background tile to the header of the instance *****************************/
TD.bannerLeft, TD.bannerCenter, TD.bannerRight, TR#banner_row{
    background-color: ${banner.background.color};
    background-image: ${banner.background.image};
    background-position: ${banner.background.position};
    background-repeat: ${banner.background.repeat};
}
```

Note: The banner image and banner text associated with the primary company or specific companies may be used instead of the glide.product.image and glide.product.description properties to get the same effect.

Modify the banner

The banner is displayed at the top of the page and is rendered using certain system properties.

- glide.product.image
- <div>glide.product.name</div>
- <div>glide.product.description</div>

The DIV that contains the glide.product.name property is only shown if the property contains a value, otherwise, it is not used when rendering the banner. Also, the property glide.banner.image.title controls the tool tip that appears when the cursor is over the banner.

Note: The properties are overridden by the My Company record.
These properties are used to set the window title as follows:

\[ \text{glide.product.name} \text{ glide.product.description} \]

If \text{glide.product.name} is blank, then the ServiceNow name is used as the product name for the window title.

**My Company**

The banner text and banner image defined for the Company that a user is assigned to may be used to override the \text{glide.product.image} and \text{glide.product.description} properties. The banner text, if specified, is used instead of the \text{glide.product.description} property. The banner image, if specified, is used instead of the \text{glide.product.image} property.

**Style the banner**

The \text{glide.product.description} property and the company banner text field may contain HTML if necessary to allow links, color, etc. to be shown in the banner.

**Role required:** admin

Use the \text{glide.product.name.style} property to set CSS properties for the DIV used to display the product name in the banner. Often, this style is set to \text{display: none} so that the product name is not displayed, but is still used as part of the window title.

Use the \text{glide.product.description.style} property to set CSS properties for the DIV used to display the product description in the banner, or company banner text.

You can also use CSS properties to change the banner background color by completing the following steps.

1. Navigate to **System Properties > CSS**.
2. In the **Banner and list caption background color** field, enter the color you want to apply to the banner.
3. Click **Save**.

**Comparing field values**

Field comparison allows users to evaluate equality between fields on the same table or on related tables by using operators in the condition builder.

Additionally, you can compare date type fields to determine if the values are within a certain range of each other. For example, you can compare the planned start date of a task to the actual start date. You can use field comparisons in a list view and to generate reports.
The primary function of field comparison is evaluating whether two fields on a record or related record have identical values. For example, you can create a filter to display all incidents whose **Caller** field references the same user record as the **Closed by** field.

**Available operators**

Field comparison provides several filter operators for comparing field values.

- **[is same]** evaluates to true if two field values are the same.
- **[is different]** evaluates to true if two field values are not the same.
- **[is less than]** evaluates to true if two date values are within a user-defined range of each other.
- **[is more than]** evaluates to true if two date values are not within a user-defined range of each other.

**Comparing choice list values**

Field comparison compares the dictionary **Value** field of a choice list, not the **Label** value. For example, a high priority incident has a priority value of 1, not 1 - High. To find the **Value** of a choice, right-click the field label and select **Configure Dictionary**. The **Choices** related list shows the **Value** for each choice.

**Comparing empty fields**

By default, most filter operations do not return empty fields in their result set. To include records with empty fields in a result set, add a filter condition for the left operand with an operator of **[is empty]**. For more information, see **Filtering on empty fields** on page 158.

**Using operators and operands**

When comparing fields, the two fields being compared are called the left operand and right operand.

The type of field selected in the left operand, and the operator selected, determine which right operands are available. When using the **[is same]** or **[is different]** operators, the right operand choices include only fields of the same field type, such as **String** or **Integer**, as the left operand.

For example, a filter on the Task [task] table with a left operand of **[Opened by]** and an operator of **[is same]**, only allows you to choose user reference fields, such as the **[Closed by]** field, in the right operand.

The **[is more than]** and **[is less than]** operators are only available with date type fields.

This example filter returns records where the user who opened the record also closed the record.

![Figure 109: Example filter](image-url)
Comparable fields

Field comparison supports the comparison of several fields. The types of fields that are comparable include the following.

- String, choice, integer, and boolean fields: return true if both values match.
- Reference fields: return true if both reference fields refer to the same record.
- Date and time fields: can match date values based on hour, day, week, month, quarter, or year. Additionally, you can evaluate whether two dates fall within a certain range of each other.

**Note:** Field comparison does not support journal, keyword, script, duration, list, or HTML fields.

Comparing dates

Field comparison allows you to evaluate equality between two components of the date, such as the hour of the day or the date within a month. Additionally, you can evaluate if two dates fall within a certain range of each other.

Date comparisons are based on the active user's time zone. For example, as a user in the PST time zone, a filter of [Created] [is same] [Day] as [Closed] evaluates true for an incident created at 6 AM PST and closed at 3:00 PM PST as both times are within the same day. However, a user in the GMT time zone would not see this same incident record in response to the example filter; in GMT those times do not fall on the same date.

Evaluate equality between date values

Date comparison evaluates a match for one of several date increments.

You can specify granularity to the hour, day, week, month, quarter, or year. For example, the filter [Created on] [is same] [Week] as [Closed] returns records that were closed in the same week that they were opened. When you run this type of filter, be sure to specify the year in an additional filter condition of [Created] [is same] [Year] as [Closed] to eliminate records that were created a year before they were closed.

![Figure 110: Date field comparison](image)

1. In the condition builder, create a new condition.
2. Select a date field from the left operand choice list.
3. Select [is same] or [is different] from the operator choice list.
   - An additional choice list appears.
4. Select the granularity from the date range choice list.

<table>
<thead>
<tr>
<th>Date Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hour</td>
<td>Filters on the hour of the day.</td>
</tr>
<tr>
<td>Day</td>
<td>Filters on the day of the month, not the date. For example, a Day value of the 1st of August matches with a Day value of the 1st of September.</td>
</tr>
<tr>
<td>Week</td>
<td>Filters on the week of the year. ServiceNow defines a week as Sunday through Saturday for the purposes of Field Comparison.</td>
</tr>
<tr>
<td>Month</td>
<td>Filters on the month of the year. For example, any date within December returns the 12th month of the year.</td>
</tr>
<tr>
<td>Quarter</td>
<td>Filters on the quarter of the year.</td>
</tr>
<tr>
<td>Year</td>
<td>Filters on the year.</td>
</tr>
</tbody>
</table>

5. Select a different date field from the right operand choice list.

6. Click Run.

Evaluating unequal dates within a range

You can compare unequal date field values by evaluating whether two dates fall within a certain range of each other.

For example, you can create a filter of [Created on] [is more than] [3] [Months] [before] Closed to display all records that were created at least three months before they were closed. The numerical value specified, such as the value 3 in the example, must be an integer of no more than two digits. If you need to evaluate a difference larger than 99 units, select a less granular unit of time, such as Months instead of Days.
Figure 111: Unequal dates field comparison

Table 63: Choice field date comparison choices

<table>
<thead>
<tr>
<th>Choice field</th>
<th>Date Comparison Choices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operator</td>
<td>is more than, is less than</td>
</tr>
<tr>
<td>Unit of time</td>
<td>Hours, Days, Weeks, Months, Quarters, Years</td>
</tr>
<tr>
<td>Relative position of dates</td>
<td>before, after, before or after</td>
</tr>
</tbody>
</table>

Add help to a field label on a form

You can create field-level help in forms by placing help icons in individual fields and converting the field labels to links to external or internal URLs.

Role required: personalize_dictionary

You can link to any type of file, document, or Wiki, and open it in a separate browser window. The following is an example of a form with field label help enabled.
Figure 112: Field label help enabled

1. Open the form.

2. Right-click the label for the field and select **Configure Label**. The Field Label form appears. The fields in the top portion of the form are pre-populated. The **Help** field is not currently used.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint</td>
<td>Type text to use as a tooltip that appears when a user places the cursor on the field label.</td>
</tr>
<tr>
<td>URL</td>
<td>Enter the URL of the target file to open when the field label or icon is clicked. This can be a complete URL to a file outside the instance, or a relative URL to a target on the instance.</td>
</tr>
<tr>
<td>URL target</td>
<td>(UI11 only) Type _blank to have the help file open in a new tab, or leave the field blank to have the help file replace the instance in the browser. In UI16 and UI15, the help file opens in a new tab regardless of the URL target value.</td>
</tr>
</tbody>
</table>

4. Click **Update**.
Context menus

Context menus in lists of records are right-click menus that provide three different levels of controls, depending on the view from which they are opened. The content and behavior of context menus can be controlled by an administrator.

Certain context menus are configured for administrative users by default. The menu options are for commonly used tables, such as Incident [incident] and Change [change_request]. Other options might appear on menus for other tables.

Menu options presented to users can be controlled with roles.

List title

You can click the title of the list to access options related to viewing and filtering the entire list.

![Context menu list title](image)

Figure 113: Context menu list title

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>Changes the view of the list by presenting different information.</td>
</tr>
<tr>
<td>Filters</td>
<td>Changes the values in the filter. Some of the choices are: <strong>None</strong>, <strong>Active</strong>, and <strong>Edit personal filters</strong>.</td>
</tr>
<tr>
<td>Group by</td>
<td>Groups records in a list by the values in a selected field from that table. Any field from the table can be used as a group filter, whether or not it appears in the list.</td>
</tr>
<tr>
<td>Show</td>
<td>Changes the number of rows shown on each page of the list.</td>
</tr>
</tbody>
</table>
List header

You can right-click in the header row of a column to display actions related to that column.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh List</td>
<td>Refreshes the list to show changes immediately.</td>
</tr>
<tr>
<td>Create Favorite</td>
<td>Adds a link to this list to your favorites.</td>
</tr>
</tbody>
</table>

Figure 114: Context menu list header
**Table 65: Context menu list header options**

<table>

<tr>
<td>Assign Tag</td>
<td>Create new tags or select existing tags to organize records under <strong>Self-ServiceMy Tagged Documents</strong>.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approve</td>
<td>Approves the request in the selected record(s). This option is only available for tables in which records are subject to approvals.</td>
</tr>
<tr>
<td>Follow on Live Feed</td>
<td>Create or join a record feed for this record.</td>
</tr>
<tr>
<td>Assign to me</td>
<td>Assigns the selected record to the current user. This option is only available for tables in which records can be assigned.</td>
</tr>
<tr>
<td>Show Live Feed</td>
<td>Open the record feed for this record.</td>
</tr>
<tr>
<td>Reject</td>
<td>Rejects the request in the selected record(s). This option is only available for tables in which records are subject to approvals.</td>
</tr>
<tr>
<td>Add to Visual Task Board</td>
<td>Lets you add the record to one of your visual task boards.</td>
</tr>
</tbody>
</table>

Create a context menu option

You can create an option for a context menu.

Role required: admin

1. Navigate to **System UI > UI Context Menus**.
2. Click **New**.
3. Complete the form.

---

**Table 67: Context menu form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table to which this context menu option is attached. The base system menu items are attached to the Global [global] table, which applies the context menu option to all lists for all tables. If you specify a particular table, the option is available only on context menus in lists from that table.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same scope as the context menu.

| Menu   | Select the menu in which this option appears.  
|--------|-----------------------------------------------|
|        | • List title menu  
|        | • List header menu  
|        | • List row menu

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Select the type of menu option to create:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Action</strong>: A menu option that performs an immediate action.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Menu</strong>: Creates a parent menu that can display a submenu.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Separator</strong>: Draws a line between groups of options on a menu. Menus do not display separator lines adjacent to one another or at the bottom of a menu. If a condition that removes options for a role forces two separators together, one of the separators is removed from the view.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label</strong>: Create an unlinked label for a menu or section of a menu.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dynamic actions</strong>: Menu options dynamically created, such as the available views or user filters that can only be generated at the time the list is displayed.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Enter the label for the action as it will appear in the menu.</td>
</tr>
<tr>
<td><strong>Parent</strong></td>
<td>If this action is part of a submenu, type the name of the parent menu item. For example, in the base system, <strong>Configure</strong> is a parent.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Assign an order number to this item, menu, or separator to specify where in the menu it appears.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Enable or disable this context menu item. Only active items are shown in the context menu.</td>
</tr>
<tr>
<td><strong>Run onShow script</strong></td>
<td>Select this check box to display the onShow script field.</td>
</tr>
<tr>
<td><strong>Condition</strong></td>
<td>Create the conditions under which this menu option appears. For example, define the role that has permission to see this item.</td>
</tr>
<tr>
<td><strong>Action script</strong></td>
<td>The action script is the code that runs in response to the menu item that is selected.</td>
</tr>
<tr>
<td><strong>Dynamic actions script</strong></td>
<td>The dynamic actions script builds the dynamic items that appear on the menu, such as filters or views.</td>
</tr>
<tr>
<td><strong>onShow script</strong></td>
<td>The onShow script contains a script that runs before the menu is displayed that determines the items to present based on previous settings.</td>
</tr>
</tbody>
</table>
```javascript
function showDatabaseView(query) {
    var url = new GlideURL('sys_db_view.do?g_list-getReferringURL()');
    url.addParam('sysparm_referring_url', query); // use the query string here
    url.addParam('sysparm_domain', 'false');
    window.location = url.getString();
}

function buildContextActions() {
    var queryGen = new GlideCollectionQueryCalculator();
    var query = queryGen.buildQueryClause('g_tableName', 'name');
    g_contextMenu.addAction('dictionary', 'showDatabaseView', query + ' '); // Query is 'query'
}
```
4. Click **Submit**.

**Action script**

The action script is the code that runs in response to the menu item being selected.

This is a client-side script that runs in the user’s browser. The following JavaScript variables are available to the Action script when it is executed.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_list</td>
<td>GlideList2 against which the script runs.</td>
</tr>
<tr>
<td>g.FieldName</td>
<td>Name of the field against which the context menu runs.</td>
</tr>
<tr>
<td>g.FieldLabel</td>
<td>Label of the field against which the context menu runs.</td>
</tr>
<tr>
<td>g.sysId</td>
<td>The sys_id of the row or form against which the script runs.</td>
</tr>
</tbody>
</table>

The base system uses the following code in an action script to refresh the platform view.

```javascript
g_list.refresh(1);
```

Another example is the use of these variables in a list header menu to sort a list by the selected field in descending order (z to a).

```javascript
g_list.sortDescending(g.FieldName);
```

**Dynamic actions script**

The dynamic actions script builds the dynamic items that appear on the menu, such as filters or views.

The following JavaScript variables are available to the dynamic actions script when it is executed.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_tableName</td>
<td>Name of the current table.</td>
</tr>
<tr>
<td>g_listId</td>
<td>ID of the list for which the context menu is built.</td>
</tr>
<tr>
<td>g_itemName</td>
<td>Name defined in the UI context menu record.</td>
</tr>
<tr>
<td>g_itemOrder</td>
<td>Order defined in the UI context menu record. Use this variable to pass the value of the <strong>Order</strong> field to the dynamic actions script.</td>
</tr>
<tr>
<td>gContextMenu.addAction(item_id, label, script_string, order)</td>
<td>Add options to the context menu and select the order in which they appear.</td>
</tr>
</tbody>
</table>
The following example displays a list title menu item that controls the number of records per page in the list view.

```
g_contextMenu.addAction('50', g_itemName, 'showRowsPerPage("50");', g_itemOrder);
```

**Note:** The action script for this item must define the `showRowsPerPage` function so that when selecting this menu item, that function is called with an argument of 50.

### onShow script

The `onShow` script contains a script that runs before the menu is displayed that determines the items to be present based on current information about the menu being displayed.

The `onShow` script is typically used to change the menu items on the list header menu based on the current field column. The following JavaScript variables are available to the `onShow` script when it is executed:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>g_menu</code></td>
<td>Context menu to be displayed.</td>
</tr>
<tr>
<td><code>g_item</code></td>
<td>Current context menu item.</td>
</tr>
<tr>
<td><code>g_list</code></td>
<td>GlideList2 against which the script runs.</td>
</tr>
<tr>
<td><code>g_fieldName</code></td>
<td>Name of the field against which the context menu runs.</td>
</tr>
<tr>
<td><code>g_fieldLabel</code></td>
<td>Label of the field against which the context menu runs.</td>
</tr>
<tr>
<td><code>g_sysId</code></td>
<td>The sys_id of the row or form against which the script runs.</td>
</tr>
</tbody>
</table>

An example of an `onShow` script is one that determines when to enable or disable the **Ungroup** option in a list header menu based on whether the list is currently grouped or not.

```
if (g_list.getGroupBy()) {
    // list is grouped so enable the Ungroup menu item
    g_menu.setEnabled(g_item);
} else {
    // list is not grouped, so disable the Ungroup menu item
    g_menu.setDisabled(g_item);
}
```

### Administer the ServiceNow Platform

The primary administrator role (admin) has access to all system features, functions, and data, regardless of security constraints. Additional administrator roles manage specific applications.

ServiceNow administrators can configure the system in many different ways to address an organization’s business needs. They can install and set up any number of the process applications that are provided with ServiceNow and also create custom applications. Applications can be made available to selected
users by way of roles and other access controls. The system may also be configured to send and receive
notifications as a way to create and track service requests.

Service administration

Configure settings for services that support business applications or the platform.

Assessments

Use assessments to evaluate, score, and rank records from any table in the system.
You can assess projects that executives want to evaluate for effective management, or rate and compare
a vendor's goods and services. Use assessments to send custom questionnaires to selected users or write
scripts that query the database directly. You can then compare assessment results for the records using
unique graphical views designed to highlight key performance information. Share an assessment between
ServiceNow instances by exporting and importing the assessment as an XML file.

The Assessments plugin is enabled by default.

Domain separation

Assessments support domain separation. All assessable records be in the same domain as the elements
required to perform the assessment. A metric type in the global domain can only assess records in the
global domain. The categories, metrics, and users associated with that type must all be in the same
domain. To assess records in a different domain, the type, categories, and metrics must be created in that
domain.

Installed with Assessments

Several types of components are installed with Assessments.
Demo data is available for assessments and surveys. Vendor Performance offers an additional set of
vendor assessment demo data.

Tables installed with assessments

Tables

Assessments adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description: Assessments</th>
<th>Description: Surveys</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable Record [asmt_assessable_record]</td>
<td>Stores all assessable records.</td>
<td>For system use only.</td>
</tr>
<tr>
<td>Assessment Category Result</td>
<td>Stores all category results.</td>
<td>For system use only.</td>
</tr>
<tr>
<td>[asmt_category_result]</td>
<td></td>
<td></td>

**Client scripts installed with assessments**

**Client scripts**

Assessments adds the following client scripts.

Table 75: Client scripts for assessments

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calculate Assessable Record Field choice list</td>
<td>Trigger Condition [asmt_condition]</td>
<td>Limits the Assessable Record Field choices to those that are compatible with the selected assessment.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check survey schedule period</td>
<td>Trigger Condition [asmt_condition]</td>
<td>Checks the selected survey definition's Schedule period. If Schedule period is set to Only Once, this client script displays a warning message that each user can only take the selected survey once.</td>
</tr>
<tr>
<td>Clear display_when when depends changed</td>
<td>Assessment Metric [asmt_metric]</td>
<td>Shows the Display when field when the Depends on field is set. Clears the Display when field when the Depends on field changes and the options need to change.</td>
</tr>
<tr>
<td>Conditionally Set Type for Surveys</td>
<td>Group [sys_user_group]</td>
<td>Sets the user group Type to survey if you create a new group from the User Groups module.</td>
</tr>
<tr>
<td>Data type -- Hide choices for surveys</td>
<td>Assessment Metric [asmt_metric]</td>
<td>Ensures only Data type options that are valid for surveys are available on the Survey Question form.</td>
</tr>
<tr>
<td>Data type -- Show/Hide Not Applicable</td>
<td>Assessment Metric [asmt_metric]</td>
<td>Hides the Allow not applicable field and sets its value to false if the metric method is Assessment and the data type is Percentage, Checkbox, Date, Date/Time, Number, or String.</td>
</tr>
<tr>
<td>Datatype defaults to String for surveys</td>
<td>Assessment Metric [asmt_metric]</td>
<td>Sets the default Data type field value to String on the Survey Question form.</td>
</tr>
<tr>
<td>Fetch Min/Max</td>
<td>Assessment Metric [asmt_metric]</td>
<td>Updates the Min and Max fields to match the least and greatest metric template definition values if an assessment administrator selects or changes the Template value.</td>
</tr>
<tr>
<td>Hide Assessable Record Field</td>
<td>Trigger Condition [asmt_condition]</td>
<td>Hides the Assessable Record field unless the evaluation method of the metric type selected in the Assessment field is Assessment.</td>
</tr>
<tr>
<td>Hide assessment if empty</td>
<td>Survey [survey_master]</td>
<td>Hides the Assessment field on the Survey form unless it contains a value. The system populates the Assessment field when you migrate a survey.</td>
</tr>
<tr>
<td>Hide Survey Instance Trigger ID if Empty</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
<td>Hides the Trigger ID field and makes it read-only unless it contains a value.</td>

</table>
| Create Scheduled Job                         | Assessment Metric Type                     | **Create Scheduled Job**

**Description:**

Assessments: Generates a scheduled job for the creation of assessment components if either of these conditions is met:

- Someone creates a new metric type with the schedule type set to Scheduled.
- The schedule type changes from On demand to Scheduled.

Surveys: Generates a scheduled job for the creation of survey components if the schedule period for a survey definition is set to Daily, Weekly, Monthly, or Yearly.

**Create Survey Records**

**Description:**

Generates various records and populates certain fields on those records when someone creates a new survey definition, which is a metric type with Evaluation method set to Survey. More specifically, this business rule generates a survey category and assessable record, both associated to the survey definition.

**Create UI Action on Remote table**

**Description:**

Reserved for future use.

**decision_matrix_axis**

**Description:**

Limits available categories for X- and Y-axes to those that belong to the type if there is a metric type specified on the Decision Matrix form.

**Delete Live Feed Group**

**Description:**

Deletes the assessable record's live feed group, if there is one, when an assessment administrator deletes an assessable record.

**delete related users**

**Description:**

Deletes any stakeholders for the assessable record and category when an assessment administrator disassociates a category from an assessable record.
<table>

</table>

**Administrator tasks**

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization’s options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.

*Assessment roles*

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.
### Role Title | Role Name | Description
--- | --- | ---
Assessment administrator | assessment_admin | Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to.

#### Note: By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.

ITIL user | itil | ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.

Administrator | admin | Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.

---

**Assessments: important terms**
Assessment admins use several terms when working with assessments.
### Assessment terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A <em>metric type</em> defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An <em>assessable record</em> links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A <em>metric category</em> represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Metric</td>
<td>A <em>metric</em> is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A <em>category user</em> is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A <em>stakeholder</em> is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
</tbody>
</table>
| Assessment instance   | An *assessment instance* represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:  
  - The assessment generation scheduled job runs.  
  - An assessment administrator creates an on-demand assessment. |
<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scorecard</td>
<td>A scorecard provides a visual illustration of an assessable record's performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>A decision matrix is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrixes to determine the relative standing of assessable records in selected categories.</td>
</tr>
<tr>
<td>Bubble chart</td>
<td>A bubble chart is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category.</td>
</tr>
</tbody>
</table>

**Assessment methods**

The available methods are **Assessment**, for non-scripted metrics, and **Script**, for scripted metrics. Each method serves a different function and can be used with certain data types.

Use the **Method** field to specify how to use the metric.

**Assessment method**

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these Data type values:

- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

**Script method**

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these Data type values:
Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:

You must use the following variables in your script:

- **primary**: Input variable used to access the sys_id of the record being assessed.
- **actual_result**: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each `actual_result`, you must specify a corresponding `scaled_result` value.
- **scaled_result**: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the Scaled value field on the Metric Result form. Ensure the scaled values you specify are between or equal to the Min and Max values for the metric. The Scale definition field determines how the system uses the scaled value. A scale definition of **Low** means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. **High** means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

**Script example**

The metric Number of active devices uses the script pictured below. The `primary` variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the `actual_result`, the number of CIs associated to the vendor, then calculates the correct `scaled_result`. The script uses a series of scaled values, from the **Min** to the **Max** value, to represent actual values. Because the Scale definition is set to **High**, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.

**Assessment generation**

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- **Assessment group**
- **Assessment instances**
- **Assessment results**

**Assessment groups**

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.

The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in **Assessments > Assessments > Assessment Groups**.

The Assessment Group form displays the group **Number**, the associated **Metric type**, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
• **Metric Results**: Lists all *metric results* for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.

• **Assessment Category Results**: Lists all *category results* for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

**Note**: To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

*Create an assessment category*

Assessment categories are used in conjunction with assessment metric types and assessment metrics to generate bubble charts.

Role required: assessment_admin or admin

The Demand Management application comes with the Demand assessment metric type, five assessment metric categories, and a number of assessment metrics. From the Assessment Categories section of the application menu, you can modify existing assessment categories and create new ones.

1. Navigate to Demand > Settings > Assessments.
2. Click Create New to create a new record.

<table>

</tbody>
</table>

*Assessment metric categories*

In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called *metrics* are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

*Weight categories and metrics*
When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- **Determine a weighting scale and use it consistently.** In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.

- **Use the same weighting scale for metric categories and metrics.** Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

**Note:** If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records

After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Role required: none

1. Navigate to Assesments > Metric Definition > Categories.
2. Click New to create a new metric category.
3. Complete the Metric Category form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Type</td>
<td>[Required] Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.</td>
</tr>
<tr>
<td>Create stakeholders</td>
<td>Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>[Read-Only] Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a <strong>Type</strong> is selected.</td>
</tr>
<tr>
<td>Weight</td>
<td>[Required] Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see <a href="#">Weight categories and metrics</a>. The default value is 10.</td>
</tr>
</tbody>
</table>
| Scoring type | Scoring method for an attestation category. This field appears only when the **metric type** is an attestation with a **Scoring type** of **Percent**. Use this field to configure different scoring types for specific attestation categories. Possible selections are:  
  - **Percent**: Attestation score as a weighted percentage of correct answers for scored questions.  
  - **All or nothing**: All answers for attestation type questions must be correct or the score is zero for the entire category. |
<p>| Total metrics| [Read-Only] Number of metrics associated to this category. |</p>
<table>

<tr>
<td>Users</td>
<td>All users associated to this category. There must be at least one category user to create scheduled assessments using metrics in this category. This related list is available only when the associated metric type has schedule type set to <strong>Scheduled</strong>. Category users are not a part of the <strong>on-demand assessment</strong> process.</td>
</tr>
</tbody>
</table>

Assessable record associations

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Note: You can also manage which categories an assessable record is associated to using the **Assessable Record** form.

Manage an assessable record automatically

You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Metric Definition > Categories**.
2. Open a category.
3. In the **Filter** field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type.

   For example, for a category in the **Vendor** type, you might create the condition **[Country] [is] [Germany]**. Metrics in the category will be used only to evaluate vendors that meet this condition.
4. Save the record.

   The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter condition, the system removes and creates assessable record associations, as appropriate. Note the following:
   - The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
   - The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
   - The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the **Country** of one of the vendor records from **Germany** to **Canada**. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

   Note: To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example,
if the Vendor metric type has the condition [Vendor] [is] [true], create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition [Sys ID] [is not empty], which includes all records from any table.

Manage an assessable record manually
You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Role required: assessment_admin or admin
Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Assessable records related list, click Edit and use the slushbucket to add or remove one or more assessable records.

Only assessable records associated to this category’s metric type are available for selection.

Delete a category
When you delete a category, the system also deletes the associated category users and stakeholders.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Categories.
2. Alternatively, navigate to a record that contains a related list for categories.
3. Open a record from the list.
4. On the Metric Category form, click Delete.
5. Click OK when asked to confirm the action.

The system displays messages at the top of the form describing the actions taken.

Assessment metrics
In the Assessments application, a metric is a trait or value used to evaluate assessable records.

Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one metric category and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors’ customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and metric templates, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

Note: Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid
changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

Create a metric for a category

After you create a category, create metrics you can use to evaluate the assessable records for that category.

Role required: assessment_admin or admin

When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess. If you plan to use metrics for assessment questionnaires, you may want to review tips for writing good questions.

1. Navigate in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessments &gt; Metric Definition &gt; Categories</td>
<td>Open a category, and locate the Assessment Metrics related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
<tr>
<td>Assessments &gt; Metric Definition &gt; Metrics</td>
<td></td>
</tr>
</tbody>
</table>

2. Click New.

3. Fill in the fields, as appropriate.

Table 80: Assessment Metric form

<table>
<thead>
<tr>

<tr>
<td>Dependent plugin</td>
<td>Plugin that contains the tables queried in the script. The system executes the metric script only if the plugin is active. The default available values are <strong>Asset Management</strong>, <strong>CMDB</strong>, <strong>Core</strong>, <strong>Cost Management</strong>, <strong>Procurement</strong>, and <strong>Software Asset Management</strong>. You must select a plugin if the Method is <strong>Script</strong>. This field is visible only if the Method is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Note:</td>
<td>An administrator may need to add more <em>choices</em> of plugins to the field.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select <strong>Low</strong> if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select <strong>High</strong> if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is <strong>High</strong>. This field is visible and required unless the Data type is <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>. The results for these data types are not included in results calculations. Note: For information about how to set the scale definition for data types that do not require you to set a numerical value, see <strong>Data Types</strong>.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric. This field is visible and required only if certain data types are selected. If the data type is <strong>Choice</strong> or <strong>Likert Scale</strong>, this field is read-only and is set automatically based on the smallest metric definition Value.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max</td>
<td>Highest numerical value to be used as an answer option or scaled value. This field is visible and required only if certain data types are selected. If the data type is <strong>Choice</strong> or <strong>Likert Scale</strong>, this field is read-only and is set automatically based on the largest metric definition Value.</td>
</tr>
</tbody>
</table>

| Script    | Script that obtains the desired system information. This field is visible and required only if the Method is **Script**.                                                                                                                                                                           |

| Related List | Lists all metric definitions, which appear as answer options for questions on assessment questionnaires. Click **New** to create a new metric definition. This related list is available only if the Data type is **Choice** or **Likert Scale**. |

4. **Save the record.**

When you create a **Choice** or **Likert Scale** question, you must reopen the Assessment Metric form after you submit it to *Create a metric definition*. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.

**Create a metric definition**

Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

**Role required:** assessment_admin or admin

Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: **Very satisfied**, **Somewhat satisfied**, and **Not at all satisfied**.

1. Open the metric record you want to edit.
2. In the **Assessment Metric Definitions** related list, click **New** to create a new metric definition.
3. Fill in the fields:
   - **Display**: Enter the text you want to appear as the answer option.
   - **Value**: Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.
4. Click **Submit**.
Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of **Choice** or **Likert Scale**.

Role required: assessment_admin or admin

The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the Value setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the Order field and not the Value field.

The Order column is hidden in the base system.

To edit these records, configure the Assessment Metric Definitions related list in the question record to show the Order column, and then edit the order number in the list. The Value setting remain the same for each answer option after reorganization.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Administrator tasks on page 312.

Create metric types and generate assessable records

Each metric type sets a table and filter conditions that define a set of records to evaluate.

Role required: assessment_admin or admin

For example, the Vendor Performance application provides the Vendor metric type, which defines an assessable record for each source record in the Company table that has the Vendor field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

1. Navigate to Assessments > Metric Definition > Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click **Generate Assessable Records** to save the record and create assessable records. The page redirects to the list of assessable records created.

You must click **Generate Assessable Records** to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. **Generate Assessable Records** is located under Related Links.

Note: Clicking **Generate Assessable Records** can trigger the deletion of existing assessable records under certain circumstances. For more information, see *Enforce a condition to delete an assessable record* on page 350.

### Table 81: Metric types

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the type. It may be practical to give the type a name that indicates which records it defines.</td>
</tr>
<tr>
<td>Assessment duration</td>
<td>Amount of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated. The assessment duration sets the <strong>Due date</strong> that appears on assessment instances. Changes made to the duration of an attestation in the GRC Control Test Definition form are updated dynamically in this field. The default duration is 14 days.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that determines whether to enable (selected) or disable (cleared) the Live Feed view in scorecards for all assessable records created from this type.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box that determines whether to send (selected) email notifications a user’s manager when that user fails to submit an assigned questionnaire on time.</td>
</tr>
<tr>
<td>Assessment manager</td>
<td>Manager for this assessment metric type. These users are responsible only for managing the assessment process and not the results. The system notifies the assessment manager when an assessment for this metric type is past due.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Scoring type</td>
<td>Scoring method to use for questions with a data type of attestation. The possible selections are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Percent</strong>: Attestation score as a weighted percentage of correct answers for scored questions. When you select this scoring type, categories can be scored as <strong>Percent</strong> or <strong>All or nothing</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>All or nothing</strong>: Requires all answers for attestation type questions to be correct, or the score is zero for the entire attestation. When you select this scoring type, all categories are scored automatically as <strong>All or nothing</strong>.</td>
</tr>
<tr>
<td>Scale factor</td>
<td>[Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor.</td>
</tr>
</tbody>
</table>

**Note**: This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor you are satisfied with before you save the metric type.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roles</td>
<td>Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record as well as to associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrices. <strong>Note:</strong> Users with these roles do not have access to Assessments modules unless they are also assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to easily grant certain users access to specific assessment data in special cases. For example, the <strong>Vendor</strong> metric type provides access to users with the vendor_manager role so they can view results and compare assessable records when they open scorecards or decision matrices in the Vendor Performance application.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to an assessment. For more information, see Create an assessment signature on page 347.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit an assessment for this metric type. When a return URL is configured, the end note content does not appear.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-Only] Status of the assessment: Draft or Published.</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the specified table. When a new record is added to the table that meets the metric type conditions, the business rule generates a corresponding assessable record. If someone changes the metric type’s table or conditions, the system updates the business rule to reflect the changes. Existing assessable records associated with the metric type are not affected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Schedule type</td>
<td>Setting that determines which assessment process to use. Select <strong>On demand</strong> or <strong>Scheduled</strong>.</td>
</tr>
<tr>
<td>Scheduled job</td>
<td>[Admin only] Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format <code>&lt;type name&gt;-Assessment Creation</code>. Administrators can configure a recurring assessment generation schedule for the metric type. This field is visible only when the schedule type is <strong>Scheduled</strong>. <strong>Note:</strong> If you change the schedule type from <strong>Scheduled</strong> to <strong>On demand</strong>, the system deletes the scheduled job. If you change the schedule type back to <strong>Scheduled</strong>, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired.</td>
</tr>
</tbody>
</table>
| Evaluation method  | [Admin only] Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are:  
  • **Assessment**: Default filter value for metric types. Only this evaluation method uses **assessable records**, conditions, and **stakeholders**.  
  • **Attestation**: For details, see **Attestations**.  
  • **Survey**: For details, see **Survey definitions** on page 576.                                                                                                                                                                                                                                                                                                                   |

</table>

Related Lists

<table>
<thead>
<tr>
<th>Metric Categories</th>
<th>All metric categories associated with the type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable Records</td>
<td>All assessable records associated with the type. This related list is hidden in the Attestation view of this form.</td>
</tr>
</tbody>
</table>

**Note:** The Generate Assessments button is visible to administrators in certain cases for scheduled assessments. Do not click the button until after completing the prerequisite tasks.

Delete a metric type

Deleting a metric type entails deleting many related records.

Role required: assessment_admin or admin

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

1. Delete the records associated with the type to delete:
   - Assessment results (metric and category results)
   - Assessment instance (questions and assessment instances, in that order)
   - Assessment groups

2. Delete the type.
   A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. Click OK to delete the type and these related records:
   - Scheduled job for assessment generation
   - Business rule for assessable record generation
   - Assessable records
   - Metric categories
   - Category users
Export an assessment
You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.
Role required: assessment_admin or admin

Note: The system exports a single XML file that does not contain result data.

The XML file contains a metric type [asmt_metric_type] and the following records that are associated with the type:
• Assessable records [asmt_assessable_record]
• Metric categories [asmt_metric_category]
• Metrics [asmt_metric]
• Metric definitions [asmt_metric_definition]
• Category users [asmt_m2m_category_user]
• Stakeholders [asmt_m2m_stakeholder]
• Decision matrixes [asmt_decision_matrix], [asmt_m2m_xcategory_matrix], and [asmt_m2m_ycategory_matrix]

1. Navigate to Assessments > Metric Definition > Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Import an assessment
Share assessments between ServiceNow instances by importing a previously exported assessment.
Role required: admin
1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in Import a Record as XML Data.

Create an assessment signature
A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.
Role required: assessment_admin or admin

You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called Require authentication for user signature allows you to require users to provide their user name and password when an assessment asks for a full name signature.

1. Navigate to Assessments > Metric Definition > Signatures.
   All signatures in the system appear in this list.
2. Click New.
3. Complete and submit the form using the fields in the table.
### Table 82: Assessment signature fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are <strong>Checkbox</strong>, <strong>Full name</strong>, or <strong>Assertion only</strong>. If <strong>Assertion only</strong> is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can [generate on-demand assessments](#) from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open a record from the list.
   By default, the list displays only assessable records with **Active** metric types.
3. On the **Assessable Record** form, edit fields and perform other actions as necessary (see table).

### Table 83: Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Read-Only] Assessable record name based on the <strong>display value</strong> of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click <strong>Edit</strong> to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see <a href="#">Stakeholders</a>. This related list is available only when the associated metric type has the <strong>Scheduled</strong> schedule type.</td>
</tr>
</tbody>
</table>

**Enforce a condition to delete an assessable record**

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Role required: assessment_admin or admin

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

1. On the Assessment Metric Type form, select the **Enforce condition** check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click **Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.

   The system does not automatically delete assessable records, even if the **Enforce condition** check box is selected. You must click **Generate Assessable Records** with the check box selected every time you want the system to delete non-matching assessable records.

**Delete an assessable record**

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

**Note:** If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.

**Create a metric template**

Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Metric Definition > Templates**.
2. Click **New**.
3. Fill in the **Name** field on the **Assessment Metric Template** form and save the record.
4. Under the **Assessment Template Definitions** related list, click **New**.
   
   Create a template definition for each answer option you want to appear on an assessment question.
5. Fill in the following fields:
   - **Display**: Enter the text to appear as the answer option.
   - **Value**: Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.

   When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

   **Tip**: To prevent reporting confusion, no two template definitions for a given template should have the same Value.

6. Click **Update**.

**Metric templates**

Metric templates define reusable rating scales for evaluating non-scripted metrics. Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

Metric templates are available for metrics that have Template as the Data type. The following metric templates are available by default.

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
</tbody>
</table>

**Update a metric minimum and maximum value to match a template**

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

**Role required**: assessment_admin or admin

The system sets the **Min** and **Max** fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.
To edit the minimum and maximum values for a question that has the Template data type:

1. Navigate to Assessments > Metric Definition > Metrics.
2. Configure the list to show the Min and Max columns.
3. Run the following list filter condition: [Template] [is] [<select the template you updated>]
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.
   
   If the values do not match, edit the Min and Max directly from the list.

Note: When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Category users and stakeholders

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

Note: Category users and stakeholders are used only for scheduled assessments.

Category users

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.

Stakeholders

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- Configure the system to create stakeholders automatically.
- Associate multiple category users to multiple assessable records.
- Associate multiple category users to one assessable record.
- Associate one category user to one assessable record.

Note: Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

Create a category user

Create category users by associating users in the system to metric categories.

Role required: assessment_admin or admin
When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor's discount practices.

1. Navigate to **Assessments > Metric Definitions > Categories**.
2. Open a category record.

   **Note:** The category must be associated to a metric type that has the **Schedule type** set to **Scheduled**.

3. In the **Users** related list, click **Edit**.
4. Select the appropriate users for this category.

Create stakeholders automatically
You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the **Create stakeholders** check box on the Metric Category form.

Role required: assessment_admin or admin

If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

   **Note:** Use the **Create stakeholders** check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.

1. Navigate to **Assessments > Metric Definition > Categories**.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the **Create stakeholders** check box.
5. Click **Update**.
   All the category users are associated to all the assessable records as stakeholders.
6. In the **Assessable Records** related list, click **Edit**.
7. Using the slushbucket, associate an assessable record to the category.

8. Click **Save**.
The system makes all category users stakeholders for the new assessable record.

9. Delete stakeholders as needed.

Associate multiple category users to multiple assessable records
The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.
Role required: assessment_admin or admin
You can select category users from one category at a time.

Note: You cannot edit or delete stakeholders using the list helper.

1. Navigate to Assessments > Advanced > Create Stakeholders.
The stakeholder list helper appears.
2. Select a metric type from the list of available types.
   
   **Note:** Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.
   
   **Note:** Only categories within the selected metric type are available.

   The system populates the **Category User** and **Assessable Records** lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the **Category Users** list.

5. Select one or more assessable records from the **Assessable Records** list.

6. Click the **Associate** arrow between the lists to complete the association.
   A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records
You can delete stakeholders for multiple assessable records.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Advanced > Assessment Stakeholders**.

2. Sort the list by **Assessable Record** or **Category User** depending on the perspective you want.

3. Select the check box for each stakeholder you want to delete.

4. Select **Delete** in the **Actions** choice list.

5. Click **OK** to confirm the action.
   The system deletes the stakeholders.
Associate one category user to one assessable record
You can create a single stakeholder using the list in the Assessment Stakeholders module.

Role required: assessment_admin or admin

Associate any category user to any assessable record.

1. Navigate to **Assessments > Advanced > Assessment Stakeholders.**
2. Click **New.** On the Assessment Stakeholders form, fill in these fields:
   - **Category user:** Select a category user.
   - **Assessable record:** Select an assessable record.
3. Click **Submit.**
   The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

   ![Assessment Stakeholders](image)

   **Note:** Do not create stakeholders from category users and assessable records of different metric types.

Associate multiple category users to one assessable record
You can create many stakeholders for a single assessable record from the Assessable Record form.

Role required: assessment_admin or admin

You can also edit or delete stakeholders from the form.

1. Navigate to **Assessments > Assessable Records.**
2. Open a record from the list.
3. In the **Category users** related list, click **Edit.**
   These category users are the stakeholders for this assessable record.
4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders.

The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

Delete a stakeholder for one assessable record
You can delete stakeholders for one assessable record.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open an assessable record.
3. In the **Category Users** related list, select the check box for each stakeholder you want to delete.
4. Select **Delete** in the **Actions** choice list.
5. Click **OK** to confirm the action.
The system deletes the stakeholders.

*Generate an on-demand assessment*
Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Role required: assessment_admin or admin

Select the **assessable records** to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured **stakeholders** are not used for on-demand assessments.

1. Create a **metric type** and set the **Schedule type** to **On demand** to allow for testing of your assessment configuration.
2. Generate the **assessable records** for the metric type you created.
3. Create the **metric categories** required to evaluate the assessable records selected.
4. Create one or more assessment questions, or **metrics**, for each category.
5. **Publish the assessment.**
6. Perform an **on-demand assessment** to test your categories and metrics.
7. Analyze the assessment ratings in an **assessment scorecard** or **decision matrix**.

On-demand assessments

On-demand assessments can be generated for metric types with the Schedule type field set to **On demand**.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or **multiple assessable records**.

Generate an on-demand assessment for one assessable record

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open an assessable record associated to a metric type that has the **On demand** schedule type.
3. On the Assessable Record form, click **Assign Assessment**.
The Select Assessor dialog box appears.

4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an on-demand assessment for multiple assessable records

When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Role required: assessment_admin or admin

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type that has the On demand schedule type.
3. On the Assessment Metric Type form, click Assign Assessment.

The Select Assessor dialog box appears.

4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

Generate an assessment with the on-demand API

The Assign Assessment buttons call an API to generate on-demand assessments.

Role required: assessment_admin or admin

1. To generate an assessment, call the AssessmentCreation API from any script in the system, such as a business rule or client script.
2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.
Schedule an assessment
After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Role required: assessment_admin or admin
1. Open the metric type you created for the on-demand assessment and set the Schedule type to Scheduled.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually. This procedure must be done by a system administrator.
6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Schedule types
You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Set an assessment generation schedule
You can set assessment generation schedules. You must set a schedule for each metric type individually.

Role required: assessment_admin or admin
1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click the reference icon next to the Scheduled job field to open the Schedule Item record.
4. Locate the Trigger type field and set a recurring schedule for the scheduled job.

For example, if you want to generate assessment components each month, select the Interval or Repeat trigger type and specify a Repeat value of 30 days. Alternatively, select Day in Month and specify a Run time and Run day of month.

The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type
Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Role required: assessment_admin or admin

The State field on the Assessment Metric Type form indicates whether the type is published. The default state is Draft, which disables the system from generating assessments.

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type record, and click Publish.
The **Publish** button is available only if the state is **Draft** and there is at least one metric associated with the type.

**Note:** A metric type cannot be moved back to the **Draft** state after it has been published.

Scheduled assessments

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**.

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**. Each scheduled job generates assessment components for the related metric type. By default, the scheduled job runs when an administrator executes it manually, but administrators can set a schedule to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and **published**. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- **Assessable record**
- **Stakeholder** associated to one of the assessable records
- **Metric**

Generate a scheduled assessment manually

Administrators can generate scheduled assessments manually.

Role required: assessment_admin or admin

Use this option, for example, if you have set a schedule but want to generate assessments before the next scheduled run date.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open the appropriate metric type record.
3. Click **Generate Assessments** to trigger the scheduled job immediately.

**Note:** Be careful to click **Generate Assessments**, not **Generate Assessable Records**.

Generate a vendor type assessment manually

The Vendor Performance feature provides a direct method of generating assessments for the Vendor metric type.

Role required: admin

1. Navigate to **Vendor Performance > Admin > Generate Assessments**.
2. Click **Generate Assessments** to execute the scheduled job for the **Vendor** type.

Clean up assessment data

The assessment process generates a considerable amount of data, some of which is not useful after a short time.

Role required: assessment_admin or admin

The assessment process generates a considerable amount of data, some of which is not useful after a short time. Assessments include a scheduled job called Remove Old Assessment Data that is available to administrators only. The scheduled job removes these items if they are more than a year old:

- Assessment instance questions
- Assessment instances
• Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

1. Navigate to **System Scheduler > Scheduled Jobs > Scheduled Jobs**.
2. Open the **Remove Old Assessment Data** record.
3. On the Schedule Item form, set the **Trigger type** field to run the scheduled job on a recurring schedule.
   
   It is recommended to set the scheduled job to run on a weekly or monthly basis.
4. Optional: Click **Execute Now** to run the scheduled job.

**Assessment instances**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in *Scheduled assessments* and *On-demand assessments*, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

Example:

Recall that there can be multiple stakeholder records associated with one user record. Minh Leclare is a stakeholder for these items related to the **Vendor** metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance. Minh must evaluate Amazon, Acme, and Cisco by answering questions from the categories for which she is a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh’s questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment *for a specific assessable record*, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment *for a metric type*, the assessment instance contains questions about all that metric type’s assessable records and their associated categories.

**View an assessment instance**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

Role required: none

1. Navigate to **Assessments > Assessments > Assessment Instances**.
2. Click an assessment instance number to open the record.
3. View the record, which displays the following information.
Table 86: Assessment Instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type Assessment duration field. The system generates email notifications related to the due date.</td>
</tr>
<tr>
<td>State</td>
<td>State of the assessment. The possible states are Ready to take, In progress, Complete, and Canceled.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
<tr>
<td>Signature result</td>
<td>Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User [sys_user] table or checked, indicating that the recipient acknowledged reading the assertion by selecting a check box.</td>
</tr>
</tbody>
</table>

4. Click **Take assessment** to **open the questionnaire**.

This button is available if all the following conditions are true for the assessment instance:

- It is **Assigned to** you.
- The **State** is **Ready to take** or **In progress**.
- The associated metric type is active.

*Configure trigger conditions for an assessment*

Trigger conditions specify when to send a particular assessment and who to send the assessment to.
Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Trigger Conditions**.
2. Complete the fields as described in the table:

**Table 87: Trigger Condition form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>[Required] Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the <strong>On demand</strong> schedule type.</td>
</tr>
<tr>
<td>Table</td>
<td>[Required] Table to run the trigger condition on. You can select only tables in the current application scope. The table must have a connection to the assessable records for the selected <strong>Assessment</strong>. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the Incident [incident] table. After you select a table, ensure there is at least one option for the <strong>Assessable Record Field</strong>. If there is not, select a different table.</td>
</tr>
<tr>
<td>User field</td>
<td>[Required] Field that stores the users you want to send the assessment. You can select any field, on the selected <strong>Table</strong> or on a related table, that references the User [sys_user] table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the <strong>Probability (%)</strong> field.</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the <strong>Trigger randomly</strong> check box is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Assessable Record Field</strong></td>
<td>[Required] Field on the selected <strong>Table</strong> that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected <strong>Table</strong> are available to select. If there are no <strong>Assessable Record Field</strong> options available, you must select a different <strong>Table</strong>. If the selected <strong>Assessment</strong> evaluates records on the Company [core_company] table and the selected <strong>Table</strong> is Incident, the only <strong>Assessable Record Field</strong> options are fields on the Incident table that reference the Company table. For example, <strong>Company</strong> or, if vendor ticketing is enabled, <strong>Vendor</strong>. If you select <strong>Vendor</strong>, the trigger condition sends an assessment about the <strong>Vendor</strong> for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record. <strong>Note:</strong> This field is not available if the selected <strong>Assessment</strong> is a metric type used for surveys. See <strong>Survey trigger conditions</strong> on page 596.</td>
</tr>
<tr>
<td><strong>Related Field 1 – Related Field 4</strong></td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected <strong>Table</strong>. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select <strong>Caller</strong> and <strong>Vendor</strong> as related fields. That stores the caller and vendor associated with the incident as <strong>Related record 1</strong> and <strong>Related record 2</strong> in the assessment instance record. To view these fields, configure the Assessment Instance form.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Summary information to identify the trigger condition.</td>
</tr>
</tbody>
</table>
Assessment trigger conditions

A trigger condition tells the system who to send a designated assessment to and when, based on specific conditions.

With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

Table 88: Trigger condition configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>[Required] Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>

Trigger condition example

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto’s issue and sets the Vendor field to Microsoft. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- **Related record 1**: User: Modesto Scroggie
- **Related record 2**: Company: Microsoft
**Note:** Even though the trigger condition is set to be triggered every time the conditions are met, the **Repeat Interval** setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.

**Enable manager notifications**

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

**Role required:** assessment_admin or admin

This notification sends emails to assessors’ managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open a metric type.
3. Select the **Notify if overdue** check box.

To disable manager notifications, clear the check box.

4. Save the record.

**Note:** The assessor’s user record must have a manager specified in the **Manager** field to use this notification. You might need to configure the form to use this field.

**Assessment notifications**

In the Assessments application, you can configure the instance to send email notifications to remind assessors and their managers of assessment questionnaires that must be completed. An assessment workflow triggers the notifications. Users with the required roles, as detailed in each section, can administer different aspects of the notification system.

**Note:** Ensure that your system is configured to send and receive email notifications.

**Included Email Notifications**

The Assessments application includes some predefined email notifications. Administrators can view and customize the provided email notifications or create new ones.

1. Navigate to **System Policy > Email > Notifications**.
2. Locate the following email notifications, all of which run on the Assessment Instance [asmt_assessment_instance] table, and edit them as needed. For more information about editing or creating email notifications, see **Create an email notification** on page 2756.
### Table 89: Email notifications

<table>
<thead>
<tr>
<th>Email notification name</th>
<th>Purpose</th>
<th>Email subject</th>
<th>Email message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify assessment user</td>
<td>Notifies assessors when they are assigned assessment instances. The notification includes the metric type, the due date from the <strong>Due date</strong> field on the Assessment Instance form, basic instructions, and a link to the assessment instance.</td>
<td>Assessment notification: New assessment on <code>&lt;metric type name&gt;</code> - due by <code>&lt;assessment instance due date&gt;</code>&lt;br&gt;Example: Assessment notification: New assessment on Vendor - due by 2013-07-30</td>
<td>You have been designated as an assessment participant on <code>&lt;metric type name&gt;</code> due to your role in the organization and subject matter knowledge. As required by management, please follow the link below and complete the assessment by <code>&lt;assessment instance due date&gt;</code>. You can save your responses until you are ready to submit them. When you are satisfied with your responses, submit the assessment.&lt;br&gt;Click here to take your assessment: <code>&lt;Assessment instance number hyperlink&gt;</code>&lt;br&gt;To view your assessment queue at any time, sign in and navigate to <code>&lt;correct navigation path based on version&gt;</code>.</td>

</tbody>
</table>

Assessment reminder: Assessment on Vendor - due by 2013-07-30

Example: Assessment reminder: Assessment on Vendor - due by 2013-07-30
<table>
<thead>
<tr>
<th>Email notification name</th>
<th>Purpose</th>
<th>Email subject</th>
<th>Email message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify manager</td>
<td>Notifies assessors' managers when assessors do not complete their assigned assessment instances by the due date. The notification includes the assessor's name from the Assigned to field on the assessment instance, the metric type, the due date, and a link to the assessment instance. Managers must have the assessment_admin role to view the assessment instance. An assessment administrator must enable this notification separately for each metric type.</td>
<td>Assessment notification: &lt;Assigned user name&gt;'s assessment on &lt;metric type name&gt; is overdue.</td>
<td>&lt;Assigned user name&gt; has not completed an assessment on &lt;metric type name&gt; by the due date: &lt;assessment instance due date&gt;. You are being notified because you are specified as &lt;assigned user name&gt;'s manager. Please contact &lt;assigned user name&gt; and take appropriate action. It is important that users complete assessments, as the data is critical to our business process decisions. Click here to view the overdue assessment: &lt;Assessment instance number hyperlink&gt;</td>
</tr>
</tbody>
</table>

Assessment notification workflow

The system sends assessment notifications according to the Notify assessment user workflow. Users with the workflow_admin, workflow_creator, or workflow_publisher roles can view workflows.

1. To open the graphical workflow editor, navigate to Workflow > Workflow Editor.
2. In the activity menu, click the link to choose an existing workflow.

![Figure 119: Workflow Window](image)

3. Select Notify assessment user from the Workflow Versions list.

The workflow appears.
Figure 120: Notify Assessment User Workflow

View a metric result
Metric results contain values that represent an evaluated record's performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Role required: assessment_admin or admin

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user's responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

1. Navigate to **Assessments > Results > Metric Results**.
2. Click the reference icon ( ) to open the metric result record.
3. View the Metric Result form.
   All fields on the form except **Updated** and **String value** are read-only.

### Table 90: Metric Result form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result is associated.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric to which these metric result values apply.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the metric.</td>
</tr>
<tr>
<td>Method</td>
<td>Method of the metric.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Source record of the assessable record evaluated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the assessment questionnaire. This field is blank when the method is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Instance</td>
<td>Assessment instance completed by the Assigned to user. This field is blank when the method is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Actual value</td>
<td>Unscaled value from a user response or script, depending on the method:&lt;br&gt;  • Assessment: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:&lt;br&gt;   • Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.&lt;br&gt;   • Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.&lt;br&gt;   • Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.&lt;br&gt;   • Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.&lt;br&gt;   • Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.&lt;br&gt;  • Script: Value the script placed in the actual_result variable.&lt;br&gt;  This field is hidden and left blank when the data type is Duration.</td>
</tr>
<tr>
<td>Duration value</td>
<td>Specific kind of actual value that is only applicable if the data type is Duration. The duration value is the value obtained by the script query from the actual_result parameter, such as the average duration of outages for a vendor.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Scaled value  | Appropriate value from the `scaled_result` variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where `actual_result` is the number of CIs, and `scaled_result` is a representation of the quantity of CIs:  

```java
if (actual_result < 1)  
scaled_result = 0;
else if (actual_result < 1000)  
scaled_result = 1;
else if (actual_result < 10000)  
scaled_result = 2;
else if (actual_result < 25000)  
scaled_result = 3;
else if (actual_result < 100000)  
scaled_result = 4;
else  
scaled_result = 5;
```

If the script detects 315 CIs for the vendor, the Actual value is 315 and the Scaled value is 1 for this metric result.  

**Note:** Although this field is visible only when the method is **Script**, the system populates the field with the Actual value when the method is **Assessment**, as the scaled value is used in the **Normalized value** calculation.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Normalized value | Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric. The normalized value is calculated as follows:  
Normalized value = (Input Value - Min value defined in metric) / (Max value defined in metric - Min value defined in metric) * current metric weight / (sum of valid metric weight) * scale_factor  
This formula cannot be customized.  
As an example, calculate the normalized value for this metric: Please rate the competency of the technician. This metric has the following values:  
• Input value = 3  
• Minimum value = 1  
• Maximum value = 6  
• Current metric weight = 10  
• Number of responses = 6  
  • 4 of type=number  
  • 1 of type=yes/no  
  • 1 of type=string (invalid data type; value cannot be calculated)  
  • Valid metric weight of each response = 10  
  • Scale factor = 10  
Normalized value = (3 - 1) / (6 - 1) * 10 / (10 + 10 + 10 + 10 + 10) * 10 = 0.8  
Several data types are ignored because the values cannot be calculated.  
These invalid data types include string, date, and datetime. For reporting purposes, use the Metric Result [asmt_metric_result] table. |
| String value   | Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the metric data type is Percentage.  
The string value is N/A for unanswered questions of certain data types. |

**Assessment results**

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.
Assessment administrators can view assessment results.

The system calculates **metric results** first, normalizes the scores, and then calculates **category results**. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

**Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in **scorecards** and **decision matrixes**. These tools display only the most pertinent data in graphical, comparative formats.

**Excluded Responses**

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the **Not Applicable** answer option on a questionnaire.
- The user does not answer the question and the **data type** is not Checkbox.
- The question data type is one of the following: Date, Date/Time, or String.
- The metric result **Actual value**, **Scaled value**, and **Normalized value** fields are set to -1.

**Assessments overview module**

The assessment overview module is a type of homepage that displays various assessment gauges, such as results by category and assessments by state.

**Prerequisites**

You can view the overview page and refresh, add, delete, and rearrange gauges.

Role required: assessment_admin
For details about editing gauges on homepages, see *Add existing gauges to a homepage* on page 478.

To use the Assessments Overview module, navigate to **Assessments** > **Overview** and click elements within the gauges to obtain more information.

The available gauges are:

**Table 91: Assessments overview module gauges descriptions**

<table>

</tbody>
</table>

**Assessment results calculation**

For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

**View a bubble chart for assessments**

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Role required: assessment_admin or admin

1. Navigate to **Assessments** > **Admin** > **Bubble Charts**.
2. Click a **Name** to open the bubble chart record.
3. Under **Related Links**, click **View Bubble Chart**.

**Note:** Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications.

**Bubble charts for assessments**

A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.
Create a bubble chart
Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to **Assessments > Admin > Bubble Charts** and create a record (see table for field descriptions).

**Note:** For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.

![Bubble Chart form](image)

<td></td>
</tr>
<tr>
<td>• Metric Z category</td>
<td></td>
</tr>
<tr>
<td>Quadrant label color</td>
<td>Color of the label text for the quadrant borders.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.</td>
</tr>
</tbody>
</table>

**Bubble chart components**

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.
The bubble chart page has these components:

- **Bubble Chart**
  - **X- and Y-axes**: Each axis represents a metric category.
  - **Bubbles**: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

- **Source record list**: List of all records defined by the Table and Condition fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.
## Vendor Quality Bubble Chart

The chart illustrates the quality of vendors based on reliability and essential partner alignment. Each vendor is represented by a bubble, with its size indicating the level of alignment and position on the X-axis indicating the reliability score.

Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents.

The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

![Bubble chart score summary](image)

Figure 124: Bubble chart score summary

View an assessment scorecard

Scorecards contain a header that displays the name of the source record, and a section that compares the ratings. The Vendor Performance application provides an additional section for vendor scorecards and installs demo data that includes sample data for vendor assessments.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open a record.
3. Under **Related Links**, click **View Scorecard**.

Assessment scorecards

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a **Related Link** on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors.

Create a link to a scorecard

Users with the admin role can create UI actions that allow users to view scorecards from tables.
Role required: assessment_admin or admin

1. Generate **assessable records** you want to evaluate.
   For example, you might create a metric type called **Project** to assess project management records.

2. Navigate to **System Definition > UI Actions**.

3. Open the View Scorecard record.

4. Right-click the header bar and select **Insert and Stay** from the context menu to create a duplicate record.

5. Change the **Table** name to the table on which you want the UI action to appear.
   For example, you might select **Project [pm_project]**.

6. Do not edit the **Action name** field or the **Condition** script.

7. Save the record.

8. Navigate to the table on which you created the UI action and open an assessable record.
   a) In this example, navigate to **Project > Projects > All**.
   b) Open any record in the list.
   c) Click **View Scorecard** under **Related Links** to open the scorecard for that assessable record.
The scorecard appears with the title in the form of `<table display name> Scorecard`. For example, a scorecard for an assessable record in the `Project [pm_project]` table is named `Project Scorecard`.

**Note:** Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.

9. Insert a new `View Scorecard` UI action record for each table where you want the related link to appear.

Export a scorecard as an image

You can export scorecards as images.

Role required: assessment_admin or admin

1. Click the menu icon and select `Save as PNG` or `Save as JPEG` as the download format.
2. When the export is complete, select `Download` to save the scorecard image to a storage location.

Averages

The `Averages` view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).
Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the Filter field field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red**: Ratings are below average in this category. The Diff value displays a negative number.
- **Green**: Ratings are above average in this category. The Diff value displays a positive number.
- **White**: Ratings are average in this category. The Diff value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

**Figure 125: Group scorecard with ratings filter**

Scorecard categories
The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:
- All History
- Last 3 Months
- Last 12 Months
Figure 126: Scorecard categories

Scorecard category metrics

The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.

Select a metric category from the choice list to display the chart.
Figure 127: Scorecard category metrics

Head to head compare
The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

Head to head compare
The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.
Figure 128: Scorecard head to head compare

**Overall Rating**

The Overall Rating is calculated as:

\[
\text{(sum of normalized values in category result)} / \text{(number of assessment groups)}
\]

In the following example, the calculation is

\[
(2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7) / 2 = 8.15
\]
<table>

**Figure 130: Overall Rating on the Group Scorecard**

**History**

The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current assessment against the previous assessment.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Figure 131: Scorecard history - 3 years

- **4 Quarters**: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Figure 132: Scorecard history - 4 quarters

Live feed

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.
To configure a live feed view, an assessment administrator selects the **Live feed** check box on the **Assessable Record** form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:

- **My Feed**: Displays the user’s My Feed preferences.
- **Company**: Displays the user’s company feed.
- **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group's conversations.
- **Tags**: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.
Figure 133: Scorecard Live Feed group
The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

Review the results from the submitted quizzes in reports and scorecards.

**Quizzes**

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No

- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

**Data types for quizzes**

Table 95: Terms used in quiz application

<table>
<thead>
<tr>
<th>Terms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes</td>
<td>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</td>
</tr>
<tr>
<td>Categories</td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td>Questions</td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
<tr>
<td>Category user</td>
<td>A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.</td>
</tr>
<tr>
<td>Templates</td>
<td>A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.</td>
</tr>
</tbody>
</table>

Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Quiz Overview module

The Quiz Overview module is a homepage that displays various gauges that report on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin
For details about editing gauges on homepages, see *Add existing gauges to a homepage* on page 478.

Users with the `assessment_admin` role can view the overview page and refresh, add, delete, and rearrange gauges.

1. Navigate to **Quizzes > Overview**.
2. Click elements within the gauges to obtain more information. The available gauges are:

<table>
<thead>
<tr>
<th>Gauge</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes by State</strong></td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td><strong>Total Questions by Quiz</strong></td>
<td>Assessment Metric [asmt_metric]</td>
</tr>
<tr>
<td><strong>Questions by Data Type</strong></td>
<td>Assessment Metric [asmt_metric]</td>
</tr>
<tr>
<td><strong>Correct Answers by Assigned User</strong></td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td><strong>Number of Correct Answers</strong></td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td><strong>Incorrect Answers by Assigned User</strong></td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td><strong>Number of Incorrect Answers</strong></td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
</tbody>
</table>

**Quiz designer**

The quiz designer provides a single interface that users with the `assessment_admin` role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the *assessment engine* to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables.

**Tools on the Quiz Designer**

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to **Quizzes > Quiz Designer**.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

**Controls**

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
# Question controls

**Figure 135: Question controls**

### Table 96: Question controls

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
<th>Scored</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>

<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see <em>Configure a template question</em>.</td>
<td>Y</td>
</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

New quizzes open in the **Design** view. The quiz **Name** field appears above first category in the canvas. A blank question field appears in the category container.

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin
When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar. The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.

5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.
Note:
To designate a question as scored, you must use Assessment forms. For instructions, see *Configure a scored question*.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.

2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

Table 97: Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
</tbody>
</table>
| String option     | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:  
  - **Single line**: Single line text field 40 characters in length that allows strings of any length.  
  - **String line wide**: Full page width text field that allows a single line entry of any length.  
  - **Multiline**: Full page width multi-line text field that allows word wrap and returns. |
<p>| Min               | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale. |
| Max               | Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question <strong>Date type</strong> is not <strong>Boolean</strong> with a check box option.</td>
</tr>
</tbody>
</table>
| Randomize answers          | Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.  
**Note:** Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order. |
| Details                    | Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images. |
| Correct answer             | Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except **Date**, **Date/Time**, and **String**. |
### Field | Description
--- | ---
Choices | Options for a question with a data type of **Choice** or **Scale**. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.

**Dependency**

**Displayed when** | Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of **Boolean**, **Choice**, **Scale**, or **Template**. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

4. To create any special conditions that must be met for a question to appear on the quiz, click the **Dependency** tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.
8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

Configure a quiz
You can configure an entire quiz.
Role required: assessment_admin or admin
The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

Table 98: Quiz designer configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

Select a quiz recipient

When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

### Table 99: Select recipients

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Create quizzes with forms
As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

The best practice for creating a quiz using assessment forms is to follow the procedures in the order shown here:

- Create the quiz.
- Set up the categories.
- Create the questions for the quiz.
- Create the answers for the questions.
- Distribute the quizzes to recipients.

**Note:** The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category
A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.

Categories have weighting values that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

You can create a new category or edit an existing one from the Metric Categories related list of a quiz record.
Select a user for a category

Category users are the recipients of the questions for each category.

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

To select users for a category, select the **Users** related list in a category record, and click **Edit**.
Create questions

A category can have multiple questions associated with it.

Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management > Questions and create a new record (see table).

**Warning:** When you create a Choice or Likert Scale question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question.</td>
</tr>
<tr>
<td>Category</td>
<td>[Required] Category the question belongs to. The system populates this category if you create a new question from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the **Depends on** field is set or if another metric depends on this metric.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Method  | Setting that determines how to use the question.  
- **Assessment**: Makes the question available on a quiz distributed to users. The **Assessment** method is compatible with all data types except **Duration**.  
- **Script**: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user's knowledge of a topic.  
**Note**: If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value. |
| Weight  | Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For more information on weight values, see *Weight categories and metrics* on page 324. This field is available and required unless the **Data type** is **Date**, **Date/Time**, or **String**. These data types are not included in results calculations. |
| Order   | [Required] Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category’s section. By default, the order is 100.  
**Note**: It does not matter which order value you use for metrics with the **Script** method, because they do not appear on questionnaires. |
<p>| Active  | Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is available only if the Method is Assessment, the Depends on field is empty, and the Data type is not Checkbox.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as a possible answer for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results.</td>
</tr>
<tr>
<td>Question</td>
<td>The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.</td>
</tr>
<tr>
<td>Depends on</td>
<td>An existing question that this question is dependent on. You can select Checkbox, Choice, Likert Scale, Template, and Yes/No questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Question Type</td>
<td></td>
</tr>
<tr>
<td>Data type</td>
<td>[Required] Format of the expected response data. See the table of data types for details.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the data type if another question depends on this question.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the Data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select Low if lesser numerical values are better. Select High if greater numerical values are better. The default value is High. This field is available and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations. When the Scored check box is selected, the scale value is set to High and the field is hidden.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data types for assessments on page 317.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value that can be used as an answer option. This field is available and required only if Data type is Number, Duration, or Percentage.</td>

<tr>
<td></td>
<td>• Yes/No</td>
</tr>
<tr>
<td></td>
<td>Selecting this check box hides the Scale definition field and sets the value in that field to High.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>[Required] Desired answer to a scored question. This field is available when the Scored check box is selected.</td>
</tr>
<tr>
<td>Template</td>
<td>Answer template to use with this question. This field is available when the Data type is Template.</td>
</tr>
<tr>
<td>Related List</td>
<td></td>
</tr>
<tr>
<td>Assessment</td>
<td></td>
</tr>
<tr>
<td>Metric Definitions</td>
<td>List of options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

Create answers for questions

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question What type of men’s trousers are not permitted by company policy? might have these three answers configured as metric definitions: Slacks, Jeans, and Casual cotton.

To create an answer option, open the question record you want to edit and click New in the Assessment Metric Definitions related list. Be sure to give each option a Value. The system uses this number to establish the order in which the answers appear in the quiz.
Distribute a quiz

When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

You can send the quiz to all the category users configured for the quiz or to a single category user.

1. Navigate to Quiz Management > Quizzes.
2. Open the quiz record, and click Publish. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See Modifying Published Quizzes to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
   - Assign Quiz: Send the quiz to one category user.
   - Send Quizzes: Send the quiz to all of its category users.

Note: These buttons are hidden if there are no category users defined for the quiz.
Modify a published quiz

You can edit a quiz even after it has been distributed, with these results:
• Added questions are available only on quizzes that are distributed after this change.
• Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
• Deleted questions are also deleted from the distributed quizzes in users' queues.

Edit a quiz
You can update a quiz after the quiz has been distributed.
Role required: assessment_admin or admin
• Questions that you add are available only on quizzes that are distributed after the update.
• Before a quiz is submitted or during the retake period:
  • Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  • Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Configure a scored question
Only scored questions are considered when calculating category and quiz results.
Role required: assessment_admin or admin
A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.
1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box. This check box is not available if the question's data type is not supported for scoring.
6. Select the Correct answer for the question.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

Enable a quiz retake
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.
View a quiz result
You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Navigate to **Quizzes > Quiz Results**.

---

Quiz reports
Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart **Type**. To sort a column in ascending or descending order, click the arrow in the column heading.

View a quiz scorecard
You can view scorecards for a quiz record.
Role required: assessment_admin or admin
For detailed information about scorecards, see Quiz scorecards.

1. Navigate to **Quiz**es > **Qui**zzes.
2. Open a quiz record.
3. Under **Related** Links, select **View** Scorecard.

   The scorecard link is hidden if there are no quiz results to report.

4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:
   • Category Results
   • Question Results
   • Average Ratings
   • History

Quiz scorecards
The Quizzes application prepares printable scorecards.
A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results
The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 136: Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Figure 137: Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart

The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Company Policies

Quiz Scorecard

Question Results | Office Supplies

Office Supplies

- (empty) = 3 (27.27%)
- Batteries = 2 (18.18%)
- Employees cannot take office supplies for personal use = 3 (27.27%)
- Printer paper = 2 (18.18%)
- Staplers, if they bring them right back = 1 (8.96%)

Figure 138: Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Figure 139: Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

• **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Figure 142: Scorecard history - 3 years

- **4 Quarters**: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Category results contain values that represent an evaluated record's performance in a specific metric
category. Each category result record stores data from one assessment group. Category result values are
calculated based on category and metric weights and from metric result values for the same category.

Role required: assessment_admin or admin

Note: The system does not include metric results from certain responses in category result
calculations. To compensate, the system adjusts the weight of the other normalized metric result
values within the same category.

1. Navigate to Assessments > Results > Category Results.
2. Click the reference icon ( ) next to an assessment group number to open the category result record.
3. View the Assessment Category Result form.
   All fields on the form are read-only.

   **Table 101: Assessment Category Result form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rating | Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:  

\[
\text{Rating} = \frac{\text{Sum of all normalized values that share a particular assessment group, category, and assessable record}}{\text{Number of assessment instances for the assessment group}}
\]

For example: In the Assessment Category Results table example, the assessment group ASG0000801 with category Politeness from group NY DB (the assessable record) has a Rating value 8.86.  

On the associated Metric Results table, you can see that there are 4 instances of this group: AINST0000801, AINST0000802, AINST0000803, and AINST0000804.  

The system calculated the rating using  

\[
(5.14 + 5.14 + 1.43 + 5.71 + 5.14 + 4.29 + 4.29 + 4.29) / 4 = 8.86
\]
Create a decision matrix

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Role required: assessment_admin or admin

1. Navigate to Assessments > Admin > Decision Matrixes.
2. Click New and then select the metric Type to plot results for.
3. Right-click the form header and select Save.
   The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.
The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.

Figure 144: Decision matrix axes

5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.
### Decision Matrix

### Decision Matrixes
Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes. Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.
The decision matrix page has these components:

Table 103: Decision matrix components

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Options</td>
<td></td>
</tr>
<tr>
<td>Filter</td>

<tr>
<td>Plotted items</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of <em>category result</em> data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the <em>scorecard</em> for the assessable record.</td>
</tr>
</tbody>
</table>

![Decision Matrix Diagram](image)
Plotted item rating summaries:

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record’s average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

Figure 145: Decision matrix rating summary

View a decision matrix

How to view decision matrix.

Role required: assessment_admin or admin

1. Navigate to Assessments > Admin > Decision Matrixes.
2. Click a Name to open the decision matrix record.
3. Under Related Links, click View Matrix to view the decision matrix page.
Take an assessment

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click **Take Survey** when you are ready.

Role required: none

Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the **Modify Assessment** button on the card.

1. Navigate to **Self-Service > My Assessments & Surveys**.

   **Note:** Users with the assessment_admin role can display other users' assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

   **Note:** Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click **Take Assessment** to open the questionnaire.

   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon (−) or expand icon (+) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.
4. Answer each question to the best of your ability. Point to a question for more information.

If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.
6. Save or submit the assessment.
   - **Save**: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   - **Submit**: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.
   If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.

8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click **Modify Assessment**.

*Assessment questionnaires*
In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.
No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Administrator tasks on page 312.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

• To delete a single record, open the record and click Delete.
• To delete multiple records, use the Assessable Records list.

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).
# Table 104: Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Read-Only] Assessable record name based on the <em>display value</em> of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>[Read-Only] Source record the assessable record is linked to. The <strong>Source</strong> reflects the table name and source record display value. For example, if the <strong>Name</strong> field is the display value for the Company table, the assessable record for a company record named <strong>Amazon</strong> has the <strong>Source</strong> value <strong>Company: Amazon</strong>.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-Only] Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record’s results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the <strong>View Matrix</strong> related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Live feed group</td>
<td>[Read-Only] Live feed group for this assessable record. When you select the <strong>Live feed</strong> check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

  Opens the scorecard for the assessable record.
### Related Lists

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click <strong>Edit</strong> to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.</td>
</tr>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click <strong>Edit</strong> to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see <strong>Stakeholders</strong>. This related list is available only when the associated metric type has the <strong>Scheduled</strong> schedule type.</td>
</tr>
</tbody>
</table>

### Approvals

Approvals can be defined for all tasks and allow users or groups to be associated with a task, for the purpose of either approving or rejecting that task. Approvals are defined by navigating to **System Policy > Approvals**.

The following information defines an approval:

**Table 105: Approval definition information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record.</td>
</tr>
<tr>
<td>Approving</td>
<td>Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Not Yet Requested (This state indicates that you are not yet asking your approvers to approve this request. Until you set the status to <strong>Requested</strong> they will receive no email notifications about the request.)</td>
</tr>
<tr>
<td></td>
<td>• Requested</td>
</tr>
<tr>
<td></td>
<td>• Approved</td>
</tr>
<tr>
<td></td>
<td>• Rejected</td>
</tr>
<tr>
<td>Comments</td>
<td>A journal field for storing comments regarding the approval.</td>
</tr>
</tbody>
</table>
Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.

Table 106: Approval engine options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to System Policy &gt; Approvals.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table.</td>
</tr>
</tbody>
</table>

**Caution:** Not turning off the approval engines might have a performance or behavioral impact on your instance.

Set up an approval engine

1. Navigate to System Properties > Approval Engines.

The following page appears with the Approval Engine option for each Task table in the system. If the Approval Engine option is greyed out and shows Turn engines off, read the Notes in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
2. Select the *approval engine option* for each Task table from the choice list.
3. Click *Save*.
   These preferences are saved as system properties that are named glide.approval_engine.<table_name>.
Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization's budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gating approvals</td>
<td>Must occur before a request can be initiated. For example, allow a manager to reject an employee's request for a company car.</td>
</tr>
<tr>
<td>Process approvals</td>
<td>Take place within an execution plan process that has been initiated. For example, allow the security group to reject a request for access to SSN even though the employee's manager approved it.</td>
</tr>
</tbody>
</table>

Note: To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules

Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to Requested.

Prerequisites

Role required: admin

Approval rules have two new fields:

- **Run rule before**: If true, the approval rule runs before the record is inserted/updated.
- **Set State**: If this rule applies, then the task record's approval state is automatically set to this value.

Note: The Set State field only behaves as expected if the Run rule before check box is enabled.

- In the example below, this rule automatically sets the state of the task to Approved thereby auto-approving the task.
Gating approvals

A gating approval acts as a gate through which a request must pass before it can start.

Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval rules</td>
<td>Can apply to the service catalog as well as any other task table.</td>
</tr>
<tr>
<td>Item-based approvals</td>
<td>Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.</td>
</tr>
</tbody>
</table>

Set up a gating approval via an approval rule

You can set up a gating approval via an approval rule.

Role required: admin

1. From the left navigation pane, select **System Policy > Approval Rules**.
2. Click **New**.
Table 109: Approval rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Task table to which this rule applies. For most service catalog approvals, select Request.</td>
</tr>
<tr>
<td>Note:</td>
<td>The list shows only tables and database views that are in the same scope as the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td>Run Rule Before</td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td>User</td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td>Group</td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td>Set State</td>
<td>Value of the approval field on the task in after this rule runs. In most cases, select Requested.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which the rule applies.</td>
</tr>
<tr>
<td>Script</td>
<td>An optional server script to programmatically specify who the approver should be. For example, for the one-line script current.requested_for.manager, ServiceNow checks the requested_for reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

Notes and limitations:

1. You can have as many rules as you want on a given table. If more than one rule applies, you'll get more than one approver.

2. You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.

3. By default all requests start out in a Not yet requested approval state. Approval notifications will not go out until the request's approval state is set to Requested. You can do that manually, or you can do it in script, but the easiest way to do it is to use the Set State field to automatically set the request to Requested.
Set up a gating approval based on the item being ordered

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.

We can, for example, specify that all Blackberrys need to be approved by David Loo. To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- **Approved By Group**: A list of groups that have to approve requests for this item
- **Approved By**: A list of users who have to approve requests for this item

---

**Approved By Group**

<table>
<thead>
<tr>
<th>New</th>
<th>Edit...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval group</td>
<td></td>
</tr>
<tr>
<td>Hardware</td>
<td></td>
</tr>
</tbody>
</table>

**Approved By**

<table>
<thead>
<tr>
<th>New</th>
<th>Edit...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td></td>
</tr>
<tr>
<td>David Loo</td>
<td></td>
</tr>
</tbody>
</table>

---

**Figure 147: Approve list**

In the example above, this request must be approved by all members of the Hardware group and by David Loo.

**Notes and limitations:**

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he will only get one approval request.

2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

**Process approvals**

Once a request has passed its gating approvals, any relevant execution plans are initiated.

Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select **Service Catalog > Execution Plans**, and then select the plan to which to add an approval step. Then click the **New Approval** button.
Figure 148: Add approval

The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right click the title bar and select **Save**. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete
Figure 149: Approval task

In the example above, this security approval task must be approved by Fred Luddy.

Note: When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn't necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

Approve with a process guide
Process guides work similarly to approval rules in that their execution is controlled via a condition.

The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people

You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:

1. "Any of" or "All of" approvals
2. **Sequenced approvals**

You can link a process guide to an execution task.

1. From the left navigation pane, select **System Policy > Process Guides**.
2. Create a new guide.
3. Set the table to **Catalog task**.
4. Fill in a condition under which this guide should attach.

**Example #1**: Apply to all "Capacity Review" tasks.

```
Add Condition
   -  +  State ▼ is ▼ Open ▼
   -  +  and Delivery task ▼ is ▼ Capacity Review
```

**Example #2**: Apply to all "Capacity Review" tasks where the requester is in Atlanta.

