This time, the record being updated is at the same level in the domain hierarchy as the user, so the record is updated with a more appropriate name. Here is the resulting rule. Notice that database incidents will now be directly assigned to David.
Figure 741: Database specific policy assignment rule

If a new incident is created in the Database domain or lower in the hierarchy, the new rule is applied. It has overridden the global assignment rule. If a new incident is created in the global domain or any other domain not within the Database domain hierarchy, then the global rule applies.
In the following scenario, Don Goodliffe, in the Database/Database San Diego domain hierarchy, decides that database incidents created in his domain should be assigned to him rather than to David Loo. As an administrator, Don Goodliffe starts out with the following assignment policy:

![Assignment Rules](image)

Notice that this level of the hierarchy starts out with the policy established at the parent level (the Database domain). After changing the **Database Specific Policy**, the list looks like this:

![Assignment Rules](image)

**Figure 742: Don Goodliffe’s starting view of assignment rules**

Notice that this level of the hierarchy starts out with the policy established at the parent level (the Database domain). After changing the **Database Specific Policy**, the list looks like this:
Figure 743: Database San Diego rules override Database specific policy rules

Again, the attempted update is changed automatically to an insert, and the override value is supplied to indicate that the higher-level policy is being overridden. Here is the resulting rule; it shows that database incidents created in the Database San Diego domain will be assigned to Don Goodliffe.
Figure 744: San Diego specific policy

The result of the above customization is:

- A database incident from the Database San Diego domain will be assigned to Don Goodliffe.
- A database incident from the Database hierarchy other than Database San Diego will be assigned to David Loo.
• A database incident from any other domain, including global, will be assigned to the system administrator.

The above customizations all show changes to higher-level policy. However, new policy can also be created at any level of the domain hierarchy.

During a transaction, the current user's domain normally determines the policy to load. For example when a user in the Database domain updates an incident, the Database domain is used for business rules and policies even if the incident record was originally created in the Database San Diego domain. By default, the user's domain supersedes the record's domain.

There is a system setting that can change this behavior. If Using the Current Record's Domain Instead of the Current User's Domain is set to true, then the above behavior is reversed. The domain of the record is used to determine which policy to load, not the domain of the user. For example if a user in the Database domain updates an incident that is in the Database San Diego domain, then the business rules and policy that exist for Database San Diego are executed. The domain of the user still determines the records that are visible to the user, and the domain of the user sets the domain for records that user creates, but is not a factor in determining rules and policies.

Domain query methods

A domain query method allows the instance to efficiently query large numbers of domains.

Part of Domain Support 2.0 is a new query engine designed to perform and scale to tens of thousands of domains. Prior methods, including domain numbering, have had limitations that domain paths resolves. While you have the flexibility to continue using your existing query method, we highly recommend that you switch to domain paths through the new Domain Configuration screen at your earliest convenience.

Domain paths:

A domain path is a series of three-character codes separated by a slash (/) delimiter that uniquely identifies a domain. Each digit in the three-character code consists of one of the following 60 possible characters:

```
!#$&()*+,-./0123456789:;<@ABCDEFGHIJKLMNOPQRSTUVWXYZ\]^`{|~
```

The three-character codes that make up a path are not unique across a domain tree. Rather, the entire path string itself is unique. For example:
Figure 745: An example domain tree

Table 611: Domain tree example

<table>
<thead>
<tr>
<th>Domain name</th>
<th>Parent domain</th>
<th>Domain path</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNC</td>
<td>None</td>
<td>!!!/</td>
</tr>
<tr>
<td>SNC/US</td>
<td>SNC</td>
<td>!!!/!!!/</td>
</tr>
<tr>
<td>SNC/EU</td>
<td>SNC</td>
<td>!!!/!!!#/</td>
</tr>
<tr>
<td>SND/RU</td>
<td>SNC</td>
<td>!!!/!!$/</td>
</tr>
<tr>
<td>SNC/US/NY</td>
<td>SNC/US</td>
<td>!!!/!!!#/</td>
</tr>
<tr>
<td>SNC/US/CA</td>
<td>SNC/US</td>
<td>!!!/!!!#/</td>
</tr>
<tr>
<td>SNC/EU/DE</td>
<td>SNC/EU</td>
<td>!!!/!!!#/</td>
</tr>
<tr>
<td>SNC/EU/FR</td>
<td>SNC/EU</td>
<td>!!!/!!!#/</td>
</tr>
</tbody>
</table>

Note: With three-character codes delimited by a single character in a path string of 255 total characters, each node of the domain tree supports up to 216,000 child domains, and the maximum depth of the tree is 63 levels.

Domain separation setup

Setting up domain separation involves activating the plugin, setting options, and assigning users and records to domains.

Activating the Domain Extension plugin enables these features:

- Domain separation is based on the Domain [sys_domain] table.
- Delegated administration lets each domain have separate policy.
- All records are part of the global domain.
• The current user’s domain determines the domain to use when viewing or operating on a record in a different domain.

Domain separation replaces Company Separation. However, if company separation is already active when you activate domain separation, both plugins are active at the same time. You can control the company separation activation status with the glide.db.separation.field property.

Domain support plugins

All domain support features are consolidated into one plugin called Domain Support, version 2.0.

The plugin combines the features of the previous plugins:

• Domain Support (version 1.0)
• Domain Support - Common
• Domain Support - Partitioning (Data separation)
• Domain Support - Delegated Administration
• Domain Number Support

In addition, the Domain Support version 2.0 offers these new features:

• Choice of domain query method
  • Domain Paths (new)
  • Domain Numbers
• All-new Domain Admin UI
• Improved stability and scalability

Activate or deactivate a domain

MSP Extensions allows you to activate or deactivate a domain, which cascades the activation status to companies in the domain.

Role required: admin

When you activate a company record, MSP Extensions automatically activates the company's associated domain. For example, if you activate the ACME company, then you also activate the TOP/ACME domain.

1. To deactivate a domain, navigate to the domain record.
2. Clear the Active check box.
3. Click Update.

**Warning:** Do not delete domains. Deactivate domains that you no longer need instead of deleting them.

Grant visibility domains to an individual user

How to grant visibility domains to an individual user.

Role required: admin

1. Navigate to **User Administration** > **User**.
2. Select the user you want to provide with visibility domains.
3. Add the **Visibility domains** related list to the form.
4. From the Visibility Domains related list, click **Edit**.
5. Select the domains whose records you want the user to see.
6. Click **Save**, and then click **Update**.

![Visibility domain embedded list](image)

The Visibility domain embedded list contains the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Domain that is visible to the group or user.</td>
</tr>
<tr>
<td>Inherited</td>
<td>Domain is inherited from domain visibility or a parent domain.</td>
</tr>
<tr>
<td>Granted By</td>
<td>Name of the group that granted domain visibility.</td>
</tr>
<tr>
<td>Parent visibility</td>
<td>Name of the parent domain and used for grouping records. If the parent record is deleted, then all records with the same parent are deleted as well.</td>
</tr>
</tbody>
</table>

**Select the domain query method**

Converting from domain numbers to domain paths requires a one-time background conversion process.

Role required: admin

This process can take several hours depending on the number of domains to be converted. Consider scheduling the conversion during off-peak hours to minimize the performance impact on users.

1. Navigate to **Domain Admin > Configuration**.
2. From **Query Method**, select either **Enable Domain Paths** or **More > Enable Domain Numbers**.
3. Click **OK** to confirm the selection.

**Note:** The conversion duration depends upon the current number of domains in the instance. The more domains there are, the longer the conversion takes to add path or number references to the domains.

**Configuration module**

The Domain Configuration module is the central location where an administrator enables, configures, and views the status of domain separation support.
Figure 746: Domains Configuration

The Configuration module consists of these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Table</td>
<td>Select the table containing domain names for domain separation. You can select any existing table. By default, the system uses the Domain [domain] table. <strong>Warning:</strong> No domain can have the name global. Verify that the name global is not used in any of the domain names in the table before saving the domain configuration.</td>
</tr>
<tr>
<td>Domain Validation</td>
<td>Lists any current validation issues. Click the More link to see validation troubleshooting options.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Domain Progress Workers</td>
<td>Lists any currently running conversion or validation processes.</td>
</tr>
<tr>
<td>Domain Alerts</td>
<td>Lists any information, warning, or error messages relating to domain separation. You can also find</td>
</tr>
<tr>
<td></td>
<td>this information in the instance log.</td>
</tr>
<tr>
<td>Enable Domain Separation</td>
<td>Select whether to enable or disable domain separation. By default, domain separation is enabled.</td>
</tr>
<tr>
<td></td>
<td>You can manually disable domain separation with this setting. However, the sys_domain column will</td>
</tr>
<tr>
<td></td>
<td>still be present on any table it was added to. This option maps to the system property glide.sys.domain.partitioning.</td>
</tr>
<tr>
<td>Enable Delegated Administration</td>
<td>Select whether to enable or disable delegated administration. Activating the plugin automatically</td>
</tr>
<tr>
<td></td>
<td>enables delegated administration. You can manually disable delegated administration with this setting.</td>
</tr>
<tr>
<td></td>
<td>This option maps to the system property glide.sys.domain.delegated_administration.</td>
</tr>
<tr>
<td>Enable verbose domain logging</td>
<td>Select whether to enable additional debugging information for domain separation. This option maps to</td>
</tr>
<tr>
<td></td>
<td>the system property glide.sys.domain.verbose.</td>
</tr>
</tbody>
</table>

### Domain separation options

You can set the following domain separation configuration options by navigating to **Domain Admin > Configuration**.

- Select the **domain query method**.
- Provide a list of roles that ignore the domain of the current record.
- **Enable domain log and debug messages**.
- **Add domains to a visibility domains list** on page 2609.
- Create a contains relationships between domains.
- Create domain-specific personalizations.
- Prevent a user from seeing the complete domain list.
- Display **domain selection menus**.

### Add a domain field to a table

Administrators can domain separate custom tables by adding a sys_domain field to it.

Role required: admin

1. Navigate to the table’s list view. For example, type `<table name>.list` in the navigation filter.
2. Right-click the list header and select **Configure > List Layout**.
3. In the **Create new field** section, enter `sys_domain` as the Name and Domain ID as the Type.
4. Click **Add**.
5. Click **Save**.
**Note:** Any other means of creating a field adds a `u_` prefix to the column name. For domain separation to work the column name must be `sys_domain` without any `u_` prefix.

---

**Add domains to a visibility domains list**

Adding a visibility domain allows a user or group to see and potentially edit records from another domain regardless of the user or group's normal domain membership.

Role required: admin

Assigning visibility domains to all members of a group is preferred over granting them to individual users.

**Note:** Adding a visibility domain does not change a table or record's access control rule requirements.

1. Navigate to the domain table.
2. Select the group you want to provide with visibility domains.
3. Add the **Visibility domains** related list to the form.
4. From the **Visibility domains** related list, click **Edit**.
5. Select the domain records you want the group or domain to see.
6. Click **Save**, and then click **Update**.

---

**Create contains relationships between domains**

Creating a contains relationship between domains changes the domain hierarchy.

Role required: admin

Domains in a contains relationship inherit the visibility settings of the containing domain. The containing domain allows users to see data in the contained domain as well as any of its children. Processes are unaffected by a contains relationship.

1. Navigate to the domain table.
2. Select the domain record that will be the parent (container) domain of the new contains relationship.
3. **Toggle the domain scope** to switch between the session scope and record scope, if necessary.
4. From the Contains Domains related list, click **Edit**.
5. Select the domain records that is the child (contained) domains of the contains relationship. Only child domains appear by default when the domain picker is set to Global. Toggle the domain scope to see all domains in slushbucket.
6. Click **Save**, and then click **Update**.

---

© 2017 ServiceNow. All rights reserved.
Create a domain-specific choice list
Administrators can configure choice lists to contain entries specific to a particular domain.

Role required: admin

1. Select the domain from domain picker where the choice should be added.
2. Right-click the field and select **Configure Choices**.
3. Update or add choices.
4. Push changes through the normal change process such as update sets.

**Note:** Administrators should ensure that choices are unique across domains to prevent administrative confusion in the global domain.

If an administrator adds a new choice from the global domain, then users from domains lower in the hierarchy see the new choice at the end of their current choice lists. If the new choice is not active at the global level, then it is available to the domain users via **Configure Choices** but does not show as an active choice.

**Domain selection menus**
The instance offers domain selection via two menu formats.

The available menu formats are:

- **Simple domain picker:** provides a simple drop-down list of available domains.
- **Domain reference picker:** enables a reference field that offers filtering and an auto-complete, type-ahead, entry feature. This format is suitable for longer lists.

The placement of these pickers and the procedure to show or hide them differ depending on the user interface version.

Enable the simple domain picker on UI11 and UI15
The simple domain picker is a drop-down list of available domains and does not support the auto-complete, type ahead feature.

Role required: admin

On UI11 and UI15, you must enable a UI macro. On UI16, you can use the **General** tab on the **System Settings page** of the banner frame.

1. Navigate to **System UI > UI Macros**.
2. Select the **domain_select** macro.
3. Select the **Active** check box and click **Update**.
4. Refresh the browser.
5. Click the gear icon in the banner frame (UI15) or the Domain choice list (UI11).

![Domain Picker](image)

**Figure 747: The simple domain picker for UI15**

Enable the domain reference picker for UI11 and UI15

Use the domain reference picker with auto-complete for long lists that require excessive scrolling.

Role required: admin

On UI11 and UI15, you must enable a UI macro. On UI16, use the General tab on the System Settings page of the banner frame to enable only the simple domain picker. Starting with Geneva patch 4, you can enable a property to enable this domain reference picker.

1. Navigate to System UI > UI Macros.
2. Select the `domain_reference_picker` macro.
3. Select the `Active` check box, and click `Update`.

   **Note:** The `domain_select` macro must be set to `false`.

4. Refresh the browser.
5. Click the gear icon in the banner frame to show the `Domain` field (UI15). The `Domain` field appears by default on the banner in UI11.

![Figure 748: The domain reference picker for UI15](image)

6. Click the magnifier icon in this field to open a list of domains that can be filtered for easy selection.
7. To use the auto-complete feature, type a letter in the field. The menu displays all domains beginning with that letter.
Restrict access to domain selection by role (UI15 and UI11)

You can include a comma-separated list of roles in domain-related UI macros to restrict access to domain selection by user role.

Role required: admin

1. Navigate to System UI > UI Macros.
2. Select any of the four domain-related UI macros: two named domain_select and two named domain_reference_picker.

There are two of each type two support different UIs. The UI macros with the Media Type field empty are for UI11, and the other two are for UI15.

3. Locate one of the following lines of code:
   - domain_select:

```javascript
var ds = new DomainSelectControl("gsft_domain","itil","Domain","Domain");
```
• **domain_reference_picker**:

```javascript
var dp = new
DomainPicker("${jvar_id}" ,"itil", "DomainReference", "Domain");
```

4. Replace the parameter itil with a comma-separated list of roles to control who sees the domain selection menu.

**View domain relationships**

The domain map offers domain administrators a read-only representation of the active domains on the instance and how they relate to each other.

Role required: admin

All domain maps must have one domain set as the primary domain. In addition, each domain in the domain map must meet these criteria:

- The **Parent** field must be filled in (the primary domain is the only exception to this).
- The **Active** check box must be selected.

The domain map does not draw domain relationships for domains that fail to meet the mapping criteria.

1. Navigate to **Domain Admin > Domain Map**.
2. Click the plus (+) or minus (-) icons on the domain headers to show or hide sub domains.

**Select a primary domain**

The primary domain indicates the top level domain in the domain map.

Role required: admin

The primary domain cannot have a parent domain and must have at least one child domain. There can only be one primary domain at a time. If you select another domain as the primary domain, it overrides the previous primary domain.

1. Navigate to **Domain Admin > Domains**.
2. Select the domain you want to be the primary domain. For example, TOP.
3. Select the **Primary** check box.
4. Click **Update**.

Actions on selected rows...
Create a domain
You can create a new domain by creating a new record in the [domain] table.

Role required: admin

When creating a new domain, keep the following in mind:

- Only one domain can be the default domain.
- Only one domain can be the primary domain.

1. Navigate to Domain Admin > Domains.
2. Click New.
3. Fill in the necessary fields (see table).
4. Click Submit.

![Domain form fields](image)

Table 612: Domain form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the domain.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a domain type that describes the domain. By default the domain types are Vendor, Customer, and MSP. You can also add your own choices.</td>
</tr>
<tr>
<td>Primary</td>
<td>Select the check box if this domain is to be the top level domain in the hierarchy. The top level domain only has child domains and no parent domains.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Parent</td>
<td>Select the name of the domain higher in the hierarchy that contains this domain. This field must have a value for the domain to appear in the domain map.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to make the domain available for use. You must select this option for this domain to appear in the domain map.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the domain.</td>
</tr>
</tbody>
</table>

Each domain record can also have several related records:

- Companies
- Contains Domains
- Contained By

To change the domain hierarchy, go to the Contains Domains related list and select the domain records that will be the child (contained) domains of the contains relationship.

**Change domain visibility**

By default, when a user in the global domain views a table containing a `sys_overrides` column, the user sees records from only the global domain.

Role required: admin

1. Change the glide.sys.restrict_global_domain_processes property to `true`.
2. To view records from all domains, click **Expand Domain Scope** under Related Links.
3. To return to viewing records from the global domain only, click **Collapse Domain Scope**.

**Deactivate a domain**

Brief introduction to the topic that appears on overview pages and in link previews.

Role required: admin

⚠️ **Warning:** Do not delete domains. Deactivate domains that you no longer need instead of deleting them.

1. Open the domain record.
2. Deselect the **Active** option.

3. Save the record.
Domains and associated companies
Domain separation allows you to cascade changes you make to a company record to the domain and other records associated to the company.

By default, the system automatically assigns users to the same domain as their company. For example, all users of the ACME company automatically become members of the TOP/ACME domain.

Note: Users with the admin role have the ability to change their own user records and therefore can change domains. Managed Service Providers may want to either disable delegated administration or set up an approval process to verify that the user needs the admin role.

When you change a company’s domain, the instance automatically changes the domain of the following associated records to match the company’s new domain.

• Locations
• Departments
• Groups
• Users

When you change a company’s domain, the instance automatically changes the domain of the following associated records to match the company’s new domain.

Note: The instance does not automatically change the domain of any record where you have selected the Managed domain checkbox.

Domain deactivation and associated companies:
When you deactivate a domain, the instance also automatically completes the following actions.

• Deactivates all companies in the domain.
• Prevents all users assigned to the inactive company from logging in.

Note: When a user from an inactive company attempts to log in, the user sees an error message.

For example, if you deactivate the ACME domain from the sample data, the instance also deactivates the ACME company, and the three sample users are locked out.

Figure 750: Login error message example
Default domain scope
Administrators have access to properties and user preferences that control domain scope.

Properties

New activations of domain separation automatically restrict domain scope to the record’s domain for all processes. When the property is set to **true**, the record's domain is used for all process when the user is viewing any record from the form view. If the form has tabs, each tab is considered to have its own domain based on the record.

<table>
<thead>
<tr>
<th>Property</th>
<th>Details</th>
</tr>
</thead>
</table>
| glide.sys.domain.use_record_domain_for_processes | Restricts domain scope to the record's domain for all processes. This property does not apply to business rules. Business rules are always processed from the domain record.  
  - Type: true | false  
  - Default value: true  
  - Location: System Property [sys_properties] table |
| glide.sys.domain.use_record_domain_for_data   | Specifies what domain sets the view of data on a record. Options are to use the record's domain (true) or the user's domain (false). Instances on Fuji should always have this property value set to true.  
  - Type: true | false  
  - Default value: false |

When the glide.sys.domain.use_record_domain_for_processes property is set to **true**, the following properties are not used, regardless of their setting:

- glide.sys.domain.use_record_domain
- glide.sys.domain.use_record_domain_for_client_scripts
- glide.sys.domain.domain_change_notify
- glide.sys.domain.no_change_roles

User preferences

In addition, user administrators can set the following user preference globally or on a per-user basis:
## Table 614: Domain scope user preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Category</th>
<th>Updated By</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.domain.session_scope</td>
<td>Domain</td>
<td>Admin Only</td>
<td>When true, sets the default scope to the user's session domain rather than the record's domain. When false, the default scope is the record's domain. Users with the domain_expand_scope user role can still change the domain scope as needed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Default value</strong>: false</td>
</tr>
<tr>
<td>glide.domain.session_scope_notification</td>
<td></td>
<td>Admin Only</td>
<td>When true, displays a visual cue that record values include an expanded domain scope. When false, the notification is hidden.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Default value</strong>: true</td>
</tr>
</tbody>
</table>

### Add a user and a record to a domain

By default, all users and records are part of the global domain and are therefore accessible to all users.

Role required: admin

To use data separation and delegated administration, you must first assign users and their relevant records to one or more domains.

1. Personalize the list or form to add the Domain field.
2. Set the Domain field for the user or record.

For example, assign Bow Ruggeri to the Network domain. Assign Don Goodliffe to the Database domain. Add the Network and Database domains to relevant records such as incidents, configuration items, requests.
Make a domain the default
The default domain is the domain to which the system automatically assigns task and user records that are not already assigned to a domain.

Role required: admin

1. Navigate to **Domain Admin > Domains.**
2. Open the domain you want to be the default domain. For example, Default.
3. Configure the form layout to add the **Default** field.
4. Select the **Default** check box.
5. Click **Update.**
Tasks and users without a domain are placed in this domain when created/updated. This behavior can be overridden by:
1) Unchecking the Default field on this record, or
2) Checking the Default field on another Domain record.
If no domain is set as Default, Tasks and Users with no domain are placed in the global domain.

<table>
<thead>
<tr>
<th>Name:</th>
<th>Default:</th>
<th>Parent:</th>
<th>MSP</th>
</tr>
</thead>
<tbody>
<tr>

    - **New**
    - **Contains**
  - **Domain**
- **Contains By**
  - **New**
  - **Domain**
Manually manage the domain for particular records

By default, the system automatically assigns a domain based on the user's company record. In some cases, however, domain administrators want to manually manage which domain a particular record belongs to.

Role required: admin

The **Managed domain** field allows domain administrators to manually select a domain for the user, group, department, location, or CI record, rather than using the domain assigned automatically from the company record. The **Managed domain** field is available on these record types.

- User records
- Group records
- Department records
- Location records
- CI records

1. Navigate to the record you want to manually manage.
2. Select the **Managed** domain check box.
3. From the **Domain** field, select the domain for the record.
4. Click **Update**.
Clearing the Managed domain check box hides Domain field and the record uses the domain value from the record's company.

Provide a list of roles that ignore the domain of the current record

By default, all roles use the domain of the current record when Use the domain of the record being viewed instead of the user's own property is true.

Role required: admin

You can provide a list of roles that ignore this property and always use the user's domain rather than the record's domain. You may want certain roles such as administrators to always work from their own domain rather than use the domain of the record they are viewing.

1. Navigate to Domain Admin > Configuration.
2. For List of roles (comma-separated) that will not trigger the automatic change of domain to the domain of the record that is being viewed, enter a comma-separated list of roles that ignore automatic domain change behaviors.
3. Click Save.

Use a custom table for the domain table

You can use a custom table as the domain table if the custom table contains a reference field column called parent that refers back to the custom table.
Role required: admin

1. Create a custom table to store the domain information. For example:

<table>
<thead>
<tr>
<th>Table</th>
<th>Column name</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_organization</td>
<td>u_name</td>
<td>string</td>
<td></td>
</tr>
<tr>
<td>u_organization</td>
<td>u_description</td>
<td>string</td>
<td></td>
</tr>
<tr>
<td>u_organization</td>
<td>u_location</td>
<td>reference</td>
<td>cmn_location</td>
</tr>
</tbody>
</table>

2. Create a reference field within the custom table that refers back to the custom table. For example:

<table>
<thead>
<tr>
<th>Table</th>
<th>Column name</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_organization</td>
<td>parent</td>
<td>reference</td>
<td>u_organization</td>
</tr>
</tbody>
</table>

3. Select the custom the table from the list of tables in the New Domain Table list.
Installed with domain separation

Several types of components are installed with domain separation.

Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain_admin</td>
<td>Can create, edit, and delete domains.</td>
</tr>
</tbody>
</table>

Additions to [sys_domain] fields

The sys_domain field is added to the following tables:

Table 615: Tables with the sys_domain field

<table>
<thead>
<tr>
<th>Tables</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_attachment</td>
</tr>
<tr>
<td>sys_user_has_role</td>
</tr>

### Field for the Task Table

MSP Extensions add a task_for field to the Task table to support the New Ticket module. This reference field refers to the User table.

![Dictionary Entries](image)

**Figure 751: The task_for column on the Task table**

### Options for the Group Type

MSP Extensions add several new default options to the type field of the Group table. Add to or update these types as needed to support your domains.

Domain separation administration

Administrators can view information about domain separation, identify potential issues, and change configuration settings.

Validate the domain tree

By default, the instance validates the domain hierarchy every time you change the domain table, change the query method, or reset the records to the global domain.

Role required: admin

The Domain Progress Workers list displays any currently running domain tasks. Use the following procedure to manually start the validation process.

1. Navigate to Domain Admin > Configuration.
2. From Domain Validation, click More > Validate domains hierarchy.
3. After the validation process completes, review the Domain Alerts section for any renumbering or path conversion errors.

   The domain validation process automatically fixes some validation errors and provides information about errors that cannot be automatically fixed.
View the domain log

If the domain validation indicates errors, you can see the affected domain records by navigating to the Domain Log [syslog_domain] table.

Click a domain log record to see details.

</tbody>
</table>
View a list of tables using domain separation

You can view a list of all domain-separated tables from the Configuration module.

Role required: admin

1. Navigate to Domain Admin > Configuration.
2. From Domain Validation, click More > Show tables with Domain field.

Ignore data and proceed

When you set up domain separation, you can ignore data, which has an affect on domain visibility settings, overrides, and contains definitions.

Several changes occur when you select Ignore All Data and Proceed

- The domain table changes to the table you selected.
- All domain visibility settings (both user and group) are deleted.
- All existing records with a domain value refer to invalid domains until you migrate the domain data.
- All existing domain overrides refer to invalid domains until you migrate the domain data.
- All existing domain contains definitions refer to invalid domains until you migrate the domain data.

**Note:** Visibility settings are deleted whenever the domain table reference changes.

When you select the ignore option, no existing domain-separated tables are moved to the global domain, and it is your responsibility to migrate the domain records. Until the migration is complete, the domain validator will show warnings about inconsistent domain data. If necessary, you can manually reset all domain-separated tables to the global domain.

Reset all records to the global domain

You can manually reset all domain-separated records to the global domain at any time.

Role required: admin

**Warning:** The only way to recover resetting records to the global domain is to restore from a data back-up.

1. Navigate to Domain Admin > Configuration.
2. From Domain Validation, click More > Reset all records to Global.

Manually re-enable delegated administration

Delegated administration allows administrators in lower portions of the domain hierarchy to add domain-specific policies that override policies set higher in the domain hierarchy.

Role required: admin

By default, activating domain separation enables delegated administration. Use the following steps to manually re-enable delegated administration if it was previously disabled.

1. Navigate to Domain Admin > Configuration.
2. For Enable delegated administration, select the Yes check box.
3. Click Save.

Manually re-enable domain separation

Use the following steps to manually re-enable domain separation if it was previously disabled.
Role required: admin

1. Navigate to **Domain Admin > Configuration**.
2. Select the domain table. For example, to navigate to the Group \[sys_user_group\] table, click **User Administration > Groups**.
3. Select the domain query method. For example, **Switch to Domain Paths**.
4. For **Enable domain separation**, select the **Yes** check box.
5. Click **Save**.

**Disable and re-enable domain numbering**

Your instance maintains domain numbers even after you install domain paths so that you have to the option to switch back and forth between paths and numbers during a validation period.

Role required: admin

Since maintaining domain numbers requires additional overhead, disable numbers after you successfully test and validate the domain paths query method.

---

**Note:** Domain numbers are no longer supported.

To disable domain numbering updates, add the system property `glide.sys.domain.numbers.installed` and set it to `false`. This property prevents the instance from making any further updates to the `sys_domain_number` and `sys_domain_increment` fields.

You can re-enable the domain numbering if you must revert query methods for any reason.

1. Navigate to **Domain Admin > Configuration**.
2. From **Query Method**, click **More > Show tables with Domain field**.
3. Click **OK** to confirm the selection.

**Troubleshoot domain separation problems**

You can use the following information to troubleshoot problems with domain separation.

Role required: admin

1. Navigate to **Domain Admin > Configuration**.
2. For **Enable verbose domain logging**, select the **Yes** check box.
3. Click **Save**.

**Enable domain logging and debug messages**

Domain log and debug messages allow you to troubleshoot domain configuration errors.

Role required: admin

1. Navigate to **Domain Admin > Configuration**.
2. For **Enable verbose domain logging**, select the **Yes** check box.
3. Click **Save**.

View a real-time domain message

You can view real-time domain messages from the system logs.

Role required: admin

1. Enable verbose domain logging.
2. Navigate to **System Diagnostics > Session Debug > Enable All**. Because this is a real time review, there is no need to let the debug session run for a time before checking the log files.
3. Navigate to **System Logs > System Log > All.**
4. Search for the text Query against table.

This query finds log messages in this format:

```
08:36:43.974: [Domain Spool] Query against table incident restricted by domain values [Database Atlanta[db53580b0a0a0a6501aa37c294a2ba6b], Database[287ee6f6a919fe198100ada7950d0b1b73], Database San Diego[db53a9290a0a650091abebeccf833c6], global, NY DB[5f74727dc0a8010e01efe33a29193f9]]
```

In this example, the user viewing the Incident table only saw records that matched the Database Atlanta, Database, Database San Diego, global, and NY DB domains.

View a historical domain message

You can view historical domain messages in the log file to troubleshoot domain separation issues.

Role required: admin

1. Enable verbose domain logging.
2. Navigate to **System Diagnostics > Session Debug > Enable All.**
3. Let the debug session run for a time period, such as a day, before checking the log files.
4. Navigate to **System Logs > Utilities > Node Log File Download.**
5. Open the record for the day you want to view. Log files use the naming format `localhost_log.<yyy-mm-dd>.txt`.
6. Click the Download log related link.
7. Open the downloaded log file in a text editor and search for log messages with the following format:

```
Query against table incident restricted by domain values [global, Software[8a4dde73c6112278017a6a4baf547aa7]]
```

In this example, a user only saw records from the Incident table that matched the global and Software domains.

View domain relationships

The domain map offers domain administrators a read-only representation of the active domains on the instance and how they relate to each other.

Role required: admin

All domain maps must have one domain set as the primary domain. In addition, each domain in the domain map must meet these criteria:

- The **Parent** field must be filled in (the primary domain is the only exception to this).
- The **Active** check box must be selected.

The domain map does not draw domain relationships for domains that fail to meet the mapping criteria.

1. Navigate to **Domain Admin > Domain Map.**
2. Click the plus (+) or minus (-) icons on the domain headers to show or hide sub domains.

**Troubleshoot domain separation errors**

If you encounter domain separation issues, review this list of solutions.
<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
</table>
| A domain sys_id points to a non-existent domain      | This error occurs when a data record, such as a user or task record, has a sys_domain column value whose sys_id does not exist in the current domain table. The domain sys_id could have been accidentally deleted or it could refer to a previous domain table if you changed the domain table. To fix the error, open a list for the table containing the error, filter on the invalid sys_domain value. Then, either manually enter the correct sys_domain value or remove it.  
  **Note:** You can have invalid domain sys_ids in any table that references the domain table. For example, invalid domain IDs can occur in the User Visibility Domain [sys_user_visibility], Group Visibility Domain [sys_user_group_visibility], and Contained Domain [domain_contains] tables. |
| A domain path or domain number sys_id points to the wrong domain | This error occurs when a domain number or domain path query is out of sync with the actual domain name. This error can occur with domain numbers when adding domains requires renumbering or during the conversion from domain numbers to domain paths. To fix the error, validate the domain tree and let the background conversion process run to completion. If the error persists, you can manually edit the value for the sys_domain_path or sys_domain_number columns to point to the proper domain. |
| The domain tree structure is corrupt                 | This error occurs if there is a series of domain contains relationships that create an infinite loop among domains. To fix the error, open a list for the domain table and manually edit the domain contains values to not form a loop. |

**ServiceNow Edge Encryption**

With Edge Encryption, you can control and possess all encryption keys for encrypted data.

Edge Encryption is a proxy application that resides in your network and encrypts data before the data is sent over the Internet to your instance (encrypted in motion). The data remains encrypted while stored in the instance (encrypted at rest). The encrypted data is sent back to the proxy application (encrypted in...
motion) when requested. Finally, the encrypted data is decrypted by the proxy before being sent to the client in your network.

Your security administrator specifies which fields are to be encrypted. AES 128 or AES 256 encryption algorithms can be used. Attachments can be encrypted on a table by table basis.

Depending on the encryption type chosen for a field, certain levels of UI filtering, sorting, or compare functionality can be preserved.

![Edge Encryption Diagram]

**Figure 753: Edge Encryption**

You own and manage the encryption keys. Encryption keys are never sent to the instance. ServiceNow never possesses the clear data and cannot see it. Three key storage mechanisms are supported: file store, Java KeyStore, and SafeNet. The Edge Encryption proxy obtains encryption keys from one of the key stores to encrypt and decrypt data.

**Edge Encryption limitations**

Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

**Field type restrictions**

Restrictions on encrypting field types.

- Only string fields can be encrypted. Choice fields, virtual fields, journal fields, and any fields other than string fields cannot be encrypted. See **Field types** on page 777 for more information.
- Fields in system tables, except for certain fields in sys_user, cannot be encrypted.
- System fields in tables cannot be encrypted.
- Fields named "number" and fields associated with an auto-numbering scheme cannot be encrypted.
- Encrypted fields are not available in **Go to** and header filter boxes.
- When encrypting fields used as an index, only order preserving and equality preserving encryption types can be used. Indexed fields cannot be encrypted using the standard encryption type.
Configuration restrictions

Restrictions and behavior of encryption configurations.

• After a field has been added to the Edge Encryption Configuration table, the configuration record cannot be deleted. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table, and schedule an encryption job to decrypt the data.

• If a field in a parent table is marked to be encrypted, the field in all inherited tables is also encrypted. For example, if the short description field in the Task table is encrypted, then the contents of the short description field in the Incident table are encrypted.

• If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if short description in the Incident table is marked to be encrypted, then short description in the Task table cannot be encrypted. In the example, you can encrypt the short description in the Problem table.

• When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server. Importing data to a field with an encryption configuration defined is not supported.

Instance restrictions

Impact of using Edge Encryption on the instance.

• Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

• Scripts run on the server cannot change encrypted data.

• Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be what the user expects.

• Encrypted data cannot be copied to a record where the field is not encrypted.

• Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.

• Other than file store, Java KeyStore, and SafeNet, no third-party software, or hardware encryption key management is supported.

• While multiple encryption proxies connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.

• System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.

• The Edge Encryption proxy server can only connect to a single instance

• If your instance uses an Oracle database and the string field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.

• If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.

• Encrypted values included in emails are encrypted.

Getting started with Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation.

Answer the following questions in the planning stage.

• Which fields are to be encrypted?

• Which encryption types are to be used?

• How many Edge Encryption proxies are needed?
• If an order preserving encryption type is to be used, where will the MySQL instance be located?
• Which key management system is to be used?
• How are browsers to be set up to access an Edge Encryption proxy?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

• System administrators need the security-admin role. The system administrator needs to:
  • Download the Edge Encryption proxy application.
  • Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  • Configure Edge Encryption on the instance.
  • Schedule encryption jobs.
  • Monitor Edge Encryption.
  • Create and edit encryption rules.

• Your network administrator needs to:
  • Install the Edge Encryption proxy application.
  • Know network addresses for proxy servers, and the database server used with order-preserving encryption.
  • Install the database to be used with order-preserving encryption.
  • Start and stop the proxy applications.
  • Perform encryption key management.
  • Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
  • Deal with the issues of using multiple encryption proxy applications.

• Your security administrator must determine the encryption types to be assigned to each field.

Edge Encryption application and proxy

Edge Encryption has these components: the Edge Encryption applications installed via a plugin and the Edge Encryption proxy which can be downloaded from one of the menu options from the Edge Encryption application.

Use the Edge Encryption application to specify which fields and attachments are encrypted, manage encryption rules, and schedule mass encryption jobs.

The Edge Encryption proxy uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy. This includes any requests originating from a browser, as well as any SOAP and REST requests.

Encryption types

Edge Encryption provides a variety of encryption types. For each encryption type, it provides support for AES with 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, it also provides support for 256-bit encryption keys for each of the encryption types.

The following encryption types are listed in decreasing security quality.
Table 616: Encryption types

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

When using standard encryption, the encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

When using equality preserving encryption, the encrypted value of a field is the same when the field value remains the same. When a field is encrypted using equality preserving encryption, it is possible to perform equality comparisons and group by operations on that field.

**Note:** When equality preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group together fields with the same value if one is encrypted and the other is not.

When a field is encrypted using order preserving encryption, in addition to supporting all the features supported by equality preserving, it also supports the ability to sort data in the field. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption Proxy.

**Note:** When using order preserving encryption and the proxy database is down, updates can be made to fields using order preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Group by will also not work as expected. When the database is again operational, schedule an order token repair job to repair missing tokens.

Encrypted attachments

You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:

- On a record with attachment encryption enabled:
  - The user can see that there are attachments and the attachment names.
  - The user cannot open or download the attachments.
  - The user cannot add new attachments.
On a record without attachment encryption enabled:
- The user can open and download existing attachments.
- The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

Key management

You are responsible for providing and managing the encryption keys used by Edge Encryption.

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, you should consider the following:
- Whether to use AES 128 or AES 256. You must define a default AES 128 encryption key even if it is not used.
- Whether to use file store, Java KeyStore, or NAE.
- When to rotate encryption keys.
- When and if to use a mass encryption job to re-encrypt data using the new key.

Each key is defined by a set of properties. These properties must be the same in every proxy configuration file. When adding a new key, also add the set of properties to each proxy configuration file. Removing the set of properties also removes the key from use. Before removing a key from the proxy configuration files and the key store, decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a single key rotation job.

A number is appended to the property to make the property unique. For example, edgeencryption.encrypter.type.1. The group of properties for a key must have the same number appended.

Key store management

Encryption keys must be stored in one or more encryption key stores.

Edge Encryption supports the following types of key storage mechanisms.

- **File system**: Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted so it is your responsibility to protect these files.
- **Java KeyStore**: Keys are stored in Java's JCEKS keystore. A Java Keystore is protected by a password so it is more secure than storing keys in a file in the file system. A single Java Keystore can store multiple keys and the keys are identified by a key alias, making it easier to manage multiple keys.
- **NAE (Network Attached Encryption) key store**: Keys are stored and retrieved with SafeNet's KeySecure key management.

The Edge Encryption proxy ships with the Java JCEKS Keystore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow certificate used to validate encryption rules that have been signed by ServiceNow.

**Note**: If using a keystore other than the base system JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

In addition to the encryption keys, the Java JCEKS Keystore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.
Request Edge Encryption

The Edge Encryption plugin is available as a separate subscription.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager will arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

Edge Encryption proxy installation

Install one or more Edge Encryption proxy applications on your network.

Installing a Edge Encryption proxy includes these steps.

- Install the Edge Encryption proxy application on a server in your network.
- Generate the RSA key pair for digitally signing encryption configurations and encryption rules.
- Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.
- If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore key store.
- If order preserving encryption types are to be used, set up a MySQL database instance on a machine in your network.
- Set up the `edgeencryption.properties` configuration file.
- Set up each user’s browser to point to an Edge Encryption proxy.
Accessing the proxy server

Once installation is complete, point each user’s browser to an Edge Encryption proxy using the URL format: `<host>:<port>`. Values are determined by the host and port properties in the `edgeencryption.properties` file. See Configure the proxy properties on page 2651.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>hostname.mycompany.com</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>8081</td>
</tr>
</tbody>
</table>

A client will access the proxy server using the following address: `http://hostname.mycompany.com:8081/`.

**Note:** DNS settings and routing rules may be used. Host and port values are determined by your network administrator.

Edge Encryption system requirements

The Edge Encryption proxy application can run on servers or virtual machines running Windows or Linux.

The Edge Encryption proxy distribution comes with JRE 1.8. Out of the box, the Edge Encryption proxy uses the JRE bundled with the distribution. You can change this by modifying the `wrapper.conf` file in the `<installation dir>/conf` directory.

Proxy server minimum configuration

The minimum configuration includes:

- A minimum of 4 GB of available RAM per proxy server (6 GB is recommended for most deployments).

  **Note:** The host machine running the proxy server must have at least 1 more GB of RAM available for OS services than is needed to run the proxy server. Specifically, if a proxy server is set to use 4 GB of RAM, the VM or hardware must have at least 5 GB of RAM installed.

- 3+ GHz CPU, with a 4-core CPU preferred.
- Multiple proxy servers behind a load balancer. The number of proxy servers will depend on the number of application nodes, number of simultaneous users, and failover needs. See Sizing your Edge Encryption environment on page 2646 for considerations.
- Ability to ride-along with other services, depending on the server utilization and resource availability.

Proxy server supported systems

The following systems are supported.

- Windows Server
  - All Windows Server 2012-R2 editions or later
  - Virtual machines or physical hardware
  - 32-bit and 64-bit systems
- Linux
• Virtual machines or physical hardware
• 32-bit and 64-bit systems

**Note:** Because the proxy server requires access to at least 4 GB of RAM, a 64-bit operating system and JVM is recommended.

On 64-bit Linux systems, you must install the 32-bit *GNU C library* (glibc). The installation command for CentOS is: `yum install glibc.i686`

**Proxy database minimum configuration**

Order preserving encryption requires a MySQL database configured for the Edge Encryption proxy server. Use a dedicated machine to run the proxy database. The minimum requirements include:

- **Version:** MySQL database versions 5.5 and higher
- **OS:** 64-bit systems
- **CPU:** 2+ GHz CPU, with a 4-core CPU preferred
- **RAM:** 16 GB
- **Disk:** SAN or local storage (RAID 10 recommended)
- **Size:** Determined by the number of potential records multiplied by record size. *Calculate the proxy database size* on page 2647.
- **Configuration:** High Availability cluster. If you are unsure of how to configure your MySQL server, contact MySQL for configuration information.

*Sizing your Edge Encryption environment*

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

**Redundancy**

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

**Size**

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.
For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.

**Load balancers**

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

**CPU utilization**

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

**Memory**

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.

*Calculate the proxy database size*

If using order-preserving encryption, determine the size of your MySQL database by multiplying the number of potential records by record size.

**Note:** Use a dedicated machine to run the proxy database. Do not run the database on the same hardware as the proxy server.

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a) Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b) To allow for growth, multiply the result by three.

2. Multiply the result of step 1 by 1,536.
   1,536 is the average size of a record in bytes.

The calculated value is the recommended size in bytes for your proxy database.

**Encryption proxy connection requirements**

The proxy server that will run the Edge Encryption application must be able to communicate with machines in your network.

Make sure that the proxy server has these network privileges:

- **Firewall access:** Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.
- **Network access**: Configure each client to let the proxy server connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.

- **Network account**: Install the proxy server with the proper account, either local or domain administrator.

Additionally, for the proxy server to access your instance:

- Ensure network access to the instance. Make sure that the network used by the proxy server is configured to allow traffic over TCP port 443.

---

**Download the Edge Encryption proxy application**

Download the Edge Encryption proxy application from your instance, and then copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

Role required: security-admin

1. Navigate to **Encryption Configuration > Installation & Downloads > Downloads**.
2. Select the OS version for your proxy server.
3. Copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

---

**Install the encryption proxy on Linux**

You can install an Edge Encryption proxy on a 32-bit or 64-bit Linux computer.

1. Create the installation directory.
2. Copy the Edge Encryption archive file to the installation directory.
3. Change to the installation directory.
4. Run the following command:

   ```bash
   java -jar edgeencryption-dist-<version>-linux-x86-64.zip -m install -n <ProxyName> -h <host> -p <port> -proto https
   ```

**Table 617:**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version number of the Edge Encryption release.</td>
</tr>
<tr>
<td>ProxyName</td>
<td>The name of the encryption proxy instance.</td>
</tr>
<tr>
<td>host</td>
<td>Your instance.</td>
</tr>
<tr>
<td>port</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments:

```bash
java -jar edgeencryption-dist-<version>-linux-x86-64.zip
```

The **ProxyName_port** directory is created in the current directory. The **edgeencryption.properties** file is updated with the host, port, and protocol values from the command line.
Install the encryption proxy on Windows

You can install an Edge Encryption proxy on a 32-bit or 64-bit Windows computer.

1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Start the Windows cmd terminal program with administrator privileges.
4. Change to the installation directory.
5. Run the following command:

```
java -jar edgeencryption-dist-<version>-windows-x86-64.zip -m install -n <ProxyName> -h <host> -p <port> -proto https
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version number of the Edge Encryption release.</td>
</tr>
<tr>
<td>ProxyName</td>
<td>The name of the encryption proxy instance.</td>
</tr>
<tr>
<td>host</td>
<td>Your instance.</td>
</tr>
<tr>
<td>port</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-windows-x86-64.zip`

6. Optionally change the name of the service.

**Caution:** You must perform this step before running the install command on Windows. See Start the Edge Encryption proxy on page 2667.

If this step is not performed, the Edge Encryption proxy service installs under the name Wrapper.

a) Open the `conf/wrapper.conf` file on the new proxy and add the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

b) Save and close the file.

The `ProxyName_port` directory is created in the current directory. The `edgeencryption.properties` file is updated with the host, port, and protocol values from the command line.

Configure the target properties

In the `edgeencryption.properties` file, specify which instance the Edge Encryption proxy will communicate with. These values are initially set when the proxy application is installed.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Enter the following target properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.host</td>
<td>The host name for the instance. It must be the same for all encryption proxies. This property is set when the proxy is installed. For example, <code>instancename.service-now.com</code></td>
</tr>
<tr>
<td>edgeencryption.target.port</td>
<td>The instance port. It must be the same for all encryption proxies. This property is set when the proxy is installed.</td>
</tr>
<tr>
<td>edgeencryption.target.protocol</td>
<td>The instance protocol. It must be the same for all encryption proxies. This property is set when the proxy is installed.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.

Set up an Edge Encryption user account

The Edge Encryption proxies connect to the instance as a user, in order to obtain and update encryption configuration information. Create a user account for this purpose and give the `edge_encryption` role to the user.

The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the `edge_encryption` role to the user.
3. On each proxy, update the `edgeencryption.properties` file with the properties for the user account.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the user account.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.username</td>
<td>The user name that the proxy uses to log in to the instance. The user must have the <code>edge_encryption</code> role.</td>
</tr>
<tr>
<td>edgeencryption.target.password</td>
<td>The password that the proxy uses to log in to the instance.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.
Configure the proxy properties

In the `edgeencryption.properties` file, you can specify how the Edge Encryption proxy will communicate with your ServiceNow instance.

**Note:** If you are copying an `edgeencryption.properties` file from one proxy to another, verify that the name property is unique.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Enter the proxy properties.

**Table 620: Proxy properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.name</code></td>
<td>Name of the proxy. It must be unique for each proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.port</code></td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.

Configure web proxy properties

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy. This feature is available in Geneva Patch 5 and subsequent releases.

If your network does not use a web proxy, leave these configuration parameters commented out.

The Edge Encryption proxy supports HTTP connection to and basic authentication with the web proxy.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Enter the proxy properties.

**Table 621: Proxy properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.webproxy.host</code></td>
<td>Can be the web-proxy's name or its IP address.</td>
</tr>
<tr>
<td><code>edgeencryption.webproxy.port</code></td>
<td>Port on the web proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.webproxy.user</code></td>
<td>User name to be used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>edgeencryption.webproxy.password</td>
<td>Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.

5. If the web proxy requires a customer-specific client certificate, add the certificate to the Edge proxy Java truststore at `<installation directory>/java/jre/lib/security/cacerts`.
   
   To import a certificate to the truststore, execute the command:
   
   ```bash
   keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>
   ```

Install the Java Cryptography Extension (JCE)

If you want to use AES 256 encryption, you must install the Java Cryptography Extension (JCE) jurisdiction policy files and copy them into each Edge Encryption proxy.

Edge Encryption ships with the AES 128 policy files, which you must overwrite with the AES 256 policy files. It is only necessary to download the JCE once, but every Edge Encryption proxy must be updated.

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server, copy the `local_policy.jar` and `US_export_policy.jar` files into the `<proxy-dir>/java/jre/lib/security` folder.

Create and configure the RSA key pair for the digital signature

Create an RSA key pair that the proxy can use to create the digital signature for signing changes to the encryption properties and configuration.

To generate and validate the digital signature, an RSA key pair must generated and stored in a JCEKS Java KeyStore and each proxy must be configured to use this key pair. You generate an encryption key pair by using the `keytool` command.

If the proxy was installed on SElinux (e.g. CentOS), to use the `keytool` utility you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.