```
Add Condition
   -  +  State ▼ is ▼ Open ▼
   -  +  and Delivery task ▼ is ▼ Capacity Review
   -  +  and Request item.Request.Requested for Location ▼ is ▼ Atlanta
```

**Process guide tips and tricks**:

1. All catalog tasks are generated when a request is first submitted, but tasks which aren’t active yet have a state of “pending”. So if you do not want to send out approval requests until a task has actually started, add "state=open" as part of your condition.

2. There is a "Default" process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

_Schematic of a hypothetical approval process_

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.
Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form. The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
**Change Request**

<table>
<thead>
<tr>
<th>Number</th>
<th>CHG0000001</th>
<th>Requested by</th>
<th>David Loo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Affected CI</td>
<td>Sales Force Automation</td>
<td>Type</td>
<td>Normal</td>
</tr>
<tr>
<td>Planned start date</td>
<td>2016-07-27 16:00:00</td>
<td>Risk</td>
<td>High</td>
</tr>
<tr>
<td>Planned end date</td>
<td>2016-07-27 18:00:00</td>
<td>Impact</td>
<td>3 - Low</td>
</tr>
<tr>
<td>Short description</td>
<td>Rollback Oracle Version</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The **Reject** button allows the approver to reject one or more requested items in a multi-item request, before approving the overall request. If a requested item is rejected, the workflow for that item never starts. The approver can then choose to **Approve** the item.

**Note:** When the overall request is approved, you must ensure this **Approve** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state.

Similarly, the **Approve** button on requested items should only appear before the overall request is approved or rejected.

---

**Summarizers**
Approval summarizers are stored in the Macro [sys_ui_macro] table.

From the left navigation pane, select **System UI > UI Macros**. Summarizers use a naming convention of approval_summarizer_+ '<table_name>' (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

**Change a summarizer**
You can modify existing approval summaries to include additional information.

These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

1. Navigate to **System UI > UI Macros**.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click Update.

Create a new custom summarizer
After you add a new table that has approvals to an instance, you can add a custom summarizer by creating a new UI macro.
1. Navigate to System UI > UI Macros
2. Click New.
3. Give the macro a name that follows the summarizer naming convention:
   approval_summarizer_<tablename>
4. Complete the rest of the form and click Submit.
5. Add the custom summarizer to the appropriate form.

Approval with e-signature
Approval with e-signature allows users to approve requests by re-entering their login credentials.
Approval with e-signature supports the following authentication credentials:

- User name and password matching a user in the local database.
- User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

Activate approval with e-signature
To activate approval with e-signatures, refer to the following topic.

Activate a plugin.

De-activate e-signatures
Use this procedure to de-activate e-signatures.
Although plugins cannot be removed, e-signatures can be disabled.
1. Navigate to System Definition > E-Signature Registry.
2. Set Enabled to False on any tables where e-signatures are no longer required.

Use e-signature approvals
Users can approve requests with an e-signature.

Users can approve requests with an e-signature by:
- Selecting the Approve or Reject option on a list context menu.
- Clicking the Approve or Reject button on a form.
- Changing a request record's State to Approved in either the list-editor or form.

Selecting any of these options presents the user with an Approver Authentication window, which requests the user's credentials again.

E-signature SAML properties
Configurable properties for e-signature with SAML 2.0 update 1.

**Note:** You DO NOT need to configure these properties if you activate Multiple Provider Single Sign-on.
### Table 110: E-Signature SAML Properties Form

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AuthnRequest URL for eSignature Authentication</td>
<td>Enter the URL that points to the SAML 2.0 Identity Provider AuthnRequest Consumer for eSignature Authentication. In most cases, this will be the same as the AuthnRequest URL used in general authentication. Leave this setting blank if you intend to use the same AuthnRequest Consumer URL that is used for general SAML 2.0 authentication in your instance.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The SAML 2.0 Assertion Consumer URL for eSignature authentication</td>
<td>In most cases, this URL will be: <a href="https://YOURINSTANCE.service-now.com/consumer.do">https://YOURINSTANCE.service-now.com/consumer.do</a>. However, if you employ a customized method of handling the SAML authentication for eSignature, you can set up your own consumer URL. If you are using Multi-Provider SSO, you do not need to use this property. Configure the Identity Provider form, add the <strong>Assertion Consumer URL for eSignature authentication</strong>, field, and set the URL in that field.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.approval_consumer_url]</td>
<td></td>
</tr>
<tr>
<td>The SAML 2.0 Assertion Consumer Index for eSignature authentication</td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.assertion_consumer_service_index]</td>
<td></td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Width</td>
<td>When a user approves a request using eSignature, a dialog allows the user to enter their credentials. This setting controls the width of that dialog box.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.popup_dlg_width]</td>
<td></td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Height</td>
<td>When a user approves a request using eSignature, a dialog allows the user to enter their credentials. This setting controls the height of that dialog box.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.popup_dlg_height]</td>
<td></td>
</tr>
</tbody>
</table>

*Installed with approval with e-signature*

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see [E-signature SAML properties](#)
- Client Script - Authenticate Approver
- Script Include - User
- Script Include - UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two out-of-the-box Approve UI Actions on the sysapproval_approver table.

*Select an approval table*

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

1. Navigate to System Definition > E-Signature Registry.
2. In **Table name**, use the drop-down list to select a specific table.
Table 111: Table Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table drop-down to select the table that requires e-signatures.</td>
</tr>
<tr>
<td>Enabled</td>
<td>If selected, e-signature is required. Clear this option to remove the e-signature requirement.</td>
</tr>
</tbody>
</table>

Set up an approval from a local database
To set up Approvals with e-signature using credentials from a local database:

1. Activate the Approval with E-Signature plugin.
2. Create user records for approval users.

Set up an approval from a SAML 2.0 authentication
Setting up e-signature with SAML 2.0 requires configuration on the identity provider and the instance.
The SAML Identity Provider (IdP) must support and honor the forceAuthn attribute in SAML Assertion Requests. E-signature will not function without this IdP setting.
To set up Approval with e-signature using credentials from a SAML 2.0 authentication:

1. Activate or upgrade to a SAML 2.0 Update 1 integration.
2. Activate the Approval with E-Signature plugin.
3. Enter the e-signature SAML properties.
4. Regenerate the service provider metadata and update it on the IdP.
5. Create user records for approval users.

Note: Customers on SAML 2.0 Update 1 no longer have to create custom UI pages for logging the user out or deleting session cookies.

Note: If you are a Life Science Customer using E-Signature, you must deactivate the User self-lockout prevention business rule. See KB0547061 for more information.

Set up e-signature approvals
The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:
- Setting up approvals from a local database
- Setting up approvals from a SAML 2.0 authentication

Note: ADFS 2.0 does not support re-authentication requests that E-Signature requires.

Approval status
The approval status of a change request is determined by looking at the current status of all the approvers. If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested
status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an "one of" approval where only one person of a group of approvers needs to approve, consider using Workflows.

Generate an approval using approval rules

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.

In the sample below, a change opened in the category network is assigned to the System Administrator:

![Approval Rules](image)

**Figure 154: Approval Rules**

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

Generate approvals using the approvers related list

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the Edit button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to "Not Requested". When the status of the approver is changed to "Requested", the approver will be sent an email requesting approval action.

Generate approvals using workflows

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow activity generates an approval record, the system populates the **Workflow activity** field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see Approval and Rollback Activities.

**Note:** Conflicts can arise when the approval process for a table is managed by both the workflow engine and the approval engine. In general, if there is a workflow that manages the approval process for a table, the approval engine should be turned off for that table.

Multiple approvers

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".
Receive notifications

Approval notifications will be sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using System Definition > Business Rules and System Policy.

Note for Blackberry users: In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements state:approved or state:rejected within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

Dynamic approval forms

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you're looking at a Change Management approval request, you'll see details from the relevant change request. For a Service Catalog approval request, you'll get details of the request.

![Approval Form Example](image)

Figure 155: Change request approval example
Execution order of scripts and engines

Scripts, assignment rules, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

**Note:** Client-based code that executes in the browser, using Ajax or running as Javascript, will always execute before the form submission to the server.

The order of execution is as follows:

1. *Before* business rules: Scripts configured to execute before the database operation with an order less than 1000.

2. *Before* engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)

3. *Before* business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.

4. The database operation (insert, update, delete).
5. *After* business rules: Scripts configured to execute after the database operation with an order less than 1000.

6. *After* engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)

7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications

8. *After* business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.

Geolocation

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent's position each time that agent updates a task record. When the system updates an agent's location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

Activate geolocation

An administrator can activate the Geolocation plugin.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

Installed with geolocation

The following components are installed with Geolocation:

Modified by Geolocation
The Geolocation plugin adds a field called *Geolocation tracked* to the User [sys_user] table. This field allows the system to track individual users by their geographical coordinates.

**Business rules installed with geolocation**

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeoLocation Data updated</td>
<td>User [sys_user]</td>
<td>Populates the <strong>Latitude</strong> and <strong>Longitude</strong> fields on the Geolocation History [geo_history] table when the <strong>Latitude</strong> and <strong>Longitude</strong> fields are updated on the User [sys_user] table.</td>
</tr>
</tbody>
</table>

**Client scripts installed with geolocation**

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Geolocation on Task</td>
<td>Task [task]</td>
<td>Populates the <strong>Latitude</strong> and <strong>Longitude</strong> fields on a user record with GPS coordinates when that user loads any record on the Task table or a table that extends Task. This occurs only when geolocation tracking is enabled for the user.</td>
</tr>
</tbody>
</table>

**Properties installed with geolocation**

Geolocation provides the following configurable properties in Geolocation > Administration > Geolocation Properties.

The Google Maps plugin provides additional map properties that are used to implement and control specific geolocation features. You must have a private key for Google Maps API for Business to take advantage of the properties listed here.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.geolocation.allow.toll.roads      | Allow toll roads to be used. Allows the system to use toll roads when auto-routing an agent's tasks.  \  
  • **Type**: True/false    \  
  • **Default value**: True |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

</tr>
</tbody>
</table>
| glide.geolocation.proximity               | Minimum distance an agent must move to be considered in a new location (in meters). This setting establishes a geolocation perimeter that prevents ServiceNow from creating unnecessary history records when an agent has multiple tasks in the same vicinity. An example of this might be when an agent has several tasks in one building. The system assumes that all task activity within the specified radius is part of a single record and does not create additional records when the agent moves from task to task around the building. | • **Type**: Integer  
  • **Default value**: 500                                                                                                                                                                                                                                                                                                                                                                                                          |
| glide.geolocation.proximity.location      | Maximum distance an agent can be from a specific location and still be placed at that location (in meters). This setting defines the maximum distance that an agent can be from a specified location and still be placed at that location by the system.                                                                                                                                                                                                                                                                                                | • **Type**: Integer  
  • **Default value**: 200                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| glide.geolocation.rush.travel.buffer      | Percentage to add to all rush hour travel times. The system uses this percentage to calculate schedules when auto-routing an agent. Use this property when both morning and evening rush hour times are defined. An example of a valid time buffer percentage is 15.                                                                                           | • **Type**: Integer  
  • **Default value**: 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| glide.geolocation.tracking.frequency      | Sets the length of the recurring interval, in seconds, that the system waits between attempts to update a user’s geographic coordinates. The system updates geographic coordinates only for users who have geolocation tracking enabled. Minimum amount of time between updating the user’s location (in seconds). This setting defines how long the system waits before updating an agent’s location, regardless of task activity or travel. This prevents ServiceNow from creating unnecessary history records if an agent in one location views a task multiple times. | • **Type**: Integer  
  • **Default value**: 300                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
### Table 115: Script Includes

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeolocationAJAX</td>
<td>Utilities the system uses when making geolocation AJAX calls.</td>
</tr>
<tr>
<td>GeolocationUtils</td>
<td>Core utilities for geolocation functionality.</td>
</tr>
</tbody>
</table>

#### Geolocation Google key

Geolocation requires a Google Maps API for Business license to enable the use of Google driving time estimates and to use Google Maps. Applications, such as Work Management, have functionality that requires this license.

If you are using auto-routing or auto-dispatch in Work Management, both the Google Maps API for Business private key and the client ID must be set for precise time estimates. Without these values, driving times for auto-routing and auto-dispatch are not available, and a rough estimate or fixed time is used. Use these properties, found in **System Properties > Google Maps**, Google Maps, to enable the geolocation feature.

- **Client ID for Google Maps API for Business**: Google client ID for your organization. This ID is from Google and starts with `gme-`, such as `gme-mycompanyname`.
- **Private key for Google Maps API for Business**: Key required to get accurate driving time estimates from Google for some features of Geolocation. An example of an encoded key is: `vNIXE0xscrmjlyV-12Nj_BvUPaw="`

#### Geolocation history

The Geolocation History `[geo_history]` table contains the history of each tracked user's location over time.

To view geolocation history, navigate to **Geolocation > Geolocation History**. The record list shows time stamped location data for all users configured for geolocation tracking.

The following system properties, located in **Geolocation > Administration > Geolocation Properties**, control the data that appears in this table.

- **Minimum distance an agent must move to be considered in a new location (in meters)**: Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.
• Maximum distance an agent can be from a specific location and still be placed at that location (in meters): Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
• Number of days to keep history data: Time period for which the system retains history data.
• Minimum amount of time between updating the user’s location (in seconds): Time period the system waits before updating a user's location, regardless of how often the user accesses tasks.

Location tracking

Geolocation adds the **Geolocation tracked** field to the User form. In the default view of a user record, select the **Geolocation tracked** check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user's geographic coordinates whenever the user opens, or loads, a record from the Task [task] table or from a table that extends Task. After this initial update, the system continues to update the user's geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to Geolocation > Administration > Geolocation Properties and change the setting for the **property** that regulates the update interval for the user’s location. The default setting for this property is 300 seconds (5 minutes).

**Note:** The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the **Geolocation tracked** check box selected may be prompted by their browsers to share or withhold their location.

Homepage administration

A homepage is a dashboard that consists of navigational elements, functional controls, and system information.

When a user logs in to an instance, the default homepage defined for their role appears unless the user switched to another homepage. Administrators can customize several settings for homepages, including settings that control read or write access for any homepage and how homepages render.

Administrators can also perform the following actions for homepages.

- Create new global homepages for all users or specific homepages for users with a specified role.
- Specify an alternate login landing page that appears instead of a homepage.
- Configure the homepage splash page, which is a lightweight page that loads before a homepage loads.

Restrict content additions to a homepage

By default, anyone with a role can add content to a homepage.

If the user does not have permission to edit the homepage, the edits are applied to a homepage specific to the user. You can restrict who can add content to homepages by modifying the following property under the **Homepage Admin > Properties** module.

**Note:** The option **Add to homepage** does not take into account the property cms.glide.add_content. This means that users can add reports to any homepage they can view. The result is that users create new homepages with the added information when they modify a homepage that they don't own.
Secure a homepage

Homepages have two types of roles: read and write. Read roles limit who can view the page, and write roles limit who can make edits to the page, such as moving around gauges or deleting the homepage.

Role required: admin

**Note:** If no write roles are specified on a homepage, then any user with one of the specified read roles may access this page and delete it.

**Note:** The option *Add to homepage* does not take into account the property `cms.glide.add_content`. This means that users can add reports to any homepage they can view. The result is that users create new homepages with the added information when they modify a homepage that they don’t own.

1. Navigate to **Homepage Admin > Pages**.
2. Select the homepage you want to secure.
3. Click the edit icons next to Write roles or Read roles.
4. Move the roles you want to restrict homepage access to from the Available column to the Selected column.
5. Click **Done**.
6. Click **Update**.

Homepage user preferences

You can set your homepage user preferences.

After users have selected a homepage to view, their homepage preference is stored in **User Administration > User Preferences** in a preference named homepage. The value of the preference is the sys_id of the homepage the user sees. You can access a list of homepages by navigating to **Homepage Admin > Pages**.

Users must have at least one role to view homepages.

Add a homepage to an update set and application

You must manually add homepages and content pages to update sets prior to distribution.

Role required: admin
After inclusion, the update set always uses the current version of the page and does not require additional action. Applications automatically include any homepages and content pages that are created within or associated to an application.

1. Navigate to **Homepage Admin > Pages**.
2. Right-click a homepage record.
3. Select **Unload Portal Page**.

   The page is added to the current update set.

### Add existing gauges to a homepage

A gauge is visible on a homepage and can contain up-to-the-minute information about current status of records that exist on tracked tables.

You can add gauges to a homepage. Gauges can be created from reports or from lists of records on a table and can be sorted and filtered as needed.

1. Navigate to a homepage.
2. Click the add content icon (+)
3. Select **Gauges** in the top left column of the **Add content** pop-up window.
4. Select a table in the top middle column.
5. Select an available gauge in the top right column.
6. Click the appropriate **Add here** button to place the gauge in the corresponding section of the homepage.
7. To add more gauges, repeat steps 3 through 6.
8. Click the close icon (×) in the top right corner when you finish adding gauges.

### Arrange gauges on a homepage

Arrange gauges on custom homepages to customize your ServiceNow experience. You can always restore the homepages to the arrangement your system administrator created.

- **Moving gauges** - Click, hold and drag near the top of a gauge to move it another area. Gauges in the top or bottom areas display at 100% of the available width. Gauges in the right, left, or center areas display at 50% of the available width. If gauges are added to all these areas, they display at 33% of the available width.

- **Removing gauges** - Click the section close icon (×) to remove a gauge.
- **Refresh** - Refresh the data in a gauge by clicking the refresh icon at the upper right corner.

### Create a new gauge from a report

You can create any report as a gauge and then add that report to a homepage.

**Role required:** gauge_maker or admin

Gauges created from list reports do not preserve user list view preferences, such as the option to automatically expand grouped records.

1. Navigate to **Reports > View / Run**.
2. Open or create a report that you want to access from a gauge.
3. Open the **Save** menu and select **Make Gauge**.

   The page refreshes with a message that the gauge was created from the report.
4. Reopen the **Save** menu and select **Add to Dashboard**.

*Create a new gauge from a list of records*
You can create gauges from lists of records, for example My Work and Unassigned Incidents.

Role required: gauge_maker or admin

1. Navigate to **System UI > Gauges** and click **New**.
2. Enter a unique name for your gauge.
3. In the **Type** field, select **List**.
4. Select a table.
5. In the **Aggregate** field, select **Count**.
6. In the **Query** field, define the conditions that records must meet to be included in the gauge.
   Other fields on the form are not used when creating a list gauge.
7. Click **Submit** to save the gauge, or click **Try It** to save and view the new gauge.

After you save the gauge, you can *add it to a homepage*.

*URL gauge variable height workaround*
URL gauges can be used to display a different web page or website as part of a homepage.

URL gauges are set with a fixed height, meaning that you may have to scroll to see the entire web page in the gauge. URL gauge widths are controlled by the positioning of the gauge on a particular homepage. You cannot modify URL gauge height, but you can set up an iFrame in a UI page to manage the height.

1. First, create a UI page. The UI page name must start with `render_gadget_` (for example, `render_gadget_iFrameSNC`). Add the following to the **HTML** field, replacing the `src` with the URL that should appear in the iFrame. The height you specify must be a static value and you must use CSS style tags for this to work.

   ```html
   <iframe id="myframe" src="http://www.service-now.com" scrolling="yes" style="height:450px; width:100%"></iframe>
   ```

2. Next, navigate to **System UI > Widgets** and create or modify a widget to use for selecting your UI page from the **Add content pop-up window** on a homepage. The widget script must reference your UI page. The widget **Name** must be the name of the category in the **Add content** pop-up window. For **Renderer type**, select **JavaScript**. The following script can be added to the **Script** field if you want to create a new widget.

   ```javascript
   function sections () {
        return { 'ServiceNow' : { 'type' : 'iFrameSNC' } };  
    }

    function render ( ) {
        var scope = gs.getCurrentScopeName();
        var type = renderer.getPreference('type');
        return renderer.getRenderedPage(scope + type);  
    }

    function getEditLink ( ) {
        var scope = gs.getCurrentScope();
        var type = renderer.getPreference('type');
        return "sys_ui_page.do?sysparm_query=name=render_gadget_" + scope + type;  
    }

3. When the widget is saved, go to any homepage and add the new content.
*Count gauge colors*

In a count gauge, the count item color is based on the upper and lower limit values on the gauge panel.

The following colors are used:

- **Red**: If the count result is greater than or equal to the upper limit.
- **Orange**: If the count result is between the upper and lower limit.
- **Green**: If the count result is less than or equal to the lower limit.

You cannot customize these colors.

The upper and lower limit fields are in the Gauge [sys_gauge] table. You can configure the Gauge form to add these fields.

**Top Searches homepage**

The Top Searches homepage displays the most popular searches over the past hour, day, week, or month. The homepage includes widgets for specific tables and across the entire instance.

- Users with the itil role can view the homepage by default. To control access to the page, administrators can secure the homepage.
- Users can add any of the top searches widgets to their homepages. Administrators can control who has access to top searches widgets.
- Users can select the time period for which to view top searches and perform searches directly from the widget.
Figure 158: Top Searches homepage
Use a top search widget
Top searches widgets display the top 10 searches over the past hour, day, week, or month for the specified table or across the entire instance (All).

Take either of the following actions to use a top searches widget.

- Click the desired time period for which to see top searches (default is Day). You can change the time period at any time, and your most recent selection is loaded the next time you view the homepage.
- Click any item on the list to search for it. The Top Searches - All widget performs a global search and a table-specific widget performs a search of the table or application. For example, knowledge searches return knowledge base search results.

Note: Each user's time period selection is stored by the top_searches.period user preference.

Add a top search on a homepage
You can add a top searches widget to a homepage.

1. Click the add content icon (+) in the top left corner.
2. Select Text Search from the left panel and Top Searches from the middle panel.
3. Select the desired top search widget from the right panel.
4. On the bottom of the window, click Add here in the appropriate layout position, and then close the window.
5. Select the time period for which you want to see the top searches (default is Day).
   The widget displays the top 10 searches for the selected time period.

Control access to a top search widget
You can control who has access to top searches widgets by restricting who can add content to homepages or by applying roles to the widget.

Role required: admin

1. Navigate to System UI > Widgets.
2. Select Text Search.
3. Click the edit user roles icon and select the required access rights, then click Done.
4. Click Update.

Define a table for a top search
You can define the tables for which top searches widgets are available.

Role required: admin

1. Navigate to System Properties > Text Search.
2. Enter the tables for which you want top searches widgets in the Comma-separated list of table names which will have home page top searches widgets available for them field (the glide.ts.widget.top_search_tables property).
   The default tables are Knowledge, Problem, Incident, Change Request, Catalog Item, and Live Message (kb_knowledge,problem,incident,change_request,sc_cat_item,live_message).

   Note: Adding a parent table includes all searches on tables that extend the parent table. For example, if you add Task, then all Incident, Problem, and other task tables are included.
3. Click Save.
View user preference for time period
Each user's time period selection is stored with a user preference.

- **top_searches.period**: stores the user's selection for the Top Searches - All widget.
- **top_searches.period.<table name>**: stores the user's selection for the Top Searches - <Table> widget. For example, **top_searches.period.kb_knowledge** stores the user's preference for Top Searches - Knowledge.

1. To view user preferences, navigate to User Administration > User Preferences.
2. Find the top searches preferences.
3. Make the necessary changes to the user preferences and save the record.

Update a top search statistic
Top search statistics are compiled on an hourly basis by the TS Search Summary scheduled job.

Role required: admin

Use the following procedure to manually refresh the list.

1. Navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs.
2. Open TS Search Summary.
3. Change the date and time in the Next action field to run the scheduled job at the specified time. For example, if it is currently 9:48 AM and you want to run it immediately, set the date to today and the time to 10:00.

   **Note:** This scheduled job is designed to collect hourly data. For optimal data accuracy, do not run this job more frequently.

4. Click Update.

Custom homepage widgets
There are a number of widgets provided out-of-box to be added to a homepage, but administrators can also create their own widgets.

To create a widget, an administrator must first create a UI page to control its functionality. UI pages are coded in either HTML or Jelly script, and will power the functionality of the widget.

Creating a UI page is outside the scope of this article. However, once the UI page exists, it will be used to render the widget. It is very easy to create a trivial UI page named “my_ui_page” with a single line of text, add it to a homepage, and see how it renders.

After the UI page is scripted, create a widget that renders the UI page and executes its script.

Create a widget referencing the UI page

Role required: admin

   **Note:** This functionality requires a knowledge of JavaScript.

1. Navigate to System UI > Widgets and click New.
2. Give the widget a **Renderer type** value of JavaScript and a **Name** value of My Custom Page.
3. Include the following required functions in the script.

   - The **sections()** function adds the widget to the **Add Content** section of a homepage.
The `sections()` function needs to return a JavaScript array describing how the widget should appear in the homepage Add Content UI, and what UI page should be displayed. Here is an example:

```javascript
function sections() {
    return {
        "Cool Page" : { "name" : "my_ui_page" }
    };
}
```

The above example appears in the Add Content UI as shown below, where the Name of the widget appears in the first column, and the Cool Page text appears in the second column. The UI page displayed in the preview is my_ui_page:

- The `render()` function defines how the widget should be rendered in the homepage. It can be the same for all custom widgets. This code works with scoped and global applications:

  ```javascript
  function render() {
      var scope = gs.getCurrentScopeName();
      var page = renderer.getPreference('name');
      return renderer.getRenderedPage( scope + page);
  }
  ```

  The function uses the value of the name object returned by the `sections()` function. In the example, the value is my_ui_page. This is the name of the UI page that is rendered. If the UI page does not exist, then Form not found is displayed.

- The `getEditLink()` function defines the target page to use when editing the widget. It can be the same for all custom widgets. This code works with scoped and global applications:

  ```javascript
  function getEditLink() {
      var scope = gs.getCurrentScopeName();
      var page = renderer.getPreference('name');
      return "sys_ui_page.do?sysparm_query=name=render_gadget_" + scope + page;
  }
  ```

  The function uses the value of the name object returned by the `sections()` function. In the example, the value is my_ui_page. This is the name of the UI page that is rendered. If the UI page does not exist, then Form not found is displayed.
Here is the entire example widget with all functions.

Create a new personal homepage

Users with at least one role can create new personal homepages that are visible to themselves.

You can create a completely new personal homepage with no content on it, or you can create a new homepage that uses the content of an existing page. Either way, the personal homepage is only visible to you by default unless the administrator makes your homepage global.

1. Navigate to **Self-Service > Homepage** to open your current homepage.
2. In the **Switch to page** choice list in the header, select **New page**.
Your new homepage appears with a single dropzone.

3. **Add content** as needed.

Create a personal homepage based on an existing homepage

Users with at least one role can create personal homepages based on existing homepages that are visible to themselves.

1. Navigate to any existing homepage that you have access to.
2. **Change the layout** of the homepage or add new content.

   The system automatically creates a new homepage with the word My in front of the title, indicating that the homepage is a personalized one. Any changes you make are applied to the personalized version, not the global version.

Create a global homepage or a homepage for specific users

You can create and edit a global homepage that is accessible to all users, or homepages that are accessible to users with specific roles.

Role required: admin

1. Navigate to the **Homepage Admin > Pages**.
2. Click **New**.
3. Complete the form.

### Table 116: Portal page fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the title of the homepage that appears at the top.</td>
</tr>
<tr>
<td>Selectable</td>
<td>Select this option to make the homepage appear in the <strong>Switch to page</strong> choice list for users. If you specify a user or a role, only the specified user or the users with the specified role can see the page in the choice list.</td>
</tr>
<tr>
<td>View</td>
<td>Enter a unique value that you can use when referencing a global homepage in a URL or module. The View value must be unique. Otherwise, if the View is used by multiple homepages, the Edit Homepage link may not redirect to the current homepage record. You must specify a view to be able to edit the homepage for all users who can access it.</td>
</tr>

<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| User        | If you want the homepage to be a personal homepage for a specific user, select it here. Clear this field to keep the homepage global or if you want to specify the roles that are required to access the homepage.  
  **Note:** If this field is populated, the homepage cannot be global.                                                                                     |
| Order       | Enter a value that specifies where in the choice list of homepages that this page appears. Lower values move the page up the choice list.                                                                          |
| Write roles | Specify the roles you want users to have to edit this homepage.                                                                                                                                               |
  **Note:** If no write roles are specified on a homepage, then any user with one of the specified read roles may access this page and delete it. See Secure a homepage on page 477. |
| Read roles  | Specify the roles you want users to have to access this homepage. The **User** field takes precedence over this field. If you specify a user in the **User** field, only that user can view the homepage, regardless of what roles you add here and regardless of what role that user has.  
  **Note:** If no write roles are specified on a homepage, then any user with one of the specified read roles may access this page and delete it. See Secure a homepage on page 477. |

4. Right-click the header and select **Save**.
5. Click the **Edit Homepage** related link to see the homepage.
6. **Add content** as needed.

**Note:** You must click **Edit Homepage** to make changes to a global homepage that take effect for all users who can access the homepage. If you click **View Homepage** and make changes, a personal homepage is automatically created for you and those changes take effect only on that personal homepage. To see the **Edit Homepage** link, you must enter a value in the **View** field.
Table 117: Related links

<table>
<thead>
<tr>
<th>Related Links</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit Homepage</td>
<td>Edit the homepage as a global homepage. Any changes you make when editing the homepage are visible to all users who can access it.</td>
</tr>
<tr>
<td>View Homepage</td>
<td>View the homepage as a user would. Any changes you make when viewing the homepage automatically create a personalized version of the homepage.</td>
</tr>
</tbody>
</table>

**Note:** You can also add the homepage as a module link in the application navigator.
The new homepage is available in the **Switch to Page** choice list for the users you specified or for all non-ESS users if the homepage is global.

### Homepage customization

Users with at least one role can see a customized homepage when logging in.

**Note:** If no write roles are specified on a homepage, then any user with one of the specified read roles may access this page and delete it. See *Secure a homepage* on page 477.

The content on the homepage comes from various sources, including:

- Graphs and charts generated from a report
- Application modules
- A service catalog category
- The scrolling news widget (the News knowledge category)

**System Administration homepage**

The System Administration homepage shows administrative tasks as catalog categories that provide administrators with quick access to all the items they need to configure core features, such as homepages, user administration, and email notifications.
Administrators can customize the System Administration homepage and add a homepage to an update set and application.

View your homepage
When users log in to an instance, their homepage appears.

Users who customized their homepage see the customized homepage. Users who did not customize their homepage see the homepage for their role, such as admin or itil. If their role has no homepage, a blank page appears.

After logging in, users can return to the last homepage they viewed by navigating to **Self-Service > Homepage**.
Note: Users see the homepage with the lowest Order value of the pages they have roles to see when they log in. For more information, see *Create a new personal homepage* on page 485.

Refresh the homepage
Homepage users can specify a refresh time of 5, 15, 30, or 60 minutes, or no refresh.

The default is Off (no refresh). Users can click the refresh icon ( ) at any time.

![ITIL Homepage](image)

**Figure 160: Home page refresh**

Modify the number of records displayed in a list gauge
List gauges on a homepage display the same number of records as you have configured for other lists.

For example, if you display 100 records in lists, a maximum of 100 records appears in list gauges. For instructions on changing this number, see *Customize the number of list rows per page* on page 67.

*Customize a homepage*
You can customize the default homepages that appear for each user.

Role required: admin
For pre-Geneva Patch 8 instances, customizations to out of the box homepages are lost the first time the instance is upgraded.

- Administrators can customize the default homepages that appear for each user by navigating to **Homepage Admin > Pages** and selecting the homepage.
- Any user who has a role can customize the homepage that is specified for their role by navigating to **Self-Service > Homepage**.

Homepage items
You can add different types of objects or widgets to homepages using the **Add content** button.

You add an item to a homepage by clicking the add content icon ( ) at the top, left.

In the pop-up window, you select the homepage item you want to add. Some items pertain to specific features and applications, such as *CMS content blocks* and the Work Management dispatch map. The available items vary depending on what is active on your system.
Warning: Each gauge on your homepage is the equivalent of running a report. For example, a homepage with 10 gauges runs 10 separate reports each time it refreshes. Keep this in mind when adding content to your homepage. If your homepage consistently loads slowly, try removing gauges to determine why.

You can reposition items on a homepage by clicking the item header and dragging it to the new location. To remove a homepage item, click the close icon (X) on the right side of the item header.

Table 118: Homepage Items

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Live Feed</td>
<td>Your company feed.</td>
</tr>
<tr>
<td>Text Search</td>
<td>Lists of top searches in the instance.</td>
</tr>
<tr>
<td>Filters</td>
<td>System definition filters.</td>
</tr>
</tbody>
</table>

For more information on adding content to homepages, see Add existing gauges to a homepage on page 478.

Edit widget appearance

You can edit the way a homepage item, also called a widget, looks.

1. Move the pointer to the upper right corner of the widget to show the editing controls.
2. Click the edit widget icon ( ) on the right side of the item header.
3. Select one or more options to control the appearance of the widget, such as to show a border, set title alignment and size, and set the report height.
4. Optional: Use the Interactivity options to make the widget a subscriber or publisher. Interactive publishers require Performance Analytics premium.
5. Click Done.
Change the homepage layout

You can change the layout of widgets on the homepage.

1. In the Switch to page list at the top right of the homepage, select Change Layout.
2. Select the layout you want to use.
   Administrators can create or modify layouts by navigating to Homepage Admin > Layouts.
3. Click Change.

Delete a custom homepage

Deleting a customized page restores the default homepage for that user.
Warning: If a user with the admin role clicks **Delete page**, it deletes the homepage from the instance, which affects all users. This action cannot be reverted.

1. Navigate to the custom homepage to delete.
2. Click the **Delete page** link in the bottom right.

3. Click **OK** to confirm the deletion.

### Homepage and content page layouts

Layouts are UI elements that define how blocks of content can be added to a page. Layouts are used for homepages and content pages. Layouts provide the following functionality.

- Administrators can define custom layouts for homepages or content pages.
- Users who are allowed to modify their homepage can select a layout for their homepage.
- Users who are allowed to add content to their homepages can choose where in the layout to add content.

Most successful web sites use a fairly limited number of layouts to define the structure of a much larger number of pages. For example, a web site may have several dozen pages, but only two or three layouts.

**Layout concepts**

Layouts define the overall structure of the page by arranging where dropzones appear on the page.

The dropzone is where content blocks, which make up the content of the page, can be added. The name "dropzone" comes from the fact that content blocks can be dropped into any of these zones. Most content blocks match the width of the dropzone, so the dropzone controls both the location and sizing of the content block.

Defining a custom layout requires knowledge of Jelly script, but there are a number of out-of-box layouts that can be used. After a layout is chosen, the layout dictates where the dropzones on a page appear.

Content blocks can be added at any dropzone to create the actual content of the site. Every layout divides the page into one or more logical areas. A number of commonly used predefined layouts are available, but you can also define your own custom layouts.
Custom layouts
A homepage layout is a UI macro whose name begins with layout_. You can create a UI macro to define a custom layout.

To view the list of available layouts, navigate to **Homepage Admin > Layouts**.

- Layouts are XHTML scripts that contains one or more dropzones.
- Dropzones are defined by a TD (table data cell) within the HTML where content can be placed.

**Note:** Knowledge of Jelly is required to understand the following example.

For example, here is the code for a layout.

```xml
<?xml version="1.0" encoding="utf-8"?>
<j:jelly trim="true" xmlns:j="jelly:core" xmlns:g="glide"
xmlns:j2="null" xmlns:g2="null">
<table border="0" cellspacing="6" id="${jvar_name}" width="100%">
<tr>
<td colspan="2" id="dropzone0" dropzone="true"/>
</tr>
<tr>
<td id="dropzone1" dropzone="true" valign="top" width="50%"/>
<td id="dropzone2" dropzone="true" valign="top" width="50%"/>
</tr>
<tr>
<td colspan="2" id="dropzone999" dropzone="true" valign="top"/>
</tr>
</table>
</j:jelly>
```

**Rules for scripting layouts:**

1. A layout must contain at least one table.
2. All dropzones must be TDs within a table.
3. A dropzone has two key attributes:
   a. Its ID starts with "dropzone" (e.g., "dropzone2" or "dropzone3").
   b. It has an attribute of dropzone="true."
4. Dropzone IDs must be unique (e.g., you can't have two dropzones named "dropzone1").

**Optional layout features:**

- Nested tables are allowed, so it is possible to have a table within a TD within a table.
- There can be TDs that are not dropzones.
- Styles and formatting elements are acceptable.
- Fixed-width TDs (as opposed to variable width) are allowed, although some content, such as graphs, must have a significant minimum width.
- Fixed-height TDs are allowed.

**Layout hints and tips:**

If cellspacing and cellpadding are set to zero, the drag-and-drop algorithm may have trouble distinguishing one cell from another, since multiple empty cells can potentially occupy the same point in space. It is still possible to place things via
the layout control, and they will render properly. However, to use drag-and-drop to move things around, do not drop both cellspacing and padding to zero.

Choose a layout
Certain users have rights to modify their homepage. For example, an ESS user cannot change the layout of a homepage, but an ITIL user can change it.

Role required: any role that lets the user change homepage content.

1. On the homepage, click **Switch to page** in the top right corner and select **Change Layout** at the bottom of the choice list.

   The dialog box that appears contains a list of available layouts and a short description of each. Select a layout to see a simplified preview of the layout.

2. Select a layout and click **Change**.

   **Note:**
   
   1. If the page already has content and the layout changes, the existing content stays in the same dropzones it started in. For example, content in dropzone2 of the old layout appears in
dropzone2 of the new layout as well, although the dropzone may be in a significantly different location on the page.

2. If the new layout has fewer or different dropzones than the old layout, there may be orphaned content. For example, if there is content in dropzone5 of the old layout, and the new layout does not have a dropzone5, that content is now orphaned. Any orphaned content is moved to dropzone1.

---

**Add content to a homepage**

The Add Content interface allows you to specify into which dropzone you want to place your content.

You can see this in action by selecting the add content icon ( ) in the top left of your homepage.
When you select a piece of content, you see a preview of the content in the middle of the dialog. At the bottom of the dialog, you see a model of your current layout with an Add here link in each dropzone.
To add content to a particular dropzone, click **Add here** in the appropriate dropzone. Your content is automatically added without closing the dialog. You see the homepage change in the background.

Users who can change content on a homepage can search for gauges within a category when adding content to a homepage, and configure the appearance of gauges on homepages.

### Homepage caching

Complex, frequently visited homepages can slow down instance performance by consuming system resources. Homepage caching can improve performance by using less resources to load homepages.

When this feature is enabled, individual homepage widgets are cached and can be used by multiple users until the underlying data they depend upon changes, requiring a re-render.

Administrators can configure properties for homepage caching.

#### Configure homepage cache properties

The render cache is enabled by default with a set of sensible defaults. However, the configuration can be modified by a system administrator based on the needs of a particular customer environment.

This behavior is controlled by a set of three properties available under **Homepage Admin > Properties**.

<table>
<thead>
<tr>
<th>Enable the homepage render cache</th>
<th>Enables or disables the entire cache. If you disable the cache, then nothing is cached and nothing is retrieved from the cache.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum amount of time an entry stays in the render cache (in seconds):</td>
<td>By default, the system pulls an entry out of the cache if its underlying data changes. For example, if you have a gauge of &quot;incidents by priority&quot; that goes in the cache, the system removes it from the cache if the underlying incident data is updated. However, even if the underlying data has not changed, the system automatically expires cache entries older than this age. The default is 60 seconds, meaning that, at most, a cache entry persists for 60 seconds before being expired.</td>
</tr>
</tbody>
</table>

| Enable aggressive caching | If aggressive caching is turned on, then the only time entries are removed from the render cache is |

---

© 2017 ServiceNow. All rights reserved. 499
if they expire. Even if the underlying data changes, the system still returns the previously rendered chart/graph/whatever until it expires from old age.

Setting this to true can significantly improve performance, but it does so at the expense of serving known stale data. Under some circumstances, however, a combination of aggressive caching and a short maximum cache age (see above), may be appropriate.

**Homepage caching notes and limitations**

1. Customers with less than one hundred or so concurrent users should not expect to see a significant benefit to this feature in most real-world scenarios. Homepage visits in these situations are infrequent enough that most widgets will have aged out of the cache before a second user visits a homepage. If you're not seeing performance problems with your homepages, tweaking the behavior of this cache is probably going to be counterproductive, or at least a poor use of your time.

2. The homepage cache is segmented by company, domain, and roles, so customers with different rights and visibility into the system cannot see each other's data by pulling it out of the cache. This does, however, mean that cache efficiency will be lower for customers making extensive use of domain separation.

3. In an environment with a cluster of multiple UI nodes (as opposed to a UI node + worker configuration), each node has its own homepage cache. Entries are removed from the homepage cache only when their data changes on the node upon which they are cached. Entries are, of course, still removed from the cache when they expire.

**Homepage splash page**

When the homepage splash page is configured, a lightweight splash page loads before a homepage loads. The result is a more responsive experience for users.

For example, after logging in, users can navigate directly to the information they need without waiting for the homepage to load.
Figure 162: Homepage splash page

Activate the homepage splash page
Homepage splash pages are automatically activated for new instances. If you are upgrading from a previous version, activate the Homepage Splash Page plugin if it is not already active.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Configure a property for a homepage splash page
The Homepage Splash Page plugin installs the glide.home.page property and modifies the value of the glide.login.home property.

1. Enter sys_properties.list in the navigation filter and press the Enter key.
2. Select the glide.home.page system property.
   This property defines which page to load when a user selects a homepage from the banner.
3. Set the Value field to one of the following strings.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To use the homepage splash page (default)</td>
<td>home_splash.do?sysparm_direct=true</td>
</tr>
</tbody>
</table>
Manage a service catalog homepage

The homepage for a service catalog provides the primary front end for ordering items within that catalog. Administrators and catalog administrators can design a homepage in any of the following ways.

- Customizing the catalog homepage.
- Adding, removing, and arranging categories.
- Enabling content types.
- Using catalog properties to provide additional control over behavior and appearance.
- Using renderers to define the appearance of categories.

**Note:** End users can access the catalog through the customizable user homepage, or with content management pages that use content blocks for categories.

Enable content types

To select content types, also called widgets, to use for a catalog:

1. Navigate to **Service Catalog > Catalog Policies > Properties**.
2. In the **List of content types (comma-separated) to allow on the catalog homepage** (glide.sc.home.filter) property, enter the content types to use in the service catalog.

   To see a list of content types available, navigate to **System UI > Widgets**.
   
   The default value is **Service Catalog**, which includes only service catalog categories. For example, to include service catalog categories and gauges, set the property to **Service Catalog, Gauges**.

Customize a catalog homepage

1. Navigate to **Service Catalog > Catalog**.
2. Click the add content icon (+) at the top of the page to add a category.
3. Select a category in the middle panel of the pop-up window that appears.
4. Click **Add here** in the location where the category should appear on the homepage.
5. Optional: Repeat steps 3-4 to add more categories.
6. Close the pop-up window.
7. Optional: To change a category's location, drag it to the appropriate place.
8. Optional: To remove a category, click the (X) icon on the top right of the category header.

Define the mobile layout
You can configure the mobile layout for categories within a service catalog.

Role required: admin

By default, service catalog categories appear on mobile devices in the same order as on desktop devices.

1. Navigate to Service Catalog > Mobile Admin > Mobile Layout to display a list of service catalogs.
2. Click the lookup icon for the service catalog you want to configure.
   The mobile layout details for that catalog displays.
3. Click Edit to select which categories appear on mobile devices, and in which order.
4. Add, remove, or reorder the selected mobile categories, and then click **Save**.

**Note:** To return the display to the default desktop layout settings for the portal page associated with that catalog, click the **Replace categories with desktop layout** related link.
Configure content types
You can configure content types for the service catalog.

You can use service catalog properties to configure content types, which are also called widgets.

Navigate to Service Catalog > Catalog Policies > Properties to view service catalog properties.

Navigate to System UI > Widgets to see a list of content types available.

Enable content types for the Service Catalog

By default, only service catalog categories are displayed on the service catalog homepage.

To select additional content types, add these types in a comma-separated list in the List of content types (comma-separated) to allow on the catalog homepage property (glide.sc.home.filter).

For example, to include service catalog categories and gauges, set the property to Catalog Categories, Gauges.

Display the expand / collapse icon

By default, the expand / collapse icon is not displayed for categories on the service catalog homepage.

To display this icon on the left of each category, check Yes beside the Toggle whether the expand/collapse icon is rendered for category widgets on the service catalog homepage property (glide.sc.homepage.show.collapse).
Configure search and navigation
You can use service catalog properties to configure search and navigation within the service catalog homepage.

Navigate to Service Catalog > Catalog Policies > Properties to view service catalog properties.

Restrict search access
Each catalog homepage provides a search bar to help locate items not displayed on the homepage. By default, any user who can access the catalog homepage can search using this search bar.

To restrict access to this search function by role, use the List of roles (comma-separated) that can search the service catalog property (glide.sc.can_search).

For example, to only allow logged-in users to access search, set this to blank. To remove the search function for all users, set this to None.
Note: Search results only show items that the logged-in user can access.

**Hide search results from inactive categories**

By default, search results are returned from all categories, including inactive categories.

To avoid returning results from inactive categories, set the **Service catalog searches return items in inactive categories** property (glide.sc.search.disabled_cats) to **No**. For example, when designing a new category, you may want to avoid users seeing search results from this category until you are ready to make it active.

Note: Security constraints may also make a category or catalog item inaccessible.

**Restrict search by item type**

By default, a search field does not appear when viewing order guides, record producers, and wizard launchers.

To define which catalog item types do not show the search field, list these types in the **List of class names for catalog items that do not have the search field displayed** (glide.sc.item.cannot_show_search) property.

For example, to enable searching when viewing record producers, remove `sc_cat_item_producer` from this list.
Request a reset of a password for a service or an application.

Request a reset of a password for a service or an application.

- Telephone
- SMS

Submit

Figure 164: Service catalog search bar removed
Enable breadcrumb links

By default, breadcrumbs appear without links when using content management pages as service catalog homepages.

To display these breadcrumbs with links, set the **Use links for breadcrumbs rendered in Service Catalog pages accessed via a CMS site** property (glide.sc.use_breadcrumb_links.cms) to Yes. This provides greater navigational control for end users.

Disable search suggestions

By default, service catalog searches display “Did you mean?” suggestions if a search does not return any results and an alternate spelling or similar recent search does.

To disable these suggestions, set the **Specify whether search suggestions should be enabled** property (glide.sc.search.suggestions) to No.

Change the parameter for parallel homepage rendering

The system uses a parallel rendering algorithm to speed up home page rendering.

Role required: admin
In testing, the average performance benefit is between 20% to 50% depending on the page in question. Administrators can set parallel homepage rendering properties for optimal performance on an instance. To change the parameters for parallel homepage rendering, add the following system properties.

1. glide.ui.homepage.parallel: enables or disables parallel homepage rendering. The default value is true.
2. glide.ui.homepage.parallelism: sets the number of threads to use when rendering a homepage. The default value is 2.

Turn on homepage render time

To see render times on homepage widgets, you can turn on homepage debugging.

Role required: admin

Navigate to System Diagnostics > Debug Homepage Render.

For the remainder of your session, load times appear on homepage widgets and debugging messages appear at the bottom of homepages. Use these times to identify items that may slow down homepage rendering.
Debug Output  Others

13:24:53.431: Homepage Widget "Users by Location" output in time: 0.108
13:24:53.441: Homepage Widget "My Groups Work" output in time: 0.120
13:24:53.583: Homepage Widget "Open Items by Escalation" output in time: 0.130
13:24:53.596: Homepage Widget "My Work" output in time: 0.157
13:24:53.610: Homepage Widget "ITIL Summary Counts" output in time: 0.020
Troubleshoot a report on a homepage

You can troubleshoot reports that may be impacting homepage performance by identifying which reports are on the problem homepage, determining which reports are running slowly, and correcting problems in slow reports.

Role required: admin

1. Navigate to **Homepage Admin > Pages**.
   
   Opening the homepage record instead of the homepage saves time and system resources.

2. Open the problem homepage record.

3. In the **Portal** related list, note item names in the **Summary** field.
   
   These items may not all be reports.

4. Enter `sys_report.list` in the navigation filter to open a list of all reports.

5. Search for a report title that matches an item on the homepage that you noted down from the **Summary** field.

6. Open the report and run it.

7. If the report runs slowly, look for and correct the following common reporting mistakes.

   • Returning too many results
   • Grouping by fields such as duration or name
   • Reporting on a user-created table that uses many joins on other tables

8. If the report runs slowly and correcting common mistakes does not help, examine the type of report and what data it reports. Look for ways to optimize or replace the report.

9. Repeat these steps for each item on the homepage.

Create a widget that displays a ServiceNow UI page

You can create a widget that displays a ServiceNow UI page. This widget can be added to homepages and dashboards.

Role required: admin

A UI page is a ServiceNow page that is not a list or a form. Certain UI pages, such as external site widgets or gadgets, may not display properly on a homepage or dashboard.

1. Identify the UI page that you want to create into a widget and note its name.

2. Navigate to **System UI > Widgets** and click **New**.

3. Enter a **Name** for the widget. This field defines the first category a user selects when adding the widget to a dashboard or homepage.

4. Enter the following code, making substitutions as noted below.

   • **Widget** is the title of the widget. This title appears on the top of the widget when you add it to a dashboard or homepage.
   • **widgetname** is the name of the UI page from step 1. This field defines the second or subcategory a user selects when adding the widget to a dashboard or homepage.

```javascript
function sections() {
    return {
        'Widget': {
            'type': 'widgetname'
        }
    };
}
```
function render() {
    var scope = gs.getCurrentScopeName();
    scope = (scope == "rhino.global" ? "" : scope + "_");
    var page = renderer.getPreference('type');
    return renderer.getRenderedPage(scope + page);
}

function getEditLink() {
    var scope = gs.getCurrentScopeName();
    scope = (scope == "rhino.global" ? "" : scope + "_");
    var page = renderer.getPreference('type');
    return "sys_ui_page.do?sysparm_query=name=" + scope + page;
}

To learn how to make a UI page without using a framework page template, see the Making a UI page without using the framework page template blog posting by a developer in the ServiceNow Community.

State flows

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task [task] table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the State field in an incident changes from Active to Awaiting User Info. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Work Management application were reimplemented to use state flows.

Installed with state flows

Several types of components are installed with state flows.

Tables installed with state flows

Tables

State flows adds the following tables.

Table 119: Tables for state flows

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow [sf_state_flow]</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
<tr>
<td>Work Order Flow [sf_work_order]</td>
<td>Contains state flow definitions for work orders. This table is installed when Work Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow [sf_work_task]</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Work Management is activated.</td>
</tr>
</tbody>
</table>

Business rules installed with state flows
## Business rules

State flows adds the following business rules.

### Table 120: Business rules for state flows

<table>
<thead>

<tr>
<td>StateFlowAJAX</td>
<td>Allows access to state flow functionality from client scripts.</td>
</tr>
</tbody>
</table>

Use state flows

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending *email notifications*.

Administrators can configure state flows to:

- Limit the *choice list* for the *State* field to contain only those states that are valid for the flow.
- Define the *behavior and visibility* of specific fields on a task form when state transitions occur and for certain end states.
- Configure *events that are triggered when a task changes states*.
- *Set up* UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

Create a state flow

Creating State Flows.

1. Navigate to *State Flows* > *State Flows* and click *New*.
2. Fill in the fields, as appropriate.

   The system enforces the field controls with the same client script that filters the choice list for the State field.

### Table 122: Creating state flows

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number</td>
</tr>
<tr>
<td>Table</td>
<td>[Required] Table on which the state flow record runs. Only tables that extend the Task [task] table are available in the list.</td>

<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Starting state</td>
<td>Name of the state at the beginning of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Ending state</td>
<td>Name of the state at the end of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Client script</td>
<td>Client script to run for this transition. The client script controls the available states you can select by limiting the contents of the State choice list to valid states. This client script also controls specific field behavior configured for state changes in the Field Controls section of the form.</td>
</tr>
<tr>
<td>Event</td>
<td>Name of an existing event to trigger when this transition occurs. See Triggering Events on State Changes for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of this record. Make sure the name is descriptive of the state transition or the processing that the record is performing. This name does not have to be unique.</td>
</tr>
<tr>
<td>Roles</td>
<td>Not used for any processing.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this state flow record.</td>
</tr>
<tr>
<td>Class</td>
<td>Defines the state flow class for this record. The system selects the appropriate class from these options:</td>
</tr>
<tr>
<td></td>
<td>• State Flow: Records created for state flows in all task-based tables except those in work management.</td>
</tr>
<tr>
<td></td>
<td>• Work Order Flow: Records created for state flows in the Work Order [wm_order] table. This class is available when work management is activated.</td>
</tr>
<tr>
<td></td>
<td>• Work Task Flow: Records created for state flows in the Work Order Task [wm_task] table. This class is available when work management is activated.</td>
</tr>
<tr>
<td>Dictionary override</td>
<td>Sets the starting value for the State field on all new records for the table named in the state flow record. See Dictionary Overrides for configuration procedures.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Noteworthy comments about this state flow transition. For details about how these notes are used, see Work Notes.</td>

<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Manual (Runs scripts from a UI action that require the user to click a button or related link.)</td>
<td></td>
</tr>
<tr>
<td>Manual condition string</td>
<td>Conditions for enabling a UI action that cannot be defined with the condition builder. For example, you can use this string to define UI actions for mobile devices. This condition has an [and] relationship with the condition in the Manual condition field.</td>
</tr>
<tr>
<td>Manual condition</td>
<td>Conditions for enabling a UI action that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Manual condition string field.</td>
</tr>
<tr>
<td>Manual script</td>
<td>Script that defines what the UI action does when the conditions are true. This script runs when the user clicks a button or a related link.</td>
</tr>
<tr>
<td>UI action</td>
<td>[Read Only] Name of the button that the system creates to enable this transition. The system creates the label using the same name as the state flow record that created it.</td>
</tr>
<tr>
<td>Automatic (Runs a business rule automatically when a task record is changed and updated.)</td>
<td></td>
</tr>
<tr>
<td>Automatic condition string</td>
<td>Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an [and] relationship with the condition in the Automatic condition field.</td>
</tr>
<tr>
<td>Automatic condition</td>
<td>Conditions for running the business rule that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Automatic condition string field.</td>
</tr>
<tr>
<td>Automatic script</td>
<td>Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the Automatic condition must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field Controls (Determines <em>field properties</em> when a record transitions between states or reaches a specific end state.)</td>
<td>Makes the selected fields required when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Mandatory fields</td>
<td>Makes the selected fields required when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Read only fields</td>
<td>Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Visible fields</td>
<td>Displays the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not mandatory</td>
<td>Makes the selected fields optional when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not read only</td>
<td>Makes the selected fields editable when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not visible</td>
<td>Hides the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.
   - Manual: Click **Create UI Action** to create a button on the task form that enables users to execute the transition manually. The system uses the value in the Name field as the label for the UI action. The UI action executes the script in the Manual Script field when the conditions are true. For example, a manual transition can create an **Activate** button when an incident is in the New state that enables a user to mark the incident as active.
   - Automatic: Click **Create Business Rule** to create the business rule. The business rule executes the script in the Automatic Script field when the conditions are true. For example, a business rule created by the system can set an incident state to Assigned when the Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see [Business Rules](#).

4. Optional: Click **Create Client Script** to create the script that limits the values offered in a task record's State field to valid states for that transition.

5. Configure the fields in the Field Controls section to control how specific fields display when a task record changes states.

*Dictionary overrides in state flows*
A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.

1. In a state flow record, select an **Ending state**.
   - This is the override value which becomes the starting state for all new records in the table named.

2. Click **Create Default Value**.
The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the Create Default Value button on all subsequent state flow forms for that table.

**Events triggered on state changes**
You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a *business rule* called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

**Field controls**
You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

The best practice when creating field controls is to configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record's State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

**Note:** State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects as needed to enforce field properties in state flows:

**Table 123: Field Controls**

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>State Flow Notes for &lt;table name&gt;</td>
<td>Enforces mandatory fields for the table on which that field behavior is defined.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>&lt;table name&gt; state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>&lt;table name&gt; change state flow</td>
<td>Sets updated mandatory, read-only, and visible properties when a record is changed.</td>
</tr>
</tbody>
</table>

**Rebuild state flows**
You can rebuild state flows when a mismatch between existing and new sys_ids occurs.
When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to State Flows > Admin > Rebuild State Flows. This module runs a script that compares the numerical value of each item in the State field choice list until it finds a match in the imported state flow record.

State flow cleanup

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td></td>
</tr>
<tr>
<td>Dictionary override</td>
<td></td>
</tr>
<tr>
<td>Business rule that processes events triggered by a state flow</td>
<td>All state flows for the table specified that have events configured are deleted.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>All state flows for the table are deleted.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>All state flows with field controls are deleted.</td>
</tr>
<tr>
<td>Work notes business rule</td>
<td>All state flows with field controls or work notes are deleted</td>
</tr>
</tbody>
</table>

Work notes

Work notes are an important part of the state flow process and are used to communicate information about state transitions.

The state flow adds these work notes to the Work notes field of any task making this transition.

These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

Objects to enforce state flow field properties

ServiceNow creates the following objects as needed to enforce field properties in state flows.
Table 125: Objects for Enforcing Field Properties in State Flows

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>State Flow Notes for &lt;table name&gt;</td>
<td>Enforces mandatory fields for the table on which that field behavior is defined.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>&lt;table name&gt; state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>&lt;table name&gt; change state flow</td>
<td>Sets updated mandatory, read-only, and visible properties when a record is changed.</td>
</tr>
</tbody>
</table>

Survey Management

The Survey Management application allows you to create, send, and collect responses for basic surveys.

Table 126: Survey applications

<table>
<thead>
<tr>
<th>Survey Management</th>
<th>Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Note: Survey administrators can continue to use legacy survey functionality and data. The recommended course of action, however, is to migrate legacy surveys to the Survey Management platform. Concurrent use of both Survey Management and Legacy Surveys applications can result in confusion and redundancy.</td>
</tr>
<tr>
<td></td>
<td>Survey wizards are not impacted and cannot be migrated.</td>
</tr>
<tr>

<tr>
<td>Create survey modules.</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td><strong>Public survey:</strong> Allow persons to take a survey without logging in.</td>
<td>✔️</td>
<td>✔️</td>
</tr>
</tbody>
</table>
There are also many options for advanced configuration. Some of the many things you can do with surveys include:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it and send all of them invitations simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

### Survey Management roles

The Survey Management application uses the following roles.

No role is required to take survey questionnaires that are assigned to you.

#### Table 128: Survey management roles

<table>
<thead>
<tr>
<th>Role title</th>
<th>Role name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey administrator</td>
<td>survey_admin</td>
<td>Survey administrators create and administer surveys. They know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey Management application menu. The survey_admin role contains the survey_reader and assessment_admin roles.</td>
</tr>
<tr>
<td>Survey reader</td>
<td>survey_reader</td>
<td>Survey readers view surveys and related information, such as survey responses, survey groups, scorecards, and reports.</td>
</tr>
<tr>
<td>Administrator</td>
<td>admin</td>
<td>Administrators have access to all aspects of the survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>
Key survey terms
Survey admins use particular terms when working with surveys.

Table 129: Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information like the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the Assigned to field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on survey questionnaires for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

Survey results
Survey results for each question and category are calculated automatically.

If you use survey result calculations for results and scorecards, ensure that the Positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.
Survey responses

Survey results are stored in the Metric Result [asmt_metric_result] table and display the recipients’ answers to each question in a category. To view general results, navigate to Survey > Survey Responses. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.

Figure 166: Survey designer metric results

Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the [Type.Evaluation method] [is] [Survey] condition.

Figure 167: Assessment category results

Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a scorecard on page 529.
Survey responses
Survey responses are stored on the Metric Result [asmt_metric_result] table.

There is a metric result record for each user's response to each question on every survey instance.

Survey readers and survey administrators can view results for all surveys or for one specific survey.

View results for all surveys
Survey responses are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey Management > Survey Responses.
2. Do not confuse this module with Survey Management > Legacy Surveys > Survey Responses, which displays legacy survey responses.
3. The Type column displays the survey definition each response is associated with. Recall that survey definitions are stored on the Assessment Metric Type table, which is what the name Type refers to.

View the results for a particular survey
Survey responses are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey Management > View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   - The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   - The metric result contains the user's response as well as calculated values, which advanced survey administrators may be interested in. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.
Metric result fields
List of field descriptions for the Metric Result form.

**Table 130: Metric Result form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• Checkbox: The actual value is 0 if the checkbox is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the question’s Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

**View a scorecard**

Role required: survey_admin or survey_reader

1. Navigate to Survey Management > View Surveys.
2. Open a survey definition.
   The scorecard link is hidden if there are no survey results to report.

The scorecard contains a header that displays the name of the survey and a section that displays results or compares the ratings. The scorecard presents results in the following views:

- Category Results
- Question Results
- Average Ratings
- History

**Survey scorecards**

The Survey Management application prepares printable scorecards.

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

The scorecard contains a header that displays the name of the survey and a section that displays results or compares the ratings. The scorecard presents results in the following views:

- Category Results
- Question Results
- Average Ratings
- History

**Survey scorecard category results**

The Category Results view is a stacked bar chart showing survey results for all questions in a category by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.

**Figure 169: Survey scorecard category results detail**

Survey scorecard question results
The Question Results view shows the results for each question in a category using different chart types, based on a data type.

**Pie chart**

The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)
Bar chart

A bar chart appears when question results use the Percentage data type.

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

Was technician ab...  

Average Normalized value
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

![Diagram of survey scorecard history]

**Figure 172: Average ratings detail**

Survey scorecard history
The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year’s ratings.

Figure 174: Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Figure 175: Survey scorecard history - 4 quarters
Export a scorecard as an image
Role required: admin or survey_admin

Click the menu icon (⋮) and select **Save as PNG** or **Save as JPEG** as the download format.

When the export is complete, select **Download** to save the scorecard image to a storage location.

**Survey Administrator tasks**

Survey administrators create and administer surveys. They know what types of surveys are necessary, and when and how to send a survey to survey readers.
Survey administrators can use all modules in the Survey Management application. The survey_admin role contains the survey_reader and assessment_admin roles.

*Create a survey in the Survey Designer*

When you create a survey, you can create one or more categories and then add questions to each category.

Role required: admin or survey_admin

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. Create a survey using these procedures:

- Create the categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Survey designer**

Users with the survey_admin role can use the survey designer to create, edit, and distribute surveys.

The survey designer replaces the survey creator. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

**Survey designer elements**

The survey designer is accessible from [Survey > Survey Designer](survey_designer). The survey designer contains controls, a header bar, and the design canvas.

**Controls**

To create a question, drag the appropriate data type control from the [Controls](controls) palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score between 0 and 10.
### Table 131: Question data types

<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a Template Question.</td>
</tr>
<tr>
<td>Reference</td>
<td>No</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.</td>
</tr>
</tbody>
</table>

### Header bar

The tabs on the header bar display views and a menu of functions.
Figure 177: Survey Designer header bar and menu

Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a *signature*.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon () to select an option. The list of options depends on the currently open survey.

- **Save**: Save the current survey.
- **Preview**: Display a preview of the survey as it will appear to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.

**Design canvas**

New surveys open in the canvas of the **Design** view. The survey **Name** field appears above first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer
The configuration values you use in this procedure are applied to the entire survey.
Role required: admin or survey_admin
1. Select **Configuration** in the survey designer.
2. Complete the Survey Designer Configuration form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box for collecting survey responses anonymously. Recipients are not listed with survey results.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the survey to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the <strong>End note</strong> content does not appear.</td>
</tr>
</tbody>
</table>

**Figure 178: Initial appearance of the Survey Designer canvas**
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a <strong>Return URL</strong> is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.</td>
</tr>
</tbody>
</table>

**Note:** By default, the system runs a script every 30 days to cancel expired survey and assessment instances that are in the **Work in progress** or **Ready to take** states. The schedule item is called **Cancel Expired Assessments**.

Create a category in the survey designer

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions. For simple surveys, one category is usually enough.

Consider creating additional categories to:

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

1. Navigate to **Survey > Survey Designer**.
2. Enter the name of the survey in the **Name** field. The system uses this name as the name of the survey and the first category.
3. To configure the category, click in the gear icon in its title bar. The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to recipients.
4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create a survey category
Survey administrators can create and administer survey categories.
Role required: admin or survey_admin
Only one category is required for each survey, but you can create as many as you like.

1. Navigate to Survey Management > View Surveys.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category or click **New**. Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.

4. Complete the Survey Category form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the category. The category name appears on questionnaires when:</td>
</tr>
<tr>
<td></td>
<td>• There is more than one category for the survey.</td>
</tr>
<tr>
<td></td>
<td>• There is only one category and its name is different than the survey</td>
</tr>
<tr>
<td></td>
<td>definition name. If you create a survey using the survey creator, the</td>
</tr>
<tr>
<td></td>
<td>category name is the same as the survey definition name.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the category.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment</td>
<td>All survey questions in this category.</td>
</tr>
<tr>
<td>Metrics</td>
<td></td>
</tr>
<tr>
<td>Users</td>
<td>All survey users for this survey.</td>
</tr>
</tbody>
</table>

5. Save the record.

Survey categories
Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

Create a question in the survey designer
You can create multiple questions for each category, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Complete the form.
## Table 134: Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. If a question is marked inactive, it does not appear on surveys generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit surveys until they answer all mandatory questions, which are denoted by a red field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multiline text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question Data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a survey. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Note: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low values if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High values if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options. You must have at least two options, and each option must have a unique value. <strong>Note</strong>: Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dependency</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of <strong>Boolean</strong>, <strong>Choice</strong>, <strong>Scale</strong>, or <strong>Template</strong>. Create the condition that must exist for recipients to see the dependent question, using the <strong>is</strong> or <strong>is one of</strong> operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab. Fill in the fields, as appropriate. Dependent questions appear on the survey when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the **Displayed when** field.
The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

Survey question data types
You must choose a **Data type** for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

**Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Date and Date/Time data types**

The **Date** and **Date/Time** data types are very similar.

- **Date:** On questionnaires, users select a date.
Figure 180: Question of the Date data type

- **Date/Time**: On questionnaires, users select a date and time.

Figure 181: Question of the Date/Time data type
**Likert Scale data type**

On questionnaires, users select a multiple choice value from a custom *Likert scale*. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options *Easy, Average, and Difficult*.

![Likert Scale Example](image)

**Figure 182: Question of the Likert Scale data type**

If you select *Likert Scale*, you must fill in the *Scale definition* field and create answer options. Select *High* for the scale definition if the answer option with the largest metric definition *Value* is best.

**Note:** The system sets the *Min* and *Max* fields automatically based on the *Value* settings for the associated metric definitions.

**Number data type**

On questionnaires, users enter a number.

![Number Example](image)

**Figure 183: Question of the Number data type**

If you select *Number*, you must fill in these additional fields:

- **Scale definition**: Select *High* if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. It is usually best to state the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.
If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min and Max**: Enter the smallest and largest numbers users can enter. Generally, 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

### Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
Figure 185: Question of the Reference data type

String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 186: Single line
**Template data type**

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

**Yes/No data type**

On questionnaires, users select **Yes** or **No** from a list.
Geneva    ServiceNow    ServiceNow Platform

Figure 189: Question of the Yes/No data type

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

Edit a survey in the survey designer
You can modify surveys using the survey designer.
Role required: admin or survey_admin

You can edit a survey even after it has been distributed, with these results:
• Added questions are available only on surveys that are distributed after this change.
• Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
• Deleted questions are also deleted from the distributed surveys in users' queues.

1. Navigate to Survey > Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.

Configure category weights for a survey
The system calculates results from the weight configured for each category.
Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.
1. Navigate to Survey > View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. In the Survey Category form, click the menu icon in the header bar and select Configure > Form Layout.
4. Move the Weight field to the Selected list, and click Save.
5. Edit the default weight value, and update the record.

View a survey instance
A survey instance represents one questionnaire assigned to one user. You might view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.
Role required: admin or survey_admin

Navigate to Survey Management > Survey Instances and open a survey instance.
Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.
### Table 135: Survey Instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Survey definition this survey instance was created from. Survey definitions are stored on the Assessment Metric Type table, which is why the field is called Metric type.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the survey instance should be completed. The system populates the due date based on the Assessment duration of the associated survey definition, which is set to 14 days by default. For example, a survey instance generated March 2nd would be due March 16th by default. The survey due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> By default, the system runs a script every 30 days to cancel expired survey and assessment instances that are in the Work in progress or Ready to take states. The schedule item is called Cancel Expired Assessments.</td>
</tr>
<tr>
<td>State</td>
<td>State of the survey instance. The possible states are Ready to take, In progress, Complete, and Canceled.</td>

<tr>
<td>Assigned to</td>
<td>User this survey instance is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Expiration date</td>
<td>Date on which the assigned user can receive a new instance of the same survey definition. The system automatically populates the expiration date based on the Schedule period of the associated survey definition.</td>
</tr>
<tr>
<td>Related List</td>
<td></td>
</tr>
</tbody>
</table>
### Field Description

**Assessment Instance Questions**

All instance question records, which store user response values for each question on the survey questionnaire. The following columns are relevant to surveys:

- **Category**: Displays the survey categories the questions belong to.
- **Metric**: Displays the survey questions.

---

**Select recipients for a survey in the survey designer**

You can use this procedure to determine who receives the survey.

**Role required**: admin or survey_admin

1. After a survey is created and configured, click *Availability* to determine who receives the survey, and specify accessibility by selecting one of the following.

   - **Anyone**: Allows any user with an account on the instance to take the survey. For example, you can send users the survey URL via email.
   - **Specific users**: Allows you to choose specific users, groups, or survey groups.

2. Click *Save*.
Designate a survey user

You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to **Survey Management > View Surveys**.
2. Open a survey definition.
   There must be at least one category.
3. In the **Survey Users** related list, click **New** to open the Survey User form.

   ![Survey User form]

4. Select a **User**.
5. Click **Submit** to return to the survey definition.

   To remove survey users, in the **Survey Users** related list, use the action check boxes and choice list.

Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users from the survey creator.

Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition **Schedule** period is set to **Daily**, **Weekly**, **Monthly**, or **Yearly**. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the survey creator, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Survey creator

You can designate multiple survey users using the survey creator. In the Survey User Access section, select the **Selected users can take this survey** option, then use the slushbucket to add users.
Alternatively, select the Members of the selected groups can take this survey option, then use the slushbucket to add survey user groups or other groups. The system saves the users as survey users when you save or publish the survey.

Create a survey user group
Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys.

Role required: admin or survey_admin

When you use the survey creator you can select survey user groups or any other groups whose members you want to assign surveys.

Though it is possible to designate members of any group as survey users, you might want to create a survey group for the added convenience of viewing it in the survey User Groups module.

Note: The user_admin role is required to create and edit groups.

1. Navigate to Survey Management > Administration > User Groups.
2. Click New.
3. Fill in the fields on the Group form and add members, as appropriate.

Designate or remove multiple survey users at one time
Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.

3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   
   The changes are also reflected in the Survey Users related list on the survey definition.

Allow recipients to retake a survey
You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Role required: admin or survey_admin

Results are not calculated until the survey's configured duration has elapsed. The card in the user's queue remains visible until the survey's due date, and a button is displayed to allow retakes.

1. Navigate to **Surveys > View Surveys**.
2. Select a survey from the list.
3. In the Survey Definition form, click the menu icon in the header bar and select **Configure > Form Layout** from the context menu.
4. Move the **Allow retake** field to the **Selected** list, and click **Save**.
5. Select the **Allow retake** check box, and update the form.

---

**Publish a survey**

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The **State** field on the Survey Definition form indicates whether the survey is in the **Draft** or **Published** state. If you do not publish the survey when you use the survey creator, open a draft survey definition and click **Publish**.

When you publish a survey, the system generates survey instances for any associated survey users. You can **assign** the survey to other users manually.

**Note:** You cannot return a survey to the **Draft** state after it has been published. You do have the option to deactivate a survey by clearing the **Active** check box.

---

**Publish a survey in the survey designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. To view the survey as the recipients will view it, point to the menu icon and click **Preview**.
2. When you are satisfied with the survey, click either **Save and Publish** or **Publish** to distribute it.

   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

---

**Customize the appearance of a survey**

You can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

**Note:**

- For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

1. Navigate to either of the following modules.
   - **Assessments > Admin > Assessment Properties**
   - **Survey Management > Administration > Properties**
2. On the properties page, edit the properties as needed. Reference the screenshot below to see what parts of assessment questionnaires are controlled by the properties.

3. Click **Save**.

**Note:** You may need to clear the browser’s cache to see updates.

---

### Editing assessment and survey properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| `css.assessment.question.header.background.color` | Assessment question header background color | Sets the background color of question headers on assessment and survey questionnaires.  
  • **Default value:** #767676            |
| `css.assessment.caption.background.color`    | Assessment caption background color | Sets the background color of the caption on assessment and survey questionnaires.  
  • **Default value:** #eee               |
| `css.assessment.caption.font.color`          | Assessment caption font color  | Sets the font color of the caption text on assessment and survey questionnaires.  
  • **Default value:** #ffffff            |

---

**Assessment and survey properties**

Assessment administrators and survey administrators can use properties to customize assessments and surveys. Note that customizations you save apply to all assessments and surveys.

**Change the survey question header color**
All of the lists and forms draw the color of their headers from the base color, allowing theming from the CSS properties. One notable exception is the survey, which has its own set CSS. It is possible to change the CSS by adding a property.

1. Enter sys_properties.form into the navigation filter to display a new Property form.
2. Name the new property css.list.row.survey.background.color and enter the hexadecimal value of the desired color into the Value field.
3. Save the property.

The survey should now use the desired color.

Customize a survey definition
Survey administrators can customize survey definitions by adding options.

Role required: admin or survey_admin

1. Navigate to Survey Management > View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.
2. Open a survey definition.
3. Modify the fields on the Survey Definition form, as appropriate.

<table>
<thead>
<tr>

**Note:** If you add this related list to the form, use list control to omit the New button. Survey instances must be generated by the system to produce functional surveys.

4. Save the record.

**Schedule periods**

The available schedule periods are **Only Once**, **No Limit**, **Daily**, **Weekly**, **Monthly**, and **Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything but **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job does the following:

- Ensures that a user can take one survey instance of the same survey per schedule period.
• Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not Complete.

For example, if you set the schedule period to Monthly and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the Expiration date field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything but No Limit, the Expiration date field is automatically set to the appropriate date. For example, if the schedule period is Weekly, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period. Consider the following example: Sal Pindell receives a survey instance when the schedule period is Weekly. The next day, a survey administrator changes the schedule period to No Limit. Sal cannot receive another survey instance until one of the following actions occur:

• Seven days pass from the time Sal's survey instance was generated.
• A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

Note: If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.

Survey definitions
A survey definition is the root record on which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators might want to modify the survey definition to configure additional options for the survey or publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Create a survey designer template question
You can create a question that uses choice lists from a template.

Role required: admin or survey_admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.
Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.
Create or modify survey questions
You can create and administer survey questions.
Role required: admin or survey_admin

Note: Changes to a survey, such as the addition of questions or the modification of question templates, do not apply to the existing survey instances immediately. However, the changes apply immediately to any new survey instances that you create after saving the changes.

1. Navigate to Survey Management > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.
5. Complete the Survey Question form, as appropriate.
   The specific fields available depend on the selected Data type.

Table 138: Survey Category form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. When you create a survey using the survey creator, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>[Required] Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>

</tr>
<tr>
<td>Data type</td>
<td>[Required] Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the data type if another question depends on this question. See <strong>Depends on</strong>.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the data type is <strong>Template</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the template if another question depends on this question.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only when certain data types are selected. For more information, see Survey question data types on page 555.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the data type is <strong>Choice</strong> or <strong>Likert Scale</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options for certain questions may make those questions confusing for the person answering. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>

<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is <em>not</em> Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
</tbody>
</table>
| Allow not applicable | Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations.  
This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.  |
| Depends on      | Setting used to make this a conditional question, meaning it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.  
The triggered survey example demonstrates how to create and use conditional questions. |
<p>| Displayed when  | Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.  |
| Min             | Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>Answer options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.

Be sure to create answer options if you select the Choice or Likert Scale data type.

---

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, like the question text and the data type. You might want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.
Survey questions are available from **Survey Management > Questions**. The list displays information about each question, such as the associated survey definition, which appears in the **Type** column, and the data type. Survey administrators can modify these questions.

**Survey question data types**

You must choose a **Data type** for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

![Choice data type example](image)

**Figure 190: Question of the Choice data type**

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

**Note**: The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Date and Date/Time data types**

The **Date** and **Date/Time** data types are very similar.

- **Date**: On questionnaires, users select a date.
Figure 191: Question of the Date data type

- **Date/Time:** On questionnaires, users select a date and time.

Figure 192: Question of the Date/Time data type
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom *Likert scale*. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options *Easy*, *Average*, and *Difficult*.

![Likert Scale Example](image)

Figure 193: Question of the Likert Scale data type

If you select *Likert Scale*, you must fill in the *Scale definition* field and create answer options. Select *High* for the scale definition if the answer option with the largest metric definition *Value* is best.

**Note:** The system sets the *Min* and *Max* fields automatically based on the *Value* settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.

![Number Example](image)

Figure 194: Question of the Number data type

If you select *Number*, you must fill in these additional fields:

- **Scale definition:** Select *High* if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max:** Enter the smallest and largest numbers users can enter. It is usually best to state the range of acceptable answers in the question text.

Percentage data type

On questionnaires, users enter a number.
Figure 195: Question of the Percentage data type

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min and Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 197: Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

Create a survey question template
You can create and administer question templates.

Role required: admin or survey_admin

| Note: Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. |

1. Navigate to Survey Management > Templates.
   Each template is stored as a record on the Assessment Metric Template [asmt_template] table.

2. Click New.

3. Fill in the Name field and save the record.

4. In the Assessment Template Definitions related list, click New.
   Create a template definition for each answer option you want to appear on a question.

5. Fill in the following fields:
   - Display: Enter the text to appear as the answer option.
   - Value: Enter a numeric value, greater than or equal to zero, to which the answer option equates.
     Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.

6. Click Update.
Note: Any templates you create are available for use with both surveys and assessments.

Survey question template
Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

Figure 201: Template definition

Templates are available for survey questions that have Data type set to Template. The following question templates are available by default.

Table 139: Default question templates

<table>
<thead>
<tr>
<th>Name</th>
<th>Template Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Name</td>
<td>Template Definitions</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

Update min and max values to match templates

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

The system sets the Min and Max fields based on the template definition values when you create a question of the Template data type. The system does not, however, update the fields for existing questions if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey Management > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>]
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin

   **Note:** Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Open a choice or Likert scale survey question.
2. In the Assessment Metric Definitions related list, open a metric definition or click New.
   Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
3. Complete the Assessment Metric Definition form.

   **Table 140: Assessment Metric Definition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>[Required] Text to appear as the answer option.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

**Table 141: Answer option order based on value**

<table>
<thead>
<tr>
<th>Answer Option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question **Scale definition** is set appropriately based on the answer options. In the previous example, if you want the answer option **Good** to earn the highest score, the scale definition should be **Low** because **Good** has the smallest value.

**Change the order of survey questions**

You can easily reorder survey questions at the category level or the question level.

**Role required:** admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. You may want to change the order of questions if you add a new question manually after creating other questions when you use the survey creator.

When you create questions using the survey creator, the system sets the **Order** field for the first question to **101**, the second to **102**, and so on. When you create a new question outside of the survey creator, the **Order** is set to **100** by default, which means it appears before all questions generated by the survey creator.

1. Navigate to **Survey Management > View Surveys** and open the appropriate survey definition.
2. In the **Metric Categories** related list, edit the values in the **Order** column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the **Assessment Metrics** related list.
   b) Edit the values in the **Order** column.
4. Click **Update**.

*Configure a trigger condition for a survey*

You can configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to **Survey Management > Trigger Conditions**.
2. Click **New**.

   **Note:** Do not specify particular users for a triggered survey because only the specified users will be able to take the survey.

3. Complete the form, as appropriate.

### Table 142: Trigger condition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident [incident] table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User [sys_user] table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send her only one survey every 30 days.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the Schedule period of the selected survey definition is set to **No Limit**. If the schedule period is set to a different value, it may prevent the trigger condition from sending surveys as expected.

<p>| Active      | Check box that determines whether this trigger condition is active (selected). |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Related Field 1-4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, if you select the Incident table, you might select Assigned to and Problem as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>
You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.

---

**Survey trigger conditions**

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met or can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

---

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure they are deactivated before you recreate them as trigger conditions.

---

**Trigger condition example**

A trigger condition is configured as follows:

- **Assessment:** Service Desk Satisfaction Survey
- **Table:** Incident [incident]
- **User field:** Caller
- **Repeat interval:** 30 days
- **Active:** true
- **Trigger randomly:** false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie's complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- Related record 1: User: Boris Catino
- Related record 2: Problem: PRB010101

Note that even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey another of her incidents closes within 30 days of the first incident.

**Send survey invitations to users**

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all the following conditions:

- **Active** check box is selected.
- **State** is Published.
- Associated with at least one question.

**Note**: You (or a trigger) can send more than one instance of a survey to a user at any time.

Navigate to Application > Module.

**Assign a survey to a user**

You can assign more than one instance of a survey to a user at any time.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Click Assign Survey.
4. In the dialog box, select a user and click OK.
   - The system creates a survey instance assigned to the user, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

**Send invitations to survey users**

Use the Send Invitations button to immediately assign survey instances to each survey user who is listed in the survey definition.
Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition that is associated with at least one survey user.
3. Click Send Invitations.

   The system creates survey instances assigned to each survey user who is eligible to receive a new survey instance.

Share a survey
There are several ways to make surveys available to users: send users survey invitations, share a survey URL that opens the survey directly, or create a module that opens a survey.

Role required: admin or survey_admin

Sharing survey URLs
You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire.
  
  When someone opens the URL, first the system ensures the person is logged in. Then the system searches for an instance of the associated survey that is assigned to the logged-in user.

  If a survey instance meets these criteria, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens. If no survey instance meets the criteria, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire.
  
  When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire. The appropriate action occurs, depending on the State of the survey instance (see table).

Table 143: Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready to take: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>In progress: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
</tbody>
</table>
| Complete: User has submitted all required responses. | If the schedule period is No Limit or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin.  
If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears. |
If someone opens a URL for a survey that is deactivated or that has not been published, an error message appears.

Obtain and distribute a general survey URL
You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator.

1. Navigate to Survey Management > View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. Under Related Links, click View Survey URL.
   This related link is visible only if the survey definition is Active.
4. In the dialog box that appears, select and copy the URL.
5. Click OK or Cancel to close the dialog box.
6. Distribute the URL to users as needed.

   When a survey user clicks the general survey URL that you provide, the system creates a survey instance for the survey user (if the user does not have an instance in the Ready to take state). The system is configured by default to send an email notification when a survey instance is generated for a user. As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This might confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys
When you send a survey notification with a general survey URL to a survey user, the user might receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to System Notification > Email > Notifications.
2. In the list of Notifications, click the Survey User Invite notification.
3. Customize the form to add the Send to event creator check box.
4. The Send to event creator check box is selected by default. Clear the check box to cause the system to not send the auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin

The survey instance URL is available on the survey instance record.

1. Navigate to Survey Management > Survey Instances.
2. Open the instance for the survey.
3. Under Related Links, click View Instance URL.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box that appears, select and copy the URL.
5. Click OK or Cancel to close the dialog box.
6. Distribute the URL to the assigned user as needed.

Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin
When a user clicks a survey module, the system creates a new survey instance, opens an existing one, or displays an error message, depending on configuration options for the survey and other factors.

1. Perform the appropriate action for your version of the UI:

| UI16 | 1. Navigate to **System Definition > Application Menus**.  
2. Open the application menu to which you want to add the survey module. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15 or UI11</td>
<td>Right-click the application menu you want to add the module to and select <strong>Edit Application Menu</strong>.</td>
</tr>
</tbody>
</table>

2. In the Modules related list, click **New**.

3. Fill in the following fields:
   - **Link type**: Assessment
     Do not select **Survey**, which is used for legacy surveys only.
   - **Assessment**: Select the survey you want the module to open.

4. Complete the form, as appropriate.

Exporting and importing surveys

Export a survey to import it to a different ServiceNow instance.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the records that it is associated with:

- Assessment Metric Template [asmt_template]
- Assessment Template Definition [asmt_template_definition]
- Metric definitions [asmt_metric_definition] (survey question answer options)
- Scheduled Jobs associated with the Survey [sys_trigger]
- Survey categories [asmt_metric_category]
- Survey questions [asmt_metric]
- Survey users [asmt_m2m_category_user]
- Trigger Condition [asmt_condition]

Export a survey

You can export a survey.

Role required: admin, survey_reader, or survey_admin

1. Navigate to **Survey Management > View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

Export a survey scorecard as an image

You can export a scorecard as an image in either the PNG or JPEG format.

Role required: admin, survey_reader, or survey_admin

1. Open the scorecard to the view you want to export.
2. Click the menu icon in the scorecard and select **Save as PNG** or **Save as JPEG** as the download format.
3. When the export is complete, select **Download** to save the scorecard image to a storage location.
Import a survey
You can import a survey that has been exported as an XML file.

Role required: admin or survey_admin

Ensure that the target instance has assessments enabled. Then import the records as XML data. Note that the exported XML file does not contain result data.

Migrate a legacy survey
Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin
To avoid timing out for very large surveys, you can disable the transaction quota. See *Transaction quotas* on page 2032.

1. Navigate to **Survey Management > Legacy Surveys > Masters**.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the **Assessment is empty** breadcrumb.

2. Open a survey.

3. Under **Related Links**, click **Migrate to Assessment**.
   A dialog box appears, which describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

4. Click **OK**.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to:
   - Notify you of questions that could not be migrated.
   - Advise you to review any migrated questions with the **Multiple Choice** type.

5. Optional: View the new assessment survey by clicking the reference icon (🔗) beside the **Assessment** field, which appears on the Survey form when the legacy survey has been migrated.

6. Optional: Remove survey users from the assessment survey if you want all users to be able to take it. When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

7. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to **Survey Management > Legacy Administration > Survey Conditions**.
   b) In the **Active** column, ensure the value is false for any survey conditions that reference the migrated survey.
   c) Navigate to **Survey Management > Administration > Trigger Conditions** to create new trigger conditions.

The **Migrate to Assessment** related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the **Assessment** field, the related link reappears and you can migrate the legacy survey again.

Migrate legacy surveys to the current survey system
Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables.

The following legacy survey components are migrated:
- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

**Note:** Survey wizards cannot be migrated.

Survey management, built on the assessment engine, is available as an alternative to legacy surveys.

Survey question migration
Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey type to an assessment data type, if there is one.

<table>
<thead>
<tr>
<th>Legacy survey type</th>
<th>Assessment survey data type</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Wide Single Line Text</td>
<td>String (String option set to Single line wide)</td>
</tr>
<tr>
<td>Yes / No</td>
<td>Yes/No</td>
</tr>
</tbody>
</table>

Migrated components
When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.
Review migrated questions

If you want to maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the **Multiple Choice** and **Select Box** types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

Metric definitions and survey question choices are comparable and have similar fields:

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **0**, meaning that a lower metric value indicates a better result.
is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. **Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to 1. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.

### Table 144: Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

### Table 145: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no **Order** values for the legacy survey question choices, the system sets each corresponding metric definition **Value** based on the alphanumeric order of the legacy **Text** value:

### Table 146: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the **Scale definition** setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

**Take a survey**

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: survey_reader, survey_admin, or admin
Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red bar, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.

   **Note:** Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.

   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.

   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save your responses without submitting them</strong></td>
<td>Click <strong>Save</strong>. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td><strong>Submit the survey after answering all questions</strong></td>
<td>Click <strong>Submit</strong>. You cannot return to the questionnaire after submitting.</td>
</tr>
</tbody>
</table>

   **Note:** The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.

**Survey questionnaires**

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

**Survey notification**

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.
Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No

- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Quiz application: Important terms

The quiz application involves several terms.

<table>
<thead>
<tr>
<th>Table 147: Terms used in quiz application</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes</strong></td>
</tr>
</tbody>
</table>
Categories

A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.

Questions

A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.

Category user

A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.

Templates

A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.
Review the results from the submitted quizzes in reports and scorecards.

Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.
### Table 148: Quiz roles

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
</table>
| assessment administrator [assessment_admin]   | Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.  

**Note:** The itil_admin role and the survey_admin role contain the assessment_admin role. |
| Administrator [admin]                          | Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.                                                     |

### Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.  
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.  
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

### Quiz Overview module

The Quiz Overview module is a homepage that displays various gauges that report on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

For details about editing gauges on homepages, see Add existing gauges to a homepage on page 478.

Users with the assessment_admin role can view the overview page and refresh, add, delete, and rearrange gauges.

1. Navigate to Quizzes > Overview.
2. Click elements within the gauges to obtain more information. The available gauges are:

<table>
<thead>
<tr>
<th>Gauge</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Total Questions by Quiz</td>
<td>Assessment Metric [asmt_metric]</td>
</tr>
<tr>
<td>Questions by Data Type</td>
<td>Assessment Metric [asmt_metric]</td>
</tr>
<tr>
<td>Correct Answers by Assigned User</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
</tbody>
</table>
Quiz designer

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables.

Tools on the Quiz Designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes > Quiz Designer.

The designer contains the following elements:

• Controls
• Header bar
• Design canvas

Controls

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.

<table>

</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (menu) in the in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

New quizzes open in the **Design** view. The quiz **Name** field appears above first category in the canvas. A blank question field appears in the category container.

*Create a quiz*

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin
When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.

2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.

3. To configure the category, click the gear icon in its title bar.

   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.

4. Click the X icon to close the category properties dialog box and save your settings.

5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions

You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.
Note:
To designate a question as scored, you must use Assessment forms. For instructions, see *Configure a scored question*.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.

2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

Table 150: Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator. This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question <strong>Date type</strong> is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except <strong>Date, Date/Time,</strong> and <strong>String.</strong></td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. Click the <strong>+</strong> icon to add an option, or click the <strong>X</strong> icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

### Dependency

| Displayed when | Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of **Boolean**, **Choice**, **Scale**, or **Template**. Create the condition that must exist for recipients to see the dependent question, using the **is** or **is one of** operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A. |

4. To create any special conditions that must be met for a question to appear on the quiz, click the **Dependency** tab. Fill in the fields, as appropriate.

   Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.

9. Drag questions to change their order within a category or move them between categories.

10. To delete a question, click the X in its title bar.

Configure a template question
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.
Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.

7. Configure the properties for the remaining questions.

8. Click the X icon to close the template properties dialog box and save your settings.

Configure a scored question

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.

2. Open the quiz containing the questions you want to mark as scored.

3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.

4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.

5. In the Question Type section of the Assessment Metric form, select the Scored check box.
This check box is not available if the question's data type is not supported for scoring.

6. Select the **Correct answer** for the question.
7. Click **Update**.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a quiz

You can configure an entire quiz.

**Role required:** assessment_admin or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click **Configuration** and then fill in the fields as described in the table.

---

**Table 151: Quiz designer configuration**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the <strong>End note</strong> content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a <strong>Return URL</strong> is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
</tbody>
</table>
Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

Table 152: Select recipients

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Create quizzes with forms
As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

The best practice for creating a quiz using assessment forms is to follow the procedures in the order shown here:

- Create the quiz.
- Set up the categories.
- Create the questions for the quiz.
- Create the answers for the questions.
• Distribute the quizzes to recipients.

**Note:** The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

---

**Edit a quiz**
You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

• Questions that you add are available only on quizzes that are distributed after the update.

• Before a quiz is submitted or during the retake period:
  • Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  • Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

**Enable a quiz retake**
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz’s due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user’s queue remains visible until the quiz’s due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

**View a quiz result**
You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Navigate to Quizzes > Quiz Results.
View a quiz designer scorecard

The quiz scorecard opens in the Category Results view.

For detailed information about scorecards, see Quiz Scorecards.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz whose results you want to view.
   
   The scorecard for the selected quiz opens in the Category Results view.
4. Select a category to view from the choice list above the chart.
View a quiz category result

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question.

1. To view category results, navigate to Quizzes > Category Results.

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category's weight:
   3. Navigate to Quizzes > Categories, and select a category from the list.
   4. In the Metric Category form, edit the default value in the Weight field.
   5. Click Update.

   **Note:** You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz

All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Role required: none

No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

1. Navigate to Self-Service > My Assessments & Surveys.
2. Click **Take Quiz** on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.

4. Click **Save** at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.

5. When you are ready to submit the completed quiz, read any assertions that require your attention.

6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.

7. Click **Submit**.

8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a **Modify Quiz** button after submission. If retakes are not permitted, the card disappears from your queue.

9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.

10. To edit your answers and resubmit a quiz that permits retakes, click **Modify Quiz**. You can modify your responses to the quiz until its due date.

**Quiz scorecards**

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

**Category results**

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions

This view displays responses that use the following **data types**:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the **Quiz designer**.
Figure 203: Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

**Figure 204: Quiz category result details**

*Question results*
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

**Pie chart**
The pie chart shows question results for these *data types*:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

*Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer*
Figure 205: Quiz scorecard question results - pie chart
**Bar chart**

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to **Reports > Administration > Report Ranges**.

**Average ratings**

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for *scored questions*.
Figure 206: Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics. You can share these reports with specific users or groups and change the display options. For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

**Wizards**

Administrators can create wizards to provide a step-by-step sequence of dialog boxes that lead the user through a procedure. For example, a wizard may lead users through reporting an incident (creating an incident record) without opening a list or form.

![Figure 208: Record generator wizard](image)

Create a basic wizard

This example creates a basic wizard that reports an incident.

1. **Activate the system wizards application**, if necessary.
2. Navigate to **System Wizards > Wizards**.
3. Click **New**.
4. Enter the wizard Name of **Report Incident**.
5. Right-click the header and select **Save**.

Define a wizard variable

How to define a wizard variable.

**Note:** To learn more, see *Define a Wizard Variable*.

Define wizard variables:

![Wizard Variable](image)

Figure 209: Basic variables

1. In the Wizard Variable related list, click **New**.
2. Enter the variable details.
• Type: Multiple Choice
• Name: incident
• Question: What are you having difficulties with?

3. Right-click the header and select Save.
4. In the Question Choices related list, click New.
5. Enter Email Issue in the Text and Value fields, and click Submit.
6. Repeat steps 4 – 5 for the following question choices:
   • Computer Issue
   • Password Reset

7. In the Wizard Variable related list, click New.
8. Enter the variable details and click Submit.
   • Type: Wide Single Line Text
   • Name: description
   • Question: Please describe your symptoms

Create the first panel

Create the first panel of the example wizard.

Note: To learn more, see Wizard Panels.

1. In the Wizard Panels related list, click New.
2. Select a Type of A panel that prompts the user to answer questions.
3. Enter the panel details.
   • Name: Service Questions
   • Title: Service Desk Wizard

4. Right-click the header and select Save.
5. In the Variables related list, click Edit....
6. Using the slushbucket, select and arrange the variables as listed:
   1. What are you having difficulties with?
   2. Please describe your symptoms

7. Click Update.
Create the second panel option

How to create the second panel option.

1. In the Wizard Panels related list, click **New**.
2. Select a Type of **A panel that creates something (like a change request or an incident)**.
3. Enter the panel details and click **Submit**.
   - **Name**: Email Incident
   - **Table**: Incident [incident]
   - **Final View**: ess
4. Right-click the header and select **Save**.
5. In the Field Setters related list, click **New**.
6. Enter the field setter details and click **Submit**.
   - **Type**: Set field to a variable
   - **Field**: Short description
   - **Variable**: description

7. In the Field Setters related list, click **New**.

8. Enter the field setter details and click **Submit**.
   - **Type**: Set field to a specific value
   - **Field**: Category
   - **Value**: software

9. Repeat steps 1 – 8 to create additional panels with the values listed in the table.

<table>
<thead>
<tr>
<th>Step 3. Panel Name</th>
<th>Step 8. Category Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Incident</td>
<td>hardware</td>
</tr>
<tr>
<td>Password Incident</td>
<td>network</td>
</tr>
</tbody>
</table>

**Test the wizard**

Run through several scenarios to test transition logic and record generation.

1. Navigate to **System Wizards > Wizards**.
2. Click **Report Incident**.
3. Click **Test**.
4. Enter the following information and click **Next**.
   - What are you having difficulties with?: Email Issue
   - Please describe your symptoms: Can't access email
5. Verify that a new record is created and the values match step 4.
6. Repeat steps 1 – 5 to test each multiple choice answer.
Wizard transitions

Transitions define logic used to move between panels in wizards.

Transition logic may be based on a predefined order (basic panel flow) or user input (defined transitions).

**Note:** The System Wizards application is not active by default.

*Use basic panel flow in a wizard*

Basic panel flow moves through wizard panels in order, without the need to define logic for each transition. A wizard may use either basic panel flow or defined transitions, but not both.

1. Open the wizard.
2. Select the **Basic panel flow** check box. If necessary, configure the wizard form to add the field.
3. Enter the **First panel** in the reference field.
4. For each panel, define an **Order**. If necessary, configure the panel form to add the field.

*Define a panel transition*

1. Open the panel.
2. In the **Transitions** related list, click **New** or select the transition to edit.
3. Using the **condition builder**, define a transition condition based on wizard variables. Leave the condition empty to use the transition in all cases.
4. In the **To** field, select the next panel.
5. In the From field, select the previous panel.
6. Optional: Define a Transition script that runs when the transition is used.

### Wizard variables

Wizard variables are questions that collect and store user input. Define variables for a wizard and then add them to wizard panels.

Use data collected by wizard variables to:
- Define transition conditions
- Set field values in record generators
- Define dynamic functionality with UI policy and client scripts
- Implement advanced functionality with wizard scripts

**Note:** The System Wizards application is not active by default.

---

**Add a variable to a panel**

To collect user input, add variables to a panel that prompts user to answer questions (wizard panel) or a survey panel (requires Survey Wizard plugin):

1. Navigate to **System Wizards > Wizards**.
2. Open the wizard.
3. In the **Wizard Panels** related list, open the panel to which you are adding a variable.
4. In the **Variables** related list, click **Edit**.
5. Using the **slushbucket**, add and arrange the order in which variables appear on the panel. Only variables defined on the wizard are available on a panel.
Define a question choice
Some variable types require choices. For example, a multiple choice question—such as What kind of e-mail account do you want?—requires options—such as Exchange and UNIX.