```bash
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the `keytool` utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.
   
   The default password is `changeme`.
   
   ```bash
   keytool -keystore keystore.jceks -storetype jceks -storepasswd -new <new password>
   ```
3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the `keytool` utility prompts for one.
Enter this command on a single line.

```
keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
```

4. Update the encryption proxy property file (`edgeencryption.properties`).
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the digital signature.
      These properties must be the same for all proxies.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.signature.keystore.path</code></td>
<td>Path and Java KeyStore file name.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.signature.keystore.password</code></td>
<td>Password. The default password is <code>changeme</code>. Change the password after installing the Java KeyStore.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.signature.keystore.keyalias</code></td>
<td>Key alias given in as the <code>-alias</code> argument when the RSA key pair was generated.</td>
</tr>
</tbody>
</table>

5. Save and close the `edgeencryption.properties` file.

Import and configure the certificate for secure SSL connection

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

You must obtain the server certificate before you can add it to the Java KeyStore.

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java Keystore and generated the certificate from that key.</td>
<td><code>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</code></td>
</tr>
<tr>
<td>If you have a PKCS12 file that contains the RSA key and the certificate.</td>
<td><code>keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srcstoretype pkcs12</code></td>
</tr>
</tbody>
</table>

Make sure the private key password is the same as the Java Keystore password.

You can run this command to change the password.

```
keytool -keypasswd -keystore keystore.jceks -alias <key alias>
```
For testing, you can use this command to generate a self-signed certificate.

```
keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa
```

2. Update the `edgeencryption.properties` file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the SSL certificate.

   The certificate must be the same for all proxies.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.https.cert.alias</code></td>
<td>Alias of the certificate.</td>
</tr>
</tbody>
</table>

3. Save and close the `edgeencryption.properties` file.

Configure encryption keys using SafeNet KeySecure

If you are using a SafeNet key store, copy a set of libraries into the proxy distribution directory.

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

**Note:** On Linux, the file paths use a forward slash.

1. Copy these files to `<installation directory>/lib` directory:
   - `ingrian-nae-8.2.0.000.jar`
   - `ingrian-log4j-api-2.0-rc1.jar`
   - `ingrian-log4j-core-2.0-rc1.jar`

2. Change to the `<installation directory>/conf/` directory, and open the `edgeencryption.properties` file.

3. Enter the properties for the SafeNet key store.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.nae.retries</code></td>
<td>Number of retries to make.</td>
</tr>
<tr>
<td><code>edgeencryption.nae.enabled</code></td>
<td>If an NAE device is available.</td>
</tr>
<tr>
<td><code>edgeencryption.nae.server</code></td>
<td>Name of the NAE server.</td>
</tr>
<tr>
<td><code>edgeencryption.nae.port</code></td>
<td>Port used by the NAE server.</td>
</tr>
<tr>
<td><code>edgeencryption.nae.protocol</code></td>
<td>Protocol used by the NAE server.</td>
</tr>
<tr>
<td><code>edgeencryption.nae.keystore.path</code></td>
<td>Path to the key store on the NAE server.</td>
</tr>
<tr>
<td><code>edgeencryption.nae.keystore.password</code></td>
<td>NAE key store password.</td>
</tr>
</tbody>
</table>
An example for a SafeNet key store.

```plaintext
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_truststore
edgeencryption.nae.keystore.password = keystore password
edgeencryption.encrypter.nae.user.1 = nae.user.com
edgeencryption.encrypter.nae.password.1 = <ChangeMe>
```

4. For each encryption key stored in a SafeNet key store, enter the properties for the encryption key.

You will have this set of properties for each encryption key stored in a NAE key store. A number is appended to each property to make the properties unique. For example, `edgeencryption.encrypter.type.3`.

**Table 625: Properties for encryption keys stored in a NAE device**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.encrypter.type</td>
<td>Defines a type of key store system. This property is specified for each key. Value is <code>nae</code>.</td>
</tr>
<tr>
<td>edgeencryption.encrypter.key</td>
<td>Specifies the key name. This property is specified for each key. This name is used to specify the default keys. This is the key alias included as part of the metadata included with each encrypted item, which means that it is stored on the instance.</td>
</tr>
</tbody>
</table>

An example for an encryption key stored in a SafeNet key store.

```plaintext
edgeencryption.encrypter.type.3 = nae
edgeencryption.encrypter.key.3 = naekey128
```

5. Save and close the `edgeencryption.properties` file.

Create and configure encryption keys using Java KeyStore

You can use the keytool shipped with the encryption proxy distribution to create AES 128 and AES 256 encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

To find out more about the keytool utility, see the [Java SE Documentation](https://docs.oracle.com/javase/8/docs/technotes/guides/security/StandardNames.html#keytool).
1. Change to the key store directory, `<installation directory>/keystore/`.

2. To create the encryption key, run one of the following commands.

   **Note:** If you choose to run these commands from a directory other than the key store directory, that is you skipped the previous step, you must change the `-keystore` option to include the path from your current directory to the key store directory. For example, if you were in the `<installation directory>/bin` directory, the option would be `-keystore ../keystore/keystore.jceks`.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td><code>keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks</code></td>
</tr>
<tr>
<td>AES 256</td>
<td><code>keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks</code></td>
</tr>
</tbody>
</table>

3. For each encryption key stored in a Java KeyStore key store, enter the properties for the encryption key.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the encryption key.

   You will have this set of properties for each encryption key stored in a Java KeyStore key store. A number is appended to each property to make the properties unique. For example, `edgeencryption.encrypter.type.2`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.encrypter.type</code></td>
<td>Defines a type of key store system. This property is specified for each key. Value is keystore.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.key</code></td>
<td>Specifies the key name. This property is specified for each key. This name is used to specify the default keys. This is the key alias included as part of the metadata included with each encrypted item, which means that it is stored on the instance. The key name must use lowercase letters.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.password</code></td>
<td>Specifies the password for accessing the key store.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.keystore.path</code></td>
<td>Specifies the URL of the KeyStore.</td>
</tr>
</tbody>
</table>
An example for a Java KeyStore key store.

```plaintext
edgeencryption.encrypter.type.2 = keystore
edgeencryption.encrypter.file.2 = keystore/keystore.jceks
edgeencryption.encrypter.password.2 = password
edgeencryption.encrypter.key.2 = keyalias
```

4. Save and close the `edgeencryption.properties` file.

Create and configure an encryption key stored in a file

You can use a file as a key store. Each file holds a single encryption key.

You must create the encryption key separately. The files must be in the `<installation directory>/conf` directory.

1. Create a file store.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

2. Update the `edgeencryption.properties` file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the file store.

You will have this set of properties for each encryption key stored in a file. A number is appended to each property to make the properties unique. For example, `edgeencryption.encrypter.type.1`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.encrypter.type</code></td>
<td>Defines the type of key store system. This property is specified for each key. Value is file.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.file</code></td>
<td>Specifies the path and file name of the key's text file on the proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.key</code></td>
<td>Specifies the key name. This property is specified for each key. This name is used to specify the default keys. This is the key alias included as part of the metadata included with each encrypted item, which means that it is stored on the instance.</td>
</tr>
</tbody>
</table>

An example for a file system key store.

```plaintext
edgeencryption.encrypter.type = file
edgeencryption.encrypter.file = conf/mykey.txt
```
Configure the default encryption key properties

The encryption key default properties specify the keys that are to be used for the different encryption types. All AES 128 encryption types use the encryption key specified by the `edgeencryption.encrypter.default.key128` property. All AES 256 encryption types use the encryption key specified by the `edgeencryption.encrypter.default.key256` property.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Enter the encryption key default assignments.

**Table 628: Properties for the encryption keys being used**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.encrypter.default.key128</code></td>
<td>Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.</td>
</tr>
<tr>
<td><code>edgeencryption.encrypter.default.key256</code></td>
<td>Specifies the name of the current AES 256 key. Must be the same for all proxies.</td>
</tr>
</tbody>
</table>

**Note:** If you do not plan to use AES 256 encryption, remove this property from the configuration file.

4. Save and close the `edgeencryption.properties` file.

Set up password encryption

You can encrypt passwords in the `edgeencryption.properties` file.

Encrypting passwords in the `edgeencryption.properties` file is good for security, but makes it difficult to debug connection and access issues during initial start up. Make sure that the encryption proxy is set up and running before you set this property. Always set this property in production environments.

1. Change to the `<installation directory>/conf/` directory.
2. In the `conf` directory, create a text file that contains the password you want to use to encrypt the passwords in the `edgeencryption.properties` file.
3. Open the `edgeencryption.properties` file.
4. Enter the password property.
Table 629: Password property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.encrypter.properties.password</td>
<td>Name of the file in the conf folder that contains the clear text password or phrase used to encrypt passwords in the edgeencryption.properties file. If this property is not set, the passwords are not encrypted. Leave this property blank until after the proxy configuration has been set up and tested.</td>
</tr>
</tbody>
</table>

5. Save and close the `edgeencryption.properties` file.

Set the clear text and IV properties

Set the clear text and IV (initialization vector) properties during the initial installation. Make sure that these properties are the same for all proxies.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Replace the default values for these proxy properties with values that are unique for your installation.

Table 630: General encryption properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.customer.assigned.known.cleartext</td>
<td>Clear text to let the instance verify that all proxies are using the same keys. At start up, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.encrypter.static.iv</td>
<td>The static IV (initialization vector) to be used in equality preserving and order preserving encryption. This property must be the same for all proxies, and it must be exactly 16 bytes (e.g. 16 ASCII characters.)</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.

Lock the proxy configuration

If you want to prevent encryption configuration changes to the proxy in production, set the proxy locked property.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Set the proxy locked property.
Table 631: Proxy configuration locked property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.locked</td>
<td>When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Use this on the production instance after all fields and tables that are to be encrypted have been configured.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.

Configure the order preserving database properties

If you are using an order preserving encryption type, you must set the Edge Encryption proxy properties for the order preserving database.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Enter the properties for the order preserving database.

Table 632: Order preserving database properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.db.url</td>
<td>Location of the database used to support order preserving encryption types. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.db.user</td>
<td>User name for accessing the order preserving database. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.db.password</td>
<td>The password for accessing the order preserving database. The default is blank. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.db.name</td>
<td>The name of the database used to support order preserving encryption types. Must be the same for all proxies.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> <code>edgeencryption</code></td>
</tr>
<tr>
<td>edgeencryption.db.bootstrap.file</td>
<td>The bootstrap file for the order preserving database. The file is relative to the <code>sql/</code> directory. Must be the same for all proxies. This parameter should not be changed under normal circumstances.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.
Set the proxy server initial and upper bound memory limits

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). The initial and upper bound memory limits determine how much memory the proxy server can consume.

1. In your proxy server directory, open `<install dir>/conf/wrapper.conf`.
2. Set the proxy server’s initial memory limit.
   a) Locate the line: `#wrapper.java.initmemory=3`.
   b) Replace it with: `wrapper.java.initmemory=6144`.
3. Optionally set the upper bound memory limit.
   Because an upper bound memory limit is not set in the base system, the proxy server may utilize all available memory. If other services are running on the server, you may want to set the upper bound memory limit.
   a) Locate the line: `wrapper.java.maxmemory=<max_memory_specified_in_MB>`.
   b) Set the max memory to the desired number.
4. Save and close the file.

Edge Encryption general properties

The proxy configuration file contains properties that should not be changed under normal circumstances. Generally, these properties should not be changed.

Table 633: Proxy configuration properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.config.poll.interval</code></td>
<td>The poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.</td>
</tr>
<tr>
<td><strong>Note:</strong> Do not change this property.</td>
<td></td>
</tr>
<tr>
<td><code>edgeencryption.rules.dir</code></td>
<td>Folder where the encryption rules are stored on the proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.encryption.order_preserving.cache</code></td>
<td>Whether caching is used to support order preserving encryption types.</td>
</tr>
<tr>
<td><code>edgeencryption.encryption.order_preserving.cache</code></td>
<td>Maximum cache size, in bytes.</td>
</tr>
<tr>
<td><code>edgeencryption.jobs.concurrency</code></td>
<td>Maximum number of mass encryption jobs that can run concurrently on this proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.jobs.requests_per_second</code></td>
<td>Number of http job requests per second that can be sent to the instance by this proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.attachments.request.timeout.seconds</code></td>
<td>Attachment upload request timeout in seconds.</td>
</tr>
<tr>
<td><code>edgeencryption.request.buffer.size</code></td>
<td>If an encryption request is larger than this size, the excess is saved to disk. You should not change this number.</td>
</tr>
</tbody>
</table>
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.register.retry.count</code></td>
<td>Maximum number of times the proxy will ping the instance to try to register. The default is 0 (no limit).</td>
</tr>
</tbody>
</table>

---

**Add an additional proxy on Linux**

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on Linux.

**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules.

1. Install the proxy using the command for Linux. See *Install the encryption proxy on Linux* on page 2648.
2. Copy all the encryption keys and the `edgeencryption.properties` file from the first proxy to the new proxy.
   
   Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.
3. Open the `edgeencryption.properties` file on the new proxy.
4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.name</code></td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy. Do not change this property if installing the proxy server on the same machine the properties file was copied from.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.port</code></td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. Save and close the file.
6. Launch the proxy using the appropriate command. See *Start the Edge Encryption proxy* on page 2667.

---

**Add an additional proxy on Windows**

After the first Edge Encryption proxy is configured, you can set up additional proxies on Windows.
**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules.

1. Install the proxy using the command for Windows. See *Install the encryption proxy on Windows* on page 2649

2. Copy the encryption keys and the `edgeencryption.properties` file from the first proxy to the new proxy.

   Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.

3. Open the `edgeencryption.properties` file on the new proxy and change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.name</code></td>
<td>Unique name of the proxy server.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td>The server name, IP address, or fully qualified domain name of the computer running the proxy. Do not change this property if installing the proxy server on the same machine the properties file was copied from.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td>Port on the proxy for HTTP communication. Must be unique across processes on the machine.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.port</code></td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

4. **Caution:** You must perform this step before launching the proxy server.

   Open the `conf/wrapper.conf` file on the new proxy and add the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wrapper.ntservice.name</code></td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td><code>wrapper.ntservice.displayname</code></td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td><code>wrapper.ntservice.description (Optional)</code></td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

5. Save and close the file.

6. Launch the proxy using the appropriate command. See *Start the Edge Encryption proxy* on page 2667.

**Edge Encryption ODBC driver integration**

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.
Import a self-signed certificate to the ODBC truststore

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
      ```
      keytool -list -keystore keystore.jceks -storetype jceks -v
      ```
   b) Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```
4. Change to your ODBC truststore directory: `ODBC\ip\Java\jre\lib\security\cacerts`.
5. Import the certificate to your ODBC truststore.
   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

Set the ODBC driver properties

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC Management Console.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the DataSourceIPProperties attribute.
4. Change the Value to the URL of your Edge Encryption proxy server, such as https://<IP address>:<port>
5. Click OK.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

**Edge Encryption MID Server integration**

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server's endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

**Limitations when integrating with the MID Server**

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- While string fields in an ECC Queue record can be encrypted, the Edge Encryption proxy server cannot encrypt values within the structured data in the ECC Queue payload field. Alternatively, the entire ECC Queue payload field can be encrypted, or the MID Server can use REST calls or other MID Server capabilities to pass values marked for encryption to the Edge Encryption proxy server.
- Encrypted data cannot be used with Discovery or Service Mapping.

**Point the MID Server to the Edge Encryption proxy server**

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.

1. Navigate to your local MID Server directory and open the `config.xml` file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, `http://hostname.mycompany.com:8081`.
   - This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

**Start the Edge Encryption proxy**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The `edgeencryption.properties` file on this machine has been configured.
- If using an order preserving encryption type, the order preserving database is running.
Note: The first time you set up the `edgeencryption.properties` file or change properties, you may want not to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| On a Linux machine | 1. cd to ServerName_port  
                     2. Execute ./startup.sh |
| On a Windows machine | 1. cd to ServerName_port/bin  
                        2. Execute edgeencryption.bat install  
                        3. Execute edgeencryption.bat start |

2. Check the log on the proxy server to verify that the proxy is running.

Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

1. Stop the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute ./shutdown.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute edgeencryption.bat stop</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify the proxy has stopped.

Configure Edge Encryption on the instance

Configure Edge Encryption by configuring fields and attachments for encryption.

Before you encrypt a field, determine what system features might be impacted. Examine all scripts for use of the field.

Before marking a field as encrypted, make any desired adjustments to the field's size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to hold the extra space needed to store the encrypted data. The process of expanding the field size can take a long time depending on how many records the table has.

Test all changes on a sub-production instance before making the changes to the production instance.

To configure field encryption, you must be connected to the instance through the Edge Encryption proxy.

Configure field encryption

Select the fields to be encrypted and identify the encryption type.

Role required: security-admin
Warning: Specifying a field as encrypted cannot be undone. Clicking Submit creates an encryption record that cannot be deleted. Encrypted fields can be marked as inactive (by clearing the Active box), and then the field contents decrypted, but the encryption record cannot be deleted, and the encryption type cannot be changed.

2. Fill in the fields on the form, as appropriate.

Table 634: Edge Encryption configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted.</td>
</tr>
<tr>
<td></td>
<td>This field appears when the Type is Column.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

3. Click Submit.

After the encryption record has been added, you can create an encryption job to encrypt existing data. If you do not run an encryption job, the existing data is encrypted the next time it is changed.

Update the Edge Encryption proxy

You must update the Edge Encryption proxy when new versions of the proxy and supporting software become available.

You must manually update each Edge Encryption proxy with the latest security updates for Java. This process is not automatic.

Uninstall the Edge Encryption proxy on Linux

Before installing a new version of the Edge Encryption proxy, you must shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute the shutdown.sh shell script.
3. Check the log on the proxy server to verify that the proxy server is shutdown.
4. Delete the files in the distribution folder.
Uninstall the Edge Encryption proxy on Windows

Before installing a new version of the Edge Encryption proxy, you must shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

1. You may want to save the `edgeencryption.properties` file before deleting the distribution directory.
2. Execute `edgeencryption.bat stop`
3. Execute `edgeencryption.bat remove`
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

Rotate encryption keys

Edge Encryption provides the tools to support encryption key rotation.

Before setting an encryption key as the default key on any proxy, add the encryption key to all proxies and restart the proxies. This ensures that the proxies have the key to decrypt fields that are encrypted with the new default key assignment. You must restart the proxy after adding a new key and after setting a new key as the default key.

Note: Before removing a key from the proxy configuration files and the key store, ensure that no data on the instance uses the key. You can do this by setting up and running a single key rotation job.

1. Obtain the new encryption key and make it accessible to all encryption proxies.
2. For each encryption proxy, add the new encryption key.
   a) Edit the encryption properties file to add the new key.
      This can be adding an encryption key stored in a file store, Java KeyStore, or NAE key store and adding the necessary properties. After updating the first proxy, you may be able to copy and paste the new encryption properties into subsequent encryption-proxy properties files.
   b) Shut down and restart the proxy.
3. For each encryption proxy, set the new encryption key as the default key.
   a) Edit the encryption properties file to set the new key as the default key.
   b) Shut down and restart the proxy.
4. If desired, create and run a mass encryption job to encrypt existing data using the new encryption key.
   You can change the default encryption key assignment so that all new data is encrypted using the new key, and let existing data remain encrypted with the old key until the data is accessed again.

Scheduled encryption jobs

If you have the security-admin role, you can schedule several different types of jobs to be performed by the Edge Encryption proxy.

You can schedule jobs for the following:
• Encrypting, decrypting, or re-encrypting data in a table field or attachments for a table.
• Repairing order tokens.
• Recreating the order token database.

Running any of these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.

Schedule an encryption job

You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, the records are encrypted as they are saved to the instance.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the field that you want to schedule an encryption job for.

   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for any previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>

<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule an attachment encryption job

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table you want to schedule an encryption job for.

   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.
Schedule a decryption job

You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

Note: You must mark the encryption record for the field as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the field that you want to decrypt.
   
   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.
Schedule an attachment decryption job

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

Note: You must mark the encryption record for the table as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table with the attachments that you want to decrypt.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule a mass key rotation job

You can schedule a job to find data encrypted with old keys and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

Role required: security-admin

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Mass Key Rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
</tbody>
</table>
Schedule a single key rotation job

You can schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

Role required: security-admin

Before scheduling this job, make sure you update the default key in the edgeencryption.properties files of all Edge Encryption proxies.

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Single Key Rotation.</td>
</tr>
<tr>
<td>Key Alias</td>
<td>Enter the key to be retired. Make sure this key is no longer the default key in any edgeencryption.properties files.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.

Schedule an order token repair job

You can schedule a job to find and repair fields where the order token is missing.

Role required: security-admin

Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the order token database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Order Token Repair.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Order Token Repair.</td>
</tr>
</tbody>
</table>
Schedule a database recovery job

Run this job when the database on the client system that supports order preserving encryption has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the order preserving database can be rebuilt.

Role required: security-admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Database Recovery**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Database Recovery</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.

Edge Encryption monitoring

You can monitor sessions that use Edge Encryption proxies.

The instance tracks all encryption proxies. Each encryption proxy registers when it starts up. The instance is notified when:

- A new encryption proxy starts up.
- An encryption proxy is intentionally shut down.

If an encryption proxy attempts to register with an instance that does not have Edge Encryption installed, the proxy will not start.
All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click **History > List** in the menu. The Mass Encryption Job file is not audited.

You can also monitor the following lists and file for information about your proxies:

| Edge Encryption Configuration > Diagnostics And Troubleshooting > Invalid Insert Attempts | List of attempts to save the following data to encrypted fields:
| --- | --- |
|  | • Unencrypted data.
|  | • Data that did not come from an Edge Encryption proxy.
|  | The instance rejects and then logs any attempts to save this data. If you have the security-admin role, you can view the logs in the Invalid Insert Attempts list.

| Edge Encryption Configuration > Proxies > Online | List of online proxies.
| --- | --- |

| Edge Encryption Configuration > Proxies > All | List of all proxies.
| --- | --- |

| System log | The instance periodically checks for messages from each encryption proxy, and it logs an error if a proxy has not sent a message in the required time frame. The log message contains information about the encryption proxy and the last time the proxy pinged the instance. If the instance determines that none of the encryption proxies are online, it logs a message. These messages are added to the system log.

| xmlstats | Information about the number of registered encryption proxies, and the number of pending and running mass encryption jobs.

## Edge Encryption logging

Edge Encryption logs information on the instance and on each proxy server.

You can view a log file listing all cases of when an attempt was made to save unencrypted data to an encrypted field. Navigate to **Edge Encryption Configuration > Diagnostics And Troubleshooting > Invalid Insert Attempts**. An administrator can trace back to why data was not saved.

There are encryption log files on each proxy server.

## Encryption rules

It may be necessary to write encryption rules when you want to encrypt data passed as part of GET/POST requests to processors or APIs on the instance. You can create rules for mapping elements of fields in requests to Glide table-field names.

Edge Encryption uses encryption rules executed on the proxy to map fields in a HTTP request to fields in a table. Each encryption rule is composed of a condition and an action. The condition identifies the type of request, and the action performs the mapping from fields in the request to fields in a table.

A set of encryption rules is installed as part of the Edge Encryption plugin. These rules handle the core platform use cases such as editing a field from the list edit form, updating a record from record form, direct
web services, and the REST API. Applications created using standard forms and lists should work without needing custom encryption rules.

You must write encryption rules for scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts you develop, if data in the requests needs to be encrypted.

You must have the security-admin role to be able to create a rule. The script is checked for compliance with JavaScript syntax before the rule is saved.

Except for attachment requests, each HTTP request goes through the process of executing the encryption rule conditions until either all conditions return false, or one condition returns true. When a condition returns true, the action part of the rule is run, and the result is forwarded to the instance, i.e. no other conditions are evaluated. As a result, encryption rule conditions must be as specific as possible to avoid inadvertently satisfying the condition. If a generic condition for a rule is unavoidable, the rule should be marked with a high order value so that more specific rules are evaluated first.

Encryption rules are written using a combination of JavaScript and the Edge Encryption API that allows you to easily iterate through post parameters, and JSON and XML content in the request body. The API uses expressions similar to XPath to navigate through both JSON and XML content.