1. Open the variable definition.
2. In the Question Choices related list, click New.
3. Enter the question choice details and save the record.
   • Text - option the user sees
   • Value - value stored in the variable
4. Repeat steps 2 – 3 for all available options.

Define a wizard variable
1. Navigate to System Wizards > Wizards.
2. Open the wizard to which you are adding a variable.
3. In the Wizard Variable related list, click New.
4. Select the variable Type.
   Wizards use the same variable types as service catalog items.
5. Enter the name used by the system, for example: `resolved_to_satisfaction`.
6. Enter an order number and select the name of the associated Wizard in the **Expert** field.
7. Enter a descriptive question in the **Question** field.
8. Enter the remaining variable details if necessary and save the record.

### Publish the basic wizard

Create a wizard launcher to make the wizard available through the service catalog homepage.

**Note:** To learn more, see *Publish a Wizard.*
Figure 210: Basic publish

1. Navigate to **Service Catalog > Wizards**.
   If you do not see **Wizards** under **Service Catalog**, complete the next step.

2. Optional: To add the **Wizards** module to the **Service Catalog**, perform the appropriate action for your version of the UI:

   | UI16         | 1. Navigate to **System Definition > Application Menus**.  
   |             | 2. Select **Service Catalog**.  
   |             | UI15 or UI11  
   |             | Right-click the **Service Catalog** application menu and select **Edit Application Menu**.

3. Click **New**.

4. Enter the wizard launcher details and save the record.
   - Name - Report an Incident
   - Category: Can We Help You?
   - Wizard: Report Incident
   - Active: select the check box

*Link to a Wizard*
Provide access to wizards via links, such as defining a new module or sending a link via email (public wizards only).

<table>
<thead>
<tr>
<th>Desired Action</th>
<th>URL schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start a new wizard or resume an in progress wizard if the user is logged in</td>
<td>https://&lt;base URL&gt;/nav_to.do?uri=expert_shell.do?sysparm_sys_id=&lt;wizard sys_id&gt;</td>
</tr>
<tr>
<td>Require the user to restart a wizard from the beginning regardless of previous progress</td>
<td>https://&lt;base URL&gt;/nav_to.do?uri=expert_shell.do?sysparm_sys_id=&lt;wizard sys_id&gt;%26sysparm_initial=true</td>
</tr>
</tbody>
</table>

Example - Define a Wizard Module in Self-Service:

1. Navigate to **System Wizards > Wizards**.
2. Open the wizard.
3. In the **Roles** field, add the user roles that have access to the wizard.

4. Right-click the header and copy the **sys_id** for the wizard.

5. Click **Update**.

6. In the navigation pane, right-click **Self-Service** and select **Edit Application**.

7. In the **Modules** related list, click **New**.

8. Enter the following information and save the record.
   - **Title** and **Order**
   - **Link type**: URL (from arguments)
   - **Arguments**: /expert_shell.do?sysparm_sys_id=<wizard sys_id from step 2>

---

**Create a public page**

A public page is accessible to all users without having to log in or have a particular user role.

Create a **public page**:

1. Navigate to **System Definition > Public Pages**. (You may need to enable the module, as it is not active by default.)

2. Click **New**.

3. Enter the name of the UI page specified (for example, **test_page**)

---

**Make a wizard public**

Public wizards are available for use without logging in.

Reasons to make a wizard public include:

- Allowing non-users to report an incident
- Collecting anonymous survey responses (requires Survey Wizard Plugin)

Once a wizard is made public, deliver it using a link via email or a module on the welcome page (available before a user has logged in).

---

**Make a role public**

Add public to all relevant roles for the wizard:

1. Add **public** to the **Roles** field.

2. For each **wizard variable** defined for that wizard, add **public** to the **read roles** and **write roles** fields. (You may need to personalize the form to add the **read roles** and **write roles**.)

3. Similarly, add **public** to the **read roles** and **write roles** fields for each variable associated with each **wizard panel** for that wizard.

---

**Modify a script**

*Modify the script* for all **Record Generators** (wizard panels) within the wizard.

1. Navigate to **System Wizards > Wizards**.

2. Open the relevant wizard.

3. In the **Wizard Panels** related list, open the record generator panel(s).

4. Enter the following script in the **Script** field for each record generator (Personalize the form to add the **Script** field, if necessary):

   ```javascript
   if ( typeof gs. getRoles () == "undefined" || gs. getRoles () == '' ) {
   current. insert () ;
   ```
Process description
Enable and Select the Wizard

Select the wizard to be made public:

1. **Activate** the Wizards application in the application navigator.
2. Navigate to **System Wizards > Wizards**
3. Select and open the wizard to be made public.

Publish a wizard
Administrators can provide users with access to wizards:

- Using links
- As an item in the service catalog

Administrators can also restrict user access to wizards by role and make wizards available to the public (users that are not logged in).

**Note:** The System Wizards application is not active by default. To use wizards, see **Activate a System Wizard.**

To define the user roles that have access to a wizard:

1. Navigate to **System Wizards > Wizards.**
2. Open the wizard.
3. In the **Roles** field, define the user roles that have access to the wizard. Leave the field blank to allow access for all users.

Send a public wizard link via email
After a wizard is configured as public, it can be delivered via email to anyone, including recipients who are not ServiceNow users.

To send a link to the public wizard via email:

1. Navigate to **System Wizards > Wizards.**
2. Open the wizard.
3. Right-click the header and copy the sys_id for the wizard.
4. Create an email with an email link, using the URL schema:
   
   https://<base URL>/nav_to.do?uri=expert_shell.do?sysparm_sys_id=<wizard sys_id from step 3>

Test the page
Verify the wizard is functional for a public user.

Log out, then click the module (in this example, the Test module under the Self-Service application).

Add a wizard to the service catalog
Create a wizard launcher to make the wizard available through the service catalog homepage:

1. Navigate to Service Catalog > Wizards.
2. Click New.
3. Enter the wizard launcher details and save the record.
   - Name - name by which the wizard appears in the service catalog
   - Category - category under which the wizard appears
   - Wizard - reference to the wizard
   - Active - select the check box
   - Short Description and Description (optional)

Create module
Create Module
Create a public module within the parent application, pointing to the wizard,

1. Copy the sys_id for the wizard: right-click the wizard header, and copy the wizard’s sys_id.
2. In the application navigator, right-click the parent application name (for example, Self-Service) and select Edit Application Menu.
3. Add public to the Roles field.
4. In the **Modules** section, select **New** to create a new module, with the following fields, then select Submit to save the record.

**Table 155: Create Module**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Module title (for example, Test)</td>
</tr>
<tr>
<td>Link type</td>
<td>URL (from Arguments)</td>
</tr>
<tr>
<td>Roles</td>
<td>public</td>
</tr>
<tr>
<td>Arguments</td>
<td>expert_shell.do?sysparm_sys_id=&lt;sys_id of the Wizard&gt;</td>
</tr>
</tbody>
</table>

**Note:** The wizard panel does not link to the beginning by default. To cause the wizard to link to the beginning by default, add &sysparm_initial=true to the URL Argument. For example, /nav_to.do?uri=expert_shell.do?sysparm_sys_id=<wizard sys_id>&sysparm_initial=true.

### Survey wizards

The Survey Wizard plugin creates surveys using wizards.

Advantages versus other survey functionality include the ability to:

- Ask different questions based on responses (dynamic surveys)
- Create multiple page surveys
- Record answers for partially completed surveys

This plugin integrates with the Best Practice - Task Survey Management plugin. Because the plugin relates to the Legacy Surveys application, the plugin is documented on the ServiceNow wiki.

**Configure the survey property**

How to configure the survey properties (apply to all survey wizards and surveys).

1. Navigate to **Survey Wizards > Survey Properties**.
2. Ensure the **Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions** property is enabled (select the check box).

**Create a page**

How to create the survey pages (wizard panels) and add questions.

1. Navigate to **Survey Wizards > All** and open the survey wizard.
2. In the **Survey Panels** related list, click **New**.
3. Enter the **Name**, **Title**, and **Description**.
4. Right-click the header and select **Save**.
5. In the **Variables** related list, click **Edit**.
6. Using the **slushbucket**, select and arrange survey questions on the panel.
7. Repeat steps 1 – 6 for each page of the survey wizard.

**Note:** To learn more, see **Wizard Panels**.
Create a dynamic effect optional
Create dynamic effects, such as hiding or showing fields on a panel based on answers.

1. Navigate to Survey Wizards > Wizard Policy > Wizard UI Policy or Survey Wizards > Wizard Policy > Wizard Client Scripts
2. Click New.
3. Enter the UI policy or client script details.

Note: To learn more, see Wizard UI Policy and Client Scripts.

Define a transition
Transitions define the logic used to move between pages (wizard panels) in a survey.

Use panels and transition logic to implement multiple page surveys and dynamic effects, such as skipping pages based on answers.

Define transitions:
1. Navigate to Survey Wizards > All and open the survey wizard.
2. Open a survey panel.
3. In the Wizard Panel Transitions related list, click New.
4. Enter the transition details and click Submit.
5. Repeat steps 1 – 4 for all transitions between pages in the survey wizard.

Note: To learn more, see Wizard Transitions.

Create a survey condition
How to create a survey condition that controls when and to whom the survey wizard is sent.

Create a survey condition that controls when and to whom the survey wizard is sent:
1. Navigate to Survey Wizards > Survey Conditions.
2. Click New.
3. Select a Type of Survey Wizard. Only a survey or survey wizard is sent (determined by Type), even if both are defined for the condition.
4. Enter the condition details.
5. Click Submit.

Create the email notification
Create an email notification to deliver the survey wizard.

Role required: admin or survey_admin
1. Navigate to System Policy > Email > Notifications.
2. Filter the list to view notifications with an Event Name of task.send_survey, which is the event that is triggered when survey conditions are met.
3. Open a survey notification in the filtered list or click New.
4. Enter the email notification details. If you are creating a new notification, be sure to adjust conditions and weight to avoid conflicts with existing survey notifications (Event Name of task.send_survey).
5. Click Update or Submit.

Create the survey wizard
How to create the survey wizard.
The following steps provide an overview of building a survey wizard.

1. *Activate the Survey Wizard plugin*, if necessary.
2. Navigate to **Survey Wizards > All**.
3. Click **New**.
4. Enter the survey wizard **Name**.
5. In the **Roles** field, add the **public** role.
6. Right-click the header and select **Save**.

**Define a question**
How to define survey questions (wizard variables).

1. In the **Wizard Variable** related list, click **New**.
2. Enter the variable details.
3. In the **Read roles** field, add the **public** role.
   Configure the form to add the **Read roles** field, if necessary.
4. Click **Submit**.
5. Repeat steps 1 – 4 for all questions in the survey.

**Note:** To learn more, see *Define a Wizard Variable*.

**Installed components**
Fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional).

The following tables are modified:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Conditions (survey_conditions)</td>
<td>Add fields to determine which survey is sent when conditions are met:</td>
</tr>
<tr>
<td></td>
<td>• Type - either a survey or survey wizard</td>
</tr>
<tr>
<td></td>
<td>• Survey_wizard - reference to applicable survey wizard</td>
</tr>
<tr>
<td>Task Survey (task_survey)</td>
<td>Add fields to track which surveys were sent to users:</td>
</tr>
<tr>
<td></td>
<td>• Type - either a survey or survey wizard</td>
</tr>
<tr>
<td></td>
<td>• Survey_wizard - reference to applicable survey wizard</td>
</tr>
<tr>
<td>Survey Instance (survey_instance)</td>
<td>Add fields to track survey wizard instances along with surveys</td>
</tr>
<tr>
<td>Wizard (expert)</td>
<td>Add field to support new survey wizard table</td>
</tr>
</tbody>
</table>

The following tables are added:
Table 157: New tables

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Panel (expert_panel_survey)</td>
<td>Adds a survey panel to wizards. Extends the expert_panel table</td>
</tr>
<tr>
<td>Survey Wizard (expert_survey)</td>
<td>Stores survey wizards. Extends expert</td>
</tr>
</tbody>
</table>

The **SurveyUtils** script include is added to record responses during survey panel transitions.

The **Task Survey Events** business rule is modified to include logic for sending survey wizards. Customers who have modified this business rule can not install the updated version automatically.

For information about the link generated from the business rule script, see **Survey Wizard - Multiple Instances** on the ServiceNow Community.

The plugin adds **Survey** as a new type of wizard panel. Survey wizards are created using survey panels.

Survey wizard responses are saved when the user navigates between survey panels (clicks **Next** or **Previous**), as opposed to saving responses only at the end (surveys). This feature allows a logged in user to resume a survey that is in progress and allows survey readers to collect response data for partially completed surveys. To support the ability to resume surveys in progress, survey wizard answers are also temporarily stored in XML in the **expert_instance** table. When the user clicks **Done** on the last panel of the survey wizard, the record in the **expert_instance** table is deleted.

For information about having more than one instance of a given Wizard in play at a time, see **Survey Wizard - Multiple Instances** on the ServiceNow Community.

Demo data is available with this plugin. If you choose to install demo data, a sample survey wizard, called Customer Satisfaction Survey, is added to the database.

**Request survey wizard**

Before activating this plugin, consider the installed components, dependencies, and impact.

- Installed Components - fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional). For more details, see **Installed Components**.
- Dependencies - Best Practice - Task Survey Management (active by default)
- Impact - adds fields to existing tables, installs the Best Practice - Task Survey Management plugin, and modifies the Task Survey Events business rule. You may choose to install a demo survey with the plugin. The plugin integrates with standard survey functionality, so there is no need to transition existing surveys to survey wizards. However, survey administrators must specify a type (survey or survey wizard) for new survey conditions.

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

| Date and time must be at least 2 business days from the current time. |

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click **Submit**.

**Test the survey wizard**
How to test the survey wizard.

1. Navigate to **Survey Wizards > All** and open the survey wizard.
2. Click **Try it**.
3. Answer survey questions and verify the transition logic based on answers, if applicable.
4. At survey completion, click **Done**.
5. Navigate to **Survey Wizards > Survey Instances**.
6. Search for and open the most recent instance of the survey wizard.
7. Verify that your survey answers are properly recorded.
8. Run through several scenarios to test transition logic and data collection.

**Create a survey wizard (demo)**
This example creates a survey using a survey wizard.

This example creates a survey using a survey wizard (requires the **Survey Wizard plugin**). The survey uses dynamic features that are available using wizards.

Create the survey wizard demo
Create the survey wizard.

1. **Activate the Survey Wizard plugin**, if necessary.
2. Navigate to **Survey Wizards > All**.
3. Click **New**.
4. In the Name field, enter Software Needs Analysis.
5. In the Roles field, add the **public** role.
6. Right-click the header and select **Save**.
Define a survey question
How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click New.
2. Enter the variable details as listed in the table.
3. In the Read roles field, add the public role.
   *Configure the form* to add the Read roles field, if necessary.
4. Click Submit.
5. Repeat steps 1 – 4 for all variables in the table.

</table>
Create a survey page

Create the survey pages (wizard panels) and add questions.

1. Navigate to Survey Wizards > All and select Software Needs Analysis.
2. In the Survey Panels related list, click New.
3. Enter the Name, Title, and Description as listed in the table.
4. Right-click the header and select Save.
5. In the Variables related list, click Edit....
6. Using the slushbucket, select and arrange the variables as listed in the table.
7. Repeat steps 1 – 6 for all panels in the table.

Table 159: Panel variables table

<table>
<thead>
<tr>
<th>Name and Title</th>
<th>Description</th>
<th>Add variables</th>

|                         |                                                                           | Describe projects for which you use these tools:
| End Note                | Thanks for completing our survey. To order new or upgraded software, visit the service catalog. |
Create a dynamic effect

How to create a dynamic effect.

On the Describe Needs panel, if the user selects **Other**, then the Please specify field should be visible and mandatory.

![Image of Survey wizard UI](image)

**Figure 211: Survey wizard UI**

1. Navigate to **Survey Wizards > Wizard Policy > Wizard UI Policy**.
2. Click **New**.
3. Enter the UI policy details.

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wizard</td>
<td>Software Needs Analysis</td>
</tr>
<tr>
<td>Reverse if false</td>

<td>select the check box</td>
</tr>
<tr>
<td>Short description</td>
<td>If Other is true, show Specify</td>
</tr>
<tr>
<td>Wizard Conditions</td>
<td>other is true</td>
</tr>
</tbody>
</table>

4. Right-click the header and select **Save**.
5. In the Wizard UI Policy Actions related list, click **New**.
6. Enter the action details and click **Update**.
   - Variable Name: otherprod
   - Mandatory: True
   - Visible: True

Define a transition demo
How to define transitions.

1. Navigate to **Survey Wizards > All** and select **Software Needs Analysis**.
2. Open a survey panel as listed in the table.
3. In the Wizard Panel Transitions related list, click **New**.
4. Enter the transition details and click **Submit**.
5. Repeat steps 1 – 4 for all panel transitions in the table.

<table>
<thead>
<tr>
<th>Panel</th>
<th>Condition</th>
<th>Order</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Describe Needs</td>
<td>office is true</td>
<td>100</td>
<td>Microsoft Office</td>
</tr>
<tr>
<td>Describe Needs</td>
<td>creativesuite is true</td>
<td>200</td>
<td>Adobe Creative Suite</td>
</tr>
<tr>
<td>Describe Needs</td>
<td></td>
<td>300</td>

<tr>
<td>Adobe Creative Suite</td>
<td></td>
<td>100</td>
<td>End Note</td>
</tr>
</tbody>
</table>

Test the survey wizard demo

How to test the survey wizard.

1. Navigate to **Survey Wizards > All** and select **Software Needs Analysis**.
2. Click **Try It**.
3. In the Business software you use (select all that apply) question, select: **Microsoft Office, Other**.
4. Verify that the Please specify field appears and is mandatory when Other is selected (UI policy created in **Dynamic Effects**).
5. Click **Next**.
6. Verify that the Office panel appears.
7. Enter test values for the questions and click **Next**.
8. Verify that the End Note panel appears (the transition logic skips the Adobe Creative Suite panel when the Adobe Creative Suite check box is not selected on the first panel).
9. Click **Done**.
10. Navigate to **Survey Wizards > Survey Instances**.
11. Search for and open the most recent instance of the Software Needs Analysis survey wizard.
12. Verify that your survey answers are properly recorded.
13. Run through several scenarios to test transition logic and data collection.
Configure the survey

How to configure the survey.

1. Navigate to Survey Wizards > Survey Properties.
2. Ensure the Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions. property is enabled (select the check box).
4. Click New.
5. Enter the condition details and click Submit.

Table 162: Condition details

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Survey Wizard</td>
</tr>
<tr>
<td>Survey wizard</td>
<td>Software Needs Analysis</td>
</tr>
<tr>
<td>Active</td>
<td>select the check box</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>User field</td>
<td>Caller</td>
</tr>
<tr>
<td>Description</td>
<td>Send software survey to all users with software questions</td>
</tr>
<tr>
<td>Condition</td>
<td>Category is Software</td>
</tr>
</tbody>
</table>

6. Navigate to System Policy > Email > Notifications.
7. Click **New**.
8. Enter the email notification details and click **Submit**.

<table>
<thead>
<tr>
<th>Table 163: Email notification details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Event Name</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>User field</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Conditions</td>
</tr>
<tr>
<td>Subject</td>
</tr>
<tr>
<td>Message</td>
</tr>
</tbody>
</table>

9. Filter the Email Notifications list using the **condition**: Event Name is task.send_survey and Table is Incident.
10. If any other notifications exist, increase their Weight value so that only the Software Survey is sent when the incident category is software (the Software Survey has a Weight of 0, so it has the highest priority of any notifications for the incident table).

**Wizard panels**

Wizard panels are screens that appear in a defined order. Each step in a wizard is represented by a panel. A wizard panel prompts users to answer questions. Wizard panel type-specific information is:

- **Title** - label that appears above the panel in wizard view.
- **Description** - text that appears above questions in wizard view.
- **Variables** - questions that collect user input. To learn more, see *Wizard Variables*.

**Note:** The System Wizards application is not active by default.

*Catalog order and checkout panels*

What catalog order and checkout panels display.

A catalog order panel displays listings for service catalog items in tabbed view. A catalog checkout panel displays an order confirmation screen for the items on the preceding catalog order panel. Use these panels to create an order guide using wizards.

*Change a banner setting*

How to change a banner setting.

Steps displayed in the banner can be manually defined or automatically generated.

To change the banner settings:

1. Navigate to **System Wizards > Wizards**.
2. Create or open a wizard.
3. Set the Banner type field:
   - Select **Fixed number of (user defined) steps** for manually defined steps.
   - Select **Generated based on panel history** for automatically generated steps. Automatically generated steps do not display initially but are added as the user reaches each step. Automatic banner text is generated using the Title field of each wizard panel.
   - Select **None** to disable the wizard banner.

Create a fixed wizard banner step
How to create fixed wizard banner steps.

Steps displayed in this banner can be manually defined or automatically generated.

1. Select **Fixed number of (user defined) steps** from the Banner type dropdown.
2. Select the Banner steps related list and click **New**.
3. Assign a name to your banner step. This name is what appears on the wizard.
4. Assign a display order (such as 100, 200, 300).
5. Repeat steps 2 – 4 for each banner step in the wizard.
6. On the wizard record, click the **Wizard Panels** related list.
7. In the Banner step field, enter the banner step that is completed when the wizard panel is displayed. Completed steps display in green in the wizard banner.

**Note:** You may need to **configure the list** to add the Banner step field.

---

Create a panel
How a user creates a panel.

1. Navigate to **System Wizards > Wizards**.
2. Open the wizard to which you are adding a panel.
3. In the Wizard Panels related list, click **New**.
4. Select the type of panel to create.
5. Enter basic panel information.

Table 164: Basic panel information

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Brief description of the panel</td>
</tr>
<tr>
<td>Expert</td>
<td>Name of the wizard</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Next message</td>
<td>Label on the button that transitions to the next panel. This option does not apply for the last panel</td>
</tr>
<tr>
<td>Previous message</td>
<td>Label on the button that transitions to the previous panel. This option does not apply for the first panel</td>
</tr>
</tbody>
</table>

6. Enter type-specific information and save the record.
   - Prompts user to answer questions (wizard panel)
   - Catalog Checkout
   - Catalog Order
   - KB Viewer
   - Redirect
   - Record Generator
   - Survey (requires Survey Wizard Plugin)

**Edit a panel**

An Edit Panel button is available on wizard panels when testing the wizard. The button is available if the user can write to the expert record.

To control who can access this button, edit the write ACL on the Wizard [expert] table.

1. Navigate to System Wizards > Wizards.
2. Open the wizard containing the panel you want to edit.
3. Click Try It.
4. Click Edit Panel.
**Field setters**
A field setter defines a field value for a record created by a record generator.

Define field setters using:

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>Name of the record generator panel.</td>
</tr>
<tr>
<td>Type</td>
<td>To define a static value (the same for each record created by the record generator), select <strong>Set field to a specific value</strong>. To define a value based on a wizard variable, select <strong>Set field to a variable</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Select the field name.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the value (static) or select the wizard variable name.</td>
</tr>
</tbody>
</table>

**KB viewers**
What a KB viewer panel displays.

A KB Viewer panel displays a knowledge base article. KB Viewer type-specific information is:
- KB Article - reference to the desired knowledge base article
- Title - label that appears above the article in wizard view

**Record generators**
A record generator panel creates a record in a table, such as an incident or change request.
There is no transition after the Record Generator. The following table includes fields specific to the Record Generator.

<table>
<thead>
<tr>
<th>Title</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>table in which to create a record (select Global when using a script)</td>
</tr>
<tr>
<td>Template</td>
<td>(optional) define field values on the new record using a template</td>
</tr>
<tr>
<td>Final view</td>
<td>(optional) enter the view in which to show the submitted form (such as ESS)</td>
</tr>
<tr>
<td>Script</td>
<td>script that runs when the panel is used. To learn more, see <strong>Wizard Scripts</strong>.</td>
</tr>
<tr>
<td>Field setters</td>
<td>define field values in the target table. To learn more, see <strong>Field Setters</strong>.</td>
</tr>
</tbody>
</table>

**Redirect panel**
A Redirect panel specifies a URL to which the user is taken upon transition to the panel.

Redirect type-specific information is:
• URL - URL location to which user should be taken
• Advanced - select this option to use a script
• Script - script that runs when the panel is used. To learn more, see *Wizard Scripts*.

*Use wizard banners*

The wizard banner is a graphical flow of wizard steps displayed at the top of a wizard.

![Wizard banner highlighted](image)

*Figure 212: Wizard banner highlighted*

*Activate a system wizard*

The System Wizards application is not active by default.

To activate system wizards:

1. Navigate to **System Definition > Application Menus**.
2. In the breadcrumbs, click **All** to display both active and inactive applications.
3. Search for **System Wizards**.
4. Ensure the Active field is set to true.

![Application panels](image)

*Define a basic transition*

How to define a transition.

---

**Note:** To learn more, see *Wizard Transitions*.

---

Define transitions:

1. In the Wizard Panels related list, click **Service Questions**.
2. In the Wizard Panel Transitions related list, click **New**.
3. Enter the transition details and click **Submit**.
4. Repeat steps 2 – 3 for all panel transitions in the table.

### Table 167: Panel transition details table

</tr>
</tbody>
</table>

### Advanced customization

An advantage of wizards is the ability to implement advanced, custom functionality with a user-friendly interface.

Create advanced wizards using:

- **Wizard UI Policy and Client Scripts** - create dynamic effects and validation for wizards, panels, and variables.
- **Wizard Scripts** - run scripts from record generator panels, transitions, and UI policies.

### Create an advanced wizard (demo)

This example creates a wizard that associates assets and details and then creates a contract with this information.

The wizard uses a script to create a new record.

**Create the wizard**

How to create the wizard.

1. **Activate the system wizards application**, if necessary.
2. Navigate to **System Wizards > Wizards**.
3. Click **New**.
4. In the Name field, enter **Contract Creation**.
5. Right-click the header and select **Save**.

---

**Define a variable**
How to define a variable.

1. In the Wizard Variable related list, click **New**.
2. Enter the variable details and save the record.
3. Repeat steps 1 – 2 for all variables in the table.

---

**Table 170: Wizard Variables Details Table**

<table>
<thead>

</tbody>
</table>
Create a panel demo
How to create the first two panels and add variables.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Prompts user to answer questions.
3. Enter the Name, then right-click the header and select Save.
4. In the Variables related list, click Edit....
5. Using the slushbucket, select and arrange the variables as listed in the table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Add variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Contract Screen</td>
<td>Associate assets?</td>

<td>Enter short description for contract</td>
</tr>
<tr>
<td>2 Asset Screen</td>
<td>Asset Listing</td>
</tr>
</tbody>
</table>

Table 171: Panel variables table

Create the third panel and add a field setter
How to create the third panel and add field setters.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Creates something (record generator).
3. Enter the following information, then right-click the header and select Save.
   - Name: 3 Contract No Assets
   - Table: Contract [ast_contract]
4. In the Field Setters related list, click New.
5. Enter the field setter details and save the record.
6. Repeat steps 4 – 5 for all field setters in the table.

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>

<td>Short description</td>
<td>short_description</td>
</tr>
<tr>
<td>Set field to a variable</td>
<td>Ends</td>
<td>ends</td>
</tr>
<tr>
<td>Set field to a variable</td>
<td>Starts</td>
<td>starts</td>
</tr>
</tbody>
</table>

Table 172: Field setter details table

Create the fourth panel and add a script
How to create the fourth panel and add a script.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Creates something (record generator).
3. Enter the following information, then right-click the header and select **Save**.
   - **Name**: 4 Create Contract and Assets
   - **Table**: Global

4. Paste the example script into the Script field. **Configure the form** to add the field, if necessary.

Example script:

```javascript
//Call the createContract function to obtain the ID of the created contract
var contract_id = createContract();

//Construct a url that will be used to redirect the user after submission
var uri =('ast_contract.do?sysparm_query=sys_id='+ contract_id);

//Redirect the user to the url
wizard.redirect= uri;
gs.addInfoMessage('Contract created');

//Create a new contract
function createContract(){
    var cc = new GlideRecord('ast_contract');
    cc.sys_class_name= wizard.contract_type;
    cc.starts= wizard.starts;
    cc.ends= wizard.ends;
    cc.short_description= wizard.short_description;
    var cntr = cc.insert();
    //We created a new contract and have the id so now we need the assets to associate
    associateAssets(cntr);
    return cntr;
}

//This is the way we loop through the elements in a list collector - assets in this case
function associateAssets(id){
    var items = wizard.asset_select.toString();
    items = items.split(',');
    for(var i =0; i < items.length; i++){
        var sys_id = items[i];
        if(sys_id !=''){
            var rl =new GlideRecord('ast_contract_instance');
            rl.ast_contract= id;
            rl.ci_item= sys_id;
            rl.insert();}
    }
}
```

*Define a transition (advanced demo)*

How to define a tradition.

1. Open a panel.
2. In the Wizard Panel Transitions related list, click **New**.
3. Enter the transition details and save the record.
4. Repeat steps 1 – 3 for all panel transitions in the table.
### Table 173: Panel transition details table

<table>
<thead>
<tr>
<th>Panel</th>
<th>Condition</th>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

*Test the wizard for a record with no assets*
Run through several scenarios to test transition logic and record generation.

1. Open the wizard record and click **Test**.
2. Enter the following information and click **Next**.
   - Associate assets?: No
   - Which type of contract?: select a value other than the default
   - Start Date: enter a date
   - End Date: enter a date
   - Enter short description for contract: enter a description
3. Verify that a new record is created and the values match step 2.

---

*Test the wizard for a record with an asset*
Test the wizard for a record with assets.

1. Open the wizard record and click **Test**.
2. Enter the following information and click **Next**.
- Associate assets?: Yes
- Which type of contract?: select a value other than the default
- Start Date: enter a date
- End Date: enter a date
- Enter short description for contract: enter a description

3. Verify that the asset screen opens.
4. Select assets to add to the list and click **Next**.
5. Verify that a new record is created and the values match steps 2 and 4.

---

**Publish the wizard demo**
Restrict access to users with asset role.

1. Open the wizard.
2. In the Roles field, select **asset** and save the record.

**Add the wizard as a module in the Asset Contracts application**
Add the wizard as a module in the Asset Contracts application.

1. Open the wizard.
2. Copy the sys_id.
3. In the navigation pane, right-click **Asset Contracts** and select **Edit Application**.
4. In the Modules related list, click **New**.
5. Enter the following information and save the record.
   - Title: Create Contract
List administration

Administrators control the data presented to end users in a list, the controls that appear, and the behavior of the controls.

Note: For information about using lists, see Lists on page 56.

List configuration

Users with the appropriate roles can configure various aspects of lists. Configuration changes apply to all users.

With list configuration, you can add, remove, and reorder list columns. You can configure calculations to appear under columns. You can also hide controls and define access conditions by role for existing list controls. Configuring lists is called personalizing lists in versions prior to the Fuji release.

Note: Configuring a list in this way modifies the list for all users. To make changes to a list that are visible to you only, see Personal lists on page 93.

Configure the list layout

You can configure a list to choose which columns appear in a list, create list views, and create new fields on the table.

Role required: personalize_list

1. Open the list in the view you wish to modify.
   For example, to modify the incident mobile view, navigate to Incident > Open and select View > Mobile from the context menu.
2. Right-click any column heading and select Configure > List Layout.
3. Use the slushbucket to select the columns and the order of appearance.
   The first non-reference field automatically links to the form view of the record. For this reason, consider using the record number as the first column in the list layout.
Note: If you create a personal list and then configure the list view differently, the changes do not appear until you reset your personal list to column defaults.

Add an extended field to a base table list
Administrators can configure a property that determines whether fields on extended tables can be added to a parent table list. For example, when this feature is enabled, you can view and filter on the Caller field, from the Incident table, on a Task table list.

Role required: admin

Note: Enabling this property does not show the extended table fields in the personalize list.

1. Navigate to System Properties > UI Properties.
2. Locate the property Allow base table lists (task, cmdb_ci, etc.) to include extended table fields (incident_state, os_version, etc.), and allow filtering on extended table fields (glide.ui.list.allow_extended_fields).
3. Select the check box to enable extended fields on parent table lists. Clear the check box to disable the feature.
4. Click Save.

Configure list calculations
You can configure list calculations for columns, which calculate column totals, minimums, maximums, and averages.

Role required: personalize_list

You can configure list calculations for multiple columns in the same list. List calculations apply only to the view of the list in which they are configured. All users can see configured list calculations.

Note: List calculations are available in list reports.

1. In a list of records, right-click the header of a numeric column you want to evaluate with list calculations.
2. Select Configure > List Calculations.
   A dialog box appears.

   ![Price (calculations)](image)

3. Select one or more of the following list calculation options:
   • Total value (not available for string, date, or date/time fields)
   • Minimum value
• Maximum value
• Average value (not available for string, date, or date/time fields)

4. Click **OK**.
   The calculations appear below the last record in the column. If the list is grouped, in addition to the overall calculations at the bottom of the list, group calculations appear below the last record in each group.

**Configure list controls**

You can configure list controls, such as buttons and filters.

Role required: personalize_control

1. Right-click a list column header.
2. Select **Configure > List Control**.
3. Complete the form.
Note: The list controls that are available for embedded lists are more limited. Unless otherwise noted, the list control fields in the following table are available for both standard and embedded lists.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>View the name of the table for the list or related list. For example, Change Request [change_request]. This value is set by the system automatically.</td>
</tr>
<tr>
<td>Related list</td>
<td>View the name of the table and field that define the related list. For example, sysapproval_approver.sysapproval. This value is set by the system automatically.</td>
</tr>
<tr>
<td>Label</td>
<td>Enter the label to display for this list. Allows an admin to customize the label for a related list or list. If not supplied, the default plural label for the file is used. For example, the label for the Incident table would be Incidents.</td>
</tr>
<tr>
<td>Omit new button</td>
<td>Select the check box to prevent the New button from displaying on this list. Clear the check box to display the New button or to control the New button with roles (New roles field). This field is available for standard lists only.</td>
</tr>
<tr>
<td>Omit edit button</td>
<td>Select the check box to prevent the Edit button from displaying on this list. Clear this check box to display the Edit button or to control the Edit button with roles (New roles field). The Edit button does not apply to all lists. This field is available for standard lists only.</td>
</tr>
<tr>
<td>Omit if empty</td>
<td>Select the check box to omit the Related List from the form entirely (no header) if there are no entries for the Related List.</td>
</tr>
<tr>
<td>Omit columns if empty</td>
<td>Select the check box for a top-level list to omit the column headers AND filters/breadcrumbs for an empty column.</td>
</tr>
<tr>
<td>Omit filters</td>
<td>Select the check box to hide filters or breadcrumbs for this list. Clear this check box if you always want filters or breadcrumbs or to control filters/breadcrumbs with roles (Filter roles field). This field is available for standard lists only.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Omit links</td>
<td>Select the check box to hide links for fields that reference other files in this list. Leave this button unchecked to generate links or to control the use of links with roles (Link roles field).</td>
</tr>
<tr>
<td>Omit drill-down link</td>
<td>Select the check box to disable the link to the record from the first column in list view. Users can still click the reference icon to access the record. This field is available for standard lists only.</td>
</tr>
<tr>
<td>Hierarchical lists</td>
<td>Inserts a hierarchical list into a record list. Hierarchical lists enable a user to view the contents of a record's related lists without leaving the record list form. This field is available for standard lists only.</td>
</tr>
<tr>
<td>List edit type</td>
<td>Controls the ability of a user to edit values directly in individual cells in a list. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Save immediately (cell edit mode):</strong> enables cell editing. The entire row is saved when the user enters a new value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Save data by rows:</strong> enables cell editing. The row is saved only when the user navigates away from the row or clicks the <strong>Save</strong> icon (✔️). This mode allows the user to modify multiple values before saving a record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disable list editing:</strong> prevents users from editing cells in the list.</td>
</tr>
<tr>
<td>List edit tag</td>
<td>Enter an arbitrary string of letters or numbers to create a unique tag that is sent to a reference qualifier as the script variable listEditRefQualTag.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>List edit insert row</td>
<td>Select the check box to enable or clear the check box to disable the ability for a user to create new records in list view. When it is enabled, an empty row appears at the bottom of the list.</td>
</tr>
</tbody>
</table>

This field is available for standard lists only.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New roles</td>
<td>Specify the user roles that can access the New button on this list. Leave the field blank to enable all users to access the New button. This option does not apply to embedded lists, which do not contain New buttons.</td>
</tr>
</tbody>
</table>

| Edit roles | Specify the user roles required to have the Edit button appear in the list. This field is available for standard lists only.                                                                                   |
| Filter roles | Specify the user roles required to have the filter appear in the list. This field is available for standard lists only.                                                                                     |
| Link roles | Specify the user roles required to have links generated for fields that reference other files.                                                                                                              |

**Example of configuring list controls**

The following example shows how to configure a list of related incidents in a problem record to suit specific business needs.

Role required: personalize_control

In this example, a related list label is configured to say Child Incidents, not just Incidents. The related list is also configured to remove the New button to prevent users from creating new incidents from the Problem form.

1. Navigate to a problem record.
2. Right-click in a column header of the embedded Incidents list and select Configure > List Control.
3. On the List Control form, change the Label field to Child Incidents.
4. Select the Omit new button check box.
5. Click **Submit**.
In the problem record, the label for the embedded incident list has changed and the **New** button is no longer available.

### Advanced list control with scripts

You can write scripts to specify which list elements, such as links, filters, and buttons, are present.

These scripts can react to the record that is being displayed. For related list controls, the parent record is identified by the global variable `parent`. For primary lists, there is no parent record.

**Configure** the List Control form and add the script field that you need:

- **Omit Columns Condition**: Omit column headings if there are no conditions.
- **Omit Edit Condition**: Omit the **Edit** button.
- **Omit Empty Condition**: Omit the list header if there are no conditions.
- **Omit Filter Condition**: Omit the list filter.
- **Omit Links Condition**: Omit related links.
- **Omit New Condition**: Omit the **New** button.

In these script fields, if the script evaluates to `true`, the item is omitted. The following script is an example that you can use on the **Affected CIs** related list to show only the **Edit** button if the parent task is active. This script is placed in the **Omit Edit Condition** script field.

```javascript
var answer;
if (parent.active == true) {
    // Do not remove the 'Edit' button
    answer = false;
} else {
    // Remove the 'Edit' button
    answer = true;
}
answer;
```

**Configure a list UI action**

You can create a UI action that opens the slushbucket interface to customize lists in the list view

Role required: **ui_action_admin**

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. In the **Table** field, select the **List [sys_ui_list]** table.
4. Select the **List context menu** check box.
5. Ensure the **Active** check box is selected.
6. Paste the following script in the **Script** field:

```javascript
var url = "slushbucket.do?sysparm_form=list&sysparm_list=" + current.
    name + "&sysparm_view=" + current. view. name;
url += "&sysparm_collection=" + current. parent + 
    "&sysparm_collection_relationship=" + current. relationship;
url += "&sysparm_referring_url=sys_ui_view.do?sys_id=" + current. view.
    toString () ;
action. setRedirectURL (url ) ;
```
7. Click **Submit**.
Controlling the sort sequence used to display lists

All lists have a default sort sequence based on the type of fields present in the list.

When a user displays a list for the first time, it is sorted by one of the following items.

- The **order** field if one is present in the table
- The **number** field if one is present in the table
- The **name** field if one is present in the table
- The field specified as the display field for the table

Setting the default sort order in the system dictionary

An administrator can set the sort order of records displayed for a table in the system dictionary when there is no other sort specified. This sort is the sort order presented to all users initially. Once a user sorts a list, that user preference is saved, and the list is always sorted for that user based on the previous sorting preference.

Sort order control

For any list, if the user has clicked a column header to sort by that column, then that action is remembered. The next time that list is displayed, the same field is used to order the list.

This remembered sort field can be overridden by adding a `sysparm_order` specification to the definition of the module. For example, if each time **News** is displayed, you want the new items listed in order of importance, then the **News** module can be updated accordingly.

```
&sysparm_order=sysparm_order=importance
```

**Figure 213: Set module sort order to the Importance field value**

The actual order (ascending or descending) can be specified by adding a `sysparm_order_direction` specification. Here are two examples of sorting a list by the `sys_created_on` field, one ascending and one descending:

```
&sysparm_order=sys_created_on &sysparm_order_direction=desc
&sysparm_order=sys_created_on &sysparm_order_direction=asc
```

Sort by multiple fields

To sort a list by multiple fields, remove everything from the filter field and place it in the arguments field. For example, if the filter specifies `[Active] [is] [true]` and you want to sort by category and subcategory, remove the condition and put the following in the module arguments:

```
active=true^ORDERBYcategory^ORDERBYsubcategory
```

This argument first orders by the category and then orders by the subcategory. If you want any field to be a descending sort then change `ORDERBY` to be `ORDERBYDESC`.

List editor administration

The list editor allows users to edit field values directly from a list without navigating to a form.

Administrators can manage this feature by using the following options.

- Configure global properties
- Configure list control settings for a table
- Configure contextual security rules
- Manage user preferences

**Warning:** Client scripts and UI policies run on forms only (client-side) and do not apply to list editing. Allowing list editing with client scripts running on fields in a form can result in incorrect data being saved to the record. For systems in which client scripts or UI policies apply to forms, either disable list editing or create appropriate business rules or access control to control the setting of values in the list editor. See [Use business rules and client scripts to control field values](#) on page 3811 for information on managing form and list editing.

Configure list editor properties

You can configure list editor properties that control whether lists can be edited, and which field types cannot be edited.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. To disable list editing, set the **Enable list editing** (glide.ui.list_edit) property to **No** by clearing the check box.
   
   This property is enabled by default, and it globally enables list editing. When you disable it, the list editor is disabled globally.

3. To configure the field types that cannot be edited, complete the following steps.
   a) Locate the **List of element types (comma-separated) that cannot be edited in the list editor** (glide.ui.list_edit_ignore_types) property. It contains several element types that cannot be edited by default.

   The following field types are not editable from the list editor by default.
   
   - Conditions [conditions]
   - Currency [currency]
   - Document ID [document_id]
   - Field List [field_list]
   - HTML [html]
   - Image [user_image]
   - List [glide_list]
   - Price [price]
   - Template Value [template_value]
   - Time [glide_time]
   - User Roles [user_roles]
   - Video [video]

   b) Add any other field types you want to disable to the end of the list, separated by a comma.

4. Click **Save**.
Configure list control settings for the list editor

You can configure the list control settings that affect the list editor.

Role required: personalize_control

List control settings customize the behavior of list functions for a table.

1. Navigate to a list view for the desired table.
2. Right-click a list column header and select Configure > List Control.
3. Select the desired settings.

Table 175: Control settings for the list editor

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List edit type</td>
<td>Controls the ability of a user to edit values directly in individual cells in a list. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Save immediately (cell edit mode)</strong> enables cell editing. The entire row is saved as soon as the user enters a new value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Save data by rows</strong> enables cell editing. The row is saved only when the user navigates away from the row or clicks the</td>
</tr>
<tr>
<td></td>
<td><strong>Save</strong> button. This mode allows the user to modify multiple values before saving a record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disable list editing</strong> prevents users from editing cells in the list.</td>
</tr>
</tbody>
</table>

| List edit insert row | Controls the ability of a user to create new records in list view. Select the check box to enable or clear the check box to   |
|                     | disable this ability. When it is enabled, an empty row appears at the bottom of the list.                                      |

4. Click **Update**.
Managing user preferences for list editing

Users can set user preferences for list editing by personalizing a list (available when the list mechanic is activated).

To view and manage list editor user preferences, navigate to User Administration > User Preferences.

Table 176: User Preferences

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list_edit_enable</td>
<td>Set the value to true to enable or false to disable list editing. Default value is true.</td>
</tr>
<tr>
<td>list_edit_double</td>
<td>Set the value to true for double-click or false for single-click. Default value is true.</td>
</tr>
</tbody>
</table>

Configuring contextual security for the list editor

The list editor enforces existing access control rules (ACLs) and additional security controls to restrict editing from a list.

The list_edit security operation specifically controls the ability to edit information in a list. Apply this operation in the same manner as the write operation to limit list editing for fields that require the user to navigate to the form. Reasons you may require a user to edit a field in a form include complex UI policy constraints or other policies you have in place.

The list_edit security operation specifically controls the ability to edit information in a list. Apply this operation in the same manner as the write operation to limit list editing for fields that require the user to navigate to the form. Reasons you may require a user to edit a field in a form include complex UI policy constraints or other policies you have in place.

• write and list_edit access to the field
• write and list_edit access to any dependent fields of the field
• write and list_edit access to any fields that are dependent on the field being edited

To configure access controls, navigate to System Security > Access Controls. The following examples use the list_edit security operation to restrict list editing in certain contexts.

Example - Restrict a table

This access control prevents everyone from editing all fields in the Incident table in a list.
Figure 214: Restrict the Incident Table

- **Type**: record
- **Operation**: list_edit
- **Name Incident**: [incident]
- **Admin overrides**: Clear the check box.
- **Script**: `answer = false;`

Example - Restrict a field

This access control prevents everyone except an administrator from editing the Short Description field of an incident record in a list.
Figure 215: Restrict the Incident Short Description

- **Type**: record
- **Operation**: list_edit
- **Name**: Incident [incident], Short Description
- **Admin overrides**: Select the check box.
- **Script**: `answer = false;`

**Example - Restrict a field with a script**

This access control prevents everyone from editing an incident with a category of Software in a list. It is defined by a script.
**Figure 216: Restrict Software Incidents**

- **Type:** record
- **Operation:** list_edit
- **Name Incident:** [incident]
- **Admin overrides:** Clear the check box.
- **Script:**

  ```java
  if (current.category == 'software')
  answer = false;
  else
  answer = true;
  ```

**Example - Restrict a field with a condition**

This access control prevents everyone from editing a Critical Incident in a list. It is defined by a condition.
Figure 217: Restrict Critical Incidents

- **Type**: record
- **Operation**: list_edit
- **Name Incident**: [incident]
- **Admin overrides**: Clear the check box.
- **Condition**: Priority is not 1 - Critical

Personal list administration

Users can customize the layout for any list view by personalizing a list. Administrators can manage the personal lists of other users.

Administrators can manage personal lists using the following options:

- Activate or deactivate it globally
- Control user access to it based on roles
- Manage users’ personal lists

The personal list function requires the list mechanic UI macro.
Enable or disable personal lists

You can enable or disable personal lists through the UI Macros module.

Role required: ui_macro_admin

1. Navigate to **System UI > UI Macros**.
2. Activate (or deactivate) the **list_mechanic2** UI macro.

Control which roles can personalize lists

You can control who can create personal lists.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. Locate the property **List of roles (comma-separated) that can use Personal Lists. If blank, all can use** (glide.ui.list_mechanic.roles).
3. Enter the roles for which personal lists are available, separated by commas, or leave the field blank to allow access for all users (default).

Manage personal lists

Administrators can manage personal lists.

Role required: admin

1. Navigate to **System UI > Lists**.
2. Review personal lists that have a value in the **User** field.

Administer detail rows

Detail rows provide additional information about records in a list.

Role required: admin

To display detail rows, an administrator must enable them globally and add them to lists.

**Note:** Detail rows are supported in UI15 and up.

1. To enable detail rows, *add a new system property* with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.list.detail_row</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

2. To add detail rows to a list, complete the following steps.
   a) Add the **detail_row** *dictionary attribute* to the table.
      Specify the name of the field to display in the following format:
      detail_row=short_description
b) Use the all_tables element descriptor with the detail_row attribute to display detail rows for all child tables that contain the designated field.
For example, all_tables.detail_row=short_description is on the Task [task] table by default, so the short description detail row appears in lists for Incident [incident], Problem [problem], and other child tables unless you set detail_row to a different field for each one.

Restrict filters and breadcrumbs with fixed queries

The record list view allows users to navigate to different subsets of a table using breadcrumbs and filters. You can limit access to parts of the table by restricting active links in breadcrumbs or by suppressing breadcrumbs and filters for specific roles.

Role required: admin

A breadcrumb option enables an administrator to control the base view of a record list presented to users. By adding a fixed query to the argument for a module, an administrator can prevent users from expanding their view past a specified starting point. The argument for this fixed query is written as &sysparm_fixed_query=active=true. A use case for this query is to prevent users from using the breadcrumbs to switch a list of open incidents to a list of all incidents. When users select Incident > Open, they are limited to viewing and filtering a list of open (active=true) incidents.

1. Perform the appropriate action for your version of the UI:

| UI16          | 1. Navigate to System Definition > Application Menus.  
               | 2. Open the application menu that contains the module you want to edit. |
|---------------|-----------------------------------------------------------|
| UI15 or UI11  | Right-click the application in the navigation pane and select Edit Application. |

2. Select the module to edit.
   For example, select Open.

3. In the Link Type section, select List of Records for the Link type.

4. Delete the Active is true filter, if present.

5. Add &sysparm_fixed_query=active=true to the Arguments field and update the record.
6. Navigate to Incidents > Open and examine the breadcrumbs.

The Active=true link is the widest view permitted in the list of Open incidents. Notice that the breadcrumb for All is not linked.
Suppress filters and breadcrumbs with list controls

You can use list controls to suppress filters and breadcrumbs on defined tables for users with specific roles.

Role required: personalize_control

1. Navigate to the record list view of the table to restrict breadcrumbs.
2. Right-click any column header, and select Configure > List Control.
   You can also navigate to System UI > List Control.
3. Select the Omit Filters check box. Clear the check box to include filters.

The Filter Roles field allows an administrator to specify certain roles who can see the filters.

Suppress filters and breadcrumbs using script includes

You can use a script to restrict filters and breadcrumbs to specific roles, either on a per-table basis or global basis. Using a script is an advanced option that offers additional flexibility compared to using list control.

Using a script include requires knowledge of JavaScript.

Role required: script_include_admin or admin

1. Create a script include with the name <tablename>DisplayFilter.
   The script section contains one function with the same name as the script include.
2. Use your function to set the global variable answer to either true (show the filters and breadcrumbs) or false (hide them.)
   The following example restricts filters and breadcrumbs on the Incident table to users with any role. Be sure that the name of the script matches the function name exactly, including case.

   ```javascript
   var incidentDisplayFilter = Class.create();
   ```
incidentDisplayFilter.prototype = {
    type: 'incidentDisplayFilter',
    initialize: function() {
    },
    incidentDisplayFilter: function() {
        var answer;
        if (gs.hasRole()) {
            answer = true;
        } else {
            answer = false;
        }
        return answer;
    }
};

3. Optional: To exclude a specific role from having access to filters and breadcrumbs, make the following change.

var incidentDisplayFilter = Class.create();
incidentDisplayFilter.prototype = {
    type: 'incidentDisplayFilter',
    initialize: function() {
    },
    incidentDisplayFilter: function() {
        var answer;
        if (gs.hasRole() && !gs.hasRole('newrole')) {
            answer = true;
        } else {
            answer = false;
        }
        return answer;
    }
};

Users with the role newRole cannot access filters and breadcrumbs.

4. Optional: To let all users use filters and breadcrumbs on the Incident table, make the following change to your script.

var incidentDisplayFilter = Class.create();
incidentDisplayFilter.prototype = {
    type: 'incidentDisplayFilter',
    initialize: function() {
    },
    incidentDisplayFilter: function() {
        var answer = true;
        return answer;
    }
};
5. Optional: To modify filter and breadcrumb access for another table, create a script include using the name of that table instead of Incident.

Increase the allowed number of breadcrumb entries

You can add a property to allow for a larger number of breadcrumb entries in the filter.

Role required: admin

1. Enter `sys_properties.list` in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.

2. Verify the property does not already exist by searching for `glide.ui.breadcrumb_max_entries`.

3. Click **New**.

4. Complete the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.breadcrumb_max_entries</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Value</td>
<td>The number of breadcrumb entries you want to appear in the filter, for example, 15. The default number is 10.</td>
</tr>
</tbody>
</table>

5. To verify this property, go to any table and use the filter modifier **is one of** to search for any number of items. The number of entries you entered in the Value field will display before ending in a […].

![Figure 218: Breadcrumb entries](image)

Enable a hierarchical list

You can enable hierarchical lists to make data from related lists directly accessible from within a record list.

Role required: personalize_control

Hierarchical lists enable a user to view the contents of a record's related lists without leaving the record list form.

---

**Note:** You cannot enable a hierarchical list view for an embedded list.

1. Right-click any column header, and select **Configure > List Control** from the context menu.
2. Select the **Hierarchical lists** check box in the List Control dialog box and then click **Submit** or **Update**.
3. Click the arrow for a record number to display the related lists for the record.
Use list controls in hierarchical lists

By default, no related list tabs are visible in a hierarchical list and only a single related list is displayed at a time. The column headers are hidden by default.

Role required: none

1. To select a different related list, click the link in the list title.
2. Select a list from the menu.
If the related list is empty, the hierarchical list indicates that there are no records to display.

The platform remembers this preference and displays the last selected related list for each table when you open another hierarchical list within that table.

3. To display column headers in the related list, click the show/hide headers icon in the upper right corner of the hierarchical list.
The platform remembers this preference and opens all hierarchical lists with column headers enabled until the headers are hidden.

Context ranking

Context ranking allows a user to sort a collection of records preferentially, that is, independently of the attributes of those records.

For example, a Customer Support manager can organize a list of incidents in the order in which a technician should work on the tasks. Creating such an arbitrary list with a list filter is not possible.

Activate context ranking

You can activate the Context Ranking plugin (com.glide.sorting) if you have the admin role. This plugin activates related plugins if they are not already active.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

## Create a ranking definition

Enable context ranking for a related list by creating a ranking definition.

**Role required:** admin

1. Navigate to **System Definition > Ranking Definitions**.
2. Click **New**.
3. Enter a **Name** for the ranking definition.
4. In the **Record table** field, select the table for which ranking is enabled.
   This is the table of the records in the ranked related list. For example, to enable ranking for a related list of incidents in the Problem form, select the Incident [incident] table.
5. In the **Context column** field, select the reference column providing the context in which ranking is to be performed.
   In this case, the context is the form in which the related list appears and not a table name. For example, a related list with a **Record table** of Incident [incident] can have a number of contexts, including the Problem form or a **Configuration item** form.
6. Complete the relationship-based fields if the ranking is to be performed on a related list that is defined by a relationship.
   - **Relationship table**: select the table forming the other side of the relationship. In the case of the ranking definition for Product stories in scrum, you might use the Product Model [cmdb_model] table.
   - **Relationship column**: select the column from the relationship table to compare with the context column. To avoid adding a related list of user stories to the Product Model [cmdb_model] table, you might use the Sys ID column, which defines a subclass of the Product Model table (cmdb_model.sys_id).
7. In the **Attributes** field, enter attributes to change and restrict the contents of the Rank dialog box, as appropriate.
   - **visible_columns**: a semi-colon separated list of columns to be displayed in the Rank dialog box.
     If not specified, the Rank dialog box uses the default view of the related list you selected in the **Record table** field.
   - **extra_conditions**: an encoded query to restrict the records shown in the Rank dialog box. For example, the query `extra_conditions=^state!=7` displays all incidents whose state is not Closed. If not specified, the Rank dialog box shows all records for the relationship.
8. Click **Submit**.

The index is generated automatically. The system completes these read-only fields:

- **Index column**
- **Rank ui action**
- **Context menu item**

**Note:** After you submit a ranking definition, only the **Attributes** field can be edited. If additional changes are required, delete the record and create a new one with the revised settings.

The system does not generate indexes for ranking definitions inserted into the database by an update set. To use a ranking definition inserted by an update set, you must generate the indexes manually. To generate indexes, open the Ranking Definition form and click **Generate Indexes**.
Rank a list

After you create a ranking definition for a table, related lists based on that table and context include options for ranking the list and displaying the list by rank.

Role required: none

You can set the preferential order of records.

1. Click the **Rank** button in the related list to reorder the records.
The Rank dialog box appears, allowing you to sort the records in any order.
2. Click and drag the move icon ( ) to change a record's position.

**Note:** Administrators can define which columns appear in the Rank dialog box in the Attributes field of the Ranking Definition form.

**Apply a new sort order to a list**
You can apply a new sort order to the records in a list.

Role required: none

1. Open the context menu from the list title and select **Sort by rank.**
2. To remove the ranking and return to the original order of the list, click the label in any column that contains data.

Scrum ranking definitions

Ranking definitions for user stories are part of the SDLC (scrum process) application. These ranking definitions enable scrum users with the proper roles to rank related lists of stories in the these tables:

- Product stories: Application Model [cmdb_application_product_model] table
- Release stories: Release [rm_release] table
- Sprint stories: Sprint [rm_sprint] table

Users can rank stories in the scrum planning board by priority. Story lists ranked in the planning board appear in the new order in product, release, and sprint forms. Stories ranked in one of these scrum forms changes the order in the planning board.

Story points for each story are listed in a ranked view, which is useful for prioritizing stories.
The Context Ranking feature enables all scrum users to manually sort a related list of stories by priority. A product owner or release planner uses this tool to establish the order in which the stories are to be worked. Stories ranked in a related list (in the Product, Release, and Sprint forms) appear in the same order in the planning board when the appropriate backlog is displayed. Conversely, stories ranked in the planning board appear in that order when viewed in the related list in the form. Users can switch the view in a Stories related list from ranked to any sort order without changing the ranking in the planning board.

1. In the Stories related list, click Rank.
   A dialog box appears, allowing you to arrange the stories in any order, such as by priority.
2. Click and drag each story into position using the move icon to the left of the story number.
3. When you are finished, click the X in the upper right corner to close the list.
   The Stories related list is not sorted by your ranking initially.
4. To view the related list in its ranked order, open the context menu from the related list and select Sort by rank.
5. To return the sort order of the list to an unranked state, click once in the heading of any column that contains data.

The system uses this ranked list to display the appropriate backlog in the planning board. For example, if you rank stories in the Stories related list in the Release form, the release backlog in the planning board uses the same ranking to display the stories. Conversely, scrum masters, product owners, and release planners can create a new ranking order for the Stories related list by rearranging the list of stories in the planning board.

Form administration

Configure forms to add new content, create custom forms, and personalize form layout.

Configure a form

The layout of a form can be configured for any form view.

Role required: personalize_form

1. Click the form context menu icon and select Configure > Form Layout.
2. Using the slushbucket, select the fields and the order in which you want them to appear.
   Available items that appear in green followed by a plus (+) sign represent related tables. To access fields on these tables, use dot-walking.
3. Click **Save**.

**Warning:** It is not recommended to add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.
Configure task record insert options

The Insert and Insert and Stay options are disabled by default for task records such as incidents and change requests. You can set a system property to show these options for task records.

Role required: admin

1. Navigate to System Properties > UI Properties.
2. Locate the property Allow the use of the "Insert" and "Insert and Stay" options on task derived tables. (glide.ui.task.insert)
3. Select the check box to enable or clear the check box to disable (default) the options for tasks.
4. Click Save.

Add a related list

You can configure related lists to appear on forms and in hierarchical lists.

Role required: personalize_form

Related lists display records in another table that have a relationship with the current record.

1. Open the form.
2. Click the form context menu icon and select Configure > Related Lists.
3. Using the slushbucket, select the related list to display on the form.
4. Click Save.
   Related lists appear at the bottom of the form.

Add a chart to a form

You can add a chart to a form.

Role required: personalize_form

The following report types are not supported on forms: List, Pivot, Multilevel Pivot, Calendar, and Single Score.
Figure 220: Chart on a form

1. Open the form.
2. Click the form context menu icon and select **Configure > Form Layout**.
3. Using the slushbucket, select *Chart*.
4. Enter a **Label** in the chart details.
5. Click **Save** to return to the form.
6. Click **Configure chart**.
7. Select a chart in the **Report** field and configure other options as desired.
8. Click **Update**.

Configure customer updates indicator

Customer updates are changes that are tracked by update sets, such as scripts, service catalog items, and other configuration tables.

Role required: admin

The customer updates indicator icon () may appear on the header of forms that have customer updates. Clicking the customer updates indicator opens the update set records for the item.
You can configure this indicator to appear for all or for specific administrators using the owned_by_indicator.form user preference.

1. Navigate to User Administration > User Preferences.
2. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable the indicator for all administrators</td>
<td>Set the owned_by_indicator.form preference to true.</td>
</tr>
</tbody>
</table>
| Enable the indicator for an individual administrator | 1. Set the owned_by_indicator.form preference to false.  
2. Create a new user preference with the following values:  
  • Name: owned_by_indicator.form  
  • User: Select the administrator for which to enable the preference.  
  • Value: true |

Form design

Administrators or users with the personalize_form role can use the form design feature to quickly create new or change existing form views.

Form design is an alternative to configuring forms that combines several configuration options into one tool.

Form design is available by default for new instances and requires UI16 or UI15. Administrators who upgrade from a previous version must activate the Form Designer (com.glide.ui.ng.fd) plugin to use the feature.

This video highlights the features of Form Design to create and customize forms.

Parts of the form design interface

The form design interface is divided into sections.
**Page header**

The page header displays the current table and view being designed. Each form is tied to a unique table and view combination. For example, there can only be one form for the incident table default view. Select a different view to modify different form layouts for a table.
Figure 222: Header

Field navigator

The field navigator allows you to manage fields on the form. It contains the following elements:

- **Filter:** Allows text search on the currently selected tab.
- **Fields:** Displays a list of existing fields you can add to the current form.
- **Field Types:** Displays a list of field types you can add to the current form. Adding a field type to the form layout creates new fields in the selected table when the form layout is saved.
Field properties are accessed by clicking the gear icon that appears when you point to a field in the form layout.

Figure 223: Field navigator
The form layout displays a separate cell for each field, section, annotation, UI element, and related list that is on the form. Each cell has an identifying label and a handle icon to aid in selecting and moving it. The location of the cell in the form layout represents its relative position on the form. Only fields visible on the form layout are displayed on a form.
Figure 225: Form layout
Change or create new form
You can create a form or change the content of a form.
Role required: personalize_form
1. Navigate to the form.
2. Right-click the form header and select Configure > Form Design. The form design interface opens in a new browser tab or window.
3. Optional: At the top of the Form Design:
   a) Select the table for the form.
   b) Select a form view to change, or click New to create a form for the selected table.

   By default, form design displays the form layout for the currently selected table and view.
4. Modify the form as desired.
5. Click Save.

Select which field to display
Move fields to and from the form workspace to display the fields on the form.
Role required: personalize_form

   Note: Use the filter to quickly find fields in the field navigator.

1. Navigate to the form designer.
2. From the list of fields in the Field Navigator, select the field you want to display from the list of available fields.
3. Drag the field to the form layout.
4. Drag the field to the location you want it to be on the form.
5. To remove a field from the form layout, select the field and click the Remove this field (X) button beside the field label.
6. Click Save.

Add a new field
You can add a field to a form and the associated table.
Role required: personalize_form

Adding a field creates a dictionary entry for the new column in the current table. You can create a custom table and then use the form designer to add fields to the form.

   Note: Use the filter to quickly find field types in the field navigator.

1. Navigate to the form designer.
2. Click the Field Types tab.
3. Select the cell for the field type to create.
4. Drag the field type to the location you want it to be on the form.
5. Enter a label for the field.
6. Optional: Point to a field in the form design area and click the gear icon to access properties.
7. Click **Save**.

### Add a new section

Move sections to and from the form layout to display or remove the sections on the form.

Role required: personalize_form

Sections can have a one- or two-column layout.

**Note:** By default, the first section on a form is always a read-only section displaying the label of the table. You cannot remove this section.

1. Navigate to the form designer.
2. Select an existing section.
3. Click the (+) button beside the section label to add a section.
4. Enter a label for the section.
5. Drag sections to reorder them.

**Note:** The label for the first section on the form designer is displayed as the form title.

6. To delete a section, click the (x) button beside the section label.
7. Click **Save**.

### Add an annotation

Use annotations to provide instructions or additional information about fields on a form.

Role required: personalize_form

1. Navigate to the form designer.
2. Click the **Field Types** tab.
3. Select the **Annotations** field type.
4. Drag the annotation to the appropriate location on the form.
5. Point to the **Annotations** field and click the gear icon to open Properties dialog box.
6. In the Properties dialog box, enter a value for **Annotation Text**.
   You can use HTML tags to format the annotation text.
7. Click **Save**.

### Add a formatter

Use formatters to add information from macros or previously scripted UI elements to a form.

Formatters are used to add information from macros or previously scripted UI elements to a form.

1. Navigate to the form designer.
2. Click the **Fields** tab.
3. In the filter, enter the string **Format**.
4. Select the formatter you want to add to the form.
5. Drag the formatter to the location you want it to be on the form.
6. Click **Save**.
Form personalization administration

Users can customize the layout for any form view by personalizing the form. Form personalization is available in UI16 and UI15.

Administrators can manage this function using the following options.

- Activate or deactivate form personalization globally
- Control user access to form personalization based on roles
- Manage users’ personalized forms

**Note:** Personalizing a form in this way modifies the form for you only. To make changes to a form that are visible to all users, you must configure the form.

Activate form personalization

Form personalization is activated for new instances. To activate form personalization for upgraded instances, an administrator must activate the Form Personalization (com.glide.ui.personalize_form) plugin.

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

Change form personalization role requirements

By default, the itil role is required to personalize forms. You can change the role requirements.

Role required: admin

1. Enter **sys_properties.list** in the navigation filter.
2. Locate the glide.ui.personalize_form.role property in the System Properties list.
3. In the **Value** field, specify the roles that can access form personalization.

Manage personalized forms

When a user personalizes a form, the system stores the customizations as a user preference record. You can view and manage the user preferences.

Role required: admin

1. Navigate to **User Administration > User Preferences**.
2. Filter the list by **[Name] [contains] [personalize]**.
   - There is a user preference for each form view each user personalizes. The name format combines the word personalize with the name of the table and the name of the view. For example, if a user personalizes the default view of the Asset [alm_asset] form, the user preference is called personalize_alm_asset_default.
3. Delete a user preference to remove the customizations for the user.

**Disable form personalization**

You can disable form personalization.

Role required: admin

Activating the Personalize Forms plugin sets the glide.ui.personalize_form property to true. You can disable form personalization.

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the `glide.ui.personalize_form` property in the System Properties list.
3. Set the `Value` field to `false`. The personalize form icon is removed from forms.

**Form annotation**

A form annotation is additional information on a form, such as a line or paragraph of text. Use form annotations to provide on-screen instructions to your users.

**Toggle annotations**

Users can toggle annotations on a form in UI16 and UI15.

The visibility of annotations for each user is controlled by the `glide.ui.show_annotations` user preference.

1. Navigate to a form.
2. Perform the appropriate action for your version of the UI.

<table>
<thead>
<tr>
<th>UI16</th>
<th>Click the more options icon (●●●) to see the annotations icon. The icon is light grey and cannot be toggled when no annotations are available.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15</td>
<td>Click the annotation toggle icon (?) to show or hide annotations.</td>
</tr>
</tbody>
</table>

**Add a form annotation**

You can add annotations to forms.

Role required: personalize_form

1. Navigate to a form.
2. Right-click the header and select **Configure > Form Layout**.
3. Under **Form view and section**, select a section.
4. In the Available list, double-click *Annotation* to move it to the **Selected** list. The Annotation Details section appears.

© 2017 ServiceNow. All rights reserved. 716
5. Place it above the field to annotate.
6. In Annotation Details, select the type of annotation. The available types of annotations include **Info Box Blue**, **Info Box Red**, **Line Separator** (any text you add appears beneath the line), **Section Details**, **Section Separator**, and **Text**.
7. Select either Plain Text or HTML for the data type and enter the annotation in the text box. All valid HTML tags are supported.

   For example, select the Text annotation type, the HTML data type, and enter `<span style="color:red">Select the primary location:</span>`. The text appears red on the form.

8. Click Save.

Support multiple languages for a form annotation

You can store multiple translations of form annotation text.

Role required: admin

To support multiple languages, use message records to translate annotation text.

1. Navigate to System UI > Messages.
2. Create a message record for each language you support.
3. On the Message form, set the **Key** field to a unique identifier for the annotation text.
   The annotation text is a good key. The key must be the same for each translation message for the annotation.

4. Select the appropriate **Language**.

5. In the **Message** field, enter the translated annotation text.

6. Edit the form annotation and reference the message key with a `gs.getMessage` call.
   For example, if the message key is **Message key text**, enter `${gs.getMessage("Message key text")}` in the form annotation.

### Administer form annotation types

You can define the form annotation types to control their appearance.

Role required: admin

1. Navigate to **System UI > Form Annotation Types**.
2. Set the **Active** field to **false** for any types you do not want to use.
3. Click **New** to add a type.

### Disable annotations

You can disable form annotations.

Role required: admin

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the `glide.ui.form_annotations` property in the System Properties list.
3. Set the **Value** field to **false**.
   By default, this property is set to true to display annotations.

### Modify form focus

By default, forms set focus on the first writable field on the form. An administrator can change that functionality to focus on other fields in the form.

#### Modify form focus using a client script

Modify the form focus with `onLoad()` client script on the form.

```javascript
function onLoad ( ) {
    setTimeout ( "var refocus =
        g_form.getElement('table_name.field_name');refocus.focus();", 0 ) ; }
```

Based on the nature of the field you are targeting, replace `table_name.field_name` with the appropriate value:

- For non-reference fields, enter the name of the field to focus on (for example, `incident.caller_id`).
- For reference fields, use the format `sys_display.table_name.field_name` (for example, `sys_display.incident.caller_id`).
Disable form focus

Disable form focus by setting the property glide.ui.focus_first_element to false. To do so, navigate to System Properties > UI Properties and deselect the On form load, focus on first writable element check box.

Change the preference to submit a form with the enter key

By default, pressing the Enter key in a simple, one-line, choice list, or a Boolean field submits the form.

Role required: admin

A system preference controls this behavior, and it can be deactivated.

1. From the left navigation pane, select User Administration > User Preferences.
2. Select the enter_submits_form preference.
3. Set the value to false.
4. Click Update.

The change does not take effect until user preferences are reloaded either at login or when a session is created.

Multiple form splits

Form splits enable you to organize fields on a form into columns. When you use multiple form splits, you are grouping sets of fields together, one columnar group below another columnar group. A system property controls the use of multiple form splits.
Figure 226: Configuration of two form splits
When you organize fields in this manner and the user is viewing the form on a small mobile device, the fields within the first split are listed before the fields in the second split. In this example, the Asset tag, State, Serial number, and Substate field are listed before any of the fields below them. You can also create elements that span the form at the top of the form.

The property glide.ui.form_multiple_splits must be enabled to use this capability. If this property is missing or false, then things work as they always have. If this property is set to true, the following options appear in the Available column of the Configure Form slushbucket:

- |- begin_split -|
- |- split -|
- |- end_split -|

When you move any of these options to the Selected column, the names remain in the Available column, so you can select them multiple times.

**Note:** Additional split sections beyond the default split section must contain all three items: the begin, the split, and the end.

Add a property to enable multiple form splits

You can create the property to enable multiple form splits if it does not exist in your instance.

**Role required:** admin

1. Enter sys_properties.list in the Navigation filter.
The entire list of properties in the System Properties [sys_properties] table appears.

2. To determine whether the property exists, search for *multiple in the Name column. If the glide.ui.form_multiple_splits appears, you do not need to proceed with the following steps.

3. If the property does not exist, click New.

4. Enter the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.form_multiple_splits</td>
</tr>
<tr>
<td>Description</td>
<td>Enable multiple form splits</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

5. Click the form context menu icon and select Save. The Categories related list appears.

6. Click Edit and move UI to the Categories List.

7. Click Save. The System Property form reopens and the new property appears in the UI Properties page.

Form section administration

Users with the form_admin role can divide forms into sections to organize the fields into logical groupings. Users can expand or collapse form sections to show or hide the fields they need. If you have tabs enabled, each form section appears on a separate tab. The default Change Request form is an example of a form with multiple sections as shown in the following image.
Figure 228: Change Request form sections

Create a form section

You can create a form section.
Role required: form_admin

1. Right-click the form header and select **Configure > Form Layout**.
2. In the **Form view and section** area below the slushbucket, click **New** in the **Section** list.
3. In the **Section caption** field, give the new section a title, then click **OK**.
4. Select a form section name and click the up or down arrow to change the section order.

   **Note:** The caption for the first section on the form becomes the form title.

5. Add fields to the new section using the slushbucket.
6. Click **Save** when you are finished.
   The new section appears on the form with the fields you selected. If you do not add any fields to a section, the section stays empty.

**Delete a form section**

You can delete a form section.

Role required: form_admin

1. Navigate to **System UI > Form Sections**.
2. Filter for the table that contains the section you want to delete. For example, the Incident table.
   The name of the form section to be deleted is displayed in the **Caption** field.
3. Select the check box beside the form section to delete.
4. From the **Actions on selected rows** menu, select **Delete**.
5. Click **OK** to confirm the deletion.

**Show or hide a form section**

When you show or hide a form section, your selection is saved as a user preference.

1. Open a form with multiple sections.
2. Perform the action appropriate to your version of the UI.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16 or UI15</td>
<td>Click the expand (&gt;) or collapse () arrow on the section header. The expand and collapse arrows are visible only when tabbed forms are disabled.</td>
</tr>
<tr>
<td>UI11</td>
<td>Click the expand (+) or collapse (-) icon on the section header.</td>
</tr>
</tbody>
</table>

The next time you access a record that uses the same form, the same section is shown or hidden.

**Templates**

Templates simplify the process of submitting new records by populating fields automatically.

To use a template, populate the most-used fields for a specific table, save it as a template, and then make the template accessible to your users. Users can apply the template to new records on that table, or define scripts that apply the template.

Create templates for the forms that you use frequently, such as incident, problem, and change. There is no limit to the number of templates that you can create or access. Having many templates for each form makes the templates more complex to manage.
You can apply ACL rules to template creation. The user creating the template must satisfy the `save_as_template` ACL for any field modified by the template.

**Automatically applied templates**

You can make a template that automatically applies to new, user-created records on a specific table. To create this kind of template, set the template name to match the name of the table to which the template applies.

For example, imagine you want to apply a template automatically when a user creates a record on the Windows Server [cmdb_ci_win_server] table. Set the Name field to `cmdb_ci_win_server` and the Table field to Windows Server [cmdb_ci_win_server] on the Template form.

Automatic templates are always global. They do not honor the User and Group fields on the Template form. Automatic templates do not apply to records created by the system, such as those records generated by business rules, UI actions, or workflows.

**Toggle the template bar**

The template bar appears at the bottom of forms in UI16 and UI15. It provides shortcuts to apply, edit, and create templates.

Role required: none

You can toggle the template bar, which hides or shows it for all forms. The template bar is shown by default.

---

**Note:** The template bar is not available in UI11.

1. Navigate to a form.
2. Perform the appropriate action for your version of the UI.

| UI16 | 1. Click the more options icon (≡≡≡) in the form header.  
2. Select **Toggle Template Bar**. |
|------|----------------------------------------------------------------------------------------------------------------------------------|
| UI15 | 1. Right-click the form header.  
2. Select **Toggle Template Bar**. |

The template bar is hidden or shown.

Create a template using the Template form

You can create a template record for any table.

Role required: admin

1. Navigate to **System Definition > Templates**.
2. Click **New**.
3. Complete the form, as appropriate.

**Table 177: Template form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of this template.</td>
</tr>
</tbody>
</table>
| Table | Table this template applies to. Select **Global** to make the template available for use with all tables.  
Note: The list shows only tables and database views that are in the same scope as the template. |
| Active| Option for making the template available for use. A template must be active to be used. |
| User | User who can configure and apply the template. If a user is defined, no other users can see the template unless the **Global** check box is selected. |
| Group | A group whose members can configure and apply the template. If a group is defined, no other groups can see the template unless the **Global** check box is selected. |
| Global | Option for allowing any user who can access templates to view and apply this template. |
Field | Description
---|---
Short description | Description of the template.  
**Note:** Text added in this field does not add the text to the Short description field of forms that use this template.

Template | The content that automatically populates records based on this template. Select a field from the specified table in the left column, then enter the data to automatically populate in the right column.  
**Note:** Even though you can select dot-walked fields in the template, they do not apply to fields that are on the form.

4. Click **Submit**.

See **Application scope**.

Create templates for related task records

Administrators can create a template for a Task table record that also creates one or more related records in the child Task table.

Role required: admin

Administrators need to understand the parent-child relationships between Task tables. For example, the Change Task table is a child of the Change table and the Incident Task table is a child of the Incident table.

1. From the parent Task table template, **configure the form layout** to add these fields.
   - **Next Related Child Template**
   - **Next Related Template**
   - **Link element**

2. **Create a template** for the parent Task table.  
   For example, create this template for the Change table.

   **Table 178: Sample Change template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Add server to network</td>
</tr>
<tr>
<td>Table</td>
<td>Change [change_request]</td>
</tr>
<tr>
<td>Short description</td>
<td>Set up a server on the network</td>
</tr>
</tbody>
</table>
3. **Create a template** for the first related task.
   For example, create this template for the Change Task table.

   **Table 179: First sample Change Task template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Order server</td>
</tr>
<tr>
<td>Table</td>
<td>Change Task [change_task]</td>
</tr>
<tr>
<td>Short description</td>
<td>Order server hardware</td>
</tr>
<tr>
<td>Template</td>
<td>• [Short description][Order server hardware]</td>
</tr>
<tr>
<td></td>
<td>• [Assignment group][Hardware]</td>
</tr>
<tr>
<td>Link element</td>
<td>Change request</td>
</tr>
</tbody>
</table>

4. **Create a template** for each additional related task.
   For example, create one additional template for the Change Task table.

   **Table 180: Second sample Change Task template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Install server on network</td>
</tr>
<tr>
<td>Table</td>
<td>Change Task [change_task]</td>
</tr>
<tr>
<td>Short description</td>
<td>Install server on network</td>
</tr>
<tr>
<td>Template</td>
<td>• [Short description][Install server on network]</td>
</tr>
<tr>
<td></td>
<td>• [Assignment group][Hardware]</td>
</tr>
<tr>
<td>Link element</td>
<td>Change request</td>
</tr>
</tbody>
</table>

5. From the parent Task table template, set **Next Related Child Template** to the first related child task.
   For example, add this value to the **Add server to network** template.

   **Table 181: First sample related template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next Related Child Template</td>
<td>Order server</td>
</tr>
</tbody>
</table>
6. For each child related task, set **Next Related Template** to the next related task template. For example, add this value to the **Order server** template.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Next Related Template</strong></td>
<td>Install server on network</td>
</tr>
</tbody>
</table>

**Table 182: Second sample related template**

*Note:* The last related task template will not have a value for **Next Related Template**. For example, the **Install server on network** template will not have a value in **Next Related Template**.

Create a module for the parent Task table template. For example, create a module for **Add server to network**.

**Save a form as a template in UI11**

You can save a populated form as a template.

Role required: none

1. Navigate to a form, such as **Incident > Create New**.
2. Complete the form as it should appear when a user applies the template.
3. Right-click the form header and select **Save**.
4. Right-click the form header and select **Templates > Save as Template** to save only field values in the template, or **Templates > Save All as Template** to include related list relationships in the template.

*Note:* Read-only fields are not added to the list of fields on the template. If a field is made read only via ACL, UI policy/client script, or the dictionary, it does not populate in the template form creator.
After saving the template, the Template form appears.
5. Make any additional changes as needed using the Template form.
6. Click **Update** to save any changes to the template.

You can delete the original record, the incident in this example, after creating the template.

By default, the system displays 15 templates in the Apply Template context menu. Type `sys_properties.list` into the Application Navigator, then search for the `glide.template.max_context` system property to change it.

**Save a form as a template in UI16 or UI15**

You can save a populated form as a template.

Toggle the template bar so it is visible on forms.

**Role required:** none

1. Navigate to a form.
2. Complete the form as it should appear when a user applies the template.
3. In the template bar, click the plus icon (+).
4. Enter a descriptive name to make it easy for a user to select the correct template.
5. Make any additional changes as needed.
6. Click **Save**.
Schedule a template

You can define a scheduled job to create new records based on a template.

Role required: admin

For example, you can regularly create a populated task record to perform a weekly backup.

1. Navigate to System Definition > Templates.
2. Select a template record.
3. Click Schedule.
   The Scheduled Entity Generation form appears.
4. In the Run choice list, select how frequently to create a record.
5. Complete the schedule information.
6. Click Submit.

Create a module for a template

You can create a module to open a form with pre-populated template data.

Role required: admin

Child templates are only applied if the parent template is applied from a module. Child templates are not applied by applying a template to a new form.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>UI15 or UI11</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Navigate to System Definition &gt; Application Menus.</td>
<td>Right-click an application menu, such as Self-Service, and select Edit Application Menu.</td>
</tr>
<tr>
<td>2. Open the application menu to which you want to add the module.</td>
<td></td>
</tr>
</tbody>
</table>

2. In the Modules related list, click New.
3. Fill in the Title and Order fields as appropriate.
4. In the Link Type form section, select the Table.
5. For the Link Type field, select New Record.
6. In the Arguments field, enter <table>.do?sys_id=-1&sysparm_template=<templatename>
7. Click Submit.
8. Refresh the application navigator to view the new module.

Scripted templates

You can apply an active template to a record using JavaScript.

**Apply a template to current**

To apply a template, use the applyTemplate method.

```javascript
current.applyTemplate("<templatename>");`
```
Apply a template to a GlideRecord

To apply the template to a record other than current, change current to a GlideRecord variable. When using a GlideRecord variable, you may need to initialize it after declaring the variable.

```javascript
var rec1 = new GlideRecord("incident");
rec1.initialize();
rec1.applyTemplate("my_incident_template");
```

Apply a template from a UI action

The following script demonstrates a possible customization to the Create Change UI action on the Problem form. After you add this script to the UI action, a user can select the UI action to create a change record with information from both the problem record and the change template.

```javascript
var change = new GlideRecord("change_request");
change.initialize();
change.short_description = current.short_description;
change.description = current.u_details;
change.cmdb_ci = current.u_service;
change.priority = current.priority;
change.requested_by = current.caller_id;
change.assignment_group.setDisplayValue('Change & Release');
change.u_status = 'New';
change.parent = current.number;
change.applyTemplate("standard_rfc");
current.rfc = change.insert();
current.comments = 'Change ' + change.number + ' created.';

var mySysID = current.update();

gs.addInfoMessage("Change " + change.number + " created");
action.setRedirectURL(change);
action.setReturnURL(current);
```

Script a template with child templates

When using applyTemplate with a template that has one or more child templates, the system creates the parent record before applying the child templates. This behavior ensures that any references or dot-walked fields from the child record to the parent have a valid target.

For example, if a template for the Change Request table has a child template for the Change Task table, applying the Change Request template inserts a Change Request record into the database. It assigns this record as the Change request for the Change Task record, then applies the child template to the Change Task record.

UI actions

UI actions add buttons, links, and context menu items on forms and lists, making the UI more interactive, customizable, and specific to user activities. UI actions can contain scripts that define custom functionality. Administrators and users with the ui_action_admin role can define UI actions.
UI action controls

You can create a UI action to provide any or all of these controls.

- A button on a form
- A context menu item on a form that appears when you open the form context menu or right-click the form header
- A related link in a form
- A button in the banner on top of a list
- A button at the bottom of a list
- A context menu item on a list that appears when you open the list context menu or right-click the list header
- A menu item for the action choice list at the bottom of a list
- A related link at the bottom of a list

**Note:** To hide or restrict the New or Edit UI action on a list or related list, use list control.
UI action visibility

You can use conditions to control UI action visibility by role. You can use the **UI Action Visibility** related list to restrict a UI action by view.

**Control UI action visibility by role**

Use this syntax to check for a role:

```java
gs.hasRole('role_name')
```

**Note:** This role is deprecated, starting with the Geneva release. See *Mandatory roles* on page 2527.

**Example: Require the admin role**

```java
gs.hasRole('admin')
```

**Example: Require the itil_incident or itil_problem role**

```java
gs.hasRole('itil_incident') ||
gs.hasRole('itil_problem')
```

**Example: Require the itil_incident and itil_problem role**

```java
gs.hasRole('itil_incident') && gs.hasRole('itil_problem')
```

**Control UI action visibility with views**

You can use the **UI Action Visibility** related list to restrict a UI action by view. A UI action is available for a given view according to the following rules.

1. If there are no visibility rules, the action appears on all views.
2. Any exclude rule on a given view means that the action does not appear on that view.
3. If there is at least one include rule, then the action appears only on views that are specifically included.

**Example: Show an action everywhere except the Cost Management view**

Add an exclude rule for the Cost Management view.
Example: Show an action on the Routine and ITIL views, but nowhere else

Add include rules for the Routine and ITIL views.
Edit a UI action

You can edit an existing UI action or create a new one.

Role required: ui_action_admin or admin

You can add UI actions to tables and database views that are in the same scope as the UI action and tables that allow UI actions from another application scope to run on them.

1. Navigate to System Definition > UI Actions.
2. Click New or open an existing record.
3. Define the UI action by completing the fields.
   You may need to configure the form to see all the fields.

Table 183: Editing UI actions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Defines the text that appears on the button, link, or context menu item.</td>
</tr>
<tr>
<td>Table</td>
<td>Defines the table on which the UI action is available. By default, the UI action also appears on tables that extend the selected table (for example, Task actions appear on the Incident table). Select Global to make the action available on all tables.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the order in which the UI action appears. The order applies to buttons from left to right and to menu actions from top to bottom.</td>
</tr>
<tr>
<td>Action name</td>
<td>Defines a name to use when referencing the UI action in scripts.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables the UI action when selected. To disable a UI action, clear the check box.</td>
</tr>
<tr>
<td>Show insert</td>
<td>Shows a button on new records that have not been inserted.</td>
</tr>
<tr>
<td>Show update</td>
<td>Shows a button on existing records.</td>
</tr>
<tr>
<td>Client</td>
<td>The UI action executes its script in the user's browser, not on the server. When enabled, the Onclick field appears above the Condition field.</td>
</tr>
<tr>
<td>Form button</td>
<td>Puts a button on a form.</td>
</tr>
<tr>
<td>Form context menu</td>
<td>Puts a context menu item on a form (right-click the form header).</td>
</tr>
<tr>
<td>Form link</td>
<td>Puts a link in the Related Links section of a form.</td>
</tr>
<tr>
<td>List banner button</td>
<td>Puts a button in the banner of a list.</td>
</tr>
<tr>
<td>List bottom button</td>
<td>Puts a button at the bottom of a list.</td>
</tr>
<tr>
<td>List context menu</td>
<td>Puts a context menu item on list rows (right-click a row in a list).</td>
</tr>
<tr>
<td>List choice</td>
<td>Puts an item in the action choice list at the bottom of a list.</td>
</tr>
<tr>
<td>List link</td>
<td>Puts a link in the Related Links section at the bottom of a list.</td>
</tr>
<tr>
<td>Comments</td>
<td>Provides descriptive content regarding this UI action.</td>
</tr>
<tr>
<td>Hint</td>
<td>Defines the text that appears when a user points to the UI action control.</td>
</tr>
<tr>
<td>Onclick</td>
<td>The name of the JavaScript function to run when the UI action is executed. The function is defined in the Script field.</td>
</tr>
<tr>
<td>Condition</td>
<td>Defines the conditions that restrict when a UI action appears.</td>
</tr>
<tr>
<td>Script</td>
<td>Defines the script to run when the UI action is executed.</td>
</tr>
<tr>
<td>Requires role</td>
<td>Restricts the roles that have access to this UI control.</td>
</tr>
</tbody>
</table>

Related lists on the form view:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI Action Visibility</td>
<td>Specifies other views of the form that the UI action applies to.</td>
</tr>
<tr>
<td>Versions</td>
<td>Shows all versions of the UI action. Use this list to compare versions or to revert to a previous version.</td>
</tr>
</tbody>
</table>

4. Click **Submit** or **Update**.

**Note:** If the UI action is enabled to run on the client side, wrap it in a function. Otherwise, the contents of the Script field run when the page loads.

Override or remove a UI action for an extended table

This example describes how to override or remove a UI action for a table that is extended from another table.

When a UI action is defined for the Task table, it applies to all tasks, including incidents, changes, problems, and any other tables that extend the Task table. Similarly, a global UI action applies to every table. However, you can override a UI action for a specific table. This example demonstrates how to override a UI action on the Task table for only the Incident table.

1. Complete the following steps to override a UI action on the Task [task] table for just the Incident [incident] table.
   a) Create a UI action on the Incident table with the same **Action name**.
      If the **Action name** is not defined, use the same **Name**.
   b) Enter a script that is specific to the Incident table.

2. Complete the following steps to remove a UI action on the Task [task] table for the Incident [incident] table.
   a) Navigate to the UI action definition for the Task table.
   b) Add the condition `current.getRecordClassName() !== 'incident'`.

UI action restrictions

When needed, you can restrict when a UI action is available.

For example, you might want to show **Close Incident** only to group managers or only for incidents that are already in the **Resolved** state. Alternatively, you might want to display an action only on certain views of a form.