The API uses stream parsing to parse JSON and XML data, so it is recommended that operations on the data in the action part of an encryption rule process the data in one pass. Trying to fetch and parse the content of the request body multiple times may lead to unexpected results.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as `current`. Since the rules are created for HTTP Post and HTTP Get objects, a global variable `request` is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

Encryption rule conditions

An encryption rule condition should return true if the rule is to handle the HTTP request; otherwise, it should return false. The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request.

The condition has access to these fields via the `request` object.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET or POST</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters</td>
</tr>
</tbody>
</table>

An example:

```javascript
function SampleCondition(request) {
  if (endsWith(request.path, "/sample_processor.do")) {
    return true;
  }
  return false;
```
An example accessing a URL query string parameter:

```javascript
//Check if the property ‘myParam’ exists in the urlParams object.
if (request.urlParams.myParam) {
  var myParam = request.urlParams.myParam;
}
```

Encryption Rule Actions

An encryption-rule action is responsible for mapping fields in an HTTP request to fields in a table. In addition to the fields available in the condition part of a rule, the action part of a rule has access to the JSON or XML content in the request.

**POST parameters**

To access POST parameters in any part of an encryption rule, you get the `postParams` property from the `request` object. Each POST parameter is a property of the `postParams` object.

An example of accessing the `postParams` object in a string context. The parameter evaluates to the string representation of the value.

```javascript
if (request.postParams.myparam == "hello") {
  var paramValue = request.postParams.myparam;
}
```

An example accessing the `postParams` object in a `for` loop.

```javascript
for (var paramName in request.postParams) {
  var paramValue = request.postParams[paramName];
}
```

**XML content**

You can access XML data from either a post parameter or from the HTTP request content.

You access XML data in post parameter by calling `request.postParams.<parameter name>.getAsXmlContent()`.

You access XML data in the request content by calling `request.getAsXmlContent()`.

Calling either of these two functions will return an object of type `XMLContent` that provides methods to iterate over the XML content.

An example using an `XMLContent` object with the following XML.

```xml
<records>
  <record>
    <name>Test Record 1</name>
    <description>Test Record 1 Description</description>
  </record>
  <record>
    <name>Test Record 2</name>
    <description>Test Record 2 Description</description>
  </record>
</records>
```

To iterate through the XML, you can do the following.

```javascript
var xmlContent = request.getAsXmlContent();
// This outer loop will iterate over all record elements
```
for (var xmlElementIter = xmlContent.getIterator('/records/record');
xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    // This inner loop will iterate over all elements within each record
    element
    for (var childIter = xmlElement.getIteratorOverAllChildren();
    childIter.hasNext(); ) {
        var childElement = childIter.next();
        var fieldname = childElement.getName();
    }
}

By calling `xmlContent.getIterator('/records/record')` you can iterate over the record elements by calling `hasNext()` to determine if there is another element with the path specified in the expression argument in the call to `getIterator()`. The `next()` method gives you the next element found matching the expression. An object of type `XMLElement` is returned.

**JSON content**

You can access JSON data from either a post parameter or from the HTTP request content.

You access JSON content from a post parameter by calling `request.postParms.<parameter name>.getAsJsonContent()`.

You access JSON content from the HTTP request by calling `request.getAsJsonContent()`.

Calling either of the methods returns an object of type `JsonNode`. With a `JsonNode` object, you can easily iterate over the properties by calling `iterator()` with an XPath-like expression.

An example using a `JsonNode` object with the following value.

```javascript
{
    records: [
        {
            name: 'Test Record 1',
            description: 'Test Record 1 Description'
        },
        {
            name: 'Test Record 1',
            description: 'Test Record 1 Description'
        }
    ]
}
```

To iterate through the JSON, you can do the following.

```javascript
var jsonContent = request.getAsJsonContent();
//Get the table name from a URL parameter
var tableName = request.urlParams.tableName;

// This outer loop iterates over all elements in the records array
for (var jsonNodeIter = jsonContent.getIterator('/records');
jsonNodeIter.hasNext(); ) {
    var jsonNode = jsonNodeIter.next();
    // This inner loop iterates over all child elements in an object in the
    records array
    for (var propertyIter = jsonNode.iterator(); propertyIter.hasNext(); ) {
        var property = propertyIter.next();
        var propertyName = property.getName();

        //The valueFor method replaces the value of the 'current' element
        with an encrypted
        //value if the field in the table provided as arguments is marked as
        encrypted. Otherwise,
        //it leaves the value as-is.
```
Error handling
When a rule throws an exception the proxy disables the rule.
If an encryption rule condition or action throws an exception, the exception is caught and the encryption rule is disabled. The proxy continues to evaluate the remaining rules in order as if the rule that threw the exception was not present. The exception is logged in the localhost log with a stack trace identifying the root cause of the problem.

request API
The request object is a global object available in Edge Encryption rule action scripts.

request - getEncodedQueryFor(String tableName)
Specifies that the value of the parameter is an encoded query for the specified table.
Calling this function on a parameter tells the proxy that the value of the parameter represents an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that need to be encrypted.

This method is available only in an Edge Encryption rule action script.

Table 636: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>A table name</td>
</tr>
</tbody>
</table>

Table 637: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the List Request encryption rule.

```javascript
function ListRequestAction(request) {
    var path = request.path;
    var tableNameEndIndex = path.indexOf("_list.do");
    var tableName = path.substring(1, tableNameEndIndex);
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
}
```

request - valueFor(String tableName, String fieldName)
Identifies that the parameter maps to the specified field in the specified table.
Calling this function on a parameter value tells the proxy that the value for this parameter maps to the specified field in the specified table. The proxy then decides if the field needs to be encrypted.

This method is available only in an Edge Encryption rule action script.
Table 638: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name</td>
</tr>
</tbody>
</table>

Table 639: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the Form Post encryption rule.

```javascript
function FormPostAction(request) {
    var tableName = request.postParams.sys_target;
    for (var paramName in request.postParams) {
        var fieldName = paramName.replace("sys_display.original." + "", "");
        fieldName = fieldName.replace("sys_original." + "", "");
        fieldName = fieldName.replace("sys_display." + "", "");
        fieldName = fieldName.replace(tableName + ".", "");
        request.postParams[paramName].valueFor(tableName, fieldName);
    }
}
```

request - getAsJsonContent()

Returns the request as an object of type `JsonNode`.

This method is available only in an Edge Encryption rule action script.

Table 640: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 641: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request</td>
</tr>
</tbody>
</table>

This example is from the REST Json encryption rule.

```javascript
function RESTJSONAction(request) {
    var urlArray = request.path.split('/');
    var tableName = urlArray[urlArray.length - 1];

    if (request.urlParams && request.urlParams.sysparm_query) {
        request.urlParams.sysparm_query.encodedQueryFor(tableName);
    }
}
```
request - getAsXmlContent()

Returns the request content as an object of type **XMLContent**.

This method is available only in an Edge Encryption rule action script.

**Table 642: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 643: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update');
       xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
         xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
      for (var xmlFieldIter = xmlRecord.getIterator('field');
            xmlFieldIter.hasNext(); ) {
        var xmlField = xmlFieldIter.next();
        var fieldName = xmlField.getAttributeValue('name');
        for (var childIter = xmlField.getIteratorOverAllChildren();
             childIter.hasNext(); ) {
          var childElement = childIter.next();
          childElement.valueFor(tableName, fieldName);
        }
      }
    }
  }
}
```
The JsonNode class is available in Edge Encryption rule action scripts.

You get a JsonNode object by calling the next() method of a JsonNodeIterator object.

Note: This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the iterator() method.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
  var urlArray = request.path.split('/');
  var tableName = urlArray[urlArray.length - 1];
}
if (request.urlParams & request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
}

var jsonContent = request.getAsJsonContent();
for (var jsonElementItr = jsonContent.iterator(); jsonElementItr.hasNext();) {
    var jsonElement = jsonElementItr.next();
    jsonElement.valueFor(tableName, jsonElement.getName());
}

**JsonNode - getAsString(String propertyName)**

*Returns the string value of the specified property.*

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value</td>
</tr>
</tbody>
</table>

**JsonNode - getName()**

*Returns the name of the current JSON node.*

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the JSON node</td>
</tr>
</tbody>
</table>
JsonNode - `valueFor(String tableName, String fieldName)`

Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field needs to be encrypted.

This method is available only in an Edge Encryption rule action script.

### Table 652: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name</td>
</tr>
</tbody>
</table>

### Table 653: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
    var urlArray = request.path.split('/');
    var tableName = urlArray[urlArray.length - 1];

    if (request.urlParams && request.urlParams.sysparm_query) {
        request.urlParams.sysparm_query.encodedQueryFor(tableName);
    }

    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.iterator();
         jsonElementItr.hasNext(); ) {
        var jsonElement = jsonElementItr.next();
        jsonElement.valueFor(tableName, jsonElement.getName());
    }
}
```

JsonNode - `encodedQueryFor(String tableName)`

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on an JSON node tells the proxy that the value is an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that need to be encrypted.

### Table 654: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>A table name</td>
</tr>
</tbody>
</table>
This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
  var urlArray = request.path.split('/');
  var tableName = urlArray[urlArray.length - 1];

  if (request.urlParams && request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
  }

  var jsonContent = request.getAsJsonContent();
  for (var jsonElementItr = jsonContent.iterator();
   jsonElementItr.hasNext(); ) {
    var jsonElement = jsonElementItr.next();
    jsonElement.valueFor(tableName, jsonElement.getName());
  }
}
```

**JsonNodeIterator API**

The `JsonNodeIterator` class is available in Edge Encryption rule action scripts.

You get an `JsonNodeIterator` object by calling the `getIterator()` or `iterator()` methods of the `JsonNode` class.

**JsonNodeIterator - hasNext()**

Determines if there is another property available.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
  var urlArray = request.path.split('/');
  var tableName = urlArray[urlArray.length - 1];

  if (request.urlParams && request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
  }
```
JsonNodeIterator - next()

Returns the next property in the iterator.
This method is available only in an Edge Encryption rule action script.

Table 658: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 659: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode</td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
  var urlArray = request.path.split('/');
  var tableName = urlArray[urlArray.length - 1];

  if (request.urlParams && request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
  }

  var jsonContent = request.getAsJsonContent();
  for (var jsonElementItr = jsonContent.iterator();
       jsonElementItr.hasNext(); ) {
    var jsonElement = jsonElementItr.next();
    jsonElement.valueFor(tableName, jsonElement.getName());
  }
}
```

**XMLContent API**
The `XMLContent` class is a global object available in Edge Encryption rule action scripts.

`XMLContent - getIterator()`

Returns an `XMLElementIterator` object for the XML content.
This method is available only in an Edge Encryption rule action script.
### Table 660: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 661: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
    var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter = xmlContent.getIterator('record_update');
        xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
            xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            var fieldName = xmlRecord.getAttributeValue('field');
            for (var xmlFieldIter = xmlRecord.getIterator('field');
                xmlFieldIter.hasNext(); ) {
                var xmlField = xmlFieldIter.next();
                var childIter = xmlField.getIteratorOverAllChildren();
                var childElement = childIter.next();
                childElement.valueFor(tableName, fieldName);
            }
        }
    }
}
```

**XMLContent - getIterator(String xPath)**

Returns an XMLElementIterator object for the XML content based on the specified parameter.

This method is available only in an Edge Encryption rule action script.

### Table 662: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An XPath like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>
### Table 663: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
    var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter = xmlContent.getIterator('record_update');
        xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
            xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            var xmlFieldIter = xmlRecord.getIterator('field');
            xmlFieldIter.hasNext(); } {
            var xmlField = xmlFieldIter.next();
            var fieldName = xmlField.getAttributeValue('name');
            for (var childIter = xmlField.getIteratorOverAllChildren();
                childIter.hasNext(); ) {
                var childElement = childIter.next();
                childElement.valueFor(tableName, fieldName);
            }
        }
    }
}
```

**XMLElementIterator API**

The `XMLElementIterator` class is available in Edge Encryption rule action scripts.

You get an `XMLElementIterator` object by calling the `getIterator()` method of the `XMLContent` class.

**XMLElementIterator - hasNext()**

Determines if there is another element available.

This method is available only in an Edge Encryption rule action script.

### Table 664: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 665: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>
This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update');
      xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
      xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
      var xmlFieldIter = xmlRecord.getIterator('field');
      for (var xmlField = xmlFieldIter.next();
        xmlFieldIter.hasNext(); ) {
        var fieldName = xmlField.getAttributeValue('name');
        for (var childIter = xmlField.getIteratorOverAllChildren();
          childIter.hasNext(); ) {
          var childElement = childIter.next();
          childElement.valueFor(tableName, fieldName);
        }
      }
    }
  }
}
```

XMLElementIterator - next()

Returns the next element in the iterator.

This method is available only in an Edge Encryption rule action script.

### Table 666: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 667: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update');
      xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
      xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
    }
  }
}
```
var xmlRecord = xmlRecordIter.next();
for (var xmlFieldIter = xmlRecord.getIterator('field');
xmlFieldIter.hasNext(); ) {
    var xmlField = xmlFieldIter.next();
    var fieldName = xmlField.getAttributeValue('name');
    for (var childIter = xmlField.getIteratorOverAllChildren();
childIter.hasNext(); ) {
        var childElement = childIter.next();
        childElement.valueFor(tableName, fieldName);
    }
}

XMLElement API
The XMLElement class is available in Edge Encryption rule action scripts.

You get an XMLElement object by calling the next() method of an XMLElementIterator object.

XMLElement - getIterator(String xPath)
Returns an XMLElementIterator object for the XML element based on the specified parameter.
This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An XPath like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

function ListEditAction(request) {
  var xmlContent =
    request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter =
    xmlContent.getIterator('record_update');
xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
xmlRecordIter.hasNext(); ) {
        var xmlRecord = xmlRecordIter.next();
        for (var xmlFieldIter = xmlRecord.getIterator('field');
xmlFieldIter.hasNext(); ) {
            var xmlField = xmlFieldIter.next();
            var fieldName = xmlField.getAttributeValue('name');
            } } }

© 2017 ServiceNow. All rights reserved. 2691
XMLElement - getIteratorOverAllChildren()

Returns an XMLElementIterator object that includes all sub elements for the XML element based on the specified parameter.

This method is available only in an Edge Encryption rule action script.

Table 670: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 671: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
    var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter = xmlContent.getIterator('record_update');
        xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
            xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            for (var xmlFieldIter = xmlRecord.getIterator('field');
                xmlFieldIter.hasNext(); ) {
                var xmlField = xmlFieldIter.next();
                var fieldName = xmlField.getAttributeValue('name');
                for (var childIter = xmlField.getIteratorOverAllChildren();
                    childIter.hasNext(); ) {
                    var childElement = childIter.next();
                    childElement.valueFor(tableName, fieldName);
                }
            }
        }
    }
}
```
XMLElement - valueFor(String tableName, String fieldName)
Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then decides if the field needs to be encrypted.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update');
    xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
      xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
      var fieldName = xmlRecord.getAttributeValue('field');
      for (var xmlFieldIter = xmlRecord.getIterator('field');
        xmlFieldIter.hasNext(); ) {
        var xmlField = xmlFieldIter.next();
        var fieldName = xmlField.getAttributeValue('name');
        for (var childIter = xmlField.getIteratorOverAllChildren();
          childIter.hasNext(); ) {
          var childElement = childIter.next();
          childElement.valueFor(tableName, fieldName);
        }
      }
    }
  }
}
```

XMLElement - encodedQueryFor(String tableName)
Specifies that the value of the element is an encoded query for the specified table.

Calling this function on an element tells the proxy that the value of the element is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that need to be encrypted.

This method is available only in an Edge Encryption rule action script.
Table 674: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>A table name</td>
</tr>
</tbody>
</table>

Table 675: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XMLElement - getName()
Returns the element name.
This method is available only in an Edge Encryption rule action script.

Table 676: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 677: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name</td>
</tr>
</tbody>
</table>

XMLElement - getAttributeValue(String attribute)
Returns the value of the specified attribute.
This method is available only in an Edge Encryption rule action script.

Table 678: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name</td>
</tr>
</tbody>
</table>
Global methods
Several global methods can be used in encryption rules.

print(String message)
Prints a message to the wrapper log file: <proxy server directory>/logs/wrapper_<date>.log.
This method is available only in an Edge Encryption rule action script.

Table 680: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Table 681: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

endsWith(String toMatch)
Brief description of the method.
This method is available only in an Edge Encryption rule action script.

Table 682: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>toMatch</td>
<td>String</td>
<td>The string to match</td>
</tr>
</tbody>
</table>

Table 683: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the specified string matches the end of the target string.</td>
</tr>
</tbody>
</table>

This example is from the Vacation encryption-rule condition.

```javascript
function VacationCondition(request) {
    if (endsWith(request.path, '/service_catalog.do') &
```
request.postParams.sysparm_action == 'execute_producer' &&
request.postParams.sysparm_id ==
'c322301653a33100c0eca5f4a11c084d')
return true;
return false;
}

string.replace(String old, String new)
Creates a new string with the specified existing sub-string replaced with the specified new sub-string.
This method is available only in an Edge Encryption rule action script.

Table 684: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old</td>
<td>String</td>
<td>The sub-string to be replaced</td>
</tr>
<tr>
<td>new</td>
<td>String</td>
<td>The sub-string replace the old sub-string</td>
</tr>
</tbody>
</table>

Table 685: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The string with the specified sub-string replaced with the new sub-string.</td>
</tr>
</tbody>
</table>

Prohibited keywords
The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

Table 686: Prohibited keywords

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>
<td><strong>LINE</strong></td>
</tr>
<tr>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>proto</strong></td>
</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
</tbody>
</table>
Dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields.

To set an Edge Encryption dictionary attribute to true, you must enter `attribute=true` in the Attributes field. To add a dictionary attribute to a record, see *Dictionary attributes* on page 1453.

Table 687: Edge Encryption dictionary attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Target element</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Excluded</td>
<td>true/false</td>
<td>field or table</td>
<td>When set to true, the field or table cannot be encrypted.</td>
<td>False</td>
</tr>
<tr>
<td>[edge_encryption_excluded]</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target element</td>
<td>Description</td>
<td>Default value</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------</td>
<td>----------------</td>
<td>-------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Edge Encryption Enabled</td>
<td>true/false</td>
<td>field</td>
<td>When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.</td>
<td>True for String fields</td>
</tr>
<tr>
<td>Edge Encryption Clear Text Allowed</td>
<td>true/false</td>
<td>field</td>
<td>When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field.</td>
<td>False</td>
</tr>
</tbody>
</table>

**Note:**
This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

**Installed with Edge Encryption**

Several types of components are installed with the Edge Encryption feature.
Tables installed with Edge Encryption

**Tables**

Edge Encryption adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Configuration</td>
<td>Contains encrypted fields and tables for which attachments are encrypted.</td>
</tr>
<tr>
<td>[sys_encryption_configuration]</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Rule</td>
<td>Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.</td>
</tr>
<tr>
<td>[sys_encryption_rule]</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Invalid Insert Log</td>
<td>Contains log messages created for attempts to save unencrypted data to an encrypted field.</td>
</tr>
<tr>
<td>[sys_edge_encryption_invalid_insert_log]</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Proxy</td>
<td>Contains information about the encryption proxy application.</td>
</tr>
<tr>
<td>[sys_encryption_proxy]</td>
<td></td>
</tr>
<tr>
<td>Edge Proxy Encryption Type</td>
<td>Used for enabling and disabling encryption types on the encryption form.</td>
</tr>
<tr>
<td>[sys_proxy_encryption_type]</td>
<td></td>
</tr>
<tr>
<td>Encryption Job Execution</td>
<td>Supports mass encryption jobs.</td>
</tr>
<tr>
<td>[sys_encryption_job_execution]</td>
<td></td>
</tr>
<tr>
<td>Encryption Job Execution Chunk</td>
<td>Supports mass encryption jobs.</td>
</tr>
<tr>
<td>[sys_encryption_job_execution_chunk]</td>
<td></td>
</tr>
<tr>
<td>Scheduled Encryption Job</td>
<td>Lists scheduled jobs for encryption, decryption, key rotation, order token repair, and database recovery.</td>
</tr>
<tr>
<td>[sysauto_encryption_job]</td>
<td></td>
</tr>
</tbody>
</table>

**Properties Installed with Edge Encryption**

**Properties**

Edge Encryption adds the following properties.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.
Table 689: Properties for Edge Encryption

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_edge_encryption.logging.destination</td>
<td>Where log messages are to go.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: file</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Properties [sys_properties] table</td>
</tr>
<tr>
<td>sn_edge_encryption.logging.verbosity</td>
<td>The logging level to use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: info</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

Roles installed with Edge Encryption

Table 690: Roles installed with Edge Encryption

<table>
<thead>
<tr>
<th>Role title</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge_encryption</td>
<td>Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.</td>
<td>None</td>
</tr>
</tbody>
</table>

Notifications

Notifications keep users informed of events that concern them. The system can notify users by email, SMS text message, or push notification. It can also integrate with telephony providers to manage phone calls and SMS messages.

What’s new

- Email and notifications release notes

Email

- Basic email setup on page 2702
- Advanced email setup on page 2705
- Create an email notification on page 2756
- The email client on page 2857
- System mailboxes
- Inbound email actions on page 2822

Push Notifications

- Set up push notifications for the ServiceNow mobile app on page 2876
- Set up push notifications for a custom push app on page 2880
- Push notifications on page 2869

Subscription-based notifications

Notify

Troubleshoot and get help
Email notifications

Use email notifications to send selected users email about specific activities in the system, such as updates to incidents or change requests.

If you want to change how the instance processes incoming email, see Inbound email actions on page 2822.

Email notifications allow administrators to specify:

• When to send the notification
• Who receives the notification
• What content is in the notification

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

• Raw HTML content is converted into a WYSIWYG format.
• The content can be edited in a feature-rich HTML editor.
• Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
• To prevent broken links, items like images and incidents, that are linked with URLs relative to a particular instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

Note: The rich HTML format is the default for all new email notifications.

See the Email logs on page 1059 for examples of what you might see if a notification or inbound email action is not processed.

Note: Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

Email setup

All email notifications use the email properties that you define and the email accounts that you set up.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.
Email properties

Use *Email Properties* to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email size restrictions

For instances that use a *standard email configuration*, the system cannot send or receive emails that are larger than 25MB, including the email header, body text, and attachments. Instances configured to use an *alternate email configuration* may support different maximum total file sizes. The maximum email size limit is enforced regardless of any configured attachment size limits.

**Note:** Even if the email and its attachments are less than 25MB, the actual size of an email message could be larger when it gets encoded by an email client. So these messages might exceed the limit when they reach the instance.

Email service availability

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post *Whitelisting emails sent from the ServiceNow infrastructure* by a ServiceNow Technical Support Engineer in the ServiceNow Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in *Email notifications* on page 2701.

Instance-to-instance communication via email

ServiceNow does not recommend using email notifications to communicate between two instances. Use *Web services* on page 3044 instead.

Basic email setup

All production instances can send and receive email using ServiceNow-provided resources.

Basic email offers the following services and features:

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.
- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.
Enable basic email
Enable basic email to use ServiceNow-provided email servers and accounts.

Role required: admin

1. Navigate to System Properties > Email.
2. Configure these email properties and click Save.

### Table 691: Email Property Descriptions

</tr>
</tbody>
</table>

Network layout basic email
Basic email uses ServiceNow-provided mail servers and email accounts. The instance has an email address of instance@service-now.com.
Figure 755: Standard email configuration
Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

Enable email forwarding to instance

You can use your own SMTP server to forward email to the ServiceNow-provided email address.

- Role required: admin
- Email server required: SMTP

1. Configure your SMTP server to forward email sent to a custom address to the actual instance email address. For example, forward mail sent to service-desk@company.com to instance@service-now.com.

2. Navigate to System Properties > Email.

3. Configure these email properties and click Save.

<table>
<thead>
<tr>
<th>Property section</th>
<th>Label</th>
<th>System property</th>
<th>Setting required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outbound Email Configuration</td>
<td>Email sending enabled</td>
<td>glide.email.smtp.active</td>
<td>Yes</td>
</tr>
<tr>
<td>Inbound Email Configuration</td>
<td>Email receiving enabled</td>
<td>glide.email.read.active</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Enable using your own SMTP server

You can use your own SMTP server to send email from the instance.

- Role required: admin
- Email server required: SMTP

1. Optional: To receive email sent to a custom address, configure your SMTP server to forward email sent to the custom address to the actual instance email address. For example, forward mail sent to service-desk@company.com to instance@service-now.com.

2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.

3. Locate the record for ServiceNow SMTP and change Active to false.
4. Click **New**. The system displays a blank Email Account form.

5. Create an email account record for your SMTP server where the **Type** is **SMTP**.

6. From **Related Links**, click **Test SMTP connection**. If the email account is valid, the system returns a **Completion code** of **Success**.

7. Navigate to **System Mailboxes > Administration > Email Properties**. The system displays the list of email properties.

8. Configure this email property.
Table 693: Outbound email property

<table>
<thead>
<tr>
<th>Property Section</th>
<th>Label</th>
<th>System Property</th>
<th>Setting Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outbound Email</td>
<td>Email sending enabled.</td>
<td>glide.email.smtp.active</td>
<td>Yes</td>
</tr>
<tr>
<td>Configuration</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

9. Optional: If you want the instance to receive email, configure this email property.

Table 694: Inbound email property

<table>
<thead>

<td>Yes</td>
</tr>
<tr>
<td>Configuration</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

10. Click **Save**.

**Enable using your own POP3 server**
You can use your own POP3 server to store and receive email for the instance.

- Role required: admin
- Email server required: POP3

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for **service-desk@company.com**.
2. Navigate to **System Mailboxes > Administration > Email Accounts**. The system displays the list of available email accounts.
3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false**.
   
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the **ServiceNow POP3** account active allows the instance to receive email sent to the instance default email address.
4. Click **New**.
   The system displays a blank Email Account form.

5. Create an email account record for your POP3 server where the **Type** is **POP3**.

6. From **Related Links**, click **Test POP3 connection**.
   If the email account is valid, the system returns a **Completion code** of **Success**.

7. Navigate to **System Mailboxes > Administration > Email Properties**.
   The system displays the list of email properties.

8. Configure this email property.
Table 695: Inbound email property

<table>
<thead>
<tr>
<th>Property Section</th>
<th>Label</th>
<th>System Property</th>
<th>Setting Required</th>
</tr>
</thead>
<tbody>

<td>enabled.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

10. Click **Save**.

*Enable using your own SMTP and POP3 servers*

You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

- Role required: admin
- Email servers required:
  - SMTP
  - POP3

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.

2. Navigate to **System Mailboxes > Administration > Email Accounts**.
   The system displays the list of available email accounts.

3. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.
4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change **Active** to **false**.

An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active means that the instance receives email sent to its default email address.

<table>
<thead>
<tr>
<th>Email Accounts</th>
<th>New</th>
<th>Go to</th>
<th>Name</th>
<th>Search</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ServiceNow POP3</strong></td>
<td></td>
<td></td>
<td><strong>true</strong></td>
<td><strong>POP3</strong></td>
</tr>
<tr>
<td><strong>ServiceNow SMTP</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. Click **New**.

The system displays a blank Email Account form.

6. Create an email account record for your SMTP server where the **Type** is **SMTP**.

7. From **Related Links**, click **Test SMTP connection**.

If the email account is valid, the system returns a **Completion code** of **Success**.
8. Click **New**.
   The system displays a blank Email Account form.

9. Create an email account record for your POP3 server where the **Type** is **POP3**.

10. From **Related Links**, click **Test POP3 connection**.
    If the email account is valid, the system returns a **Completion code** of **Success**.

11. Navigate to **System Mailboxes** > **Administration** > **Email Properties**.
    The system displays the list of email properties.

12. Configure these email properties.
Table 697: Email properties

<table>
<thead>
<tr>
<th>Property Section</th>
<th>Label</th>
<th>System Property</th>

13. Click **Save**.

**OAuth email authentication**

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

---

**Note:** Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See [KB0546976](#) for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See **Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API** on page 3408 for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see **OAuth 2.0** on page 1952 for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the **Load demo data** check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click **Activate**.

Enable OAuth 2.0 for email

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.
• Role required: admin
• Plugin required: Email - OAUTH support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   • client ID
   • client secret
   • authorization URL
   • token URL
   • redirect URL
   • token revocation URL

3. Navigate to System OAuth > Application Registry.
4. Click New.
5. Click Connect to a third party OAuth Provider to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form.
   See Use a third-party OAuth provider on page 1958 for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
7. Click Submit.
8. Navigate to System Mailboxes > Administration > Email Accounts.
   The system displays the list of available email accounts.
9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change Active to false.
   The system can receive email from multiple POP3 email accounts.
10. Locate the records for ServiceNow SMTP and change Active to false.
11. Click New.
   The system displays a blank Email Account form.
12. Create an email account record for your OAuth 2.0 SMTP server where the Type is SMTP.
13. For Authentication, select OAuth 2.0.
14. For OAuth Profile, select the application registry record you created.

15. Click Authorize Email Account Access to obtain the access and refresh tokens.

   Another browser window opens asking you to authorize the account access on the third-party email account.

16. Authorize the access.

   After the authorization is successful and the tokens are saved to the instance, the Authorize Email Account Access button no longer appears on the Email Account form.

17. Click New.

   The system displays a blank Email Account form.

18. Create an email account record for your OAuth 2.0 IMAP server where the Type is IMAP.

   Use the same Authentication and OAuth profile settings as the OAuth SMTP email account.

---

**Network layout email forwarding**

You can use your own SMTP server to forward email sent to a custom email address to the actual instance email address.

Typically, organizations use a custom email address to change the reply-to address from the instance name to a custom email address within their domain. This configuration requires an SMTP server in your internal email architecture to forward email sent to your custom email address to the actual instance email address. Implement a spam filter on your custom email address to prevent unwanted mail from triggering actions on your instance.
Network layout using your own SMTP server
You can use your own SMTP server to send email to and from your instance.

This layout bypasses the ServiceNow-provided SMTP server normally used to send email from your instance.

Email accounts

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

**Note:** The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use `email properties` to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address instance@service-now.com. Likewise, the ServiceNow SMTP server sends email from the address instance@service-now.com. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.
Figure 760: A ServiceNow configured email account

Configure an email account
You can create email accounts in addition to the accounts provisioned for you.

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP

1. Navigate to System Mailboxes > Administration > Email Accounts.
2. Click New.
3. Fill in the fields on the form (see table).
4. Click **Submit**.
5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

**Identify email as a forward by these subject prefixes**

fw:, fwd:

**Discard everything below this text if found in a reply body (comma separated, case sensitive)**

```plaintext
\n\n---- Original Message ----, \n\n________ \n\nFrom:
```

**Ignore email with these headers (comma separated name:value pairs)**

X-ServiceNow-Spam-Flag:YES,X-ServiceNow-Virus:INFECTED,Auto-Resp:

**Ignore email when subject starts with text (comma separated, case insensitive)**

out of office autoreply, undeliverable:, delivery failure:, returned mail:, aut:

**Ignore email from these senders. Use the name before the @ sign. (comma-separated)**

mailer-daemon, postmaster

**Automatically create users for incoming emails from trusted domains**

- Yes | No

**Default password for users created from email sent from trusted domains. (must reset upon login)**

password

</table>

**Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.

<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.pop3.ignore_headers | Ignore email with these headers (comma separated name:value pairs) | Specifies the comma-separated list of email headers that cause the instance to ignore an email message. Use the format name:value to specify email header types and values. You can use a wildcard (*) for the subtype. For example, Content-Type:multipart/*; report-type=delivery-status; ignores emails containing a type of multipart and a value of report-type=delivery-status. For syntax specifications, see http://www.w3.org/Protocols/rfc1341/4_Content-Type.html.  
- Type: string  

**Note:** If the Email Filters plugin is activated, the **Ignore header** email filter overrides this property. The property does not appear on the Mail Properties page when email filters are enabled.
<table>
<thead>
<tr>

**Additional email properties**

There are several advanced email properties that you can use to fine tune the way your instance sends or receives email.

You must add these properties to the System Property [sys_properties] table before they can be used to overwrite the defaults.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| com.glide.email.max_body_bytes | Sets the maximum body size in bytes allowed per inbound email.  
  • Type: integer  
  • Default value: 1048576 |
| com.glide.email.max_read | Specifies the maximum number of emails a POP3 reader should process concurrently.  
  • Type: integer  
  • Default value: 20 |
| com.snc.on_call_rotation.reminders.showtz | Specifies whether to show a user's timezone.  
  • Type: true | false  
  • Default value: false |
| glide.email.inbound.calendar_behavior | Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):  
  • Attach: Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.  
  • Ignore: Discard the calendar data.  
  • Inline: Store the calendar data as text in the email Body field.  
  • Type: string  
  • Default value: Attach |
| glide.email.inbound.convert_html_inline_attachment_references | Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.  
  • Type: true | false  
  • Default value: true |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.inbound.max_attachment_count     | Sets the maximum number of attachments allowed per inbound email. This property is available starting with the Eureka Patch 4 release.  
• Type: integer  
• Default value: 30  
• Location: System Property [sys_properties] table |
| glide.email.inbound.max_total_attachment_size | Sets the maximum total attachment size in bytes allowed per inbound email. This property is available starting with the Eureka Patch 4 release.  
• Type: integer  
• Default value: 18874368  
• Location: System Property [sys_properties] table |
| glide.email.mail_to                          | Specifies the email address for sending notifications that use the ${mailto:} variable.  
• Type: string  
• Default value: value of glide.email.user property |
| glide.email.name_split                       | Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "." (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.  
• Type: string  
• Default value: period (. ) |
| glide.email.notification.save_when_no_recipients | Controls whether a notification-generated sys_mail record is saved even if there are no recipients. Used in conjunction with other notification recipient logging properties, this property enables troubleshooting problems with notifications.  
• Type: true | false  
• Default value: true |
<table>
<thead>
<tr>

<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 18874368</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td>glide.email.override.url</td>
<td>Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is: <a href="https://servicenow.customerdomain.com/production/nav_to.do">https://servicenow.customerdomain.com/production/nav_to.do</a>. This property is suitable for customers who use custom redirect URLs for their instances.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: instance URL</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| glide.cms.use_email_override_url | Forces the system to use the glide.email.override.url property, rather than the glide.servlet.uri property, when a notification has a link to a CMS page in an instance.  
  • Type: true | false  
  • Default value: false  
  • Location: System Property [sys_properties] table |
| glide.email.smtp.max_recipients | Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.  
  • Type: integer  
  • Default value: 100 |
| glide.email.smtp.max_send | Specifies how many emails to send through each new SMTP connection. The instance establishes a new SMTP connection if there are more emails to send than the specified value.  
  • Type: integer  
  • Default value: 100 |
| glide.email.text_plain.strip_xhtml | Indicates whether both outbound and inbound emails that are shown in comments convert the XML to plain text (true) or preserve the XML (false).  
  • Type: true | false  
  • Default value: true |
| glide.imap.secure | Specifies whether to enable SSL encryption for connections to the IMAP server.  
  • Type: true | false  
  • Default value: false |
| glide.imap.secure.port | Specifies the communications port for IMAP secure connections.  
  • Type: string  
  • Default value: 995 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.imap.tls | Specifies whether to start the IMAP server in Transport Layer Security (TLS) mode.  
- Type: true | false  
- Default value: false |
| glide.notification.recipient.exclude_logging | Master switch to enable or disable logging all reasons a recipient was excluded. If set to true, the subsequent properties dealing with the exclusion of logging are enabled. If it is set to false, none of the subsequent properties relating to the exclusion of logging are enabled. This property cannot suppress log messages generated by the glide.email.test.user property.  
- Type: true | false  
- Default value: true |
| glide.notification.recipient.exclude_logging.device_inactive | Logs recipients who are excluded because their chosen notification device record is marked as inactive.  
- Type: true | false  
- Default value: true |
| glide.notification.recipient.exclude_logging.device_schedule | Logs recipients who are excluded based on the Schedule field on the New Device for System Administrator form for their chosen notification device.  
- Type: true | false  
- Default value: true |
| glide.notification.recipient.exclude_logging.event_creator | Logs recipients who are excluded because they initiated the notification event, such as updating an incident record, and the Send to Event Creator check box is cleared on the notification record.  
- Type: true | false  
- Default value: true |
| glide.notification.recipient.exclude_logging.invalid_email | Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.  
- Type: true | false  
- Default value: true |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.notification.recipient.exclude_logging.user_calendar_integration_disabled | Logs recipients of calendar invitations who are excluded because the **Calendar Integration** field is set to **None** on the user record.  
  • Type: true | false  
  • Default value: true |
| glide.notification.recipient.exclude_logging.user_inactive | Logs recipients who are excluded because the **Active** check box is cleared on the user record.  
  • Type: true | false  
  • Default value: true |
| glide.notification.recipient.exclude_logging.user_notification_disabled | Logs recipients who are excluded because the **Notification** field is set to **Disabled** on the user record.  
  • Type: true | false  
  • Default value: true |
| glide.notification.recipient.include_logging | Master switch to enable or disable logging all reasons a recipient was included. If set to true, the subsequent properties dealing with the inclusion of logging are enabled. If it is set to false, none of the subsequent properties relating to the inclusion of logging are enabled.  
  • Type: true | false  
  • Default value: true |
| glide.notification.recipient.include_logging.delegate | Logs recipients who are included because they are delegates of another user.  
  • Type: true | false  
  • Default value: true |
| glide.notification.recipient.include_logging.event_parm | Logs recipients who are included because they are in the **parm1** or **parm2** fields of the event record.  
  • Type: true | false  
  • Default value: true |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.notification.recipient.include_logging.recipient_fields | Logs recipients who are included via a notification target record, such as an incident record, specified in the **Users/Groups in Field** field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, if the record that triggered the notification is an incident, and the **assigned_to** field for the incident is listed in recipient_fields, that user is included as a recipient.  
  - Type: true | false  
  - Default value: true |
| glide.notification.recipient.include_logging.recipient_groups.group_email | Logs recipients who are included in a group email for any group provided in the notification record's recipient_groups or the event **parm1** or **parm2** field.  
  - Type: true | false  
  - Default value: true |
| glide.notification.recipient.include_logging.recipient_groups.manager | Logs recipients who are included because they manage any group provided in the notification record's recipient_groups or the event **parm1** or **parm2** field.  
  - Type: true | false  
  - Default value: true |
| glide.notification.recipient.include_logging.recipient_groups.membership | Logs recipients who are included via membership in any group provided in the notification record recipient_groups or the event **parm1** or **parm2** field.  
  - Type: true | false  
  - Default value: true |
| glide.notification.recipient.include_logging.recipient_users | Logs recipients who are included via notification record's **Users** field (recipient_users).  
  - Type: true | false  
  - Default value: true |
| glide.notification.recipient.include_logging.subscription | Logs recipients because they are subscribed via User Notification Preferences.  
  - Type: true | false  
  - Default value: true |

**Deprecated mail server properties**

In previous releases, you could configure email accounts from the Email Properties page.
Starting with the Geneva release, you must configure email accounts from the **System Mailboxes > Email Accounts** module. Properties related to email accounts are deprecated. The same functionality in these deprecated properties is configured on the Email Account form.

**Properties deprecated in the Geneva release**

- SMTP mail server (glide.email.server)
- SMTP account (glide.email.user)
- Outgoing mail display name (glide.email.username)
- SMTP account password (glide.email.user_password)
- POP3 mail server (glide.pop3.server)
- POP3 account (glide.pop3.user)
- POP3 account password (glide.pop3.password)
- POP3 server port (110) (glide.pop3.port)
- Connect to POP3 server using SSL encryption (glide.pop3.secure)
- SMTP server requires username and password authentication (glide.smtp.auth)
- SMTP server port (25) (glide.smtp.port)
- SMTP Encryption (glide.smtp.encryption)
- [Legacy] TLS security for SMTP (glide.smtp.tls)

**Email diagnostics**

The Diagnostics and Connection page displays information about the current state of your email configuration.

Email diagnostics are available from either of these modules:

- **System Mailboxes > Email Diagnostics**
- **System Diagnostics > Email Diagnostics**
Figure 764: Email diagnostics

**Connection Status**
### Email logs

The email log records all email notifications sent from all instances within the system.

This is a verbose and unfiltered view of email. For a more detailed view, see the [System Mailbox application](#).

This log provides the following information for all notifications.

#### Table 702: Email log

<table>
<thead>
<tr>
<th>Field</th>

<td>The date and time of the email activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Deleted</td>
<td>An indication of whether the email was deleted from an instance mailbox.</td>
</tr>
<tr>
<td>Weight</td>
<td>The weight of the email, which determines the sending priority relative to other notifications on the same table.</td>
</tr>
<tr>
<td>Importance</td>
<td>An indication that the email was sent with a changed level of importance, such as Urgent.</td>
</tr>
<tr>
<td>Originating Event and Notification</td>
<td>An embedded list that stores the event and notification that initiated the email notification. For more information, see <a href="#">Events</a> on page 2996.</td>
</tr>
<tr>
<td>Subject</td>
<td>A configured description of the action that generated the email notification. You create the subject text for notifications in <strong>System Notification &gt; Email &gt; Notifications</strong>.</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email address of the recipient of each notification.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

Invalid email addresses that the instance strips out of outbound email messages are logged, starting with the Geneva release.

*Email size limits*
To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.
Administrators can modify the maximum values using properties.

**Note:** The system cannot send or receive emails that exceed the maximum email size, even if one or more properties are configured to allow bigger attachments.

Message body size limit properties
Several properties enforce the maximum email body size allowed for inbound and outbound emails.

**Properties**

In some situations, an email message may contain more information in the body than the system can process, especially when string searches and regular expressions are used. By default, the system can process only up to 16MB worth of information in the email body and body_text fields (8MB each). If the email body exceeds this limit, the system truncates the body text.

Users with the admin role can configure the following properties to control email body size limits. The properties can be added to the System Property [sys_properties] table. Neither property should exceed the system limit of 16MB. Setting either of the following properties to an excessively large value may cause performance issues.

**Table 703: Message body size limit properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.email.max_body_bytes</td>
<td>Sets the maximum body size in bytes allowed per inbound email. Ensure that the sum of this property and the glide.email.inbound.max_total_attachment_size_bytes property is well below the maximum total email size.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 1048576</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more:</strong> Inbound Email Attachment Processing</td>
</tr>
<tr>
<td>glide.email.outbound.max_body_bytes</td>
<td>Sets the maximum body size in bytes allowed per outbound email. Ensure that the sum of this property and the glide.email.outbound.max_total_attachment_size_bytes property is well below the maximum total email size.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 1048576</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more:</strong> Outbound Email Attachment Processing</td>
</tr>
</tbody>
</table>

**Note:** A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.
**Inbound email body processing**

For inbound emails, the system enforces the maximum body size as set by the `com.glide.email.max_body_bytes` property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

```
Email set to receive-ignored because its size exceeds the value set in com.glide.email.max_body_bytes. 1995 character(s) were truncated from the body field.
```

**Outbound email body processing**

For outbound emails, the system enforces the maximum body size as set by the `glide.email.outbound.max_body_bytes` property. When the body size exceeds the configured value:

- The system does not send the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

```
Email set to send-ignored because its size exceeds the value set in glide.email.outbound.max_body_bytes. 1337 character(s) were truncated from the body field.
```

**Attachment limit properties**

Several properties control email attachment limits.

**Properties**

All the properties are located in the System Property [sys_properties] table. Setting any of the following properties to an excessively large value may cause performance issues.

**Table 704: Attachment limit properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.inbound.max_attachment_count</code></td>
<td>Sets the maximum number of attachments allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: 30</td>
</tr>
<tr>
<td></td>
<td>- <strong>Learn more</strong>: Inbound Email Attachment Processing</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| glide.email.inbound.max_total_attachment_size_bytes | Sets the maximum total attachment size in bytes allowed per inbound email.  
  - **Type**: integer  
  - **Default value**: 18874368  
  - **Learn more**: Inbound Email Attachment Processing |
| glide.email.outbound.max_attachment_count | Sets the maximum number of attachments allowed per outbound email.  
  - **Type**: integer  
  - **Default value**: 30  
  - **Learn more**: Outbound Email Attachment Processing |
| glide.email.outbound.max_total_attachment_size_bytes | Sets the maximum total attachment size in bytes allowed per outbound email. Note that in order to send an email, the system must encode the contents of the email. This process may significantly increase the size of the email, including any attachments. It is best to set this property to a value well below the maximum email size.  
  - **Type**: integer  
  - **Default value**: 18874368  
  - **Learn more**: Outbound Email Attachment Processing |

**Note:** A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.

**Inbound email attachment processing**

For inbound emails, the system enforces the maximum number and size of attachments as set by the glide.email.inbound.max_attachment_count and glide.email.inbound.max_total_attachment_size_bytes properties. When the attachments for an inbound email exceed either value, the system logs a warning and discards the excess attachments. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

**Inbound email attachment processing**

For outbound emails, the system enforces the maximum number and size of attachments as set by the glide.email.outbound.max_attachment_count and glide.email.outbound.max_total_attachment_size_bytes properties. Email records are created from a number of sources and may exceed the configured attachment limits.
Emails that are ready to be sent from the Email [sys_email] table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this:

Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.

**Emails for notifications, scheduled reports, and exported tables**

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export a number of records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

**Maximum email body size**

A system property controls the maximum size of a message body before the instance stops processing inbound email actions.

In some situations, an email message may contain more information in the body than the instance's data policy permits a field to write to the database. By default, an inbound email action can process only up to 16MB worth of information in the message body. If the email body exceeds this limit, the instance truncates the message body. The default value is set to match the data policy write limit of 16MB. You cannot set a higher value without conflicting with the write data policy limit. If you want to set a lower limit, you can add this system property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>com.glide.email.max_body_bytes</td>
</tr>
<tr>
<td>Description</td>
<td>Specify the maximum size of an email message body in bytes. The size cannot exceed the default value of 16MB.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>16777216</td>
</tr>
</tbody>
</table>

**Note:** Email attachments have a separate size limit.

**Next steps after enabling email**

After enabling email on your instance, consider performing several of these important tasks.

- Test the email configuration by routing all email to a single user (set the glide.email.test.user property).
- Review the baseline email notifications and templates to determine if they meet your business needs.
• Review the baseline inbound email actions to determine if they meet your business needs.
• Determine if you want to use email filters to restrict the email the instance receives.
• Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
• Determine what kind of watermarks outbound email uses to associate records with email messages.
• Determine if you want to create users when the instance receives an email from an unrecognized user.
• Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the glide.smtp.precedence_bulk property).
• Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
• Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Create an email notification

Creating an email notification involves specifying when to send it, who receives it, and what it contains.

Role required: admin

Note: If you do not see all the fields on the form, switch to the Advanced view.

1. Configure email properties to enable your instance to send and receive email.
2. Navigate to System Notification > Email > Notifications.
3. Click New.
4. Fill in the fields at the top of the Email Notifications form, as appropriate (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the database table to link the notification to, for example Incident [incident].</td>
</tr>
<tr>
<td><strong>Attention:</strong></td>
<td>Do not select the Task [task] table. This table is for extending other tables. Notifications that run on the Task table directly are not supported.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Only tables and database views that are in the same application scope appear in the list.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of notification you are creating: EMAIL or Meeting Invitation.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the email notification.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description for this notification.</td>
</tr>
</tbody>
</table>

5. Fill in the fields on the **When to send** tab (see table).
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent: when a record is inserted or updated or when a particular event is triggered.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>[Required] Set a numerical value for the notification priority relative to other notifications with the same target table and recipients. The system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification. <strong>Note:</strong> The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select <strong>Priority &gt; greater than &gt; 3 - Moderate</strong> to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field is visible only when the Send when field has been set to <strong>Record inserted or updated.</strong></td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field is visible only when the Send when field has been set to <strong>Record inserted or updated.</strong></td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field is visible only when the Send when field has been set to <strong>Event is fired.</strong></td>
</tr>
</tbody>
</table>
6. Fill in the fields on the **Who will receive** tab (see table).

**Tip:** Consider limiting the recipient list of any notification to **1000** users. By default, if a notification has more than 100 intended recipients. The system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property glide.email.smtp.max_recipients.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Advanced condition         | Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. **The advanced condition** script must return **true** or set a global answer variable to **true** to send the notification. The advanced condition script uses the following global variables:  
  • current: contains the current record from the table to which the notification is linked.  
  • event: contains the event that triggered the notification.  
  **Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification. |

Notifications can be sent to specific Users and Groups or to User/Groups in fields on the record that generated this notification.

<table>
<thead>
<tr>
<th>Users</th>
<th>Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users/Groups in fields</td>
<td>Assignment group</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select users or groups from reference fields. For example, if a notification uses the Incident [incident] table, then you can select users or groups from incident fields like <em>Opened by</em> and <em>Assignment group</em>. This list of users or groups is variable and depends upon the values of the associated task record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users you selected.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field.</td>
</tr>
<tr>
<td></td>
<td>For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td></td>
<td>If you want know why you may not be receiving certain email notifications, see the blog post <em>Troubleshooting email notifications - Send to the Event Creator</em> by a ServiceNow Technical Support Engineer in the ServiceNow Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more email recipients (in a comma separated-list). This field is visible only when the <em>Send when</em> field is set to <em>Event is fired</em>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more email recipients (in a comma-separated list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired</strong>.</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Select this check box to allow all users to subscribe to this notification. See <strong>Subscription-based notifications</strong> on page 2896 for more information.</td>
</tr>
</tbody>
</table>

**Note:** Do not enable this option for notifications that contain sensitive or protected data or where you want to restrict who can see it.

**Note:** The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details. If the record contains sensitive or protected data, consider restricting the recipient list to just those users and groups who normally have access to it, and do not enable the **Subscribable** option.

7. Fill in the fields on the **What it will contain** tab (see table).
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email template</td>
<td>If you want to reuse existing content, select an email template to add content to the email notification.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter the subject line for the email message. The subject can include variables from the <code>Select variables</code> column.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Message HTML</td>
<td>Enter the content of the email notification message. The message can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. The <strong>Message HTML</strong> field is visible only if you set the content type to <strong>HTML and plain text</strong> or <strong>HTML only</strong>. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email notifications, see the blog post <em>Extra line spacing with paragraph tags in email client</em> by a ServiceNow employee in the ServiceNow Community.</td>
</tr>
<tr>
<td>SMS alternate</td>
<td>Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters.</td>
</tr>
<tr>
<td>Importance</td>
<td>Set the importance of the email message to low or high.</td>
</tr>
<tr>
<td>Content type</td>
<td>Select the content type for the email notification: • <strong>HTML and plain text</strong> • <strong>HTML only</strong> • <strong>Plain text only</strong> By default, <strong>HTML only</strong> is enabled.</td>
</tr>
<tr>
<td>Include attachments</td>
<td>Select this check box to send all attachments from the triggering record as email attachments.</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>Use this check box to apply or remove the watermark attached to each email. Do not remove the watermark as a reply to an email without a watermark creates an incident rather than updating the incident the original email referred to. For more information, and an alternative way to hide watermarks, see <em>Watermarks on notification emails</em> on page 2855.</td>
</tr>
<tr>
<td>Message Text</td>
<td>Enter the notification message to send in plain text. This field is visible only if you set the content type to <strong>HTML and plain text</strong> or <strong>Plain text only</strong>.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Enter the email address that you want the email notification to use in the From field. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field.</td>
</tr>
<tr>
<td>Reply to</td>
<td>Enter the email address you want people to use when replying to the email notification. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field.</td>
</tr>
<tr>
<td>Push message only</td>
<td>Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The Push Notification feature must be active.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

Images can be inserted into email notifications that were created in the Eureka release or that were converted to rich format using the HTML editor. The images can be stored in the image library in your instance, or they can be inserted as attachments.

*Convert legacy email notifications to rich HTML*

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to **System Policy > Email > Notifications**.
2. On the **Email Notifications** list screen, click the name of the email notification you want to convert.
3. Click the **What it will contain** tab.
4. Click **Switch to Rich HTML Editor**.

Any raw HTML in the **Message** field is rendered as WYSIWYG text. Additionally, any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script [sys_script_email] table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications in the Eureka release, it is a best practice to write mail scripts using System Policy > Email Notification > Email Scripts. When the scripts are completed, add a `${mail_script:script name}` embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by `<mail_script> </mail_script>` in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.
In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

The advanced condition script must set the answer variable to true to send the notification. For example, to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group, use this code:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else{
    answer = true;
}
```