**Note:** In UI11 only, you can control whether the UI action appears at the bottom of the form in addition to the top. **Create the property** `propertyglide.ui.buttons_bottom` and set it to **true**.

Control visibility with conditions

The most direct way to control the availability of an action is to define the **Condition** field. The condition must evaluate to **true** for the action to appear. If you leave the field empty, the condition defaults to **true**.

For example, the following condition is configured for the **Close Incident** button.
Figure 233: UI action condition

For this action to appear on a form, these conditions must evaluate to true:

- current.incident_state must equal 6: The incident must already be in a Resolved state.
- gs.hasRole("itil_admin"): The current user must have the itil_admin role.

OR this condition must evaluate to true:

- gs.GetUserID() == current.caller_id: The current user is the user who requested the change.

**Note:**

- The current object is not available for conditions on a list context menu (the List context menu check box is selected). Any use of current on these actions is ignored.
- You can reference the parent record for the UI action conditions on a related list button. For example, to disable the **New** and **Edit** buttons on the Affected CIs related list for closed changes, copy the global m2m UI actions to the task_ci table and add a condition of `parent.active`.

---

**URL redirection using a UI action**

As part of a UI action, you can redirect a user to a URL.

For example, you can add links to a form or open a new record after it is created from a UI action.

To redirect a user to a URL from a UI action, use this syntax to define the redirect link:

```java
action.setRedirectURL ( 'http://www.mysite.com/mypage.htm' ) ;
```

To direct a user to a record, use this syntax, where `new_record` is the variable name for the **GlideRecord**:

```java
action.setRedirectURL ( new_record ) ;
```

**Tabbed forms**

Tabbed forms offer a useful way to make forms and related lists take up less space by reducing the scrolling that must be done to navigate the form.
Figure 234: Tabbed forms
Form sections and related lists are tabbed separately, each with their own tab line. A user always sees the first form section. All sections after that can be tabbed. Tabs are enabled by default for new instances.

Display tabbed forms

Users can enable tabbed forms in their user preferences.

Tabbed forms are enabled by default for new instances. A system user preference with the name `tabbed.forms` specifies whether the tabbed UI is used by default for all users. Users can change this preference as described in this procedure.

1. Click the gear icon in the banner frame.
2. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Select the Forms tab and enable Tabbed forms.</td>
</tr>
<tr>
<td>UI15</td>
<td>Enable Tabbed forms.</td>
</tr>
<tr>
<td>UI11</td>
<td>Click the tabs toggle icon, which appears on any form with more than two sections and on any form with more than one related list.</td>
</tr>
</tbody>
</table>

In UI16 and UI15, an option is enabled when the switch appears green and is toggled to the right.

Require fields on a form

When Required Form Fields is activated, an administrator can designate specific fields on a form as required (protected) fields. Users cannot hide required fields when they personalize the form.

If present on a form, only an administrator can remove required fields. When you configure a form, required fields appear in a gray color and have a tooltip indicating they are required. Required fields are defined in the Required Form Fields [sys_ui_element_required] table.

The expected (although not the only) use case for this feature is as part of a delegated administration scheme. For example, you can grant branch offices the rights to modify forms by granting the personalize_form role, but not allow them to remove certain fields which are critical to overall business processing.

Activate required form fields

You can activate the Required Form Fields plugin (com.snc.required_form_fields) if you have the admin role. This plugin activates related plugins if they are not already active.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.
Define required fields

You can specify which form fields are required in forms. This action prevents users with the personalize_form role from removing the field by configuring the form layout.

Activate the Required Form Fields plugin before you perform this task.

Role required: admin

1. Navigate to sys_properties.list.
2. Locate the property named glide.ui.form.enforce_required_fields and make sure it is set to true.
3. Navigate to System UI > Required Form Fields.
4. Click New.
5. Select the table and field, and then select the Required check box.
   The following example sets the Short description field on the Incident form to be required.

![Required Form Field](image)

If you decide later that you do not want to make the field required, clear the Required check box. This action is preferable to deleting the record.

6. Click Submit.

If the table specified has extension tables, then the Required Form Field record applies to forms of all extended tables. For example, if an administrator specifies that the Short description field is required for the Task table, then this configuration applies to the Incident form, Change Request form, Problem form, and so on.

An extended table can override the base table Required Form Field rule. For example, if the Short description field is required for the Task table, but not required for the Incident table, it is required for all Task tables except Incident.

Display information from other records

Administrators can display fields that are associated with another field.

For example, on the Incident form, the name of the submitter appears in the Caller field. You can configure the Incident form to show the caller's city. The city is derived from the User table using the value in the Caller field to determine which record is correct.
When you configure a form, the fields that have derived fields associated with them appear in green with the + symbol next to them. Click the field, and then click the expand icon to show the other associated fields that can be added to the form. The following example shows the derived fields, based on the Caller, that can be added to an Incident form.

**Figure 235: Available table fields**

Choose the **Caller** field and click the expander icon.

**Figure 236: Caller fields**

Select the available fields associated with the **Caller** field.

### Control the label type for derived fields

A derived field is a field that is not in the primary table that is being displayed. A derived field is obtained by following a reference from the primary table to another table. You can configure the type of label that appears for derived fields.

**Role required:** admin

An example would be displaying the caller's email address when looking at an incident record. The caller's email address is not stored in the Incident table, but is obtained by following the caller reference from the incident to the User table.
You control the label type by setting a system property. For example, the field label for an incident caller's email address can be either of the following strings.

- **Caller Email**, which represents the complete label to uniquely identify this field as the email from the caller's user record. If you display the email address for the person the ticket is assigned to, its label would be **Assigned to Email**.
- **Email** which is the label for the target field. This label is not unique on the form if, for example, you are also displaying the email address of the person assigned to the incident. However, usually the placement of the field on the form makes it clear what the field represents.

1. Navigate to **System Properties > System**.
2. Locate the **Use short labels for all fields. For example, if a form contains the caller's email address, use the "Email" label rather than the full label of "Caller Email"** (glide.short.labels) property.
   - The default value is **true**, meaning that the short label is displayed in all forms.
3. If you want to display the complete label in forms, clear the check box.
4. Click **Save**.

**Attachment administration**

Administrators can configure options for how files are uploaded and attached to records.

**Note:** To learn how to upload attachments to records, see *Add attachments* on page 127.

**Attachment tables**

When you store an attachment to any table, a record is created in the Attachment [sys_attachment] table that contains attachment metadata, and the file data is stored in the Attachment Document [sys_attachment_doc] table, in 4k chunks. For example, if you attach a 12k file called *My_attachment.pdf*, then there is an Attachment entry with three related Attachment Document entries.

**Disable attachments on a table**

You can prevent attachments from being added to records on a specific table.

Role required: admin

1. Open a record in the table.
2. Right-click the form header and select **Configure > Dictionary**.
3. In the list of dictionary entries, select the first record in the list (the record with no **Column name** entry).
4. Add **no_attachment** to the **Attributes** field, separated by commas from any existing attributes.
   - See *Dictionary attributes* on page 1453 for more information.

**Disable the drag and drop feature**

You can disable the drag-and-drop attachment feature.

1. Navigate to **System Properties > UI Properties**.
2. Clear the check box for the **Allow attachment drag and drop in supported HTML5 browsers** property.
3. Click **Save**.
Limit attachment file size

You can specify the maximum attachment size.

2. Enter a value in the Maximum file attachment size in megabytes property. Leave the field empty to allow attachments up to a maximum of 1GB. By default, this field is blank.
3. Click Save.
   The maximum attachment size for email attachments is configured separately.

   Warning: Uploading large attachments might lead to issues with the user's active session on the instance.

Restrict who can attach files

You can restrict who can add attachments by using a role.

2. In the Attachment limits and behavior section, locate the List of roles (comma-separated) that can create attachments property (glide.attachment.role).
3. Enter one or more roles separated by commas.
   Only roles listed in this property are able to upload attachments to a record. If no roles are entered, then all roles can upload attachments.
4. Click Save.

Restrict file extensions

The glide.attachment.extensions property restricts the file extensions that users can upload as attachments.

Use this property to improve security by preventing users from uploading harmful files, such as viruses, as attachments. Additionally, this capability can prevent the use of incompatible filetypes. For example, Internet Explorer does not support icons in .png format. Note that this property does not restrict files based on the actual file type, but only based on the extension.

2. In the Attachment limits and behavior section, locate the List of file extensions (comma-separated) that can be attached to documents via the attachment dialog property.
3. Enter the file extensions and click Save.
   If no extensions are specified, then all extensions are allowed. However, if any extensions are specified, all unlisted extensions are restricted. Listed extensions should not include the dot (.) prefix or spaces after commas. For example, enter xls,xlsx,doc,docx.

Hide the attachment [view] link

Users can open an attachment by clicking either the file name or the [view] link. The [view] link opens the file from within the browser, which executes JavaScript code as part of the attachment.

1. Add the glide.ui.disable_attachment_view and glide.ui.attachment_popup properties.
For instructions on adding properties to the platform, see Add a property on page 1411.

2. For the glide.ui.disable_attachment_view property, set the Type to true/false and set the Value to true.

3. For the glide.ui.attachment_popup property, set the Type to true/false and set the Value to false.

4. To return to the default behavior (enable the link), set the glide.ui.attachment_popup property Value to true.

**Note:** Users can still view attachments by clicking the file name.

### Configure attachment icons

You can configure the icon that appears beside an attachment of a particular file type.

1. Determine the path of the image file. If desired, upload a new image.

2. Navigate to **System UI > Attachment Icon Rules**.

3. Open an existing rule or click **New** to create a new rule.

4. Enter the rule details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select icon by</td>
<td>Select MIME Type or File Extension.</td>
</tr>
<tr>
<td>MIME type</td>
<td>If <strong>Select icon by</strong> is MIME Type, enter the MIME type and subtype to associate with the icon, separated by a slash (example: application/pdf).</td>
</tr>
<tr>
<td>File extension</td>
<td>If <strong>Select icon by</strong> is File Extension, enter the file extension to associate with the icon beginning with the period (example: .pdf).</td>
</tr>
<tr>
<td>Icon</td>
<td>Enter the path to the icon image file (example: images/icons/attach_pdf.gifx)</td>
</tr>
</tbody>
</table>

5. Click **Submit** or **Update**.

### Attachment events and logging

Uploading, viewing, and deleting file attachments triggers a single event that can be used for notifications or in scripts. Attachment events can be processed by a script action or notification.

Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.read</td>
<td>An attachment has been read or downloaded.</td>
</tr>
</tbody>
</table>
### Event logging

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.uploaded</td>
<td>An attachment has been uploaded. If multiple attachments are uploaded to a record at one time, only one event is created.</td>
</tr>
<tr>
<td>attachment.deleted</td>
<td>An attachment has been deleted. This event is also triggered when the record containing the attachment is deleted. If a record is deleted that contains multiple attachments, a separate event is triggered for each attachment in the deleted record.</td>
</tr>
<tr>
<td>attachment.renamed</td>
<td>An attachment has been renamed.</td>
</tr>
</tbody>
</table>

### Attachment logging

When an attachment is downloaded, the attachment.read event record is written, and you can do something with this event. For example, you can record when and by whom certain attachments are downloaded. For this functionality, `current` is a `sys_attachment` record, and the event record uses the following parameters:

- `parm1`: File name
- `parm2`: Table name

### Enable attachment indexing on a table

When you enable the attachment indexing for a table, text searches can return matches from the record and its file attachments.

Role required: admin

By default, attachment indexing is enabled for the Knowledge Base.

Enabling attachment indexing causes the platform to re-index the selected table, its parent table, and any children of the parent table.

**Warning:** For large tables, such as the Task table, re-indexing can take several hours and slows down the system until complete. Re-indexing is best performed during non-peak times.

1. Navigate to **System Definition > Dictionary** and select the record for the table.
2. Click the **Attributes** tab.
3. Click **New** and add the following values.

### Table 185: Attribute values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Attachment index</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

**Note:** The attachment indexing attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, indexing attachments on the Task table does not index attachments on the Incident table.
4. Click **Submit**.
5. Optional: To disable attachment indexing, remove the attribute.
6. Click **Update**.
   The indexing process begins. When it is complete, attachments can be searched on that table.

**Debug attachment indexing**

To change debugging options for attachment indexing, add these system properties.

- `glide.ts.index.attachment.debug`: when the value is set to **true**, enables log messages for exceptions that occur when indexing attachments (default is **false**).
  You can leave this property enabled during normal operations to capture stack trace information about any exceptions.
- `glide.ts.index.attachment.list_terms.debug`: when the value is set to **true**, logs all indexed terms when an attachment is indexed (default is **false**).
  [Recommended] For optimal performance, set this property to **false** during normal operations. Only enable this property when you are actively debugging an issue.

**Create a UI policy**

UI policies offer an alternative to client scripts for dynamically changing information on a form. Use UI policies to define custom process flows for tasks.

Role required: **ui_policy_admin**

All fields are evaluated by a UI policy condition even if they are not visible on the form (in UI16 and UI15 only). This function removes the requirement that a field must be on a form for it to be evaluated. In UI11, a UI policy condition only evaluates fields that are present on a form. Fields that are not present are not evaluated. For UI11, ensure that any field called by a UI policy exists on the form.

- **Note**: Policies carried over from versions prior to Fuji are evaluated differently. Fields that previously were not evaluated are evaluated.
- **UI policies are not supported on search screens.**

1. Navigate to **System UI > UI Policies**.
2. Click **New**.
   The UI Policy [Advanced view] form opens
3. Optional: To change the view, in **Related Links** click **Default view**.
4. Complete the form, as appropriate.
   You may need to configure the form to see all the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table for the form to be modified.</td>
</tr>
<tr>
<td>Active</td>
<td>The UI policy active status. Only active UI policies are applied.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short summary of the UI policy.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order [Advanced view]</td>
<td>The processing sequence, from lowest to highest number. If two policies conflict, the UI policy with the higher number is executed.</td>
</tr>
<tr>
<td>When to Apply</td>
<td></td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions which, if fulfilled, cause the UI policy to be applied. Conditions are built with the condition builder. To set conditions using a script, use a client script instead. Conditions are only rechecked if a user manually changes a field on a form. If the change is made by a UI action, context menu action, or through the list editor, it is not evaluated. In UI11, the field must be on the form to be checked by a UI policy. To test the value of a field but hide it from users, add the field to the form and use UI policies to hide it. This requirement also prevents dot-walked fields from being used as conditions.</td>
</tr>
<tr>
<td>Global [Advanced view]</td>
<td>Option for specifying whether the UI policy applies to all form views. If this check box is cleared, the UI policy is view-specific.</td>
</tr>
<tr>
<td>View [Advanced view]</td>
<td>Option for indicating which view or views the UI policy applies to. This option is visible only if Global is not selected.</td>
</tr>
<tr>
<td>Reverse if false [Advanced view]</td>
<td>Option for specifying that the UI policy action is reversed when its conditions evaluate to false. In other words, when the conditions are true, actions are taken and when they change back to false, the actions are reversed (undone).</td>
</tr>
<tr>
<td>On load [Advanced view]</td>
<td>Option for specifying that the UI policy behavior is performed OnLoad as well as when the form changes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Inherit [Advanced view]                    | Option for specifying whether extended tables inherit this UI policy. When a child table has an inherited UI policy from its parent table, the UI policy on the child table always runs first. This event is true regardless of the Order of the UI policies. Consider the following example:  
  - A child table has a UI policy with Order value 500 that shows the Urgency field when its conditions are met.  
  - Its parent table has a UI policy with the same conditions that hides the Urgency field. The parent table UI policy has Order value 100.  
  - Although the parent table Order field has a lower value, the child UI policy runs first and then the parent UI policy runs. When the conditions are met, the Urgency field is hidden. |

**Script**

<table>
<thead>
<tr>
<th>Run scripts [Advanced view]</th>
<th>Option for specifying whether advanced behavior can be scripted for both true and false conditions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Execute if true [Advanced view]</td>
<td>A script that executes if the UI policy conditions are fulfilled. This field is available only if Run scripts is selected.</td>
</tr>
<tr>
<td>Execute if false [Advanced view]</td>
<td>A script that executes if the UI policy conditions are not fulfilled. This field is available only if Run scripts is selected.</td>
</tr>
</tbody>
</table>

**Other fields**

<table>
<thead>
<tr>
<th>Run scripts in UI type</th>
<th>The UI type for this UI policy: Desktop, Mobile, or Both.</th>
</tr>
</thead>
</table>

**Related List: UI Policy Actions**

<table>
<thead>
<tr>
<th>Table</th>
<th>Table the UI policy action executes on.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>Field on the selected table that the UI policy performs an action on if conditions are met.</td>
</tr>
</tbody>
</table>
| Mandatory                                  | Choice list for specifying how the UI policy affects the mandatory state of the field. Choices are:  
  - Leave alone  
  - True  
  - False |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Visible         | Choice list for specifying how the UI policy affects the visible state of the field. Choices are:  
• Leave alone  
• True  
• False         |
| Read only       | Choice list for specifying how the UI policy affects the read-only state of the field. Choices are:  
• Leave alone  
• True  
• False         |

### Related Links

| Default view or Advanced view | Changes the form view to the default or advanced view. The fields change based on the view. |

5. Click **Submit**.

**Example: Create a UI policy**

Create a UI policy to implement controls in the Incident form when the state changes to **Resolved**.

**Role required: ui_policy_admin**

This example demonstrates how to implement the following controls.

- Make a **Close Notes** field mandatory.
- Hide the **Opened by** field.
- Make the **Priority**, **Severity**, and **Urgency** fields read-only.
- Run a client script that displays an alert message.

1. Navigate to **System UI > UI Policies**.
2. Click **New**.
3. Supply the following information.

### Table 187: New UI policy

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Incident state] [is] [Resolved]</td>
</tr>
<tr>
<td>Reverse if false</td>
<td>Select this check box. If the incident state is not <strong>Resolved</strong>, the UI policy is reversed.</td>
</tr>
<tr>
<td>On load</td>
<td>Select this check box to perform the actions when the form is loaded or when the condition changes.</td>
</tr>
</tbody>
</table>
4. Right-click the form header and select **Save** from the context menu. The **UI Policy Actions** related list appears.

5. In the related list, click **New**.

6. Provide the following information.

   **Table 188: New UI policy actions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>Close notes. This UI action makes the Close notes field mandatory.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
<tr>
<td>Visible</td>
<td>Leave alone</td>
</tr>
<tr>
<td>Read Only</td>
<td>Leave alone</td>
</tr>
</tbody>
</table>

7. Click **Submit**.

8. Repeat the process to create UI policy actions to hide the **Opened by** field, and to make the **Priority**, **Severity**, and **Urgency** fields read-only.

**UI policy options**

You can use different options in the UI Policy form to control when and how the UI policy is applied. These options include client scripts, OnLoad execution, and view-specific UI policies.

**Client scripts for UI policies**

Administrators can use the UI Policy form to create client scripts that run onChange when the UI policy conditions are met (**Execute if true**) or not met (**Execute if false**). To display these scripting fields in the UI Policy form, in the Script section, select the **Run scripts** check box.

For example, to display an alert to the user when the incident **State** field changes to **Resolved**, create the following script in the **Execute if true** field.

```javascript
function onCondition(){
    alert('You changed the "Incident state" to Resolved. Please enter your comments in the "Close notes" field.');
}
```

**On load check box**

You can check or clear the **On load** check box in a UI policy to control whether it runs every time a form is loaded when the conditions are satisfied. In this example, an administrator does not want an incident to enter the **Awaiting user info** state unless the user provides an explanation to the customer. The administrator creates a UI policy with the following settings.

- In the **When to Apply** section, adds the condition **[State] [is] [Awaiting user info]** and clears the **On load** check box. This condition means that the UI policy applies only when the state is changed to **Awaiting user info**.
- In the **UI Policy Actions** related list, creates a record that makes the **Additional comments** field mandatory when the condition is met.
If the administrator selected the **On load** check box, the UI policy would apply every time a user opens an incident in the **Awaiting user info** state.

**View-specific UI policies**

By default, the **Global** UI policy applies to all form views. However, a UI policy can be specific to a view. For example, you can define a UI policy for only the itil view of a form. Two fields on the UI Policy form control who can view a form.

- **Global**: If the **Global** check box is not selected, the **View** field is displayed.
- **View**: Select a view and the UI policy applies only to that view of the form.

**Convert a UI policy to a data policy**

To make a UI policy the default setting, convert the UI policy to a data policy.

Role required: `ui_policy_admin`

You can also apply a UI policy to import sets or to data imported by SOAP web services when you convert it to a data policy. Converting a UI policy to a data policy deactivates the UI policy. To retain the policy in the UI, ensure that the **Use as UI Policy on client** check box is selected on the data policy record.

For a UI policy to be eligible for conversion to a data policy, the following conditions must be met on the UI Policy form.

- The **Run scripts** check box must be cleared.
- The **Global** check box must be selected.
- None of the UI policy actions can have **Visible** set to **True** or set to **False**. **Visible** must be set to **Leave Alone**.

1. Navigate to **System UI > UI Policies**.
2. Open an existing UI policy.
3. Under **Related Links**, click **Convert this to Data Policy**. A new data policy record is created.
4. Edit the fields on the data policy record as necessary.

**Formatters**

A formatter is a form element used to display information that is not a field in the record. Add formatters to a form by configuring the form.

**Table 189: Examples of formatters in the base platform**

<table>
<thead>
<tr>
<th>Formatter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity formatter</td>
<td>Displays the list of activities, or history, on a task form.</td>
</tr>
<tr>
<td>Process flow formatter</td>
<td>Displays the different stages in a linear process flow across the top of a record.</td>
</tr>
<tr>
<td>Parent breadcrumbs formatter</td>
<td>Provides breadcrumbs to show the parent or parents of the current task.</td>
</tr>
<tr>
<td>Approval summarizer formatter</td>
<td>Displays dynamic summary information about the request being approved.</td>
</tr>
<tr>
<td>Formatter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CI relations formatter</td>
<td>Displays on the CI form a toolbar for viewing the relationships between the current CI and related CIs.</td>
</tr>
</tbody>
</table>

Creating a custom formatter involves the following three tasks.

1. Create a UI macro to define content for the formatter.
2. Create a formatter that refers to the UI macro.
3. Add the formatter to the form.

**Note:** Formatter elements cannot be exported to PDF. When exporting PDF data from a form, any formatter elements added to the form will not display in the PDF output.

Create a UI macro for a formatter

Create a UI macro to define the content that the formatter displays.

This functionality requires a knowledge of Jelly script.

Role required: ui_macro_admin

1. Navigate to System UI > UI Macros.
2. Click New.
3. Complete the form.
4. In the XML script field, enter Jelly script to define the content to be displayed by the formatter.

**Note:** The UI Macro for the formatter represents a row in the UI. It must begin and end with <TR></TR> tags.
This Jelly script is reproduced below in plain text that you can copy into the Macro form as a basis for your macro script.

```xml
<?xml version = "1.0" encoding = "utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
<tr>
    <td colspan="2">
        Here is some descriptive text for the Priority field.
    </td>
</j:jelly>
```

5. Click **Submit**.

Create a formatter and add it to the form

Create the formatter after creating the UI macro that defines the content.

Role required: admin
With the UI macro in place, create the formatter that references it, and add it to the form.

1. Navigate to **System UI > Formatters**.
2. Click **New**.
3. In the **Name** field, enter a descriptive name for the formatter.
4. In the **Formatter** field, enter the name of the UI macro with `.xml` appended to it.
5. In the **Table** field, select the table in which the formatter is used.
6. In the **Type** field, select **Formatter**.
7. Click **Submit**.
8. To add the formatter to a form, **configure the form**.
   The formatter appears on the form according to your selections.

### Override a formatter with macros

The platform uses formatters to handle complex rendering of specific form elements.

**Role required:** `ui_macro_admin`

Examples of form elements rendered by formatters in the base platform are:

- **Activity formatter**: Displays the list of activities, or history, on a task form.
- **Process flow formatter**: Displays the different stages in a linear process flow across the top of a record.
- **Task parent breadcrumbs formatter**: Provides breadcrumbs to show the parent or parents of the current task.
- **Approval summarizer formatter**: Displays dynamic summary information about the element being approved.

Formatters provided in the base system can be overridden by a UI macro.

1. Navigate to **System UI > UI Macros**.
2. Click **New**.
3. In the **Name** field, enter the same name as the formatter you want to override, but omit the `.xml` extension.
4. Complete the remaining fields on the form.
5. Click **Submit**.

This example shows the form that defines the existing approval summarizer formatter:
Here is the form for the UI macro that overrides the approval summarizer formatter:

Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form.

The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
Summary of Item being approved

Change Request

Number: CHG0000001
Requested by: David Loo

Affected CI: Sales Force Automation
Type: Normal

Planned start date: 2016-07-27 16:00:00
Risk: High

Planned end date: 2016-07-27 18:00:00
Impact: 3 - Low

Short description: Rollback Oracle Version

Description: Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend.

We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.
Figure 238: Catalog request approval summary

The **Reject** button allows the approver to reject one or more requested items in a multi-item request, before approving the overall request. If a requested item is rejected, the workflow for that item never starts. The approver can then choose to **Approve** the item.

**Note:** When the overall request is approved, you must ensure this **Approve** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state.

Similarly, the **Approve** button on requested items should only appear before the overall request is approved or rejected.

Activity formatter

The activity formatter provides an easy way to track items not saved with a field in the record, for example, journal fields like comments and work notes.

The activity formatter is enabled by default on the Task [task] table and other tables that extend the Task table, such as the Incident [incident] table. It is also enabled on the Approvals [sysapproval_approver] table.

You can filter the content that appears on the activity formatter and participate in the record feeds on the record. You can create an activity formatter for any form and configure properties that control what fields appear in the formatter.

In UI16, the activity formatter shows updates in real time so you can see the latest information without refreshing the form. User presence enables you to see when other users are entering comments.
Figure 239: UI16 activity formatter
Add the activity formatter to a form

You can add an activity formatter to any form.

Role required: personalize_form

1. Verify that the table associated with the form is audited.
2. Configure the form layout to add **Activities (filtered)**.

Enable the Live Feed-Activity toggle

The Live Feed-Activity toggle allows users to switch between the activity feed and the document feed for a record.

Role required: admin

Use live feed to interact with other users on a record by posting messages and adding attachments to the feed. Use the activity formatter to see an overall summary of activity for the record.
Figure 241: Live Feed/Activity toggle

- The glide.ui.show_live_feed_activity property is enabled. Navigate to Collaborate > Feed Administration > Properties and enable the Toggle the display of the live feed tab in the activity formatter option.

1. Verify that the live feed and record feed plugins are active.
2. View the form to ensure the activity formatter is visible. If not, configure the form to add it.
3. Set the live_feed dictionary attribute to true on the form. This adds live feed to the activity formatter.
4. Complete the following steps to enable the system property.
   a) Navigate to Collaborate > Feed Administration > Properties.
   b) Enable the Toggle the display of the live feed tab in the activity formatter option (glide.ui.show_live_feed_activity property).

Customize activities
You can customize which fields appear in the activity formatter. You can add or remove fields from the list of activities that users can select when they open the activity filter.

Role required: personalize_form
1. Scroll to the activity stream and perform the appropriate action for your version of the UI:

| UI16 | 1. Click the activity filter icon ( ).
|      | 2. At the bottom of the list, click **Configure available fields**. |
| UI15 or UI11 | Right-click the **Activity** header and select **Configure Activities**. |

2. In the slushbucket, select the desired fields in the **Available** column and move them to the **Selected** column.

   **Note:** The activities appear in alphabetical order, regardless of the order in the **Selected** column.

3. Click **Save** to add them to the activity formatter and the filter.

Administrators can also modify the system property **Incident activity formatter fields** (glide.ui.incident_activity.fields). Access this property through **System Properties > UI Properties**.
The system automatically synchronizes the values in the system property and the selections made through Configure Activities.

Create an activity formatter
You can create an activity formatter for any audited table.

Role required: admin

1. Navigate to System UI > Formatters.
2. Click New.
3. Enter a name for the formatter, such as Activities (task).
4. Select a Table.
5. Enter activity.xml in the Formatter field.
6. Leave the Type as Formatter.
7. Click Submit.

**Note:** You can create more than one activity formatter for a table, however, the system does not allow you to add more than one activity formatter to a form.

Add the new activity formatter to forms as needed.

Configure the email property for activity formatter
The system property glide.ui.activity.email_roles enables you to control which roles can see emails in the activity formatter.

Role required: admin

In the activity formatter, users see activity only for fields they have permission to read. For example, self-service users might see the activity formatter on the self-service view of the Incident form, but they do not see work notes, unless security rules have been customized to allow this.

If the Sent/Received Emails field is included in the activities list, all users see all emails. No determination is made whether an end user, for example, should see an email containing work notes. Configure this property to restrict this capability to specified roles.

**Note:** Email does not appear as an activity until it is sent. If email properties are not configured for outbound delivery, the message can be found by navigating to System Mailboxes > Outbox.

1. Navigate to System Properties > UI Properties.
2. Locate the property labeled List of roles (comma separated) that can view emails in the Activity Formatter when "Sent/Received Emails" are included.
3. Add roles to the property, separated by commas.
   These are the only roles that can see email in the activity formatter. All other roles are prevented from seeing email. If no roles are listed, all users can see email. The itil role is on the list by default.
4. Click Save.

Process flow formatter
The process flow formatter provides a graphical summary of the stages in a process. The formatter is typically shown at the top of forms that are part of a process.

Each record on the Flow Formatter [sys_process_flow] table represents a process stage and can have a different condition applied to it. When specified conditions are fulfilled, the formatter highlights the current stage and all previous stages.
These examples show a workflow in the UI15 and UI11 interface.

**Figure 243: UI15 process flow for an incident**

As soon as any formatter stages are defined for a table, they appear on the form associated with that table in the order specified, assuming the formatter has been added to the form.

**Add a process flow formatter**

To add a process flow formatter, complete these tasks.

1. Create a process flow formatter.
2. Attach the process flow formatter to the form.

**Create a process flow formatter**

You can create a process flow formatter stage.

Role required: admin

1. Navigate to **System UI > Process Flow**.
2. Click **New**.
3. Complete the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table for this process flow formatter.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name to identify the formatter.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Label</td>
<td>Enter the name to be displayed in the Personalize Form Layout slushbucket.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to ensure the formatter stage is active. When the check box is cleared, the formatter stage does not appear in the flow display.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where in the process flow the formatter will be displayed. Formatters are arranged with the lowest number on the left and the highest number on the right.</td>
</tr>
<tr>
<td>Condition</td>
<td>Use the condition builder to set the conditions under which the formatter is highlighted as current. Any field available in the condition builder, such as SLA or Impact, can be used to trigger a process flow stage.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the process flow formatter stage in this HTML field.</td>
</tr>
</tbody>
</table>

4. Repeat as necessary for each stage.

Attach the process flow formatter to the form

After creating the formatter, attach it to the form.

Role required: personalize_form

Configure the appropriate form to attach the new formatter.
Activate the process flow formatter

You can activate the Process Flow Formatter plugin.

Role required: admin

1. Navigate to System Definition > Plugins.

2. Right-click the plugin name on the list and select Activate/Upgrade.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.

Add the parent breadcrumbs formatter to a form

The parent breadcrumbs formatter on the Task table provides breadcrumbs that show the parent or parents of the current task.

Role required: personalize_form

This formatter can be used also on any table that extends Task.

To add the parent breadcrumbs formatter to a form, configure the form and add Parent Breadcrumbs to the desired location. The breadcrumbs show only six levels of parents. If more levels exist, the breadcrumbs display an ellipsis ("...").
The Parent reference field also has to contain a value for the breadcrumbs to appear. You may need to configure the form to contain the Parent field as well.

**Figure 245: Breadcrumbs**

**Customize the parent breadcrumbs formatter**

You can customize the parent breadcrumbs formatter

Role required: admin

1. Navigate to **System UI > Formatters**.
2. Select **Parent Breadcrumbs**.
3. Click **View UI Macro for this Formatter** to view or modify the underlying formatter.

By default, the breadcrumb uses the default display field, `gr.getDisplayValue()`, as the link in the breadcrumb. To customize this, add the following line, replacing the `fieldName` parameter with the desired field name (not the field label):

```java
pc.setLabelField("fieldName")
```

If a user points to a breadcrumb, the short description for that record appears as a hint by default. To display alternate hover text for the breadcrumb, add the following line, replacing the `fieldName` parameter with the desired field name (not the field label):

```java
pc.setTitleField("fieldName")
```

Be sure to add these lines in the proper location, as shown in the following example:

```java
//parent crumb functions - script include
var pc = new ParentCrumbs(gr);
pcsetLabelField("short_description");

//override the default display field to be used for label
pc.setTitleField("number");
```
Use the parent breadcrumbs formatter on non-Task tables

The parent breadcrumbs formatter can be used on non-Task tables as long as the table has a reference to itself through a field called **parent**.

Role required: admin

To make the formatter available for a different table, duplicate the formatter used by the Task table:

1. Navigate to **System UI > Formatters**.
2. Select **Parent Breadcrumbs**.
3. Set the **Table** field to the appropriate table.
4. Right-click the form header and choose **Insert**.
5. Add the new formatter to the appropriate form.

Embed lists within a form

You can embed lists within a form. When a list is embedded in a form, any changes made to the contents of the list are saved when the form is saved.

Role required: personalize_form

This allows the embedded list to be treated just like another element on the form. In addition, users can create new records in the list view. After a row is added to the list, double-click any cell in the list to edit its value. You can add the same lists to a form as embedded lists or as related lists, depending on the path selected in the context menu.

You can also modify embedded list controls, such as the name of the related list and the roles required to create new records in the embedded list.

1. Select a record from the list.
2. Right-click the form header and select **Configure > Form Layout**.
   - The slushbucket shows the available fields and the lists that can be embedded in the form. Lists appear in red at the bottom of the **Available** list.
3. Select a list and move it to the **Selected** column.
4. Use the up and down arrow buttons to position the list in the form.
5. Click **Save**.
   - Lists adjust to fit the frames of the adjacent fields.
Secure records in an embedded list

To apply security to the records in embedded lists, limit editing and deleting records in embedded lists to specific roles.
Elevate to the security_admin role.

Role required: security_admin

1. Navigate to System Security > Access Control (ACL).
2. Open the Write or Delete record for the appropriate table.
3. In the Requires Role section of the form, add the roles that have write or delete permission for that table.
4. Save the changes.

When records from the associated table appear in an embedded list, the edit and delete options are available only to users with the specified roles.

Field administration

The individual pieces of data in a record are called fields. Users can enter data in fields by using the list editor or by using a form. In form view, fields appear as fields in the form, and in list view they appear as columns of data in the table. Administrators can create new or modify existing fields.

Field types

These field types are available to administrators when creating fields or changing the type of existing fields.

Note: If you edit a field on a child table that is present on the parent table, you also change it for the parent table and all other child tables.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audio</td>
<td>Field for uploading and embedding .mp3 or .ogg audio files.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of choices that can be configured.</td>
</tr>
</tbody>
</table>
| Color         | String field that accepts CSS color declarations (including hex or RGB notation) and displays a preview. See:  
                   - HTML Colors (W3CSchools) for more information on hex and RGB notation.  
                   - HTML Color Names (W3CSchools) for valid color names.             |
<p>| Condition String | Text field that accepts a plain JavaScript condition statement that is validated automatically for correctness before an update. |
| Conditions    | Field that adds the condition builder to a form. Specify a dependent field that references the table name. |</p>
<table>
<thead>
<tr>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Currency</td>
<td>Decimal field with two digits after the decimal point. When displayed on a form, a currency field also includes an extra choice list for selecting the currency type. If there is no default value for the field, empty currency fields use the default system currency. Adding a value causes the field to use the preferred currency of the active user.</td>
</tr>
<tr>
<td>Data Structure</td>
<td>Field that allows the selection of one of the following data structures and entry of values to organize particular information in the record.</td>
</tr>
<tr>
<td>Date</td>
<td>Day, which can be selected with a calendar widget.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Day and time of day, which can be selected with a calendar widget.</td>
</tr>
<tr>
<td>Decimal</td>
<td>Number with up to two digits after the decimal points (for example, 12.34).</td>
</tr>
<tr>
<td>Document ID</td>
<td>Reference to any field on any table.</td>
</tr>
<tr>
<td>Domain ID</td>
<td>System field that contains a reference to the domain.</td>
</tr>
<tr>
<td>Due Date</td>
<td>String input field that stores a date-time.</td>
</tr>
<tr>
<td>Duration</td>
<td>Length of time. Stored in the database as a positive integer number of milliseconds, but displays in days, hours, minutes, and seconds. Negative duration values are not supported.</td>
</tr>
<tr>
<td>Encrypted Text</td>
<td>Field that is encrypted for security. Depending on the user's encryption context, the field can be hidden, the value can be hidden, or the field and value can display.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Reference field for a field name in the table selected in a Table Name field type. Make this field dependent on the Table Name field.</td>
</tr>
<tr>
<td>Floating Point Number</td>
<td>Number with up to seven digits after the decimal point.</td>
</tr>
<tr>
<td>HTML</td>
<td>String field with a built-in HTML editor.</td>
</tr>
<tr>
<td>Image</td>
<td>Field for uploading and embedding images.</td>
</tr>
<tr>
<td>Integer</td>
<td>Number with zero decimal points.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Journal</td>
<td>Field that accepts text entries and displays previous entries with a user name and timestamp.</td>
</tr>
<tr>
<td>Journal Input</td>
<td>Field that accepts text entries but does not display previous entries.</td>
</tr>
<tr>
<td>Journal List</td>
<td>Field that displays the contents of journal fields. Specify the journal fields as the dependent fields. If a journal list field depends on more than one journal field, the entries are displayed chronologically.</td>
</tr>
<tr>
<td>List</td>
<td>Reference field that accepts multiple references rather than just one.</td>
</tr>
<tr>
<td>Long</td>
<td>Integer field that can contain a longer number than the integer field.</td>
</tr>
<tr>
<td>Password (1 Way Encrypted)</td>
<td>Text field that stores passwords with one-way encryption. One-way encryption stores the password as a secure hash value that cannot be decrypted.</td>
</tr>
<tr>
<td>Password (2 Way Encrypted)</td>
<td>Text field that stores passwords with two-way encryption. Two-way encryption stores the password as a secure encrypted value that can be decrypted programmatically within the instance. You can use Password 2 encryption with form variables. To encrypt text fields on forms, use Encryption Contexts.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Decimal field that renders a percent complete bar in lists.</td>
</tr>
<tr>
<td>Phone Number (E164)</td>
<td>String field that provides E164-compliant formatting and validation for telephone numbers.</td>
</tr>
<tr>
<td>Price</td>
<td>Decimal field with an additional list for currencies.</td>
</tr>
<tr>
<td>Reference</td>
<td>Query that displays records from another table.</td>
</tr>
<tr>
<td>Script</td>
<td>Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting. It also provides a list of fields and server APIs. Specify a dependent field that references the table name for the list of fields.</td>
</tr>
<tr>
<td>Script (Plain)</td>
<td>Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>String</td>
<td>For 254 characters or less, the string field is a single-line text field. Anything 255 characters or over appears as a multi-line text box. Note: The database translates the value you provide in the Max length field to the closest matching database field type. For example, a max string length of 80 maps to the nearest database field type of VARCHAR(100). For Oracle instances, users are not able to increase the max length of a string field to anything greater than 4000 through the application UI because the increase requires the CLOB datatype in Oracle. If you require a field to be larger than the max length, you can log an incident to request that a DBA change the max length for you.</td>
</tr>
<tr>
<td>String (Full UTF-8)</td>
<td>A string field that can contain UTF-8 character encoding. The string restriction on the number of characters applies to this field type.</td>
</tr>
<tr>
<td>Suggestion</td>
<td>String field that provides suggested values but accepts free-form text. Available when you add a field by configuring a form or list. Otherwise, you must modify the dictionary entry of an existing string or journal field.</td>
</tr>
<tr>
<td>Table Name</td>
<td>String field that lets you select a table. If you use the Field Name field type, add this field type and make the Field Name field dependent on the Table Name field.</td>
</tr>
<tr>
<td>Time</td>
<td>Specific time. Stored in the database as a string in milliseconds, but displays in hours, minutes, and seconds.</td>
</tr>
<tr>
<td>Translated HTML</td>
<td>HTML field that displays different translations based on the user's language.</td>
</tr>
<tr>
<td>Translated Text</td>
<td>Text field that displays different translations based on the user's language.</td>
</tr>
<tr>
<td>True/False</td>
<td>Boolean field that appears as a check box.</td>
</tr>
<tr>
<td>URL</td>
<td>String field that is a clickable URL field when locked.</td>
</tr>
<tr>
<td>Video</td>
<td>Field for uploading and embedding video.</td>
</tr>
<tr>
<td>Wiki</td>
<td>String field with a built-in Wikitext editor that accepts a simplified version of standard Wikitext formatting.</td>
</tr>
</tbody>
</table>
Modify string field length

You can modify the maximum character limit for a string field.

Role required: personalize_dictionary

1. Right-click the field label in the form and select Configure Dictionary.
2. Change the Max length field to the desired length.

   Note: You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.

3. Click Update.
   The system cancels any length change that results in data loss due to truncation.

Enable the text field character counter

By default, multi-line text fields have a 4000 character limit. To help users see how many characters remain before they reach the limit, you can enable the glide.ui.textarea.character_counter property.

Role required: admin

This property adds a counter under text fields, such as the Additional Comments and Work notes fields. The counter is dynamically updated as users enter text.

1. Navigate to System Properties > UI Properties.
2. Select the check box next to Character counter for textarea (journal and multi line text fields).
3. Click Save.
Valid data type changes

You can only change a dictionary entry's data type when the change does not result in data loss. Use the following guidelines to change a dictionary entry's data type.

Table 191: Valid data type changes

<table>
<thead>
<tr>
<th>Condition</th>
<th>Restrictions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The field is empty in all table records.</td>
<td>None. You can convert an empty field from any data type to another without restriction.</td>
</tr>
<tr>
<td>The table contains existing data for the field.</td>
<td>You can only convert between logical data types that map to the same physical data type in the database. For example, you can convert a glide duration to a glide datetime since both logical data types map to the DATETIME physical data type in the database.</td>
</tr>
<tr>
<td>The field is a string field you are converting to another type of string field.</td>
<td>You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.</td>
</tr>
<tr>
<td>The field is a string field you are converting to a globally unique ID (GUID).</td>
<td>You can only convert a string field to a GUID if all of the existing data in the field are already Sys ID values.</td>
</tr>
<tr>
<td>The field is a GUID field you are converting to a string field.</td>
<td>None. You can convert a GUID field to a string field without restriction.</td>
</tr>
</tbody>
</table>

Database field types

Available field types and their corresponding MySQL database types.

Typically, it isn't necessary to perform any actions at the database level. To learn about changing a field type, see System dictionary on page 1443.

Table 192: Database field types

<table>
<thead>
<tr>
<th>Field types</th>
<th>Options</th>
<th>Dictionary XML type</th>
<th>MySQL DB type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>small</td>
<td>string</td>
<td>VARCHAR(40)</td>
</tr>
<tr>
<td>String</td>
<td>medium</td>
<td>string</td>
<td>VARCHAR(100)</td>
</tr>
<tr>
<td>String</td>

<td></td>
<td>decimal</td>
<td>Decimal (15,2) older instances may have (12,2)</td>
</tr>
<tr>
<td>Integer</td>
<td></td>
<td>integer</td>
<td>Integer</td>
</tr>
<tr>
<td>True-False</td>
<td></td>
<td>boolean</td>
<td>TINYINT(1)</td>
</tr>
</tbody>
</table>
Add a new field to a table

Administrators can add new fields to a table to store and display data.

Role required: admin

**Warning:** Do not add more than 10 medium-length or longer String fields to a single table. Attempting to save a large number of characters in 11 or more String fields can result in the following error: Syntax Error or Access Rule Violation detected by database (Row size too large (> 8126)).

1. Navigate to any form.
2. Right-click the form header and select **Configure > Form Layout**.
3. In the **Create new field** section, fill in the following fields:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the field as you want it to appear on forms and lists.</td>
</tr>
<tr>
<td>Database column name</td>
<td>Enter the database name for the field.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a field type.</td>
</tr>
<tr>
<td>Field length</td>
<td>Select a field length. This field is visible only for certain field types.</td>
</tr>
</tbody>
</table>

4. Click **Add**.
5. Use the slushbucket to place the field in the desired location on the form.
6. Click **Save**.
   The field now appears on the form in the designated location.

<td>VARCHAR(40)</td>
<td></td>
</tr>
<tr>
<td>Due-Date</td>
<td>due_date</td>
<td>DATETIME</td>
<td></td>
</tr>
</tbody>
</table>
Make a field mandatory

Fields can be marked as mandatory, meaning they must contain a value before the record can be saved. Mandatory fields are marked with a field status indicator before the label.

Role required: personalize_dictionary

A mandatory field that populated by the platform with default data, such as a value from a client script, does not display the indicator. If you delete this value from the field, however, the indicator appears. The color of the indicator depends on the field state. For more information, see UI16 and UI15 field status indicators on page 106 or UI11 field status indicators on page 106.

1. Right-click the field's label in the form and select Configure Dictionary.
2. In the Dictionary form, select the Mandatory check box.
3. Click Update.

The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.

**Note:** Mandatory fields are global. The field is marked as mandatory everywhere it appears in a form.

**Mandatory Reference Fields**

A form can be saved with an empty mandatory field, if that field is a reference field (derived from another table) and if the parent field is also blank. However, if the mandatory reference field shows a value from the parent field, then the form cannot be saved if this value is deleted. If the value in the referenced field is changed, the value for that field is changed everywhere it appears.

Specify a default field value

A default value populates a value in a field when a new record is created.

Role required: personalize_dictionary

The default value populates the field on the blank form for a new record, and also when the new record is submitted if the field is empty. Default values can be specified as either a constant or generated through script.

1. Right-click the field's label in the form and select Configure Dictionary.
2. Enter the default value in the Default value field.

To set a constant value, type it into the Default value text box field. To assign a default value using a more complex formula, use JavaScript to output a default value.

**Note:** The default value is the underlying value that would be present in the field, not the label. For example, in a choice list field, use the value of the choice as the default value, not the choice's name.

**Constant default values**

**Javascript default values**

**Set a default value for assignment_group**

**Set a default value for assigned_to if user has the itil role**

**Set a default value for a duration field**

Set a default value for the Priority field.
To view out-of-box examples of JavaScript default values, navigate to **System Definition > Dictionary** and enter this filter: `[Default value] [starts with] [javascript]`. Open some of the records and view the default value javascript entries.

The following example sets a default value in a `[sys_user_group]` reference field by getting the ID from the name of a group.

```
javascript:GetIDValue('sys_user_group', 'Development');
```

Configure the default value for the `[assigned_to]` user equal to the current user id if the user has a role of itil.

- Column label: **Assigned to**
- Column name: `[assigned_to]`
- Reference Specification section
  - Reference: **User [sys_user]**
  - Reference qual condition: `[Roles] [is] [itil]`
- Default value script:

```javascript
javascript:if (gs.hasRole("itil")) current.assigned_to = gs.getUserID();
```

To set a default value for a duration field, use the following in the Default value field of the duration field's dictionary entry:

```javascript
javascript:current.duration_field.setDisplayValue('3 04:30:14');
```

Do not hard-code a particular date-time because the value becomes invalid if the system date-time format changes.

Make a field dependent

A choice or reference field can be declared dependent on another field on the same table. Dependent fields limit their available values based on the value in the dependent field.

Role required: personalize_dictionary

If a required dependency does not function as expected, as might happen if there is a many-to-many relationship between the fields, consider using reference qualifiers to accomplish the goal.

1. Right-click the field label in the form and select Configure Dictionary.
2. In theDependentfield, enter the name of the field that this field will depend on.
3. Click Update when done.

The "subcategory" field is made dependent on "category". The "category" value in a form will determine which options appear for the "subcategory" field.

**Note:** Fields cannot be made dependent on derived fields.

Require unique values for a field

You can require that a field's values are unique. This means no two records have the same value for that field.

Role required: personalize_dictionary
Warning: Making a field unique when the corresponding table already has different values for that field causes data loss. All duplicate records are deleted.

By default, fields are created without this constraint. A field can have unique values only if there are not already duplicate values in the database for that field.

1. Verify that no records in the table for the field have values, or that they all have the same value.
2. Right-click the field label in the form and select Configure Dictionary.
3. Configure the form to add the Unique field if it does not already appear.
4. Select the Unique check box.
5. Update.

Change the field label or hint

You can change a field’s label or the text that appears as a hint when you point your cursor to the field.

Role required: personalize_dictionary

1. Navigate to the form the field appears on.
2. Right-click the field label and select Configure Label.
3. Update the form.

Table 193: Changing the Field Label or Hint

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table the label appears on.</td>
</tr>
<tr>
<td>Label</td>
<td>The label that the field displays. You can enter up to 50 characters for the label, but not all databases support this many characters. The recommended maximum is 30 or fewer characters. HTML in field labels is not supported.</td>
</tr>
<tr>
<td>Plural</td>
<td>The plural version of the field label.</td>
</tr>
<tr>
<td>Element</td>
<td>The dictionary name of the field.</td>
</tr>
<tr>
<td>Help</td>
<td>Helpful text stored in the record.</td>
</tr>
<tr>
<td>Hint</td>
<td>A short description of the field that displays when the user points to it.</td>
</tr>
<tr>
<td>URL</td>
<td>If this field is not blank, a URL link that displays on the label.</td>
</tr>
<tr>
<td>URL target</td>
<td>A target attribute that determines where the URL opens. For information on the target attributes, see this W3Schools article.</td>
</tr>
</tbody>
</table>

4. Click Update.
Delete fields

You can delete custom fields that you created. Custom fields begin with u_. Remove the field from forms and lists instead of deleting it.

Role required: admin

You cannot delete base system fields. In addition, any missing base system fields are recreated when the instance is upgraded.

1. Navigate to a form that contains a custom field to delete.
2. Right-click the field label and select Configure Dictionary.
3. Click Delete Column in the form header, and then click OK.
4. To delete multiple custom fields, complete the following steps.
   a) Navigate to System Definition > Dictionary.
   b) Locate the custom fields to delete.
      For example, search for column names that start with u_.
   c) Check the boxes next to the fields to delete and select Delete from the action list below the list.
      A confirmation dialog opens. If there are dependencies for the selected fields, they are listed.
   d) Click Delete.

UI16 and UI15 field status indicators

Indicators are used on some fields to denote a special field type.

A field status indicator is a colored asterisk that may appear to the left of mandatory fields. Field status indicators change colors to represent different states of mandatory fields.

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unpopulated</td>
<td>Required field is empty. The user must enter a value to save the form. Default color is red.</td>
</tr>
<tr>
<td>Populated - saved</td>
<td>Required field contains a value that was saved or needs to be saved. Default color is grey.</td>
</tr>
<tr>
<td>Populated - unsaved</td>
<td></td>
</tr>
</tbody>
</table>
Figure 247: UI16/UI15 field status indicators

Note: Tabs containing required fields have black asterisks.

UI11 field status indicators

A field status indicator is a colored bar that may appear to the left of form elements. These indicators convey the following statuses.

<table>
<thead>
<tr>
<th>Field status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory</td>
<td>Required field that is empty. The user must enter a value to save the form. Default color is red.</td>
</tr>
<tr>
<td>Populated mandatory</td>
<td>Required field for which a value has already been saved. Default color is light red. If the user enters a new value, the field status indicator changes to modified (default green).</td>
</tr>
<tr>
<td>Modified</td>
<td>Contains data that has not been saved. Default color is green.</td>
</tr>
<tr>
<td>Read-only</td>
<td>User cannot edit on the form. Default color is orange.</td>
</tr>
</tbody>
</table>
Figure 248: UI11 field status indicators

An administrator can customize the color of these field status indicators by navigating to **System Properties > CSS**:

Figure 249: Customize UI11 field status indicator colors

**HTML fields**

An HTML field allows users to define how field content is rendered by using HTML. Knowledge articles, service catalog item descriptions, release documentation, and HTML content blocks are common examples of HTML fields. Administrators can **add HTML fields** to any form and also **customize the functionality** of HTML fields.

**Types of HTML editors**

There are two types of HTML editors in the system.

- TinyMCE: A What You See Is What You Get (WYSIWYG) field that displays text as readers would see it on the screen. TinyMCE is the default editor.
- htmlArea: The legacy editor, which offers a more basic WYSIWYG interface as well as a mode that shows only HTML markup.

The **glide.ui.html.editor** system property specifies which interface is used for all HTML fields.
Note: Styles declared by HTML fields may be overridden by CSS declarations in the themes.css file that styles the entire instance. To determine what attributes are overriding a style, use a web development tool (for example, Firebug for Firefox).

TinyMCE HTML editor

Versions of the TinyMCE editor that are available.

- Version 4, which provides a simplified toolbar and an updated table designer tool.
- Version 3.

The version of the TinyMCE editor currently in use depends on the user interface:

- The UI16 and UI15 interfaces use version 4.
- The UI11 interface uses version 3.

Figure 250: TinyMCE v4
Figure 251: TinyMCE v3

Users can modify the TinyMCE toolbar and add or remove functionality. For more information, see Configure the TinyMCE HTML toolbar on page 809.

HtmlArea editor

The HtmlArea editor is the legacy editor for HTML fields.

Figure 252: HtmlArea

Use the editors

The editors provide controls that are similar to a word processing program.

Formatting
The formatting table displays how to control the way text appears.

In the following table, the TinyMCE v3/htmlArea icon column displays icons that are available with the TinyMCE version 3 and htmlArea editors. The TinyMCE v4 icon column displays icons that are available with the TinyMCE version 4 editor. Names marked with an asterisk (*) are not available with the htmlArea editor.

Click the button to use the current color, or click the arrow next to the button to view more colors. Click More Colors... to view various color options and the hexadecimal codes. |
|                          |                | Clear Formatting* | Removes the inline styles and formatting from the selected text. |
| x_2                      |                | Subscript* | Applies subscript text, which appears half a character below the baseline, to the current word or selected text.  
**Code reference:** `<sub>` |
**Table functions in the TinyMCE version 4 editor**

The TinyMCE version 4 editor uses menus and menu selections to create and edit tables.

<table>
<thead>
<tr>
<th>UI element</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Table Icon" /></td>
<td>Click the table icon ( ) to access the TinyMCE version 4 table menu. Use the table menu to:</td>
</tr>
<tr>
<td><img src="image" alt="Insert Table" /></td>
<td>- Insert or delete a table</td>
</tr>
<tr>
<td><img src="image" alt="Table Properties" /></td>
<td>- Modify table properties</td>
</tr>
<tr>
<td><img src="image" alt="Delete Table" /></td>
<td>- Add, move, or delete rows and columns</td>
</tr>
<tr>
<td><img src="image" alt="Cell" /></td>
<td>- Modify row and column properties</td>
</tr>
<tr>
<td><img src="image" alt="Row" /></td>
<td>- Split and merge cells</td>
</tr>
</tbody>
</table>

**Table 196: TinyMCE version 4 editor**

<table>
<thead>
<tr>
<th>TinyMCE v3/htmlArea icon</th>
<th>TinyMCE v4 icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Superscript Icon](image) | | Superscript* | Applies superscript text, which appears half a character above the baseline, to the current word or selected text. *

*Code reference:* `<sup>`
To insert a table in the HTML field, click **Insert table** and highlight squares in the grid to represent the desired number of rows and columns. Click the last highlighted square to insert the table.

After you insert the table, you can modify the size by clicking and dragging the handles at the table edges.

From the table menu, click **Table properties** to open the Table properties dialog box. From this box you can take any of the following actions.

- **General tab:**
  - Set table width and height
  - Set cell spacing and padding
  - Enable borders and captions
  - Set the table alignment

- **Advanced tab:**
  - Configure the table style
  - Select the border color
  - Select the background color
With the cursor in the desired table cell, open the table menu and click **Cell properties**. From this box you can set the following properties for table cells.

- **General tab:**
  - Width and height
  - Type and scope
  - Horizontal and vertical alignment

- **Advanced tab**
  - Configure the cell style
  - Select the border color
  - Select the background color

With the cursor in a table cell in the desired row, open the table menu and click **Row properties**. From this box you can set the following properties for rows.

- **Row type**
- **Alignment**
- **Height**

- **Advanced tab**
  - Configure the row style
  - Select the border color
  - Select the background color

---

**Table functions in the TinyMCE version 3 and htmlArea editors**

The TinyMCE version 3 editor and the htmlArea editor use icons to create and edit tables.

Names marked with an asterisk (*) are not available with the htmlArea editor.
<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![insert/edit table icon] | Insert/Edit Table           | Inserts a table and defines properties for the current table, including columns, rows, width, layout, and spacing. To learn more, see the table styles example.

<td>Preview*</td>
<td>Opens a preview of the HTML field in a separate window without saving changes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Toggle Full Screen Mode*</td>
<td>Expands the HTML field to use the full form view for easier editing. Click the button again to return to standard form view. This feature is not available for Internet Explorer.</td>
</tr>
</tbody>
</table>
*These options are not available with htmlArea.

**Highlight text in the TinyMCE editor**

On the bottom bar of the TinyMCE editor, the path of HTML tags for the text at the cursor position is displayed.

Click a tag in the path to highlight the text affected by the tag.

**Insert a line break in the HTML editor**

When you use the Enter key, the editor creates a new paragraph element (<p>) tag, which appears as a double space.

To enter a single line space, use the Shift + Enter key combination, which inserts a line break (<br>) tag.

**Use HTML source mode in the htmlArea editor**

In HTML source mode, you can use standard HTML to edit text.

Click the HTML source icon (HTML) to open the HTML source code in a separate window. Make your changes and then click **Update**.

![HTML Source Editor](image)

**Figure 253: HTML editor**

**Note:** Fields which are blank may still have default HTML tags applied by default - for example, a <body></body> tag. These tags will be displayed in the HTML Source Mode.

**Table style example**

This example uses HTML field controls to format a table in a knowledge article.
To add the formatted table to a knowledge article:

1. Navigate to **Knowledge > Edit** and select the article to edit.
2. In the HTML field, position the cursor in the location for the table.
3. Click the table icon, click **Insert table**, and then select the number of rows and columns.
4. Complete the following steps to edit the table properties.
   a) Position your cursor in the table, click the table icon, and select **Table properties**.
   b) Enter the following values on the **General** tab.
      • Width: 75%
      • Cell spacing: 3
      • Cell padding: 3
      • Border: 1
      • Alignment: Left
   c) On the **Advanced** tab, click the text field next to **Border color** and enter **Gray**. The color picker box to the right turns gray to indicate the color you entered. You can also click the box and select the color in the palette.
   d) Click **Ok**.

5. Complete the following steps to update the header table row.
   a) Select the cells in the first table row, click the table icon, and select **Row > Row properties**.
   b) Enter the following values on the **General** tab.
      • Row type: Header
      • Alignment: Center
   c) On the **Advanced tab**, enter **#87cefa** in the text box beside **Background color** to set it to a light blue.
   d) Click **Ok**.

6. To set cell properties, complete the following steps.
   a) Select all table cells in the first column except those in the header row, click the table icon, and select **Cell > Cell properties**.
   b) Enter the following values on the **General** tab.
7. To set the background color of the middle row, complete the following steps.
   a) Position your cursor in the middle table row, click the table icon, and select **Row > Row properties**.
   b) On the **Advanced tab**, enter **Silver** in the text box beside **Background color** to set it to color #c0c0c0.
   c) Click **Ok**.

   You need to repeat this procedure for every other table row.

8. To set column width, complete the following steps.
   a) Click the first column of the table, click the table icon, and select **Cell > Cell properties**.
   b) On the **General tab**, enter **30%** in the **Width** text field.
   c) Click **Ok**.

9. Right-click the form header and click **Save**.
10. Enter data in the table cells and then save the article.

Adding media to HTML fields

Users can add media elements, including images and web links, to HTML fields.

Embedding videos is not available for this release due to browser plugin constraints. You can attach any video file to the form using the attachment option. For more information on attachments, see **Add attachments** on page 127.

**Embed images in HTML fields**

You can use the HTML field image picker to embed images into HTML fields, and to add images to the image library.

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed an image in it.

**Note:** Administrators and users with the image_admin role manage the image library at **System UI > Images**. See **Storing images in the database** on page 205.

1. Open the form that contains the HTML field.
2. Click at the position where the image is to appear, or to modify an existing image, click the image.
3. Click the insert/edit image icon on the HTML editor toolbar.
   - The Insert/Modify Image form opens.
4. Enter information in each field.
### Table 200: Insert/Modify Image form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Type** | Select the image type.  
  - **Image Library**: may be reused.  
  - **Attachment**: available in the current record only |
| **Image** | Begin typing a file name and select an image from the list, or click the reference lookup icon and select an image.  
  To upload a new image, click **New**, click **Choose File**, locate the image, and click **Upload**.  
  If you chose the **Attachment** type, click **Choose File**, locate the image, and click **Attach**. |
| **Tooltip** | Enter alternate text that appears when a user points to the image. |
| **Alt** | Enter alternate text that can be used to improve accessibility. For example, it could be used with a screen reader. If this field is left blank, it defaults to the text entered in the **Tooltip** field. |

**Note:** To resize an embedded image (not available for Chrome browsers), click the image. The sizing frame appears. Drag a sizing point until the image is the desired size. Corner points adjust the size proportionally.

5. Optional: To provide additional control over the image's appearance, click **Advanced options**.

#### Table 201: Advanced options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Layout</strong></td>
<td>Select the image <strong>Alignment</strong> (default is <strong>Baseline</strong>) and enter the <strong>Border thickness</strong>.</td>
</tr>
<tr>
<td><strong>Spacing</strong></td>
<td>Enter the number of <strong>Horizontal</strong> and <strong>Vertical</strong> pixels around the image.</td>
</tr>
<tr>
<td><strong>Size</strong></td>
<td>Enter the <strong>Width</strong> and <strong>Height</strong> of the image (in pixels).</td>
</tr>
</tbody>
</table>

6. Click **OK**.

*Link to a website in HTML fields*  
You can insert a link to a website in an HTML field:
Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and link to a website in the article text.

1. Move the cursor to the position where the link is to appear.
2. Click the insert/edit link icon (🔗) in the HTML toolbar.
3. Enter information in each field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL for the link. Copying and pasting is usually the easiest method.</td>
</tr>
<tr>
<td>Text</td>
<td>Enter the text you want to display for the link.</td>
</tr>
<tr>
<td>Target</td>
<td>Select the target window for the URL. For files, the None (use implicit) selection is generally the best choice. However, if you are linking to a complete web page, choose New window (_blank) so the browser opens the link in a new tab or window.</td>
</tr>
</tbody>
</table>

4. Click **OK** to insert the link into the field.

HTML field administration

An HTML field allows users to use HTML to define how field content is rendered.

The HTML editor provides WYSIWYG (what you see is what you get) functionality and HTML source mode editing. Administrators can customize some of the functionality associated with HTML fields. The HTML editors available depend on your version of the UI.

<table>
<thead>
<tr>
<th>HTML editor</th>
<th>UI support</th>
</tr>
</thead>
<tbody>
<tr>
<td>TinyMCE version 4</td>
<td>UI16, UI15</td>
</tr>
<tr>
<td>TinyMCE version 3</td>
<td>UI11</td>
</tr>
<tr>
<td>htmlArea (legacy)</td>
<td>UI11</td>
</tr>
</tbody>
</table>

Configure the TinyMCE HTML field editor

You can configure HTML fields to use the TinyMCE editor. This editor provides better stability and more editing functions than the legacy htmlArea editor.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. Locate the property called **HTML field editor to use** (glide.ui.html.editor).
3. Select **TinyMCE**.
4. Click **Save**.
Configure the TinyMCE HTML toolbar

When HTML fields are configured to use the TinyMCE HTML editor, follow this procedure to configure which buttons are available on the toolbar.

Role required: admin

This procedure applies to both versions of the TinyMCE editor: version 3, available in UI11, and version 4, available in UI16 and UI15.

1. **Navigate to System Properties > UI Properties.**
2. **Locate the appropriate properties based on your version of the UI.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **UI16 or UI15**                                      | • (TinyMCE v.4.0.26) Configures the editing toolbar (first line) for HTML fields (glide.ui.html.editor.v4.toolbar.line1)  
• (TinyMCE v.4.0.26) Configures the editing toolbar (second line) for HTML fields (glide.ui.html.editor.v4.toolbar.line2) |
| **UI11**                                             | • Configures the editing toolbar (first line) for HTML fields (glide.ui.html.editor.toolbar.line1)  
• Configures the editing toolbar (second line) for HTML fields (glide.ui.html.editor.toolbar.line2) |

3. **Enter or remove buttons for each toolbar as a comma-separated list without spaces.**
   - Use a vertical bar ("|") to add a section separator.
   - Use the following button names when defining these properties. For a description of button functionality, see *Use the editors* on page 792.

<table>
<thead>
<tr>
<th>Button purpose</th>
<th>Accepted button names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting</td>
<td>newdocument, bold, italic, underline, strikethrough, justifyleft, justifycenter, justifyright, justifyfull, formatselect, fontselect, fontsizeselect, bullist, numlist, outdent, indent, blockquote, forecolor, removeformat, backcolor, sub, sup</td>
</tr>
<tr>
<td>Table functions</td>
<td>tablecontrols</td>
</tr>
<tr>
<td>Editing</td>
<td>cut, copy, paste, pastetext, search, replace, undo, redo</td>
</tr>
<tr>
<td>Extended functions</td>
<td>link, unlink, cleanup, code, hr, visualaid, charmap, image, media, preview, spellchecker, fullscreen (not supported by Internet Explorer)</td>
</tr>
</tbody>
</table>

The **spellchecker** tool is not supported in UI16 or UI15.

4. **Click Save.**
Configure TinyMCE editor to allow deprecated tags

You can set a dictionary attribute on a TinyMCE editor field to allow the use of deprecated HTML tags, such as `<b>` and `<i>`. By default, the TinyMCE editor uses the `<strong>` and `<em>` tags for bold and italic formatting.

Role required: personalize_dictionary or admin

After you set the dictionary attribute, use code view to manually enter deprecated tags. The editor does not validate any tags you enter manually, for example, if you type an incorrect character.

1. Navigate to the form with an HTML field that uses the TinyMCE editor.
2. Right-click the HTML field label and select **Configure dictionary**.

3. In the **Attributes** field, enter `tinymce_allow_all=true`, separated by a comma if needed. If other attributes are already listed, use a comma as a separator.
Configure the legacy HTML field editor
Administrators can configure HTML fields to use the legacy htmlArea editor in UI11.

Role required: admin

Note that the htmlArea HTML editor is not supported in UI16 or UI15.

1. Navigate to **System Properties** > **UI Properties**.
2. Locate the property called **HTML field editor to use** (glide.ui.html.editor).
3. Select **htmlArea**.
4. Click **Save**.

Configure the legacy HTML toolbar
When HTML fields are configured to use the legacy htmlArea HTML editor, follow this procedure to configure which buttons are available on the toolbar.

Note that the legacy HTML toolbar is not supported in UI16 or UI15.

1. Navigate to **System Properties** > **UI Properties**.
2. Locate the property called **Configures the editing toolbar for HTML fields** (glide.ui.html.toolbar).
3. Enter a comma-separated list, without spaces, to define the buttons that should appear on the toolbar. Use the following button names. For a description of button functionality, see **Use the editors** on page 792.
<table>
<thead>
<tr>
<th>Button purpose</th>
<th>Accepted button names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting</td>
<td>formatblock, fontname, fontsize, bold, italic, underline, justifyleft, justifycenter, justifyright, justifyfull, insertorderedlist, insertunorderedlist, outdent, indent, forecolor, hilitecolor</td>
</tr>
<tr>
<td>Editing</td>
<td>copy, paste, undo</td>
</tr>
<tr>
<td>Extended functions</td>
<td>createlink, inserthorizontalrule, insertimage, insertvideo, inserttable, htmlmode</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Note:**

The **Configures the editing toolbar (first line) for HTML fields** (glide.ui.html.editor.toolbar.line1) and **Configures the editing toolbar (second line) for HTML fields** (glide.ui.html.editor.toolbar.line2) properties only apply to the TinyMCE version 2 editor. The **Configures the editing toolbar (first line) for HTML fields** (glide.ui.html.editor.v4.toolbar.line1) and **Configures the editing toolbar (second line) for HTML fields** (glide.ui.html.editor.v4.toolbar.line2) properties only apply to the TinyMCE version 4 editor. Changes to these properties only apply when the TinyMCE editor is enabled; they do not affect the legacy htmlArea editor.

---

**Components installed with the TinyMCE HTML field editor**

The following components are included with the TinyMCE HTML Field Editor plugin.

- Properties
- Business rules

<tr>
<td>validate_tinymce4_buttons</td>
<td>Ensures that the TinyMCE HTML version 4 editor toolbar is configured with valid buttons.</td>
</tr>
</tbody>
</table>

Modify image uploads
By default, users can use and upload images to the image library from an HTML field. You can disable access to the image library from HTML fields.

Role required: admin
1. Navigate to System UI > UI Pages.
2. Select html_insert_image_dialog.
3. Locate the following lines of code in the HTML field and comment them out.

```html
<j:if test= "${jvar_use_dbimage}">
  <j:set var = "jvar_default_insert_image_type" value = "dbimage" />
  <g:ui_select_option text = "${gs.getMessage('Image Library')}" value = "dbimage" selected = "${jvar_default_insert_image_type}" />
</j:if>
```
4. Click Update.

To remove the Upload from URL option in the HTML editor, add a new property named glide.ui.html.image.allow_url and set the Value to false.

Add an image field
Image fields enable you to add images to forms.

Role required: personalize_form
For example, you can add portraits to the user records in your system. The image type must be .gif, .jpg/.jpeg, or .png.

Image resizing is defined by the CSS. Larger images are resized to 250 pixels. For most browsers, the larger of the height and width measurements is reduced to 250 pixels and the proportion of the image is maintained. For example, an image with a size of 1508 x 663 pixels is resized to 250 x 110 pixels. Some browsers resize both the height and width measurements to 250 pixels, resulting in a square image.

You can add a new image field.
1. Open the desired form.
2. Create a new field with the Type set to Image.
   For instructions, see Add a new field to a table on page 783.
3. Add the new field to the form and save your customization.
   The form displays the new blank image field.
4. Click Click to add in the image field, select an image to upload, and click OK.
   The selected image is attached to the form and displayed in the image field.
Journal fields

There are three types of journal field: journal, journal_list, and journal_input. Each type of journal field behaves differently.

<table>
<thead>
<tr>
<th>Journal field types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>journal</td>
<td>Allow and store input, and display the combined inputs below the input box.</td>
</tr>
<tr>
<td>journal_input</td>
<td>Allow and store input, but do not display the combined inputs.</td>
</tr>
<tr>
<td>journal_list</td>
<td>Do not allow or store input; they merely display the contents of other Journal fields upon which the journal_list field is dependent. If a journal_list field is dependent on more than one Journal field, it will chronologically interweave those fields’ inputs.</td>
</tr>
</tbody>
</table>

Render journal field entries as HTML

Journal fields can render text enclosed within code tags as HTML.

- Role required: any role that grants write access to a journal field
- System property: the High Security Setting glide.ui.security.allow_codetag is set to the default value of true

By default, a High Security Setting *escapes* any HTML code you type in a journal field by replacing it with its equivalent HTML entity value. Escaping causes the system to display HTML code as text rather than forwarding it to the browser as rendering instructions.

1. Enter \[code\] [/code] tags around any code you want to render as HTML.

**Note:** A single journal entry can contain multiple code tags as long as each code tag has a beginning and ending tag.
For example, enter these lines:

### Table 207: Results of entering HTML code

<table>
<thead>
<tr>
<th>Code entered</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;a href=&quot;http://www.servicenow.com&quot;&gt;ServiceNow&lt;/a&gt;</code></td>
<td>The system renders a hyperlink to the ServiceNow web site.</td>
</tr>
<tr>
<td><code>&lt;b&gt;This text will be bold.&lt;/b&gt;</code></td>
<td>The system renders the sentence in bold.</td>
</tr>
<tr>
<td><code>&lt;b&gt;This text will not be bold.&lt;/b&gt;</code></td>
<td>The system escapes the bold tags and renders them as text.</td>
</tr>
<tr>
<td><code>&lt;script&gt;gs.info(gs.getUserDisplayName());&lt;/script&gt;</code></td>
<td>The system escapes the content of the script tag.</td>
</tr>
</tbody>
</table>

**Note:** By default, the HTML Sanitizer prevents the entry of `<script>` elements.

For more examples of HTML formatting options, see the blog post [Formatting within Journal fields using HTML & [code]](https://community.servicenow.com/b/ServiceNow-TechSupportBlogPosts) by a ServiceNow Technical Support Engineer in the ServiceNow Community.

2. Click **Post**.

**Note:** You cannot edit previous journal entries.

The system renders the text within code tags as HTML.

### Restrict the CODE tag in journal fields

You can prevent journal fields from rendering HTML code by disabling support for the `[code]` tag.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. Clear the check box for **Allow support for embedding HTML code by using the [code] tag** (the glide.ui.security.allow_codetag property).
3. Click **Save**.

### Validate HTML in journal fields

You can prevent users from saving invalid HTML in a journal field.

Role required: admin

1. Add the property glide.ui.allow_deep_html_validation. For instructions, see [Add a property using sys_properties.list](https://community.servicenow.com/b/ServiceNow-TechSupportBlogPosts) on page 1411.
2. Set the **Value** to **true** (it is false by default).
3. Click **Save**.

Users now see a warning in the activity formatter when they enter invalid HTML code in a journal field.
System property for restricting the number of entries sent in a notification

Administrators can control the number of journal entries notifications include with the following system property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.journal.lines | Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all). | Specifies the number of entries from a journal field (such as Additional comments and Work notes) included in email notifications. A value of -1 includes all journal entries.  
  * Type: integer  
  * Default value: 3  
  * Location: System Properties > Email |

Code for getting the contents of a journal field into an array

To put the contents of a journal field into an array so that you can iterate through each entry, you can use the code in this page.

```javascript
var notes = current.work_notes.getJournalEntry(-1);  //gets all journal entries as a string where each entry is delimited by '\n 
var na = notes.split("\n\n");  //stores each entry into an array of strings
for (var i = 0; i < na.length; i++)
gs.print(na[i]);
```

Journal field display limits

Journal fields can greatly increase the size of task records because they allow users to enter very large string values.

Display limits prevent the instance from loading the entire journal field into memory. Administrators have the option to:

- Set the length at which journal fields stop displaying the entire field's contents and instead only display a portion (called a preview) of the field's contents. Users can still access the field's entire contents by clicking a Show All button.
- Set the size of the preview text the journal field displays.
• Set the maximum number of journal entries journal fields can display.

Set the maximum display size for journal fields
You can set the maximum display size for journal fields by adding a system property.

Role required: admin

When a journal field exceeds the length set in this property, the instance shows a preview of the journal field instead of the field's entire contents. The preview includes a Show All button to display the rest of the field's contents. A separate property determines the number of characters the preview displays.

1. Add a system property with the following settings.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.max_journal_list_size</td>
</tr>
<tr>
<td>Description</td>
<td>Size in megabytes when a journal field should display a preview rather than the field's entire contents.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Click Submit.

Set the journal preview size
When a journal field exceeds the size of the glide.max_journal_list_size property, the instance displays a preview rather than the field's entire contents.

Role required: admin

To specify the amount of text to display as a preview, set the following system property. Users can click the Show All button to see the rest of the field's contents.

Add a system property with the following settings. For instructions, see Add a property using sys_properties.list on page 1411.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.shortened_journal_length</td>
</tr>
<tr>
<td>Description</td>
<td>Number of characters to display as a preview of journal fields.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>512000</td>
</tr>
</tbody>
</table>

Set the maximum number of journal entries
To set the maximum number of entries the system shows in the activity formatter, edit the following system property. The activity formatter displays the entries starting with the most recent entry up to the maximum number.

Role required: admin

1. Enter sys_properties.list in the navigation filter.
2. Search for the property glide.history.max_entries.
3. Edit the Value of the property.
### Journal field script values

The `setValue()` method is not supported for journal fields. Instead, assign values in script as in the following example.

```javascript
var gr = new GlideRecord('incident');
//query priority 1 incidents in the state of either 'new' or 'active'.
gr.addQuery('priority', 1);
var gc = gr.addQuery('state', 1);
gc.addOrCondition('state', 2);
gr.query();
while(gr.next()) {
    //print a list of the incident numbers updated
    gs.print(gr.number);
    //add an entry to the 'work notes' journal field for each incident
    gr.work_notes = "This is a high-priority incident. Please prioritize.";
    gr.update();
}
```

### Percent complete fields

Administrators can create percent complete fields, which accept decimal input and appear as progress bars when displayed in lists.

For example, use a percent complete field to set the completion percentage for a task or project in a form and then see that percentage displayed as a progress bar in a list.

Administrators can also configure views that compare actual progress with a target value to determine if goals are being met and then apply color to provide visual alerts where progress does not meet expectations.

![Percent complete field](image)

**Figure 255: Form view of a percent complete field**
Create a percent complete field

You can add a percent complete field to a form.

Role required: personalize_form

1. Navigate to any form.
2. Right-click the form header and select Configure > Form Layout.
3. Create a new field and set the Type to Percent Complete.
4. Click Add.
   The new field appears at the bottom of the Selected list.
5. Use the up and down arrow buttons to move the field to the desired location in the form.
6. Click Save.
   The form reloads and displays the new field.

Convert a field to a percent complete field

You can convert any existing decimal field to a percent complete field.

Role required: personalize_form

1. Right-click the decimal field's label and select Configure Dictionary.
2. Change the Type field from Decimal to Percent Complete.
3. Click Update.

Add a target field attribute

Add an optional attribute (target_field) to a percent complete field to compare the actual completion percentage of a task or project with a target percentage in a different decimal field that specifies where the task should be at this point.

Role required: personalize_dictionary

If a target field is not specified, the target of 100 is assumed.

1. Right-click the % Complete field in a form.
2. Select Configure Dictionary from the pop-up menu.
3. In the Dictionary Entry form, add the following attribute:
   target_field=percent_complete_target
4. Update the dictionary record.
   In the list, a gray bar appears behind the colored bar to indicate the target value. The gray target bar appears only if you defined a target field.
Target threshold colors attribute

If the `target_field` attribute is configured, a second attribute called `target_threshold_colors` enables an administrator to define additional parameters.

The parameters are:

- Different thresholds at which the colored bar should change color
- A specific color for each threshold

The format of this attribute's value is `number1:color1;number2:color2` and so on. Use this attribute to apply warning colors to completion percentages that are lower than target percentages. These values are defined as the percentage of target accomplished. For example, a value of `0:red;50:yellow;90:green` displays a red bar if the progress to target percentage is between 0-49. If the percent of target is between 50 and 89, the color is yellow. Percent of target 90 and above displays in green. Completion percentages that exceed target percentages also display in green. Order the color attributes from the smallest percentage to the largest.

If you do not specify a `target_field`, then a target of 100 is used, allowing you to use the color thresholds with a single field value.

```plaintext
target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen
```

The following table lists examples of percent of target calculation using the colors defined above.

<table>
<thead>
<tr>
<th>Target percent</th>
<th>Percent field value</th>
<th>Percent of target calculation</th>
<th>Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>40</td>
<td>40%</td>
<td>tomato</td>
</tr>
<tr>
<td>65</td>
<td>59</td>
<td>90.7%</td>
<td>lightgreen</td>
</tr>
<tr>
<td>15</td>
<td>10</td>
<td>66.7%</td>
<td>khaki</td>
</tr>
</tbody>
</table>
Phone number fields

The E.164 phone number standard ensures that all necessary information for a phone number is included and properly formatted to successfully route an international call over a territory's public telephone network.

When a user enters a phone number, it is received and stored as a string of numbers. An E.164 phone number field automatically formats and validates the numbers so that they are E.164-compliant when displayed as local and international numbers. The E.164 phone number field type does not replace the phone field type.

E.164 phone number field characteristics

What an E.164 phone number field displays.

An E.164 phone number field displays:

- [Optional] A choice list for the phone number territory.
- [Always] An input box for entering phone numbers.
- [By Default] A red underline when a phone number does not match the format for the selected phone territory and cannot be saved.
- [Optional] A green underline when a phone number does not match the format for the selected phone territory but can be saved with Other / Unknown as the territory.

Territories assigned

 Territories are assigned to locations, and are not assigned directly to users.

A user's territory, and so the user's E.164-compliant phone functionality, is based on the user's location. For example, if a user has a location of **SHS quadra 5, Bloco E., Brasilia** defined in the User [sys_user] table, the parent record for Brazil in the location table defines the phone territory. The phone territory may be assigned at any level of the **locations** hierarchy, which is searched going up to the next parent until the territory is found or no parents remain.
Dependent fields

In the dictionary, you can specify a dependent field in the User or Location field, which displays the appropriate territory in the selector choice list when a user enters a phone number.

In the dictionary, you can specify a dependent field in the User or Location field, which displays the appropriate territory in the selector choice list when a user enters a phone number. For example, if you enter caller_id in the dependent field in the Incident table, the appropriate territory is added to the territory selector choice list when a user enters caller information.

E.164 phone number field configuration

Administrators can use the phone number system properties and dictionary attributes to do certain things. The system properties apply the configuration option to all phone number fields that do not have a comparable dictionary attribute. The dictionary attributes apply the configuration only to the phone number field it is added to. Since dictionary attributes take precedence over system properties, administrators can set a global configuration with a property and then apply exceptions on a field-by-field basis.

Requiring territory format validation

By default, phone number fields require that a phone number match the display format of the selected territory.

By default, phone number fields require that a phone number match the display format of the selected territory. If a phone number does not match this format, the input box displays a red line underneath the phone number and users are prevented from saving it.

![Call Back Number: North America +185585551212](image)

Figure 259: Phone e164 strict

Setting the glide.phone_number_e164.strict system property to false or adding the pn_strict dictionary attribute allows the phone number input box to display a green line underneath numbers that do not match the territory format listed for the selected territory. In this case, a user can save a phone number in an invalid format, but the field continues to display a warning until the phone number matches the format required by the territory. You can use the Other / Unknown territory to store otherwise invalid phone numbers.

![Call Back Number: North America +185585551212](image)

Figure 260: Phone e164 not strict

⚠️ Warning: Switching from optional territory format validation to required territory format validation may result in some phone numbers failing validation altogether. In such cases, the E.164 phone number field displays an error message.

Requiring entry of international format

By default, users can enter phone numbers in their territory's local format and do not have to format the number for international dialing.

The phone number field automatically formats local phone numbers into E.164-compliant international phone numbers when the user finishes editing the field. As long as the phone number entered matches the territory's format for a local number, users can save the phone number.
Changing the `glide.phone_number_e164.allow_national_entry` system property or adding the `pn_allow_national_entry` dictionary attribute requires users to enter a phone number in the territory's international format, which starts with the plus (+) character. Users cannot save a locally formatted phone number, and the phone number input box displays a red line underneath phone numbers without the proper international formatting.

**Configure the display of the local format**

By default, an E.164 phone number field always displays phone numbers in an international format.

Change the E.164 phone number to use the local format in certain circumstances by adding the following system property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.phone_number_e164.display_national</code></td>
<td></td>
</tr>
</tbody>
</table>
|  • **Type**: string  
  • **Default value**: false  
  • **Other possible values**:  
    • **true or form**: displays phone numbers in a local format on forms, but displays an international format on lists.  
    • **all**: always displays phone numbers in a local format.  
    • **user**: only displays phone numbers in a local format when the phone number matches the local setting of the current user.  
    • **false**: does not display phone numbers in local format. |

Select one of the possible values to determine how the system handles the E.164 phone number.

You can also - to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pn_display_national</code></td>
<td>Overrides the <code>glide.phone_number_e164.display_national</code> property setting for how an E.164 phone number is displayed.</td>
</tr>
</tbody>
</table>
Configure the phone territory selector choice list
By default, an E.164 phone number field always displays the phone territory associated with the phone number.

Changing the system property or adding the dictionary attribute hides the territory selector choice list. If the territory selector choice list is hidden, users can only enter a local or national number.

Figure 264: Phone e164 hide selector

Add the following system property to show or hide the territory selector choice list:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.phone_number_e164.display_territory_selector</td>
<td>Determines whether to display the territory selector choice list. Hiding the territory selector choice list restricts users to entering only local or national phone numbers.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: true</td>
</tr>
</tbody>
</table>

You can also add the following dictionary attribute to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pn_display_territory_selector</td>
<td>Overrides the glide.phone_number_e164.display_territory_selector property setting that determines whether to display the territory selector choice list. Available values are identical to those described above for the glide.phone_number_e164.display_territory_selector property.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Example</strong>: pn_display_territory_selector=false</td>
</tr>
</tbody>
</table>

Configure the display of territory labels
A property controls how territory labels are displayed.
You can display territory labels to the right of the number in an E.164 phone number field by setting the system property or adding the dictionary attribute. This is useful if the territory selector choice list is turned off and you want the user to see the territory for the entered phone number.

Figure 265: E164 phone display territory labels

Enabling territory labels also displays the phone territory in lists.

*Add the following system property* to display the territory label to the right of the number in an E.164 phone number.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.phone_number_e164.display_territory_text</td>
<td>Determines when an E.164 phone number field displays a territory label.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: read-only</td>
</tr>
<tr>
<td></td>
<td>• <strong>Other possible values</strong>:</td>
</tr>
<tr>
<td></td>
<td>• <strong>all</strong>: always displays the territory label.</td>
</tr>
<tr>
<td></td>
<td>• <strong>national</strong>: displays the territory label only if the phone number is in local format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>read-only</strong>: displays the territory label in read-only mode, regardless of whether the number is in local or international format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>read-only-national</strong>: displays the territory label in read-only mode only if the number is in local format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>list</strong>: displays the territory label in a list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>list-national</strong>: displays the territory label in a list if the number is in national format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>none</strong>: does not display the territory label.</td>
</tr>
</tbody>
</table>

You can also *add the following dictionary attribute* to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pn_display_territory_text</td>
<td>Overrides the glide.phone_number_e164.display_territory_text property that defines when a phone number field displays a territory label. Available values are identical to those described above for the glide.phone_number_e164.display_territory_text property.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: read-only</td>
</tr>
<tr>
<td></td>
<td>• <strong>Example</strong>: pn_display_territory_text=all</td>
</tr>
</tbody>
</table>
Configure the international direct dialing prefixes
A property is available to control the display of prefixes.

You can enable the display of the international direct dialing prefix, which appears between the territory selector choice list and the input box for an E.164 phone number field on forms, by setting the system property or adding the dictionary attribute.

Figure 266: E164 phone display idd

Add the following system property to display the international direct dialing prefix.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.phone_number_e164.display_users_idd</td>
<td>Determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
</tbody>
</table>

You can also add the following dictionary attribute to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pn_display_users_idd</td>
<td>Overrides the glide.phone_number_e164.display_users_idd property that determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. Available values are identical to those described above for the glide.phone_number_e164.display_users_idd property.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• Example: pn_display_users_idd=false</td>
</tr>
</tbody>
</table>

E.164 phone number field system properties

These properties are available to configure E.164 phone number fields.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.
### Table 209: e.164 phone number field system properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

</tbody>
</table>

**Configure a territory phone display rule**

The string of numbers that make up a phone number is automatically validated and formatted for a specific territory by applying a series of regular expressions.

**Role required: admin**

The number is first validated against the phone validations that have been defined for the territory, and in the order specified by the Order field. To be valid, the number must match the regular expression defined in the Condition field for at least one phone validation.

After a number has been validated, the Condition expression for each format defined for the territory is applied to the number in the order determined by the Order fields. The Pattern and Format regular expressions are applied to produce a phone number that is formatted correctly for the territory.

The Sys Phone Territory screen allows administrators to edit the display rules for a given territory. Administrators may want to modify the Active, Display, or Order fields. To edit the display rules for a territory:

2. Click a territory Name.
3. Edit the fields, as appropriate (see table).
4. Click Update.
### Table 211: Territory phone display rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The unique name of the territory.</td>
</tr>
<tr>
<td>Country calling code</td>
<td>The <em>country code</em> for dialing numbers from outside the territory.</td>
</tr>
<tr>
<td>International direct dial</td>
<td>The prefix for calling internationally from the territory, such as 00 or 001.</td>
</tr>
<tr>
<td>STD</td>
<td>The subscriber trunk dialing code, also known as the direct distance dialing code, which is a sequence of numbers before the telephone number that indicate whether the call is to be routed outside of the local calling area.</td>
</tr>
<tr>
<td>International prefix</td>
<td>The prefix required to dial an international call, such as a plus sign (+).</td>
</tr>
<tr>
<td>National prefix</td>
<td>The prefix required to dial a local call.</td>
</tr>
<tr>
<td>Active</td>
<td>An indicator for whether the territory phone definition is active. If deactivated, this territory unavailable to users.</td>
</tr>
<tr>
<td>Trunk dialing code optional</td>
<td>An indicator for whether the STD code is optional.</td>
</tr>
<tr>
<td>STD follows country</td>
<td>An indicator for whether the STD code should be displayed to the right of the country calling code.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display</td>
<td>An indicator for whether to display the territory in the choice list. Clearing this check box removes the territory from the choice list. If an international number is entered for a territory that is not displayed in the territory selector choice list, that territory is temporarily added to the selector choice list for that field only. For example, if the United Kingdom Display field is not selected, the United Kingdom does not appear in the territory selector choice list. However, if the user enters an international number beginning with +44, the United Kingdom is added to the list and the number is formatted and validated accordingly.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which a territory appears in a choice list. Territories are sorted numerically by the number assigned here. If more than one territory is assigned the same number, they are subsorted alphabetically. All territories are assigned a default value of 100. To display a territory at the top of the list, assign a value that is less than 100. To display a territory at the end of the list, assign a value that is greater than 100. For example, if a territory is assigned an order of 500, it is displayed at the end of the list, and if more than one territory is assigned an order of 500, they are listed alphabetically at the end of the list.</td>
</tr>
</tbody>
</table>

**Phone validations**

Phone validations are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.
Figure 267: E164 phone validations

**Phone formats**
Phone formats are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.

Figure 268: E164 phone formats

**Watch lists**
Watch lists allow multiple users to subscribe to notifications of a task.

Users must have an email address defined in their user record or enter an email address into the watch list email field to receive watch list notifications.

**Important:** Administrators configure email notifications for watch lists (see Watch list configuration on page 838).
Use a watch list

Using a watch list includes expanding the watch list and selecting users with the glide controls.

Role required: none

1. Expand the watch list by clicking the lock icon (🔒/🔓).
2. Select users with the glide list controls (see table).

<table>
<thead>
<tr>
<th>UI16/UI15 icon</th>
<th>UI11 icon</th>

<tr>
<td>✗</td>
<td>✗</td>
<td>Remove the highlighted user</td>
</tr>
<tr>
<td>🛡</td>
<td>🛡</td>
<td>Open the highlighted user's record (active only when a user record exists)</td>
</tr>
<tr>
<td>🕵</td>
<td>🕵</td>
<td>Open a slushbucket to add or remove multiple users (not available until a record has initially been saved)</td>
</tr>
<tr>
<td>🗑</td>
<td>🗑</td>
<td>Collapse or expand the watch list</td>
</tr>
</tbody>
</table>
### Watch list configuration

Watch lists (glide_list field type) allow multiple users to subscribe to notifications of a task.

Administrators can configure options for watch list fields.

**Configure email notifications for watch lists**

You can specify in an email notification that members of the watch list receive the notification when the conditions are met.

Role required: admin

To receive these notifications, users must define an email address in their user record or enter an email address into the watch list email field.

1. Open the notification to configure.
2. In the Who will receive section, select the icon beside Users/groups in fields.
3. Double-click Watch list in the Available column to move it to the Selected column.
4. Click Update.

**Multiple watch lists**

An advanced configuration using watch lists might involve placing two watch lists on a form, one for the general comments on a task and another for work notes or non-public comments. By configuring separate email notifications, separate users on each watch list can be notified about different information.

**Troubleshooting duplicate email notifications**

If users on a watch lists are getting more than one email for each update to an incident, it may be because the people involved in the incident are replying to an email notification in which other user's names appear in the To: or CC: field. Recipients may be receiving email through their email system (Outlook, Groupwise, etc.) and through ServiceNow ITSA Suite. To stop this duplication, remove the names of other users from the email or the watch list.

**Hide email addresses in a watch list**

You can remove the email address text entry element from a watch list by modifying the dictionary.

Role required: admin

1. Open a task record that displays the Watch list field.
2. Right-click the label and select Configure Dictionary.
3. In the Attributes related list, click New.
4. Enter or select the no_email attribute and enter true in the Value field.
5. Click Submit.

The email entry field is hidden. Users can select users from the reference field to add to the watchlist.
Wiki fields

Wiki text fields use the basic wiki markup language and support links to external URLs and to sources within the system.

Some fields in the base system support wiki text and administrators can add wiki text fields on any form in the system.

Supported wiki tags

Basic tags are supported for wiki text fields in the system.

<table>
<thead>
<tr>
<th>Format</th>
<th>Wiki tag</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Headers</strong></td>
<td>= Header 1 =, == Header 2 ==, etc.</td>
</tr>
<tr>
<td><strong>Numbered step</strong></td>
<td>#Step 1</td>
</tr>
<tr>
<td><strong>Bullets (multi-level)</strong></td>
<td>*Bullet 1, **Bullet 2</td>
</tr>
<tr>
<td><strong>Indentation</strong></td>
<td>::Level 1, ::::Level 2</td>
</tr>
<tr>
<td><strong>Line break</strong></td>
<td>&lt;br&gt;</td>
</tr>
<tr>
<td><strong>Tables</strong></td>
<td>Full table support, including cell spacing, padding, borders, background shading, and width measurements.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Sortable tables are not supported (class=&quot;sortable&quot;).</td>
</tr>
<tr>
<td><strong>Code blocks</strong></td>
<td>&lt;pre&gt; Generic block &lt;/pre&gt;</td>
</tr>
<tr>
<td><strong>Bold</strong></td>
<td>'''text'''</td>
</tr>
<tr>
<td><strong>Italics</strong></td>
<td>''text''</td>
</tr>
<tr>
<td><strong>Ignore Wiki and HTML formatting</strong></td>
<td>&lt;nowiki&gt; wikitext &lt;/nowiki&gt;</td>
</tr>
<tr>
<td><strong>Web link</strong></td>
<td>[<a href="http://community.service-now.com/">http://community.service-now.com/</a> &lt;link text&gt;]</td>
</tr>
<tr>
<td><strong>Placed images</strong></td>
<td>[[Image:&lt;image name&gt;]] See for details on uploading image files to the database.</td>
</tr>
<tr>
<td><strong>HTML</strong></td>
<td>Most common HTML tags are supported</td>
</tr>
<tr>
<td></td>
<td>&lt;b&gt;bold&lt;/b&gt;, &lt;strong&gt;strong&lt;/strong&gt;, &lt;i&gt;italics&lt;/i&gt;, &lt;h1&gt;header1&lt;/h1&gt;, &lt;h2&gt;header2&lt;/h2&gt;, &lt;h3&gt;header3&lt;/h3&gt;, &lt;p&gt;paragraph&lt;/p&gt;, &lt;sub&gt;sub&lt;/sub&gt;, &lt;sup&gt;sup&lt;/sup&gt;, &lt;center&gt;center&lt;/center&gt;</td>
</tr>
</tbody>
</table>

Create a wikitext field

You can create a wikitext field.
Role required: personalize_form

1. Create a new field with the **Type** set to **Wiki**.
2. Click **Wikitext** to begin editing.

The wiki field appears on the form.

**Extend the functionality of a wikitext field**

Configure the wiki field to link to other sources within the system.

Role required: personalize_dictionary

1. Right-click in the header of the new wiki field.
2. Select **Configure Dictionary**
3. In the **Dependent** field of the dictionary form, enter the field you want to use for linking to other pages.
   
   For example, on the Incident table, you might choose the **number** field.
This configuration enables you to link to any incident by using that incident’s number. For example, to open INC0000002, you enter `[[INC0000002]]`.

The following *dictionary attributes* are available for *wiki_text* fields.

- `preview_first=true` - sets the preview mode to display on page load, otherwise editor will be displayed
- `preview_selector=true` - enables the toggle button to switch between the editor and preview
- `dual_mode=true` - enables displaying both the editor and the preview simultaneously during edit mode.

**Choice lists**

A choice list is a type of field that lets the user select from a pre-defined set of choices.

Administrators can define the available choices and customize the behavior and appearance of choice lists.
Choice list security

The personalize_choices security role can be used to let non-administrators modify the options for Choice elements on all tables.

If more granular control is desired, you can also create a custom ACL (security rule) governing the personalize_choices operation either for a particular field or for all fields (\*) on a particular table. However, access to the personalize_choices operation on a particular field does not confer the ability to add new choices for that field. To be able to create new choices for a particular field, two ACLs are required:

- An ACL that grants personalize_choices access for that field.
- An ACL that grants create access to the Choice table (sys_choice).

For example, to give the hris_admin role the ability to personalize only the Category field for Human Resources KB articles, you need:

- An ACL granting personalize_choices access to the hris_admin role on the Category field of the Knowledge (kb_knowledge) table.
- An ACL granting create access to the hris_admin role on the Choice (sys_choice) table.

There are predefined ACLs granting both types of access to the personalize_choices security role, for all fields on all tables. The personalize_choices security role also has read, write, and delete access to the sys_choices table. However, this additional access is not required when making just the Personalize Choices functionality available on a granular basis.

View choice list definitions

You can view the values that appear in choice lists in the Choice [sys_choice] table.

Role required: personalize_choices

The Choice Set [sys_choice_set] table contains a record for every field that uses a choice list. The choice set record is associated with an application file, which allows update sets and team development to track and transfer all choices for a field in a single update record.

Choice list values allow a maximum length of 40 characters.

1. Right-click the choice list field label and select **Show Choice List**. To view other choice list values, modify the filter at the top of the list.
2. Review the items in the list.
Warning: Do not add new choices to the list. To add new choices to a choice list field, use the Configure Choices option.

Define an option for a choice list
How to define a static list of available options.

Role required: personalize_choices

1. Navigate to a form where the field appears.
2. If the choice list is dependent on another field, enter the choice value that the options depend on.
   For example, on the incident table, the Subcategory is dependent on the Category. To customize which subcategory choices are available for the hardware category, select Hardware in the Category field.
3. Right-click the field label and select Configure Choices.
4. Use the slushbucket to rearrange the order, add, or remove items or to create new items.
5. Click Save.

   To dynamically add items to a choice list, use the addOption GlideForm method.

Note: Some business rules may be affected by changes to choice list options (for example, default Incident states).

Reuse a choice list
After defining a set of choice list values, you can reuse the values for another field in a different table.

Role required: personalize_choices

1. Right-click an existing choice field (Field A) and select Configure Choices.
2. Add the desired choice list values.
3. To reuse the choice list values for another field (Field B) in a different table, right-click the label for Field B and select Configure Dictionary.
4. In the Choice table field, select the table where Field A resides.
5. In the Choice field field, select Field A.
6. Click Update.

The choice list values defined on Field A are displayed on Field B. When you add or remove choice list values on Field A, those changes are also reflected on Field B.

Remove the None option
How to remove the None option from a choice list.

Role required: personalize_dictionary

1. Navigate to a form where the field appears.
2. Right-click the field label and select **Configure Dictionary**.
3. Change the Choice field value to **Dropdown without -- None -- (must specify a default value)**.
4. Ensure that the **Default** field is populated to determine which choice is displayed by default.

   **Note:** If the field is dependent on another field, the **-- None --** option remains available.

*Change the None display value*

You can change the default display label of the **None** option for a choice field.

Role required: personalize_choices

1. Navigate to a form on which the field appears.
2. Right-click the field label and select **Show Choice List**.
3. Click **New**.
4. Complete the form.

<table>
<thead>
<tr>
<th>Table 214: Choice form fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Element</td>
</tr>
<tr>
<td>Language</td>
</tr>
<tr>
<td>Sequence</td>
</tr>
<tr>
<td>Inactive</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Value</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Dependent value</td>
</tr>
<tr>
<td>Hint</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Delete all choice list options*
You can delete all choices for a choice field from the Choice Set record.

Role required: personalize
You may want to use this method when you are developing a new application and the business requirements change. If you are updating a choice list that is already in use, consider deactivating the options you no longer use to avoid conflicts with existing data or scripts that may rely on the previous options.

1. In the navigation filter, enter `sys_choice_set.list` and press Enter.
2. Open the choice set record for the field.
   
   For example, to locate the choice set for the incident subcategory, filter by `[Table] [is] [incident] AND [Element] [is] [subcategory].
3. Check the box beside the choice set record to delete and select Delete from the Actions choice list below the list.
4. Click Delete in the confirmation window.
   
   All choices for the field are deleted.

Create a choice list for another field type

You can create a choice list for a field with another type (for example, an Integer field).

Role required: personalize_dictionary

You can use this configuration to standardize data entry and limit available options for a field while still maintaining the original field type.

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the field.
3. Change the Choice value to Dropdown with --- None --- or Dropdown without --- None --- (must specify a default value).
4. Right-click the form header and select Save.
5. Click Create Choice List.
   
   • The Choices related list appears on the dictionary entry form.
   • If records on the table contains data for the field, a choice list value for each unique field value is created. For example, if three records exist on the table and each record has a unique value in the field, then three choices are created.
   • If no data exists in the field, a choice list value of -- New choice -- is created.

Display invalid choice list values

By default, inactive or invalid choice list values appear in blue text instead of black. You can disable the color indicator for invalid choices.

Role required: admin

In the following example, the Network category has been deactivated, so it appears in blue for records that still contain the inactive value.
1. Navigate to **System Properties > UI Properties**.
2. Clear the check box for the **Display missing choice list entries** property.

### Adjust the choice list width

By default in UI11, all choice lists use a width of 160 pixels. You can adjust the width for all choice lists on the instance, or change the value for a particular list. This procedure is not applicable to newer versions of the UI.

**Role required:** admin or personalize_styles

1. To change the width for all choice list on the instance, complete the following steps (requires admin role).
   a) Navigate to **System Properties > UI Properties**.
   b) Change the value for the **Default choice list width (pixels)** property (glide.uiinstancedefautwidth).
   c) Click **Save**.

2. To change the value for a particular list, for example, a list with much longer option names than other choice lists, complete the following steps.
   a) Navigate to a form where the field appears.
   b) Right-click the field label and select **Configure Styles**.
   c) Click **New**.
   d) In the **Style** field, enter **width:auto**.
      Leave the **Value** field empty so that the field style applies to all the choices for the field.

   a) Click **Submit**.

      When the field is displayed, the width adjusts to the size of the content.

### Values to associate with choice labels for scripting

When you write a script that references a choice list, you need to know the value that is associated with each choice.
For example, to check whether the incident_state field is active, you could not use the condition `current.incident_state == "active"` because the value associated with the choice labeled **Active** is the integer 2. Instead, you would use the condition `current.incident_state == 2`.

The **Type** field on the choice list dictionary entry determines the data type of the values.

To determine the value associated with a choice, right-click the field label and select **Show Choice List**, and then locate the choice for which you need to know the value.

![Choice List Table](image)

**Figure 271: Show choices list values**

The **-- None --** option may not have a sys_choice record associated with it. A choice list field set to **-- None --** evaluates to these values, depending on the script context as listed below.

- For client-side scripts, such as client scripts: "" (empty string)
- For server-side scripts, such as business rules: "0" (string of the number zero)

**Integer values for default choice lists**

Queries on choice list fields use the value, not the label.

Some common choice lists use integer values that do not match the string labels. For example, the Problem table uses these default values for the **State** field.

<table>
<thead>
<tr>
<th>Value</th>
<th>Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open</td>
</tr>
<tr>
<td>2</td>
<td>Known Error</td>
</tr>
<tr>
<td>3</td>
<td>Pending Change</td>
</tr>
<tr>
<td>4</td>
<td>Closed/Resolved</td>
</tr>
</tbody>
</table>
These integer values are also used in several default business rules. For example, a business rule on the Incident table sets the active flag to false when the State field changes to 7, which is the default value for the Closed. If you change the values of your Incident state options, this business rule may no longer behave as desired or expected.

On the Incident table, the Active, State, and Incident state fields are affected by the following default business rules.

### Table 216: Default business rules

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mark_closed (incident)</td>
<td>If the incident_state changes to 7 (Closed), the Active field is set to false</td>
</tr>
<tr>
<td>incident reopen (incident)</td>
<td>If the incident_state is less than 7 (Closed) and the Active field is false, the Active field is set to true</td>
</tr>
<tr>
<td>mark closed (task)</td>
<td>If the state changes to either 3 (Closed Complete) or 4 (Closed Incomplete), the Active field is set to false</td>
</tr>
<tr>
<td>task closer (task)</td>
<td>If the Active flag changes from true to false and the state is neither 3 (Closed Complete) nor 4 (Closed Incomplete), the state is set to 3 (Closed Complete)</td>
</tr>
<tr>
<td>task reopener (task)</td>
<td>If the Active field changes from false to true and the state is either 3 (Closed Complete) or 4 (Closed Incomplete), the state is set to 1 (Open)</td>
</tr>
</tbody>
</table>

**Note:** Notice that these business rules do not change incident_state based on a change to either the Active field or the State field. Changes to incident_state drive the other two fields, not the other way around.

### Best practices for state field choice values

When you configure choice values for the state field, keep a few things in mind.

- Use a negative value to add a new active state field.
- Search for and study the business rules that use a state number filter on the Script and Conditions fields. You can use the Debug tool to trace the order of the business rule execution.
- New values representing inactive states should have a value above 8.

**State modification examples**

Follow these examples for modifying the states of incidents and change requests.

Role required: admin

1. Navigate to System Definition > Choice Lists.
2. At the top of the list, construct a list filter like the following:
   - **Table:** incident
   - **Element:** incident_state
3. Run the filter.
Notice that the Closed state has a value of 7 and the Resolved state has a value of 6. Any state greater than or equal to 7 is assumed to be inactive. Therefore, you should use a positive integer greater than 7 if you want to add a new inactive-type of state. Use a negative value like -1 or -2 if you wish to add a new active-type of state field, such as Awaiting Vendor.

5. At the top of the list, construct a list filter like the following:
   • Table: change_request
   • Element: phase_state

6. Run the filter.
   Notice that the Complete state has a value of 8. Any state greater than or equal to 8 is assumed to be inactive. Therefore, you should use a positive integer greater than 8 if you want to add a new inactive-type of state, such as Cancelled. Use a negative value like -1 or -2 if you wish to add a new active-type of state field, such as Pending.

Troubleshoot change states and business rules
Business rules in the system make assumptions about state values. You can troubleshoot business rules to see the order in which they run and see how it affects changes you make to State field values.

Role required: admin
1. Navigate to System Definition > Business Rules.
2. Construct a filter like this one to view the scripts and conditions that pertain to the Resolved incident_state of 6 or the Closed incident_state value of 7:
   
   The Script field contains 7 OR the Condition field contains 7 OR the Script field contains 6 OR the Condition field contains 6 AND the Table field is incident AND the Active field is true.

See Debug Business Rule for information on how to trace the order of business rule execution. You can click Debug All, resolve an incident, and then check the trace at the bottom of form to watch the business rules execute. These two line examples show that the mark_closed business rule code is entered =>> and then exited <==

```plaintext
=>> 'mark_closed' on incident
<= 'mark_closed' on incident
```

Define field styles
Field styles allow you to declare individual CSS styles for a field in a list or form.

Role required: personalize_styles or admin

The CSS lets you change the following attributes of a field.

- Change the color.
- Change the font attributes (bold, italics, underline).
- Change the padding and alignment of text.

You can define field styles for tables and database views that are in the same scope as the field style and for other tables that have at least one field in the same scope as the field style. Note that field styles defined for a table will not apply to database views that include the table. You must create separate field styles for database views.

1. Navigate to the list of styles for the field in one of the following ways.
• Right-click the field label on the form and select **Configure Styles**.
• Navigate to **System UI > Field Styles**, and locate the field to apply a style (admin only).

2. Click **New**, or click the style to modify.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>The field to which the style applies.</td>
</tr>
<tr>
<td>Value</td>
<td>The exact value or script-based-condition required to apply the style.</td>
</tr>
<tr>
<td>Style</td>
<td>The CSS style to apply. For example, to make the background of the Incident Category fields red in record lists, with a 24px font size and white text color, enter the following code.</td>
</tr>
</tbody>
</table>

| Note: | The list shows only tables and database views that meet the scope protections for field styles. |
| Note: | The value only affects list field styles. To apply field styles on both lists and forms, leave this field blank. |

4. Optional: To add alternative text for a style, **configure the form** to add the alternative text field. For styles like the VIP style icon, you can add alternative text so that screen readers can differentiate between the style and the text.

5. Click **Submit** or **Update**.

**Advanced style selection**

Use a script-based-condition to determine if the system should apply a style to a field in the list.

You can enter a script-based-condition in the **Value** field with the syntax `javascript:<script>`. If the evaluated script returns true, the system applies the style to the list item.

The script has access to the current script object, which allows you to build conditions based on the field values of the current record. For example, this script checks for overdue items based on a field value:

| javascript:gs.dateDiff(gs.now(), current.u_datefield.getDisplayValue(), true) < 0 |

| Note: | In this example, `current.u_datefield` refers to the name of a custom date field. |
The system only supports one `javascript:<script>` entry in a Value field. If you want to enter multiple JavaScript conditions, consolidate the conditions into one statement. For example, instead of this invalid entry:

```javascript
javascript: current.state == "Completed" javascript: current.error_tables > 0
```

Consolidate the conditions into one statement such as:

```javascript
javascript: current.state == "Completed" && current.error_tables > 0
```

Define reference styles

Reference styles are similar to field styles, but apply to any reference to a table. You can define styles that apply to any reference to a table.

Role required: admin

For instance, a reference style on the User [sys_user] table would apply to any reference field on any table that refers to User.

1. Enter `sys_ui_reference_style.list` in the application navigator filter and press Enter.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>If the check box is selected, the style is applied where appropriate.</td>
</tr>
<tr>
<td>Table</td>
<td>The table to which all references will be styled.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The list shows only tables that meet the scope protections for table styles.</td>
</tr>
<tr>
<td>Style</td>
<td>A CSS style to apply.</td>
</tr>
</tbody>
</table>

Managing record numbering

Records in tables can be numbered automatically.

In the base system, several tables are numbered, including Incident, Problem, Change Request, and Knowledge. You can also use these numbers anywhere that script is present, for example to generate watermarks for emails.

Administrators can manage record numbering by navigating to **System Definition > Number Maintenance**. The current number format for a table, including the prefix (such as **INC** for incidents or **CHG** for changes), is stored in a record on the Number [sys_number] table.
You can renumber auto-incremented tables that extend the task table or manage numbering with a database field named **Number this field**. For information about renumbering custom tables, see *KB0538764: Renumbering auto-incrementated custom tables* in the ServiceNow knowledge base.

### Auto-numbering records in a table

**How to set up numbering for a table.**

**Role required:** admin

1. Navigate to **System Definition > Number Maintenance**.
2. Click a table name to view the number record for that table, or click **New**.

   **Note:**
   
   You can only define one number format per table.

3. Define the number format by completing the fields (see table).
4. Click **Submit** or **Update**.

   If an auto-numbered field does not already exist, a new field is automatically created on the table with the following values:
   - Label: Number
   - Name: u_number
   - Default value:

   ```javascript
   javascript:getNextObjNumberPadded();
   ```

   **Note:** This script renumbers records when the **Number of digits** is updated. To use a script that does not renumber records when the **Number of digits** is updated, open the
dictionary entry for the **Number** field and enter the following script in the **Default value** field.

```javascript
g getNextObjNumber();
```

### Table 218: Auto-numbering records in a table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Prefix</td>
<td>Enter a prefix for every number in the table (for example, <strong>INC</strong> for Incident).</td>
</tr>
</tbody>
</table>
| Number           | Enter the base number for this table (default value is 1000). Record numbers are automatically incremented, and the next number is maintained in the Counter [sys_number_counter] table.  

If you set the base number to a value higher than the current counter, the next record number uses the new base number. Otherwise the next record number uses the current counter. The counter does not reset to a base number lower than itself. To see the current counter, click the **Show Counter** related link.  

| Number of digits | Enter the minimum number of digits to use after the prefix (default value is 7).  

- Leading zeros are added to auto-numbers, if necessary. For example, **INC0001001** contains three leading zeros.  
- The number of digits can exceed the minimum length. For example, if **Number of digits** is **2** and more than 99 records are created on the table, the numbers continue past 100 (such as **INC101**).  

---

**Warning:** Changing this field may update all number values for existing records on a table. Take care when changing this field on a production instance.

---

**Note:**

To change the default values for new number formats, change the **Default value** field on the system dictionary record for the **Number** or **Number of digits** field. These fields are on the **Number** table.
Prepare to left-pad number fields in custom tables

Before you configure left padding of number fields on a custom table or a table that does not extend the task table, you must prepare business rules and script includes.

Role required: admin

1. Duplicate the base system business rule named Pad Numbers: Click **Insert and Stay**. If **Insert and Stay** is not available on your instance, create a new business rule and manually copy all field values from Pad Numbers.
2. Give the business rule a new name and change the script field to read as follows:

```javascript
function padCurrentCategory() {
    var target = new GlideRecord(current.category + "");
    if (!target.isValidField("u_number") || target.isValidField("number"))
        return;
    var nm = new UNumberManager();
    nm.padTableNumbers(current.category, current.maximum_digits);
} Save the changes.
```

3. Duplicate the base system script include named **NumberManager**.
4. Change the following two lines as indicated:

```javascript
105: currentNumber = records.u_number.toString();
117: records.u_number = prefix + currentNumber;
```
5. Name the new script include **UNumberManager** and save your changes.
You can now continue with the process of configuring left-padding and renumbering records.

Configure left padding of a system number in a table

You can configure the left padding of the system numbers on a table. For example, pad the **Number** field on an Incident, Problem, or Change Request.

If you are configuring numbers on a custom table or a table that does not extend the task table, then, before performing the following procedure, you must prepare business rules and script includes. For more information, see **Prepare to left-pad number fields in custom tables** on page 856.

Role required: admin

1. Navigate to the form, then right-click the **Number** field and select **Configure Dictionary**.
2. Enter the following script in the **Default value** field and click **Update**.

```javascript
javascript:getNextObjNumberPadded();
```
3. Navigate to **System Definition > Number Maintenance**.
4. Open the table record.
5. Enter a value in the **Number of digits** field.
6. Click **Update**.

Number padding is applied to both existing and new records.
Prevent numbering gaps

By default, numbers are generated every time a new record is created. When records are created but not saved, a gap in the numbering is created. You can prevent these numbering gaps by generating numbers only when records are saved.

Role required: admin

1. Navigate to System Properties > System.
2. Set the property Assign a task number only upon insert (prevents unused numbers), glide.itil.assign.number.on.insert, to true.
3. Click Save.

Enforcing unique numbering

Although duplicate numbers are rare, numbering does not enforce uniqueness, by default.

To enforce uniqueness, you can:

• Create a before business rule on insert only to check for duplicate values and replace duplicates with the next available number.
• Enable a unique index on the table.

**Note:** While unique indexes ensure data integrity they also prevent any insert involving a duplicate number. This may cause unexpected errors during data entry.
Sample business rule

This sample script can be used as part of a before business rule on insert only to check for duplicate numbers and replace them with the next available number.

```javascript
var curNum = current.number + '';
if(curNum) {
    var recordClass = current.getRecordClassName();
    var gr = new GlideRecord(recordClass);
    gr.addQuery('number', curNum);
    gr.query();
    if(gr.getRowCount() > 0) {
        var newNum = getNextObjNumberPadded();
        gs.addInfoMessage("The number " + current.number + " was already used by another " + recordClass + ". The " + recordClass + " number has been changed to " + newNum);
        current.number = newNum;
    }
}
```

Field spell checking

Spell checking can be added to any journal field, such as a **Comments** box or an HTML editor. Spell checking can be added to any input field, but is not typically done for single line input fields. To enable the spell checking dictionary, install the appropriate language plugin. Localization plugins have the same name format, such as I18: German Translations.

**Note:**
- Field spell checking is not supported in UI16 or UI15.
- The words in the dictionary are part of the language plugin. You cannot add, remove, or modify the dictionary.

Add spell checking to a field

You can add a spell check option to any field in UI11.

Role required: personalize_dictionary

**Note:** Field spell checking is not supported in UI16 or UI15.

1. Navigate to **System Definition > Dictionary**.
2. Filter the list to view **journal** type fields and select a field to spell check.
   An example is the **comments** field in the Task table. This applies spell checking in the specified language to the multi-line **Comments** text box for incidents, problems, and changes.
3. Click the table name to open the Dictionary form.
4. Configure the form and add the **Spell check** check box.
5. Select the check box to enable spell checking in every **Comments** field on the Task table.
6. To use the spell checker in a task record, click the spell check icon ( ) next to the field label.
The spell checker highlights the misspelled words.

Select dictionaries for spell checking

In UI11, specific dictionaries are available for users to check spelling in fields. After you activate a language plugin, you can configure the dictionary to use for languages that don't have a spell check dictionary.

The dictionaries available for spell checking include the following:

- Brazilian Portuguese
- Czech
- Dutch
- English US
- English UK
- Finnish
- French
- German
- Hebrew
- Hungarian
- Italian
- Polish
- Portuguese
- Russian
- Spanish
- Thai

1. Navigate to **System Properties > System Localization**.
2. Select the dictionary to use for the language that does not have a spell checker dictionary.

3. Click **Save**.

Condition count widget

The condition count widget can be activated on condition fields to display a preview of the records that would meet the current set of conditions.
For fields where the condition count widget is activated, the number of records that match the conditions will automatically display. The count refreshes if the field the condition field depends on, such as Table, is changed; if the Table field is left blank, the widget is hidden.

In this example, a condition is run on the Incident table to look for incidents where Category is Network:

![Figure 273: Condition count](image)

The list shows that there are 112 records with Network as its category.

To refresh the preview, click the update count icon ( ).

To view details of the results, click the number of records to open the list view of the results:

![Figure 274: Condition count results](image)

Adding the condition count widget

You can add the condition count widget to a condition field.

Role required: personalize_dictionary

1. Right-click the field label and select Configure Dictionary.
2. Add show_condition_count=true to the Attributes field.
3. Submit.

Reference fields

A reference field stores a reference to a field on another table. For example, the Caller field on the Incident table is a reference to the User [sys_user] table.

When you define a reference field, the system creates a relationship between the two tables. Adding a reference field to a form makes the other fields in the referenced table available to the form.
**Note:** A reference field can refer only to records from one other table. To add a field that can refer to records on any table, use the Document ID element type.

Administrators can create new reference fields and configure several options for reference fields.

**Table 219: Reference field options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display values</td>
<td>Each reference field stores a sys_id for each referenced record in the database, but the sys_id is not shown. The reference field shows the specified display value.</td>
</tr>
<tr>
<td>Decorations</td>
<td>A reference decoration is an icon that appears next to a reference field.</td>
</tr>
<tr>
<td>Reference styles</td>
<td>Reference styles are specialized field styles that control the appearance of reference fields.</td>
</tr>
<tr>
<td>Reference qualifiers</td>
<td>Reference qualifiers restrict the records that are available for reference fields.</td>
</tr>
<tr>
<td>Cascade delete rules</td>
<td>Cascade delete rules specify what should happen to records that reference a record that is deleted.</td>
</tr>
<tr>
<td>Auto-complete</td>
<td>By default, a reference field auto-completes as the user types in the field. Administrators can configure auto-complete settings.</td>
</tr>
<tr>
<td>Reference key</td>
<td>A reference key saves a field other than sys_id as the unique identifier for a reference field.</td>
</tr>
<tr>
<td>Enable dynamic creation</td>
<td>When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.</td>
</tr>
</tbody>
</table>

**Add a reference field**

Add reference fields to a table using the same method as for any other field.

Role required: personalize_form

The related table also appears in the Available Tables list for future form customizations.

1. Open the desired form.
2. Right-click the header and select **Configure > Form Layout**.
3. Use **dot-walking** to locate and select the field in the referenced table that you want to add. It appears as Table name.Field. For example, the caller's email address appears as Caller.Email.
4. Click **Save**.

**Display values**

Reference fields store a sys_id for each referenced record in the database, but the sys_id is not shown.
The reference field shows the display value. For example, an incident's **Assigned to** field stores the sys_id of a particular user, but actually displays the user's name. The following example shows how **Charlie Witherspoon**, which is the display value of a user record, is shown in the **Assigned to** field.

Figure 275: Display value xml

<table>
<thead>
<tr>
<th>Reference field</th>
<th>Value stored in database</th>
<th>Display value field of source table</th>
<th>Value displayed in UI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigned to</td>
<td>46b87022a9fe198101a78787e40d7547</td>
<td>[sys_user.name]</td>
<td>Charlie Whitherspoon</td>
</tr>
</tbody>
</table>

Reference fields show display values in:

- **Lists**
- **Forms**
- **Reports**
- **Auto-complete suggestions**
- **Slushbuckets**

**Select a field as the table display value**

Only one field can be defined as the display value for a table.

Role required: personalize_dictionary

When you set the **Display** value to **true**, a business rule sets the **Display** value to **false** for all other fields on the table. In previous versions, you must manually ensure that no other fields on the table have a value of **true** in the **Display** column.

**Note:** Extended tables inherit the display value of the parent table. Setting a separate display value for the extended table overrides the parent table's display value.

1. Navigate to **System Definition > Dictionary**.
2. Filter on `[Table] [is] [<name of the referenced table>]`.
3. Locate the desired field and set **Display** to **true**.

   For best results, choose a field that is required and unique in each record as the display value field.
**Note:** If you make a field the display field for a table, be sure to translate all values for the field in the Translated Text [sys_translated_text] table into all the languages provided. Display field options left untranslated are not presented by the autocomplete (type ahead) feature.

Reference fields look for the display value in the following order:

1. A field with `display=true` in the system dictionary on the lowest sub-table for extended tables.
2. A field with `display=true` in the system dictionary on the parent table.
3. A field named `name` or `u_name`.
4. The **Created on** field of the referenced record.

**Decorations**

Reference decorations are icons which appear next to the reference field. The reference lookup is always visible and is used to select a record to reference. Other reference decorations appear when a record is selected.

**Reference lookup**

Clicking the reference lookup icon (🔍 in UI16/UI15) displays a list of records on the referenced table in a pop-up window.
Figure 276: Reference lookup list UI16 and UI15
The reference lookup can be rendered in the tree picker format by modifying the dictionary and adding the attribute `tree_picker`.

You cannot customize the label names used in the tree picker. The label names are taken from the values in the table.

*Reference field icon*

When a record is referenced, pointing to the reference icon (自信 in UI16/UI15, 信息 in UI11) displays information about the referenced record.
Figure 278: UI15 reference record

Clicking the reference icon updates the current form and navigates to the referenced record.

Customizing the reference icon

Administrators can use the sys_popup form view to configure the fields in the pop-up that appears when pointing to a reference icon.

Configure the fields in the pop-up for a reference icon

You can use the sys_popup form view to configure the fields in the pop-up that appears when pointing to a reference icon. If the table has no sys_popup view, the pop-up uses the default view.
Role required: personalize_form

1. Navigate to the following URL, substituting the instance name and table name as appropriate:

   `<your instance name>.service-now.com/<table name>.do?sysparm_view=sys_popup`

2. Configure the form to add or remove fields as appropriate.

Configure the pop-up delay for a reference icon

The pop-up appears after a configurable period of time. This default delay is 100 ms, and you can configure a different value

Role required: admin

   Note: Setting the value extremely low can lead to unwanted pop-ups being requested from the server. Additionally, a low setting can make it difficult to drill through the reference icon because the icon is not clickable until the pop-up appears. Conversely, an extremely high setting makes the pop-ups somewhat sluggish.

1. Navigate to System Properties > UI Properties.
2. Modify the property called Record popup delay (milliseconds): (glide.ui.popup.delay).
   The property controls when the request for the pop-up is made; the actual display time depends on the browser.
3. Click Save.

Configure pop-ups on read-only fields

Reference pop-ups and click-throughs are hidden by default if a client script, UI policy, or ACL makes the field read-only. The ability to see or click through to the target record does not depend on whether the reference field is writable. You can change the read-only setting.

Role required: admin

1. Navigate to System Properties > UI Properties.
2. Change the value of the Enable click-through of a reference field when the reference field is read-only. (glide.ui.reference.readonly.clickthrough) property.
   If set to true, the pop-up appears for read-only fields.

   If this system value is set to false, you can override the setting for a specific read-only reference field. Configure the dictionary entry and add the readonly_clickthrough=true attribute.
Configure the related incidents icon
You can configure an icon to appear beside a reference field in a form, such as the **Caller** field, to display related incidents.

Role required: admin

The show related incidents icon (in UI16 and UI15, in UI11) displays other incidents related to the referenced record.

1. In the form, right-click the label for the reference field and select **Configure Dictionary**.
2. Add the `ref_contributions=user_show_incidents` dictionary attribute in the **Attributes** field.
3. Click **Update**.
   - The form reopens and the related incidents icon appears beside the field on the right.

**Configure the show workflow icon**
You can configure an icon to appear beside a workflow field to display the related workflow in the workflow editor.

Role required: admin
The show workflow icon ( ![in UI16 and UI15] in UI16 and ![in UI11] in UI11) opens the workflow in the workflow editor.

1. In the form, right-click the label for the workflow field and select **Configure > Configure Dictionary**.
2. Add the `ref_contributions=show_workflow` dictionary attribute in the **Attributes** field.
3. Click **Update**. The form reopens and the show workflow icon appears beside the field on the right.

**Reference styles**

Reference styles are specialized field styles that control the appearance of reference fields. For more information, see *Define reference styles* on page 853.

**Reference qualifiers**

Use reference qualifiers to restrict the data that is selectable for a reference field.

For example, if you want another record to be able to reference records with the **San Diego** location name, you can create a reference qualifier on the **Location** field of the record. The qualifier specifies that the user can choose only location records with the **City** field set to **San Diego** for the **Location** field.

**Note:** Reference qualifiers are available when using reference lookup (magnifying glass) from forms, applying the qualifier condition and displaying the filtered information in the displayed list. They are not applicable for condition builders.

**Types of reference qualifiers**

The following types of reference qualifiers are available:

- Simple qualifiers provide choice lists for you to specify a reference qualifier condition on the table where the reference field is located. Simple qualifiers only apply when using "type-ahead" functionality on a form; they do not apply to condition builders.
- Dynamic qualifiers allow you to use a dynamic filter to run a query against a reference field without having to enter JavaScript code or query strings.
- Advanced qualifiers provide a text field for you to create either of the following:
  - A static encoded query string, which is a single string that specifies a database query, such as `active=true`.
  - JavaScript code that references script includes or functions in global business rules.

**Note:** To define a reference qualifier on an extended table differently from the reference qualifier on the parent table, use a Dictionary Override.
3. To change views, select **Default view** or **Advanced view** under **Related Links**.

4. In the Reference Specification section, verify that the table already present in the **Reference** field is the correct one, or select another table if necessary.

5. Select the type of qualifier in the **Use reference qualifier** choice list.

6. Configure the qualifier:
   - **Simple**: *Build the condition* using the choice lists.
   - **Dynamic**: *Select a dynamic filter option*.
   - **Advanced**: Enter the encoded query string or the JavaScript that returns a query string in the **Reference qual** field.

7. In the **Reference Specification - Additional Customization** section, configure these options if necessary:
   - **Reference key**: allows you to *identify a field other than sys_ID* to use as the unique identifier for the reference field.
   - **Reference cascade rule**: allows you to *define what happens to a record* if the record it references is deleted.
   - **Reference floats**: *enables the Edit button on related lists* for one-to-many relationships.
   - **Dynamic creation**: lets you determine if the system should *create a new record* when a value for the reference field does not match an existing record. If you select this option, enter a script in the **Dynamic creation script** field that specifies how to create the record.

8. Click **Update**.

**Simple reference qualifier example**

Use simple reference qualifiers when you want to limit the values for a reference field based on other values in the referenced table or related tables.

The base system provides several simple reference qualifiers by default. An example is the reference qualifier on the **Vendor** field on asset forms, such as the Hardware form. The qualifier restricts the companies you can select for this field to only those companies with the **Vendor** field set to **true**.

![Simple reference qualifier example](image)

**Figure 280: Simple reference qualifier**

**Note**: Simple reference qualifiers can have a maximum of thirteen reference qualifier conditions.

**Dynamic reference qualifier example**

The advantage of using a dynamic reference qualifier is that you can create one dynamic filter option and in as many dynamic reference qualifiers as needed.
Use dynamic reference qualifiers when you want to limit the values for a reference field based on *Create a dynamic filter option* on page 80 that uses *Create scripted filters* on page 80.

The base system provides several dynamic filter options by default. An example is the dynamic filter option for the reference qualifier on the **Model ID** field. This field appears on a configuration item form, such as the default **Computer** form. The reference qualifier calls the **CI Model Qualifier** dynamic filter option, which in turn calls the **ModelAndCategoryFilters** script include. This script include refines the reference qualifier based on the class of the CI so that the only options for the model ID are those that belong to the same class as the current CI. For example, only CIs that belong to the Computer class are available in the **Model ID** field on a Computer configuration item form.

Figure 281: Dynamic reference qualifier

**Advanced reference qualifier example**

Use advanced reference qualifiers if you want to enter an encoded query string or make a JavaScript call to a script include that returns a query string.

To create advanced reference qualifiers, enter the query string or JavaScript code in the **Reference qual** field on the Dictionary Entry form.

---

**Note:** As a good practice, make JavaScript calls to functions in a script include instead of a global business rule. See for more information.

**Encoded query strings**

An example of an encoded query string is `vendor=true`, which returns all companies that are designated as vendors. Entering this string is the same as using the condition builder as shown in the example for the simple reference qualifier.
JavaScript calls

JavaScript calls.

An example of a JavaScript call is the following code:

```
javascript:new myScriptInclude().my_refqual()
```

This code calls a function named `my_refqual()` in a script include named `myScriptInclude()`. The function must return a query string that can filter the options available on a reference field.

**JavaScript example: Limiting the Assigned to Field by Users with a Specified Role**

This example shows how to restrict an incident's Assigned to choices to only the users with the itil_admin role. You could also change `itil_admin` to any other role on a reference field that refers to the User table.

1. Open an incident.
2. Right-click the Assigned to field and select Configure Dictionary.
3. In the Reference qual field, enter
   ```javascript:
   "sys_idIN"+getRoledUsers("itil_admin").join(',').
   ```
4. Save the record.
5. To see the base-system business rule that this JavaScript code calls, navigate to System Definitions > Business rules.
6. Open getRoledUsers.
7. The business rule uses the following JavaScript code:

   ```javascript
   // Return an array of sys_ids of the users that have at least one role
   // optional parameters allow the exclusion (NOT IN) of some roles or//
   // look for specific roles (IN)
   //
   // optional: queryCondition - 'IN' or 'NOT IN'
   // optional: roleList - a comma separated list of role names
   //
   function getRoledUsers(queryCondition, roleList){
     var roleListIds;
     if(queryCondition && roleList){
       roleListIds = getRoleListIds(roleList);
     }

     var users ={};
     var gr =new GlideRecord('sys_user_has_role');
     if(roleListIds){
       gr.addQuery('role', queryCondition, roleListIds);
     }
   }
   ```

© 2017 ServiceNow. All rights reserved.
JavaScript example: Limiting the Assigned to field

This example shows how to restrict an incident's **Assigned to** choices to only the users with the itil_admin role.

You could also change itil_admin to any other role on a reference field that refers to the User table.

1. Open an incident.
2. Right-click the **Assigned to** field and select **Configure Dictionary**.
3. In the **Reference qual** field, enter
   ```javascript
   sys_id IN getRoledUsers("itil_admin").join(",")
   ```
4. Save the record.
5. To see the base-system business rule that this JavaScript code calls, navigate to **System Definition > Business Rules**.
6. Open **getRoledUsers**.

The business rule uses the following JavaScript code.

```javascript
// Return an array of sys_ids of the users that have at least one role
// optional parameters allow the exclusion (NOT IN) of some roles or
// look for specific roles (IN)
//
// optional: queryCondition - 'IN' or 'NOT IN'
// optional: roleList - a comma separated list of role names
//
// function getRoledUsers(queryCondition, roleList) {
// var roleListIds;
// if (queryCondition && roleList) {
//  roleListIds = getRoleListIds(roleList);
// }
// var users = {};
// var gr = new GlideRecord('sys_user_has_role');
// if (roleListIds) {
//  gr.addQuery('role', queryCondition, roleListIds);
// }
// gr.query();
// while (gr.next()) {
//  users[gr.user.toString()] = true;
// }
// var ids = [];
// for (var id in users)
//  ids.push(id);
// return ids;
// }

// get sys_id's for the named roles
function getRoleListIds(roleList) {
```
var(ids)[];var gr = new GlideRecord('sys_user_role');
gr.addQuery('name', 'IN', roleList);
gr.query();
while (gr.next()) {
    ids.push(gr.sys_id.toString());
} return ids;
}

JavaScript example: Constraining the assignment group field

This example shows how to restrict an incident's Assignment group choices to only the groups that contain the user already specified in the Assigned to field.

1. Open an incident.
2. Right-click the Assignment group field and select Configure Dictionary.
3. If the form appears in Default view the Related Links list, click Advanced view.
4. In the Use reference qualifier field, ensure that the Advanced option is selected.
5. In the Reference qual field, enter javascript:new BackfillAssignmentGroup().BackfillAssignmentGroup().
6. Save the record.
7. Navigate to System Definitions > Script Includes.
8. Click New.
9. Create a script include with the following JavaScript code:

var BackfillAssignmentGroup = Class.create();
BackfillAssignmentGroup.prototype = {
    initialize: function() {
    },

    BackfillAssignmentGroup:function() {
        var gp = '';
        var a = current.assigned_to;

        //return everything if the assigned_to value is empty
        if(!a) return;

        //sys_user_grmember has the user to group relationship
        var grp = new GlideRecord('sys_user_grmember');
gr.addQuery('user', a);
gr.query();
while(grp.next()) {
    if (grp.length > 0) {
        //build a comma separated string of groups if there is more than one
        gp += (',' + grp.group);
    } else {
        gp = grp.group;
    }
}

    // return Groups where assigned to is in those groups we use IN for lists
    return 'sys_idIN' + gp;
},
type: 'BackfillAssignmentGroup'
The next time you create an incident, select a user in the **Assigned to** field. Then click the **Assignment group** lookup icon. Only the groups that contain the user you just selected appear.

For example, if Bob Smith belongs to the Database group and the Networking group and you assign an incident to Bob, the only options you can select for the assignment group are Database and Networking.

**Related lists and reference qualifiers**

Whenever you edit a reference field from a related list, it might be necessary to know which related list the reference field is on in order to properly build the reference qualifier for the field.

This occurs when the same field appears on different related lists and the context is necessary to know how to properly qualify the reference values.

To do this, configure the list control for the related list and fill in the **List edit tag** with any tag you choose. This tag value will be available to the advanced reference qualifier function as a variable named `listEditRefQualTag`. For example, your advanced reference qualifier script include can look like this:

```javascript
// Advanced reference qualifier on the CI Relationship Child field that takes into account the related list that we are editing the child field on, if the field is being edited from a tagged related list.

cmdb_rel_ci_child_refQual:function(){
  if(listEditRefQualTag =="application")return"sys_class_name = cmdb_ci_appl";
  if(listEditRefQualTag =="database")return"sys_class_name = cmdb_ci_database"
}
```

**Use the INSTANCEOF operator**

Use the INSTANCEOF operator in a reference qualifier to shorten or simplify a complex class qualifier.

For example, you can use the INSTANCEOF operator for a reference field to the `cmdb_ci` table to specify that you want all subclasses of a class included in the results. The following reference qualifier returns all servers, including Linux, UNIX, Windows, and so on, because each of those subclasses extend the `cmdb_ci_server` class:

```
sys_class_nameINSTANCEOFcmdb_ci_server
```

Likewise, the following reference qualifier can be similarly simplified:

```
u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_name=cmdb_ci_computer
^ORsys_class_name=cmdb_ci_server
^ORsys_class_name=cmdb_ci_win_server
^ORsys_class_name=cmdb_ci_unix_server
^ORsys_class_name=cmdb_ci_linux_server
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

If you use the INSTANCEOF operator, the reference qualifier is as follows:

```
u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_name=cmdb_ci_computer
^ORsys_class_nameINSTANCEOFcmdb_ci_server
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```
Troubleshooting

If you receive a **Bad Gateway Error** in Internet Explorer when searching in a reference lookup window, then you cannot use `ref_qual_elements=*` in the advanced reference qualifier.

**Reference qualifiers for service catalog variables**

Service Catalog reference variables restrict the available values for choice-based variable types.

Reference Qualifiers

Service Catalog reference variables can use advanced reference qualifiers to restrict the available values for choice-based variable types based on the result of a script or other variables on the catalog item.

For example, you could create a **Location** reference variable with a reference qualifier that restricts the available location choices to those associated with groups in which the **Requested For** user is a member.

**Note:** This functionality requires knowledge of scripting.

Reference Qualifier Uses

The `ref_qual_elements` attribute can be used to specify dependent fields in the following cases:

- Catalog Item ordering screen
- Requested Item form
- Catalog Task form

In the JavaScript function called by the advanced reference qualifier, the current record (`current`) is in scope, allowing access to additional information. For example:

- Variable information for the ordered item is available with `current.variables.variablename`.

Filter names example

Following is an example script of a function.

The function defines an advanced reference qualifier for a user (`sys_user`) reference variable that filters the available user records to those where **Name** contains the value of a variable named `textmatch` on the same item:

```javascript
function getBlackberryUsers () {
  var answer = '';
  var includes = current.variables.textmatch;
  var usr = new GlideRecord('sys_user');
  usr.addQuery('name', 'CONTAINS', includes);
  usr.query();
  while (usr.next()) {
    if (answer.length > 0) {
      answer += (',' + usr.sys_id);
    } else {
      answer = '' + usr.sys_id;
    }
  }
  return 'sys_idIN' + answer;
}
```

Configure cascade delete rules

When a record is deleted, there are different options for how the deletion will affect records that reference the deleted record. You can configure what happens to records that reference a record when that record is deleted.

Role required: personalize_dictionary
For example, if you delete a user record that is referenced in the **Caller ID** field on several incident records, you can configure what happens to those incident records. By default, the references are cleared, so the incident records are maintained with an empty **Caller ID** field.

1. Navigate to a reference field on a form.
2. Right-click the field label and select **Configure Dictionary**.
3. Under **Related Links**, click **Advanced view**.
5. In the **Reference cascade rule** field, select one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear or -- None --</td>
<td>Deleting a record clears references (default option).</td>
</tr>
<tr>
<td>Delete or Cascade</td>
<td>Deleting a record also deletes all referencing records. For example, when a user record is deleted, any incidents assigned to the user are also deleted.</td>
</tr>
<tr>
<td><strong>Caution:</strong> Use this method with caution.</td>
<td></td>
</tr>
<tr>
<td>Restrict</td>
<td>Deleting a record is restricted unless there are no references to the record. For example, prevent the user record from being deleted if any incident includes a reference to the user. This option has no effect for tables with m2m relationships, meaning that in this example, if the tables have an m2m relationship, the user record is deleted.</td>
</tr>
<tr>
<td>None</td>
<td>Deleting a record does not change records that reference the record.</td>
</tr>
</tbody>
</table>

6. Click **Update**.

**Auto-complete for reference fields**

By default, a reference field auto-completes as the user types in the field. Administrators can configure additional auto-complete options. A user must have table-level read permission on the referenced table for auto-complete to display any options.

```
<table>
<thead>
<tr>
<th>Caller:</th>
</tr>
</thead>
<tbody>
<tr>
<td>joel</td>
</tr>
<tr>
<td>Location:</td>
</tr>
<tr>
<td>Joe Employee</td>
</tr>
</tbody>
</table>
```

**Figure 283: Auto complete**

**Dictionary attributes for auto-completion of reference fields**

There are dictionary attributes that are specific to reference fields and that determine auto-complete behavior.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ref_auto_completer</td>
<td>Specifies the name of the client-side JavaScript class that creates the drop-down auto completion choices. Valid class values include:</td>
</tr>
<tr>
<td></td>
<td>• AJAXReferenceCompleter: Displays matching auto-complete choices as a drop-down choice list. The list only displays the reference table’s display value column. Reference fields automatically use this class if there is no other auto-completion class specified.</td>
</tr>
<tr>
<td></td>
<td>• AJAXTableCompleter: Displays matching auto-complete choices as rows in a table. The table displays the reference table’s display value column and any columns listed in the ref_ac_columns attribute.</td>
</tr>
<tr>
<td></td>
<td>• AJAXReferenceChoice: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the reference table’s display value column. Furthermore, the list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class.</td>
</tr>
<tr>
<td>ref_ac_columns</td>
<td>Specifies the list of reference table columns to display. Separate column names with a semi-colon. For example, ref_ac_columns=user_name;email;sys_created_on allows auto-complete to match text from the user_name, email, and sys_created_on columns.</td>
</tr>
<tr>
<td>ref_ac_columns_search</td>
<td>Enables auto-complete to match text in the columns listed in the ref_ac_columns attribute. Set this attribute to true to enable auto-complete to match text in all reference field columns. By default (or when this attribute is false) auto-complete only matches text in the display value column.</td>
</tr>
<tr>
<td>ref_ac_order_by</td>
<td>Specifies the reference table column that sorts the auto-completion choices. For example, ref_ac_order_by=name sorts the auto-completion choices alphabetically by name.</td>
</tr>
</tbody>
</table>

Administrators can also set a user preference to use a contains auto-complete search.

**Auto-complete UI features**

UI Features

The AJAX table completer class has a number of UI improvements:
• The table completer always displays the number of records the auto-complete query finds.
• The table completer highlights the entire selected row by changing the color of the background and text.
• The table completer lists a value for every column.
  • The first time a value appears in a column, the table completer displays it in black text.
  • The table completer displays subsequent duplicate values in grey text. Previously, the table completer displayed an empty cell in a column containing a duplicate value.

Figure 284: Selected row highlight

Set the ref_auto_completer=AJAXTableCompleter dictionary attribute to use these improvements.

Define auto-complete attributes for all references to a table
A field inherits and uses the reference table's auto-complete attributes unless the field has its own value for the same attributes. You can define the attributes for references to a table, and it affects every form that references that table.

Role required: personalize_dictionary
A field-level attribute overrides a table-level attribute of the same name. If a field uses different reference attributes from those that are defined for the reference table, then the field uses both sets of attributes.

Use these steps to define auto-complete attributes for all fields in a table that do not already have their own auto-complete attributes. This example describes how to define auto-complete attributes for all references to the User [sys_user] table.

Note: A field's auto-complete attribute value supersedes a table's auto-complete attribute value. This means that any existing field-level value for an auto-complete attribute supersedes any value the administrator applies to the auto-complete attribute from the reference table.

1. Navigate to a form of the target table, such as User Administration > Users.
2. Right-click the column header and click Configure > Dictionary.
3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first sys_user link.
5. In the Attributes field, enter a comma-separated list of auto-complete attributes you want to apply to all fields in the table.
   For example, to display the user's department with all references to the sys_user table, enter:
   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department,ref_ac_order_by=department
   ```
6. Click Update.
To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now include both the user name and department.

Remove the display value column
You can remove the display value column from a reference field by setting the ref_ac_display_value attribute to false.

Role required: personalize_dictionary
This causes the reference field to remove the display value column and only display the columns listed in the ref_ac_columns attribute. This feature requires the use of the AJAXTableCompleter class and the ref_ac_columns, ref_ac_columns_search, and ref_ac_display_value attributes.

**Note:** Auto-complete cannot match text from additional columns when the reference field is a product of the ui_reference UI macro. This means any auto-complete action against a selector, such as the Impersonate User list, can only match text against the display value.

This example describes how to remove the display value column from references to the User [sys_user] table and replace it with references to the first_name and last_name columns.

1. Navigate to a form of the target table, such as **User Administration > Users**.
2. Right-click the form header and click **Configure > Dictionary**.
3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first **sys_user** link.
4. Under **Related Links**, click **Advanced view**.
5. In the **Attributes** field, add the ref_auto_completer, ref_ac_columns, ref_ac_columns_search, and ref_ac_display_value attributes.
   For example, to hide the display value column and only display the user’s first and last names enter the following.
   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=first_name;last_name,ref_ac_columns_search=true,ref_ac_display_value=false
   ```
6. Click **Update**.

To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now hide the display value column (user_name) and only display the first_name and last_name columns.
Improve auto-complete queries
By default, all reference fields use a *starts with* query to search for matching text in the reference table. This prevents auto-complete from executing inefficient *contains* queries every time a user searches a reference field. You can require all reference fields to use a *starts with* query.

Role required: admin

The following example illustrates a *contains* query. Note that the letter "d" appears anywhere in the user's first or last name.

This procedure describes how to change the glide.ui.ref_ac.startswith system property to always use a *starts with* query.

1. In the navigation filter, enter `sys_properties.list` and press the Enter key.
2. Select the `glide.ui.ref_ac.startswith` property.
   
   To search for the property, enter `*startswith` in the Go to search filter for the Name column.
3. In the Value field, replace `false` with `true`.
   
   **Note:** Setting the `glide.ui.ref_ac.startswith` system property to `true` overrides any existing autocomplete.contains settings in both user and system level preferences. This property changes the autocomplete query method for all users regardless of preferences.
4. Click Update.
5. Test the change by opening a record with a reference field and entering a character in it, as illustrated in the example below.
Configure auto-complete to match text from any reference field

By default, auto-complete only matches text in the display value column. You can configure a reference field to match text from any additional column the reference field displays.

Role required: personalize_dictionary

You can add the ref_ac_columns_search attribute to enable auto-complete to match text in any column listed in the ref_ac_columns attribute. Set the ref_ac_columns_search attribute to true to match text from all reference field columns. By default (or when this attribute is false) auto-complete only matches text in the display value column.

1. Right-click the label of a reference field.
2. Select Configure Dictionary from the choice list.
4. In the Attributes field, add the desired auto-completion attributes.

For example, these attributes add the department field to the caller list and sort callers by their department:

ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department,ref_ac_order_by=department
Figure 285: Auto-complete attribute

5. Click **Update**.

The following example describes how to set the **Configuration Item** field display the CI class names from auto-complete choices for the Configuration item [cmdb_ci] table.

```plaintext
ref_auto_completer=AJAXTableCompleter,ref_ac_columns=sys_class_name,ref_ac_order_by=sys_class_name,ref_contributions=task_show_ci_map;ci_show_incidents
```

**Note:** The ref_contributions attribute controls the icons that appear next to the reference field.
Display a reference field as a choice list
You can display a reference field as a choice list instead of opening a lookup window.

Role required: personalize_dictionary

1. In the form, right-click the label for the reference field and select Configure Dictionary.
2. In the Choice List Specification section, select one of the following options in the Choice field.
   - Dropdown with --None--
   - Dropdown without --None--
3. Right-click the form header and click Save.
5. In the Attributes field, add the following attribute, separated from other attributes by a comma.

   "ref_auto_completer=AJAXReferenceChoice"

6. Click Update.
   The form reopens, with the reference field as a choice list.
Note:
When a reference field is displayed as a choice list, the maximum number of choices is limited by the glide.ui.max_ref_dropdown property (default value is 25). Users with the personalize_dictionary role can modify this property, but should test any modifications for performance and usability impact.

Users with the personalize_dictionary role can also override the property value for a specific field by adding the max_ref_dropdown attribute to the field's dictionary entry.

If a reference qualifier returns more choices than the limit for the field, then the field is displayed as a reference field, not as a choice list.

This works on reference fields with advanced reference qualifiers.

Enable contains auto-complete searches
By default, the reference auto-complete uses a starts with search. A user preference can be created to implement a contains search.

Role required: admin
1. Disable the glide.ui.ref_ac.startswith system property.
   For more information, see Improve auto-complete queries on page 881.
Note: Setting the glide.ui.ref_ac.startswith system property to true overrides any existing "autocomplete.contains" settings in both user and system level preferences. This property changes the auto-complete query method for all users regardless of preferences.

2. Navigate to User Administration > User Preferences.
3. Select the preference "'<referenced table>.autocomplete.contains'".
4. Set the value field to true.

![User Preference Configuration](image)

5. Click Update.

Log out and log back in to display the updated search.

Wildcards in reference auto-completes

Wildcard searches use the auto-complete functionality.

Use an asterisk in the reference field for wildcard searches.

![Assigned to:](image)

Figure 286: One asterisk wildcard search

If two asterisks are entered, a list of available records display in the auto-complete suggestions.
Define the reference key

By default, reference fields store the sys_id of the record in the database.

Role required: personalize_dictionary

By defining a reference key, you can identify a field other than sys_id to use as the unique identifier for the reference field. The value of the reference key field, instead of the sys_id, is stored in the database for that reference field.

1. Navigate to System Definition > Dictionary.
2. Open the field record (for example, resolved_by on the Incident table).
3. In the Reference key field, enter a field name on the referenced table (for example, email on the sys_user table).

   Note: Always choose a field from the referenced table that is both required and unique.

4. Click Update.
Enable dynamic creation for reference fields

When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.

Role required: personalize_dictionary

By default, a user must enter a value in a reference field that matches an existing record in the table that the reference field refers to. For example, the Caller field in an Incident must have a value that is an existing user. You can enable dynamic creation to create a new record on the referenced table when a user enter a nonexistent value in a reference field instead of returning an error.

1. Right-click the field label in the form and select Configure Dictionary.
2. Populate the following fields (you may need to configure the Dictionary form):
   - **dynamic_creation**: Select the check box.
   - **dynamic_creation_script**: Enter a script that dynamically creates the record.
3. Click Update.

Examples:

You could use the following **dynamic_creation_script** to create a record on the referenced table.

```javascript
current.name = value;
current.insert();
```

You could create a script include named **MyUserReferenceCreator** with the following contents:

```javascript
var MyUserReferenceCreator = Class.create();
MyUserReferenceCreator.prototype = {
    initialize: function() {
    },
    create: function(current, value) {
        current.name=value;
        return current.insert();
    },
    type: 'MyUserReferenceCreator'
}
```
When the script include is created, the following `dynamic_creation_script` generates a new location for an invalid reference field value:

```javascript
new MyUserReferenceCreator().create(current, value);
```

Recent selections

Reference fields store a list of each user's recent selections to allow users to quickly select past values when filling in a reference field.

By default, the system stores up to 15 selections from a reference field for each user in the Recent Selection [sys_ui_recent_selection] table. Users can see the recent selections list by selecting an empty reference field.

**Note:** The system does not store recent selections for service catalog reference variables.

![Recent selections](image1)

**Figure 288: Recent selections**

The system uses auto-complete to filter the list of recent selections to match values the user enters.

![Recent selections filtered](image2)

**Figure 289: Recent selections filtered**

The system adds a Recent Selection record whenever a user inserts or updates a reference field value. Administrators can control the number of recent selections the system displays with the `glide.xmlhttp.max_choices` system property. Setting the property to zero disables recent selections.

**Note:** This property also controls how many entries the system displays in choice lists.

Create a document ID field

You can create document ID fields to reference any record on any table.

Role required: personalize_dictionary
In comparison, a reference field references a record on a specific table. To reference records from any table, two fields need to work together—one to store the table reference and another to store the record reference.

You can select the document ID type when creating a new field.

1. Navigate to the form view for the table.
2. Right-click the header and select Configure > Form Layout.
3. Create a field to store the table name and click Add.
   - Name: any label (for example, Model table)
   - Type: String
4. Create a field to store the record reference and click Add.
   - Name: label for your document ID field (for example, Model ID)
   - Type: Document ID
5. Click Save.
6. Right-click the form header and select Configure > Dictionary.
7. Open the dictionary entry for the document ID field.
8. Under Related Links, click Advanced view.
9. In the Dependent field, enter the column name of the table reference field (for example, u_model_table).
10. Optional: In Attributes, add the show_all_tables dictionary attribute to display system tables.
11. Click Update. When users click the reference lookup for the document ID field, a dialog appears that allows them to select the table and then the record. The sys_id of the selected record is stored in the document ID field and the table name is stored in the table reference field.
12. Optional: Configure the form to remove the table reference field.

![Select the document dialog](image)

Field normalization

Field Normalization includes two features: normalization and transformation.

- **Normalization** forces the platform to convert different forms of the same field value to a single, accepted value automatically. By forcing a field to use a simple, recognizable description for multiple variations of the same thing, normalization can eliminate duplicate records and make searches easier. In addition to reconciling different forms of the same value in fields, normalization can be configured to adjust queries automatically to return normalized results.
- **Transformation** enables an administrator to transform raw field input into standardized values that are more meaningful to an organization. An example of a standardized value might be to round RAM size in configuration items to a whole number, such as 4000 MB instead of 4112 MB. Transformations are controlled by parameters and conditions and can be configured to return transformed values in queries.
Activate the field normalization plugin

The Field Normalization plugin is published and can be activated by a user with the admin role.

*Activate a plugin* on page 1233

Installed with field normalization

What components are installed with Field Normalization.

The following preferences ([Field Normalization > Administration > Preferences](#)) control features for normalization and transformation:

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable field normalization</td>
<td>This preference enables or disables the Field Normalization functionality, including transformations.</td>
</tr>
<tr>
<td>Enable field normalization auditing</td>
<td>This preference enables or disables auditing of field normalization tables.</td>
</tr>
<tr>
<td>Logging</td>
<td>Select the maximum level of logging detail desired. For example, select Error to log only errors and Information to log errors, warnings, and information.</td>
</tr>
<tr>
<td>Decoration URL</td>
<td>Enter the URL for the help/information link associated with the Field Normalization decoration. This link opens the page presented to users who do not have rights to see the normalization or transformation record. The default link opens a ServiceNow Wiki page with a general explanation of Field Normalization. The purpose of this page is to explain to normal users why a field value they entered was changed automatically.</td>
</tr>
<tr>
<td>Restrict decorations to roles</td>
<td>Use this preference to define the user roles that can view the reference icon (decoration) adjacent to a normalized field. This decoration displays transformation and normalization records to users with the normalizer role. For all other users, it opens the URL specified in the Decoration URL preference. If this preference does not specify any roles, then all roles can see the decoration.</td>
</tr>
</tbody>
</table>
The following business rules were created for this plugin:

- Ensure Rules Application Job
- Ensure Transform Application Job
- Ensure Rules and Alias Jobs
- Ensure Transform Application Job
- Ensure Decoration Attribute
- Cleanup on field or table change
- Prevent duplicates in class hierarchy
• Handle potential duplicates
• Run job
• Ensure Pending Value Collection Job
• Ensure name changer job
• Flush forms when activating

<table>
<thead>

</table>
Field type behavior

Field types determine which fields are available for normalization and which transform categories are used.

- Normalization: Field types determine which fields are available for normalization. When a user creates a new normalization record, the only fields that appear in the choice list are those that match the defined normalization field types for the table selected. For example, in the base system, users see only string fields and not date or integer fields.

- Transformation: Field types determine which transform categories are used. Each category contains a list of transformation definitions that is presented to the user when a new transform is created. The default associations are appropriate for most transforms, but can be reconfigured to suit an organization's business needs.

Normalization field types must match the system field types (from the dictionary). The default field types available depend upon the platform version.

Create a field type

Most field types in the dictionary are available for normalization. Some fields that cannot be normalized are Table and Field (which have hard-coded values) and any reference fields.

To normalize or transform a value in a reference field, apply the processing to the field in the target table.

1. Navigate to Field Normalization > Administration > Field Normalization.
2. Click New in the record list.
3. Enter a Name for the field type that clearly describes the type in the dictionary. This value is for reference only and is not used in any processing. For example, you might enter IP Address for the field type of ip_address.
4. Enter the Type from the dictionary.
5. Select the appropriate check box to use this field type to normalize or transform fields.
6. Right-click in the header bar and select Save from the choice list. The Transform Categories Related List appears.
7. If this field type is being used for transforms, click Edit to associate an existing Transform Category with this field type.

Note: If you create a custom field type that is used for normalizations only, a link to a transform category is not necessary.

The relationship of a field type to a category, and the category to a list of transformation definitions, is completely configurable.
Normalize a field

Field normalization converts different varieties of the same field value, to a single, preferred value.

When a process or a user enters a value in a normalized field, the platform determines if that value can be replaced with a normal value. By forcing a field to use a simple, recognizable description for multiple variations of the same value, normalization can eliminate duplicate records and make searches easier. Normalization also automatically adjusts queries to return normalized results and normalizes values in scripts.

Field normalization is available for every field in the platform, with the exception of reference fields. However, some fields are more likely to be normalized than others, such as the **CPU type** field. Another obvious candidate for normalization is the **Name** field in the Company table. Company names might appear in records in several different forms (for example, Inc., Incorporated, Corporation). Normalized fields can eliminate confusion by providing logical replacements for ambiguous values.
What field normalization does
Records for things like devices and companies are brought into the ServiceNow platform by manual entry, imports, and Discovery.

Depending on how it is introduced into the database, a field value might appear in several different forms. For example, the CPU Type field on a computer CI form might display any of the following names for the same type of CPU, depending on the source of the entry:

- Xeon L3350 or L3350 (manual entry)
- Intel Xeon 5.4.554 (created by Discovery)
- E3350 (Intel) 4.5.2234 (imported value)

The lack of a normalized CPU type field in this example could result in duplicate CMDB records for each variation in the field value. Different CPU types also present a problem for reporting. To report accurately on all computers that use a Xeon processor, an administrator must know all the possible permutations of the name and construct a very complex query. To prevent these issues, an administrator can normalize the original values using one of two methods:

- Aliases: Aliases map all the variations of the name manually to one normal value. Use aliases for short lists of name variants. During processing, the platform looks here first when determining how to normalize a field. If no aliases are defined, the platform searches for rules that apply.
- Rules: Write a rule to associate large numbers of variant names to a normalized value automatically by using standard operators, such as begins with, starts with, or contains. Rules and aliases can be combined to normalize a field. Make sure to test your rules before applying them to all the existing records in the database.

In our example, aliases are sufficient for converting the possible variations of the Intel Xeon CPU type into one, normalized value, such as Xeon. When a recognized variant is entered in a field, the platform automatically replaces the variant with the normalized value. If properly configured, field normalization also affects the search results from a filter in a record list. In our example, an entry of L3350 in a filter returns a list of Xeon CPUs, if that variation of CPU type was normalized.

Scripting and normalization

Scripts that update records or insert records into the database (GlideRecord) are normalized automatically when field normalization is applied. For example, if a script to insert a CI record contains a CPU type of Xeon L3350, the script is normalized to insert the CI with a CPU type of Xeon instead. Scripts that query the database for normalized field values (using the conditions of equals or not equals) can be configured to return the normal value (such as Xeon) rather than the original (raw) value.

Normalized queries

An administrator can configure normalization to apply to queries issued against normalized fields in lists. Select the Normalize query check box on the Normalization form to enable this functionality. In a list containing normalized values, create a filter using the original (raw) value for the normalized field in the query condition.
Figure 291: Normalized query example

The filtered list returns records with the normal value substituted for the raw value. However, the breadcrumbs for the filter display the original query conditions.

Figure 292: Normalized query results

*Data jobs created by field normalization*

Field Normalization creates four data jobs during the normalization process to collect or change data.
All jobs except **Pending value collection** are executed manually. Data jobs have a roll back feature that allows you to undo normalization at different stages before committing changes that affect the entire database.

- **Pending value collection**: This data job is created when a field normalization record is submitted. This job runs automatically to collect all the values from the database for the field to be normalized. This data job does not modify the database.
- **Normal value change**: This data job is created when an existing normal value that is used to normalize a field is changed. When the job is run, the platform updates all the normalized fields in the database that use the new normal value.
- **Alias application**: This data job is created when an alias is created. When the job is run, all field values in the database containing the alias are normalized.
- **Rule application**: This data job is created when a rule is created. When the job is run, all field values in the database that match this rule are normalized.
- **Coalesce to normal**: This data job coalesces data from existing records containing a normalized field value into a single record that uses a normal value.

### Create the normalization record

Regardless of the normalization method selected, all field normalization requires a list of existing variants and a normal value that is configured to replace these variants in forms and in queries.

If you want to also show the original (raw) input in a field on a form after it has been transformed, create a raw field.

Normalize a field by selecting aliases for a normal field value or by creating rules that use condition statements to match field variants with a normal value.

**Note:** Users must have the normalizer role to create and manage normalization records.

### Special Cases

- Reference fields cannot be normalized. To normalize values appearing in reference fields, normalize the field in the target table. Examples of this would be normalized values for the Name fields in the Company [core_company] and Location [cmn_location] tables, which are referenced by other tables in the platform. The normalized names are available to all fields that reference these tables.
- Fields in a choice list can be normalized if they are of a type string.

1. **Activate** the Field Normalization plugin.
2. Navigate to **Field Normalization > Configurations > Normalizations**.
3. Click **New**.
4. Create a normalization record.

### Table 226: Normalization record fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this normalization record. This value is for reference only and is not used in any processing.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the ServiceNow table for the field being normalized.</td>
</tr>
<tr>
<td>Field</td>
<td>Select the field to normalize.</td>
</tr>
</tbody>
</table>
The three available modes are Off, Test, and Active. All normalization records are created in the test mode by default. If you are planning to select aliases for your normal values, change the Mode to Active. If you intend to normalize the field using rules, be sure to leave this record in the Test mode. To disable this normalization, switch the mode to Off.

Select this check box to apply the field value normalized by this record to all queries involving this field. Queries formed with the raw (original) field value return records displaying the normal value. Queries issued by a script using the conditions equals or not equals return normalized values. See Normalized Queries for details.

Select this check box to reset all references in the database to records containing an alias field value to a single record using a normal value. See Coalesce Normal Values for details.

Select the field to use to display the original (non-normalized) input values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Creating a Raw Field.

After the normalization record is submitted, the platform runs the Pending value collection job in the Data Jobs related list automatically to gather all the current values (Pending Values) for the field being normalized.
Click the **Pending Values** related list to view values for the normalized field that have been entered manually, imported into the platform, or created by Discovery.
**Roll back data jobs**

How to roll back data jobs.

To roll back data gathering, select the job in the **Data Job** related list, and then click the **Rollback** related link in the Data normalization jobs form.
Figure 293: Normalize extant data 2

The values in the **Pending Values** Related List are removed and the data job **State** indicates that it was rolled back.
Create a normal value
A normal value is a simplified, generic value for a field that replaces all the possible variants of that value that exist in the database.

Normal values should be clear and unambiguous.

After the platform runs the data job, the Pending Values related list on the Data normalization jobs form is populated with all the unique values for the field in the database. Examine the values in the list and decide which normalizing method is best for the existing data. The best practice is to define an alias for a small pool of values and a rule for a large pool of values. The following screenshot shows the pending values for CPU types in Linux servers in a network. The list contains several choices for Intel Xeon CPUs, which might be normalized as Xeon.

1. Navigate to Field Normalization > Normalizations.
2. Open the appropriate normalization record.
3. Click the Normal Values related list.
4. Click New.
5. In the Normal Value form, create normal values for the variants in the Pending Values related list. These are the values the platform uses to replace the variants configured as aliases.

Create aliases
Aliases are the variants of a field value in the instance that will be replaced by the normal value.

The list of potential aliases is the contents of the Pending Values related list. After creating a normal value, assign aliases to this value if the pool of pending values is small. A normalized field can have a combination of aliases and rules.

1. Navigate to Field Normalization > Configurations > Normalizations.
2. Open a normalization record.
3. Click the Normal Values related list.
4. Select one of the values.
5. In the normal value record, click the Aliases related link.
6. Select aliases for this normal value from the available (pending) values that appear in the slushbucket, and then click **OK**.

   The aliases for this normal value now appear in the **Aliases** related list.
Apply aliases

After testing, aliases can be normalized in all new records or in existing records when they are updated. Each time an alias is created for a normal value, a data job is created. The alias is not applied to values in the entire database until its data job is started manually. Run each job separately or run the jobs together to apply all aliases at once.

1. In a normalization record, ensure that the Mode is set to Active.

   Data jobs cannot run in the Test mode.

2. Click the Normal value related list.

3. Select a value from list.

4. In the Normal Value record, select the Data Jobs related list.

   A data job is listed for each alias configured for this normal value.
5. Run the extant data jobs to replace the aliases with the normal value in all existing records in the database.
   1. Select the check box next to a job, and then select **Start** from the Actions menu.
   2. To run all data jobs at once, select all the check boxes, and then select the **Start** action.
   3. Refresh the list to check the progress of the data jobs to ensure that they complete normally.

*Create rules*

The use of rules to normalize a field is intended for large lists of variant field values.

Always test your rules before applying them to all the existing records in the database. Prior to creating the rule, make sure to generate the list of **Pending Values** and create a **normal value** for the field. A normalized field can have a combination of aliases and rules.

The rules in this example are based on the following Pending Values:
Figure 296: Normalization rules 3

1. In a Normalization record, open the Normal Values related list.
2. Open a Normal Value record.
3. Open the Rules related list in the Normal Value form, and then click New.

   The Field Normalization Rule form provides the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this rule. For example, this name might be Xeon CPU Type.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which this rule should be evaluated. The platform parses the rules in the order configured until it finds one that evaluates to true.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this rule. By default, new rules are active (true)</td>
</tr>
<tr>
<td>Make alias</td>
<td>If this check box is selected, and the rule evaluates to true, the rule makes an alias automatically from a pending value. If this check box is not selected, and the rule evaluates to true, the platform automatically changes the value for the named field in the record to the normal value, but does not create an alias.</td>
</tr>
<tr>
<td>Case sensitive</td>
<td>All pending values for the named field must match the case of the same value in a rule to be normalized.</td>
</tr>
<tr>
<td>Rule</td>
<td>Use the ServiceNow rule builder to construct the rules for normalizing fields. Rules automate the transformation of large numbers of pending field values into aliases.</td>
</tr>
</tbody>
</table>

4. Create a set of rules to incorporate all the possible variants of the pending values.

   For this example, the rules might be:
   - **Intel Xeon**: CPU type matches pattern "Intel*Xeon". This rule normalizes all variants in which Intel precedes Xeon, including Intel Xeon, Intel(R) Xeon(TM) CPU 2.80GHz, and Intel(R) Xeon(TM) CPU 3.00GHz.
   - **Xeon**: CPU type contains Xeon
   - **L3350**: CPU type contains L3350
   - **E3350**: CPU type contains E3350
For every rule that is created, the platform generates a **Rule applier** data job. In the testing mode, the **Start** controls are not available, and the job cannot be run until the mode is changed to **Active**.

5. Test all the rules before making the normalization record **Active**.

**Testing Rules**

**Note:** Users must have the normalization_tester role to create test records.

Field normalization records are created in the **Test** mode by default, enabling administrators to test normalization rules thoroughly before applying them to the existing records in the database. In the testing mode, the **Start** controls are not available for the **Rule applier** data job. The job can be run only when testing is complete and the **Mode** has been changed to **Active**. In the testing mode, only records that have been created or updated by a user with the normalization_tester role are normalized. The normalizer and normalization_tester roles can be combined for a single user or granted separately.

**Coalesce records on a normal value**

Coalescence enables an administrator to redirect references to multiple records containing variants of the same field value to point to a single record, based on a normal value.

An example of this is the Company table that might have multiple variants of a company name, such as Hewlett-Packard, Hewlett-Packard, Inc., Hewlett-Packard Incorporated, HP, and so on. Potentially, thousands of records might reference each of these duplicate company records. Using the variants of the Hewlett-Packard name as aliases, coalescence unifies all these references into a single record that normalizes the **Name** field in the Company record to a normal value such as **HP**.
**Note:** Coalescing normal values changes the record values permanently. If a rollback is performed, records will be returned to the table, but the normalized values will not be rolled back to the original variants.

1. In a normalization record, select the **Coalesce each normal** check box. This applies coalescence to each normal value in the record.
2. Create a normal value for this field, including aliases. An additional field called **Coalesce to** appears on the Normal Value form.
3. Click the magnifier icon in this field and select the specific record from the table (containing this normal value) to which all references should be coalesced.

4. Update the record.
5. **Start** all the **Alias application** data jobs to replace the aliases with the normal value in existing records in the database.

   After these jobs have completed, the **Coalesce to normal** data jobs start automatically for each alias. These jobs redirect all references to normalized records to the selected coalesce record and remove all duplicate records from the database.

*Identify normalized fields*

Normalized fields are marked with an icon that links to different targets, depending on the user’s role.

Users with the normalizer role can click the icon to access the normalization configuration record for that field directly. When a user without the normalizer role clicks the link, a help page appears that provides help on the form. A preference, called Restrict to roles, enables an administrator to define the roles that are permitted to see the icon. If no roles are specified, then the icon is visible to all roles.

---

**Figure 297: Normalization icon**

**Field transformations**

Field transformations enable an administrator to transform raw field input into standardized values that are more meaningful to an organization. Rules control transformations and can be configured for use in queries.

Field transformation standardizes a value in a specific field using rules. An example of this type of standardization might be a name format that removes designations such as Jr. and II from names. Another example is a mode that rounds the amount of computer RAM detected by Discovery to a useful interval.
(4112 MB to 4000 MB). Transform records make up the rules that define how a field transformation is executed. Order values determine the order in which each rule is evaluated. A check box on each transform enables an administrator to determine where processing stops when a rule evaluates to true.

**Note:** The sys_user record that actions the transform process must have its date format set to the default format of "yyyy-MM-dd." Any other date format causes an error during transformation. This problem is only specific to transforming **TO TARGET** fields of type Date/Time. This problem is not an issue if the target field type is of type String or if the field mapping for the date field is changed to the same date format as the transformation process.

**Field transformation scripting**

Scripts that update records or insert records into the database (GlideRecord) are also normalized. For more information on the database, see [GlideRecord](#) on page 3960.

For example, if a script to insert a CI record contains a RAM size of 4112, the script will be transformed to insert the CI with a RAM size of 4000 instead. Scripts that query the database for transformed field values return the normal value (such as 4000) rather than the original (raw) value.

**Create a normalized query for field transformations**

An administrator can configure transformations to apply to queries issued against transformed fields in lists.

For more information on configuration, see [Create a transformation record](#) on page 914.

- In the list, create a filter using the original (raw) value for the transformed field in the query condition.

  ![Filter Example](#)

  **Note:** Normalized queries for field transformations only work for \[is\] or \[is not\] queries.

The filtered list returns records with the transformed value substituted for the raw value. However, the breadcrumbs for the filter display the original query conditions (raw value).

**Field transformations data jobs**

When a Transform is created, a Transform application data job is also created.
This job can only be executed manually and applies the transform to all the appropriate fields in the
database. Data jobs have a roll back feature that allows you to undo a transformation before committing
changes that affect the entire database. Data jobs cannot be started when the Transformation record is in
the **Test** mode. When testing is complete, change the **Mode** setting in the Transformation record to **Active**
to enable the controls for the data job. See *Run a single data job* on page 920 and *Run multiple data jobs*
on page 922 for details about running data jobs.

*Field transformations testing mode*
Transformation is a powerful tool that can cause data issues if used incautiously. Test all transformations
before committing the changes to the CMDB.

Transformation is a powerful tool that can cause data issues if used incautiously. Test all transformations
before committing the changes to the CMDB. All transformation records open in **Test** mode by default,
which blocks administrators from running manual data jobs that apply changes to existing data. Only users
with the normalization_tester role can transform data when a record is in the **Test** mode. This is limited
to new records opened by the tester or records in which the transformed field is updated by the tester. To
apply transformations to the CMDB after testing, change the mode to **Active** in the transformation record
and run the appropriate data job. For information on testing transforms, see *Test a transform* on page
918.

*Transform a field*
This topic lists in order the tasks you need to perform to transform a field.

If you want to also show the original (raw) input in a field on a form after it has been transformed, *create a
raw field*.

1. *Create a transformation record* on page 914.
2. *Select a transform type* on page 915.
3. *Test a transform* on page 918.
4. Run the data job/jobs.
   - *Run a single data job* on page 920.
   - *Run multiple data jobs* on page 922.

Create a transformation record
Creating a transformation record is the first step in transforming a field.

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization > Configurations > Transformations**.
3. Click **New**.
4. Create a transformation record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this transformation record. This value is for reference only and is not used in any processing.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the ServiceNow table containing the field being transformed. It is important to understand the table hierarchy when setting up a field transform. For example, if you configure transformation for a field in the Computer [cmdb_ci_computer] table, that field will be transformed for all workstation machines, Windows servers, Linux servers, and UNIX servers.</td>
</tr>
</tbody>
</table>
Selecting a transform type

Selecting a transform type is the second step in transforming a field.

1. In the Transformation record, select the **Transforms** Related List.
2. **Click New.**

A selection list of transform types appears, displaying only those transformations appropriate for the field type selected.

---

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Select the field to transform. The list presented contains only those field types (integer and string) from the table selected that can be transformed.</td>
</tr>
<tr>
<td>Mode</td>
<td>The three available modes are <strong>Off</strong>, <strong>Test</strong>, and <strong>Active</strong>. All transformation records are created in the test mode by default. Do not change the mode until you have thoroughly tested the transformation. When testing is complete, change the mode to <strong>Active</strong>. To disable this transformation, switch the mode to <strong>Off</strong>.</td>
</tr>
<tr>
<td>Normalize query</td>
<td>Select this check box to apply the field value transformed by this record to all queries involving this field. Queries issued with the raw (original) field value will be edited to use the transformation value.</td>
</tr>
<tr>
<td>Raw field</td>
<td>Select the field to use to display the original input (non-normalized) values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see <em>Create a raw field</em> on page 938.</td>
</tr>
</tbody>
</table>

5. **Click Submit.**

The **Transforms** and **Data Jobs** Related Lists appear on the form.
Choose the type of transform you want to create:

Text  *Transforms that modify the text of the value.*

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Case</td>
<td>Adjusts the case of characters in the value</td>
</tr>
<tr>
<td>Constant</td>
<td>Supply a constant value</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete specified sequence of characters from the value</td>
</tr>
<tr>
<td>Insert</td>
<td>Insert a fixed character sequence into the value</td>
</tr>
<tr>
<td>Left</td>
<td>Keep or delete the leftmost 'n' characters</td>
</tr>
<tr>
<td>Prefix</td>
<td>Adds characters to the beginning of the value</td>
</tr>
<tr>
<td>Replace</td>
<td>Replaces occurrences of one string with another</td>
</tr>
<tr>
<td>Right</td>
<td>Keep or delete the rightmost 'n' characters</td>
</tr>
<tr>
<td>Substring</td>
<td>Keep or delete characters from a specified sub-sequence of characters in the value</td>
</tr>
<tr>
<td>Suffix</td>
<td>Append characters to the end of the value</td>
</tr>
<tr>
<td>Trim</td>
<td>Remove any leading or trailing spaces or tabs</td>
</tr>
</tbody>

The following transform example replaces the INC at the beginning of an incident number with the string ENG if the assignment group is ITSM Engineering.
Figure 299: Transformation record

8. Click **Submit**.

The new Transform appears in the Related List of the Transformation record.
When the Transform is created, a Transformation application data job is also created. This data job applies this transform to appropriate records in the entire database and should not be run until testing is complete.

Test a transform
Testing a transform is the third step in transforming a field.
Note: Users must have the normalization_tester role to create test records.

New transformation records open in the Test mode by default, enabling administrators to test transforms thoroughly before applying them to the existing records in the database. In the test mode, the Start controls are not available for the Transform application data job. There are two methods, listed below, for testing transforms before committing the transformations to existing data.

- Create or update records.
  In the test mode, only records that have been created or updated by a user with the normalization_tester role are transformed. Grant the normalizer and normalization_tester roles to the same user or grant them to separate users.
- Test transforms utility.
  This feature enables a normalization tester to transform field values on the fly without opening or updating records. This utility tests all the transforms configured for this field.
  a) Open a Transformation record.
  b) Click the Test transforms Related Link.

![Test transforms](image)

A dialog box appears for testing field values.

c) Enter a value to transform in the Raw data field.
d) Click **OK**.

The platform transforms the raw value in the **Transformed data** field.

e) Enter new raw data to test other transforms.

f) Click **Cancel** to end the test.

g) When testing is complete, change the **Mode** to **Active** and run the data job.

---

Run a single data job

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run a single data job.

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.

2. Open the Transformation record and switch the **Mode** to **Active**.

3. Select the **Data Jobs** Related List.

4. Run the data job using one of the following methods.

   - In the list of data jobs, select the check box of the job you want to run, and then select **Start** from the **Actions** menu. See #unique_1077/unique_1077_Connect_42_f_ModeSetToActive on page 921.

   - Click the link in the Created column to open the data job, and then click the **Start** Related Link. See #unique_1077/unique_1077_Connect_42_f_StartRelatedLink on page 921.
The State of the jobs turns to **Queued** as it runs and to **Completed** when it finishes successfully.
Run multiple data jobs

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run data jobs for multiple field transformations.

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Navigate to Field Normalization > Data Jobs > All.
3. Select the check boxes for the jobs you want to start.

   **Note:** These jobs must have the Mode set to Active.

4. Select Start from the Actions menu.

   **Note:** The platform only runs data jobs from Active transformations. The Action menu indicates the number of Active data jobs that can run. For example, the menu might display Start (3 of 4).

**Transformed field identification**

Transformed fields in records are marked with an icon that links to different targets, depending on the user's role.

Users with the normalizer role can click the icon for direct access to the transformation configuration record for that field. When a user without the normalizer role clicks the link, a Wiki page appears that provides help on the form. A preference, called Restrict to roles, enables an administrator to define the roles that are permitted to see the icon. If no roles are specified, then the icon is visible to all roles.
Transform definitions define the transformation actions available for a given field type.

Users select a definition when they transform a field, and then provide the definition with the specific parameters that are applied to the transformation. For example, a definition can round up an integer or insert a value at a defined position in a string. The system provides a number of definitions that are designed to meet the needs of most organizations. If an administrator needs a transformation action that is not available in the out-of-box configuration, he can create a new definition. Transform definitions can be associated with existing Transform Categories or to new categories.