You can add a script-based condition in the Advanced condition field by configuring the Email Notification form and adding the field. You can access the field in the Advanced view without configuring the form.

The advanced condition script uses the following business rule global variables:

- **current**: contains the current record from the table to which the notification is linked.
- **event**: contains the event that triggered the notification.

**Note**: The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the Condition and Advanced condition must evaluate to true in order to send the notification.

**Edit HTML content in an email notification**

For added control over the content of a converted email notification, you can edit the underlying HTML.

Role required: admin

1. With the converted email notification displayed in the Message text field, click the HTML button in the rich HTML editor.
2. Make the needed changes to the HTML.
3. Click **Update**.

*Document attachments on an email notification*

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding, which increases total attachment size by approximately 37%.

**Attaching documents with scripting**

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.
**Linking to an attachment**

You can add attachments to a notification by linking to the attachment record in the message of the notification. Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr. sys_id + '">' + gr. file_name + '</a>
 ' ) ;
```

**Attaching reports using the Sys ID**

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```javascript
${report:X:Y}
```

where:

- X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
- Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `${report:reportID:<abc123>}`
- `${report:gaugeID:<abc123>}`
- `${report:dashboardID:<abc123>}`
- `${report:chartID:<abc123>}`

*Line breaks in email notifications and rich HTML*

Rich HTML provides additional control over line breaks in your email notifications and templates.

To accommodate this, a **Newlines to HTML** check box is available in the **Email Script** form.
Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, it is a best practice to add correct HTML line breaks to template.print() statements.

If an email notification or template to rich HTML is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work; however, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

### Best Practice

When writing new scripts, it is best to insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. The same approach is recommended for existing notifications and templates. That is, a best practice would be to replace `template.print("\n")` JavaScript function calls with `template.print("<br />")`. This gives you better control over the HTML formatting of your email notifications.

#### Preview email notifications

You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

---

**Note:** If you are using Internet Explorer, you must have version 9 or later to use this feature.

You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the notification or create one. You must save the record before you can view the preview accurately.

3. Click the **Preview Notification** UI action on the top of the form. The Notification Preview window opens.

4. You can see the content of the notification, modify the preview records to see what changes take place in the notification content, and view who can receive the notification (see table for field descriptions).

Change Request CHG00000001 notification -- Rollback Oracle Version

Body

Short description: Rollback Oracle Version
Click here to view Change Request: CHG00000001

State: New
Category: Software
Configuration item: Sales Force Automation
Opened by: System Administrator
Assignment group:
Assigned to: ITIL User

Description:
Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend.

We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.
Comments and Work notes:
### Table 706: Notification preview

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Creator</td>
<td>The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked <strong>Preview Notification</strong>. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Preview Record</td>
<td>The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the table specified in the <strong>Table</strong> field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
</tbody>
</table>
| Event type          | The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:  
  - **Generated Event**: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.  
  - **Existing Event**: Preview with an existing event record in the instance. If you select this option, select the event in the **Event Record** field. |
<p>| Event Record        | An existing event to preview an event-created notification. This option appears if you select <strong>Existing Event</strong> as the event type (for event-triggered notifications only). |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Users               | The users who will receive the notification, as specified in the **Who will receive** section of the Email Notification form:  
  - All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.  
  - Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are disabled. |
| Subject and Body    | The content of the notification as defined by the template. The **Subject** and **Body** sections on the preview display the content in the corresponding **Subject** and **Message** fields on the template.  
  If the template includes a link to the record that triggered the notification, the **Preview Record** link is used. Click the link to go to that record.                                                                                           |

5. Click the X at the top of the preview window to close it.

6. Make the necessary changes to the notification or template, if necessary.

**Time zone for email notifications**

A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property *glide.email.append.timezone* controls whether to append the time zone. If true, the system time zone of the instance is appended to any dates or date/times in outbound email messages (for example, 2010-07-02 04:01:14 PST).

**Specify alternative outbound email addresses for notifications**

By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin

For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to **System Notification > Email > Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.

6. Add a different email address than the **From** address to the **Reply to** field if you want replies to this notification to go to a different address.

   The system checks the **From** field for an address. If this field is empty, then the system uses the default address for the instance. If the **Reply to** field is empty, then all replies are sent to the address from which the notification was sent. If the **Reply to** field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

   For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the **From** field.

8. Click **Update**.

---

**Specify an outbound email address for a particular language**

You can specify a different email address for each language your instance supports.

Role required: admin

1. Create or copy a notification record for the desired event.

2. In the **What will it contain** section, enter a new email address in the **From** field.

3. Create the **Subject** and **Message** content in the desired language.

4. In the **When to send** section, create a condition as follows:

   1. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.

   2. From the choice list of **Related Fields**, select the field that identifies the recipient.

      For example, select **Caller > User** fields to send the notification to the user who called in an incident, or **Assigned to > User** fields to send the notification to the user to whom an incident is assigned.

   3. From the choice list of user fields, select **Language**.

   4. Select the **is** operator.

   5. Complete the condition by selecting the language of the desired user.

5. Click **Update**.

   All notifications for that event originate from the specified email address and go out in the language of the recipient.

---

**Scripting for email notifications**

Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a **${mail_script:script name}** embedded script tag to the body of the email notification or template, replacing script name with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by **<mail_script>** and **</mail_script>** in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email
Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag (${mail_script:script_name}).

**JavaScript in emails**

Create mail scripts in **System Notifications > Email > Notification Email Script**, and refer to them by using ${mail_script:script_name} in the script field.

To print text into the body of the message, use the template.print("a string") function.

```javascript
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sys_id);
gr.query();
while(gr.next()) {
  template.print(gr.number + " " + gr.cat_item.getDisplayValue() + ", Stage: " +
  gr.stage.getDisplayValue() + "<br />");
}
```

**Figure 766: JavaScript in templates**

The event.parm1 and event.parm2 parameters that come from the originating event can also be used within the <mail_script>. To use these, enter event.parm1 or event.parm2 in the mail script.

**Links to records in email notifications**

Adding the ${URI} parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

**Figure 767: Link displayed by $URI parameter**

The $URI parameter has an extension called the $URI+ format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```javascript
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()&sysparm_scriptlet_condition=current.assigned_to.nil()&sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```
when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

**Enable links to records**

Adding the special `${URI}` parameter to an outbound email body or template creates a link to a specific record.

When a user clicks on the word **LINK**, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

**Figure 768: URI email notification**

The `${URI}` parameter has an extension called the `${URI+}` format to specify additional arguments in the email link, such as `sysparm` terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```javascript
$(URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
&sysparm_scriptlet_condition=current.assigned_to.nil()
&sysparm_view=incident_active)
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

**Change the link text**

To show the display value of the record as the link text instead of the word **LINK**, use the `${URI_REF}` parameter instead of the `${URI}` parameter.

**Figure 769: URI_REF email notification**
For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

**Link to related records**

A notification can link to a related record by specifying a reference field in front of the `${URI}` or `${URI_REF}` parameters.

Format the related record link as follows:

- `${<reference field that contains the related record you want to display>.URI}`
- `${<reference field that contains the related record you want to display>.URI_REF}`

For example:

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval [sysapproval_approver] | Approval for [sysapproval] | • ${sysapproval.URI}  
  • ${sysapproval.URI_REF} |
| Related problem record in an incident notification | Incident | Problem [problem_id] | • ${problem_id.URI}  
  • ${problem_id.URI_REF} |

For example, the following notification template produces the email links in the picture below:

```plaintext
Click here to view Incident: ${URI_REF}
Click here to view Related Problem: ${problem_id.URI_REF}
```

**Figure 770: Related record link**

**Content page links in email notifications**

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages.

The link takes the following format: `${CMS_URI+<site>/<page>}`.

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: `${CMS_URI+ess/incident_detail}`

The resulting email URL has this format:

```
https://<instance name>.service-now.com/ess/incident_detail.do?
sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56
```

**Link to content pages**

You can create links to content management pages using the following format: `${CMS_URI+<site>/<page>}`.

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format:
The resulting email URL has this format:

https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

Example scripting for email notifications

Examples of scripting for email notifications.

**Scripting examples for email notifications**

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```
template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```
template.print("Summary of Requested items:<br />
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
    template.print(gr.number + ": " + gr.quantity + " X " +
    gr.cat_item.getDisplayValue()
    + " at " + gr.cat_item.price.getDisplayValue() + " each
<br />
}
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```
... email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
...
```

Using the instance_name property ensures that the notification still works when migrated between instances.

```
dothis();
function dothis(){
    var gr = new GlideRecord('sys_attachment');
gr.addQuery('table_sys_id',current.sys_id);
gr.query();
while(gr.next()){
    template.print('Attachment: <a href="https://
gs.getProperty('instance_name')+'.service-now.com/sys_attachment.do?sys_id='+ gr.sys_id+'">'+
gr.file_name+'</a>');}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

```
//email.addAddress(type, address, displayname);
email.addAddress("cc","john.copy@example.com","John Roberts");
email.addAddress("bcc","john.secret@example.com","John Roberts");
```
The following is an example script to add users from watch_list as copied recipients.

```java
if(!current.watch_list.nil()){
    //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split(",");

    //get user records
    var user = new GlideRecord("sys_user");
    user.addQuery("sys_id", watcherIds);
    user.addQuery("notification",2);
    //email
    user.addQuery("email","!=");  //!
    user.query();

    while(user.next()){
        //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());
    }
}
```

Mail script API
Certain variables are available when processing mail_script scripts.

### Table 708: Mail script variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Handles printing from the mail script to the email message.</td>
</tr>
<tr>
<td></td>
<td>template.print(&quot;message&quot;); //outputs message to the email body.</td>
</tr>
<tr>
<td></td>
<td>template.space(&quot;number of spaces&quot;); //outputs spaces to the email body.</td>
</tr>
<tr>
<td>email_action</td>
<td>GlideRecord object for the email notification (sysevent_email_action).</td>
</tr>
<tr>
<td>event</td>
<td>GlideRecord object for the event that fired the notification (sysevent).</td>
</tr>
<tr>
<td>Variable</td>
<td>Object Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------</td>
</tr>
<tr>
<td>email</td>
<td>EmailOutbound object</td>
</tr>
</tbody>
</table>

Available methods:

- `addAddress(String type, String address, String displayname):` type can be cc or bcc.
- `setFrom(String address):` override the sender address.
- `setReplyTo(String address):` override the reply to address.
- `setSubject(String subject):` override the subject of the message.
- `setBody(String message):` override the body of the message.

The email address that is passed by setFrom and setReplyTo needs to be in a valid form such as helpdesk@sn.com or Display Name <helpdesk@sn.com>. If the email address includes a 'Display Name', then that value overrides the instance's display name.

Useful attachment scripts

This is a searchable version of the Useful Attachment Scripts.
For an easy-to-navigate version, visit the Useful Scripts portal.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.
## Table 709: Useful attachment scripts

<table>
<thead>
<tr>
<th>Name</th>

<td>GlideSysAttachment.copy('sourcetable','sys_id','destinationtable','sys_id');</td>
</tr>
<tr>
<td>Delete Duplicate Attachments</td>
<td>business rule, scheduled job, background script</td>
<td>sys_attachment</td>
<td>This script will delete duplicate images located in the attachments table.</td>
<td>None</td>
<td>function fixDuplicateImages(){var gr =new GlideRecord('sys_attachment'); gr.addQuery('table_name','LIKE','ZZ_YY%'); gr.orderBy('table_sys_id'); gr.orderByDesc('sys_created_on'); gr.query();var lastID = 'not_a_match';var lastFile = 'not_a_match';while(gr.next()){var isDuplicate = (lastID == gr.table_sys_id) &amp;&amp; (lastFile == gr.file_name); lastID = gr.table_sys_id; lastFile = gr.file_name; gs.print(gr.table_sys_id + ' ' + gr.table_name + ' ' + gr.file_name + ' ' + gr.sys_created_on + ' ' + isDuplicate);if(isDuplicate) gr.deleteRecord();}</td>
</tr>
<tr>
<td>Display Whether Tasks Have Attachments in List View</td>
<td>Business Rule</td>
<td>Attachments [sys_attachment]</td>
<td>Displays whether tasks have attachments when viewed in the record list view.</td>
<td></td>
<td>function checkAttachment(){if(current.operation()=='insert') {hasAttachment('true');} // if deleting attachment check for other attachments if(current.operation()=='delete') {var timeNow3 =new GlideDateTime(); gs.log('has_attachment br: gliderecord query start date time is: '+ timeNow3.getNumericValue(),'jwtest');var attachCount =new GlideAggregate('sys_attachment'); attachCount.addQuery('table_sys_id',current.sys_id); attachCount.addAggregate('COUNT'); attachCount.query(); var numAttachments = '0'; // if no other attachments task does not have attachment if(attachCount.next()) {numAttachments = attachCount.getAggregate(&quot;COUNT&quot;);if(numAttachments&gt;0){hasAttachment='true';}}else{hasAttachment='false';}var timeNow4 =new GlideDateTime(); gs.log('has_attachment br: gliderecord query start date time is: '+ timeNow4.getNumericValue(),'jwtest');} function hasAttachment(answer){var task =new GlideRecord('task'); task.addQuery('sys_id',current.table_sys_id); task.query(); if(task.next()) {task.u_has_attachment = answer; task.autoSysFields(false); // Don't set the lastUpdatedTime or the Simultaneous Update Alert will likely get triggered task.setWorkflow(false); // Don't allow other business rules to run, otherwise multiple notifications will likely be sent task.update();}}}</td>
</tr>
</tbody>
</table>
Attachment Logging

Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

Notification examples
There are several examples that illustrate how to set up email and SMS notifications.

The two processes are identical, with the exception of the length and content of the message. SMS messages do not permit user response to links and are limited to 140 characters. Use the SMS alternate field in the Email Template and Email Notification forms to create a brief text message for SMS devices.

Baseline email notifications
The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

Table 710: Baseline email notification descriptions

<table>
<thead>
<tr>
<th>Email notification</th>

Notification example: simple reminder

In this notification example, set up a very simple reminder that sends a user an email at a specified time, based on information in an incident.

Role required: admin

We will create the following:

- A custom date/time field on the Incident form
- A business rule to define an event based on the new field
- An email notification to react to that event

1. Create a custom Date/Time field on the Incident form labeled Reminder, with a field name of u_reminder
2. Define an event that is triggered when the **Reminder** field gets a value. We create an event called `incident.reminder` that is triggered at a specific time. We use the `gs.eventQueueScheduled()` function, which is similar to the standard event creation function, but can pass a parameter to specify when the event is triggered. In this case, the event is triggered at the date and time specified in the new **Reminder** field.

**Note:** Be sure to register your new event. If you do not, the system will not know to look for it.
3. Create an email notification record that reacts to the new incident.reminder event. This brief notification message is suitable for SMS as well.

```java
gs.eventQueueScheduled("incident.reminder", current, gs.getUserId()
    ( ), gs.getUserName( ), current.u_reminder);
```
Note: This is a very simple reminder. There is no condition in place to delete or reschedule the reminder event if the incident is deleted or if the date and time in the Reminder field is changed. The business rule, as presented, will schedule a new event every time the Reminder field is updated. Nothing is configured to display a reminder that is currently scheduled for an incident. However, this reminder is very simple and can be set up in just a few minutes.

Create a concept topic to introduce the background needed to perform this process or task.

Notification example: assignment notification

In this notification example, enhance the To Do application to send an email notification when someone is assigned a task.

Role required: admin

The email notification is triggered by an event, which is triggered by a business rule. Events can be triggered by business rules and, in turn, reacted to elsewhere. This event is triggered by the business rule created in the next procedure and will, in turn, trigger the email notification.

1. Navigate to System Policy > Events > Registry.
2. Click the New to create an event registry record.
3. Select the **To_Do** table.

4. Type **A To Do has been assigned** in the **Description** field.
   
   **Fired by** is basically a comment to remind you where the events come from. We select **Business Rule**.

5. Click **Submit**.

6. Navigate to **System Definition > Business Rules**.

7. Click **New** to create a business rule.

8. Fill in the fields as follows:
   
   - **Name**: To Do Assigned
   - **Table**: to_do
   - **Run at**: server
   - **When**: after
   - **Insert**: true
   - **Update**: true

9. Enter a condition to trigger the business rule whenever the **Assigned to** field is changed or initially populated:
   
   ```
   current.u_assigned_to.changes()
   ```

10. Enter a script to add a to_do.assigned event.

11. In addition to the event name and the current record, specify two additional parameters (user’s ID and Name).

    ```
    gs.eventQueue("to_do.assigned", current, gs.getUserID(), gs.getUserName());
    ```
12. Click Submit.
13. Test that the business rule is creating the event as follows:
   1. Change the value in the Assigned to field of an existing To Do record or create a new record and specify an Assigned to.
   2. Navigate to System Policy > Events > Event log and look for an event with the name to_do.assigned.
   3. To make this easier, you can sort the event log in descending order by created.

14. Navigate to System Notification > Email > Notifications.
15. Click New to create an email notification.
16. Fill in the following fields:
   - **Name**: To Do Assigned
   - **Event name**: to_do.assigned
   - **Table name**: to_do

   The **User field** specifies to whom the email should be sent. In this case, send it to the **Assigned to** user.
17. In **User field**, enter u_assigned_to.

   Sometimes, you do not want notifications to be sent to the person who triggered the notification. In this case, clear the **Send to event creator** check box. Select this option to see all the notifications.
18. Enter the **Subject** of the email as **To Do Assigned**.
19. Under **Select variables**, click **Due Date**.
You will see text added to the message text box which causes the value of the due date to be inserted. You can change the label (Due Date in this case) which was provided automatically. Use the same method to add two more variables to the message text: Priority and Short Description.

20. Click Submit.

21. **Warning:** Do not use your own POP server for this exercise. You should have a test account set up on your mail server (see the administrator of your mail system). It may download the contents of your POP account. You may choose to skip configuring Glide to use an email server and just check the Glide email log instead of sending an actual email (see final step below).

Navigate to **System Properties > Email**.

22. Under **SMTP Server Settings**, enter the outgoing mail server, outgoing mail address, the mail server password, and outgoing mail display name.

23. If you are using a POP server, enter the POP server, incoming POP mail account name (do not include the @ and server name here), and incoming POP mail account password.

At the bottom of the form is a space where a test email account can be provided to direct emails to it instead of the actual email addresses. Rather than test emails sent to the test users, place your own email address here.
24. Click **Save**.
25. Test the assignment notifications.
   1. Assign some **To Do** records.
   2. Navigate to **System Logs Email** to see that status of generated emails.

You should receive email notifications in a few moments.

Notification example: approval request

In this notification example, a change request approval is requested, which results in an update to the **Approval [sysapproval_approval]** table.

**Role required: admin**

The **approval events** Business Rule is executed which creates the **approval.inserted** event. The Approval Request email event is configured to process the **approval.inserted** event, which uses the change.itil.approve.role email template. This is part of an automatic response that enables the recipient to click a link in the email to send a pre-formatted response back to the system to either approve or reject the change request automatically.

1. Create an email notification that looks like this:
2. Create an email template like this:

The combination of the notification and template generates an email that looks something like the following:
Notice that the receiver of this email has the following links in the mail:

- A link to view the approval record
- A link to view all the details of the change request
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change

Notification example: priority 1 incident update

In this notification example, configure the instance to notify specific users by email whenever an incident with a priority of 1 - Critical is updated, regardless of the changes that have been made.