Create a transform definition
The following example describes the procedure for creating a new transform definition. In this example, we create a definition that transforms a number field to an odd or even integer. The transform category is Numeric and the normalization field type is Integer.

1. Navigate to Field Normalization > Administration > Transform Definitions.
2. Click New in the record list.
3. Enter a name for this definition.

   Note: In this example, we enter Odd/Even.

4. Enter a brief description of the action, such as, Transforms an integer to an odd or even value.
This information appears in the definition choice list when a user selects a new transform.

5. Right-click in the header bar and select Save in the context menu.

Two Related Lists appear in the form.

- **Transform Categories:** Click **Edit** and select **Numeric** as the category to which this definition belongs. Currently, field transformation supports two categories: **Numeric** and **Text**. The **Integer** normalization field type is already associated with this category.
- **Transform Variables:** Define any variables required by this transform definition to perform an action on a field value. Variables are not necessary if a script can perform the action alone.

Create a transform variable for a transform definition

Transform variables enable an administrator to apply the same definition to different fields in different ways.

Transform variables contain values used by a script to perform a field transformation. Scripts and variables can be created in either order, but the script must use the transform variables. Transform variables are populated with values when a user configures a transform type.

1. In the Transform Definition record, click **New** in the Transform Variables Related List.
2. Complete the form.

Important considerations for completing a form:
• The Column name is an entry in the fn_transform_var table for this variable. This becomes the variable in the script, in the form of variables.<variable name>. For this example, we enter odd_even.
• The value in the Label field appears as the variable field label in the Transform form. In our example we enter Odd/Even.
• The field Type defines the field type of the variable value. Because the values for the variables used are "even" and "odd", this is a type of string.
• The Order of the variables controls the order in which they are displayed in lists and records.
• This variable has a choice list with two options: Even and Odd. We select Dropdown without - None as our format for the list in the Choice field and define a Default value of even when the list is displayed.
• Create a Hint that becomes a tooltip for the variable in the Transform record.

3. Right-click in the header bar and select Save from the context menu.

The Variables Choice List Related List appears.
4. Click **New** in the Variables Choice List and define the list options.

5. Create records for **Even** and **Odd**.

**Note:** The **Element** value is the same as the **Column** name in both selections for the choice list.
Create a script for a transform definition

Create the script at any time during the configuration of a definition.

The script can perform a transform action without using a variable, but the action of the definition will be the same for all fields. Variables create more flexibility for the definition, enabling an administrator to use the same definition in different ways in different places. If a variable is defined, the script must reference the variable using the correct format.

There are three arguments in the script:
• Variables: Contains the variables using the format variables.<variable name>.
• Value: Contains the un-transformed value
• Parameters: Special objects that set debug messages.

1. Open the **Odd/Even** record in the Transform Definitions module.
2. Enter the following script to pass values with the odd_even variable.

```javascript
function(variables, value, parameters) {
  var odd = ('odd' == variables.odd_even);
  var val = value - 0;
  var val_odd = ((val & 1) == 1);
  if (odd != val_odd)
    val++;
  return '' + val;
}
```
Notice that the script references the variable in the form variables.odd_even.

3. Update the record to complete the configuration.

The Odd/Even transform definition is now ready to use in a field transformation.

Definitions included with field transformation
All position parameters (Starting position, Ending position, etc.) have three modes that apply to all the transform types that use this variable.

Table 228: Position parameters

| Positive positions | If the position is expressed as a positive integer, the platform calculates the starting position beginning from the left side of the field value. For example, in the string ABCDE, a position of 3 places the starting point of the action after C. |
Negative positions

If the position is expressed as a negative integer, the platform calculates the position beginning from the right side of the field value. For example, in the string ABCDE, a position of -3 places the starting point of the action before C.

Regex

If the position value starts with /regex/, everything after that is a regular expression that is used to calculate the starting position. For example, in the string ABCDE, a position of /regex/B.*D places the starting point of the action after C (B and all the characters between B and D).

| Round          | Numeric  | Rounds integers to a configured rounding interval using specific criteria. The interval must be appropriate to the value being transformed, such as an interval of 12 for a value expressed in dozens or 0.01 for decimal values expressed in hundredths. | - Interval: Select the rounding interval that is appropriate to the units of the field value. For example, an interval of 256 is appropriate for expressing RAM values in megabytes, but does not work for Disk space expressed in gigabytes. The rounding interval for the examples below is 1  
- Mode: Criteria for applying the rounding interval.  
  - Half up: Always round up a value that is exactly half way between two intervals. For example, 3.5 is always rounded up to 4, and -3.5 is always rounded up to -3.  
  - Half down: Always round down a value that is exactly half way between two intervals. For example, 3.5 is always rounded down to 3, and -3.5 is always rounded down to -4.  
  - Half away from zero: Always round an integer that is half way between the specified interval away from zero. For example, 3.5 is always rounded to 4, and -3.5 is always rounded to -4.  
  - Half toward zero: Always round an integer that is half way between the specified interval toward zero. For example, 3.5 is always rounded to 3, and -3.5 is always rounded to -3.  
  - Half to even: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is even. For example, 3.5 is always rounded to 4, and 4.5 is always rounded to 4.  
  - Half to odd: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is odd. For example, 3.5 is always rounded to 3, and 4.5 is always rounded to 5.  
  - Up: Always round an integer up by the specified rounding interval. For example, 3.4 is always rounded to 4 by a rounding interval of 1.0.  
  - Down: Always round an integer down by the specified rounding interval. For example, 4.6 is always rounded to 4 by a rounding interval of 1.0.  
  - Away from zero: Always round an integer away from zero by the specified rounding interval. For example, 3.3 is always rounded to 4, and -3.3 is always rounded to -4 by a rounding interval of 1.0.  
  - Toward zero: Always round an integer toward zero by the specified rounding interval. For example, 3.3 is always rounded to 3, and -3.3 is always rounded to -3 by a rounding interval of 1.0. |

| Substring     | Text         | Keep or delete characters from a specified sub-sequence of characters in the field value. | • Starting position: Specifies the first character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details.  
• Ending position: Specifies the final character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details.  
• Mode: Select whether to Delete the sub-sequence selected or Keep only those characters defined. |
| Suffix        | Text         | Appends characters to the end of a field value.                             | Suffix: Defines the suffix to add to the end of the field value.           |
| Trim          | Text Numeric | Removes blank spaces from the field value.                                 | No parameters                                                             |

**Transform categories**

Transform categories are used to group the transform definitions together appropriately to present to users when creating new field transforms.

You can create new categories for existing definitions or change the default associations of categories to definitions. Transform categories are associated with normalization field types to present the correct definition option list for the field being transformed. The base system provides two transform categories: Text and Numeric.

- **Text**: Definitions in the Text category transform string type field values. Included in the Text category are:
  - Left
  - Right
  - Constant
  - Trim
  - Prefix
  - Suffix
  - Change Case
- Delete
- Insert
- Substring
- Replace

- Numeric: Definitions in the Numeric category arithmetically manipulate integer type field values. Included in the Numeric category are:
  - Limit
  - Round
  - Constant

Create a transform category

1. Navigate to Field Normalization > Administration > Transform Categories.
2. Click New in the Transform Categories Related List.
3. Enter the Name of this category and a description.
4. Select an Order for this category and save the record.

The order determines the display order of categories in lists and forms. Two Related lists appear:

- **Field Types**: Click Edit to select an existing field type for this category or click New to create a new field type. The normalization field types provided are:
  - Decimal
  - Float
  - Integer
  - Numeric
  - String
  - URL

- **Transform Definitions**: Click Edit to select the transform definitions that are included in this category.

The completed category form looks like this:
Regular expressions and patterns in field normalization rules
Field Transformation definitions support the use of regular expressions (referred to in the platform as *regex*) and pattern matching for determining the position of characters in a string.

After identifying the target characters, field transformation can replace or delete the identified characters or insert other characters at that position.

**Regex**

Regular expressions can be used in transform parameters and in condition statements to determine which characters in a field value are transformed.
• Transform parameters: Regular expressions used as parameters to locate characters in transformed field values must begin with \regex/. Everything after that is a regular expression that is used to calculate character position. For details, see Transform definitions on page 923.

• Conditions: Condition statements are used to configure the transforms that select the characters to change in a field value. When using a regular expression in a condition statement, make sure to select the matches regex operator.

Example

The computer names in an organization's Windows network are expressed as domain\machine name, such as development\devlab01. The network administrator wants to simplify these names by removing the domain name and backslash. He creates a transformation record for the Computer [cmdb_ci_computer] table and selects the Name field to transform.

![Figure 303: Transformation regex example](image)

The network contains several domains, and each domain contains numerous computers. The only character common to each name is the backslash. To delete the domain name, the administrator decides to use a regular expression to replace the entire raw value in the field with the characters that appear after the backslash (the actual machine name). He creates a new Transform using Replace as the Transform Type and enters the following values:

• Find:\regex/.\(\.*\)
• Replace with:$1
Figure 304: Transformation regex example

The regular expression `.*\(.*\)` represents the entire raw value in the **Name** field - in this example `development\devlab01`. The first part of the expression, `.*`, represents everything before the backslash (the **development** domain name). The backslash by itself is the escape character in regular expressions and requires special syntax to retain its function in the computer name. The administrator must *escape* it by using another backslash (`\` means `\`). The part of the expression after the backslash, `(.*`, represents the computer name (`devlab01`) and is grouped within parentheses for reference. The value in the **Replace with** field, `$1`, references this group and replaces the entire raw value of the field with the contents of the group, `devlab01`.

The administrator clicks **Test transforms** in the transformation record and enters `development \devlab01` in the **Raw data** field. He then clicks **OK** to apply the transform to the test value. The transform replaces `development\devlab01` with `devlab01`.

Figure 305: Transformation Regex 3

When the transforms for this field are tested successfully, the administrator changes the **Mode** in the transformation record to **Active** and runs the Transformation application data job to apply this transformation to existing records in the database.

**Pattern matching**

Pattern matching in Field Normalization uses special characters differently from regular expressions to create patterns that the platform recognizes when transforming field values.
Pattern matching can be used only in condition statements. When using pattern matching characters in a condition statement, make sure to select the matches pattern operator.

Use the following special characters to create patterns for searches.

- The asterisk in a search string (*) matches any number (including zero) of any character.
- The question mark (?) in a search string matches one of any character.
- Everything else in a search string matches itself.

Examples

- the story matches the story but not that story.
- *story matches the story and that story, but not that story is the best.
- st?ry matches story and stxry, but not my story or stairy.
- *b?gus* matches bogus, my bogus story, and His bagus machine, but not my bgus story or my baigus story.

Create a raw field

A raw field is a custom field created by an administrator to show the original (raw) input in a field on a form after it has been normalized or transformed.

1. In the form containing the field that is being normalized or transformed, right-click in the header bar.
2. Select Configure > Form Layout.
3. Complete the Create new field form at the bottom of the page, and then click Add:
   - Name: Type the field label. In this case, use Raw + <field label>.
   - Type: Select a data type from the list for this field.
   - Field Length: Select the character limit for this field. The default is 40.
4. Move the new field adjacent to the normalized field using the direction arrows in the slushbucket.
5. Click Save.

Data policy

Data policies enable you to enforce data consistency by setting mandatory and read-only states for fields.

Data policies are similar to UI policies, but UI policies only apply to data entered on a form through the standard browser. Data policies can apply rules to all data entered into the system, including data brought in through import sets or web services and data entered through the mobile UI.

For example, suppose that you are configuring a web service that allows users from outside the platform to update problems on the ServiceNow instance. Since these problems are not updated through the instance UI, they are not subject to the UI policies on the problem form. To ensure that the Close notes field is completed before a problem is marked Closed/Resolved, you can create a data policy that applies to server-side imports. Data that does not comply with this data policy produces an error. You can also apply the policy on the browser by selecting the Use as UI Policy on client check box in the data policy record.

Since UI policies can also manage the visibility of fields on a form, you may want to augment UI policies with data policies rather than replace them.

By default, data policies are applied to all GlideRecord operations including those used in Scripted REST APIs, and the REST Table API. You can opt out of applying the data policy to:

- Target records of web services
• Import sets
• Client-side UI policies

The admin role is required to edit data policies.

**Note:** Defining a data policy enforces the policy when a record is submitted from the UI. This behavior cannot be changed.

---

**Installed with data policy**

What is installed with Data Policy.

**Tables**

- **Data Policy** [sys_data_policy2]
- **Data Policy Rule** [sys_data_policy_rule]

**Roles**

The following role is available with data policy:

- **data_policy_admin**: Allows you to grant access for maintaining data policy to specific users. You may have to grant this role access to the System Policy application.

**Data Policy Module**

The **System Policy > Data Policies** module displays a list of all data policies and where they apply.

**Figure 306: Data policy list 2**

![Data policy list 2](image_url)

**Data policy fields**

These fields appear on the Data Policy form and related forms.
### Table 230: Data policy fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table to which this policy applies.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the data policy.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this data policy.</td>
</tr>
<tr>
<td>Inherit</td>
<td>If selected, applies this data policy to tables that extend the specified table. For example, incident, problem, and change tables all extend the task table, therefore selecting Inherit on a data policy defined for task would apply the data policy to them as well.</td>
</tr>
<tr>
<td>Reverse if false</td>
<td>If selected, the data policy action is reversed when the conditions evaluate to false. For example, when the conditions are true, then actions are taken and when they change to false, the actions are reversed.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the data policy is used.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description that identifies the policy.</td>
</tr>
<tr>
<td>Description</td>
<td>A detailed description of the policy.</td>
</tr>
<tr>
<td>Apply to import sets</td>
<td>If selected, the data policy applies to data brought into the system from import sets. This option also applies to web service import sets.</td>
</tr>
<tr>
<td>Apply to SOAP</td>
<td>If selected, the data policy applies to data brought into the system from a SOAP web service. Scripted SOAP web services are not affected. This field does not affect data policy interaction with REST web services.</td>
</tr>
<tr>
<td>Use as UI Policy on client</td>
<td>If selected, enforces the data policy on the UI using the UI policy engine.</td>
</tr>
</tbody>
</table>

### Table 231: Data policy rule fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table on which the data policy action applies.</td>
</tr>
<tr>
<td>Field name</td>
<td>The field from the specified table to which the data policy will apply.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Read Only</td>
<td>How the data policy affects the read only state of the field. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Leave alone</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False</td>
</tr>
<tr>
<td>Mandatory</td>
<td>How the data policy affects the mandatory state of the field. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Leave alone</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False</td>
</tr>
</tbody>
</table>

**Note:** For tables that are in a different scope than the data policy record, you cannot make a field mandatory.

Create a data policy

You can create a new data policy to define data rules for a table.

Create data policies to enforce consistency. You can create data policies only for tables and database views that are in the same scope as the data policy and for other tables that have at least one field in the same scope as the data policy. For tables that are in a different scope than the data policy record, you can create data policy rules only for fields in the same scope as the data policy and you cannot make a field mandatory.

1. Navigate to **System Policy > Rules > Data Policies**. Alternatively, from any list header or form header, right-click in the header bar and select **Configure > Data Policies**.
2. Click **New**.
3. Select any options for the data policy.
4. Create the condition that must exist for the platform to apply this policy.
   For example, your conditions might include **[Problem state] [is] [Closed/Resolved]**
5. Right-click the header and select **Save**.
   The **Data Policy Rules** related list appears.
6. Click **New** in the related list and create the record that identifies the field and the policy to apply.

![Data Policy Rules](image.png)

It is possible to have multiple rules on a single field, but it is not recommended.

7. Click **Submit**.
8. Optional: Add more rules by repeating steps 6 and 7.

Convert a UI policy to a data policy

An administrator can convert a UI policy to a data policy.

Existing UI policies can be converted to data policies. This enables you to take a policy that currently applies only to records created or updated in the browser and extend the policy to apply to import sets and data imported by SOAP web services, or to apply by default.

For a UI policy to be eligible for conversion to a data policy, the following three conditions on the UI Policy form must be met:
• The **Run scripts** option must not be selected
• The **Global** option must be selected
• None of the UI policy actions can have **Visible** set to **True** or set to **False** (it must be set to **Leave Alone**)

Note that converting a UI policy to a data policy deactivates the UI policy. To retain the policy in the UI, ensure that the **Use as UI Policy on client** checkbox is selected on the data policy record.

1. Navigate to **System UI > UI Policies** and click an existing UI policy.
2. Under **Related Links**, click **Convert this to Data Policy**.

A new data policy record is created.

3. Edit the fields on the data policy record as necessary.

**Convert a data policy to a UI policy**

Converting a data policy to a UI policy is useful if a data policy already exists, but only needs to apply to records created or updated in the browser.
Converting deactivates the data policy - the new UI policy is applied only at the UI layer only and not to import sets or data imported from SOAP web services.

**Note:** An alternative to converting from a data policy to a UI policy is to select the **Use as UI Policy on client** checkbox on the data policy record. This field extends the data policy to the UI. The main difference between converting and using the **Use as UI Policy on client** checkbox is that converting provides the **Visible** field on the UI policy record. Use the **Visible** field to select how the UI policy affects the visible state of the field.

1. Navigate to **System Policy > Rules > Data Policies** and click an existing data policy.
2. Under **Related Links**, click **Convert this to UI Policy**.

A new UI policy record appears.

3. Edit the fields on the UI policy record as necessary. For details about the fields, see *Create a UI Policy*.

**Data policy debugging**

Debug messages can help administrators identify and resolve data policy problems.

Debug messages can help you identify and resolve data policy problems. To view data policy debugging messages at the bottom of the screen, navigate to **System Diagnostics > Session Debug > Debug Data Policies**.
In the example, a data policy is in place to prevent the short description on an incident from being changed when the incident state is set to Open. A user edited the short description while the incident was open and tried to save the changes, but the data policy was enforced.

![Debug Output]

Figure 307: Data policy debug messages

Data lookup and record matching support

The data lookup and record matching feature enables administrators to define rules that automatically set one or more field values when certain conditions are met.

Data lookup rules allow administrators to specify the conditions and fields where they want data lookups to occur. For example, on Incident forms, there are priority lookup rules for the sample data that automatically set the incident **Priority** based on the incident **Impact** and **Urgency** values.

Create custom data lookups

Creating new data lookups involves several steps.

1. **Create a custom data lookup table.**
2. **Add data lookup values to the data lookup table.**
3. **Create a Data Lookup Definition record.**
4. **[Optional] Create a data lookup module.**

**Create a custom data lookup table**
Create a custom table to store lookup data.

The custom table must extend the Data Lookup Matcher Rules [dl_matcher] table. For example, this custom lookup table stores information about VIP callers and incident assignments.

<table>
<thead>
<tr>
<th>Field</th>
<th>Sample value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>VIP Caller Lookup</td>
</tr>
<tr>
<td>Table name</td>
<td>u_vip_caller_lookup</td>
</tr>
<tr>
<td>Extends base table</td>
<td>dl_matcher</td>
</tr>
<tr>
<td>Create new module</td>
<td>True</td>
</tr>
<tr>
<td>Add module to menu</td>
<td>System Policy</td>
</tr>
</tbody>
</table>

**Add a data lookup value to the data lookup table**
The columns of a data lookup table contain both matcher and setter field data.
Each data lookup is a query that searches for a row containing values that match the matcher fields. The data lookup then returns the value listed in the setter fields. For example, this Priority Data Lookup [dl_u_priority] table lists the combinations of impact and urgency (matcher fields) that produce a particular priority value (setter field).

Table 233: Lookup table

<table>
<thead>
<tr>
<th>Matcher fields</th>
<th>Setter field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Impact</td>
<td>Urgency</td>
</tr>
<tr>
<td>1 - High</td>
<td>1 - High</td>
</tr>
<tr>
<td>1 - High</td>
<td>2 - Medium</td>
</tr>
<tr>
<td>1 - High</td>
<td>3 - Low</td>
</tr>
<tr>
<td>2 - Medium</td>
<td>1 - High</td>
</tr>
<tr>
<td>2 - Medium</td>
<td>2 - Medium</td>
</tr>
<tr>
<td>2 - Medium</td>
<td>3 - Low</td>
</tr>
<tr>
<td>3 - Low</td>
<td>1 - High</td>
</tr>
<tr>
<td>3 - Low</td>
<td>2 - Medium</td>
</tr>
<tr>
<td>3 - Low</td>
<td>3 - Low</td>
</tr>
</tbody>
</table>

1. In the navigation filter, enter the name of the new custom lookup table. For example, enter u_vip_caller_lookup.list.
2. Configure the list and create new fields, as appropriate. For this example, create the following new fields:

Table 234: New fields

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Field length or Table to reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Priority</td>
<td>Integer</td>
<td></td>
</tr>
<tr>
<td>Assignment Group</td>
<td>Reference</td>
<td>Group [sys_user_group]</td>
</tr>
</tbody>
</table>

3. From the table list, click New and enter appropriate matcher and setter field values. For example:

Table 235: New matcher and setter field values

<table>
<thead>
<tr>
<th>Matcher field</th>
<th>Setter fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller</td>
<td>Priority</td>
</tr>
<tr>
<td></td>
<td>Assignment Group</td>
</tr>
<tr>
<td>Beth Anglin</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>VIP Issues</td>
</tr>
<tr>
<td>Fred Luddy</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>VIP Issues</td>
</tr>
</tbody>
</table>
Create a data lookup definition record
How to create a data lookup definition record.

2. Click New.
3. Click Data Lookup Rule.
4. Fill in the fields on the form, as appropriate (see table).
5. Right-click the form header and click Save.
6. From the Matcher Field Definitions related list, click New.
7. Fill in the Matcher Field Definitions fields.
8. Click Submit.
9. From the Setter Field Definitions related list, click New.
10. Fill in the Setter Field Definitions fields.
11. Click Submit.
12. Click Update.

For example, the following data lookup definition assigns incidents to the VIP Issues group based on the Caller field. In addition, the incidents are set to critical or high priority based on the caller.

Note: Each row in a data lookup table must be unique.
Data lookup definitions fields

Data lookup definitions fields.

Table 236: Data lookup definitions fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name to identify the definition record.</td>
</tr>
</tbody>
</table>
Geneva    ServiceNow    ServiceNow Platform

Field Description
Source Table Select the table containing the fields you want to automatically update with lookup values. Data Lookup Definitions are not inherited by extension tables. For example, a Data Lookup Definition on the Task table cannot match values on the Incident incident table.

Matcher Table Select the table containing the lookup values. This table should always start with a u_ prefix.

Active Select this check box to run this data lookup rule. Clear the check box to ignore this data lookup rule.

Run on form change Select this check box to automatically look up values whenever a user or onChange client script changes a field value on a source table form.

Note: This does not include changes automatically made by other data lookup rules, such as the Priority Lookup Rules.

Run on insert Select this check box to automatically look up values whenever a user creates a new record.

Run on update Select this check box to automatically look up values whenever a user saves or updates a record.

Matcher field definitions fields

The matcher field definitions determine when a data lookup occurs.

A data lookup only occurs on fields with matcher field definitions. The data lookup uses the values of the source table fields to look up one or more values from the matcher table. Note that data lookup does not work with Journal type fields.

Table 237: Matcher field definitions fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Lookup</td>
<td>Displays the name of the parent data lookup definition record.</td>
</tr>
<tr>
<td>Source table field</td>
<td>Select the field from the source table that contains the data to match.</td>
</tr>
<tr>
<td>Matcher table field</td>
<td>Select the field from the matcher table that contains the data to match.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved. 949
Setter field definitions fields

The setter field definitions determine what fields the data lookup changes when the matching conditions are true.

Table 238: Setter field definitions fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Lookup</td>
<td>Displays the name of the parent data lookup definitions record.</td>
</tr>
<tr>
<td>Source table field</td>
<td>Select the field from the source table that the data lookup updates.</td>
</tr>
<tr>
<td>Matcher table field</td>
<td>Select the field from the matcher table that provides the new value for the update.</td>
</tr>
<tr>
<td>Always replace</td>
<td>Select this check box to replace any existing value with a value from the data lookup. Clear this check box to ignore the update if the field has an existing value.</td>
</tr>
</tbody>
</table>

Create a data lookup module

How to create a data lookup module.

 Optionally, you can create a new module for the data lookup table you created in Step 2 to simplify access to the matcher table records. The module must have these properties:

Table 239: Module properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Required value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the data lookup table you created in Step 2. For example u_vip_caller_lookup.</td>
</tr>
</tbody>
</table>
## Troubleshooting data lookup

If the custom data lookup definition rules are not behaving as expected, check for certain conditions.

- Verify that the data lookup definition is set to run on the appropriate events.
- Verify that the matcher field is not read-only. Since users cannot change read-only fields, user interactions cannot trigger an on form change event for read-only fields.
- Verify a client script is not changing a field value. Client scripts can trigger Run on form change events even on read-only fields.
- Verify that the data in the matcher table is correct.
- If the lookup requires an exact match, verify that there is a matcher table row for each possible combination (including blank values). The lookup fails if cannot find a matching value.
- Verify that you have not created a recursive rule, such as:
  
  If Field A = 1, then Field B =2. If Field B = 2, then Field A = 2

## Activate data lookup and record matching

The Data Lookup and Record Matching Support plugin is automatically active for new instances.

If you upgrade from a previous version, you can manually activate the Data Lookup and Record Matching Support plugin if it is not already active. See [Activate a plugin](#) on page 1233.

---

**Note:** Activating the Data Lookup and Record Matching Support plugin replaces the calculatePriority business rule with a priority data lookup definition, but does not transfer any custom logic. If you manually activate the plugin, you must recreate any custom business logic that uses the priority lookup rules.

---

## Suggestion fields

A suggestion field allows users to select predefined text in addition to entering text.

Suggested text can be configured for any text or journal field.

## Use a suggestion field

A suggestion field allows users to select predefined text in addition to entering text.

Role required: none

Any text or journal field may offer suggested text, depending on setup.

1. Click the light bulb icon next to a suggestion field.
2. Click the suggested text to enter. For long text fields, select a label to view suggested text and then click **Select** to enter the response.
Add a suggestion field

You can add a suggestion field to a form.
Role required: personalize_dictionary

1. Open the form to which you are adding a suggestion field.
2. Add a new field or locate an existing field.
3. Right-click the field label and select **Configure Dictionary**.
4. In the **Choice** field, select **Suggestion**.
5. Click **Update**.

Configure suggested text for string fields
Suggestions are configured differently depending on field type.

Role required: personalize_choices

You can configure the suggested text options for string fields.

1. Right-click the field label and select **Configure Choices**.
2. Using the slushbucket, select options and the order in which you want them to appear.
   - To create a new option, enter the suggested text in the **Enter new item field** and click **Add**.
   - The **Apply to Table** field is available when the current table extends another table (for example, Incident extends Task). This field allows suggested text options to be configured for all tables that extend the parent or for only the current (child) table.
3. Click **Save**.
4. To edit existing options, right-click the field label and select **Show Choice List**.
Configure suggested text for journal fields
Suggestions are configured differently depending on field type.
Role required: personalize_dictionary

You can configure the suggested text options for journal fields (field types that begin with Journal).

1. Right-click the field label and select **Configure Responses**.
2. Click **New**.
3. Enter a label, or brief description, for the option.
4. Enter the complete text in **Response text**.
5. Click **Save**.
Currency administration

Currency fields provide features for handling display and calculations of currency values.

A currency field holds a value, a currency code, and a reference currency value.

- The currency code is a three-letter ISO code that identifies the currency in which the value is specified.
- The reference currency value is a number representing the currency value in the reference currency. The reference currency value is calculated by a rate conversion when the currency value is saved.

A price field is similar to a currency field, but with special features for conversion and display. To learn more, see Price fields on page 957.

Locale settings

There are two locale settings, system and user. The system locale determines the reference currency, and the user locale determines the session currency.

The system locale is set using the glide.system.locale property. The value is of the format Language.Country where the language is an ISO 639 language code and the country is an ISO 3166 language code. Internally, this value is used as specified by Java. The system locale setting should be in the Java supported locales list. The system locale should be set once on a fresh zboot because reference currency values in currency fields are assumed to be in the currency implied by the system locale.
**Note:** Do not change the system locale after currency values have been entered into the instance. When you change the system locale, the reference currency values are not adjusted, that is, there is no rate conversion. This persistence results in invalid aggregations and filtering.

The user locale is determined by the following, in order of consideration.

- User record in which both country and language are specified.
- System locale set using the property glide.system.locale.
- Browser locale.

### Session and reference currency

The system uses two kinds of currency, session and reference.

The session currency is defined for the user by the user's locale or single-currency mode. The reference currency is determined by the system locale. The reference currency is a standard used across the entire instance. Each time a value is entered in a currency or price field, the system stores three pieces of information:

- The value as entered, in the user's locale.
- The currency code, in the user's locale.
- The value converted to the reference currency using the current exchange rate.

**Note:** In multiple-currency mode, the currency code saved in currency field may not be the same as the session currency code. For example, the session currency could be the Euro and the number entered could be the Japanese Yen.

### Session currency

When users view a currency value, they can see the value as entered or in the session-currency format. The format contains:

- The currency symbol
- The value converted to the session currency and shown in a localized number format.

The user's locale determines the session currency format.

The number format can differ in features such as the decimal separator based on the locale; for example, the US formatting is 1,234,567.89 while German formatting is 1.234.567,89. The session currency is determined by the following, in order of consideration:

- Single-currency mode setup using glide.i18n.single_currency and glide.i18n.single_currency.code.
- The default currency for the user's locale.

### Reference currency

In order to perform calculations on heterogeneous currency values, the platform stores currency values converted to a system currency, referred to as the reference currency. Every currency field in the system contains a reference currency value. The reference currency is determined by the following, in order of consideration:

- The system locale set using the property glide.system.locale
• The Java default locale, typically en.US

The filtering and aggregation features use the reference currency value to perform calculations on default currency fields. This can yield inaccurate results because of conversion rate changes.

**Issues with currency fields**

Users are often confused by the results of filtering, sorting, and displaying currency fields because the system works with at least two currencies for each value: the session currency and the reference currency.

**Note:** Aggregations and filtering of currency fields use the reference currency, and the user sees the session currency. Because of changing conversion rates, the filtered reference currency values might not result in the same order as the session currency values would suggest. The same issue happens with aggregations.

The user might see the following issues:

• Lists filtered on currency fields might not be in the expected order because the reference currency values are used for filtering but session currency values are displayed.
• Aggregation of currency fields might not produce the expected results because reference currency values are aggregated and then converted to the session currency.
• Currency values might not be formatted as expected because currency values are formatted based on the user’s locale and not on the currency code

The confusion is caused by the difference between session and reference currencies, changing conversion rates, and different session currencies used by different users.

**Single-currency mode**

Single-currency mode allows all users of the platform to see currency values in the same currency.

Before enabling single-currency mode, the system locale must be set. See [Locale setting](#) for valid locale formats.

To configure single-currency mode, set the following properties:

• i18n.single_currency – true or false
• i18n.single_currency.code – the three-letter ISO currency code
• The system locale – glide.system.locale

Single-currency mode has the following limitations:

• Single currency mode changes the currency in the user views and does not change the number formatting. Even through users in different countries see currency values in one currency, the number formatting (as determined by the user’s locale) might not be what they expect.
• Because currency value input is constrained to the single currency, price fields cannot be used.

The effects of rate conversions can be avoided by setting the system locale and the reference currency to be the single currency.

**Price fields**

A price field is a currency field that enables control over conversions and display. The Service Catalog uses price fields.
The conversion and display selections can be chosen per price field and can be changed at any time. There are three variations:

- Calculated [Default]: Behaves the same as the currency field type. Whenever conversions are performed, the latest currency conversion rates are used. When the price field is displayed, it is shown in the user’s session currency.
- Fixed: When the price field is displayed, it is shown in the currency code used when the value was entered. Whenever conversions are performed, the latest currency conversion rates are used.
- Multiple: Enables you to enter multiple price values for an item using a different currency for each price. The field’s value is the value entered in the user’s session currency; otherwise, the first price entered is converted to the user’s session currency. Whenever conversions are performed, the latest currency rates are used. Note: The first value entered is used during display. The additional values are not used during calculations.

For examples of using price field, refer to the tables used in Service Catalog.

A price field’s currency code and numeric value can be changed in a form. An edit icon is shown next to the price field. Clicking the edit icon displays a form that can be used to edit all details of the price field:

- Currency: List of currencies enabled in the system in the combo box. In single currency mode, the currency is a label and cannot be changed.
- Amount: Numeric value formatted in the user’s locale
- Type: Combo box with calculated, fixed, multiple
  - When the price type is changed to multiple, the system creates child records for all currencies enabled in the platform populated with values converted from the amount field using latest currency conversion rates.
  - In single currency mode, the type cannot be changed.
  - The price type can be modified any time.

Currency values in lists

In lists, currency values are displayed in the user’s session currency formatted for display in the user’s locale. Typically the currency symbol is followed by a formatted number.

Different field types appear as follows:

- Currency field type: Value in user’s session currency
- Price field type/Calculated: Value in user’s session currency
- Price field type/Fixed: Value in currency as entered by the user
- Price field type/Multiple: Value associated with the user’s session currency if this value exists; otherwise, the first value entered is converted to the user’s session currency

A Globe icon is displayed beside the currency value that enables the value to be changed to one of the following values:

- Value as entered by the user
- Value in session currency
- Value as entered and, in brackets, the value in reference currency.

The icon appears when the user’s session currency is different from the currency entered. Clicking the icon cycles through the listed displays.

In the preview for the record, currency values are shown as entered, formatted for display in user’s locale.
**Aggregation**

Aggregation operations can be used on currency columns. Aggregation operations include total, group by, average, minimum, and maximum. Aggregation is done in two steps:

- Aggregate the reference currency values for all records
- Convert this aggregate to the user’s session currency for display

**Note:** Because the conversion rate between the currency field’s value (what is displayed) and its reference currency value (used for the aggregation) might have changed, the result may not be what the user expects.

This limitation extends to different price types.

- For price type fixed, the calculated reference value can be old.
- For price type multiple, the reference value of the first price entered is used. The other values are not used.

The aggregate value is shown formatted in user’s locale with a currency symbol.

**Filtering**

You can set up filters on currency fields. The currency value is entered as a currency code and numeric value. Filtering is done in two steps:

- The filter currency value is converted to the reference currency.
- The filter’s calculated reference value is compared with the reference value in the records.

Matching records are shown in the list view.

**Note:** Because the conversion rate used when the filter is run might be different than the conversion rate used when calculating the reference values in the individual records, filtering results might not provide the expected result.

This limitation extends to different price types.

- For price type fixed, the calculated reference value can be old.
- For price type multiple, the reference value of the first price entered is used. The other values are not used.

**Currency values in forms**

In forms, currency values are shown in the currency in which they were entered.

In forms, a combo box gives the list of currencies available in the system. The format is determined by the user’s locale. When entering or changing the numeric value, format the value in the format specified by the user’s locale. In the form for a new record, the combo box with the list of currencies has the reference currency selected, and the numeric value set to zero.

If the record is read only, the currency value is shown as entered and formatted for display in the user’s locale. A price field shows the session currency value.

In single currency mode, the currency is a label and cannot be changed. The form for editing the details of fields previously mentioned cannot be accessed because the edit icon is not shown.
Editing the currency instance table

For users who can edit the currency instance table (fx_currency_instance), an edit icon appears next to the field. Users with the financial_mgmt_user role can edit the values associated with the currency field.

**Note:** Do not edit the fx_currency_instance table directly. The platform maintains this table, and your changes could have unintended consequences.

Currency values in reports

Currency values in reports are in the user’s session currency formatted in the user’s locale with a currency symbol.

The user depends on how the report is run.

- Shared report: The user who runs the report
- Scheduled report: Generally run as the user who scheduled the report

The two user-specific values in the report are:

- User session currency
- Converted value

**Note:** A user that has a different session currency than the person who runs a report might receive unexpected results.

Currency conversions

Currency values may be converted to other currencies when stored and accessed.

Conversions may happen in these situations.

- The currency value is converted to reference currency when stored, whether on insert or update. This means that the reference currency value is saved as well as the currency value.
- The currency value is converted to the user’s session currency for display.
- The value entered for a filter from currency specified in the filter is converted to the reference currency.

Conversion rates are stored in the fx_rate table. Each record contains the conversion rate from a given currency to the Euro. The rates are updated daily from the ECB website by a scheduled job called ECB Exchange Rate Load.

A currency conversion from one currency to another involves two rates

- Rate to convert from the first currency to Euro
- Rate to convert from Euro to the second currency

Whenever a conversion is performed, the platform uses the latest conversion rates. Therefore, calculations can potentially yield unexpected results. For example:

- Different currency values can have different rates applied to them while storing the reference currency value. Aggregation therefore can combine values at different rates and convert back at another rate.
- A filter value is converted at current rates while the values it filters in the database can be converted at different rates. A filter for $100 at today's rate can match a value of $99 obtained at yesterday’s rates.
Set a conversion rate

ServiceNow downloads a currency conversion table from the European Central Bank nightly by default. You can adjust the frequency of this behavior or disable it entirely.

1. Navigate to System Scheduler > Scheduled Jobs.
2. Open the job named ECB Exchange Rate Load.
3. Modify the schedule, as needed.
   After the job runs, rates are stored in and loaded from the Exchange Rate [fx_rate] table. Navigate to System Localization > Exchange Rates to see them.

Use your own conversion table

ServiceNow bases all currency conversions on the rates stored in the Exchange Rate table.

1. Navigate to System Scheduler > Scheduled Jobs.
2. Open the job named ECB Exchange Rate Load.
3. In the Trigger type field, select -- None --.
4. Enter new exchange rates either manually or with an import set.

Currency values in import and export

In general, currency values crossing the boundaries of the platform are represented in the user’s session currency and formatted in the user’s locale.

Import

Currency values are imported as strings just like other fields. The default transform mapping to a currency field uses `setDisplayValue()`. The expected format for this function is:

- A number formatted in the user’s locale: this is taken as a value in the user’s session currency, for example, 1,234.56.
- The number prefixed by the three-letter currency code separated by a semicolon, for example, EUR;1,234,56.

This behavior can be customized in transform map scripts.

Export

Currency values are exported in the user’s session currency formatted in the user’s locale except when exporting as XML. When exporting currency in XML, the value is in the reference currency value with no formatting.

Currency values in scripts

You can use currency fields in scripts.
These methods are available on GlideElement objects.

To display currency values, use the display APIs (getDisplayValue()). To work with currency values in any way other than display, use the APIs that return/accept unformatted numbers.

**Note:** Do not use the getDisplayValue() methods and then process the string to remove formatting information before performing calculations on the value.

Methods such as getValue() and getCurrencyValue() return unformatted numbers as strings. The floating point value can be obtained by using the JavaScript function parseFloat(). The resulting value can be used to perform calculations. The currency associated with these values can be obtained by the APIs that return the currency code. You can also use the getCurrencyCode() methods to determine a field's currency.

```javascript
var rate = parseFloat(current.base_rate);
var currencyCode = current.base_rate.getCurrencyCode();
```

Use the setValue() method to set the value of a currency field. If the currency is the user's session currency, use a plain number (either floating point number of a string containing it), otherwise prefix the value with the 3-letter ISO currency code.

```javascript
var totalCost = rate*current.hourly_rate;
currency.total_cost.setValue(currencyCode + "\;\;" + totalCost);
```

When you use GlideAggregate on currency or price fields, you are working with the reference currency value. Be sure to convert the aggregate values to the user's session currency for display. Because the conversion rate between the currency or price field's value (what is displayed) and its reference currency value (used for the aggregation) might have changed, the result may not be what the user expects.

When a record containing a currency value is deleted, the platform deletes any associated currency records.

**Note:** Do not use deleteMultiple() on tables with currency fields. Always delete each record individually.

In the following table, the example values use a currency value of 21345.67 in Japanese yen (1563.72 in Euros and 1152.48 in US dollars) with the user's locale set to German (de.DE) and reference currency set to USD.

<table>

</tr>
<tr>
<td></td>
<td>• <strong>Learn more:</strong> <a href="#">Locale settings</a> on page 955</td>
</tr>
</tbody>
</table>
By default, the ServiceNow ITSA Suite uses US standard formatting (e.g., our current default is the US Dollar sign $ displayed with two decimal places: $100.00). By customizing your locale, you can make things such as currency appear as you expect. For example, in France, one might wish to see 100,00 € instead of $100.00.

Set the instance locale

Role required: admin

1. Navigate to System Properties > System Localization.
2. Enter the locale code to use under Locale code to use for localization. Format is [language code]. [country code] (e.g. en.GB for Britain fr.FR for France, de.DE for Germany, or ja.JP for Japan).

<table>
<thead>
<tr>
<th>Country</th>
<th>Locale code</th>
</tr>
</thead>
<tbody>
<tr>
<td>United States</td>
<td>en.US</td>
</tr>
<tr>
<td>Great Britain</td>
<td>en.GB</td>
</tr>
<tr>
<td>France</td>
<td>fr.FR</td>
</tr>
<tr>
<td>Germany</td>
<td>de.DE</td>
</tr>
<tr>
<td>Japan</td>
<td>ja.JP</td>
</tr>
</tbody>
</table>

3. Click Save.

Internationalization support

ServiceNow supports multiple languages, using UTF-8 for international characters.

When a user logs in, the system uses either the system default language or the language specified in the user record. This setting determines the language in which forms and messages are displayed throughout the session.

Language internationalization support

The ServiceNow system supports multiple languages, using UTF-8 for international characters.

When a user logs in, the language for the instance session is determined by the following logic:

1. If the language selection at login is enabled, that language is used.
2. If not, the language preference selected using the language picker in the header bar is used.
3. If not, the user’s language setting in the User [sys_user] table is used.
4. If none of the above are true, the system default language is used.

Some areas of the system are not translated, including journal fields, report titles, and any field that stores free-form text. These fields remain in the language used to create them.

When creating a custom field, you must add the labels in the Field Label table because they are not added automatically.
Table 243: FAQ

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Will my custom fields be translated?</td>
<td>When you create a field, it does not create a translated label. Labels for custom fields are created with a language of English (en). You can, however, translate the fields manually.</td>
</tr>
<tr>
<td>I am not seeing journal fields translated.</td>
<td>User-defined string fields, such as short description, additional comments, and report titles are not translated. They appear in the language they were created in.</td>
</tr>
</tbody>
</table>

Global language
You can set the default language.

Before selecting a new default language, activate the plugin for the desired language in System Definition > Plugins. The default global language for the system is set in System Properties > System Localization. This property defines the language that users see if a language is not specified in their user record.

![Default language for the system (two character values):](image)

User specific language
The user has several choices for identifying the language to be used for the instance, as described here.

- Language picker at login: If user-specific language is enabled, users see a choice list on the login page to select their language. To control display of the choice list on the login page, navigate to System Properties > UI Properties and use the property Show the language select box on the login page to allow the user to specify the language they would like to be logged in with.
- Language picker in the welcome banner: When an internationalization plugin is enabled, users can select their language in the language picker in the welcome banner.
- Language setting on the user table: If you have users that require a different language in addition to the global language, you can specify a language for them in User Administration > Users. If the Language field isn’t already on the form, you can configure the form and add it.

The Language field in the User [sys_user] table overrides the default global language for that user’s sessions.
Figure 309: User language

**Note:** Setting the language for the system guest user sets the language for both the login page and all users without a user role.

**Translation tables**
ServiceNow stores translation information in these tables.

- Languages [sys_language]
- Translated Name / Field [sys_translated]
- Message [sys_ui_message]
- Field label [sys_documentation]
- Choice [sys_choice]
- Translated Text [sys_translated_text]

**Note:** The Languages table is available only after I18N:Internationalization has been activated.

**Languages table**
The Languages [sys_language] table contains a list of the languages for which translated text is available.

To enable translation to a new language, add a record to the Languages table. The main fields for this table are:

- Name: language name.
- ID: two-character ISO 639.2 code for the language.
- Text Direction: direction of text in this language.
- Active: indicator that shows whether the language has been activated (true) for this instance or not (false).
Configure a language as reading from right to left
Use the Text Direction field to configure a language that reads from right to left, such as Hebrew.

Role required: admin

Right-to-left language support is available only in the main user interface and on live feed. Other user interfaces and applications, such as the graphical workflow editor, reporting, CMS, chat, and the ServiceNow documentation sites, are not supported.

1. Navigate to System Localization > Languages.
2. Click New.
3. Enter the Name of the language, such as Hebrew.
4. Enter the two-character ISO 639.2 ID for the language. For example, Hebrew is he.
5. In the Text Direction field, select Right-to-Left.
6. Click Submit.

Translated Name / Field table
The Translated Name / Field [sys_translated] table stores translated values for text fields where the field type is translated_field (see the dictionary entry).
This option is available for text fields up to 255 characters in length. Some examples are names, titles, and short descriptions. The main fields for this table are:

- Table: name of the table this translation applies to.
- Element: name of the field this translation applies to.
- Label (translate): translated text that users see on forms and lists.
- Language: two-character ISO language code for this translated text.
- Value: English value that causes this translated text to be displayed. For example, the first item in the illustration represents the text of a multiple choice answer in a survey. If the English text is D – Poor and the current ServiceNow session uses French, that choice appears as D – Faible.
The Message [sys_ui_message] table contains the translations for informational messages, confirmation messages, error messages, and other types of system messages.

ServiceNow checks this table for translated text when a client script contains a `getMessage` call or a server script contains a `gs.getMessage` call. The main fields for this table are:

- **Application**: name of the application this message appears in.
- **Key**: internal unique identifier of this message.
- **Language**: language the message is translated into.
- **Message**: translated text that users see.

**Figure 313: Message list**
Field Label table

The Field Label [sys_documentation] table stores the text of table names along with the singular and plural labels for each field in the table.

For each table name and field label, the Field Label table contains a record for each installed language. ServiceNow uses the table and field names from this table to display lists and forms in the proper language. The main fields for this table are:

- Table: name of the table this translation applies to.
- Element: name of the field this translation applies to.
- Language: two-character ISO language code for the translated text.
- Label: translated text that users see.
- Plural: plural of the label.
- Help: reserved for future use.
- Hint: text that pops up when the cursor rests on the field.
- URL: URL for a web page that provides information about the field. When a URL is provided, the field label displays a help icon ( ).
- URL target: location where the URL appears, if a URL is given. If this field is empty, the URL opens in the current tab or window when a user clicks the help icon. If the field contains the code _blank, the URL opens in a new tab or window when a user clicks the help icon.

The main fields for this table are:

- Table: name of the table this translation applies to.
- Element: name of the field this translation is used for.
• Language: two-character ISO language code for the translated choice.
• Value: English description of this choice.
• Label: translated text that users see for this choice.

Figure 317: Choice list

Figure 318: Translated choice list

Translated text

The Translated Text [sys_translated_text] table stores translations for fields with the field type translated_text or translated_html (see the dictionary entry).

This field type is typically used for long text fields, up to 6500 characters in length, such as survey name and introduction. The main fields for this table are:

• Document: internal identifier of the record this translation applies to.
• Field name: field this translated text appears in, for example, Close notes.
• Language: language the text is translated into.
• Table Name: table this translation applies to.
• Value: translated text that the user sees.
Show translated strings

When setting up translations for the different areas of your instance, a property can be turned on that allows you to easily determine which table you need to add the translated label to.

Role required: admin

1. Navigate to **System Properties > System Localization**.
2. Select Display translation prefix on translatable strings.

Displays translation prefix on translatable strings.

- Yes
- No

3. After activating the property, refresh your browser.
4. Following the refresh, the following prefixes appear on fields, labels, and messages that have been translated internally.
Translate new customizations
When using one of the Internationalization plugins, most of the fields in the instance are automatically translated. However, customizations are not translated automatically, and need to be translated by hand. In this case, it is best to locate the individual untranslated strings, and insert those translations manually.

Below are three tools for locating untranslated strings:

- Displaying prefixes for translatable strings
- Exporting untranslated strings
- Using the translate and learn property

Locate translatable strings

These tables contain translatable strings, described more at length in Internationalization support on page 965:

- Translated Name / Field [sys_translated]
- Message [sys_ui_message]
- Field Label [sys_documentation]
- Choice [sys_choice]

Display a translation prefix
Translation prefixes indicate where to find the string for translation.

Role required: admin

1. To enable prefixes on field labels for the current user session, navigate to System Localization > Enable I18N Debugging.
2. To disable prefixes for the current session, navigate to System Localization > Disable I18N Debugging.
• For the prefix TRF, navigate to **System Localization > Translated Names / Fields.**
• For the prefix MSG, navigate to **System Localization > Messages.**
• For the prefix GMLD, navigate to **System Localization > Field Labels.**
• For the prefix TRT, navigate to **System Localization > Translated Text.**
• For the prefix CHC, navigate to **System Localization > Choices.**

Some few strings may not display translatable prefixes. This means that the string is not stored on any of these four tables. This behavior occurs with text embedded in images, such as the buttons in the Service Catalog, or text defined by properties, such as the text which follows the banner.

You must refresh your browser after accessing one of these modules to apply the change.

**Export an untranslated string**

One method for easily translating customizations is to export all of the translated names and fields, messages, field labels, and choices that only have English translations.

Role required: admin

To aid in this, there are four modules for the **System Localization** application menu that are inactive by default.

• Customizations
• Translated Name / Fields
• Messages
• Field Labels
• Choices

1. Perform the appropriate action for your version of the UI:

| UI16 | 1. Navigate to **System Definition > Application Menus.**  
|      | 2. Select **System Localization.** |
| UI15 or UI11 | Right-click the **System Localization** application menu and select **Edit Application Menu.** |

2. Use the list editor to set the **Active** field to **True** for the modules.
After the application navigator refreshes, the modules appear. Now it is possible to export the list of untranslated fields by viewing each of the lists and exporting it to any supported format.

Use the translate and learn property

The glide.translate.learn system property, when set to true, creates records in the translate tables when an instance encounters text that should be translated, but no corresponding record exists. You can use this property to help locate untranslated strings.

**Note:** Using this method hampers the use of the exporting untranslated strings method.

For example: A user switches to the French language and opens a record. When loading the form, the instance looks at the Translated Field table to find the French translation for each field. If an appropriate translation record is not found, the instance automatically generates a stub record for that missing data, which can be manually translated.

The following HR application is missing translations for two modules:

![Image](image.png)

**Figure 320: HR application missing translations**

The suffix [fr] indicates that there is a French translation missing. Because translation prefixes are enabled, the prefix **TRF:** indicates that the entry can be found in the Translated Name / Fields table. The following image shows untranslated modules, located using the filter **[Label (translate)] [contains] [fr]:**

![Image](image.png)

**Figure 321: Example untranslated modules**

**Service catalog buttons**

You can specify language-specific messages for buttons in these service catalog screens: Cart, Edit Cart, and Check Out (including workflows and approvals).

The text for the buttons is stored on the "Messages" table.
Activate a language

By default, the language supported by the platform is American English. You can activate other supported languages if you have the admin role.

The following plugins are currently available:

- I18N: Brazilian Portuguese Translations
- I18N: Czech Translations
- I18N: Dutch Translations
- I18N: Finnish Translations
- I18N: French Canada Translations
- I18N: French Translations
- I18N: German Translations
- I18N: Hebrew Translations
- I18N: Hungarian Translations
- I18N: Italian Translations
- I18N: Japanese Translations
- I18N: Korean Translations
- I18N: Polish Translations
- I18N: Portuguese Translations
- I18N: Russian Translations
- I18N: Simplified Chinese Translations
- I18N: Spanish Translations
- I18N: Thai Translations
- I18N: Traditional Chinese Translations
- I18N: Turkish Translations
In addition, the I18N: Internationalization plugin provides the elements necessary for translating an instance without any translation preloaded. This plugin is useful for translating an instance to a language other than those listed above. For more information on using the I18N: Internationalization plugin to translate an instance, see Translate an instance.

**Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

Use the following steps to activate the desired language plugins.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

**Localize price in the service catalog**

The ServiceNow service catalog fully supports localized currencies for item prices and options.

**Note:** ServiceNow has the concept of a system basis currency: the system default currency, based on the global locale property. All currency values are automatically converted to this basis currency before aggregation or conversion. Do not change the global locale setting after you have data in the system, as this can cause aggregations to calculate and display incorrectly under some circumstances.

ServiceNow supports two similar but different money field types, both of which are used in the service catalog.

**Price:**

A price represents the cost of the catalog item. A computer might cost $1000, or the provisioning of an email account may require an $80 chargeback.

ServiceNow supports these pricing models:

- **Calculated:** [Default] the price of an item is always quoted based on the user's locale. For example, a UK user sees the price of her computer in pounds, while a Japanese user sees his price in yen. The numeric value of the price is adjusted using the most current exchange rates on file.

  The locale is based on the Country code field [sys_users.country] on the user record. If this field is not set, the locale is taken by default from the instance locale, as defined by the locale code to use for localization [glide.system.locale] property.

- **Fixed:** the price of an item is always quoted in a particular currency. An item priced at $1,000 is always priced at $1,000, even if viewed by a UK or Japanese user.

- **Multiple:** a fixed price is specified for each currency. For example, you can specify that all US users pay USD 1000 for a computer, while the Japanese price is JPY 120,000, regardless of exchange rate.

**Note:** If no fixed price is set, ServiceNow uses the calculated price (default).
Currency:

A currency field represents an actual spend, that is, a discrete quantity of money spent at a particular point in time. ServiceNow keeps track of the currency that was actually spent, and the time it was spent.

On a related list, a currency field uses one of these modes. Toggle between them by clicking the globe icon next to the currency field.

- **As spent**: displays the amount in the currency that was spent. This may mean that some items in the list show yen, while others show pounds or dollars, for example, £100.00.
- **Calculated**: displays all amounts in the session display currency, for example, $137.86.
- **Reference**: displays all amounts in the currency entered and includes the system basis currency in square brackets, for example, £100.00 [$137.86].

On a form, a currency field always displays the amount in the currency entered.

**Note**: If you reference a currency field in script, its reported value is whatever the current user’s session would show. There are also several utility functions you can call against a currency field to get data back in a variety of forms. For more information, see *Scripting Currency and Price Fields*.

### Calculated currency

For price fields using the calculated currency model, the system converts the price you enter into whatever is appropriate for a particular user’s locale.

For example, in this case we’re specifying a calculated currency and we’ve entered the value of $500.

![Figure 323: Bb calculated](image)

**Figure 323: Bb calculated**

If we then view our catalog item as a UK user, we’ll see a price in pounds, in this case £362.67.

![Figure 324: Bb calculated pounds](image)
Fixed currency

For price fields using the fixed currency model, the price displayed is in the specific currency that you select.

In this example, we’ll specify that the price of the Blackberry should always be quoted in Euros.

![Currency Price](image)

**Figure 325: Currency Price**

If we view the item as a UK user, we see Euros. Note that users’ carts always display in their session currency, so the blackberry that was placed in this cart is priced in GBP.

![Catalog Item Price](image)

**Figure 326: Catalog Item Price**

Multiple currency model

For price fields using the multiple currency model, you specify a fixed price based on locale.
For example, in this model, we specify that the item costs USD 500, but GBP 450, regardless of current exchange rates.

Figure 327: Multiple currency price

If we then proceed to view this as a UK user, instead of seeing a price of about 365 pounds (which is what we’d get if we converted USD 500 into pounds at the time of this writing), we instead see the price of exactly GBP 450.

Figure 328: Catalog item fixed price

Display currencies to catalog users

You can specify that an item and its options use any of the pricing models described.
For example, set a fixed price for the default iPhone item in pounds (£), and it always appears in pounds (£), even for a US-based user. The same is true for variables with pricing implications. If you specify a fixed price on the options, then ServiceNow displays the option in that currency on the form for ordering the item.

However, prices of items displayed to end users in the shopping cart and checkout screens are always shown in the logged-in user’s session currency. For example, if a US-based end user adds a £100.00 item to his cart, the shopping cart shows the equivalent value in US dollars.

**Reporting**

Currency and price fields can be queried and reported.

Reports and aggregations always display values in the reference currency.

**Default Reports**

ServiceNow provides two reports that address service catalog spending:

- **This Year’s Spending by Department**: spending for the previous 12 months, broken down by month and department.
- **This Year's Spending by Location**: spending for the previous 12 months, broken down by month and requester location.

To run these reports, navigate to **Reports > View / Run** and go to the Requested Item section.

**Creating Custom Reports**

When creating custom reports, consider:

- Reports display currency values converted to the currency of the user running the report. A shared report displays in Euros when run by a German, but in US dollars when run by an American. Currency conversions do apply.
- Scheduled reports generally run as the user who scheduled them. So a report scheduled by an American and emailed to three Europeans shows values in US dollars.

For more information, see **Create or edit a report**

**Use locales**

ServiceNow uses the language and country specified in the user record to determine the currency and pricing model for a particular user.

If these records are incomplete or incorrect, currency and pricing models are based on the default locale. For more information, see **Define locales** on page 964.

**Set prices**

The Price field on catalog items uses the price data type, meaning that catalog items and lists of catalog items show localized prices.

By default, price fields use the calculated pricing model, meaning that regardless of the currency used to enter the price, ServiceNow converts that value to the user’s session currency and displays that converted value to the user.

When defining catalog items, catalog administrators can specify a currency and a value for the item, and can alter the pricing model by clicking the **Edit** link beside the Price field on the Catalog Item form.
Set a conversion rate

ServiceNow downloads a currency conversion table from the European Central Bank nightly by default. You can adjust the frequency of this behavior or disable it entirely.

1. Navigate to System Scheduler > Scheduled Jobs.
2. Open the job named ECB Exchange Rate Load.
3. Modify the schedule, as needed.

After the job runs, rates are stored in and loaded from the Exchange Rate [fx_rate] table. Navigate to System Localization > Exchange Rates to see them.

Use your own conversion table

ServiceNow bases all currency conversions on the rates stored in the Exchange Rate table.

1. Navigate to System Scheduler > Scheduled Jobs.
2. Open the job named ECB Exchange Rate Load.
3. In the Trigger type field, select -- None --.
4. Enter new exchange rates either manually or with an import set.

Use translated text

Each instance can be localized, translating the instance to the instance's local language.

Translated text fields allow the same field to display different content based on the user's language.

There are two different translated text fields:
- Translated Text
- Translated HTML

These fields operate the same as text and HTML fields respectively, except that they can store multiple inputs in multiple languages.

The most frequent uses of translated text fields are in the Knowledge Base (e.g. article titles or content) or the Service Catalog (e.g. names, descriptions, or variables). The Knowledge Base also has an option for internationalization with the Knowledge Management Internationalization Plugin, which allows for language-specific articles rather than translating articles.

Note: The type is translated separately from Translated Text and Translated HTML fields.

Administer translated text fields

There is a slight performance penalty associated with changing a normal HTML or text field into a translated HTML or text field. It is best only to use translated fields if the translated capability is required.

English language text is stored in the master table, but the values of other are stored in the sys_translated_text table. Each translated field on every row has one or more entries in the sys_translated_text, one per language for which ServiceNow provides a translation.

Key Fields in the Translated Text [sys_translated_text] Table:
- tablename -- the table to which this translation belongs, e.g., problem
- fieldname -- the field to which this translation belongs, e.g., workaround
- documentkey -- the sys_id of the row to which this translation belongs, e.g., the sys_id of PRB00008
Translate the content of a translated text field

After a translated text field or translated HTML field has been created and is in use, it displays English when viewed in a different language until the content is translated.

Be sure to confirm that the field is in fact a translated text field, and not a regular text or HTML field, for example, by right-clicking the field and choosing Personalize Dictionary.

The method below works best for one-off translations. To translate large numbers of translated text fields, use the Exporting Untranslated Strings method.

1. Use the language picker to switch to the language the field's content is being translated to.
2. Navigate to the field on the form.
3. Replace the English text with the text of the target language.
4. Submit.

Now the text will display English when the user's language is English and in the new language when the user's language is set to that new language.

System localization

Localization allows administrators to accommodate users from a variety of different countries, using different languages and currencies, within the same instance.

The platform supports internationalization of language and localization of currencies and prices wherever they appear.

Set localization properties

System properties to localize the instance for users from multiple countries.

Role required: admin

Some localization properties only appear after the I18N: Internationalization plugin is activated.

1. Navigate to System Properties > System Localization.
2. Set these properties

<table>
<thead>
<tr>
<th>Table 244: Customization properties for system localization</th>

- **Options**: ISO 4217 three-letter currency code  
- **Default value**: USD  
- **Learn more**: Currency administration on page 955 |
Locale code to use for localization.
glide.system.locale

Determines the system's default currency into which all prices are automatically converted before other sums or conversions are performed. Changing this property after any price or currency fields have been given a value may result in improper conversion or prices that sum incorrectly.

- **Options**: [language code].[country code] (for example, en.GB for Britain, fr.FR for France, de.DE for Germany, or ja.JP for Japan)
- **Default value**: None
- **Learn more**: Locale settings on page 955

---

Add the labels, messages, or choices to the appropriate table in English with an ending of the language code for newly added customizations that are missing translations. (Translate and Learn).
glide.translate.learn

Adds the current language suffix to UI elements such as labels and messages. Enabling the language suffix assists with translating new customizations.

- **Options**: Yes | No
- **Default value**: No
- **Dependency**: The I18N: Internationalization plugin must be active
- **Learn more**: Use the translate and learn property on page 976

---

Spell checker dictionary to use for English users.
glide.spell.dictionary.en

Sets the spell checker dictionary used in the system for English users.

- **Options**: Brazilian Portuguese, Dutch, English US, English UK, French, German, Italian, Portuguese, Russian, Spanish, and Thai
- **Default value**: English US
- **Learn more**: Locale settings on page 955

---

**Currency localization**

Currencies can be defined within the System Localization application, and can have their exchange rates loaded from the European Central Bank.

Once the Currency Support for Service Catalog Plugin has been installed, the service catalog can convert catalog item prices into the currency of the user's locale code, or can display a fixed price that will display in the same currency regardless of who is viewing it.

© 2017 ServiceNow. All rights reserved.
Location setup

If your organization supports more than one distinct location, you can configure these locations in the ServiceNow ITSA Suite to help further identify users, assets, incidents, and so on.

To see available locations for your company, navigate to **User Administration > Locations**. Click the New icon (![](images/new_icon.png)) to add a new location:

![Figure 329: Adding a new location](images/location_setup.png)

When done, click the Submit icon (![](images/submit_icon.png)). Your new location will now be available to you anywhere you can specify one.

Translate an instance

ServiceNow provides a series of Internationalization plugins, each of which translate most of the instance into a particular language.

Administrators can also translate an instance into languages other than those provided in the internationalization plugins.

**Activate the I18N: Internationalization plugin**

The first step in translating an instance is to install the elements required for translation, including tables to hold the translations, language pickers to allow users to switch between languages, and import set tables and transform maps to aid in importing translations. These elements are all provided in the plugin I18N: Internationalization.

**Request Survey Wizard**

**Create a new choice record**

This record allows users to select the language as a valid option in a User record and the language picker.
You must create a choice record for a new translation in the Choices [sys_choice] table.

1. Navigate to System Localization > Choices.
2. Click New.
3. Enter the following fields.
   • Table: Enter sys_user.
   • Element: Enter preferred_language.
   • Language: Enter the two-character ISO 639.2 code for the language this choice record is a member of. For example, tr. The default is en.
   • Label: Enter the name of the language selection as you want it to appear in the language picker. For example, Turkish.
   • Value: Enter the two-character ISO 639.2 code for the new language selection. For example, tr. The instance uses this value to set the display language.
   • Sequence: Enter a number to determine what order the option appears in the choice list if you do not want to list choices alphabetically. For example, 5.
4. Click Submit.

Create a new language record
You must create a language record for your new translation in the Languages [sys_language] table.

Role required: admin
1. Navigate to System Localization > Languages.
2. Click New.
3. Enter the following fields.
   • Name: Enter the name of the language. For example, Turkish.
   • ID: Enter the two-character ISO 639.2 code for the language. For example, tr.
   • Text Direction: Select the direction that the instance should display the language in. For example Left-to-Right.
4. Click Submit.

Import a translation from an Excel spreadsheet
The System Import Sets application contains four import tables and corresponding transform maps to assist with importing translations from an Excel spreadsheet.

1. Navigate to System Import Sets > Load Data.
2. Select Use Existing and the Table name that matches the type of data being imported, as follows.
   • For choices, select the [u_sys_choice] table.
   • For field labels, select the [u_sys_documentation] table.
   • For translated names and fields, select the [u_sys_translated] table.
   • For messages, select the [u_sys_ui_message] table.
   • For translated text, select the [u_sys_translated_text] table.
3. Select Upload an Excel file, and then click Browse to select the source Excel spreadsheet.
4. If appropriate, specify the Work sheet and Header row number.
5. Click Go.

The translations are now available in the appropriate Import Set Table.
6. Navigate to System Import Sets > Table Name and review the imported information to verify that the import was successful.
7. To transform the imported data into the corresponding table, navigate to **System Import Sets > Run Transform**.

8. Select the appropriate transform map, as follows.

    **Note:** Make sure you choose a transform map that has the **Run Business Rule** option selected. If the transform map does not have this option selected, any customized translations you have may be overwritten during the next upgrade.

    - For choices, select the **Sys Choice Translation Map**.
    - For field labels, select the **Sys Documentation Translation Map**.
    - For translated names and fields, select the **Sys Translated Translation Map**.
    - For messages, select the **Sys UI Message Translation Map**.
    - For translated text, select the **Sys Translated Text Translation Map**.

9. Click **Transform**.

*Translate a client script message*  
Client scripts include a multi-line Messages field.

Use this field to enter message strings that the client script can use as a key to look up a localized message alternative from the Message [sys_ui_message] table. Add each message key on a separate line. The instance looks for a localized message string anytime the client script makes a getMessage(msg) call where the msg string matches a key in the Messages field.

For example, if you add the string **Please populate the Reason field** to the Messages field, then the instance will look for a localized string from the Message [sys_ui_message] table any time the client script calls:

```
getMessage(Please populate the Reason field)
```

Add a new record to the Message [sys_ui_message] table for each localized string.

1. Navigate to **System Localization > Messages**.

2. Click **New**.

3. Enter the **Message** fields for the localized message.

4. Click **Submit**.

*Translate a field label*  
Field labels are the names that appear on forms and lists to describe the type of information the field contains.

The following procedure works best for translating individual field labels, such as those added with a customization. To translate large numbers of field labels, use the procedure described in **Translate the Interface**.

1. Navigate to the field on the form.

2. Right-click the field label and select **Configure Label**.

3. In the Field Label form, replace the English text with the text of the target language in the Label, Plural, and Hint fields.

4. Enter the two-character Language code of the target language.

5. Right-click the header bar and select **Insert**.

   Clicking **Insert** creates a new record in the Field Label table for this field label in the selected language.
Translate a field value
Field values are the text entries that are used for fields with the type translated_field, such as the Title or Hint field in the Module \([\text{sys\_app\_module}]\) table.

The following procedure works best for translating values for individual fields, such as those added with a customization. To translate large numbers of field values, use the procedure described in \textit{Translate the Interface}.

1. Use the language picker in the header bar to switch to the desired language.
2. Navigate to the field on the form.
3. Enter the text of the target language for this value.
4. Click \textit{Submit}.

   This creates a new record in the Translated Name / Field table for the selected language or updates the existing record.

Translate a related list name
Related lists appear at the bottom of forms.

You can translate a related list name by \textit{configuring the list}.

1. Use the language picker in the header bar to switch to the desired language.
2. Navigate to the related list on the form.
3. Right-click the related list header bar and select \textit{Configure > List Control}.
4. Replace the existing Label with the text of the target language.
5. Click **Submit** or **Update**.

This creates a new entry in the Translated Name / Field \[sys_translated\] table or updates the existing entry for this language.

*Translate long text content*

Long text content occurs in fields with the type translated_text or translated_html.

Use the following procedure to translate the content for individual text fields. To translate large numbers of text or HTML fields, use the procedure described under **Translate the Interface**.

To translate the content of a text or HTML field on a form (field type translated_text or translated_html):

1. Use the language picker to switch to the desired language.
2. Navigate to the field on the form.
3. Replace the English text with the text of the target language.
4. Click **Submit**.

This creates a new record in the Translated Text table for the active language. The field content displays English or the new language, depending on the user's language selection.

*Translate the interface*

After creating the choice record, translate the interface, including the applications, modules, UI actions, forms, lists, alerts, and choice lists.

All of these interface items are stored as translatable strings in these **translation tables**.

- Translated Name / Field \[sys_translated\]
- Messages \[sys_ui_message\]
- Field Label \[sys_documentation\]
• Choice [sys_choice]
• Translated Text [sys_translated_text]

By default, these translation tables only contain English strings. To populate these tables with translated strings:

1. Export the contents of the translation tables into a format (such as Excel) that can be easily manipulated.
2. Within the exported document, translate the Label, Plural, Hint, and Message columns for each row. Be sure to also change the "Language" column to the two character ISO code of the new language.
3. Import the translated document back into the instance as an import set.

Translate individual field labels and values
When translating just a few field labels or values, such as when you add customizations to a translated instance, use the procedure that applies to the type of text being translated.

Three types of ServiceNow fields store translated strings:

• Translated_field: Stores field labels, related list names, and certain field values. The value of the translated_field replaces the label, list name, or field value when the user selects the matching language. Translated_field values have a one-to-many relationship with their associated keys. As a result, multiple records can reference one translated_field value.

• Translated_text: Stores long text values in plain text. The value of the translated_text replaces the plain text when the user selects the matching language. Translated_text values have a one-to-one relationship with their associated keys. As a result, only one record can reference a translated_text value.

• Translated_html: Stores long text values in HTML. The value of the translated_html replaces the HTML when the user selects the matching language. Translated_html values have a one-to-one relationship with their associated keys. As a result, only one record can reference a translated_html value.

All three translated field types support list sorting. To determine the field type, right-click the field on the form, select Configure Dictionary, and check the Type field.

ServiceNow stores the translated values as separate records and displays the proper value according to the end user's language. You can translate an entire instance by exporting the translation tables and then importing the translated strings as described under Translate the Interface.

Note: In addition to translated field types, currency fields display the same price in different currencies based on the user's language.

Translate the knowledge base
The knowledge base has two separate methods for translation.

Translating the content of articles: used for articles that apply to users of all languages.

Creating language-specific articles: used when users with different languages need different articles.

Translating knowledge base articles

Knowledge base articles use translated_html fields for article content. This type of field displays the translation based on the user's language, if multiple translations are stored. To learn about using translated_html fields, see Use Translated Text.
Creating language-specific articles

Activating the *Knowledge Management Internationalization v2 plugin* adds a Language field on the Knowledge form for setting the language of the article. Users can choose a language to search and search results return only articles in that language. Users can switch between different translations of the same article, as well.

Time configuration

Schedule events and track time across applications.

Date and time fields

Records can store date and time values in several different types of fields.

These values are stored in the database as integer numbers of milliseconds, and are displayed in the appropriate date or time format.

Date and time field types

The following field types are provided for storing date and time information in records.

<table>
<thead>
<tr>
<th>Field type</th>
<th>Dictionary XML type</th>
<th>MySQL DB type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>glide_date</td>
<td>DATE</td>
</tr>
<tr>
<td>Date-Time</td>
<td>glide_date_time</td>
<td>DATETIME</td>
</tr>
<tr>
<td>Time</td>
<td>glide_time</td>
<td>DATETIME</td>
</tr>
<tr>
<td>Duration</td>
<td>glide_duration</td>
<td>DATETIME</td>
</tr>
<tr>
<td>Due-Date</td>
<td>due_date</td>
<td>DATETIME</td>
</tr>
</tbody>
</table>

Global date and time field format

The default date and time formats are defined globally using system properties.

**Date format**

The date format is defined by the property glide.sys.date_format.

An administrator can modify the property by navigating to *System Properties > System*. Modifying the property changes the date or time format globally. When modifying the standard date format, also verify the format using a *Validate Date and Time* script. Use the same 'format' strings as the java.text.SimpleDateFormat class, with minor exceptions. Note that MM is months, where mm indicates minutes. The format string consists of the following abbreviations.

<table>
<thead>
<tr>
<th>Field</th>
<th>Full form</th>
<th>Short form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Year</td>
<td>yyyy (4 digits)</td>
<td>yy (2 digits), y (2 or 4 digits)</td>
</tr>
<tr>
<td>Month</td>
<td>MMM (name or abbr.)</td>
<td>MM (2 digits), M (1 or 2 digits)</td>
</tr>
</tbody>
</table>
### Day of Month

<table>
<thead>
<tr>
<th>Field</th>
<th>Full form</th>
<th>Short form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day of Month</td>
<td>dd (2 digits)</td>
<td>d (1 or 2 digits)</td>
</tr>
</tbody>
</table>

The default format is: yyyy-MM-dd.

**Note:** A user can override the global date or time format with a personal preference.

*Personalize the system date format*

You can personalize the format in which date values appear in your instance.

Personalizing the date format does not change global settings or impact the way other users see date values.

1. Navigate to **Self-Service > My Profile**.
2. In the **Date format** field, select an option.
3. Click **Update**.

### Time format

The time format is defined by the property glide.sys.time_format.

An administrator can modify the property by navigating to **System Properties > System**. Modifying the property changes the date or time format globally. When modifying the standard time format, also verify the format using a **Validate Date and Time** script. Use the same 'format' strings as the java.text.SimpleDateFormat class, with minor exceptions. The format string consists of the following abbreviations.

<table>
<thead>
<tr>
<th>Field</th>
<th>Full form</th>
<th>Short form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hour (1-12)</td>
<td>hh (2 digits)</td>
<td>h (1 or 2 digits)</td>
</tr>
<tr>
<td>Hour (0-23)</td>
<td>HH (2 digits)</td>
<td>H (1 or 2 digits)</td>
</tr>
<tr>
<td>Minute</td>
<td>mm (2 digits)</td>
<td>m (1 or 2 digits)</td>
</tr>
<tr>
<td>Second</td>
<td>ss (2 digits)</td>
<td>s (1 or 2 digits)</td>
</tr>
</tbody>
</table>

The default format is: HH:mm:ss.

**Note:** A user can override the global date or time format with a personal preference.

*Personalize the system time format*

You can personalize the format in which time values appear in your instance.

An administrator must add the **Time format** field to the Self-Service view of the User form. For more information, see **Configure a form** on page 703.

Personalizing the time format does not change global settings or impact the way other users see time values.

1. Navigate to **Self-Service > My Profile**.
2. In the **Time format** field, select an option.
3. Click **Update**.
Configure the date picker for the list editor

In UI16 and UI15, a system property enables you to choose between two date picker configurations for the list editor.

Role required: admin

1. Navigate to `sys_properties.list`.
2. Search for the property named `glide.ui.list_edit.show_calendar_only`.
3. Set the property Value to either of the following options.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>The date picker displays a calendar as well as a field for manual date entry. This is the default behavior in UI11, regardless of the property value.</td>
</tr>
<tr>
<td>true</td>
<td>The date picker displays a calendar only. This is the default behavior in UI16 and UI15.</td>
</tr>
</tbody>
</table>
Default date and time fields

Certain time fields are provided by default to store particular date and time fields.

Global timestamp fields
All records inherit certain time stamp fields from the Global [global] table.
All records inherit the following time stamp fields from the Global [global] table.
- Created
- Updated

These fields are automatically populated with the correct date and time.

Task fields for measuring work time
Use default task fields to measure progress and resolution for certain records.

The following base system fields are provided on certain tables for keeping track of how long it takes to close tickets:
- **Time worked**: A timer which runs while the record is being viewed by a user, and pauses while the record is closed (or when it is paused manually). Used to keep track of the time spent by the help desk while working on the record.
- **Resolve time**: A calculated field which measures the time from the moment the record is opened, to the moment the record is closed. Used to keep track of how long it takes to resolve the record.

These fields provide different metrics for request response.

The following additional tools are available for tracking work time:
- **Service level agreements (SLAs)**: measure how long it takes a record fulfill certain conditions (such as an incident being marked **Resolved**).
- **Time cards**: use the **Time worked** field to break down how much time was spent by day of the week.
Time worked

The Task [task] table provides a time-tracking field called **Time worked**.

![Time worked: 03:13:18 / 00:00:10](image)

**Figure 330: Time worked field**

This field measures how long a record has been viewed in order to measure work time on a ticket. Any table that extends Task can use this field. To add the field, configure the form.

As the record is viewed, the timer counts upward. To pause the timer, click the stop icon (●).

To resume the timer, click the start icon (●).

When the task is saved, the amount of new time in the timer is used to generate a record on the Time Worked [task_time_worked] table. This table can be viewed as a related list on the task form.

By default, the time displayed in the **Time worked** field displays a cumulative value stored in the task record. If you modify a Time Worked record, the changes will not be reflected in the task timer.

You can set the property com.snc.time_worked.update_task_timer to enable updating of the task timer value based on changes to the time worked records. This is accomplished through the Update task timer business rule.

Resolve time

The **Resolve time** field is available on the Incident [incident] and Request [sc_request] tables.

Business rules calculate the field when the record is marked closed, and measure the difference between the **Opened** and **Closed** dates. This field allows for easy reporting on how long it takes for requests to be closed.

The field is stored in the system as an integer number of seconds.

**Business rule calculation:**

On the Incident table, the field is calculated on closure by the business rule mark_closed. The following lines of code calculate the resolve time:

```java
current.calendar_stc =
    gs.dateDiff(current.opened_at.getDisplayValue( ),
                current.closed_at.getDisplayValue( ), true);
```

On the Request table, the field is calculated on closure by the business rule Mark Request Closed. The following line of code calculates the resolve time:

```java
current.calendar_stc =
    gs.dateDiff(current.opened_at.getDisplayValue( ),
                current.closed_at.getDisplayValue( ), true);
```

Display resolve time as a duration

You can display the resolve time as a human-readable duration rather than an integer representing a number of seconds.

1. From the Incident or Request form, right-click the form header and click **Configure > Table**. The system displays the table form.
2. From the **Columns** embedded list, click **Resolve time**. The system displays the dictionary entry for the field.
3. From the **Attributes** related list, click **New**.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Format</td>
</tr>
<tr>
<td>Dictionary entry</td>
<td>Resolve time</td>
</tr>
<tr>
<td>Value</td>
<td>glide_duration</td>
</tr>
</tbody>
</table>

5. Click Submit.

Forms and lists display the resolve time as a number of days, hours, and minutes.

Note: This attribute does not change the field data format which remains an integer representing a number of seconds. Reports and data exports will still display the actual number of seconds rather than a duration.

Planned task time fields

The Planned Task plugin provides a table (Planned Task [planned task]) with standard fields for measuring a planned task's time. For more information, see Planned Task.

Export date and time formats

Because some export formats are intended for human consumption and others are intended for database usage, different methods provide date and time field information in different formats.

Excel

Date, Date-Time, and Time fields are all exported as their display values, displayed using a custom format instead of the system date format.

Duration fields, however, export as the value stored in the database, which is an integer value of seconds.

XML

All Date and Time fields export as the value stored in the database.

PDF

All Date and Time fields (including Duration) export as their display value.

CSV

All Date and Time fields export as the value stored in the database.

Calendars with schedule pages

Specific applications within the platform generate graphical calendar displays based on Schedule Pages.
These Schedule Pages can be displayed in a daily, weekly, or monthly view. Currently, the applications using Schedule Pages include:

- Project Management
- Maintenance Schedules
- Group On-Call Rotation
- Field Service Management

Schedule Pages are records which contain the scripts that determine the functionality of the graphical display. Because of the heavy degree of scripting involved in a schedule page, most instances should use the default schedule pages in the base platform. The schedule page uses a URL with a series of parameters attached to generate the graphical display.

Calendar content is controlled by a Schedule Page (cmn_schedule_page) record. To access Schedule Pages, navigate to System Scheduler > Schedules > Schedule Pages. The Schedule Pages form provides the following fields:

The Schedule Page record contains the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>General name that is used to identify the current schedule page.</td>
</tr>
<tr>
<td>Schedule type</td>
<td>String</td>
<td>The schedule type is a string that is used to uniquely identify the schedule page via the &quot;sysparm_page_schedule_type&quot; URI parameter. For example, a schedule page could be accessed as follows: /show_schedule_page.do?sysparm_page_schedule_type=gantt_chart&amp;sysparm_timeline_task_id=d530bf907f0000015ce594fd929cf6a4 Alternatively, the schedule page can also be accessed by setting the &quot;sysparm_page_sys_id&quot; URI parameter to that of the unique 32 character hexadecimal system identifier of the schedule page.</td>
</tr>
</tbody>
</table>
| View Type     | Choice     | Each view type displays different field combinations. There are two options available:  
- **Calendars**  
- **Timelines** |
<p>| Description   | String     | General description that provides additional information about the current schedule page. This field is not necessary. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Init function name</td>
<td>String</td>
<td>The init function name specifies the name of the JavaScript function to call inside the Client script function for calendar type schedule pages.</td>
</tr>
<tr>
<td>HTML</td>
<td>String</td>
<td>The HTML field is a scriptable section that is parsed by Jelly and injected into the display page prior to the rest of the calendar. It can be used to pass in variables from the server and define extra fields are necessary.</td>
</tr>
<tr>
<td>Client script</td>
<td>String</td>
<td>The client script is a scriptable section that allows for configuring options of the schedule page display. The API is different depending on the schedule page view type and is discussed below.</td>
</tr>
<tr>
<td>Server AJAX processor</td>
<td>String</td>
<td>The Server AJAX processor is specific to calendar type schedule pages that is used to return a set of schedule items and spans to be displayed.</td>
</tr>
</tbody>
</table>

**Calendar views from the schedule pages**

A "URL from arguments" module, a field decoration (dictionary attribute "ref_contributions"), or a UI Action linking to "show_schedule.do" is used to invoke the Schedule page.

For example, the On-call Calendars module generates the calendar from the following URL:

```
show_schedule.do?
sysparm_type=roster&sysparm_include_view=monthly,weekly,daily,oldtimeline
```
• The URL component `sysparm_type=roster` determines which Schedule Page is used to generate the Calendar Views.
• The URL component `sysparm_include_view=monthly,weekly,daily,oldtimeline` determines which Calendar Views are available.
• The URL component `sysparm_zoom=daily` determines which Calendar View appears by default.

Timespan label events

The SchedulePage may include JavaScript functions in the Client Script section to handle events triggered by user interaction with the displayed timespans and their labels.

This is done by observing events via the CustomEvent object. For example:

```
CustomEvent.observe ( "timespanclicked" , timespanClicked )
```

In this example, your client script would include a function named `timespanClicked` to correspond to the one named in the code above.

```
function timespanClicked (event , element , scheduleItem ) { alert ( "You clicked ID=" + itemID  + " which is " + element ) ; }
```

The arguments passed to the functions are the event, the HTML element for the timespan, and the GwtScheduleItem of the timespan as given by your Schedule Page’s Server AJAX Processor code.

Timespan events that can be observed are:
• `timespan.clicked`
• `timespan.contextmenu`
• `timespan.dblclicked`
• `timespan.mouseover`
• `timespan.mouseout`

Timespan label events that can be observed are:
• `timelabel.clicked`
• `timelabel.contextmenu`
• `timelabel.dblclicked`
• `timelabel.mouseover`
• `timelabel.mouseout`

View Properties:

Specify view properties to configure aspects of the view’s appearance and behavior:
• `timespan_height`: Set to a number of pixels to customize the height of timespans on the view.
• `timespan_between`: Set to a number of pixels to customize the amount of space between timespans.
• `drag_scroll`: Set to false to prevent scrolling by dragging the timeline background left or right.

Example: Specify four timespans 4 pixels tall with 16 pixels between spans and do not allow drag scrolling.

```
schedulePage.setViewProperty("timespan_height", 4);
schedulePage.setViewProperty("timespan_between", 16);
schedulePage.setViewProperty("drag_scroll", "false");
```
Examples

There are several examples of Schedule Pages used by these plugins:

- The Group On-Call Rotation plugin contains an example of an on-call calendar.
- The Project Management v2 plugin contains the **Project Resource Timeline** Schedule Page.

Client transaction timings

The Client Transaction Timings plugin enhances the system logs by providing more information on the durations of transactions between the client and the server.

By providing information on how time was spent during the transaction, performance issues can be tracked down to the source by seeing where the time is being consumed.

This plugin requires the **Response Time Indicator** to be enabled, and collects information from the following browsers:

- Firefox
- Internet Explorer
- Chrome

Client Transactions Information

Installing the plugin adds the module Client Transactions to the System Logs application, which provides a list of every logged transaction between client and server within the last day. The following information is tracked:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>The moment the transaction was recorded.</td>
</tr>
<tr>
<td>Response Time</td>
<td>The number of ms spent by the server in fulfilling the transaction.</td>
</tr>
<tr>
<td>Business Rule Time</td>
<td>The number of ms spent by business rules triggered by the transaction.</td>
</tr>
<tr>
<td>SQL Time</td>
<td>The number of ms spent by the SQL database.</td>
</tr>
<tr>
<td>Client Response Time</td>
<td>((\text{Load_completion_time}) - (\text{start_time})). It is inclusive of server time.</td>
</tr>
<tr>
<td>Client Network Time</td>
<td>The number of ms spent by the network the client is connecting through.</td>
</tr>
<tr>
<td>Browser Time</td>
<td>The number of ms spent by the browser during the transaction.</td>
</tr>
<tr>
<td>Client Script Time</td>
<td>The number of ms spent executing client scripts</td>
</tr>
<tr>
<td>UI Policy Time</td>
<td>The number of ms spent executing ui policy</td>
</tr>
<tr>
<td>Type</td>
<td>Type of transaction (one of Form, List, Other)</td>
</tr>
<tr>
<td>Table</td>
<td>The table that was displayed e.g. incident, change_request</td>
</tr>
</tbody>
</table>
Client Detailed Information

A more detailed breakdown of the client timings for all Form rendering (but not list rendering) is also tracked. To see details, drill into a particular client transaction record and observe the related list at the base of the screen.

### Table 250: Client Detailed Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>The view for this form/list</td>
</tr>
</tbody>
</table>

Components installed with Client Transaction Timings

The Client Transaction Timings plugin installs several components.

**Database Table Structure**

The plugin adds the table syslog_client_transaction.

**Properties**

The property glide.client.track_transaction_timings enables and disables the plugin.

**Scripts**

The plugin relies on the new script include AJAXClientTiming. This is the script that gathers the information required and populates them on the syslog_client_transaction table.

**Dependencies**

This plugin does not require any other plugins, but will not gather information unless the Response Time Indicator is enabled. It will also gather information only from IE and Firefox browsers.

**Impact**

The plugin has little impact on systems, and can be easily disabled.
Activating the Plugin

To activate the plugin, navigate to System Definition > Plugins and activate the plugin.

*Note:* New instances have the plugin activated by default.

Disabling the Plugin

Although plugins cannot be removed, the functionality can be disabled:

1. Enter `sys_properties.list` in the application navigator filter.
2. Locate the property named `glide.client.track_transaction_timings`.
3. Set the property value to `false`.

The functionality can be enabled again by setting the property value to `true`.

Timing values

The following diagram illustrates the timing increments for rendering a page:

![Client Transaction Timing Diagram](image)

*Figure 331: Client Transaction Timing*

The variables in this diagram are defined as follows:
### Table 251: Timing Values

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>The date and time the user requests a page (the user clicks on a link). This value is set by hooking into the beforeunload event of the previous page. The beforeunload event is not properly supported by WebKit browsers, which is why the client timings are not supported on Safari or Chrome.</td>
</tr>
<tr>
<td>load_time</td>
<td>The date and time that the current page starts loading in the browser. This value is set by an inline javascript that runs as the first script in the HTML body.</td>
</tr>
<tr>
<td>server_time</td>
<td>The time in ms spent by the server processing the transaction. The server reports this value to the client.</td>
</tr>
<tr>
<td>load_completion_time</td>
<td>The date and time that the page is fully rendered in the browser. This operation is performed as the last script on the page and identifies the time the page completed loading.</td>
</tr>
</tbody>
</table>

The following times are reported by the client in the syslog_client_transaction table:

### Table 252: Timing Values

<table>
<thead>
<tr>
<th>Label</th>
<th>Element</th>
<th>Description</th>
<th>Calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response Time</td>
<td>client_response_time</td>
<td>Calculates the overall time to deliver the page by subtracting the time the user requests the page from the time the page is fully rendered in the browser.</td>
<td>load_completion_time - start_time</td>
</tr>
<tr>
<td>Server Time</td>

<td>load_completion_time - load_time</td>
</tr>
</tbody>
</table>

Define a relative duration

From the left navigation pane, select **System Scheduler > Relative Durations**.

Out of the box there are four Relative Durations in the system:

- 2 business days by 4pm
- 3 business days by 4pm
- Next business day by 4pm
- End of next business day

**Note:** Business day durations are defined by the business schedule used. If no schedule is defined, the durations are 24 X 7 by default.

We will start by looking at the End of next business day Relative Duration. From the Relative Durations list, select the **End of next business day** Relative Duration. The variable days is set to one, because we want the result of this calculation to land one day in the future. The rest of the script is as in the screenshot below. If desired, you can customize the time at which you want the Relative Duration to end (currently set to 5pm).

There is one more important Relative Duration design aspect that is used by the other three out-of-box Relative Durations. To illustrate this design we will look at **2 business days by 4pm**.

As you can see in the image below, within the script there is an if-statement. This if-statement is checking to see if the calculated time is after 10am. If it is, then an additional day is added to the calculation. Hence the description of **2 business days by 4pm if before 10am**.
Note that “End of the business day” has nothing to do with the associated Schedule. The end time of 17:00 is hardcoded into this Relative Duration script. If you want the time to be different than the out of the box 5pm, you must change it in the script.

Use a relative duration

Relative durations provide a scripted way of working out duration time for SLAs.

When you define an SLA, you can set the **Duration type** to be a relative duration.

When using relative durations, you can also use the **Relative duration works on** field to select to calculate either against the SLA record, or the task record that the SLA record is used for.

This example demonstrates how a relative duration of End of next business day works.

1. Create an SLA that has a relative duration of **End of next business day**.
2. Complete the rest of the fields of this SLA with the values as shown below, also setting a Schedule and a Timezone if you want.

3. To show how this Relative Duration works, create a new incident.

Notice that the SLA is started for this incident. If you look at the **Planned End Date** field you will notice that the date is the next business day at 5pm (See image below).
Note: Pause conditions are not compatible with Relative Durations.

Time display
There are three interfaces that display record information over time: reports, timeline pages, schedule pages.
Reports

Figure 332: Report example

Reporting allows users to generate charts from data within the platform in a variety of formats.

Any report type can report in time information, but the following report types are particularly suited to reporting on time information. See Reporting for more information.

- Calendars
- Control Charts
- Trend Charts
- Trendbox Charts
Timeline pages example

Timeline pages allow for easy definition of linear timelines from records with time information.
Event registration

After you create a new event and a business rule that uses the event, you must register it. Registration lets other parts of the system, such as Email Notifications and script actions, see the event in their list of available events and react to the event when it occurs.

Register an event

1. To register an event, browse to System Policy > Events > Registry, and then click New.
2. Complete the Event Registration form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your new event.</td>
</tr>
</tbody>
</table>
Introduction to time-related functionality

There are a number of different functionalities that allow for tracking time and leveraging that information across applications.

**Time Fields**

Time can be stored in different ways in records. Understanding how time is stored underlies use of all of the time functions.

For more information, see: *Use Date and Time Fields.*
Time Zones

All times are stored in the platform in Universal Coordinated Time. They are displayed globally based on the system time zone, but are displayed to users in their local time zone according to user settings. Time zone information is important to keep track of to avoid calculation errors or confusing outputs.

All dates and times gathered through web services display in GMT. Data inserted using a web service uses the active user’s time zone or the system time zone if the active user does not have a time zone specified.

For more information, see *Time zones* on page 1053.

Schedules

Schedules are rules which include or exclude ranges of time for certain time-related functionality. For example, schedules can restrict SLAs to only count time during business hours.

For more information, see *Event scheduling* on page 1016.

Displaying Time

There are a number of useful user interfaces that help represent time visually.

For more information, see *Displaying Time*.

Viewing Logs

Logs within the system provide historical information as to what occurred in the instance when.

Scheduling Events

These functionalities allow other functionality to be triggered at particular times, or in response to specific events.

For more information, see *Event scheduling* on page 1016.

Timing Functionality

These functions gather information with regards to duration. They answer the question "How long?", and can time events based off of that information.

For more information, see *Timing Functionality*.

Range calculator scripts

You can specify a script include that calculates range restrictions and processes parent updates in a timeline page.

Following are three examples of script includes that help specify range restrictions.
Range Calculator Scripts

ExampleUpdateParentsRangeCalculator

Updates parent records when a child record span is moved or resized in the timeline.

```javascript
var ExampleUpdateParentsRangeCalculator = Class.create();
ExampleUpdateParentsRangeCalculator.prototype = {
initialize: function() { },
updateParents: function(id, table, startDate, endDate){
  if (table == "rm_sprint"){
    var releaseID;
    var sprint = new GlideRecord(table);
    sprint.addQuery('sys_id', id);
    sprint.query();
    if (sprint.next())
      releaseID = sprint.release + ";";
    if (releaseID) {
      var gr = new GlideRecord("rm_release_scrum");
      gr.addQuery("sys_id", releaseID);
      gr.query();
      if (gr.next()) {
        if (startDate && startDate < this.getTimeMs(gr.start_date))
          gr.start_date = this.getTimeObject(startDate);
        if (endDate && endDate > this.getTimeMs(gr.end_date))
          gr.end_date = this.getTimeObject(endDate);
        gr.update();
      }
    }
  }
},
getMinRangeDetails: function(id, table) { return [-1, -1, "", ";"]; },
getMaxRangeDetails: function(id, table) { return [-1, -1, ""]; },
getTimeMs: function(date){
  return new GlideScheduleDateTime(date).getMS(); },
getTimeObject: function(timeMS) {
  var gdt = new GlideDateTime();
  gdt.setNumericValue(timeMS);
  return gdt; },
logMessage: function(message) { gs.log(message); },
type: 'ExampleUpdateParentsRangeCalculator'
}
```

In this example, the span is identified based on the id and table from function(id, table, startDate, endDate).

ExampleMinRangeCalculator

Defines the earliest start date and the latest end date for a specified span.

```javascript
var ExampleMinRangeCalculator = Class.create();
ExampleMinRangeCalculator.prototype = {
initialize: function() { },
updateParents: function(id, table, startDate, endDate){ },
getMinRangeDetails: function(id, table){ return [-1, -1, "", ";"]; },
getMaxRangeDetails: function(id, table){ return [-1, -1, ""]; },
getTimeMs: function(date){
  return new GlideScheduleDateTime(date).getMS(); },
getTimeObject: function(timeMS) {
  var gdt = new GlideDateTime();
  gdt.setNumericValue(timeMS);
  return gdt; },
logMessage: function(message) { gs.log(message); },
type: 'ExampleMinRangeUpdateParentsRangeCalculator'
}
```
while(gr.next()){  
    var start = this.getTimeMs(gr["start_date"]);  
    var end = this.getTimeMs(gr["end_date"]);  
    var id = gr["sys_id"];  
    if (min == -1 || start <= min){  
        if (start != min)  
            minID = ";";  
        min = start;  
        minID += "," + id;  
    }  
    if (max == -1 || end >= max){  
        if (end != max)  
            maxID = ";";  
        max = end;  
        maxID += "," + id;  
    }  
    return [min, max, minID, maxID];  
}

ExampleMaxRangeCalculator  
Defines the earliest start date and the latest end date for a specified span.
logMessage: function(message){ gs.log(message); },
type: 'ExampleUpdateParentsRangeCalculator'
}

Use the following two functions to obtain the correct start and end dates in the three example script includes provided for reference.

gTimeMs: function(date){
  return new ScheduleDateTime(date).getMS();
}

gTimeObject: function(timeMS) {
  var gdt = new GlideDateTime();
  gdt.setNumericValue(timeMS);
  return gdt;
}

Set an inactivity monitor

An inactivity monitor triggers an event for a task record if the task has been inactive for a certain amount of time. If the task remains inactive, the monitor repeats at regular intervals. User updates to the task record restart the monitor. If Reset Conditions are defined for the monitor but have not been met when you update the task record, the monitor is not restarted. Inactivity monitors only apply to records on tables that extend the Task table, or the Task table itself.

When an inactivity monitor triggers, it generates an event in the form <tablename>.inactivity (for example, incident.inactivity). The inactivity monitor does not automatically specify further actions, so either an email notification or script action must be defined to drive further action.

A record's activity is only based on user updates. System updates do not count as activity.

1. Navigate to System Policy > Inactivity Monitors and click New.
2. Give the inactivity monitor a name.
3. Specify the type of record to monitor in the Table field.
4. Specify how long the inactivity monitor should wait before sending each notification in the Wait field.
5. Specify any additional conditions in the Condition field. At least one condition must be specified for the inactivity monitor to work.
6. Specify an Order if multiple inactivity monitors might have their conditions met for a given record - the one with the lowest order will be used.
7. Click Save.

Note: If conditions are changed on an inactivity monitor, the monitor stops tracking previously tracked records. An inactivity monitor does not track records that were created before the inactivity monitor, even if the record meets all other conditions.

Escalation intervals and pause conditions

Escalation Intervals and Pause Conditions are not relevant to an inactivity monitor.

The related list and field are available because the inactivity monitor table extends the table used for SLAs, but these elements are not used in any way when an inactivity monitor attaches or is triggered.

Event scheduling

There are a variety of tools available for scheduling actions or tasks to happen in the future.
There are a variety of tools available for scheduling actions or tasks to happen in the future.

**Maintenance schedules**
Changes to the CMDB can be managed through the Maintenance Schedules Plugin, which allows changes to be proposed and viewed through a timeline.

**On-call rotation**
The Group On-Call Rotation Plugin allows a schedule to be defined to determine what users are primary contacts during particular hours of the day.

**Scheduled reports**
Once reports are defined, they can be scheduled to be emailed at a specific time, or at regular intervals, using the reporting interface.

**Scheduled workflows**
Workflows provide a robust system for automating advanced multi-step processes. Workflows can be triggered by conditions, like business rules, or they can be scheduled for a particular time/recurring schedule, like scheduled jobs.

**Scheduled jobs**
Scheduled jobs are scripts which can be set to be automatically performed at a specific date and time, or on a repeating basis.

### Scheduled jobs
Scheduled Jobs are automated pieces of work that can be performed at either a particular time, or on a recurring schedule.

These kinds of tasks can be automated:
- Run and distribute a report
- Generate a record (incident, change, configuration item, etc.) from a template
- Run a business rule and do whatever the rule contains
- Scheduling at the end of the month
- Scheduling for weekdays
- Executing scheduled jobs from scripts

### Schedule a report
Scheduled reports are distributed via email. Scheduled reports created by an individual whose user account is deactivated might not display any data. To ensure that the desired data is displayed, an active user must recreate the scheduled report.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Click **New**.
3. Select **Automate the generation and distribution of a report**.
4. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify this scheduled job.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Report</td>
<td>A reference to the report to be scheduled. Calendar reports and Pivot Table reports are not currently supported for automatic emailing.</td>
</tr>
<tr>
<td>Users</td>
<td>The users to send the report to at the scheduled date and time. The user must have Notification set to Email on their user record to receive reports. To force users to receive emails, use the Email Addresses field.</td>
</tr>
<tr>
<td>Groups</td>
<td>The groups to send the report to at the scheduled date and time.</td>
</tr>
<tr>
<td>Email addresses</td>
<td>Any other email addresses to send the report to, separated by commas. These emails will always receive the report, even if there's a matching user record for that address that says Do not notify.</td>
</tr>
<tr>
<td>Active</td>
<td>If true, this report will be sent at the scheduled date and time.</td>
</tr>
<tr>
<td>Run</td>
<td>The type of schedule to send the report on. Choices are:</td>
</tr>
<tr>
<td></td>
<td>- Daily</td>
</tr>
<tr>
<td></td>
<td>- Weekly</td>
</tr>
<tr>
<td></td>
<td>- Monthly</td>
</tr>
<tr>
<td></td>
<td>- Periodically</td>
</tr>
<tr>
<td></td>
<td>- Once</td>
</tr>
<tr>
<td>Day</td>
<td>• If Run is Weekly, the day of the week</td>
</tr>
<tr>
<td></td>
<td>• If Run is Monthly, the day of the month.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>If Run is Periodically, the duration between each scheduled report. The duration can be days, hours, or minutes.</td>
</tr>
<tr>
<td>Time</td>
<td>If Run is Weekly or Monthly the time of day, on a 24 hour clock.</td>
</tr>
<tr>
<td>Starting</td>
<td>The date and time of the first scheduled report.</td>
</tr>
<tr>
<td>Priority</td>
<td>The numerical priority of a scheduled job. Set essential jobs to a priority value below 100 and nonessential jobs to a priority above 100. If 70% or more of all scheduled jobs are Overdue, any jobs marked with a value above 100 do not run.</td>
</tr>
<tr>
<td>Subject</td>
<td>The subject line for the email.</td>
</tr>
<tr>
<td>Introductory Message</td>
<td>The body of the email.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run as</td>
<td>The user creating and running the scheduled job. To have the scheduled job assigned to system behavior instead of the person creating the scheduled job, create a system or dummy user and add that user to this field.</td>
</tr>
<tr>
<td>Type</td>
<td>The file-type of the attached report. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• PDF-landscape</td>
</tr>
<tr>
<td></td>
<td>• PDF</td>
</tr>
<tr>
<td></td>
<td>• Excel</td>
</tr>
<tr>
<td></td>
<td>• CSV</td>
</tr>
<tr>
<td></td>
<td>• PNG</td>
</tr>
<tr>
<td>Include Detail</td>
<td>If checked, will include details on the records in the report.</td>
</tr>
<tr>
<td>Zip Output</td>
<td>If checked, the report will be compressed in a .zip file.</td>
</tr>
</tbody>
</table>

As a workaround for scheduling calendar and pivot table reports for email distribution, consider using the publish option. Publish creates a URL for the report and displays the address above the report form. You can create an email notification with this URL and send the link to people who need to see the report, or you can send the URL for the calendar report to a distribution list.

**Schedule a script execution**

Non-conditional and conditional scripts can be scheduled.

1. Navigate to System Definition > Scheduled Jobs.
2. Click New.
3. Select **Automatically run a script of your choosing**.
4. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify this scheduled script execution</td>
</tr>
<tr>
<td>Active</td>
<td>If true, the script will be executed at the scheduled date and time.</td>
</tr>
</tbody>
</table>
### Field | Input Value
--- | ---
**Run** | The type of schedule to execute the script on. Choices are:
- Daily
- Weekly
- Monthly
- Periodically
- Once

**Day** | • If **Run** is *Weekly*, the day of the week
• If **Run** is *Monthly*, the day of the month.

**Repeat Interval** | If **Run** is Periodically, the duration between each script execution.

**Time** | If **Run** is *Weekly* or *Monthly* the time of day, on a 24 hour clock.

**Starting** | The date and time of the first scheduled script execution.

**Application** | The application that contains the script.

**Conditional** | If checked, the entity will only be executed if certain conditions are met.

**Condition** | If **Conditional** is checked, a script determines under what conditions the scheduled script is executed. The last expression of the script should evaluate to a Boolean (true/false) value.

**Run as [Optional]** | Select another user to run the script execution as. Configure the form to add this field if it is not present.

**Run this script** | The script to run at the scheduled date and time. For example, copy script logic from a business rule or call a script include.

### Example
The following is an example of a conditional script. This example runs the scheduled job only if there are active Incidents older than 30 days.

```javascript
// Only run this Scheduled Job if there are active Incidents over 30 days old
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT');
ga.addQuery('active', 'true');
ga.addQuery('sys_created_on', '<', gs.daysAgo(30));
ga.query();
ga.next();
ga.getAggregate('COUNT') !== '0'
```
Schedule the generation of an entity

Entities include changes, incidents, and CIs.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Click **New**.
3. Select **Automatically generate something (a change, an incident, a ci, etc) from a template**.
4. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>If true, the entity will be generated at the scheduled date and time.</td>
</tr>
<tr>
<td>Run</td>
<td>The type of schedule to generate the entity on. Choices are:</td>
</tr>
<tr>
<td></td>
<td>- Daily</td>
</tr>
<tr>
<td></td>
<td>- Weekly</td>
</tr>
<tr>
<td></td>
<td>- Monthly</td>
</tr>
<tr>
<td></td>
<td>- Periodically</td>
</tr>
<tr>
<td></td>
<td>- Once</td>
</tr>
<tr>
<td>Day</td>
<td>- If Run is <strong>Weekly</strong>, the day of the week</td>
</tr>
<tr>
<td></td>
<td>- If Run is <strong>Monthly</strong>, the day of the month</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>If Run is <strong>Periodically</strong>, the duration between each scheduled generation.</td>
</tr>
<tr>
<td>Time</td>
<td>If Run is <strong>Weekly</strong> or <strong>Monthly</strong> the time of day, on a 24 hour clock.</td>
</tr>
<tr>
<td>Starting</td>
<td>The date and time of the first scheduled generation.</td>
</tr>
<tr>
<td>Conditional</td>
<td>If checked, the entity will only be generated if certain conditions are met.</td>
</tr>
<tr>
<td>Condition</td>
<td>If Conditional is checked, a script determines under what conditions the</td>
</tr>
<tr>
<td></td>
<td>scheduled script is executed. The last expression of the script should</td>
</tr>
<tr>
<td></td>
<td>evaluate to a Boolean (true/false) value.</td>
</tr>
<tr>
<td>Generate this</td>
<td>A reference to a template for a record.</td>
</tr>
</tbody>
</table>

Special cases in job schedules

Some special cases require care in job scheduling.
End of the month schedules

Because months have different lengths, take care when scheduling jobs for the end of the month.

• Scheduling an event for the 29th or 30th is not recommended, because the scheduled job will not be executed in months (like February) which are shorter than those dates.
• If an event is scheduled for the 31st, it will be executed on the last day of the month, even if the month is shorter.

For example, something scheduled to run on the 31st of the month will run on February 28th or February 29th in a leap year.

Weekday schedules

For scheduled scripts, use the following script to run only on weekdays:

```javascript
function checkWeekdays() {
    var now = new Date();
    var day = now.getDay();
    var result = false;
    if(day != 0 && day != 6) {
        result = true;
    }
    return result;
}
checkWeekdays();
```

Scheduled jobs from scripts

To execute a scheduled job triggered by an event, use the following script:

```javascript
//Execute a scheduled script job
var rec = new GlideRecord('sysauto_script');
rec.get('name', 'YOUR_JOB_NAME_HERE');
SncTriggerSynchronizer.executeNow(rec);
```

This script can be run using one of several tables:

• scheduled_import_set (Scheduled Import Sets)
• sysauto_script (Scheduled Script Execution)
• sysauto_template (Scheduled Template Generation)
• sysauto_report (Scheduled Report)

Note: SncTriggerSynchronizer does not provide methods to execute scheduled jobs in the future.

Running Scheduled Jobs Imported from Another Instance

To prevent unexpected data changes, the system does not automatically create Schedule Item [sys_trigger] records for Scheduled Jobs [sysauto] imported from an XML file such as an update set. To run a scheduled job imported from another instance, update the scheduled job record.
Create a scheduled job

Create a scheduled job on the Schedule Job [sysauto] table (System Definition > Scheduled Jobs).
Create all new scheduled jobs using this method. Some existing scheduled jobs are found on the Schedule Item [sys_trigger] table (System Scheduler > Scheduled Jobs). Do not create new scheduled jobs on the Schedule Item table.

To create a scheduled job:
1. Navigate to System Definition > Scheduled Jobs.
2. Click New.
3. Select the appropriate type of scheduled job.

The fields presented will depend on the type of scheduled job required.

View a schedule item

Schedule items are individual instances of a scheduled job.

To see which scheduled jobs will run today:

Navigate to System Scheduler > Today’s Scheduled Jobs.
The table displays each schedule item that will be run.

Note: It is usually inadvisable to modify the schedule items themselves. It is best to modify the scheduled jobs that contain them.

Event registry

Events are registered in the Event Log by Business Rules. These events can be used to automate other activities, such as script actions or notifications.

Events can be used to schedule actions or tasks to occur when conditions are fulfilled.

Examples:
• kb.view - an event triggered when a user views a Knowledge Base article, used to trigger the script action Knowledge View to create a Knowledge Use record every time an article is viewed.
• incident.commented - an event triggered when a user comments on an article, used by two incident commented email notifications.

Inactivity Monitors:
An inactivity monitor triggers an event if a record has not been updated for a defined length of time.

**Script Actions:**

Script actions are scripts which are triggered when an event is recorded in the log. In that way, scripts can be set to be performed whenever a particular activity occurs in the platform, rather than at a particular time (like scheduled jobs) or in response to particular conditions (like a business rule).

**Notifications:**

Events are also used to trigger Email Notifications when an event is recorded in the log.

**System scheduler**

The System Scheduler application contains two separate engines for scheduling: the Scheduled Jobs engine and the Schedules engine.

Functionality described here requires the Admin role.

**Scheduled Jobs:**

Scheduled Jobs performs any work that must be done at a specific time or on a recurring basis. The Scheduled Jobs module links to the Schedule [sys_trigger] table. Manipulating records on the Schedule table is not recommended. Use this table to view existing base system scheduled jobs.

The Scheduled Jobs module in System Definition is an admin-friendly front end for scheduling work. Use this module to create new scheduled jobs.

For more information, see [Create a Scheduled Job](#).

**Schedules:**

Schedules are rules which include or exclude time on a calendar. They are used by service levels, inactivity monitor, and group on-call rotation. For instance, a schedule can be defined to restrict service levels to only apply to weekdays during business hours, or to exclude holidays from an on-call rotation.

For more information, see [Use Schedules](#).

**Timeline pages**

Use timeline pages to track any activity bounded by two dates, such as the start and end date of a change request or the open and close date of an incident. For details on timeline navigation, filtering, and working with calendar perspectives, see [Using Timelines](#).
Features

- Make selected timelines available to users by role.
- Select perspective from daily to yearly views.
- Create dynamic labels for timeline spans.
- Configure tooltips for each span.
- Permit span dragging and resizing by users.
- Lock timelines to prevent editing.

Timelines

Timelines display a linear calendar of tasks, such as incidents and change requests, defined by their start and end dates.

Each task on the timeline is represented by a span, which is displayed as a horizontal bar and may have distinctive color coding. Each span has a label and can have tooltip text containing additional information about the task. You can also change the calendar’s perspective for a more granular view of the data.

Timeline pages

Timeline pages are created by an administrator and are user interactive.

They can be navigated and zoomed, and records can be updated from within the timeline by manipulating the spans.

Viewing Timelines

By default, only administrators have a module to access timeline records. ITIL users can only view timelines by selecting a context menu item from an incident record.
Figure 336: Timeline new

Administrator Role Users

Users with an administrator role can view timelines from the timeline page records.

1. Navigate to System UI > Timeline Pages.
2. Select a timeline record to view.
3. Click View Timeline.

Other Users

ITIL users can view timelines associated with any task record where the metrics are set to display as timeline records (by default, only Incident records display timeline metrics). ITIL users can select the
**Metrics Timeline** context menu UI action to view the Assigned to duration and the State duration metric timelines.

1. Navigate to active task record, such as an incident.
2. Right-click the banner, and select **Metrics Timeline**.

![Incident](image)

**Figure 337: Metrics timeline**

To allow non-administrators to view other timelines, create a custom module.

**Span details**
- If the left navigation pane is visible, the span label is visible in the left pane.
- If the left pane is hidden, hover the cursor over a span to view the tooltip.
Figure 338: Timeline tooltip

Span focus and zoom

Table 257: Focusing and Zooming on a Span

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Macintosh</td>
<td>Command + Click</td>
</tr>
<tr>
<td>Windows</td>
<td>Control + Click</td>
</tr>
</tbody>
</table>

Spans edits

If the timeline has been configured for editing (horizontal moving, start and end date dragging), use the mouse to adjust the spans to suit your needs.

Dragging the span and changing the start or end dates updates the parent record.

Move the start or end dates to change the duration of the task.

Figure 339: Timeline drag start

Move the entire span horizontally to adjust the start and end dates but not the duration.
High Priority Incidents

Move the span horizontally

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>INCO0000014, missing my home directory</td>
<td>INCO0000044, Cant log into server</td>
</tr>
<tr>
<td>INCO0000027, please remove this host</td>
<td>INCO0000016, Rain is leaking on main DNS server</td>
</tr>
</tbody>
</table>

Figure 340: Timeline drag span

Changes in perspective
Use the range selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max. Use the starting and ending calendar fields to select the timeline perspective. These fields control the same perspective as the slider at the bottom of the timeline. The green, vertical line indicates the current date and time, and sweeps across the timeline automatically.

Figure 341: Timeline perspective bar

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max. Use the starting and ending calendar fields to select the timeline perspective. These fields control the same perspective as the slider at the bottom of the timeline. The green, vertical line indicates the current date and time, and sweeps across the timeline automatically.

Figure 342: Timeline perspective bar

The pink slider at the bottom of the timeline offers another way to change the perspective. Move the slider from right to left to view all the spans on a long timeline. Adjust the end points of the slider to make arbitrary changes to the magnification. A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.
Create a timeline page

1. Navigate to **System UI > Timeline Pages**.
2. Click **New**.
3. Fill in the form as described in the table and click **Submit**.

**Table 258: Creating A Timeline Page**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name that describes the function of this timeline. For example, High Priority Change Requests.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table associated with this timeline, such as Change Request [change_request].</td>
</tr>
<tr>
<td>Start date field</td>
<td>Select a time-related field from the specified table to use as the start date for the timeline. The timeline begins with the span for the record with the earliest start date from this field, after the filter and sort order are applied. For example, you can select Updated as the start date field and start the span for each active change request on the date it was updated to a high priority.</td>
</tr>
<tr>
<td>End date field</td>
<td>Select a time-related field from the specified table to use as the end date for the timeline. The timeline ends with the span for the record with the latest date from this field, after the filter and sort order are applied. For example, you can select Closed as the end date field and display all high priority change requests by the date on which they were closed.</td>
</tr>
</tbody>
</table>

**Display Options**

<p>| Show grid lines? | Select this check box to show horizontal background shading to highlight alternate spans. |
| Show left pane?  | Select this check box to show label text in a pane on the left of the timeline. The text that appears in this pane is defined in Span text fields. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tbody>
</table>

A completed Timeline Page record looks like this.
Customize the timeline page span style

The Timeline Page Span Style related list allows you to define conditional span styles.

1. Navigate to **System UI > Timeline Pages**.
2. Open the timeline page for which you want to define the span style.
3. Go to the Timeline Page Span Styles related list and click **New**.
4. Fill in the form as described in the table and click **Submit**.

The Timeline Page Span Style form provides the following fields.
Table 259: Customizing the Timeline Page Span Styles

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Create a condition to filter the results that appear in the timeline.</td>
</tr>
<tr>
<td>Label color</td>
<td>Select the color for the text under each span.</td>
</tr>
<tr>
<td>Label decoration</td>
<td>Select a character style for the text under each span: Bold, Italic, Underline, or Line-through.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to determine the sequence in which the style conditions are evaluated. Style conditions with a lower order are evaluated first.</td>
</tr>
<tr>
<td>Span color</td>
<td>Select the color of each span.</td>
</tr>
<tr>
<td>Timeline page</td>
<td>Select the timeline page to which the span style applies. By default, the span applies to the current timeline.</td>
</tr>
</tbody>
</table>

Display a metric as a timeline

Administrators can allow users to display any metric on a timeline by activating the Timeline Metrics UI action.

1. Navigate to Metrics > Definitions.
2. Select the metric you want to display on a timeline. For example, Problem State Duration.
3. Select the Timeline checkbox.
4. Click Update.

The UI action is available on the same table as the metric. By default, only Incident metrics are available.
Make a timeline visible to a selected user

Make selected timelines available to users by creating a custom module within an application and defining the roles that can access it.

To permit these users to update task records directly from the timeline, configure the timeline to allow span dragging.

**Note:** Timelines delivered by a custom module are not entirely dynamic. The left pane, the summary pane, the auto-refresh feature, and the grid lines are not dynamic and do not reflect changes made to the timeline record after the module link is created. However, the data represented by the spans, the labels, and tooltips display all updates in the custom module.

To create a timeline page module:

1. Right-click an application (such as Incident) in the navigation pane and select **Edit application**.
2. In the application Modules related list, click **New**.
3. **Configure** the Module form to add the Timeline page field.
4. Fill in the form as described in the table and click Submit.

The Module form provides the following fields.

Table 260: Making Timelines Visible to Selected Users

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the module as it will appear in the navigation pane. For example, you might use Planning Timeline.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to determine the sequence in which this condition will be evaluated if more than one matching condition exists. Conditions with a lower order are evaluated first.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application for the new module.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a brief description of the module that appears when the user places the cursor over the module name. For example, you might enter Weekly view of high priority changes.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to enable the module for the roles defined. Clear this check box to disable the module for all users.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an appropriate icon to appear with the module name.</td>
</tr>
<tr>
<td>Link type</td>
<td>Select Timeline Page. When this link is selected, the Timeline Page field appears.</td>
</tr>
<tr>
<td>Timeline Page</td>
<td>Select the timeline page you want to appear in this module. For example, for the Change application select a change-related timeline, for the Incident application select an incident related timeline.</td>
</tr>
<tr>
<td>Roles</td>
<td>Select the roles that can access this module.</td>
</tr>
</tbody>
</table>

The completed module form looks like this.
Timeline sub item

Use the Timeline Sub Items related list to define child spans for the timeline, based on records in a table that references the parent timeline's table.

This can be used to generate a hierarchical relationship starting from a timeline page to any number of levels. For example, if there is a timeline page for a release, a sub item might be sprints, and a sprint might have stories as a sub item.

To create a new sub item:

1. Navigate to System UI > Timeline Pages.
2. Open the timeline page for which you want to add a sub item.
3. Go to the Timeline Sub Items related list and click New.
4. Fill in the form as described in the table and click Submit.

The Timeline Sub Item form provides the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent</td>
<td>[Read-only] Identifies the parent of the timeline sub item.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a unique name that describes the function of this timeline. For example, Sprints for High Priority Changes.</td>
</tr>
</tbody>
</table>

Table 261: Timeline Sub Items
<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table called by this timeline. The selected table must have at least one reference field to the table selected for the parent timeline page. For example, if the parent timeline page uses the Scrum Release [rm_release_scrum] table, you might choose the Sprint [rm_sprint] table for a timeline sub item.</td>
</tr>
<tr>
<td>Start date field</td>
<td>Select a time-related field from the specified table to use as the start date for the timeline. For example, Planned start date.</td>
</tr>
<tr>
<td>End date field</td>
<td>Select a time-related field from the specified table to use as the end date for the timeline. For example, Planned end date.</td>
</tr>
<tr>
<td>Parent Reference Column</td>
<td>Select a reference field on which to base the timeline connection between the sub item records and the parent records. If multiple reference fields are available, choose the reference field that forms part of the hierarchy to be modeled by this timeline. If this list is blank, the sub item table contains no reference fields to the parent table. In this case, you must choose a different table for the sub item. ServiceNow uses the parent reference column to determine which records are displayed at each level of the timeline.</td>
</tr>
<tr>
<td>Display Options</td>
<td></td>

<td>• Restrict by parent: Child span can be moved only within the time frame defined by the parent span.</td>
</tr>
<tr>
<td></td>
<td>• Update parent: Parent span is updated when the child span is moved outside the time frame defined by the parent span.</td>
</tr>
</tbody>
</table>

Timing functionality

Timing functionality are tools that exist to answer the question "How Long?"

Metric definitions

Defined metrics can track how long an audited field holds a certain value.

For instance, a metric can track how long an incident is assigned to an individual, or how long an incident is in the state Active.
SLAs

Service Level Agreements time how long a task meets a certain condition, and is primarily used to ensure that tasks are handled within a pre-determined time limit.

SLAs define the following conditions:

- Start Conditions
- Pause Conditions
- Stop Conditions

Once a task meets the Start Conditions, the SLA will time how long the task remains in that condition (unless it meets Pause Conditions). The timer will end if the Stop Conditions are met. If the time-limit is passed, the SLA will be marked breached.

Notifications can be driven off of the SLA to warn interested parties as the time limit approaches.

Time worked fields

The Task [task] table provides a time-tracking field called Time worked. This field measures how long a record has been viewed in order to measure work time on a ticket.

Figure 344: Time Worked

Any table that extends Task can use this field. To add the field, configure the form.

As the record is viewed, the timer counts upward. To pause the timer, click the stop icon (嘴巴).

To resume the timer, click the start icon (嘴巴).

When the task is saved, the amount of new time in the timer is used to generate a record on the Time Worked [task_time_worked] table. This table can be viewed as a related list on the task form.

By default, the time displayed in the Time worked field displays a cumulative value stored in the task record. If you modify a Time Worked record, the changes will not be reflected in the task timer.

You can set the property com.snc.time_worked.update_task_timer to enable updating of the task timer value based on changes to the time worked records. This is accomplished through the Update task timer business rule.

Schedules

Schedules are rules that include or exclude time for various actions or tasks.

Use schedules to specify when service level agreements or inactivity monitors are active, or to specify when on-call rotations should take effect. For example, if a service level agreement is set to an 8-5 Weekdays schedule, the SLA only counts time during those hours.

Default schedules

Default schedules are available in a base system.
Table 262: Default Schedules

</tbody>
</table>

**Holidays**

Each individual holiday can be defined as a schedule entry to create exceptions to existing schedules. For instance, if an SLA requires an incident be resolved within three business days excluding Christmas, create a schedule entry for Christmas to ensure that SLAs do not count Christmas when calculating elapsed time, even if it falls within the work week.

Because schedules can be included in other schedules through a parent-child relationship, it is also possible to create a holiday schedule and include it in other schedules to keep holidays consistent.

The following example shows a holiday schedule.

</tbody>
</table>
The following example shows a schedule that includes the holiday schedule shown above.

**Figure 346: Child Schedule**

Create a holiday schedule for multiple regions

You can create holiday schedules for multiple regions that follow the same work schedule but have different holidays.
The following method supports multiple regions that all follow the same work schedule (for example, an 8-5 weekdays schedule) but have different holiday schedules.

1. Create a holiday schedule for each region. For example, U.S. Holidays, British Holidays, and Australian Holidays.

2. Add the work schedule as a child schedule to each region’s holiday schedule.

This method requires making \(<\text{number of schedules}\> + 1\) total schedules. If you instead make the regional holiday schedule a child schedule of the work hours schedule, you will need to create a separate work hours schedule for each region. The total number of schedules in this case is \(<\text{number of schedules}\> \times 2\) schedules.

Parent and child schedules

Schedules can have one of two parent-child relationship with other schedules.

- **Parent field:** When a schedule record lists a value for the **Parent** field, schedule entries from the parent schedule apply to both the parent schedule and the child schedule. By default, there are no sample schedules that use the **Parent** field.
- **Child schedule:** When a schedule record has one or more child schedules in the **Child Schedules** related list, schedule entries from the child schedule apply to the containing schedule. By default, there are several sample schedules that use child schedules. For example, see the **8-5 weekdays excluding holidays** schedule that includes the **U.S. Holidays** schedule.

Parent and child schedules cannot contain conflicting schedule entry types. For example, a schedule containing maintenance schedule entries cannot also contain blackout schedule entries. Nor can a maintenance schedule have a child schedule containing blackout schedule entries.

Parent schedules are not valid if they are only exclusionary. They must have at least one entry that is not of type **Excluded**.

**Note:** The **Show Schedule** related link shows schedule entries from the current schedule and the child schedule record. For example, when showing the **8-5 weekdays excluding holidays** schedule, holidays are also shown as excluded because the holiday schedule is a child schedule.

Schedule entry fields

The **Schedule Entries** related list contains the definitions of the time periods you want to include in or exclude from the schedule.

**Note:** A schedule entry can only be associated with one schedule.

The Schedule Entry form uses these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<td>Enter a unique name for the schedule.</td>
</tr>
<tr>
<td>Time Zone</td>
<td>Select the time zone for the schedule. If you select Floating, the time zone will be relative to whatever is accessing the item at any given time. For example, if a resource manager in Amsterdam sets a floating schedule for 8:00 A.M. to 5:00 P.M., a user in San Jose sees the schedule as 8:00 A.M. to 5:00 P.M. When a schedule is defined in a specific time zone, users in different time zones see the schedule with their own time zone applied.</td>
</tr>
<tr>
<td>Parent</td>
<td>Select a parent schedule to constrain the new schedule.</td>
</tr>
</tbody>
</table>
Define a schedule

Schedules are configured with two types of records.

- Schedule records specify a time zone and a type of schedule and use one or more schedule entries. Schedule records are saved in the Schedule [cmn_schedule] table.
- Schedule entry records specify the time periods that are included or excluded from a schedule. Schedule entries are saved in the Schedule Entry [cmn_schedule_span] table.

1. Navigate to System Scheduler > Schedules > Schedules.
2. Select a pre-existing schedule or click New to create a new one.
3. Complete the fields on the form (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the schedule.</td>
</tr>
<tr>

<td>black out</td>
<td>excludes time periods from change management schedules. A schedule containing blackout schedule entries cannot also contain maintenance schedule entries.</td>
</tr>
</tbody>
</table>

Description

[Optional] Describe the schedule.

**Note:** The Schedule form displays a warning message if there are no active entries defined for the current schedule. If your schedule is a child schedule that only contains exclusions, ignore the message because exclusions are non-active entries.

4. Right-click the header bar and click Save.

**Note:** If you create a schedule of type maintenance and save the record, a UI policy hides the Type field from the form. To view or change the value for the Type field, view the list of schedules rather than the schedule form and add the Type column if necessary. You can double click the cell for the value in the Type column and modify from the list view.

5. Configure one or more schedule entries.
## Schedule

**Name:** 8-5 weekdays  
**Time zone:** -- Floating --  
**Parent:**  
**Type:**

**Actions on selected rows...**
Schedule for the fifth instance of a day of the week

When selecting a date near the end of a month for a repeating monthly schedule, it is possible to select a date that computes to the fifth instance of that week day.

ServiceNow offers three options for handling months that do not have a matching fifth instance of the selected day.

- Last: ServiceNow selects the last instance of the week day in the month.
- Next: ServiceNow selects the first instance of the week day in the next month.
- Strict: ServiceNow skips any month without a matching fifth instance and selects only months that have a matching fifth instance.

The system property glide.schedules.fifth controls how a schedule entry that selects the fifth occurrence of a week day behaves in months containing only four occurrences of that day. This property is only valid when the glide.schedules.repeat_nth property is set to Day.

The following example illustrates computing what day of the month a schedule repeats on when the schedule starts on the fifth instance of a week day in the month.

1. Navigate to sys_properties.list.
2. Open the glide.schedules.fifth property.
3. Verify that the Value is set to last.
4. Navigate to System Scheduler > Schedules > Schedules, define a new schedule, and click Submit.
5. Open the new schedule and in the Schedule Entries related list, create a new entry with the following parameters:
   - When: November 29, 2012 at 10:00 to November 29, 2012 at 11:00
   - Repeats: Monthly
   - Monthly type: Day of the Week
   - Starting: November 29 (note that November 29 is the fifth Thursday in the month)
6. Click Submit.
7. Open the same schedule entry.
   Note that the form says "Every month on the fifth Thu."
Geneva    ServiceNow    ServiceNow Platform

The schedule for the first three months is computed as:

- November 29, 2012 (5th Thursday of the month)
- December 27, 2012 (Last Thursday of the month)
- January 31, 2013 (5th Thursday of the month)

8. If the Value on the glide.schedules.fifth property is set to next instead of last in step 3, the schedule for the first three months is computed as:

- November 29, 2012 (5th Thursday of the month)
- January 3, 2012 (1st Thursday of the next month since December 2012 does not have five Thursdays)
- January 31, 2013 (5th Thursday of the month)

9. If the Value on the glide.schedules.fifth property is set to strict instead of last in step 3, the schedule for the first three months is computed as:

- November 29, 2012 (5th Thursday of the month)
- No meeting (December 2012 skipped because it does not have five Thursdays)
- January 31, 2013 (5th Thursday of the month)

Repeat a monthly schedule

For monthly schedules (Repeat is set to Monthly) that start on a particular day of the month (Monthly type is set to Day of the month), you can specify the following options:

- How ServiceNow computes the starting day each month. See Day of the Week.
- How ServiceNow handles monthly schedules that start on the fifth instance of a day. See Fifth Instance of a Day of the Week.

Day of the Week:

ServiceNow offers two methods to compute what day of the week a monthly schedule repeats on:

- Day: This method computes the day of the week to repeat on by determining the order of the selected starting date within the month. For example, if the selected starting date appears on the first Monday in the month, the schedule repeats every first Monday of every month.
- Week: This legacy method computes the day of the week to repeat on by determining what week number the selected starting date appears in the month. For example, if the starting date is a Monday during the second week of the month, the schedule repeats the second Monday of every month.
The system property glide.schedules.repeat_nth determines what method your instance uses to compute what day a repeating monthly schedule occurs on. By default, instances use the more accurate Day method.

**Note:** Use the "Week" method to maintain backwards compatibility with customized schedule logic.

The following example illustrates computing what day of the week a monthly schedule repeats on.

1. Navigate to sys_properties.list.
2. Open the glide.schedules.repeat_nth property.
3. Verify that the Value is set to day.
4. Navigate to System Scheduler > Schedules > Schedules, define a new schedule, and click Submit.
5. Open the new schedule and in the Schedule Entries related list, create a new entry with the following parameters:
   - When: November 5, 2012 at 10:00 to November 5, 2012 at 11:00
   - Repeats: Monthly
   - Monthly type: Day of the Week
   - Starting: November 5 (note that November 5 is the first Monday in the month, but it is in the second week)
6. Click Submit.
7. Open the Schedule Entry.

   Note that the form says Every month on the first Mon.

   The first few dates this schedule will run are:
   - November 5, 2012 (1st Monday of the month)
   - December 3, 2012 (1st Monday of the month)
   - January 7, 2012 (1st Monday of the month)

8. If the Value on the glide.schedules.repeat_nth property is set to week instead of day in step 3, the first few dates this schedule will run are:
   - November 5, 2012 (Schedule starts on Monday in the 2nd week of the month)
   - December 10, 2012 (2nd Monday in the month)
   - January 14, 2012 (2nd Monday in the month)

**Time zones**

All times are stored in Coordinated Universal Time (UTC). They are displayed globally based on the system time zone, but are displayed to users in their local time zone according to user preferences.
Time zone representation

Time zones that have the Country/City format are primary time zone IDs. Other time zone IDs are links to the primary time zone. For example, US/Pacific is a link to the America/Los_Angeles time zone. Both America/Los_Angeles and US/Pacific represent Pacific Standard Time with the same zone offset and Daylight Savings Time (DST) schedule.

Other than the representation, there is no impact on date and time functionality.

In the absence of a default time zone for the user or the system, JVM reads default time zone information from the machine. Depending on how the machine is configured, it might return the Country/City or link, for example, US/Pacific or America/Los_Angeles. Administrators should configure their system with a default timezone "glide.sys.default.tz" to avoid system dependencies.

Daylight Saving Time

In general, if a time zone is specified based on location (for example, America/Los_Angeles), the system automatically adjusts for daylight saving time. If a time zone is specified based on the name of a time zone (for example, GMT), it does not adjust.

User preferences

Once the System Time Zone is defined, users can also select their own time zone from their user form, accessed through Self-Service > My Profile. The System default appears as System ([name of the default time zone]). For example, if the System time zone is America/Los_Angeles, the user sees System (America/Los_Angeles).

Time zones in email notifications

The date and time stamp of a notification uses the system time zone and not the time zone of any recipient. The property glide.email.append.timezone in System Properties > Email controls whether to append the time zone. If true, the system time zone of the instance is appended to any dates or date/times in outbound email messages (for example, 2010-07-02 04:01:14 PST).

Time zones in service level agreements

Service level agreements have different options for which time zone to use. To set a time-zone for SLAs, navigate to Service Level Management > SLA Properties and locate the following property:

![Use the following time zone for SLA:](image)

Figure 347: Time zone for service level agreements
Some special considerations:

- If **The caller's time zone** is selected, unpredictable behavior can occur if the caller does not have a time zone defined.
- If **The SLA definition's time zone** is selected, the time zone must be manually defined on the SLAs form.

**Time zone in scripting**

When scripting on the server, there are several GlideSystem Date and Time Functions used to get time values. For more information about specific methods and to learn the format in which each returns the requested time, see the GlideSystem API.

**Enhancements**

DST enhancement requires that reports and queries observe daylight saving time rules. The changes affect trend charts, line charts, and filters using the “trend on” operation.

**Time zone changer**

The time zone changer is active by default. Users can change their time zone in the system settings (the gear on the top right of the banner).

**Change the time zone choice list**

Wherever users have a choice of time zone, the choices are populated using the **Time Zone** choice list on the User [sys_user] table. Not all time zones appear by default.

To add or remove time zones from the list of time zones:

1. Navigate to **User Administration > Users** and open any user record, or click **New**.

   Notice the default time zone is **System (America/Los_Angeles)**.

2. Right-click **Time zone**, and then select **Personalize Choices**.

3. Highlight the desired time zone from the **Available** or **Selected** lists, and then **Add** or **Remove** the time zones as needed.
Change a time zone in a scheduled report

By default, scheduled reports use the time zone of the user who runs them (the user in the Run As field) to evaluate the query parameters. You are able to change this time zone.

For example, a report on 'incidents open today' resolves 'today' based on the user's time zone. To manually specify the time zone used to resolve the parameters of the report:

1. Configure the form to add the Run As tz field to the Scheduled Report form.
2. Select the appropriate time zone.

Change a time zone in a scheduled data import

By default, scheduled data imports are run using the time zone of the user who creates them. However, there is a way to manually specify the time zone for the import.

To change the time zone of the scheduled data import:

1. Configure the form to add the Run As tz field to the Scheduled Data Import form.
2. Select the appropriate time zone.
3. Click Update.

Set a system time zone

How to set a default time zone for calendars and users.

1. Navigate to System Properties > System.
2. Locate the property called System timezone, used as default for calendars and users.
   By default, the input field is blank. If no time zone is defined for this property, America/Los Angeles is used as the default.
3. Type a time zone in the field and click Save. This becomes the system time zone.
   The new time zone automatically cascades to all users who do not already have a specified time zone. If a user selects a different time zone or if the administrator selects a different time zone for them, the user is assigned the selected time zone and does not use the system time zone anymore.

© 2017 ServiceNow. All rights reserved. 1056
Time zones in SLAs

Service Level Agreements have a number of options of which time zone to use.

To set a time-zone for SLAs, navigate to Service Level Management > SLA Properties and locate the following property:

![Figure 348: Time Zone SLAs]

Some special considerations:

- If The caller’s time zone is selected, there will be unpredictable behavior if the caller does not have a time zone defined.
- If The SLA definition's time zone is selected, the time zone must be manually defined on the SLA’s form.

System log information

System logs track information that can be viewed by administrators.
The **System Logs** module provides access to a variety of system logs.

- Transactions: browser activities and background processes.
- Email: emails sent from within the platform.
- Events: events defined in the Event Registry.
- Imports: import activity within the platform.
- System Logs - warnings and errors triggered by the platform itself.

There are also log utilities provided:

- Log File Browser: browses the full log file.
- Log File Download: downloads the full log file.

**Audited tables**

If a field on a particular table is audited, all changes to that field are tracked.

For more information, see *Turning on Auditing (History) for a Table.*

This information is kept in two places:

- The *History sets* on page 2564 table.
- The *Audit table*.

**Configuration logging**

Certain configuration changes are tracked in the system logs.

- Action taken, including insert, update, and delete
- Category of change
- Comments recorded with the change
- Name of the change
- XML difference of the change
- Update set the change is associated to
- Date and time of the change
- User who made the change
- Table where the change was made
- Name of the object being changed
- Type of object being changed
- View the change was made in, for changes to forms or lists

**Customer updates table**

Every change that is made in the system is recorded on the Customer Updates [sys_update_xml] table chronologically.

To navigate to this table, enter `sys_update_xml.list` into the navigation filter.

The following information is stored about each update:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name that identifies the updated record.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time the customer update record was created.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Created By</td>
<td>The user who performed the change.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the update.</td>
</tr>
<tr>
<td>Updated</td>
<td>The date and time the customer update record was updated.</td>
</tr>
<tr>
<td>Updated By</td>
<td>The user who performed the update.</td>
</tr>
<tr>
<td>Updates</td>
<td>The number of times the record has been updated.</td>
</tr>
<tr>
<td>Target Name</td>
<td>The name of the element that was altered.</td>
</tr>
<tr>
<td>View</td>
<td>The view of the form that was altered if it was a form layout change.</td>
</tr>
<tr>
<td>Payload</td>
<td>The XML contents of the record after the change.</td>
</tr>
<tr>
<td>Remote Update Set</td>
<td>A reference to that update set if the change was performed by a remote update set.</td>
</tr>
<tr>
<td>Local Update Set</td>
<td>The update set the change is associated with.</td>
</tr>
</tbody>
</table>

### Email logs

The email log records all email notifications sent from all instances within the system.

This is a verbose and unfiltered view of email. For a more detailed view, see the *System Mailbox* application.

This log provides the following information for all notifications.

**Table 266: Email log**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox to use for filtering the email notifications displayed.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the notification (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email notification (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The status of the email notification. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• received: The server received this email.</td>
</tr>
<tr>
<td></td>
<td>• received - ignored: The server received this email, but it was ignored by the instance for inbound email action purposes. Typically,</td>
</tr>
<tr>
<td></td>
<td>these emails are either spam or auto-replies. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - failed: The server has attempted to send the email and failed. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ignored: The server skipped sending this email. Typically, this is for an email which was generated but lacked a recipient email</td>
</tr>
<tr>
<td></td>
<td>address or is a duplicate email. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ready: The email is ready to be sent, but has not been sent out by the mail server. Typically, an email remains in this state for</td>
</tr>
<tr>
<td></td>
<td>only a short time.</td>
</tr>
<tr>
<td></td>
<td>• sent: The email was sent by the instance without any errors or issues.</td>
</tr>
<tr>
<td>Target</td>
<td>A Document ID reference to the record if the email is generated by an insert, update, or delete of a particular record.</td>
</tr>
<tr>
<td>User</td>
<td>The name of the user, from the user record, of the instance from which the email notification was sent.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This is a string field.</td>
</tr>
<tr>
<td>Notification Type</td>
<td>The type of notification. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• SMS</td>
</tr>
<tr>
<td></td>
<td>• SMTP</td>
</tr>
<tr>
<td>UID</td>
<td>The unique ID for the server.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time of the email activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Deleted</td>
<td>An indication of whether the email was deleted from an instance mailbox.</td>
</tr>
<tr>
<td>Weight</td>
<td>The weight of the email, which determines the sending priority relative to other notifications on the same table.</td>
</tr>
<tr>
<td>Importance</td>
<td>An indication that the email was sent with a changed level of importance, such as Urgent.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Originating Event and Notification</td>
<td>An embedded list that stores the event and notification that initiated the email notification. For more information, see <em>Events</em> on page 2996.</td>
</tr>
<tr>
<td>Subject</td>
<td>A configured description of the action that generated the email notification. You create the subject text for notifications in <em>System Notification &gt; Email &gt; Notifications</em>.</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email address of the recipient of each notification.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link <em>Preview HTML Body</em> to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

Invalid email addresses that the instance strips out of outbound email messages are logged, starting with the Geneva release.

### Event logs

The event log records all system events that occur within the system.

This log provides the following information for all events that occur:

**Table 267: Event log**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the event for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the event. You configure events in <em>System Definition &gt; Business Rules</em>.</td>
</tr>
<tr>
<td>Parm1</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Parm2</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Table</td>
<td>Database table acted on for this event.</td>
</tr>
<tr>
<td>Processed</td>
<td>Date and time the event was processed This time reflects the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Processing time</td>
<td>Time taken to process this event, in milliseconds.</td>
</tr>
<tr>
<td>Queue</td>
<td>Processor queue name.</td>
</tr>
</tbody>
</table>
Import logs

The import log displays information in a verbose format about any data import activity within the platform. For a more detailed view of the import sets that produced a particular log, see Import Sets > Transform History.

This log provides the following information for all imports:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the import for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. For import files, the level is Information.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated message regarding the status of the import.</td>
</tr>
<tr>
<td>Source</td>
<td>Name of the external source of the import, such as an integration.</td>
</tr>
</tbody>
</table>

Logged information

Certain information is tracked in the system logs.

- Workflows
- Configuration
- Chats sessions
- Transactions for each view of each page in the system, including load times for network, server, and browser
- Inbound and outbound email
- Events triggered in the system
- Imports and integrations
- System warnings, errors, and script logs
- Upgrade information for any plugin activations, update sets, or system upgrades

Log history

The system uses table rotation and table extension to archive older logs.

By default, the system uses the following schedule to archive common logs:

<table>
<thead>
<tr>
<th>Table</th>
<th>Archive schedule</th>
<th>Rotations</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event [ecc_event]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Queue [ecc_queue]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Event [sysevent]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Log [syslog]</td>
<td>Every week</td>
<td>8</td>
<td>Rotation</td>
</tr>
</tbody>
</table>
Log utilities

The instance provides the utilities log file browser and log file download.

Use System Logs > Log File Browser to view any system log entry. You can search for log files by using the following filters:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start time</td>
<td>Start date and time of the range you want to search, for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Session ID</td>
<td>System-generated hexadecimal string that identifies the session that generated the log entry.</td>
</tr>
<tr>
<td>End time</td>
<td>End date and time of the range you want to search, for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated description of the occurrence.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. The levels are Debug, Error, Warning, and Information. A warning is an error that has been handled and recovered. An error is something that must be fixed.</td>
</tr>
<tr>
<td>Thread name</td>
<td>System-generated identifier of the thread that created the log file.</td>
</tr>
<tr>
<td>Max rows</td>
<td>Maximum number of records returned for a particular filter.</td>
</tr>
</tbody>
</table>

The instance creates compressed archives of system logs every two days and purges log archives after 21 days. You can download log file archives and view them with System Logs > Log File Download. Select a log archive from the list, and then click Download log under Related Links to open or save the archive.

**Note:** Log files are only available for the node you are currently logged into. To see the currently logged into node, navigate to System Diagnostics > Stats.

Outbound email notification recipients

For outbound notifications, the email system log provides reasons that recipients were included or excluded.

Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.
A series of system properties can be used to fine-tune the information to be logged. Two master switch properties, `glide.notification.recipient.include_logging` and `glide.notification.recipient.exclude_logging`, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

![Outbound system logs](image)

**Figure 349: Outbound system logs**

**System diagnostics application**

The System Diagnostics application provides logs that relate to the platform.

These logs are available:

- **Upgrade History**: tracks every upgrade to an instance.
- **Slow Queries**: provides insight into how queries affect platform performance. See *Slow Query Logs*.

**System logs**

System logs display warnings and errors within the instance processes and records, and non-critical events such as memory usage on the server machine.

This list view displays the log entries for the current day only. To view other log files, use the log file browser.

This log provides the following information for all occurrences:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the logging activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. The levels are Debug, Error, Warning, and Information. A warning is an error that has been handled and recovered. An error is something that must be fixed.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated message regarding the nature of the occurrence.</td>
</tr>
</tbody>
</table>
### Email logs

The Emails module links to all of the mail received or sent by the platform.

For more information, see *System Mailboxes*.

### Transaction logs

The transaction log records all browser activity for an instance.

This log provides the following information for all activities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Name of the process or area affected by the occurrence. For example, the source of the occurrence might be EMAIL or Memory.</td>
</tr>
</tbody>
</table>

#### Table 272: Transaction log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the browser action for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created this activity.</td>
</tr>
<tr>
<td>Response time</td>
<td>Round trip response time for the browser request, in milliseconds.</td>
</tr>
<tr>
<td>Network time</td>
<td>Latency time of the network response after the browser request is made, in milliseconds.</td>
</tr>
<tr>
<td>Output length</td>
<td>Size of the output string sent by the instance to the browser, in bytes.</td>
</tr>
<tr>
<td>SQL count</td>
<td>Number of SQL server commands executed for this activity.</td>
</tr>
<tr>
<td>Business rule count</td>
<td>Number of business rules executed for this activity.</td>
</tr>
<tr>
<td>Business rule time</td>
<td>Elapsed time for the execution of the business rules for this activity.</td>
</tr>
<tr>
<td>URL</td>
<td>The application or module connected to by the client browser.</td>
</tr>
<tr>
<td>System ID</td>
<td>System generated identifier of the client instance making the request. This ID is used for cluster environments in which several instances (nodes) communicate with the database.</td>
</tr>
<tr>
<td>IP address</td>
<td>IP address of the client making the request.</td>
</tr>
<tr>
<td>GZipped</td>
<td>Indication of whether a compressed Web page was requested by the browser.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The HTTP protocol used by the browser for this instance.</td>
</tr>
</tbody>
</table>
The **System Scheduler > Slow Job Log** module provides a transaction log filtered to show only slow transactions.

**Workflow logging**

Certain workflow information is tracked in the system logs.

- Each activity executed, including:
  - Date and time started
  - Date and time ended
  - State, for example, Finished, Cancelled, Timed Out, Error
  - Result
  - Fault description, if there was an error

- Transition history, including:
  - Time of transition
  - Activity transitioned from
  - Activity transitioned to
  - Which transition was triggered

- Workflow log, including any log statements added to the workflow

**Search administration**

The system uses the Zing search engine to manage search functionality.

### Zing text indexing and search engine

Index and search record data by table.

Zing text search is:

- an index split into multiple database shards for parallel querying
- created entirely with ServiceNow code
- implemented purely within the relational model
- yields fast results with search engine logic
- provides search results with an emphasis on relevancy scoring
  - frequency points
  - proximity points
  - field-level scoring (such as title, metadata, and short description)
- provides search suggestions
  - Type-ahead search suggestions
  - **Did you mean:** global search suggestions

Administrators and users with the ts_admin role can configure:

- match relevance
- field weights for each table
- global stop words
- stop words for each index
- synonym dictionaries for each table
- tables with attachment indexing

By default, the system uses the Zing text indexing and search engine to search record data.
Features of Zing text indexing and search engine

Enable and configure Zing text indexing and search engine features.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Top tasks</th>
<th>State</th>
</tr>
</thead>
</table>
| Zing computes document scores using three components on page 1092 | Compute document scores based on the frequency, sequence, and weight of search terms in the document. | • Set the relative weight of a field on page 1093  
  • Enable text indexing for a table on page 1097 | Active                  |
| Global text search finds records from multiple tables on page 1069 | Search multiple record types from a single search field.                   | • Add a search group on page 1072  
  • Enable text indexing for a table on page 1097 | Active                  |
| List search finds records from the current table on page 1081  | Search records from a table list view.                                      | • Enable text indexing for a table on page 1097  
  • Regenerate a text index for a table on page 1098 | Active                  |
| Zing can include attachments in search results on page 1102    | Expand search results to include attachments from indexed tables.           | • Enable attachment indexing on a table on page 1104  
  • Enable text indexing for a table on page 1097 | Active                  |
| Zing removes stop words from queries on page 1104             | Remove common words from search queries that do not produce meaningful results. | • Configure a global stop word on page 1105  
  • Configure a table-specific stop word on page 1105 | Active                  |
| Zing matches derived words with stemming on page 1107         | Convert any multiple-character search keyword to its stem form to find derived versions of the word. | • Set localization properties on page 984  
  • Activate a language on page 977 | Active                  |

Available search options

Zing offers users several search interfaces and search operators to conduct text searches.
Table 273: Available search interfaces

<table>
<thead>
<tr>
<th>Search interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global text search</td>
<td>Find records in multiple tables from a single search field.</td>
</tr>
<tr>
<td>Lists</td>
<td>Find records in a list; search in a specific field (Go to), all fields (Search), or in a specific column.</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td>Find knowledge articles.</td>
</tr>
<tr>
<td>Navigation filter</td>
<td>Filter the items in the application navigator.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Filter, search, or sort messages in live feed.</td>
</tr>
<tr>
<td>UI pages on page 3869</td>
<td>Create a custom UI page to search for records in a table.</td>
</tr>
</tbody>
</table>

Table 274: Available search operators

<table>
<thead>
<tr>
<th>Search operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean operators</td>
<td>Include or exclude search terms from global text searches.</td>
</tr>
<tr>
<td>Quotation marks</td>
<td>Filter search results to only include matches to an exact phrase consisting of one or more words.</td>
</tr>
<tr>
<td>Wildcard characters</td>
<td>Expand search results to match any non-space character.</td>
</tr>
<tr>
<td></td>
<td>The system supports both single-character and multiple-character wildcards.</td>
</tr>
</tbody>
</table>

Global text search finds records from multiple tables
Search multiple record types from a single search field.

To perform a global text search, perform one of the following actions based on the UI version you are using.

<table>
<thead>
<tr>
<th>UI version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Click the search icon in the banner on the upper right of the UI16 banner frame on page 18, and then enter the search term.</td>
</tr>
<tr>
<td>UI15 or UI11</td>
<td>Enter the search term in the search box in the upper right of the UI15 banner frame on page 21 or UI11 banner frame on page 26.</td>
</tr>
</tbody>
</table>

All UI versions also have a global text search keyboard shortcut. The UI global_text_search UI Macro provides the global text search field.

Search groups filter search results by table
The system displays search results by search group, which are collections of related tables that users can enable or disable to filter search results.

Within each search group, the system divides search results by table. A user must have read access to a table to see search results for it.
Default search groups

Table 275: Default system search groups

<table>
<thead>
<tr>
<th>Search group</th>
<th>Example tables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tasks</td>
<td>Incident, Change Request, Problem</td>
</tr>
<tr>
<td>Live Feed</td>
<td>Live Feed Message</td>
</tr>
<tr>
<td>Policy</td>
<td>Business Rule, UI Policy, Client Script</td>
</tr>
<tr>
<td>People &amp; Places</td>
<td>User, Group, Location, Company</td>
</tr>
<tr>
<td>Knowledge &amp; Catalog</td>
<td>Knowledge Base, Service Catalog</td>
</tr>
</tbody>
</table>

Displaying search results by group

The system displays knowledge and service catalog search results within their respective search results pages. The system displays other results in list format.

For exact match searches, the system only returns records from the Task (task) and Knowledge (kb_knowledge) tables.

**Note:** The system filters global search results to display only knowledge articles that are in the same language as the preferred language setting.
Options for administrators

Administrators can customize these search groups settings for all users:

- Specifying which tables are part of the group.
- Specifying whether the search group is available for use.
- Specifying whether searches include results from this search group by default.
- Creating new search groups.

Enabling a search groups allows users to see records from the search group's tables. Disabling a search group hides records from the search group's tables.

Options for users

Users can specify these individual search group preferences:

- Specify which group and table search results are collapsed and expanded by default.
• Specify which groups and tables the system includes in search results.

You can collapse or expand each search group and search table as you like, and those settings can be used for subsequent searches if you choose. For example, if you are rarely interested in Policy or Core Items search results, but still want to search them each time, you can collapse those groups.

If you do not want to search some groups or tables, you can deselect a search group or table on a per-user basis. Your preference is saved for subsequent searches. To deselect a search group, clear its check box on the search results page.

**Figure 351: Deselecting search groups**

Click a search group's link, such as the blue **Tasks** link in the image above, to display a dialog box where you can deselect specific tables in each group.

**Figure 352: Deselecting search tables**

Add a search group

You can add a search group to filter global search results.

Role required: text_search_admin

1. Navigate to **System Definition > Search Groups**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name of the search group.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Roles | Select one or more user roles if you want to restrict access to the search group to those roles.
User group | Select a user group if you want to restrict access to the search group to users in that user group.
Description | Enter text to display as a tooltip for the search group.
Active | Ensure the check box is selected to make the search group available.
Searched | Clear the check box if you want to exclude results from this search group by default. A user can manually choose to show results from this search group on the search results page.
Order | Enter a number to determine the order in which this search group is listed relative to other search groups.

4. Right-click the form header and select **Save**.
5. In the **Text Search Tables** related list, click **New**.
6. Complete the form.

**Table 277: Text search table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table to search.</td>
</tr>
<tr>
<td>Active</td>
<td>Ensure the check box is selected to search the table.</td>
</tr>
<tr>
<td>Searched</td>
<td>Clear the check box if you want to exclude results from this table by default. A user can manually choose to show results from this table on the search results page.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to determine the order in which this table is listed relative to other tables in the search group.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select one or more conditions to determine which records on the selected <strong>Table</strong> are searched.</td>
</tr>
<tr>
<td>Optional label</td>
<td>Enter the label to display for the table. For example for a search group intended for your Sales team, display <strong>Contacts</strong> instead of <strong>Users</strong> for the <strong>User [sys_user]</strong> table.</td>
</tr>
</tbody>
</table>

7. Click **Submit**.
8. Add any other text search tables to include in the search group.

Set global text search properties
Administrators can control how global text search behaves with system properties.

Role required: admin
1. Navigate to System Properties > Global Text Search.
2. Set these properties.

Table 278: UI properties for global text search

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Global Text Search glide.ui.text_search.enable</td>
<td>The default value is true. Clear this option to disable the global text search capability.</td>
</tr>
<tr>
<td>List of roles (comma-separated) that can use the Global Text Search capability. glide.ui.can_search</td>
<td>The default value is itil,text_search_admin,admin. Add a role to enable it to use search.</td>
</tr>
<tr>
<td>List of tables (comma-separated) that will not appear as options when setting up Global Text Search tables. glide.ui.no_text_search</td>
<td>The default value is sys_audit,sys_event,ecc_queue,ecc_event,syslog,syslog_transaction,sys_journal_field,sys_audit_relation,ecc_agent_log,ecc_mi_result,sysrule_escalate_history,sys_user_token,sys_time_dimension,sys_attachment_doc. Tables that do not appear as options when defining search groups. Examples are system or maintenance tables.</td>
</tr>
<tr>
<td>Number of Global Text Search matches returned per table glide.ui.text_search.rowcount</td>
<td>The default value is 10. Users can click through to see all results for a specific table.</td>
</tr>
<tr>
<td>Global Text Search background color for Knowledge Base results css.textsearch.kb.background.color</td>
<td>The default value is #FFFFDD.</td>
</tr>
<tr>
<td>Global Text Search background color for Catalog results css.textsearch.catalog.background.color</td>
<td>The default value is #F0F7F9.</td>
</tr>
<tr>
<td>Form view to use for Global Text Search exact match - blank means Default view glide.ui.text_search.match_view</td>
<td>The default value is blank.</td>
</tr>
<tr>
<td>List and form view to use for Global Text Search results. Blank means default view. glide.ui.text_search.view</td>
<td>The default value is the text_search view. If you do not have a text_search view, you can create it.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>glide.ir.query_method</td>
<td>Query method for global text search. Run a query for each table, for each base class (parent table), against a single index regardless of table (requires text index regeneration), or let GlideRecord handle the query (simple). With the Zing text search engine, the preferred value is &quot;simple&quot;. The default value is <strong>Simple query</strong>.</td>
</tr>
<tr>
<td>glide.lucene.base_result_max</td>
<td>The maximum number of results that will be returned during a text index search. This limits the number of records that will be extracted from the text index and displayed. The default value is 100. This property is not supported by the Simple query method and is ignored.</td>
</tr>
<tr>
<td>glide.lucene.base_hits_max</td>
<td>The maximum number of entries that will be retrieved from the text index. Only the table that is involved will be returned from the text index for all entries that are between the value specified for maximum results and this value. This is done so that it can be indicated that more results exists for any given table that are going to be displayed. The default value is 500. This property is not supported by the Simple query method and is ignored.</td>
</tr>
<tr>
<td>glide.ts.global_search.parallelism</td>
<td>Number of simultaneous processes (1 to 16) used when searching though multiple groups in a global search. The default value is 4. Each search group uses one thread to render results. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

   The business rule **Text Search Property Change Rationally** validates the new values and aborts the update if they are outside its acceptable ranges.

4. **Open the System Property table** and search for the property **glide.ts.max_wildcard_expansion**.

   **Table 279: System Property for wildcard searches**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ts.max_wildcard_expansion</td>
</tr>
<tr>
<td>Description</td>
<td>Maximum number of matches for a wildcard term that are allowed as unambiguous.</td>
</tr>
</tbody>
</table>
5. Edit the Value.
   If a wildcard search matches more words than this value, the system displays a message asking the user to refine the search.

6. Click Update.

7. To set the text search stemming language, install an internationalization (i18n) plugin.

8. Navigate to **System Properties > System Localization**.

9. Set this property.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>500</td>
</tr>
</tbody>
</table>

### Table 280: Text stemming property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text Search stemming language glide.ts.stemming_language</td>
<td>The default value is <strong>English</strong>. The system supports stemming in English and German.</td>
</tr>
</tbody>
</table>

Enable the simple query method

Configure the simple query method to allow GlideRecord to handle queries and is supported by Zing Text Search.

1. Navigate to **System Properties > Global Text Search**.
2. Locate **Query method for global text search** (the glide.ir.query_method property).
3. Select **Simple query**.
4. Click **Save**.

   The following properties are not supported:
   - Maximum number of results that are displayed per table (glide.lucene.base_result_max)
   - Maximum number of results counted per base class (glide.lucene.base_hits_max)

Configure parallel processing of search groups

To improve performance, only activate search groups and tables that are necessary to meet business needs.

For example, if you do not need Change Task results, deactivate that table in the Tasks search group. If only one group of users needs Change Task results, set up a separate search group that includes Change Tasks. Other users search using a group that does not contain Change Tasks.

Global text search can render results in parallel to improve performance. To configure the number of parallel processes:

1. Navigate to **System Properties > Global Text Search**.
2. Locate the property called **Number of simultaneous processes (1 to 16) used when searching though multiple groups in a global search**.
3. Enter the number of processes to run in parallel.

   Each search group uses one thread to render results. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This
setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits.

4. Click 

Disable the junk filter

By default, Zing does not index or search for 2-digit numbers and single character words (unless they are Chinese or Japanese characters). You can turn off this filter for a table.

For example, to have the ability to search for error 92 in the knowledge base, turn off junk filtering for kb_knowledge.

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. In the Attributes field, enter text_index_filter_junk=false.
4. Right-click the header and select Save.
5. Click the Generate Text Index related link and click OK.

Note:

• To have the desired effect, you may also need to reconfigure the automatic stop words. For example, if a specific 2-digit number appears in all of your problem numbers (92-0001, 92-0002, and so on), the automatic stop word threshold is quickly exceeded and the word is no longer found in searches. To find that 2-digit number in the problem table, you must disable both junk filtering and automatic stop words.
• Disabling the junk filter results in a larger table index. For optimal performance, do not apply this attribute unless it is required.

Debug Zing

Debugging messages create a log of search processes as they occur. These messages may help administrators configure optimal performance settings.

• To view debugging messages, navigate to System Diagnostics > Session Debug > Debug Text Search. The search log messages appear at the bottom of the results page for the remainder of your session.

Figure 353: Debugging Messages

• To debug text indexing problems, you may want to view text_index events in the system log.
In rare cases, you may need to reset the text search caches after regenerating a text index. If text search fails for known words, diagnose and fix this problem:

1. Enable text search debugging messages.
2. In any table with search problems, search for the problem text.
3. In the debug output, note the numbers used for the Stemmed terms.
4. Enter `ts_word.list` in the navigation filter.
5. Locate the stemmed terms and compare the numbers in the list to the debug output (Step 3). If the numbers are different, the UI node's cache is stale.
7. Click the Reset Text Search Caches related link and click OK.

Global search user preferences

The global text search results page allows users to set several user preferences for global text search. The following search preferences are available from the Search tips and preferences link.

![Search tips and preferences](image)

Figure 354: Search preferences
<table>
<thead>
<tr>
<th>Label</th>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use remembered expand / collapse preferences</td>
<td>ts.remember.expanded</td>
<td>Specifies whether you want the collapse state of any search groups/tables remembered for your next search. If selected and you collapse the search results for the People &amp; Places search group for example, that group will be collapsed on your next search. If cleared, all groups and tables are expanded for every search.</td>
</tr>
<tr>
<td>Show list of tables with no search matches</td>
<td>ts.show_negative_result_info</td>
<td>Specifies whether or not you want to see a summary of tables that had no search matches. For example: No matches for Requests, Catalog Tasks, Tickets.</td>
</tr>
<tr>
<td>Show selectable search groups</td>
<td>ts.show_search_groups</td>
<td>Shows or hides the search group check box row.</td>
</tr>
<tr>
<td>Show groups with no search matches</td>
<td>ts.show_empty_groups</td>
<td>Shows or hides a search group if it returns no matches. If selected, the search results display a placeholder row stating there were no matches for that group.</td>
</tr>
<tr>
<td>Return task record if searching for exact number</td>
<td>ts.match</td>
<td>Shows or hides the full search results page if the search term matches a task record number. When selected, an exact match to a record number causes the system to hide the full search results and instead display the record with an exact match message. Exact search matches ignore most additional search conditions normally applied to the record such as the currently selected search groups or the knowledge article published state. For example, an exact search match for a knowledge article returns the article in any state as long as the current user has read access to it.</td>
</tr>
</tbody>
</table>

**Note:** The system filters exact search results to display only knowledge records that are in the same language as the preferred language setting.
Global text search suggestions

Global text search offers two types of search suggestions.

The knowledge base and global text searches provide suggestions as you type. Type-ahead suggestions appear under the search box. Suggestions are based on similar searches that begin with the same characters.

![Type-ahead search suggestions](image)

**Figure 357: Type-ahead search suggestions**

The knowledge base and global text searches also provide suggestions for alternate search terms. Suggestions appear if your original search does not return any results and an alternate spelling or similar recent search does. For example, if you misspell a search term (such as eail), the correct spelling (email) may appear as an alternate search suggestion. Suggestions appear beneath the search box on the results page.

![Alternate search suggestions](image)

**Figure 358: Alternate search suggestions**

Update a type ahead suggestion

The knowledge base and global text searches provide suggestions as you type. These type-ahead suggestions are compiled on a nightly basis by a scheduled job.

Use the following procedure if you need to refresh this list sooner.

1. Navigate to **System Scheduler > Scheduled Jobs**.
2. Open **TS Search Stats**.
3. Run the scheduled job.

For more about how suggestions are generated and maintained, see the blog post *Global Text Search Suggestions* by a ServiceNow Technical Support Engineer in the ServiceNow Community.

Configure a "Did You Mean?" suggestion

The Knowledge Base and global text searches can provide "Did you mean?" suggestions. Suggestions appear if a search does not return any results and an alternate spelling or similar recent search does. This feature is disabled by default.

1. Navigate to **System Properties > Text Search**.
2. Select any of the following check boxes:
   - **Suggest alternate search spellings for knowledge or global search** (the glide.ts.dym.enable_spell_correct property).
• **Suggest related searches for knowledge or global search** (the glide.ts.dym.enable_chain_suggest property); uses search chains, which generate suggestions by tracking occurrences of similar searches, in order, over time.

3. Click **Save**.

*List search finds records from the current table*
Search records from a table list view.

Indexed tables display the for text option in the list title bar, which searches all records for matching field values.
### INCIDENT CONDITIONS

All of these conditions must be met

</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
The list search field accepts *Boolean operators* (AND, OR, and NOT) in search queries. When a user adds a Boolean operator to a search query, the system only returns records that match all search conditions of the query.

The system also converts any search query into an equivalent keyword condition in the list breadcrumbs and filter. For example, searching for the text "Oracle OR SAP" produces the condition `[Keywords] [are] [Oracle OR SAP]`. The standard list controls can modify or remove these breadcrumbs and conditions.

*Boolean operators allow conditional search results*
Include or exclude search terms from global text searches.

All global text search interfaces support boolean operators.

- Global text search field
- Knowledge Base search
- List search for text

For Knowledge Base searches, if the AND search returns poor results, the search is automatically re-run with the OR operator. Administrators can configure the knowledge base search to always use OR by modifying the `glide.knowman.search.operator` property.

**Note:** Boolean operators are case-sensitive. For example, OR is an operator while or is a search term that may be a stop word.
Table 282: Boolean operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR or vertical bar symbol (</td>
<td>Finds a match if any of the terms exist in a document (a union using sets). For example, to find documents that contain either &quot;email password&quot; or just &quot;email&quot;, search for &quot;email password&quot; OR email or &quot;email password&quot;</td>
</tr>
<tr>
<td></td>
<td>When you use filter lists on keywords, OR and</td>
</tr>
<tr>
<td></td>
<td>produce the same results. However, using the .or. operator, which the system uses when you create multiple conditions with the condition builder, can produce different results. For example, these two filters produce the same result by searching for records that contain either SAML or SSO:</td>
</tr>
</tbody>
</table>

![Figure 359: Searching with the OR operator](image1)

![Figure 360: Searching with the pipe operator](image2)

But this filter may produce a different result as it searches for records containing SAML and then searches again for records containing SSO:
<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
</table>
| **AND** | Finds a match if all terms exist in a document (an intersection of sets). For example, to find documents that contain "CPU load" and "10 minutes", search for "CPU load" AND "10 minutes".  
By default, Zing applies an AND operator between all search terms regardless of whether the user entered them or not. For example, the system converts a search for the text "email server down" to [Keywords] [are] [email] AND [Keywords] [are] [server] AND [Keywords [are] [down]]. |
| **NOT, minus (-), or exclamation point (!)** | Excludes documents that contain the term after the NOT operator (a difference of sets). For example, to find documents that contain "CPU load" but not "10 minutes", search for "CPU load" NOT "10 minutes", "CPU load" -"10 minutes", or "CPU load" !"10 minutes".  
The NOT operator cannot be used with just one term. For example, the following search returns no results: NOT "10 minutes".  
NOT must be a stand-alone word. For example, atom NOT ion excludes the term ion. Whereas NOTION searches for the term notion.  
Minus and exclamation point must immediately precede the excluded term. For example, email !Joe excludes the term Joe but email ! Joe includes the term Joe. |

**Quotation marks allow exact phrase searches**
Filter search results to only include matches to an exact phrase consisting of one or more words.

Zing only matches documents that contain the exact words in the exact order you specify. An exact phrase search ignores:

- stop words
- punctuation marks
- wildcard characters

**Note:** Wildcard characters are ignored as punctuation.

For example, searching for the phrase "email password" returns the same search results as these phrases:

- "email the password" because the stop word "the" is ignored.
- "email password?" because the punctuation "?" is ignored.
- "email password*" because the wildcard "*" is ignored as punctuation.
**Wildcard characters allow searching for patterns and variations**

Expand search results to match any non-space character. The system supports both single-character and multiple-character wildcards.

The following searches support wildcard characters.

- Global text search
- Knowledge Base
- Lists (text searches of all fields)
- Reference fields

**Note:** Wildcard text searches are only effective with multiple character words. A wildcard within a sequence of pictogram characters returns too many options for an efficient search. Wildcards are best used with letter-based words.

To perform a single-character wildcard search, use the percent sign (%) character. This wildcard finds words that contain any one character in place the percent-sign-character. For example, to find words such as text or test, search for: te%t

To perform a multiple-character wildcard search, use the asterisk (*) character. This wildcard finds words that contain zero or more characters in place of the asterisk-character. For example, to find words such as planned or placed, search for: p*l*d

You can use wildcard characters anywhere in a search string. If a wildcard search returns too many hits, the system displays a message asking you to refine the search. Administrators can set a global text search property to change the limit for wildcard search results.

**Zing generates search results in four phases**

Generate search results by dividing documents among shards, searching shard documents, scoring shard documents, and merging scores into an index.

Zing generates search results in four phases:

1. Divide searchable documents among index shards.
2. Search and filter shard documents.
3. Score shard documents.
4. Merge shard document scores into an index.

**Phase 1: Divide searchable documents among index shards**

When a search is executed, the system equally divides all searchable documents among 10 index shards. Each shard has a unique list of documents.

To maximize search efficiency, the system creates 10 query threads to simultaneously search each index shard.
Phase 2: Search and filter shard documents

Each query thread searches through its list of shard documents to identify documents that match the search criteria. For example, if you search for "wifi network," the system returns all documents containing both "wifi" and "network" in no particular order.

Note: A multiple word search is equivalent to multiple single word searches connected by an AND operator. For example, `[contains][wifi][AND][contains][network]`.

The query thread assigns each matching document a numeric value (a document ID) to uniquely identify it. All other documents are ignored.

Phase 3: Score shard documents

The query thread scores each matching shard document.
Figure 363: Query threads search, filter, and score shard documents
## Phase 4: Merge and sort shard document scores

The system merges the document scores into a single index and sorts the documents from highest to lowest document score. The documents with the highest document score are most relevant to the search query.

### Figure 364: Merge and sort shard document scores

Zing filters search results with access controls

Filter search results to only display records the user can access.

For example, suppose you index the System Properties \([\text{sys}_\text{properties}]\) table. When the ITIL User searches for a term in the system properties table, Zing returns no search results because the ITIL user does not meet the ACL rule requirements.

Figure 365: ITIL User Search

When a system administrator searches for the same property, Zing returns search results from the System Properties tables because the administrator meets the ACL rule requirements.

### Knowledge & Catalog

No matches for Knowledge Bases, Catalog Items.
Zing computes document scores using three components

The Zing search engine computes document scores based on the frequency, sequence, and weight of search terms in the document.

The components of a document score are:

- **Frequency**: how often the search terms appear in the document.
- **Sequence**: how often the search terms appear in the same order as the search query.
- **Weight**: how heavily weighted the source field is in which the search terms appear.

**Figure 367: Sample document score computation**

**Frequency points**

Zing awards one point whenever a search term appears anywhere in the document. For example, when searching for "distributed database server", a document that contains "distributed" three times, "database" five times, and "server" 17 times would have 25 frequency points.
Sequence points

Zing awards a document more points when it contains the search terms in the same order in which they were typed. The more search terms in sequence there are, the exponentially higher the score becomes.

Following the example above, each time the string "database server" appears in a document, it is awarded 100 (10^2) sequence points. Likewise, each time the string "distributed database server" appears in a document, it is awarded 1000 (10^3) sequence points.

Zing awards sequence points as 10^x, where x is the number of search terms that appear in sequence.

Weight points

Zing awards a document more points if the field in which it appears is weighted. Zing applies a multiplier to frequency points based on the value of the ts_weigh attribute for the field.

By default, each field has a weight of 1. A field with a weight of 50 (ts_weight=50) would add 50 points each time a search term appeared in the field. The maximum possible weight value is 255.

In the out of box system, the following fields have elevated weight scores:

- kb_knowledge.number = 50
- kb_knowledge.short_description = 10
- kb_knowledge.meta = 10
- task.number = 50
- task.short_description = 10

Set the relative weight of a field

To improve search results, the search engine assigns to each potential match a numeric score that represents its relevancy to the query.

Role required: admin

Administrators can control the relative importance of a match for each field in a table with the ts_weight attribute. The default weight of a field is 1.

1. Open the system dictionary entry for the field.
2. In the Attributes field, enter ts_weight=<value>, where <value> is the relative weight of the field.

   The following fields have elevated scoring weights by default:

   - kb_knowledge.number = 50
   - kb_knowledge.short_description = 10
   - kb_knowledge.meta = 10
   - task.number = 50
   - task.short_description = 10

   For example, if the Title field has a ts_weight=50 and the Description field has a ts_weight=10, then a match in the title is weighted 5 times more relevant than a match in the description and 50 times more relevant than a field without the ts_weight attribute.

3. Click Update.

   Note: To view the complete scoring system, see Document Scoring.
Zing indexes words

Index documents by dividing them into words. Depending on the languages your instance supports, a word may be a single character such as a Chinese or Japanese pictogram or a sequence of characters separated by spaces such as with Latin, Arabic, and Pinyin languages.

Zing uses spaces to define the basic unit of word separation. Zing uses the following rules to index words.

**Table 283: Zing word indexing rules**

<table>
<thead>
<tr>
<th>Rule</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Punctuation</td>
<td>Zing indexes some punctuation marks as part of some words to improve search results for common search terms. Zing converts any non-indexed punctuation characters to spaces. See Zing indexes punctuation as part of some words on page 1094.</td>
</tr>
<tr>
<td>Pictograms</td>
<td>Zing supports the full range of Unicode pictogram characters. Each Chinese or Japanese pictogram is indexed as a separate word as if it were a single Latin-1 character surrounded by spaces.</td>
</tr>
<tr>
<td>Letter</td>
<td>Zing treats Latin-1, Arabic, and Pinyin characters as individual letters of space-separated-words. Sequences of letters define indexable words.</td>
</tr>
</tbody>
</table>

*Zing indexes punctuation as part of some words*

Zing indexes some punctuation marks as part of some words to improve search results for common search terms.

**Table 284: Punctuation indexed as part of a word**

<table>
<thead>
<tr>
<th>Punctuation</th>
<th>Indexed to find</th>
<th>Search behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ampersands</td>
<td>Company names</td>
<td>Zing locates terms containing punctuation characters that are common in company names: ampersands (&amp;), plus signs (+), or hyphens (-). For example, a search for H&amp;R Block locates exact matches to the search term.</td>
</tr>
<tr>
<td>Apostrophes</td>
<td>Proper names</td>
<td>Zing ignores trailing possessives and retains most others to find company names. For example, a search for O'Reilly's locates matches to O'Reilly and O'Reilly's.</td>
</tr>
<tr>
<td>Punctuation</td>
<td>Indexed to find</td>
<td>Search behavior</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>Hyphens [-]</strong></td>
<td>Company names</td>
<td>Zing locates terms containing punctuation characters that are common in company names: ampersands (&amp;), plus signs (+), or hyphens (-). For example, a search for <em>Coca-Cola</em> locates exact matches to the search term.</td>
</tr>
<tr>
<td><strong>Product numbers</strong></td>
<td></td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for <em>PROD-10-987</em> locates exact matches to the search term.</td>
</tr>
<tr>
<td><strong>Numbers [123]</strong></td>
<td>Product numbers</td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for <em>PROD10987</em> locates exact matches to the search term.</td>
</tr>
<tr>
<td><strong>Record numbers</strong></td>
<td></td>
<td>Zing locates record numbers that follow a typical pattern. To meet this pattern, search terms must start with a recognized record number prefix. For example, a search for <em>INT1234567</em> locates exact matches to the Incident record.</td>
</tr>
<tr>
<td><strong>Periods [.]</strong></td>
<td>Acronyms</td>
<td>Zing locates acronyms whether they are separated by periods or not. For example, a search for <em>u.s.a.</em> locates matches to <em>usa</em> or <em>u.s.a.</em>. Note that wildcard searches may affect acronym handling. For example, a search for <em>u.s.</em> may yield better results than a search for <em>u.s.</em>.</td>
</tr>
<tr>
<td>Punctuation</td>
<td>Indexed to find</td>
<td>Search behavior</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------</td>
<td>-----------------</td>

<tr>
<td><strong>Host names</strong></td>
<td>Zing locates sequences of letters and numbers separated only by periods. For example, a search for en.myhost123.com locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td><strong>IP addresses</strong></td>
<td>Zing locates numbers that follow a typical IPv4 address pattern. For example, a search for 10.0.0.1 locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td><strong>Product numbers</strong></td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for PROD.10.987 locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td><strong>Plus signs [+]</strong></td>
<td>Company names</td>
<td>Zing locates terms containing punctuation characters that are common in company names: ampersands (&amp;), plus signs (+), or hyphens (-). For example, a search for Google+ locates exact matches to the search term.</td>
</tr>
<tr>
<td><strong>Underscores [_]</strong></td>
<td>Product numbers</td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for PROD_10_987 locates exact matches to the search term.</td>
</tr>
</tbody>
</table>

**Note:** The punctuation handling described here does not affect wildcard and boolean operators. These operators provide separate Zing functions.

*Zing indexes some HTML elements*

Zing indexes the contents of certain HTML elements to improve document search results. This indexing is addition to the normal indexing by word.
Geneva ServiceNow ServiceNow Platform

Table 285: Indexed HTML elements

<table>
<thead>
<tr>
<th>HTML element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title attribute</td>
<td>Zing indexes the contents of the title attribute of any HTML element. This is separate from the title element, which Zing already indexes when identifying the words of the document.</td>
</tr>
<tr>
<td>Anchor link target</td>
<td>Zing indexes the target URL specified in the href attribute of any anchor element.</td>
</tr>
<tr>
<td>Alt text for an image</td>
<td>Zing indexes the alternative text of any image element.</td>
</tr>
</tbody>
</table>

*Enable text indexing for a table*
Administrators can enable text indexing on a table to allow users to search for string values from table records.

Role required: admin

By default, the system creates text indexes for the tables with a Text index record (*System Definition > Text Indexes*). For example:

- Knowledge-related tables
- Core-data-related tables
- Connect-related tables
- Task table
- User table

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

1. Navigate to *System Definition > Dictionary*.
2. Click the table name to open the dictionary entry.
   
   A table in the System Dictionary is a record that has a Table name but no Column name.
3. Select the **Text index** check box to enable text indexing for text fields on the table.

4. Click **Update**.
5. Click **Generate Text Index**.

The system schedules the table for text indexing, typically within a minute.

The Search for text option appears on the list view for the table.

**Regenerate a text index for a table**

You can regenerate a table text index when you change table stop words or display values.

Role required: admin

By default, the system maintains text indexes on a daily schedule. Typically, you only need to manually regenerate a text index when you change these values.

- You change the list of table-specific stop words.
- You change the display value of a record such as changing a user or group name.
Until you regenerate the index, text searches for old display values will still produce results and searches for the new display value will not show results.

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

1. Navigate to **System Definition > Text Indexes**.
2. Open the text index for the table. For example, select task.
   The system displays the Text Index record for the table.
3. Click the **Regenerate Text Index** related link and click **OK**.
<table>
<thead>
<tr>
<th>Table</th>
<th>Task [task]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>12</td>
</tr>
<tr>
<td>State</td>
<td>Ready</td>
</tr>
<tr>
<td>Indexed rows</td>
<td>463</td>
</tr>
<tr>
<td>Unique terms</td>
<td></td>
</tr>
<tr>
<td>Total terms</td>
<td></td>
</tr>
<tr>
<td>Disable synonym</td>
<td></td>
</tr>
<tr>
<td>Partial Match Rule</td>
<td></td>
</tr>
</tbody>
</table>

**Generate Text Index**

The text index will be generated in the background so that you can continue other work while it is being created. If this table does not have a text index, one will be created after the dictionary text index flag is set to true. Upon completion, the system will send you a confirmation email unless you specify otherwise below.