Role required: admin

We will create an email notification to alert all recipients when the default system event incident.update is triggered for a priority 1 incident. The notification will display information of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. Navigate to System Notification Email Notifications, and then click New.
2. Configure the email notification record as follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Give your notification record a unique name, such as Incident of Priority 1 Updated.</td>
</tr>
<tr>
<td>User</td>
<td>Click the magnifying glass icon and select a recipient from the list of users. You can select only one user in this field.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event to use for this notification. The incident.updated event is triggered by any change to an incident record and can be used to send our notification.</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User field</td>
<td>Enter the field name from the <strong>Incident</strong> table that defines the recipient for this notification. For example, you might send notification of an update to the person who opened the incident by typing <em>opened_by</em>.</td>
</tr>
<tr>
<td>Email template</td>
<td>Leave this field blank. We will cover the construction and use of templates in another exercise.</td>
</tr>
<tr>
<td>Group</td>
<td>Click the magnifying glass icon, and then select a group from the list of groups. You can select only one group in this field.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the appropriate database table, in this case <strong>Incident [incident]</strong>.</td>
</tr>
<tr>
<td>Group field</td>
<td>Enter the field name from the <strong>Incident</strong> table that defines the group to notify. For example, you might send notification of the update to the designated assignment group by typing <em>assignment_group</em>.</td>
</tr>
<tr>
<td>Weight</td>
<td>Weight determines the sending priority of each notification when more than one qualifies. This is an arbitrary scale that you set.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also specified in the <strong>Users/groups in fields</strong>, <strong>Users</strong>, or <strong>Groups</strong> field. If the event creator is not specified in one of these fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>EMAIL</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box <em>(true)</em> to enable email notification.</td>
</tr>
<tr>
<td>Conditions</td>
<td><strong>Updated --&gt; is anything.</strong> This creates the condition under which the notification is sent. In the example, an update to any field in an incident record sends an email to all recipients.</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Subject</td>
<td>Type an appropriate subject line for your email. Select variables for your content from fields in the <strong>Incident</strong> table. Put the cursor in the subject line where you want the variable to appear, and then click the field name in the <strong>Select variables</strong> column. For this exercise, type the following subject line and insert the variable for the <strong>Priority</strong> field: An Incident of Priority ${priority} has been updated. In this notification, the variable ${priority} returns the value 1 – Critical.</td>
</tr>
</tbody>
</table>
| Message      | Construct a message that includes all the information you think the recipients need to know about the updated incident. Select the appropriate variables for your message from the fields in the **Incident** table. Put the cursor in the message where you want the variable to appear, and then click the field name in the **Select variables** column. The special character, `<hr/>`, creates a manual break in the message that sets off the Comments section. For this example, create the following message:  

<table>
<thead>
<tr>
<th><strong>Short Description:</strong></th>
<th>${short_description}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click here to view incident:</td>
<td>${URI}</td>
</tr>
<tr>
<td>Incident number:</td>
<td>${number}</td>
</tr>
<tr>
<td>Category:</td>
<td>${category}</td>
</tr>
<tr>
<td>Assigned to:</td>
<td>${assigned_to}</td>
</tr>
<tr>
<td>Assignment group:</td>
<td>${assignment_group}</td>
</tr>
<tr>
<td>&lt;hr/&gt;</td>
<td></td>
</tr>
<tr>
<td>Comments:</td>
<td>${comments}</td>
</tr>
<tr>
<td>List</td>
<td>Click the lock icon to open a list of recipients for the email notification. Click the magnifying glass icon and select names from the list of users. You can select as many users from the list as you want.</td>
</tr>
<tr>
<td>List field</td>
<td>Enter the field name from the <strong>Incident</strong> table that identifies a list that contains potential recipients. For example, to send the notification to users who are on the watch list for this issue, type watch_list.</td>
</tr>
</tbody>
</table>
### Field | Input Value
--- | ---
SMS alternate | Enter an abbreviated version of the email message that eliminates such things as the $(URI)$ link that requires recipient interaction and the $(comments)$ field. SMS messages can only display 140 characters.

Your email notification record should look like this:

3. **Note:** After you have created the email notification record, set up a test in your environment to make sure the intended recipients get the proper notification.

Create users in your platform who have email addresses you can monitor, and then create a group that includes one of these users.
4. Open a **Priority 1 – Critical incident**, and assign it to one of the users you created. Then select the group you created as the assignment group.

5. Open your email notification record and specify the recipients.
   1. Select one of the users you created from the lookup list in the **User** field.
   2. Type `assigned_to` for the **User field** value.
   3. Type `assignment_group` for the **Group field** value.

6. Update your Priority 1 incident by adding comments, and then click **Update**.

7. Check the email accounts of the user to whom you assigned the incident and the user member of the assignment group.

The email that is sent should have the same structure as the following sample:

---

### Email templates

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

**Create an email template**

You can create an email template with rich HTML formatting, rather than plain text.

**Role required: admin**

1. Navigate to **System Policy > Email > Templates**.
2. Click **New**.
3. Fill in the form fields (see table).
Figure 771: The Email Template form with the HTML editor

Geneva    ServiceNow    ServiceNow Platform

© 2017 ServiceNow. All rights reserved. 2807
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, change.update.risk.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, Change Request [change_request].</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
</tbody>
</table>
| Subject          | Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the **Select variables** column. For example: 

   `$(sys_class_name) $(number)
   with $(risk) risk has been
   assigned to you.`  

| Message HTML     | Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident's short description or comments and work notes. **Notes:**

   - When a template is applied to a notification, the contents of this field are used if you selected **HTML and plain text** or **HTML** in the **Content Type** field in the Email Notification form.
   - You cannot use HTML code to control the appearance of the contents in the `$(comments)` variable.
   - If you want to include a link to the record that triggered the notification.  

<p>| Message Text     | Enter the notification message to send in plain text. <strong>Note:</strong> When a template is applied to a notification, the contents of this field are used if you selected <strong>HTML and plain text</strong> or <strong>Text</strong> in the <strong>Content Type</strong> field in the Email Notification form. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Create a different message to be delivered to the recipient's SMS device. You might want a brief message, showing the most important information only. If this message field is blank, the contents of the <strong>Message Text</strong> field are used for the SMS message. <strong>Note:</strong> The message in this field is used when the message is sent to a device configured as SMS.</td>
</tr>
</tbody>
</table>

*Apply a template to an email notification*
After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open the email notification record that should use the template.
3. Navigate to the **What it will contain** section.
4. From the **Email template** field, select the appropriate template.
5. Click **Update**.

*Convert an email template to rich HTML*
If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to **System Policy > Email > Templates**.
2. Open the email template you want to convert.
Thank you for submitting $\{number\}. We appreciate your willingness to help out the knowledge management team.

Your article led us to generate the following new knowledge base articles:

$\{mail_script:kb_submission_script_1\}

The knowledge engineer had the following comments upon closure:

$\{close_notes\}
3. Click **Switch to Rich HTML Editor**.

When content is converted, these changes are made to the content:

- **HTML Editor:** Any raw HTML in the **Message** field is rendered as WYSIWYG text in the **Message HTML** field. The content can be edited in a feature-rich HTML editor.

- **Simplified Mail Scripts:** Any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
Thank you for submitting $\text{number}$. We appreciate your willingness to help out the knowledge management team. Your article led us to generate the following new knowledge base articles:
$\text{mail_script:kb_submission_script_1}$
The knowledge engineer had the following comments upon closure:
$\text{close_notes}$
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

**Note:** The letter "P" at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an <HTML> tag.

**Note:** Email templates that are already formatted with rich HTML do not show the Switch to Rich HTML Editor button.

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in System Notification > Email > Notification Email Scripts. When the scripts are completed, a \$mail_script:script name\ embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the Show Notification Scripts related link.

**Override a template value**
You can customize an email notification to override a specific value without changing the basic information contained in the template.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Open an email template.
3. Enter a new value for the field you want to override.
4. Click Update.

For example, you might change the subject line to read The risk level of \$sys_class_name\ \$number\ has been raised to \$risk\). This would not change the basic information about the change request contained in the template, but would make the email notification appropriate for the change manager who needs to know when risk levels are escalated above a certain threshold.

**Construct an email message with a template**
Email templates provide a list of the fields from database tables that are available for constructing an email message.

There is also a template that allows a mailto:automatic response link which allows the receiver of the email can to simply choose a link to send a pre-formatted response back to the instance. An example is the email template that is used for notification that an approval is required. The base email is shown below:
### Notification - Approval Request [Advanced view]

<table>
<thead>
<tr>
<th>Name</th>
<th>Approval Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Approval(sysapproval,_approve)</td>
</tr>
<tr>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>Content type</td>
<td>HTML and plain text</td>
</tr>
<tr>
<td>Include attachments</td>
<td>Yes</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>No</td>
</tr>
<tr>
<td>Push Message Only</td>
<td>No</td>
</tr>
<tr>
<td>Importance</td>
<td>-- None --</td>
</tr>
<tr>
<td>From</td>
<td></td>
</tr>
<tr>
<td>Reply to</td>
<td></td>
</tr>
<tr>
<td>Push Messages</td>
<td>Approval Request</td>
</tr>
<tr>
<td>Email template</td>
<td>change审批流程</td>
</tr>
<tr>
<td>Subject</td>
<td></td>
</tr>
<tr>
<td>Message HTML</td>
<td>Select variables:</td>
</tr>
</tbody>
</table>
Notice the selection list on the right that shows the available fields from the sysapproval_approver table. All email templates get used based on an event that was created. Generally events are created based on Business Rules that execute when a database record is modified in some way. The database record being modified when the event is created is the record that is available for generating an email request.

In this case, a change request approval was being requested which results in an update to the sysapproval_approval table. The "approval events" Business Rule was executed which created the "approval. inserted" event. The "Approval Request" email event is defined to process the approval.inserted event and this email event is defined to use the change.itil.approve.role email template that is shown above. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." These are email templates that are used to construct an automatic response so that the email receiver can simply click a link in the email to automatically either approve or reject the change request.

Here is what the change.itil.approve.role template looks like using the rich HTML editor:
Figure 773: The change.itil.approve.role template

Name: change.itil.approve.role
Application: Global
Subject: $(sysapproval.sys_class_name) $(sysapproval) Approval Request

Message HTML:

Short Description: $(sysapproval.short_description)
Priority: $(sysapproval.priority)
Category: $(sysapproval.category)

$(mailto:sysapproval)

Click here to view Approval Request: $(URL)
Click here to view $(sysapproval.sys_class_name): $(sysapproval.URL)
And the `mailto.approval` template:

![Email Template](image)

**Figure 774: The mailto approval template**
Note: If you put text on the lines following the Click here to approve $\{sysapproval\}$ line, this forms the actual body of the email.

The above combination of templates would generate an email that looks something like the following:

Figure 775: Template generated email message

Notice that the receiver of this email has the following links in the mail:

• A link to view all the details of the change request
• A link to view the approval record
• A link that will generate an automatic email response to approve the change
• A link that will generate an automatic email response to reject the change

Add blank lines in an email template
You can easily add blank lines in an email template using HTML tags.

Judicious use of these HTML tags can make your email easier to read.

• You can use `<br/>` to insert a line break
• You can wrap paragraphs in `<p> . . . </p>` tags to format your email nicely.

Calendar integration
With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the Message Text field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${dtstart}$</td>
<td>Start Date</td>
</tr>
<tr>
<td>${dtend}$</td>
<td>End Date</td>
</tr>
<tr>
<td>${location}$</td>
<td>Location</td>
</tr>
<tr>
<td>${alarm_time}$</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>
The instance computes the value of iCalendar variables using import and export maps for the following tables:

- change_request
- reminder
- itil_appointment
- incident

Figure 776: Import export maps

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.

Figure 777: iCalendar change request mappings

The instance uses the **External Name** value as the variable name in the email template. For example, the icalendar.change_request import export map defines the **dtstart** and **dtend** variables.

<table>
<thead>
<tr>
<th>External name</th>
<th>Associated variable name</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>${dtstart}</td>
<td>change_request</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>dtend</td>
<td>${dtend}</td>
<td>change_request</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables
You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the \texttt{dtstart} and \texttt{dtend} variables in the import export map for the iCalendar invitation.

Role required: admin

1. In the navigation filter, enter \texttt{sys_impex_map.list}.
2. Open the \texttt{icalendar.change_request} map or the map you want to edit.
3. In the Field Maps related list, click either the \texttt{end_date} or \texttt{start_date} mapped field to change the mapping for \texttt{dtstart} or \texttt{dtend}, as needed.
4. Change the Database field to the field you want to use to set the start date or end date.
5. Click Update.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin

1. Create the custom table and fields using the Date/Time field type for the fields that map to the \$\texttt{dtstart} and \$\texttt{dtend} variables.
2. In the navigation filter, enter \texttt{sys_impex_map.list}.
3. Click New.
4. Set the following fields:
   - \textbf{Name}: Use the following naming convention: \texttt{icalendar.<table name>}. For example, \texttt{icalendar.u_my_custom_table}.
   - \textbf{Table}: Select the custom table you created.
   - \textbf{Type}: Select \texttt{icalendar}.
5. Right-click the form header and select Save.
6. In the Field Maps related list, click New.
7. In the Mapping Entry Wizard, select Mapping to a Database Field.
8. Create field mappings for \texttt{dtstart} and \texttt{dtend}. These variables are required.
   - For example, map the \textbf{External Name \texttt{dtstart}} to the \texttt{u.meeting_start_time} field in \texttt{u_my_custom_table}.
9. Click Submit.
10. Create field mappings for any other iCalendar fields as necessary.
11. Click Update.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, \texttt{u_my_custom_table}:

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{dtstart}</td>
<td>\texttt{u.meeting_start_time}</td>
<td>field</td>
<td>\texttt{icalendar.u_my_custom_table}</td>
</tr>
<tr>
<td>\texttt{dtend}</td>
<td>\texttt{u.meeting_end_time}</td>
<td>field</td>
<td>\texttt{icalendar.u_my_custom_table}</td>
</tr>
<tr>
<td>\texttt{description}</td>
<td>\texttt{u.meeting_description}</td>
<td>field</td>
<td>\texttt{icalendar.u_my_custom_table}</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   a) Set the Table field to the custom table you created.
b) In the **Message** text field, use the following format to define the iCalendar invitation.

```
BEGIN:VCALENDAR
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
END:VCALENDAR
```

**Note:** Mail script is not allowed or processed in meeting invitation email templates.

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>VERSION:2.0</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>METHOD:REQUEST</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>BEGIN:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO: ${to}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DTSTART:${dtstart}</td>
<td>Yes</td>
<td>You must use the import export map to map dtstart to a start time field on the custom table.</td>
</tr>
<tr>
<td>DTEND:${dtend}</td>
<td>Yes</td>
<td>You must use the import export map to map dtend to an end time field on the custom table.</td>
</tr>
<tr>
<td>UID:${sys_id}</td>
<td>Yes</td>
<td>You must provide the name of a field that uniquely identifies the record, such as the sys_id or the record number field.</td>
</tr>
<tr>
<td>DTSTAMP:${dtstamp}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>iCalendar template line</td>
<td>Required?</td>
<td>Notes</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------</td>
<td>-------</td>
</tr>
<tr>
<td>DESCRIPTION:</td>
<td>No</td>
<td>To include a multiple line description, you must use the import export map to map description to a text field on the custom table. The field mapping ensures that the system encodes line breaks correctly for the iCalendar file format.</td>
</tr>
<tr>
<td>SUMMARY:</td>
<td>No</td>
<td>To include a summary from a text field on the custom table, provide the name of the field, such as u_meeting_summary. The summary field value must not contain line breaks. You do not need to create a field mapping.</td>
</tr>
<tr>
<td>END:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>END:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

- **Table**: Select the custom table.
- **Type**: Select **Meeting Invitation**.
- **Content type**: Select **Plain text** only.
- **Email template**: Select the template you created.

**Inbound email actions**

Inbound email actions enable you to define the actions an instance takes when receiving email.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the inbound email action takes the action that you configure. It can take two types of actions:

- **Record action**: setting a value for a field in the target table.
- **Email reply**: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action's script.

**Attachments**

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.
Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
- Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the Email logs on page 1059 for examples of what you might see if a notification or inbound email action is not processed.

Domain separation

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the Caller field. If that user is not in the User [sys_user] table, the incident is in the global domain.

Inbound action type criteria
An instance uses a set of criteria to decide what action to take based on the type of message that is sent to the instance.
Figure 778: How an instance matches email to an inbound action type
<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward</td>
<td>The email contains the following conditions:  1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present).  2. From &lt;user email&gt; appears anywhere in the email body.</td>
<td>Create Incident (Forwarded)</td>
<td>Create new record</td>
</tr>
<tr>
<td>Reply</td>
<td>The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  1. A valid watermark that matches an existing record.  2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record.</td>
<td>Update Incident (BP)</td>
<td>Update existing record</td>
</tr>
</tbody>
</table>
Inbound email action type | Required matching criteria | Name of default action (Incident table) | Result of default action
---|---|---|---
New | The email does not meet the conditions for either a reply or forward type inbound email action | Create Incident | Create new record

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action’s table, the instance uses the **Order** field to determine the order in which the actions run.

**Recognized reply prefixes**

Emails with certain prefixes trigger inbound email actions of the type **reply**.

When no watermark or is present or the **In-Reply-To** email header is present, the instance recognizes email containing a prefix from the glide.email.reply_subject_prefix property as reply email. When this property is set, your email system uses non-standard reply prefixes.

**Table 715: Specifying recognized reply prefixes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: re:,aw:,r:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

**Note:** Prefixes are case insensitive.

**Recognized forward prefixes**

Emails with certain prefixes trigger inbound email actions of the type **forward**.

The instance recognizes any email whose subject line contains a prefix from the glide.email.reply_subject_prefix property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. When this property is set, your email system uses non-standard forward prefixes or you want forwards to behave like replies.
Table 716: Specifying recognized forward prefixes

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: fw:, fwd:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Prefixes are case insensitive.</td>
</tr>
</tbody>
</table>

Email forwards as replies
Properties are available to force inbound actions to process forwarded mail as replied mail.

These properties control the subject prefix that the inbound actions use.

Table 717: Properties that process forwards as replies

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>re:, Re:, RE:, aw:, r:, fw:, fwd:, Fwd:, FWD:</td>
</tr>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>[any text that is not a forward prefix]</td>
</tr>
</tbody>
</table>

This causes all forwarded and replied to mail to be processed by the Update Incident inbound action.

**Note:** The glide.email.forward_subject_prefix property must contain some text in order for the forwarded email to be processed as a Reply. It can be any text except a forward prefix (that is, fw:, fwd:, Fwd:, FWD:).

The matching of a sender email address to a user
The instance matches a senders email address to an active user in the User [sys_user] table using inbound actions.

**Note:** The Email Automatic User Creation plugin must be active.

When processing an email, the instance sets the current user to the user whose email address matches email.from. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the incident's caller_id to the value returned by gs.getUserID().

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

**Note:** It is strongly recommended to have unique email addresses for each user record. Otherwise, the instance can not reliably match the email to the correct user and unpredictable matches may occur.

If providing a unique email address to each user is not possible, only having one active user with the shared email address is recommended. This configuration guarantees that the instance always matches incoming email from this address to the active user.

The matching of incoming email to an inbound action type
The instance uses the following logic to match an email to a specific inbound action type.

**Incoming email matching**

By default, the instance searches email for a watermark to match the incoming email to an existing record in the system.
The instance searches for watermarks in the email subject line first, then in the email body. If no watermark is present, the instance searches for an In-Reply-To email header that matches an existing record. If that is not found, the instances searches the subject line for a recognized reply prefix.

Note: Some versions of Microsoft Exchange Server require a hotfix to support the "In-Reply-To" header when replying to email that originates from outside the organization.
Examples of matching watermarks in the Subject line or Body
The following examples illustrate how the instance matches watermarks in an email's subject line or body.

### Table 718: Examples of matching watermarks in the Subject line or body

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref:MSG0000008</td>
<td>The instance recognizes this as a watermark and searches the Email Watermarks [sys_watermarks] table for a record with the number MSG0000008. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Ref:MSGWTR0000008</td>
<td>The instance recognizes this as a watermark and searches the Email Watermarks [sys_watermarks] table for a record with the number MSGWTR0000008. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Ref:WTR0000008</td>
<td>The instance recognizes this as a watermark and searches the Email Watermarks [sys_watermarks] table for a record with the number WTR0000008. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>MSG0000008</td>
<td>The instance does not recognize this as a watermark because it does not start with the Ref: prefix. It uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

Examples of matching record numbers in the Subject line
The following examples illustrate how the instance matches record numbers in an email's subject line to an existing record when no watermark is present.
Table 719: Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example INC0005574*</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it will not find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: CHG0008593 and INC000576</td>
<td>The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance will match first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

**Note:** The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance will match first. For this reason, the instance does not recommend creating notifications that include more than one $number variable.
<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>FW: Example INC0005574</td>
<td>The instance recognizes this subject line as a forward because of the <code>FW:</code> prefix and uses the inbound action for forwarded emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Example INC0005574</td>
<td>The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

*Create an inbound email action*

You can create inbound email actions to define the actions that the system takes when an email is received.

*Role required: admin*

1. Navigate to **System Policy > Email > Inbound Actions**.
2. Click **New**.
3. Fill in the fields as described in the table.
Inbound Email Actions - Create Incident

Inbound email actions specify how ServiceNow creates or updates task records in a table when the instance receives an email. The inbound email action looks for a watermark in the email to associate it with a specific task. If the conditions specified in the inbound action are met, the script is run. More info

| Name       | Create Incident       | Application | Global
|------------|-----------------------|-------------|--------
| Target table | Incident [Incident]  | Active      |        
| Action type | Record Action         | Stop processing |     

When to run

<table>
<thead>
<tr>
<th>Only emails of the selected Type will trigger this inbound action.</th>
<th>Only emails from senders with the Required roles will trigger this inbound action.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type New</td>
<td>Required roles</td>
</tr>
</tbody>
</table>

Order determines when to run relative to other inbound actions. The inbound action with the lowest order runs first.

<table>
<thead>
<tr>
<th>Order</th>
<th>From</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td></td>
</tr>
</tbody>
</table>

Only emails from this sender will trigger this inbound action.

All of the following conditions must be true, to trigger this inbound action.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Add Filter Condition</th>
<th>Add &quot;OR&quot; Clause</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- choose field --</td>
<td>-- oper --</td>
<td>-- value --</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<tr>
<td>Script</td>
<td>Enter the script the action runs. Typically, this script uses the validators script include and email variables. A template is provided:</td>
</tr>
<tr>
<td></td>
<td><code>(function runAction(/ *GlideRecord*/ current, / *GlideRecord*/ event, / *EmailWrapper*/ email, / *ScopedEmailLogger*/ logger) { // Implement email action here }) (current, event, email, logger);</code></td>
</tr>
<tr>
<td></td>
<td>These are the objects available:</td>
</tr>
<tr>
<td></td>
<td>• <strong>current</strong>: access the record referred to by the inbound email. For example, <code>current.assigned_to</code> accesses the person assigned to the task.</td>
</tr>
<tr>
<td></td>
<td>• <strong>event</strong>: access one of the parameters of the originating event. For example, <code>event.parm1</code> accesses the first parameter of the event or <code>event.parm2</code> for the second parameter. See <strong>Events</strong> on page 2996 for more information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>email</strong>: access the inbound current email record. For example, <code>email.subject</code> accesses the content in the subject line of the email. See <strong>Accessing email objects with variables</strong> on page 2837 for more information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>logger</strong>: add a message to the log file with the source set to <code>email.&lt;Sys ID of incoming email&gt;</code>. For example: <code>logger.log (&quot;Some information&quot;)</code></td>
</tr>
</tbody>
</table>
| Description | Enter a detailed explanation of what this inbound email action does.

Other fields
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. For more information. This field is not installed by the Ordered Email Processing plugin.</td>
</tr>
</tbody>
</table>

**Accessing email objects with variables**

An inbound email action script has access to various pieces of an inbound email through script variables.

**Table 721: Accessing email objects with variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>email.to</td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td>email.direct</td>
<td>email.direct</td>
</tr>
<tr>
<td>email copied</td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td>email.body_text</td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td>email.body_html</td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
<tr>
<td>email.from</td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field matches an existing user’s Email address, this variable contains the user’s email address.</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field does not match an existing user’s Email address, this variable contains the address listed in the email Headers field.</td>
</tr>
<tr>
<td>email.from_sys_id</td>
<td>Contains the Sys ID of the user who sent the email to the instance.</td>
</tr>
<tr>
<td>email.origemail</td>
<td>Contains the email sender’s address as listed in the email Headers field.</td>
</tr>
<tr>
<td>email.subject</td>
<td>Contains the email’s subject as a plain text string.</td>
</tr>
<tr>
<td>email.recipients</td>
<td>Contains a comma-separated list of recipient addresses.</td>
</tr>
<tr>
<td>email.recipients_array</td>
<td>Contains the recipient addresses as an array.</td>
</tr>
<tr>
<td>Variable</td>
<td>Contents</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>email.content_type</td>
<td>Contains the MIME content type of the email (for example, text/plain; charset=&quot;us-ascii&quot; or text/html; charset=&quot;us-ascii&quot;).</td>
</tr>
<tr>
<td>email.headers</td>
<td>Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.</td>
</tr>
</tbody>
</table>

**Note:** The instance follows RFC 2822 (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the email.to, email.direct, and email.copied variables only if email addressed to groups follow the expected RFC format.

**Example assignment of tasks via email**

Name:value pairs in an email template can set field values in a record.

For example, the `change.itil.approve.role` email template lists several fields in the outbound notification.