Upon completion:
- **Email me**
  - **admin@example.com**
- **Do not notify me**

**Text Index Specifics**

- **Table name**: task
- **Task**: task

**Index Stop Words**

- **Index Stop Words**
  - New
  - Go to
  - Word
  - Search

**Index = task**

- **Index Stop Words**
- **Index Synonym Dictionaries**

No words to display.
The system schedules the table for text indexing.

**Regenerate a corrupt index**

Typically, a corrupt index regenerates itself. If the system does not start the regeneration process, you must issue a script command to delete the existing index and regenerate it.

For example, to regenerate the task text index, the following script could be used as a background script:

```java
var indexer = new Packages.com.glide.lucene.TextIndexEvent();
indexer.createIndex("task", "my_email@service-now.com");
```

Change the email address to the address that receives the notification when the index is completed. The script creates an event that the index handler processes so the script completes almost instantly. When the scheduled job picks up the event, you can check the Component Status page and see that the index is being generated. An entry also appears in the log, as shown in the following example:

```
10/28/09 15:36:19 (521) worker.1 worker.1 TextIndexGenerator: Text index generation starting for: task
```

As each extended table completes, it is logged:

```
10/28/09 15:37:13 (213) worker.1 worker.1 [0:00:01.462] TextIndex generation complete for: problem, rows indexed: 11
```

After all the extended tables are completed, the Component Status page entry is updated to "completed" and a final log entry is made. The log entry shows how long the process took.

```
10/28/09 15:37:20 (794) worker.1 worker.1 TextIndexGenerator: Text index generation complete for: task, in: 0:01:02.669
```

**Remove an index**

You can remove an index if you no longer want the search engine to return results for table.

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Clear the **Text index** check box and click **Update**.
   
   The system no longer indexes or queries the table for text search results.

**Remove an index for a specific field**

You can remove an index if you no longer want the search engine to return results for a specific field.

1. Navigate to a form containing the field.
2. Right-click the field label and select **Configure Dictionary**.
3. Add `no_text_index=true` to the **Attributes** field. Separate multiple attributes with a comma (with no spaces).
4. Click **Update**.
   
   The system no longer indexes or queries the field for text search results.

**Text indexing statistics and status**

To view text indexing statistics and status, navigate to **System Definition > Text Indexes**.

- If text indexing is in progress, view the status of each index in the **State** field. Refresh the list to view updates. Tables are indexed one at a time.
- To see how long it takes to index a specific table, view the **Last indexing duration** field for the table entry. Although each process varies based on activity and data, historical data can provide a good estimate.
• View statistics (such as the number of indexed rows, terms, and queries in the past week) in the list or on the form for a specific table.

Figure 368: Text Index Status

Zing can include attachments in search results

Expand search results to include attachments from indexed tables.
By default, only searches of Knowledge Base records include attachments. Administrators can enable searching attachments for other tables, but doing so causes the platform to re-index the selected table, its parent table, and any children of the parent table.

**Warning:** For large tables, such as the Task table, re-indexing can take several hours and slows down the system until complete. Re-indexing is best performed during non-peak times.

Zing supports indexing and searching these attachment file types:

- .doc
- .htm
- .html
- .ini
- .pdf
- .ppt
- .reg
- .txt
- .xls
- .docx
- .dotx
- .dot
- .pptx
- .potx
- .pot
- .xltx
- .xlt
Enable attachment indexing on a table
When you enable the attachment indexing for a table, text searches can return matches from the record and its file attachments.

Role required: admin

By default, attachment indexing is enabled for the Knowledge Base.

Enabling attachment indexing causes the platform to re-index the selected table, its parent table, and any children of the parent table.

Warning: For large tables, such as the Task table, re-indexing can take several hours and slows down the system until complete. Re-indexing is best performed during non-peak times.

1. Navigate to System Definition > Dictionary and select the record for the table.
2. Click the Attributes tab.
3. Click New and add the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Attachment index</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

Note: The attachment indexing attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, indexing attachments on the Task table does not index attachments on the Incident table.

4. Click Submit.
5. Optional: To disable attachment indexing, remove the attribute.
6. Click Update.
   The indexing process begins. When it is complete, attachments can be searched on that table.

Zing removes stop words from queries
Remove common words from search queries that do not produce meaningful results.

By default, the system maintains two types of stop words.

<table>
<thead>
<tr>
<th>Stop word type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System-wide text index stop words</td>
<td>The system always ignores system-wide text index stop words when generating text indexes. Any search for a system-wide stop word returns no search results.</td>
</tr>
<tr>
<td>Table-specific stop words</td>
<td>The system uses the table-specific Text Index record to determine whether to index the stop word or to just remove it from keyword search queries against the table.</td>
</tr>
</tbody>
</table>
By default, the system has stop words for common English words. Search administrators typically create stop words from search terms that produce too many search results such as articles, conjunctions, personal pronouns, and prepositions.

Configure a global stop word
Configure stop words that should not be indexed by the search.

1. Navigate to **System Definition > Text Index Stop Words**.
2. Add or remove stop words from the list.
3. If a message appears at the top of the list, contact Technical Support to regenerate all indexes.
   You must regenerate indexes whenever words may be missing from an index. For example, if you delete, inactivate, or change an active global stop word, the word may be missing from the index. An after business rule checks these conditions and generates the notification message when index regeneration is necessary.

Configure a table-specific stop word
You can configure stop words for a specific table.

1. Navigate to **System Definition > Text Indexes**.
2. Open the text index entry for the table.
3. Add or remove stop words from the **Index Stop Words** related list.
   For each word, select the desired **Stop mode** (Not a Stop Word (inactivates the stop word), Neither Index nor Query, or Index but do not Query).
4. If a message appears at the top of the form, click **Regenerate Text Index** and click **OK**.
   You must regenerate indexes whenever words may be missing from an index. For example, if you delete or change a stop word for which the mode was Neither Index nor Query, the word may be missing from the index. An after **business rule** checks these conditions and generates the notification message when index regeneration is necessary.

**Note:** Text search uses the global list plus the table-specific list of stop words when indexing the table.
Enable automatic stop words for a table
The system can identify and generate stop words when a search term exceeds an occurrence threshold.

- Role required: admin
- Enable text indexing for the table

By default, the TS Index Stats scheduled job identifies and creates stop words for tables with text indexes on a nightly basis. Automatically adding stop words improves your search results by removing search terms that return too many search results.

1. Navigate to System Definition > Text Indexes.
2. Open the text index entry for the table.
3. Select the Auto stop check box.
4. In Auto threshold, enter the maximum number of occurrences a search term can have in search results.
   
   When a search term generates more search results than the threshold, the system automatically creates a stop word for the search term.
For example, to create stop words for the task table, see the blog post *Configuring auto stop words and regenerating text indexes* from a ServiceNow employee on the ServiceNow Community.

5. Click **Update**.

The job identifies and creates stop words for the table with a **Stop mode** value of *Index but do not Query* and inserts a **Comment** to indicate that the stop word was generated automatically.

**Zing matches derived words with stemming**

Convert any multiple-character search keyword to its stem form to find derived versions of the word.

Stemming removes a variety of common word inflections, such as plurals and past tense forms. Zing treats all words with a common stem as synonyms of the original search term. Stemming does not apply to searches involving single-character words such as Chinese and Japanese pictograms.

Zing uses the *Porter Stemming Algorithm*, which is most effective for English text, but supports stemming in these languages.

- English
- German

The stemming language determines how the system generates indexes of record data. The system only supports one stemming language at a time regardless of how many languages the instance supports. When you change the stemming language, the system creates any new index entries based on the new language stemming rules, but does not regenerate any existing index records. You must manually regenerate indexes for tables you want to use the new stemming language.

**Installed with Zing**

Several types of components are installed with Zing.

Google custom search integration

Replace Zing text indexing and search engine with Google Site Search functionality.

Activating custom search integration replaces the default search and provides Google Site Search functionality. You can configure your Google Site Search engine to include or exclude sites in your search results. For more information on the Google Site Search feature, see Google Site Search.

Activate Google custom search integration

The Google Custom Search Integration plugin is available by request.

Role required: none

Request the plugin through the HI Service Portal.

1. In the HI Service Portal, click Service Catalog > Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

Configure a search property

The custom search properties allow you to specify the Google Site Search key and the name of the page that appears on the search form. You can also specify whether to open search results in a new page.

Role required: admin

1. Navigate to Custom Search Integration > Properties.
2. Edit the properties.
### Table 293: Search property table

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Google Custom Search key [gc_search.key] | The Google custom search key from the Google site.  
  - Type: String  
  - Default value: None |
| Name of your search to appear on form [gc_search.name] |  
  - Type: String  
  - Default value: None |
  - Type: boolean  
  - Default value: Yes |

3. Click **Save**.

### Define a custom search page

Users can access the custom search by navigating to [https://<your_instance_name>]/gc_search_widget.do to directly access the Google Site Search page. Administrators can also define custom search pages for an instance.

**Role required:** admin

1. To create the search page, complete the following steps.
   a) Navigate to **System UI > UI Pages**.
   b) Create a custom **UI page**.
   c) Embed the **gc_search_widget UI page** in the new search page.

2. Navigate to **Custom Search Integration > Pages**.
3. Click **New**.
4. Complete the form.

### Table 294: Search page table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>The URL of the search page.</td>
</tr>
<tr>
<td>Title</td>
<td>The title to display at the top of the search page.</td>

<tr>
<td>URL Domain</td>
<td>The domain of the search page.</td>
</tr>
<tr>
<td>Weight</td>
<td>The weight assigned to the page.</td>
</tr>
<tr>
<td>Average user weighting</td>
<td>The average user weighting for the page.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Set up the Google Enterprise Search

To configure the Google Site Search engine on your instance, you must first go to the Google website and obtain a Search Engine ID, set up the Google Enterprise Search, and then register the ID with your instance.

1. Go to Google Site Search and sign up for Google Site Search. You must sign up for a paid version of Google Site Search; the free version is not supported. Your organization must be compliant with the Google Site Search licensing terms.

2. Set up your Google Site Search by going to the Custom Search page while logged into your Enterprise account. In the Custom Search definition, you can define the sites to search and the sites to exclude. Click Search engine ID to retrieve your Google Custom Search Key, which you need to configure the search on your ServiceNow instance.

3. Add the URLs you want your users to be able to search. To add a website, click Add under Sites to search.

4. To exclude sites, click Advanced.
5. In your ServiceNow instance, go to **Custom Search Integration > Properties**, enter the **Google Custom Search key** that you created on the Google web site, and click **Save**.

![Figure 372: Configuring Google search engine ID](image)

**Block a robot from your site**

Your instance is configured by default to disable robots from crawling your site. However, if you choose to use the Google Site Search engine, your site will be crawled by the Google robots unless you specifically configure it not to do so.

Role required: admin

The Robots.txt Definition module allows you to define the contents of the robots.txt file associated with the instance. The syntax used is the same as for a standard robots.txt file. For more information on how to format the robots.txt file, see **Robots.txt Specifications**.

1. Go to **Custom Search Integration > Robots.txt Definitions**.

2. Click **New**.
3. Enter the contents of the robots.txt file in the Text field. If you want this file to be active, select the **Active** field. There can only be one robots.txt file active at any time. Setting a file to active automatically sets all other files to inactive. Web crawlers will recognize the contents of the active robots.txt file and honor the robots exclusion protocol.

4. Click **Submit**.

**Retaining only the web crawling blocker**

If you only want to configure web crawlers using the robots.txt file, and not deploy the Google Site Search engine on your instance, you can request the Remove Google Custom Search update set from ServiceNow support.

This update set removes the Google search functionality but leaves the web crawler configuration capability.

**Viewing the search history**

The search history shows all of the searches made on the instance in chronological order.

To view the search history, go to **Custom Search Integration > Search History**. To delete an entry, click the query name and click **Delete**.
Table 295: Search history

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>User</td>
<td>The user who executed the search.</td>
</tr>
</tbody>
</table>

Figure 373: Google search history

Mobile device configuration

Take the system on the go with mobile device support.

Get started with a ServiceNow instance on your mobile device

Use your mobile device to access an instance in a web browser or the native app.

Before you begin

You can access your instance from a web browser on your mobile device or from the native mobile app. Download the native app from the iTunes store or from the Google Play store. Make sure you are on an instance using Geneva patch 6 or higher to use the Android app. If you do not have access to the mobile platform, contact your administrator.
What to do

Access an instance on your mobile device  
To open an instance on a mobile device:
• open an instance in your mobile app  
• open an instance in your mobile browser

For mobile web access, add a shortcut to an instance browser page on your mobile device.

Set up homepage favorites  
Use the application navigator to find modules and applications.
Create and edit favorite modules or applications to appear as icons on your homescreen.

Use lists and records on a mobile device  
View a list on your mobile device by tapping a homescreen favorite or by opening a module from the application navigator.
View a recently accessed list.
View a recently accessed record.
Add a tag to a record.
View the related list for a record.

Use Service Catalog, Connect Chat, location, and barcode scanning  
Use Service Catalog to order materials.
Collaborate and stay connected with other users using Connect Chat.
Allow the ServiceNow app to access your location and camera to check in or scan barcodes.

Use an instance on a tablet web browser  
When you access an instance from a tablet browser, your tablet is automatically detected.
Most features that are available on a desktop instance are also available in the tablet browser.
Several features have been optimized for the tablet interface.
Access modules and applications in the application navigator.
Access the following tablet context menus:
• List header menu
• List row menu
• Form menu
Filter search results further by searching in a column header.
Group and organize records, and find them more easily by adding labels to the record.

Next steps

The mobile UI varies depending on the device you are using and whether you are accessing your instance from the native app or from a mobile browser. Use this section to learn more about the mobile UI.
Mobile app UI

Access an instance from the mobile interface using a native mobile app.

Download the mobile app from the iTunes store for devices running iOS 9 and above or from the Google Play store for Android phones running KitKat and above.

Supported devices for the mobile app

Certain devices and operating systems are supported by the mobile app.

<table>
<thead>
<tr>
<th>Device</th>
<th>Supported versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple® iPhone®</td>
<td>All models of iPhone running iOS 9 and above.</td>
</tr>
<tr>
<td>Apple® iPod® touch</td>
<td>All models of iPod running iOS 9 and above.</td>
</tr>
<tr>
<td>Apple® iPad®</td>
<td>All models of iPad running iOS 9 and above.</td>
</tr>
<tr>
<td>Android™ mobile devices</td>
<td>All models of Android phone running 4.4 (KitKat) and above.</td>
</tr>
<tr>
<td></td>
<td>Only Geneva patch 6 and higher is supported on the Android app.</td>
</tr>
</tbody>
</table>

Features with limited mobile support

Some features are not supported in the native mobile app.

**Not supported**

- E-signature
- Knowledge v2
- Connect Support

**Limited support**

- List filtering: Several fields listed below have limited support on mobile devices. You can still create a complex filter in a desktop instance and open it in the mobile app. However, you won't be able to edit any of the limited fields.
  - between
  - dates
  - tags
  - related fields
- Two factor authentication is not supported, however single sign on and basic authentication are supported.

Access an instance from the mobile app

You can access an instance using the mobile app for supported Apple devices.

To use the Android mobile app, you must be on an instance using Geneva patch 6 or higher.

1. Download the ServiceNow application from the Apple App Store or from the Google Play store.
2. Open the app by tapping the icon on the home page. The launch screen opens.

3. In the Instance Name field, enter the name of your instance. You don't need to include service-now.com at the end of the instance name.

4. Tap Go. The login screen appears.
5. Use your regular ServiceNow login to sign in to the app.

After you log in, the app remembers your information. As long as you don't log out, the app opens the last screen you used when you open it again.

If you do log out, the app remembers your instance. You can select the instance from the History list to log back in.
iOS and Android UI comparison

The native mobile app has the same functionality across platforms.

Android and iOS mobile apps are similar with a few minor differences to make the experiences unique to each platform. Any differences between the two platforms are designed to make the app accessible to a user on either device. For example, the location of the Navigation Menu varies between the two platforms to stay consistent with the platform-specific UI.

To use the Android mobile app, you must be on an instance using Geneva patch 6 or higher.

<td>Links to records in the instance, sometimes with visualizations.</td>
</tr>
<tr>
<td>3</td>
<td>Application navigator button</td>
<td>Displays the list of menus and modules available to the current user.</td>
</tr>
</tbody>
</table>

### Mobile favorites

Mobile favorites provide links to records in the system. The mobile app displays favorites as an icon on the home page.

Users can create favorites for the following interface elements.

- List filters
- Records
Figure 374: Sample mobile UI home page with favorites

Users can tap and hold a favorite to edit the following properties.

- Label
- Text and icon color
- Icon image
- Enable visualizations

The instance automatically synchronizes favorites between the mobile UI and the desktop UI.

Visualizations

Visualizations allow users on the mobile app UI to see relevant table information directly from the home page favorite icon.

The mobile UI offers the following visualizations.
Table 298: Favorite visualization options

<table>
<thead>
<tr>
<th>Visualization option</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>The favorite icon displays the number of records returned by the list filter.</td>
<td><img src="assigned-to-me.png" alt="Count Example" /></td>
</tr>
<tr>
<td>Bar chart</td>
<td>The favorite icon displays the number of records with a particular field value. You select the field whose values you want to display when you set up the visualization.</td>
<td><img src="assigned-to-me.png" alt="Bar Chart Example" /></td>
</tr>
</tbody>
</table>

Use the application navigator

Use the application navigator to access different modules in the mobile interface.

To open the application navigator, tap the menu icon (for iPhone and for Android).
Scroll the navigator up or down using one or two fingers. To expand an application, tap the application name. To hide the navigator, tap **Close** or the back arrow.
Mobile lists

Lists appear as a single column of records on the mobile app UI display. Each row represents a separate record.
<table>
<thead>
<tr>
<th>Mobile UI lists for iPhone</th>

<td>Displays the record number and relative time since the update was made.</td>
</tr>
<tr>
<td>Activity details</td>
<td>Displays the most recent activity update.</td>
</tr>
</tbody>
</table>

Swipe up or down to see more activity stream updates.
**Mobile filters**

Construct complex filters with the mobile app UI.

<table>
<thead>
<tr>
<th>Number</th>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Current set</td>
<td>Displays the current condition set and the number of records returned by the condition set.</td>
</tr>
<tr>
<td>Number</td>
<td>UI element</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>2</td>
<td>Current rule</td>
<td>Displays the type of rule set that applies to the current filter.</td>
</tr>
<tr>
<td>3</td>
<td>Conditions</td>
<td>Displays the conditions that are part of the current condition set.</td>
</tr>
<tr>
<td>4</td>
<td>Add rule button</td>
<td>Displays a pop-up to add a rule.</td>
</tr>
<tr>
<td>5</td>
<td>New filter button</td>
<td>Creates a condition set.</td>
</tr>
<tr>
<td>6</td>
<td>Delete set</td>
<td>Deletes the current condition set.</td>
</tr>
</tbody>
</table>

Not all filters are available on the mobile app.

Mobile condition sets

A condition set is an optional feature to generate a list by combining the results of multiple sets of conditions. Typically, condition sets are used to create complex filters.

Each set specifies whether a record must match all conditions or whether a record can match any condition. In general, condition sets requiring matching to all conditions return fewer records than sets that allow matching on any condition within a set.

For example, consider the following filter consisting of two condition sets.

**Figure 378: Sample list filter with two condition sets**
In this example, the first condition set requires matching all the conditions and returns 8 results, whereas the second set allows matching to any condition and returns 29 results. The total results count of 37 records is the combination of record results from the individual condition sets.

Mobile service catalog
The mobile app UI provides a native mobile interface for browsing the service catalog.
The mobile service catalog user interface consists of the following elements.

Table 302: Elements of the mobile UI: service catalog

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current catalog</td>
<td>Displays the title of the current service catalog.</td>
</tr>
<tr>
<td>Back button</td>
<td>Returns to the previous screen.</td>
</tr>
<tr>
<td>Search</td>
<td>Enter search strings for categories or catalog items.</td>
</tr>
<tr>
<td>UI element</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Categories</td>
<td>Search for catalog items by a logical grouping.</td>
</tr>
<tr>
<td>Application navigator button</td>
<td>Displays the list of menus and modules available to the current user.</td>
</tr>
<tr>
<td>Shopping cart</td>
<td>Displays the shopping cart to check out.</td>
</tr>
<tr>
<td>Share button</td>
<td>Displays the document providers available to share the current record.</td>
</tr>
</tbody>
</table>

**Mobile service catalog categories**

The mobile app UI provides a native mobile interface for browsing service catalog categories. The mobile app UI displays each category in its own page.
Figure 380: Elements of the mobile UI: service catalog category

Mobile service catalog categories consist of the following elements.

Table 303: Elements of the mobile UI: service catalog category

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current category</td>
<td>Displays the currently selected service catalog category.</td>

</tr>
</tbody>
</table>

*Mobile catalog items*

The mobile app UI provides a native mobile interface for browsing service catalog items.
Figure 382: Elements of the mobile UI: catalog item

The mobile interface for a mobile catalog item consists of the following elements.

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current item</td>
<td>Displays the name of the currently selected catalog item.</td>
</tr>
<tr>
<td>Back button</td>
<td>Returns to the previous screen.</td>
</tr>
<tr>
<td>Item description</td>
<td>Displays the catalog item description.</td>
</tr>
</tbody>
</table>

Table 305: Elements of the mobile UI: catalog item
<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>

**Mobile Connect Chat conversations**

The mobile app UI provides a native mobile interface for messaging in Connect Chat conversations.
Have you seen this?

ITIL User 6 min

System Administrator has been added to the group

System Administrator 5 min

that’s not your car is it??

ITIL User 5 min

No! So glad I parked on the street today!

Parking garage flooded!

INC0010004
Mobile Connect Chat conversations consist of the following elements.

### Table 311: Elements of the mobile UI: Connect Chat conversation

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conversation name</td>
<td>Displays the name of the conversation.</td>
</tr>
</tbody>
</table>
| Conversation details| Opens the conversation details page, which displays the following information.  
|                     | • Record details (record conversations only)  
|                     | • Push notification preferences  
|                     | • Conversation members  
|                     | For group and record conversations, the conversation details page also provides capabilities to add or remove conversation members and to leave the conversation. |
| Avatar              | Displays an image or initials to represent a user. Tap an avatar to view details about the user, including email address and online presence status. |
| Attachment button   | Enables you to include attachments in a message, including photos and documents.                                                             |
| Message field       | Enables you to enter and send messages.  
|                     | **Note:** For record conversations, all messages are sent as comments. The ability to send a message as a work note is not supported. |

### Mobile device location

The mobile app UI can request a mobile device’s current location and store GPS coordinates in a string field.

Administrators can take advantage of mobile device tracking features such as GPS location by configuring a string field to use the `current_location` dictionary attribute. This attribute causes the mobile app UI to display a special icon to request the mobile device’s current location.
A current location field consists of the following elements.

**Table 312: Elements of the mobile UI: current location field**

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String field</td>
<td>Displays and stores GPS coordinates. The field can have any label you want.</td>
</tr>
<tr>
<td>Get current location</td>
<td>Allows users to access the current location of the mobile device.</td>
</tr>
</tbody>
</table>

When users first interact with a current location field, the mobile app asks for permission to access the location of the mobile device.
Figure 390: Allow access to location

Users can change the mobile app's access to their location from their device Settings.
Mobile barcode scanning

The mobile app UI can request access to a mobile device's camera to scan and store barcodes in a string field.

Administrators can take advantage of mobile device barcode scanning features by configuring a string field to use the barcode dictionary attribute. This attribute causes the mobile app UI to display a special icon to request access to the mobile device's camera.
A barcode scanning field consists of the following elements.

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String field</td>
<td>Displays and stores the barcode’s numeric value. The field can have any label you want.</td>
</tr>
<tr>
<td>Scan barcode</td>
<td>Allows users to access the mobile device's camera to scan a barcode.</td>
</tr>
</tbody>
</table>

When users first interact with a barcode scanning field, the mobile app asks for permission to access the mobile device's camera.
Figure 393: Allow access to camera

Users can change the mobile app's access to their camera from their device Settings.
Mobile web UI

The system uses the mobile web UI when users access the user interface from a mobile browser. The system uses your mobile device type to determine which mobile web UI to display.

- Smartphone interface
- Tablet interface

Smartphone interface

The system supports a subset of the standard functionality on smartphones and similar devices, allowing mobile users to remotely access their instances to perform common tasks.
Supported devices for the mobile browser

Mobile browser interfaces support certain devices, operating systems, and browsers.

Table 314: Devices supported by the mobile browser interface

<table>
<thead>
<tr>
<th>Device</th>
<th>Supported versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple® iPhone®</td>
<td>All models of iPhone running iOS 7 and above. Safari is supported.</td>
</tr>
<tr>
<td>Apple® iPod®</td>
<td>All models of iPod running iOS 7 and above. Safari is supported.</td>
</tr>
<tr>
<td>Android™</td>
<td>Android version 4.0/Ice Cream Sandwich and above. Use the latest available version of Chrome to access the mobile browser interface on Android devices. Native browsers and older versions of Chrome support major interface functionality, but have some known issues.</td>
</tr>
<tr>
<td>BlackBerry®</td>
<td>All Blackberry devices running Blackberry 10 and above. Some configuration is required.</td>
</tr>
</tbody>
</table>

Note: Do not use the mobile interface on a desktop browser except for testing purposes.

Configure a BlackBerry device

BlackBerry devices require some configuration to use the smartphone interface.

1. Open the browser application.
2. Open the menu and select Options > Browser Configuration.
3. Ensure the following options are selected.
   - Support JavaScript
   - Use Background Images
   - Show Images: On WML & HTML Pages
   - Browser Identification: BlackBerry
4. Save your changes.

Depending on the size of the BlackBerry screen and personal preference, users may also want to navigate to the General Properties browser submenu and set the default font size and minimum font size to a smaller size. Smaller text displays more content, but may be difficult for some users to read.

Features of the smartphone interface

- A property called glide.ui.m_agents defines which devices are treated as mobile. By default, this list is: iPod, BlackBerry, Android, and iPhone.
- UI policies, UI actions, client scripts, and related lists are supported.
- The device home screen can be configured to display tags, favorites, and recently-accessed lists and documents.
- Online help is available in the base system. It can be modified and you can create new help screens. The help can also be localized for multiple language support.
- Journal streams allow you to sequentially view comments and work notes associated with a group of records, such as incidents.
Unsupported features

The smartphone interface supports a limited subset of functionality that enables users to perform common tasks.

The following capabilities are not currently supported in mobile browsers, though they may work to varying degrees.

- Switching to the standard browser interface from the smartphone interface
- HTML fields
- CODE tags to render HTML in Journal Fields
- Live feed
- Connect
- Chat
- Field styles
- Visual task boards
- Timeline visualizations
- Assessments, surveys, or legacy surveys
- Embedded lists
- List UI actions
- Mobile service catalog features
  - Order guides
  - Wizards
  - Content items
- These variable types:
  - Macro With Label
  - UI Page
  - List Collector
  - HTML
  - Macro
  - Label
  - Break
- Data lookup rules
- Advanced reference qualifiers
- Script include calls in reference qualifiers
- Custom auto-complete scripts

Smartphone interface use
The smartphone interface supports many of the features found in the standard browser.

Smartphone access to an instance
There are two methods for accessing an instance on a mobile device.

You can access the smartphone interface from a supported mobile browser or from the mobile app.

Access an instance from a mobile browser
You can access an instance using a supported mobile browser.

On a supported smartphone, navigate to the URL of an instance in a supported mobile browser. The instance automatically detects the device and redirects to the smartphone interface by appending $m.do to the end of the URL. Accessing the smartphone interface does not prevent the user from accessing the tablet or desktop interfaces.
Add a shortcut to the home screen
You can add an Apple home screen shortcut that opens a smartphone interface page.

1. In Safari, navigate to a page that you want to access as a shortcut, such as a list of open incidents.
2. Tap the sharing icon ( ) at the bottom of the browser.
3. Tap the ServiceNow Add to Home Screen icon.
4. Enter a descriptive name for the page and tap Add. The shortcut is saved to your device.

Change the home screen icon
Administrators can change the icon that appears for Apple home screen shortcuts to the smartphone interface.

To replace the default icon:
1. In the desktop interface, navigate to Self-Service > My Profile.
2. Switch to the Default view.
3. Click the reference icon by the Company field to open the company record.
4. Configure the form to add the Apple icon field.
5. Upload an image up to 57x57 pixels in the Apple icon field.

When users associated with the company add a home screen shortcut, the shortcut uses the new icon.
Customize the home page

You can customize the smartphone interface home page to display helpful information.

The smartphone interface home page displays the following types of information by default:

- Favorites
- Recent Lists
- Tags
- Recent Documents

![Figure 398: Home page](image)

To change the types of information on the home page:

1. Tap the gear icon (⚙).
   The tools screen opens.
2. Tap **Show section** to enable or disable a section on the home page.
3. Customize the number of **Items to show** for each section.
4. Tap **Horizontal scroll** to enable or disable horizontal scrolling for each section, where applicable.

Add a home page favorite
You can add any list, record, or module to the **Favorites** section of the smartphone interface home page.

The items you add to your favorites appear as tags on the smartphone interface home page. Use the favorites for quick access to the items that you use most often.

To add an item to the **Favorites** section:
1. Navigate to the screen that you want to add as a favorite.
2. Tap and hold the home icon (Home).
3. Give the favorite a name, assign its tag a color and icon, and tap **Save**.
Edit a home page favorite

Change the appearance of favorites in the app home page.

1. On the app home page, long press a favorite icon.
2. From the icon customization screen, change the icon name, color, or icon.
3. To delete a favorite, long press the icon then on iOS tap **Delete** or on Android tap the delete icon.

View or modify a mobile list

Modify a list on a mobile interface.

When you create a favorite list, it automatically appears on the mobile homepage. To see the details of a list or selection, tap its icon on the home page.

To modify a list:

1. Tap the list you want to modify.
2. Tap the filter.
3. To add an "And" rule, tap **Add an All Rule**. On an Android device, tap the add button and tap 'All' Rule.
   a) In the Add All section, click **Add New Condition**.
   b) Select a condition from the list.
   c) From the Select Operator list, select a condition qualifier.
   d) Click **Save**.

4. To add an "Or" rule, tap **Add an Any Rule**. On an Android device, tap the add button and tap 'Any' Rule.
   a) In the Add Any Rule section, tap **Add New Condition**.
b) Select a condition from the list.
c) From the Select Operator list, select a condition qualifier.
d) Click **Save**.

Both sets of conditions appear in the condition filter.

5. To delete a condition, tap the adjacent **x**.
6. Tap **Save**.

View a recently accessed record
   You can quickly access recently viewed records from the smartphone interface home page.
The **Recent Documents** section of the smartphone interface home page provides an at-a-glance summary of recently accessed records.

1. Navigate to the home page.
2. In the **Recent Documents** section, tap a record.
   The mobile view of the form appears. If the record contains attachments, they appear at the bottom of the form.
3. Tap an attachment name to open the attachment.
   If you are using the mobile app, the attachment opens in Safari.

Create a new tag
To help group and organize records, you can create tags and add them to specific records.
For example, you could create a tag called High Priority ABC and assign it to critical incidents submitted by an important customer. Tags can be defined with an icon and color for easy identification, and tags that you create can be viewed by other users in your organization. With a single tap, you or another user can then locate all critical incidents logged by ABC Corporation. You can add as many tags as needed to any record.

1. On the home page, tap the **Tag** section heading. You can also tap **My Tags** in the application navigator.
   Any previously defined tags are displayed. The image shows the number 1 in the **High Priority** tag, indicating that one record has been assigned this tag.

2. Tap the **Create or search tags** field and enter the new name. As you type, the new tag appears below the field.

3. Tap **Done**.
4. Select a color and icon for the new tag and tap **Save**.
Assign a tag to a record

To help group and organize records, you can create tags and add them to specific records.

You can add as many tags as needed to any record.

1. Navigate to a record that you want to assign a tag to, such as an incident record.
2. Tap the More icon in the lower right-hand corner of the screen and select Tags.

3. In the Tags screen, tap the tag you want to assign to this record. A check mark appears on the selected tag.

4. If needed, you can click the tag again to deselect it. You can also select multiple tags for the record.

5. Navigate away from the screen. Your tag selections are automatically saved.

**Note:** You may see green and red numbers on tags, as shown below. A green number indicates the number of records associated with that tag. A red number indicates the number of records associated with that tag that you have not viewed (that is, they were created or updated by other users).
Access tagged records

The Tags section on the smartphone interface home page shows the tags you have defined. Each tag shows the number of records assigned to it.

1. Tap the tag to display records that have been assigned that tag. The screen shows the records with that tag. Note that they are not necessarily the same kind of records. In the example below, the first record is an approval and the second is an incident.

2. You can sort the records by tapping the buttons at the top of the screen.

View a related list

Related lists for records are visible in the smartphone interface. Related lists show lists of records related to the current record.

To view a related list:

1. Open a record in the smartphone interface.
2. Tap the Related Lists tab.
3. Tap a related list.

View a journal stream

A *journal stream* is a real-time, sequential display of journal field entries, such as comments and work notes, from a group of records. You can view journal streams in the smartphone interface.

You can, for example, view a stream of incident work notes. The stream automatically aggregates all of the journal field entries from incidents and displays them, starting with the most recently updated record.

1. Navigate to a list of records that contain journal fields.
2. Tap the *Stream* icon. If no journal entries have been created for the type of records you are viewing, the *Stream* icon is not displayed.
Comments and work notes for the incidents are shown, starting with the most recent record.

Tutorials to use the smartphone interface
Smartphone interface tutorials.

The following video demonstrates how to navigate the smartphone interface.

Navigating the Smartphone Interface
The following video demonstrates how to customize the smartphone interface.

Customizing the Smartphone Interface

Legacy mobile UI configuration
The legacy mobile UI is available only on instances that do not use the smartphone interface.

Administrators can define which modules are available to mobile users at the application menu or module level. In the mobile UI, modules appear in sections grouped by application menu, separated by horizontal lines.

• Modules with a device type of Mobile or Any are available on mobile devices, regardless of the application menu setting.

To view all modules that are available on mobile devices, use the standard browser UI and navigate to System Definition > Modules (Mobile).

• Modules without a specified device type are available on mobile devices when the application menu setting for the default device type is Mobile or Any.

To view all application menus where modules without a device type are available on mobile devices, use the standard browser UI and navigate to System Definition > Applications (Mobile).
When accessing ServiceNow from an iPhone or Android device, users can choose whether to use the standard browser UI or the mobile UI. The user's most recent selection is saved with these user preferences:

- `mobile_use_full.iphone`
- `mobile_use_full.android`

Make module available for mobile and standard browsers

Modules are made available for mobile users, as well as standard browser users.

To make a module available for mobile and standard browsers:

1. Navigate to **System Definition > Modules**.
2. Open the module record.
3. Change the **Device type** to **Any**.
4. Enter a **Mobile title**.
   Consider providing more detail in the mobile-specific title because the application menu names are not visible in the mobile UI. For example, in the browser UI, you may define a module called Open New that appears under the Incident application menu. In the mobile view, you may call this module **Open New Incident**.
5. Enter a **View name** for this module in the mobile UI.
   Consider configuring mobile views that show a limited number of columns to improve usability for users with smaller screens or limited transmission speeds. If a view is not specified on the module record, mobile lists and forms use the Mobile view.
6. Click **Update**.

Define the mobile banner
By default, the banner at the top of the mobile UI says ServiceNow - Mobile. You can modify this text by adding a system property.

1. Enter `sys_properties.list` in the navigation filter.
2. Click New.
3. Enter the following information:
   - **Name:** glide.product.description.mobile
   - **Type:** string
   - **Value:** enter the desired mobile banner text
4. Click Submit.

Add a custom icon on the Apple home screen

Users can add a link to the ServiceNow site on the home screens of their Apple iOS devices. By default, the link appears as a ServiceNow icon. Administrators can select a custom icon instead.

1. Create the desired icon.
   
   **Note:** Use a 57x57 pixel icon, which is the maximum icon size that Apple does not automatically resize.

2. Navigate to System Properties > My Company and open the company record form.
3. **Configure the form** to add the **Apple icon** field.
4. Upload the new icon.

Define which device uses the mobile UI

You can define which devices use the mobile UI.

1. Navigate to System Properties > UI Properties.
2. Locate **Use mobile user interface if one of these strings (comma-separated) appears in the browser user_agent header** (the glide.ui.mobile_agents property).
3. Enter a comma-separated list of devices that are directed to the mobile UI.
   
   **Note:** The default list is iPod,Windows CE,BlackBerry,Android,iPhone,Opera Mini,IEMobile.

4. [Optional] If the property does not provide enough granularity, use the DetermineMobileDevice script include to define which devices use the mobile UI.
   The property value is checked first. If the user agent for the device is listed in the property, the mobile UI is used. Otherwise, the script determines which UI is used.
Disable the mobile UI
You can disable the mobile UI for all devices and direct all requests to the standard browser UI.
1. Clear the glide.ui.mobile_agents property value.
2. Deactivate the DetermineMobileDevice script include or ensure that the determine function always returns false.

Testing for mobile devices in scripts
Use the gs.isMobile() method to determine whether an action was taken through the mobile UI.

**Business Rule**

To write different messages to the log for actions through the mobile UI and through the standard browser UI, use the following script in a business rule.

```java
if (gs.isMobile())
    gs.print("submitted from mobile UI");
else
    gs.print("NOT submitted from mobile UI");
```

**UI Action Conditions (not client)**

To prevent a UI action from appearing in the mobile interface, use the following condition.

`gs.isMobile()`

**Tablet support**

ServiceNow supports nearly full-product functionality on the Apple iPad and Android tablets.

You can enjoy the mobility of the tablet device to access and manage IT service management tasks through a user-friendly tablet interface. In addition, you can take advantage of the same level of performance, availability, continuity of service, and data security that you have come to expect from ServiceNow.

**Supported tablets, operating systems, and browsers**
The following tablets, operating systems, and browsers are supported.

Apple® iOS: All models of iPad® running iOS 7 and above are supported. Safari® is supported.

Android™: Any Android tablet running OS 4.0.3 and above with the latest available version of Chrome™. Native browsers and older versions of Chrome support major tablet interface functionality, but have some known issues. The tablet UI is optimized for the iPad form factor and resolution. Not all Android tablets have the same form factor and resolution. Gesture based zoom functionality is not supported.

**Note:** The tablet interface should not be used on desktop browsers except for testing purposes.

**Features with limited tablet interface support**
Some capabilities are limited in the tablet interface.

- Editing lists: You cannot edit field values in a record from the list view. Access the record form to modify any field values.
- Dependency Views map, schema map, graphical workflow editor, Gantt chart, and visual dispatch tool: Graphics-based tools can be viewed but not modified from the tablet interface. The data presented by these tools is read-only when accessed through the tablet interface.
• Calendars: You can access calendar reports but you might not be able to scroll around the calendar as you would on the desktop interface.

• Impersonating other users: Administrators must log out and log back in as another user to see that user's access rights and views. You cannot impersonate another user while staying logged in with your normal credentials as you can on the desktop interface.

• Homepage bookmarks: UI11 bookmarks are not supported in the tablet UI. You can use favorites to mark modules in the application navigator for quick access when using the tablet UI. Note that favorites on the tablet and bookmarks on the desktop are separate features and do not synchronize with each other.

• Video and image attachment upload: iOS 6 and Android allow you to attach videos and images. Other file type attachments are not allowed.

Features that are not supported in the tablet interface
Some capabilities are not supported in the tablet interface.

• Field watcher: Administrators must use the desktop version to access the Field Watcher. JavaScript debugger:

• JavaScript debugger: Administrators must use the desktop version to access the JavaScript debug window.

• Language picker: Even if the internationalization plugin is enabled, the language picker does not appear in the tablet UI toolbar. The language selected through the desktop interface applies to the tablet UI.

• Domain picker: Tablet users cannot select any other domains that administrators configure for domain-specific personalizations. To select a new domain, use the desktop interface.

• Suffix in the navigation filter: You can use the .list, .do, or .form shortcuts to access a list of records in a table or a new form from the desktop version only.

• Help desk chat: End users cannot request a chat session nor can support technicians respond to chat requests when using the tablet interface. Help desk chat is only supported in the desktop interface.

• Printer friendly view: This view, which shows the current screen in a pop-up window without frames and the application navigator, is not available from the tablet.

• Timeline sliders and the Timeline Metrics UI actions: Features that use timelines, such as the workflow timeline and the Gantt chart are not supported from the tablet.

Tablet interface
The tablet interface provides users the flexibility to manage IT service management tasks through a user-friendly tablet interface.

This article explains unique features for the tablet interface and provides instructions for navigating ServiceNow with a tablet.

Several important actions, such as using the application navigator, accessing context menus, selecting items from pick lists, and saving bookmarks, have been enhanced.

Accessing an instance
On a mobile device that meets the tablet support requirements, you can access the standard URL of an instance. The instance automatically detects the tablet and redirects to the tablet interface by appending $tablet.do# to the end of the URL. Accessing either the tablet or desktop interface does not prevent access to the other.

Using the application navigator
The application navigator displays all the application menus you would normally see in the desktop interface.

To open the application navigator, tap the Menu icon
 on the top-left side of the interface.

Figure 399: Tablet nav button menu

Scroll the navigator up or down using one or two fingers. To expand a menu, tap the menu name. You can also filter the menu using the same filter field you see on the desktop interface just above the application navigator.

Rotating the tablet
When you rotate the tablet, the navigator behavior changes slightly.
Open the navigator by tapping the iPad menu icon (
When you rotate the tablet, the navigator behavior changes slightly. When you open the navigator while holding the tablet in landscape mode, the screen resizes so that it is all visible to the right of the navigator. When you open the navigator while holding the tablet in portrait mode, the navigator overlays the left side of the screen. If the navigator is open when you rotate the tablet, the navigator automatically closes.

Figure 400: Tablet landscape

Floating the application navigator

When the tablet is in landscape mode, you can float the application navigator. This means that the application navigator floats over the left-hand side of the screen. While working full-screen, you can open the application navigator, tap the menu or module you want to view, and close the application navigator without changing the appearance of your screen.

To turn on the floating navigator, tap the gear icon ( ) and select **Use Floating Navigator**.

Managing favorites and shortcuts
The favorites menu in the application navigator shows you only the items marked as favorites.

Use the favorites menu to access the items that you use most often. On the application navigator, tap the star icon to add an item to your favorites. You can add items that pertain specifically to you, such as incidents assigned to you. After you add a favorite, the star icon changes to dark gray. To remove a favorite, tap the star icon again.

Modules you access are automatically marked as favorites, by default. You can enable or disable automatic favorites with the Automatically Add Favorites option from the main menu.

![Favorites menu](image)

**Figure 401: Favorites menu**

Access the favorites menu

Access the favorites menu from a tablet web browser.

1. Tap the favorites icon. The icon stays depressed.

2. Tap the application navigator icon. When the favorites icon is depressed, only favorites appear in the application navigator.
**Note:** Bookmarks in the desktop version are not the same as favorites in the tablet version. Bookmarks cannot be accessed or modified through the tablet interface.

Create a Safari shortcut

Use the sharing feature on the Safari browser to create a shortcut to any ServiceNow page.

The shortcut is saved on your tablet just like an application. Use shortcuts to quickly access a specific ServiceNow page with one touch.

1. Navigate to a frequently used page, such as a list of open incidents.
2. Tap the sharing icon on the Safari browser header.
3. Tap the ServiceNow **Add to Home Screen** icon.
4. Enter a descriptive name for the page and tap **Add**. The shortcut is saved to your device.
Preview pane

The tablet interface provides a handy split-screen view that preserves a list of records in one pane while displaying a read-only preview of a record in another pane.

Use this view to preview several records in a list without having to navigate back and forth between lists and forms. The preview pane is available for all lists.

To open the split-screen view, tap the preview pane icon ( ). The icon becomes green and a read-only view of the form opens on the right.
Figure 402: Preview pane

To close the preview pane, either tap the Close icon (X) or tap the green preview-pane icon.

**Note:** If the navigation pane is open when the preview-pane icon is tapped, the navigation pane will close.

Add comments or work notes from the preview pane

You can add comments directly from the preview pane to any record that has an *Additional Comments* journal field.

This allows you to enter comments or work notes without scrolling down the form. Comments and work notes are updated in real time.

1. Tap **Comment**. The **Comments and Work Notes** pane appears.
2. Enter content in the text field.
3. Tap **Comment** or **Work note** to add the content to the relevant journal field.
View a recently accessed document

The Recently Accessed Documents screen provides an at-a-glance summary of recently accessed records.

Avoid tapping through the application navigator to access a record that you need frequently or a record that you just viewed.

1. Tap the document summary icon in the banner. The most recently accessed records appear at the top. A list of important fields appears on each record summary.

2. To open a record from this view, tap the record name.
3. To open a read-only preview of the record in another pane, tap the preview pane icon. Notice that the preview pane icon turns green
4. To close the preview pane, tap the green preview pane icon again.

Accessing the list header menu
Access the list header context menu by tapping the icon in the list header.

Tap the menu icon () in the list header.
Figure 403: List header menu iPad

Sorting by column header works the same as the standard interface. Tap the column name to sort by that column.

Accessing the list row menu

How to access the list row menu.

Tap any cell to see the list row context menu with actions related to the values in that row.
Accessing the form menu

How to access the form menu.

Tap the form name or icon to access the form context menu.

Toggling between related list views

When using a tablet to view forms that include multiple sections, such as the Incident form, you can tap Toggle Tabs to toggle between tabbed and sequential arrangements of sections.
Tap the Toggle tabs icon ( ) to toggle between tabbed and sequential arrangements of sections.

Figure 405: Toggle tabs
In sequential view, you can expand or collapse a section by tapping **expand** (+) or **collapse** (-) in the section header.

Select a related record
The tablet interface provides a split-screen record picker so you can easily add and remove related records.

Related lists allow you to **relate a record** to the record currently displayed in the form.

To select related records:

1. Navigate to a record form. In the example below, an incident record is related to a problem.
2. Tap the incident number. The screen splits to display information associated with the incident. The way that the related list area appears can be changed by tapping the Toggle Tabs button.

3. Tap the Related Records tab to view a summary of the related problem.
4. You can view or edit the problem record by tapping the preview pane icon next to the problem number.
Lookup lists
To filter the lookup results, use the filter fields above each column.

You can also perform a contains search in the filter fields using a period (\(\cdot\)). For example, to search for all names that contain the characters tu, enter the following: \(\cdot\)tu.

![Lookup list iPad](image)

**Figure 407: Lookup list iPad**

Accessing another record from a form
Tap the reference icon to jump to another record.

On the tablet, tapping the reference icon ( ) opens the related record in the full frame, rather than providing the pop-up overlay that appears on the desktop interface.
Glide list items

The tablet interface provides an easy way to interact with items that use the glide_list field type, such as watch lists.

The following example illustrates how to add a name to a watch list.

1. On a form with a watch list field, tap the lookup icon.

2. Filter the watch list by entering text in the search field above any column. The list is automatically filtered as you type. You can also perform a contains search in the filter fields by using the period (.) . For example, to search for all names that contain the characters tu, enter the following: .tu.

3. Tap the record that you want to add. The record is added to the selection column on the left.
4. To add yourself, add an email address, or clear the form, use the menu at the bottom of the selection column:

5. Tap Done when finished.

Labeling records
To help group and organize records, users can add labels, which are keywords that describe the record. For example, an incident record that deals with a wireless internet outage could be labeled with the keyword wireless. Later, someone who has access to incident records can filter all incidents by the keyword wireless to see which incidents pertain to that topic. Users can add as many labels as needed to any record. Labels are not case sensitive.

Labels that you add to a record are saved in the Labels table with the following default settings:
- Active: true. The label is enabled and appears in the tablet and desktop interfaces.
- Global: false. The label is not globally visible. Labels are visible only to the user who created them.
- Navigation: false. Tablet labels do not appear in the application navigator on either the tablet or the desktop interface.

Administrators can modify these labels as they would modify labels in the system definition.

Assign a new label
How to assign a new label to a record.

1. Navigate to a record and tap inside the Add label text box.
2. Enter the key terms or groups of terms as you want them to appear. Spaces are allowed between multiple terms.
Access a record that has labels
How to access records that have labels.

1. Tap the recent documents icon to navigate to Recently Accessed Documents.

2. Tap the gear icon in the top banner. The list of labels shows the number of records that use each label.

3. Select a label to show only records with that label.

Edit and delete labels
How to edit label text.

1. Tap the recent documents icon to navigate to Recently Accessed Documents.

2. Tap the gear icon.

3. Tap Edit in the list of labels. The labels become editable.

4. Make the necessary changes or tap the X icon to delete the label.

5. Tap Save.
BlackBerry FAQ

This topic answers frequently asked questions on using ServiceNow on a BlackBerry device.

How do I configure my BlackBerry device to access ServiceNow?

What BlackBerry devices are supported?

Blackberry OS version 4.6.0 or later is required which is included on the newer BlackBerry models. To find your BlackBerry OS version, on your Blackberry, go to Settings > Options > About to find the version. Older versions cannot be supported due to the severely limited JavaScript implementation in the BlackBerry browser.

Getting response "413 Request Entity Too Large" trying to bring up ServiceNow on BlackBerry devices.

BlackBerry devices are configured to only allow files of a certain size to be downloaded. This is typically 128K. This limitation can be changed to by your corporate BlackBerry administrator.

- Can you access https://<instance name>.service-now.com with your BlackBerry without getting the "entity request too large" error? If you can, it is most likely a problem with your specific instance:
• Have your ServiceNow administrator verify that "blackberry" is still listed on the property (glide.ui.mobile_agents) which defines the list of devices to receive the mobile UI.

• If you get the "entity request too large" error when attempting to access https://<instance name>.service-now.com:
  • If your BlackBerry device is configured to masquerade as another browser, such as Internet Explorer, then the full desktop version of ServiceNow will attempt to be sent to your device and you will likely get the "request entity too large" error as the size of the main JavaScript file will probably be larger than your configured limit. Verify your device is configured to work as a BlackBerry browser as shown in step 5 of the BlackBerry Configuration article. If it incorrect, you will then need to clear your BlackBerry device's cookies after correcting the browser.
  • Have your corporate BlackBerry administrator check to see whether the maximum size has changed recently; see this article for further information: http://www.blackberryforums.com.au/forums/general-bes-discussion/284-request-entity-too-large.html

Mobile experience set up for admins

As an administrator, configure the mobile experience for your users to access an instance on a tablet or smartphone.

Requirements

Configuration for the mobile experience takes place in a regular desktop instance. Most of the configuration options are available for both the native mobile app and the mobile web experience. Use the native app or the mobile web to test your configuration.

Role required

admin

Before you begin

Take the following into consideration before configuring the mobile experience:

• What applications and modules do you want to be accessible from a mobile device?
• How do you want mobile lists to appear on a mobile device?
• Which users or roles should have access to Connect Chat?

What to do

Activate the mobile interface

If you are using the native mobile app, download the app from the iTunes store or from the Google Play store. Make sure you are on an instance using Geneva patch 6 or higher to use the Android app.
If you are accessing an instance on a mobile device or tablet from the web, **activate the mobile web interface**.

**Configure the application menu**
Determine which **applications** and **modules** you want to appear in the mobile application navigator.

**Set up mobile lists**
Use the **table titles configuration option** to determine the length of a title in a mobile list, as well as the default fields that appear in a table.
**Customize sortable columns** in a mobile list.

**Define homepage favorites**
Set up the **default homepage favorites** for your users.

**Configure Connect Chat for mobile**
Determine which users or roles need access to **Connect Chat on a mobile device**.

**Configure mobile UI properties**
- **Disable the mobile or tablet browser UI** on page 1230.
- **Define devices that use the smartphone interface** on page 1230.
- Configure **additional theming options**.

**Configure the tablet UI**
Use **tablet properties** to allow access to the table UI, determine which devices have access to the tablet UI, and perform some basic custom theming.
**Configure UI actions** to determine the functionality allowed on a tablet.
Configure tablets to **run the smartphone interface** in place of the tablet interface.

**Next steps**
Most configuration items for the mobile UI are optional. Click any of the topics below for additional configuration.

**Activate the mobile web interface**
Mobile web interfaces are automatically active on new instances. For instances upgrading from an earlier version, an administrator can activate the Mobile UI plugin (com.glide.ui.m) if it is not already active.

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

**Smartphone interface application navigator**

Administrators can define which application menus and modules are available on the smartphone interface application navigator.

For example, the screen below shows the INCIDENT and USER ADMINISTRATION application menus.

![Smartphone modules](image)

**Figure 409: Smartphone modules**

Define a new smartphone application menu

Administrators can define which application menus are available on the smartphone interface application navigator.

1. In the standard browser interface, navigate to **System Mobile UI > Navigator Apps**.
2. Click **New**.

3. Fill in the fields, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the application menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to specify the order of the menu. For example, an entry of 100 would place this application menu before one with an <strong>Order</strong> entry of 200.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock icon to select the roles for this application menu. Only users with the designated roles can access the modules under this application menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate this application menu.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Note:** The new application menu does not appear on the smartphone interface application navigator until at least one module is added.

Define a new smartphone module
After defining the application menu, you can define modules and assign them to the new application menu.
For more information on defining the application menu, see *Define a new smartphone application menu* on page 1203.

1. On your instance, navigate to **System Mobile UI > Navigator Apps**.
2. Open the application menu you want to create the new module for.

### Modules

<table>
<thead>
<tr>
<th>Name</th>
<th>Order</th>
<th>Active</th>
<th>Table</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create New</td>
<td>10</td>
<td>true</td>
<td>Incident</td>
<td>form/incident-1</td>
</tr>
<tr>
<td>Active</td>
<td>20</td>
<td>true</td>
<td>Incident</td>
<td>[incident]</td>
</tr>
<tr>
<td>Active P1</td>
<td>30</td>
<td>true</td>
<td>Incident</td>
<td>[incident]</td>
</tr>
<tr>
<td>Assigned to Me</td>
<td>40</td>
<td>true</td>
<td>Incident</td>
<td>[incident]</td>
</tr>
<tr>
<td>Stream P1</td>
<td>60</td>
<td>true</td>
<td></td>
<td>streams/incident&amp;p=q:active=true*priority=1</td>
</tr>
<tr>
<td>Filter</td>
<td>100</td>
<td>true</td>
<td>Incident</td>
<td>list_filter/incident/create</td>
</tr>
</tbody>
</table>

3. Under **Modules**, click **New**.
4. Fill in the fields, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the module.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to specify the order of the module within the application menu. For example, an entry of 100 would place this module before one with an <strong>Order</strong> entry of 200.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application menu</td>
<td>Displays the application menu from which you accessed this screen. Select a different application menu, if appropriate.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table for this module.</td>
</tr>
<tr>
<td>Updated</td>
<td>Displays the date and time when the module record is updated.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock icon and select the roles for this module. Only users with the designated roles can access this module.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate this module. Only active modules appear in the application menu.</td>
</tr>
<tr>
<td>Filter</td>
<td>Create a filter for identifying which fields this module uses from the selected Table.</td>
</tr>
<tr>
<td>Path</td>
<td>[Optional] Enter a custom URL for the module. The URL must be in this format: type_of_link/table/parameters.</td>
</tr>
</tbody>
</table>

**Note:** If you are creating a module for a map page, see the procedure specific to map pages.

5. Click **Submit**.
Configure the mobile list layout
Configure the way forms display in the mobile UI.

1. From an instance on your desktop, navigate to any form you want to configure, for example, Incidents.
2. Click the list header menu and navigate to Configure > List Layout.
3. From the View name list, select **Mobile**.
4. Use the slushbucket to add or remove fields from the mobile list.

Related Links
Show versions
Any fields you add to the list appear as a sortable column and as a field in the card of a specific record in the mobile UI.

*Configure mobile list search fields*

Configure search fields to determine what fields are searched for in the table. If search fields aren't configured, only the columns in the mobile list layout are searched.

Search fields might not appear on the Table Title form. Add **Search Fields** to the form by editing the form layout.

1. Navigate to **System Mobile UI > Table Titles**.
2. Open the table you want to configure search fields for, or click **New**.
3. Use the slushbucket to add or remove fields from the mobile list.
Define a new smartphone table title
Administrators can define unique titles for all tables viewed in the smartphone interface. This can be useful for creating shorter display values to accommodate the smaller screen size of the smartphone.

1. In the desktop interface, navigate to **System Mobile UI > Table Titles**.

2. Click **New**.

3. Fill in the fields, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table you are defining a title for.</td>
</tr>
</tbody>
</table>

**Note**: The list shows only tables and database views that are in the same scope as the title.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fields</td>
<td>Click the lock icon to display the Fields slushbucket. Use the slushbucket to select the fields that display by default when this table is viewed in the smartphone interface.</td>
</tr>
<tr>
<td>Updated</td>
<td>Displays the date and time when the table title was updated.</td>
</tr>
<tr>
<td>Script</td>
<td>[Optional] Create a server-side script that generates a string to display under the display value on lists. For example, if you are defining a title for My Approvals, the script could display the different approval items below the title.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Define default smartphone home page favorites**
You can configure the default items for the Favorites area of the mobile home page, including the colors and icons used.

1. On the device, add a homepage favorite for a particular module. For instructions, see Add a home page favorite on page 1166.
   
   For example, you could create a favorite for My Incidents.

   ![Favorites]

   2. In the desktop interface, navigate to System Mobile UI > Home Page Favorites.
      
      Notice that My Incidents is displayed.

   3. Click My Incidents.
4. To make the **My Incidents** tag a default for all mobile users, clear the **User** field.
5. Click **Update**.

**Remove smartphone default home page favorites**

To remove default favorites, remove them from the **Home Favorites** list in the desktop interface.

1. In the desktop interface, navigate to **System Mobile UI > Home Page Favorites**.
2. Locate the favorite you want to remove.
3. Select the adjacent check box.
4. In the actions choice list, select **Delete**.
5. Click **OK**.

**Configure Connect Chat for mobile**

Configure Connect Chat to show or hide on the mobile app homepage.

Connect Chat appears on the mobile app homepage by default if it is active on the instance and the user has the correct roles. As an administrator, you can hide Connect Chat by deactivating the plugin, or by configuring the roles for certain users. Use these steps to show Connect Chat for users with a particular role.

1. Navigate to **Collaborate > Administration > Properties**. Alternatively, in System Properties, search for **connect.role**.
2. In the **Comma separated whitelist of roles able access Connect. Empty allows all roles.**, type a list of the roles you want to enable Connect Chat for.

**Configure the blur app option**

As a security feature, administrators can configure the mobile app to blur when not in focus on a mobile device.
For example, when you double-click the home button on your mobile device to close apps or navigate back to where you left off, the ServiceNow app appears blurred.

1. Navigate to **System Properties > Mobile UI Properties**.
2. Select the **Blur native app UI when the application enters the background** check box.

![Figure 410: Blurred app](image)

**Online smartphone help**

The smartphone interface includes several help screens that can be used as is or modified to suit your users’ needs.
You can also create new help screens. They can also be localized to support multiple languages.

**Note:** A basic knowledge of wiki markup is needed for editing the content.

Edit the existing smartphone help text

Users with the admin role can edit the existing smartphone help text.

The default help screens are organized based on the *index* file. That file contains links to the other help files and presents those links on the device as a menu. If items are added to or removed from this file, the resulting menu changes accordingly.

1. Navigate to **System Mobile UI > Mobile Help**.

   ![System Help Table](image)

   **Figure 411: System help**

   2. Click the **Updated** link of the help file you want to edit.
3. Click **WikiText**.
4. Edit the text and wiki markup as needed.

![Wiki text example]

**Figure 413: Sample wiki text**

5. Click **Update**.

Create a new smartphone help screen

Users with the admin role can create a new help screen.

1. Navigate to **System Mobile UI > Mobile Help**.
2. Click **New**.
3. In the *Path* field, enter a name for the new help screen; for example, *adding_aShortcut*.
   
   Spaces are not allowed in the name.
4. Click WikiText.

5. In the editing box, enter the text for the new help screen, using wiki markup to define the formatting.
Adding a Shortcut

# Navigate to a page that you want to access as a shortcut, such as a list of open incidents.
# Tap the sharing icon at the bottom of the browser.
# Tap the ServiceNow "Add to Home Screen" icon.
# Type a name for the page and tap "Add".

:::[[image:Shortcut.png|300px|left]]<br style="clear:both;" />
6. Click **Submit**.
7. On the list screen, open the file called **index**.
8. Click **Wikitext**.

9. Insert a line where you want the new help screen to appear and specify the name of the new page.

10. Click **Update**.
    
    The device shows the new help menu item and help content.
Display localized smartphone help content

You can edit and translate existing help screens so that help content in multiple languages is available.

Role required: admin
After help files have been translated, the smartphone interface uses the help screens identified by the [user-specific language] in the User [sys_user] table.

1. Navigate to System Mobile UI > Mobile Help.
2. Open the help file you want to translate.
3. Translate the existing help text. You can also insert translated images, as needed.
4. In the Language field, select the language of the translated text.
5. Click Update.
Enable UI policies for the smartphone interface
UI policies can be defined to run on forms on the smartphone interface, the desktop UI, or both.

1. In the desktop interface, navigate to System UI > UI Policies.
2. Create a UI policy that is compatible with the smartphone interface.
3. **Configure** the UI Policies form to add the **Run scripts in UI type** field.
4. Select the **Run scripts** check box.
5. In the **Run scripts in UI type** field, select **Mobile** or **Both** to have the policy run on the smartphone interface.

6. Complete the fields, as appropriate.
7. Click **Submit**.
Enable client scripts for the smartphone interface

Client scripts can be defined to run on forms on the smartphone interface, the desktop UI, or both.

1. In the desktop interface, navigate to System Definition > Client Scripts.
2. Create a client script that is compatible with the smartphone interface. To ensure this, see Client script types on page 3901.
3. In the UI Type field, select Mobile or Both to have the script run on the smartphone interface.

   **Note:** You may need to configure the form to add the UI Type field.

4. Fill in the fields, as appropriate.
5. Click Submit.
Enable mobile location and barcode scanning

Take advantage of mobile devices by allowing location and barcode scanning in the mobile app.

Role required: admin

1. Navigate to the form you want to add the location or barcode scanner to.
2. Use the form context menu to switch the form view to Mobile.
3. From the form context menu, navigate to **Configure > Form Layout**.
4. In the View name list, make sure **Mobile** is selected.
5. Use the Create new field section to add a location or barcode field to the form. Set the field type to **String**.
6. From the form, right-click the new field and click **Configure Dictionary**.
7. In the Attributes related list, click **New**.
8. Use the Attribute field on the Dictionary Attribute form to search for **barcode** or **location**.

The added fields appear on the form in the native mobile app. This feature is not available on the mobile web. Users will still need to allow the app to access their location and camera on their devices. These fields only appear when you create a new record, they won't appear in one that is already existing.

**Smartphone interface UI actions**

UI actions function the same on the smartphone interface as on desktop interface, but are keyed off a different table: UI Action - Mobile [sys_ui_ng_action]. You can add these kinds of UI actions in the smartphone interface:

- list buttons
- form buttons
- form more items (these are items that display when the user taps the **More** button)

![UI Actions - Mobile](image)

**Figure 414: UI action**

The lowest number in the **Order** column identifies the primary button at the top of the form.

**Redirect to a URL in the smartphone interface**

As part of a UI action, you may want to redirect a user to a URL in the smartphone interface. For example, you might add links to a form or open a new record after it is created from a UI action.
• Use this syntax to define the redirect link:

```javascript
action.setRedirectURL('incident.do?sys_id=-1');
```

**Note:** This functionality works the same as in the desktop version. For more information, click here.

---

Back navigation in the mobile interface

Mobile UI actions support back navigation when a UI action finishes. You can navigate back one logical navigation item in the current navigation stack.

When the `navigate_back` flag is set to true for a mobile UI action in the UI Action - Mobile [sys_ui_ng_action] table, you can move back to the previous screen.

Sometimes one or more discrete screens, or a nested or partial view of the screen, can represent a single navigation item. For this reason, back navigation can result in different UI behaviors depending on the current navigation content or device.

For example, the activity stream and form for a record are considered as one logical navigation item (the current record). However, some devices use multiple discrete screens for this navigation. When back navigation is triggered from a UI action on a form, multiple screens may be dismissed to return to a previous item, such as a list.

**Note:** Setting a redirect on the UI action through `action.setRedirectURL();` takes precedence over the `navigate_back` flag.

---

Define devices that use the smartphone interface

Users with the admin role can define the devices that use the smartphone interface.

1. Navigate to System Properties > UI Properties.
2. Locate *Use new mobile user interface if one of these strings (comma-separated) appears in the browser user_agent header* (the `glide.ui.m_agents` property).
3. Enter the types of devices that are directed to the smartphone interface.
   
   The default list is iPod, BlackBerry, Android, and iPhone.

Disable the mobile or tablet browser UI

Administrators can disable the mobile web interface for all devices and direct all activity to the standard browser UI.

This task applies specifically to users accessing an instance from a mobile browser, not the mobile app. System properties check the User Agent string of a browser for keywords found in that property’s value. If the User Agent string finds a corresponding property value, it directs to that indicated UI. For example, a property like `iPhone` would direct to a mobile UI.

**Table 315: UI Agent Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Device</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.ui.m_agents</code></td>
<td>Controls which browser is directed to the mobile UI</td>
<td>iPhone, android_phone, IE Mobile, Windows Phone, iPod, Windows CE, BlackBerry, BB10</td>
</tr>
<tr>
<td><code>glide.ui.mobile_agents</code></td>
<td>Use for the legacy mobile UI. It serves the same purpose as <code>glide.ui.m_agents</code>, but has no effect on access to the current mobile UI</td>
<td>iPod, Windows CE, BlackBerry, Android, Opera Mini, IE Mobile, Windows phone, iPhone</td>
</tr>
</tbody>
</table>
To change the rules for redirection:

- Navigate to **System Properties > Mobile UI properties** and clear the glide.ui.m_agents property value, which contains the list of mobile devices. Clearing the values in this field does not prevent access to the instance on mobile devices, but directs mobile device users to the desktop UI.

**Note:** Modifying these properties only changes the rules for redirection. Anyone can still access the mobile UI using $m.do.

- To eliminate access to the mobile or tablet UI completely, create a UI page to override $m or $tablet and redirect to a new page.

### Administering the tablet UI

Administrators can define whether the tablet UI is available and certain aspects of its appearance with a series of system properties.

Administrators can define whether the tablet UI is available and certain aspects of its appearance with a series of system properties. Additionally, administrators can configure access to UI actions based on whether the tablet UI is used.

### Managing tablet properties

Administrators can modify the following properties by navigating to **System Properties > Tablet UI Properties** or the System Properties [sys_properties] table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable tablet UI. (glide.ui.tablet_enabled)</td>
<td>Select <strong>Yes</strong> to allow users to access a ServiceNow instance from a supported tablet. Clear the check box to disable the tablet UI. This option is enabled by default.</td>
</tr>
<tr>
<td>Use tablet user interface if one of these strings. (comma-separated) appears in the browser user_agent header. (glide.ui.tablet_agents)</td>
<td>Enter the text strings that the ServiceNow instance looks for in the user agent of the tablet. If any of the strings in the property are found, the tablet interface is used. The default value is <em>ipad</em>.</td>
</tr>
<tr>
<td>Brief page title for tablet interface, also used for home screen icon labels. The iOS will truncate the title to 13 characters when adding it to the home screen. (glide.ui.tablet.title)</td>
<td>Enter the text that appears on the browser tab to indicate which website is currently loaded in the browser. The default value is <strong>ServiceNow</strong>.</td>
</tr>
<tr>
<td>Default home screen icon label used in iOS6+. (glide.ui.tablet.title.ios_webapp)</td>
<td>Enter the text that appears when you use the Safari share feature to save a ServiceNow page as an icon label on the tablet home screen. The default value is ServiceNow.</td>
</tr>
<tr>
<td>Appears on the right-hand side of the tablet interface header. (tablet.header.text)</td>
<td>Enter the text that appears on the right side of the tablet header. The default value is <strong>servicenow</strong>.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Appears in the tablet footer. (tablet.footer.text)</td>
<td>Enter the text that appears at the bottom of the tablet screen. The default value is Copyright ServiceNow 2013.</td>
</tr>
<tr>
<td>Start color of gradient for the tablet UI header. (css.tablet.gradient.start)</td>
<td>Enter the hexadecimal value for the color at the top of the gradient on the UI header. The default value is #666666 (gray).</td>
</tr>
<tr>
<td>End color of gradient for the tablet UI header. (css.tablet.gradient.end)</td>
<td>Enter the hexadecimal value for the color at the bottom of the gradient on the UI header. The default value is #111111 (black).</td>
</tr>
<tr>
<td>Color for text and icons in the tablet header and footer. (css.tablet.headerfooter.text.color)</td>
<td>Enter the hexadecimal value for the color of the text and icons on the tablet interface. The default color is #d3d3d3 or lightgrey.</td>
</tr>
</tbody>
</table>

Configuring UI actions and view rules for the tablet interface
Administrators can configure access to UI actions based on whether the tablet interface is used.

You could, for example, reduce the number of UI actions that appear on the tablet interface, limiting the UI to the most basic functions that tablet users need.

To determine if a user is accessing an instance from a tablet, create a script using the GlideMobileExtensions.runningTablet() method. To create a view rule that applies to tablet users only:

1. Navigate to System UI > View Rules.
2. Click New.
3. In the Device type field, select Tablet.
4. Fill in the other fields to define the view rule.

Use the Smartphone Interface on a tablet
Administrators can configure tablets to run the smartphone interface in place of the tablet interface.

Role required: admin
By default, the system provides tablets with their own mobile web UI. If you want a tablet to run the smartphone interface instead of the tablet interface, you must make the following changes.

1. Remove the device from the list of tablet mobile agents in the glide.ui.tablets_agents property. For example, remove the ipad value.
2. Add the device to the list of smartphone mobile agents in the glide.ui.m_agents property. For example, add the ipad value.

Core configuration

Core configuration encompasses changes made to the platform as well as supporting applications. These changes can affect global settings as well as settings for particular applications.

These settings include:
- **Forms and lists**: change the behavior and appearance of forms and lists.
- **Navigation and UI and search**: configure how users browse and search in the ServiceNow platform.
- **Time and performance**: keep your organization running and on time.
- **Localization and mobile device support**: take the ServiceNow platform anywhere.
- **Plugins and out-of-box appendix**: expand the ServiceNow platform to fit your needs.

ServiceNow plugins

Plugins provide functionality within a ServiceNow instance.

Many plugins are active in the base ServiceNow system. Optional functionality is provided with plugins that administrators can activate, request, or purchase.

---

**Note:** After a plugin is active, you cannot disable or deactivate it. You can hide the functionality, if needed.

---

Activate a plugin

Follow these steps to activate the plugin.

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

Request a plugin

Some plugins must be activated by ServiceNow personnel. These plugins do not appear in the **System Definition > Plugins** list.

Role required: none
Request the plugin through the HI Service Portal.

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Purchase a plugin**

Some features require a separate subscription from the rest of the ServiceNow platform.

Role required: admin

To purchase a subscription, contact your ServiceNow account manager. In most cases, the account manager will arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days. In some cases, you can activate the plugin within the instance.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the feature on a sub-production instance before purchase, follow the steps to activate a plugin. If the plugin is not listed in the **System Definition > Plugins** module, make a request through HI.

**List of Geneva plugins**

This table lists plugins that are currently available in Geneva.

</tbody>
</table>
| Best Practice - Task Survey Management | com.snc.bestpractice.task_survey.feature_set | **Active:** true  
**Has Demo Data?:** true  
**Dependency:**  
- com.glideapp.survey  
- com.glide.db_view  
- com.glide.notification  

Enhanced survey functionality, includes triggering survey requests based on task conditions and linking survey responses to the task that generated the survey. This allows for detailed survey reporting leveraging data from the related task record. The demo data relies on incident and user demo data, but will not be installed with this plugin.  

Note: A significantly improved and updated feature named Survey Management is available starting with the Eureka release. |
| Big Instance Available by request | com.snc.big_instance | **Active:** inactive  
**Has Demo Data?:** false  

Big instance scalability technologies. |
| Boot profile support routines Available by request | com.snc.boot_profile | **Active:** inactive  
**Has Demo Data?:** false  

Common routines for installation profiles. |

Available system properties

This page describes properties available to an instance.

Some properties are available on a system properties form, but some lesser-used properties are only available from the System Property [sys_properties] table. In some cases, the property does not exist in a base instance, but can be added if you need to change the value.

Table 316: Available System Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.attachment.max_size</td>
<td>Sets the maximum file attachment size in megabytes. Leave the field empty to allow attachments up to a maximum of 1GB.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1GB</td>
</tr>
<tr>
<td></td>
<td>• Location: [System Properties &gt; Security]</td>
</tr>
<tr>
<td>com.glide.csv.loader.ignore_non_parseable_lines</td>
<td>Enables (true) or disables (false) ignoring one or more lines (rows) in an import set that contain bad data, such as a row that is missing a column of data.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• Location: add to the System Property [sys_properties] table</td>
</tr>
<tr>
<td>com.glide.csv.loader.max_errors_allowed</td>
<td>Sets the maximum number of lines (rows) that an import can ignore before failing. If the import succeeds, the import lists the number of rows ignored due to errors.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 100</td>
</tr>
<tr>

<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| com.glide.loader.verify_target_field_size | Controls whether import set fields can automatically increase in size during an import (true) or not (false). By default, data that exceeds the import field size is truncated. Set this property to true to allow any import set field to increase the column size to match the length of the data.  
  - Type: true | false  
  - Default value: false  
  - Location: add to the System Property [sys_properties] table |
| com.glide.ssl.read.timeout | Sets the time-out value in seconds for SSL connections during read operations. Typically, this setting is used as part of LDAPS. If you enter timeout values for both this system property and the LDAP Read timeout field, the lowest timeout value takes precedence.  
  - Type: integer  
  - Default value: 10  
  - Location: add to the System Property [sys_properties] table. |
| com.snc.apps.publish.maxrows | Defines the maximum number of data records to include when publishing an application.  
  - Type: integer  
  - Default value: 1,000  
  - Location: System Property [sys_properties] table |
| com.snc.iam.log_level | Logging level for the business rule MapUpstreamImpactedCI. Debug is the most detailed option with full trace of how the Impacted CI List is calculated. Error is the minimal logging option with only severe errors being logged.  
  - Type: string  
  - Default value: info  
  - Possible values: debug,info,error  
  - Location: System Property [sys_properties] table |
| com.snc.on_call_rotation.reminders.showtz | Specifies whether to show a user's time zone  
  - Type: true | false  
  - Default value: false  
  - Location: add to the System Property [sys_properties] table |

</table>
| glide.banner.image.url_target            | Target frame used when clicking the banner image. Use gsft_main for the main frame, _top to replace the current browser window, _blank for a new window or tab.  
  • Type: string  
  • Default value: gsft_main  
  • Location: System Property [sys_properties] table                                                                                                                                                                                                                                                                                                                                                       |
| glide.businessrule.async_condition_check | Specifies if the instance checks the condition statement of async business rules (the **When** field is set to async) prior to running the business rule. If this property is set to true, the instance evaluates the async business rule conditions a second time before running the rule. If this property is set to false or missing, the instance does not evaluate the conditions a second time.  
  • Type: true | false  
  • Default value: false  
  • Location: add to the System Property [sys_properties] table                                                                                                                                                                                                                                                                                                                                                           |
| glide.businessrule.callstack             | Determines whether business rule executions are logged in the daily log when they start and finish (true) or are not logged (false). Logging is useful for troubleshooting a problem where you need to know which business rules are running and in which order.  
  • Type: true | false  
  • Default value: false  
  • Location: add to the System Property [sys_properties] table                                                                                                                                                                                                                                                                                                                                                           |
| glide.chart.decimal.precision            | Controls the rounding precision of non-currency numeric values displayed on charts. This property has a maximum possible value of 4. Currency values always specify a precision of 2.  
  • Type: integer  
  • Default value: 2  
  • Location: add to the System Property [sys_properties] table                                                                                                                                                                                                                                                                                                                                                           |

</table>
| glide.imap.secure_port                 | Specifies the communications port for IMAP secure connections.  
  - Type: string  
  - Default value: 995  
  - Location: add to the System Property [sys_properties] table                                                                                     |
| glide.imap.tls                         | Specifies whether to start the IMAP server in Transport Layer Security (TLS) mode.  
  - Type: true | false  
  - Default value: false  
  - Location: add to the System Property [sys_properties] table                                                                                      |
| glide.import_set.preserve.leading.spaces | Specifies whether the import process preserves leading spaces in Excel data cells. When false, the import process removes leading spaces from Excel data cells. When true, the import process preserves leading spaces.  
  **Note:** The import process always removes trailing spaces from Excel data cells.  
  - Type: true | false  
  - Default value: false  
  - Location: add to the System Property [sys_properties] table                                                                                      |
| glide.import_set_row.dynamically_add_fields | Specifies whether an import set can add new columns to the staging table (true) or not (false). Instances that contain large numbers of import sets can sometimes become unresponsive when an import adds a column because the instance must alter every row in the staging table. In some cases, the database alter table action causes an outage. Setting this property to false prevents an import set from adding columns to the staging table and produces a log message. As a workaround, administrators can manually add a column to the staging table by creating a new dictionary entry and then reimporting the import set.  
  - Type: true | false  
  - Default value: false  
  - Location: add to the System Property [sys_properties] table                                                                                      |

| glide.phone_number_e164.display_territory_selector | Determines whether to display the territory selector. Hiding the territory selector restricts users to entering only local or national phone numbers.  
• Type: true | false  
• Default value: true  
• Location: add to the System Property [sys_properties] table |
| glide.phone_number_e164.display_territory_text | Determines when a Phone Number (E164) field displays a territory label. When set to all, a Phone Number (E164) always displays the territory label. When set to national, a Phone Number (E164) displays the territory label only if the phone number is in local format. When set to read-only, a Phone Number (E164) displays the territory label in read-only mode regardless of whether the number is in local or global format. When set to read-only-national, a Phone Number (E164) displays the territory label in read-only mode only if the number is in local format. When set to list, a Phone Number (E164) displays the territory label in a list. When set to list-national, a Phone Number (E164) displays territory label in a list if the number is in national format. When set to none, a Phone Number (E164) does not display the territory label.

</tr>
</thead>
<tbody>
<tr>
<td>glide.quota.manager.debug</td>
<td>Controls whether to display (true) or hide (false) additional information related to the Quota Manager, such as running transactions, canceled transactions, and what quotas are matched to transactions.</td>
</tr>
</tbody>
</table>
|                                           | • Type: true | false  
|                                           | • Default value: true  
|                                           | • Location: add to the System Property [sys_properties] table |
| glide.quota.manager.heartbeat             | Sets the number of seconds between the start of each Quota Manager heartbeat. This value determines how often the Quota Manager checks for transactions exceeding a quota and how often it writes status in the log file. |
|                                           | • Type: integer  
|                                           | • Default value: 1  
|                                           | • Location: add to the System Property [sys_properties] table |
| glide.quota.manager.minimum_transaction_time | Sets the minimum number of seconds a transaction must run before the Quota Manager matches it to a transaction quota. ServiceNow recommends setting this value to at least 1 second because smaller values decrease performance and because transactions shorter than 1 second are probably not worth canceling. For optimal performance, set this value to the value of your most restrictive quota. For example, if your most restrictive quota cancels transactions longer than 1 minute, set the minimum transaction time to 60 seconds. |
|                                           | • Type: integer  
|                                           | • Default value: 1  
|                                           | • Location: add to the System Property [sys_properties] table |
| glide.remote_glide_record.max_count      | Control the maximum number of records that the GlideRecord query method returns when using the SOAP web service. ServiceNow primarily uses this property to control the records returned when using a Perl API GlideRecord query. |
|                                           | • Type: integer  
|                                           | • Default value: 250

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.schedules.fifth</td>
<td>Controls how a schedule entry that selects the fifth occurrence of a day in month behaves in a month containing only four occurrences of the day. Choices are <strong>Last</strong>, <strong>Next</strong>, and <strong>Strict</strong>. The <strong>Last</strong> option selects the last (fourth) day of the month. The <strong>Next</strong> option selects the first day of the next month. The <strong>Strict</strong> option skips the day completely. This property is only valid when the <code>glide.schedules.repeat_nth</code> property is set to <strong>Day</strong>.</td>

<tr>
<td>glide.security.checkacl.before.setvalue</td>
<td>Controls how the high security setting glide.security.strict.updates processes ACLs. When true, the instance checks ACL rules for all columns before applying any updates to a row. When false, the instance applies ACL rules as each column is processed in alphabetical order. This behavior may result in one update preventing another update from occurring. For example, suppose you create a custom ACL rule to prevent updates after a record is closed. If you attempt to close an incident and also add information to a custom resolution code field in the same update, the close action is applied first because it is controlled by the [incident.state] column and the custom field by the [incident.u_resolution_code] column. After the instance applies the close action, the custom ACL rule prevents further write updates to the row.</td>

| glide.smtp.secure           | [Legacy] Specifies whether to enable SSL encryption for SMTP connections. Use glide.smtp.encryption (See Outgoing Mail Server settings) instead to specify how to encrypt communications with the SMTP server.             |
|                             | • Type: true | false  
|                             | • Default value: false  
<p>|                             | • Location: add to the System Property [sys_properties] table                                                                                          |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.smtp.timeformat                      | Specify the time format to use for outgoing email notifications  
  • Type: string  
  • Default value: time format listed in email sender's user record [sys_user.time_format].  
  • Location: add to the System Property [sys_properties] table |
| glide.smtp.tls                             | [Legacy] Enables (true) or disables (false) Transport Layer Security (TLS) encryption for outgoing mail. Use glide.smtp.encryption (See Outgoing Mail Server settings) instead to specify how to encrypt communications with the SMTP server.  
  • Type: true | false  
  • Default value: false  
  • Location: add to the System Property [sys_properties] table |
| glide.soap.default_security_policy         | Specifies the name of SOAP security policy the instance uses when enforcing Web Services-Security (WSS) for inbound requests.  
  • Type: string  
  • Default value: default security policy  
  • Location: add to the System Property [sys_properties] table |
| glide.soap.import_set_insert_serialized.<tablename> | Controls the processing of web service inserts. When this property is set to true, the instance processes multiple simultaneous inserts one at a time (serially across nodes) to ensure an accurate transform. Serialized processing slows down the speed at which the instance processes inserts. When this property is set to false, multiple simultaneous inserts into an import set table result in simultaneous transforms that may produce duplicate target records due to the coalesce value being created at the same time.  
  **Tip:** Only set this value to false to optimize for performance when the related transform map does not have a coalesce value that may be present simultaneously.  
  • Type: true | false  
  • Default value: true  
  • Location: add to the System Property [sys_properties] table |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.soap.request_processing_timeout            | Sets the maximum number of seconds a SOAP request has to finish processing before the connection times out. This property computes a default value from the value of the property glide.http.timeout divided by 1000. There might be network infrastructure (such as proxy servers) in place that implements a shorter timeout. In this case, a socket timeout may occur unless this property is set to a shorter value. In general, you should set this property to a value several seconds less than the shortest socket inactivity timeout in effect anywhere in the network path between the client application and the ServiceNow instance.  
- Type: integer  
- Default value: 175 (value of glide.http.timeout divided by 1000)  
- Location: add to the System Property [sys_properties] table |
| glide.spell.dictionary.en                        | Sets the spell checker dictionary used in the system for English users. There are dictionaries available for Brazilian Portuguese, Dutch, English US, English UK, French, German, Italian, Portuguese, Russian, Spanish, and Thai.  
- Type: choice list  
- Default value: en.dic (English US)  
- Location: System Property [sys_properties] table |
| glide.spell.dictionary.max_matches               | Sets the maximum number of spelling errors the spell-check should detect. By default it finds only 10 spelling errors. The instance ignores any additional errors after reaching the maximum value.  
- Type: integer  
- Default value: 10  
- Location: add to the System Property [sys_properties] table |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

</table>
| glide.sys.activity_using_audit_direct                      | [Not Supported] Controls whether the record's history is generated using the Audit table (true) or not (false).  
[Required] Set the value to **false** to generate history with History Sets.  
• Type: true | false  
• Default value: false  
• Location: System Property [sys_properties] table |
| glide.sys.audit_inserts                                    | Controls whether the Audit table audits inserts (true) or not (false).  
• Type: true | false  
• Default value: false  
• Location: System Property [sys_properties] table |
| glide.sys_reference_row_check                              | Controls whether the script conditions of Access Control Rules apply to a table's reference fields.  
• Type: true | false  
• Default value: false  
• Location: add to the System Property [sys_properties] table |
| glide.template.max_context                                 | Specifies the maximum number of templates displayed in a form's context menu. If more than this number are available, users can click **Apply Template** on the context menu to open the reference list of templates.  
• Type: integer  
• Default value: 15  
• Location: System Property [sys_properties] table |
| glide.translate.learn                                      | Enables (true) or disables (false) adding the current language suffix to UI elements such as labels and messages. Enabling the language suffix assists with translating new customizations.  
• Type: true | false  
• Default value: false  
• Location: add to the System Property [sys_properties] table |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.ts.index.attachment.debug | When the value is set to **true**, enables log messages for exceptions that occur when indexing attachments (default is **false**). You can leave this property enabled during normal operations to capture stack trace information about any exceptions.  
  * Type: true | false  
  * Default value: false  
  * Location: add to the System Property [sys_properties] table |
| glide.ts.index.attachment.list_terms.debug | When the value is set to **true**, the system logs all indexed terms when an attachment is indexed (default is **false**).  
  [Recommended] For optimal performance, set this property to **false** during normal operations. Only enable this property when you are actively debugging an issue.  
  * Type: true | false  
  * Default value: false  
  * Location: add to the System Property [sys_properties] table |
| glide.ui.activity.displayname | Determines whether the activity formatter shows **name** values (true) or **user_name** values (false).  
  * Type: true | false  
  * Default value: false  
  * Location: add to the System Property [sys_properties] table |
| glide.ui.activity.email_roles | Specifies the list of roles (comma-separated) that can view email in the Activity Formatter.  
  * Type: string  
  * Default value: itil  
  * Location: add to the System Property [sys_properties] table |
| glide.ui.activity.email.use_display | Specifies whether to display email addresses or the user IDs (display value of the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.  
  * Type: true | false  
  * Default value: false  
  * Location: add to the System Property [sys_properties] table |

</table>
| glide.ui.auto.recovery.unsupported.tables | Comma-separated list of tables you want to exclude from automatic recovery.  
  • Type: string  
  • Default value: v_ws_editor  
  • Location: Auto Recovery > Properties |
| glide.ui.auto_req.extend.session | When set to true, this property enables the user to extend their user session by selecting a homepage refresh time. When set to false, it enforces session timeout. The session timeout value is ignored when the user specifies an automatic refresh value. For example, if the user selects 5 minutes for automatic homepage refresh, the session is renewed every five minutes. By adding this property and setting the value to false, administrators can force the user session to time out even if the user's page refreshes every x number of minutes. The user's session times out after the value specified in the session timeout, plus the selected refresh value. This property takes effect when the Remember me check box is not selected for the user. Tablet and mobile devices do not support this feature.  
  • Type: true|false  
  • Default value: true  
  • Location: add to the System Property [sys_properties] table |
| glide.ui.buttons_bottom | Controls whether UI actions appear at both the bottom and top of the form (true) or only at the top (false). This property works in UI11 only.  
  • Type: true | false  
  • Default value: false  
  • Location: System Property [sys_properties] table |
| glide.ui.cert_task_activity.fields | Defines which journal field is the task activity field.  
  • Type: string  
  • Default value: work_notes  
  • Location: add to the System Property [sys_properties] table |

</tbody>
</table>
| glide.ui.email_client.from | Specifies whether to display the **From:** line in the Email Client. Users can change the email address in the **From:** line by entering a new value.  
  - Type: true | false  
  - Default value: false  
  - Location: [System Properties > UI Properties](#) |
| glide.ui.email_client.reply_to | Specifies whether to display the **Reply to:** line in the Email Client.  
  - Type: true | false  
  - Default value: false  
  - Location: [System Properties > UI Properties](#) |
| glide.ui.filter.first_day_of_week | Identifies the first day of the calendar week for the company. By default, the start of the week is Monday, meaning that the calendar week begins with Monday and ends with Sunday. To change this behavior, add the property `glide.ui.filter.first_day_of_week` to the instance as an integer property. Set the value to the integer corresponding with the day of the week that the calendar begins on, where 1 is Sunday, 2 is Monday, and so on. The function impacts all charts and calculations where the day of the week is used as a parameter.  
  - Type: integer  
  - Default value: 2  
  - Location: add to the System Property [sys_properties] table |
| glide.ui.first.field.reference | Enables (true) or disables (false) having the first column in a list always link to the underlying record, even if it is a reference field. For example, if the first column on an Incident list is **Assigned to**, that value links to the Incident if this property is set to true.  
  - Type: true | false  
  - Default value: false  
  - Location: add to the System Property [sys_properties] table |