![Email Template](image)

**Figure 781: The Email Template form**

Notice the line in the template that shows `Priority:${sysapproval.priority}`. When replying to this email, the approver can change the value of the **Priority** field directly from the email. For example, the approver could set the priority to 4—Low:

```
Priority: 4
```

**Locked out users triggering inbound email actions**

A property is available to have locked out users trigger inbound actions.

The property `glide.pop3.process_locked_out` allows users who need to reset their password to send an email message to an instance asking for assistance.

**Warning:** Enabling this property also enables users from untrusted domains to trigger inbound actions.
Table 722: Property that allows locked out users to trigger inbound email actions

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.pop3.process_locked_out</td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

**Email user matching**

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

Table 723: Matching email to existing users

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>Matching User ID</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Michael Tossi&quot;<a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi, Michael&quot;<a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi&quot;<a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td>Tossi</td>
</tr>
</tbody>
</table>

**Note:** This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the gs.createUser() method. Use either the automatically-generated email variables or the gs.GetUserID() method instead.

User impersonations and inbound actions

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

**Note:** If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions.

**User creation from incoming email**

An instance can automatically create users from incoming email.

When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID [sys_user.user_name] set to the sender’s full email address.
Table 724: Creating users from incoming email

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User, New&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot; <a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

Enabling automatic user creation

To enable the automatic creation of user records from email, you must set two email properties.

1. Navigate to **System Properties > Email**.
2. Select the check box for **Automatically create users for incoming email from trusted domains** (glide.pop3readerjob.create_caller).
3. Enter the list of trusted domains in **Trusted domains for creating users from incoming emails** (glide.user.trusted_domain).
4. Click **Save**.

**Note:** When the property glide.pop3readerjob.create_caller is set to false, the instance runs inbound actions from users who do not match an existing user by impersonating the Guest user. When the property glide.pop3readerjob.create_caller is set to false, the instance runs inbound actions from users who do not match an existing user by impersonating Guest user. You may want to prevent untrusted users from triggering inbound actions by locking out the Guest user.

User creation method

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin makes the following changes:

- Sets the property glide.email.create_userid_from_email to true.
• Increases the width of the User ID \([\text{sys_user.user_name}]\) column to accommodate email addresses.

After activating the plugin, enable automatic user creation from email.

**Warning:** Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and will randomly select one of the users with the matching email address.

prevent untrusted users from triggering inbound actions
You can prevent users from untrusted domains from triggering inbound actions.

Role required: admin

For example, you can prevent email from users outside your company domain from creating incidents.

**Note:** Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

1. Enable automatic user creation and add a list of trusted domains. For example, add your company domain `example.com`.
2. Navigate to **User Administration > Users**.
3. Select the user `guest`.
4. Select the **Locked out** field to disable the guest account. Locking out a user record prevents the user from processing inbound actions.

When a user from a trusted domain sends an email to the instance, the instance either matches the email to an existing user or creates a new user. Since the incoming email matches a user record (either an existing or new one), the email can trigger an inbound action.

When a user from an untrusted domain sends an email to the instance, the instance attempts to impersonate the guest user. Since the guest user is locked out, the impersonation fails and the incoming email cannot trigger an inbound action.

**Warning:** Allowing locked out users to trigger inbound actions also allows untrusted users to trigger inbound actions.

inbound email recipient processing
The recipients variables allow processing of inbound email based on the email recipients.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>email.recipients</code></td>
<td>Returns a comma-separated list of recipient addresses as a plain text string.</td>
</tr>
<tr>
<td><code>email.recipients_array</code></td>
<td>Returns the recipient addresses as an array.</td>
</tr>
</tbody>
</table>

For example, create a script to process email based on the array values:

```javascript
var rarray  = email.recipients_array ; for ( var i  = 0 ; i  < rarray.length ; i ++ ) { var recipient  = rarray [i ] ; // do something with it }
```

© 2017 ServiceNow. All rights reserved.
The sys_email variable
You can use the global variable sys_email with inbound email actions.

This lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as uid, sys_id, content_type, and so on.

Email redirection to the instance POP3 account
You can have other mailboxes forward email to the instance’s POP3 account.

By default, the POP Reader schedules job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The POP Reader downloads any email waiting on the mail server and creates email.read events. After the instance processes the events, the inbound email actions run.

The POP Reader shows the number of emails processed during the reader’s last run. The message shows the number of emails the reader processed or 0 processed if no emails were available. The reader resets the status each time it runs.

While it is not possible to specify more than one POP3 account for the instance, you can have other mailboxes forward to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient and then set an assignment_group value.

```javascript
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities Management');
```

Field values from the email body
Values in an inbound email can set field values in a task record.

Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

To populate a reference field, use setDisplayValue() instead. See Redirecting Emails for an example of using setDisplayValue() in an inbound email action.

Note: The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

```
Foo:bar
```

The inbound email script creates the variable email.body.foo with the value of bar. You can use these variables to create conditions such as:

```javascript
if(email.body.foo!=undefined){
  current.[field]=email.body.foo;
}
```

In this example, the script sets the value of [field] to the value bar.

Integrating inbound events
This tutorial illustrates how to create a notification from an inbound JSON request.

Role required: admin

When complete, you will be able to:

- Send a JSON request to the imp_notification web service import set with the JSON processor
- Create a new import set in the imp_notification table in the instance using data from the JSON request
The following example steps assume you have your own demonstration instance.

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.
   - **Method**: POST
   - **URL**: http://<instance name>.service-now.com/imp_notification.do?JSON
   - **Headers**: Authorization: Basic
   - **Body**: 
     ```
     {"sysparm_action":"insert","message":"this is an event","uuid":"abc"}
     ```

5. Click **Send**.
7. Verify that the instance sends back a response with a **sys_id**.
8. Login to your development instance.

10. Verify that the import set table has an event matching your JSON request.

**Troubleshooting inbound email**

The following solution to this common inbound email error is useful for troubleshooting email actions.

**Table 726: Issues and symptoms**

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email from Outlook produces an empty Incident record</td>
<td>Configure the local Outlook client or Exchange server to not send Rich Text formatted (RTF) data to the instance. To prevent Windows email containing a winmail.dat file, see Microsoft <a href="https://support.microsoft.com/en-us/help/138053">KB 138053</a> for information on configuring Exchange.</td>
</tr>
</tbody>
</table>

For more information, open the Knowledge Base and access the following two articles:

- For troubleshooting inbound email, see [KB0524472](https://knowledge.citrix.com/knowledgebase/view.php3?id=kb0524472).
- For troubleshooting outbound email, see [KB0524480](https://knowledge.citrix.com/knowledgebase/view.php3?id=kb0524480).

**Inbound email action examples**

Several examples of inbound email actions are available to help you build your own inbound email actions. Inbound email action example: handling email replies
This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

Role required: admin

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the Additional Comments text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Update Incident</td>
</tr>
<tr>
<td>Type</td>
<td>Reply</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
</tbody>
</table>

3. In Script, enter this code.

```javascript
gs.include('validators');

//Note: current.caller_id and current.opened_by are already set to the first UserID that matches the From: email address
if (current.getTableName() == "incident") {
    current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;
    if (email.body.assign !== undefined)
        current.assigned_to = email.body.assign;
    if (email.body.priority !== undefined && isNumeric(email.body.priority))
        current.priority = email.body.priority;
    if (email.body.category !== undefined)
        current.category = email.body.category;
    if (email.body.short_description !== undefined)
        current.short_description = email.body.short_description;

    current.update();
}
```

Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to create a problem record.

Role required: admin

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Problem [problem]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Problem: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.description =</td>
</tr>
<tr>
<td></td>
<td>email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description =</td>
</tr>
<tr>
<td></td>
<td>email.subject.toString().substring(9);</td>
</tr>
<tr>
<td></td>
<td>current.assignment_group.setDisplayValue(&quot;Development&quot;);</td>
</tr>
<tr>
<td></td>
<td>if (email.body.assign != undefined)</td>
</tr>
<tr>
<td></td>
<td>current.assigned_to =</td>
</tr>
<tr>
<td></td>
<td>email.body.assign;</td>
</tr>
<tr>
<td></td>
<td>current.insert();</td>
</tr>
</tbody>
</table>

Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.

Role required: admin

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request [change_request]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Change Request: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.comments =</td>
</tr>
<tr>
<td></td>
<td>email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description =</td>
</tr>
<tr>
<td></td>
<td>email.subject;</td>
</tr>
</tbody>
</table>
Inbound email action example: updating an incident

Inbound Email Actions allow users to log or update incidents on an instance via email. The Inbound Email Action parses the email and responds using a script.

Role required: admin

By default, an email received by the instance creates a new incident, sets the Contact type field to Email, and adds the body of the email to the Additional Comments field. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

The following Inbound Email Action applies to email replies. Normally, when a user responds to an email sent by the instance, the inbound email action will match the watermark to an existing incident, and update the incident rather than creating a new record. However, if the watermark is missing, this Inbound Email Action will attempt to match a reply to the original incident.

To define an inbound email action for replies:

1. Navigate to System Policy > Email > Inbound Actions and click New.
2. Populate the form (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.notify = 2;</td>
<td></td>
</tr>
<tr>
<td>if (email.body_text.assign !== undefined)</td>
<td></td>
</tr>
<tr>
<td>current.assigned_to = email.body_text.assign;</td>
<td></td>
</tr>
<tr>
<td>if (email.body_text.priority !== undefined)</td>
<td></td>
</tr>
<tr>
<td>current.priority = email.body_text.priority;</td>
<td></td>
</tr>
<tr>
<td>if (email.body_text.category !== undefined)</td>
<td></td>
</tr>
<tr>
<td>current.category = email.body_text.category;</td>
<td></td>
</tr>
<tr>
<td>current.insert();</td>
<td></td>
</tr>
</tbody>
</table>

Inbound Email Actions allow users to log or update incidents on an instance via email. The Inbound Email Action parses the email and responds using a script.

Role required: admin

By default, an email received by the instance creates a new incident, sets the Contact type field to Email, and adds the body of the email to the Additional Comments field. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

The following Inbound Email Action applies to email replies. Normally, when a user responds to an email sent by the instance, the inbound email action will match the watermark to an existing incident, and update the incident rather than creating a new record. However, if the watermark is missing, this Inbound Email Action will attempt to match a reply to the original incident.

To define an inbound email action for replies:

1. Navigate to System Policy > Email > Inbound Actions and click New.
2. Populate the form (see table).

<table>
<thead>
<tr>
<th>Name</th>
<th>Update Incident</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action type</td>
<td>Reply Email</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Actions &gt; Script</td>
<td>Insert the following:</td>
</tr>
</tbody>
</table>

```javascript
gs.include('validators');
if (current.getTableName() == "incident") {
    current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;
    if (email.body.assign !== undefined)
        current.assigned_to = email.body.assign;
```
if (email.body.priority !== undefined && isNumeric(email.body.priority))
  current.priority = email.body.priority;

if (email.body.category !== undefined)
  current.category = email.body.category;

if (email.body.short_description !== undefined)
  current.short_description = email.body.short_description;

  current.update();
}

Values automatically set from incoming email

The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.caller_id</td>
<td>User ID of the first user whose email address matches the <code>email.from</code> variable.</td>
</tr>
<tr>
<td>current.opened_by</td>
<td>User ID of the first user whose email address matches the <code>email.from</code> variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance recommends having unique email addresses for each user record. If providing a unique email address to each user is not possible, the instance recommends only having one active user with the shared email address. This configuration guarantees that the instance always matches incoming email from this address to the active user.

**Ordered email processing**

The Ordered Email Processing plugin enables you to configure a processing order for inbound email actions.

In addition to forcing email actions to run in a prescribed order, the administrator can add a command to the script for an action that halts processing after the script runs. The plugin simply adds the `Order` column to the Rules [sysrule] table, which the instance uses to determine when to process emails.

Configure the processing order

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Role required: admin

1. Navigate to **System Policy > Email > Inbound Actions**.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the `Order` field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the `Order` field might be named **Execution Order**.
**Note:** Ensure each inbound action has a unique **Order** value to ensure the system stops processing as expected. If multiple inbound actions have the same **Order** value, the system might evaluate all of the inbound actions, even if one of them contains the `event.state="stop_processing";` script or has the **Stop processing** option selected.

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:

- Select the **Stop processing** check box.
- Add the following line to the bottom of the **Actions** script:

```
event.state="stop_processing";
```
Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

Role required: admin
In this example, you can create new problem records when `prb:` appears in the subject line and new change requests when `chg:` appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

1. Create an action with a condition of `Subject > starts with > chg:` and the `event.state="stop_processing";` command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of `Subject > starts with > prb:` and the `event.state="stop_processing";` command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

It is not necessary to add the `stop_processing` command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

If either a change request or a problem is created, the `stop_processing` command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Activate ordered email processing

The Ordered Email Processing plugin is enabled by default for all new instances and can be installed by a user with the admin role for upgraded instances.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Email filters

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. Email filters are inactive by default.

Default email filters

After activation, these filters are available from the System Mailboxes > Filters module:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents inbound email actions from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
</tbody>
</table>
### Filter Description

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the <code>glide.pop3.ignore_headers</code> property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the <code>glide.pop3.ignore_senders</code> property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the <code>glide.pop3.ignore_subjects</code> property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter changes an email's x-headers to mark a message as spam. This filter does not include the software product of the same name. This filter is enhanced in the Geneva release to provide better spam filtering.</td>
</tr>
</tbody>
</table>

**Note:** Using the Move spam to junk folder filter requires configuring your own email servers as the ServiceNow email infrastructure does not support changing email headers. You can accomplish such filtering with any software capable of changing email headers.

---

**Email filter script include**

Email filters use a script include called `EmailUtils` that contains a simple utility function to determine if `vCalendar` is in the body of the response email. The results of this query are used in a condition script in the Ignore VCAL email filter.

**Spam scoring and filtering**

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin. This is only available for instances that use the ServiceNow email infrastructure. See [KB0549426](#) for an explanation of email scoring and filtering.

**Activate email filters**

Administrators can activate the Email Filters plugin (`com.glide.email_filter`).

Role required: admin

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the **Load demo data** check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

Create an email filter
You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

Role required: admin

1. Navigate to **System Mailboxes > Administration > Filters**.
2. Click **New**.
3. Complete the fields (see the table).
4. Right-click in the header bar and select **Save** from the context menu.
   The Filter Actions related list appears.
5. Click **New** in the related list.
6. Select how the system should react when the conditions of this filter evaluate to true.
   The two choices in the base system are: Mark as Ignored and Move to Junk. You can use the Action script to perform additional email tasks.
Evaluates condition based on results of a script include

Additional tasks to perform when the filter condition evaluates to true.
### Table 730: New filter table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Brief, descriptive name for this filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Define an order for this filter to determine when it is evaluated. By default, the Ignore VCAL filter has the lowest order number and is evaluated first.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box (true) to enable this filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Concise description of the function of this filter.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Add conditions for this filter with the condition builder or with a condition script. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Create a script that defines the conditions for this filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Use the action script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs &gt; Email).</td>
</tr>
</tbody>
</table>

**Note:** Before creating additional email actions with a script, see *Inbound Email Actions*. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

---

### Watermarks on notification emails

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records.

The watermark always includes "Ref:" and a customizable prefix, followed by the auto-numbered identifier of the source record, such as incident, problem, or change request. The default prefix is MSG. For example, Ref:MSG3846157.

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
• Be omitted from individual email messages

Inbound email actions might not work properly if watermarks are omitted from email notifications. Without a watermark, inbound email messages cannot be associated with the accumulated comments related to the original incident, and each subsequent notification that is sent is treated as a new incident.

**Note:** Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

**Note:** Email clients that use the plain text version of the email still show the watermark.

*Create a custom watermark prefix for email notifications*

By default, email notifications use the watermark prefix **MSG**, but you can create a custom watermark prefix.

Role required: admin

Any email notifications that are forwarded from one instance to another might be indistinguishable because they use the same watermark. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.

1. Navigate to **System Definition > Number Maintenance**.
2. Open the **sys_watermark** record.
3. Make the **Prefix** unique for this instance.

![](image)

4. Click **Update**.

*Omit an email notification watermark*

You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Role required: admin

When incoming email does not contain a watermark, the system searches the subject line and message body for an incident number. The system attempts to match any incident number that it finds to an existing
incident. If there is a matching incident number, the system updates the incident with the values in the incoming email.

1. Navigate to System Notification > Email > Notifications.
2. Select the email notification to update.
3. Click the Advanced View related link.
4. In the What it will contain section, select the Omit watermark check box.
5. [Optional] If you want response email messages to generate new incidents, remove the record number \${number} variable from the Subject and Message HTML fields.

Hide email watermarks globally
Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Role required: admin
1. Navigate to sys_properties.list in the Application Navigator.
2. Create a new property named glide.email.watermark.visible and set it to false.

   This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

System mailboxes
Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mailbox.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email [sys_email] table.

System Mailboxes

- **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the Received state. If the email message matches the criteria in an inbound email action, the email is changed to Processed. If not, it is changed to Ready. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.

- **Outbound emails**: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to Sent (if sent) or Skipped (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

The email client
The email client enables you to send email directly from any record, such as an incident, change request, problem, or user record.

The email client is enabled by default, starting with the Fuji release.

The email client can be useful in cases where you want to send an email:

- To engage more people in a piece of work
- That includes Cc and Bcc recipients
- That includes personalized comments
• To a third party who doesn't have an account in your instance
• To someone about an incident where you don't have an email notification set up to do exactly what you want

The email client always uses the **multipart/mixed** content type and supports HTML markup in the message body.

**Note:** Line breaks do not appear for multi-line fields such as `{{description}}` and `{{comments}}` in the email client template.

**Email client interface**
The instance's email client interface looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

Users see an email icon based on the UI version.

• **UI16:** The email icon (✉️) appears in the more options menu.
• **UI15:** The email icon (✉️) appears in the form header.

Users click the email icon to launch the email client as a pop-up window.
Figure 783: The email client interface

**Note:** The Subject field on the email client allows a larger character count than the default setting for the Subject field on the Email table. If the subject text from the client is being truncated, increase the Max length value for the Subject field on the Email table.

**Customize the email client**
The email client has default properties and values that you can customize to suit your needs.
<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>How to Customize</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACL access</td>
<td>Defaults to allowing only users with the itil role to access the email client.</td>
<td>To control who can see the email client, see Control access to the email client on page 2862.</td>
</tr>
<tr>
<td>Email icon</td>
<td>Allows only users with write access to the current table to see the email icon.</td>
<td>To remove the email icon, see Email icon display on page 2868.</td>
</tr>
</tbody>
</table>
| Autocomplete | Defaults to only displaying a user's first and last name. A system property controls what columns the email client auto-complete displays. If your organization has several users with the same name, consider adding company or email address columns to help distinguish between users. | • To change search behavior, see Configure email client auto-complete search results on page 2860.  
• To display additional information, see Additional information in the email client auto-complete on page 2861 |
| To        | Defaults to the email address of the caller.                                  | To edit the default value, create an email client template.                                                                                                                                               |
| Cc         | Defaults to the email addresses of the user who opened the incident and all users in the watch_list. | To edit the default value, create an email client template.                                                                                                                                               |
| Subject    | Defaults to the incident number and short description.                        | To edit the default value, create an email client template.                                                                                                                                               |

Configure email client auto-complete search results
You can control the email client's auto-complete search results with an email client property.

The following properties on System Properties &gt; UI Properties control the autocomplete functionality for the email client.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of autocomplete matches returned to the Email Client. Applies separately to users and groups.</td>
<td>10</td>
</tr>
<tr>
<td>Include groups in Email Client autocomplete results</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Figure 784: Email client autocomplete properties
### Table 732: Email client properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.email_client.autocomplete.count</td>
<td>Set the maximum number of auto-complete matches.</td>
</tr>
<tr>
<td>glide.ui.email_client.autocomplete.group</td>
<td>Specify whether groups are included in auto-complete results.</td>
</tr>
</tbody>
</table>

Additional information in the email client auto-complete

A system property allows the email client to display additional columns from the User table in the auto-complete list.

Administrators can add this system property to help distinguish between individuals who have the same first and last names, and to ensure that users select the proper recipient for an email.

### Table 733: Email client properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.email_client.email_address.disambiguator</td>
<td>Sets the columns from the User [sys_user] table that the autocomplete list displays. Separate each column name with a semicolon character (;). See the system dictionary for a list of available column names. For example, to add the sys_user.email and sys_user.company columns, set the property to: email;company.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: name</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Property [sys_properties] table</td>
</tr>
</tbody>
</table>
Figure 785: Auto-complete in the email client

Control access to the email client
You can control access to the email client by changing an ACL rule.
Only users with the itil role can access the email client. The following ACL rule controls this access:

Table 734: ACL rule

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailClientProcessor</td>
<td>processor</td>
<td>execute</td>
</tr>
</tbody>
</table>

Note: Because the visibility of the email icon is determined by whether the current user has write access to the table, it is possible that a user may be able to see the email icon and still not open the email client.

Create an email client template
You can create a different template for each table that uses the email client.
Role required: admin
The email client uses its own email templates to define default values for fields.
1. Navigate to System Notification > Email > Client Templates.
2. Click New.
3. Fill in the fields on the Email Client Template form.

Table 735: Email client template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique template name.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table that the template applies to. You must enable the email client for the same table.</td>
</tr>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses.</td>
</tr>
<tr>
<td>Cc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses.</td>
</tr>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a description of the email. The description can contain a comma-separated list of field names or specific values.</td>
</tr>
<tr>
<td>Body</td>
<td>Enter any text or mail script that you want to appear in the message body.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Note:** If the Client Templates module is not visible, enable the module.

Here is a sample template for the Incident table.

```javascript
template.print("Incident number -" + current.number + ":\n");
```

Here is how the template populates an incident email.
Set the from address with an email client template
Use an email client template to set a default value for the From field if it should be different from the system default.

Role required: admin

For example, you can dynamically set the From field to the email address of the current user.

1. Navigate to System Policy > Email > Client Templates.
2. Select an existing template or create one. For example, select the Incident Template record.
3. Configure the form to add the From field.
4. Enter a script to add a default value to the From field.

For example, the following script displays the current user name and the current user email address.

```
javascript:gs.getUserDisplayName() + " <" + gs.getUser().getEmail() + " >"
```

Display an editable From field
By default, the email client does not display a From field on email messages, but you can add one and have it be editable.

Role required: admin

By default, the email client uses an email address taken from the email account. To display an editable From field in the email client:

1. Navigate to System Properties > UI Properties.
2. Select the **Yes** check box for Override the email 'From:' address in the email client 
(glide.ui.email_client.from).

*Display the Reply To field*

By default, the email client does not display the Reply to field because users cannot change this address. But you can display this field using a UI property.

Role required: admin

The email client always uses the same Reply to address as that defined for email notifications. This ensures that the email has a valid *watermark* and can generate *inbound email actions* as normal. If you want to change the global reply-to address you must configure your instance to use your own SMTP server.

1. Navigate to **System Properties** > **UI Properties**.
2. In the Override the email 'Reply to:' address in the email client (glide.ui.email_client.reply_to) field, select the **Yes** check box.

*SMS delivery with the email client*

A property is available that lets the user select an option to send a notification via SMS.

The *Subscription Based Notifications plugin* activates the following *system property*:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email_client.show_sms_option</td>
<td>Specify whether a check box appears in the email client for sending the message to the user's SMS device. If no SMS device exists, the email client sends the message to the primary email device.</td>
</tr>
</tbody>
</table>
Quick messages allow you to insert predefined text into the message body of the email client. Role required: admin.

Selecting a quick message fills the Message Text field with the body specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client. Use the following syntax: \${variable_name}.

**Note:** If you add attachments to the Quick Message templates, the attachments are not sent as part of the email distribution.

1. Navigate to **System Policy > Email > Quick Messages**.
2. Click **New**.
3. Fill in the Email Client Canned Messages form.

**Table 737: Email client canned messages form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter a name to appear in the Quick Message selector.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the quick message available for selection. Clear this check box to remove the message from the Quick Message selector.</td>
</tr>
<tr>
<td>User</td>
<td>Select the user who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Select the group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Body</td>
<td>Enter the text you want to insert into the Message Text field. By default, the field supports HTML format.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Email icon display
You can use access control rules to hide or display the email icon on forms.

Users with write access to the current table can see the email icon. To remove the icon, remove the user’s write access to the table. Typically you do this in one of two ways:

• Make the user an Employee Self-Service (ESS) user. ESS users do not have a user role, and without a role they do not have write access to the Incident table. Making a user an ESS users, therefore, hides the email icon on the Incident form.
• Create a custom ACL rule and user role that does not have write access to the table. The default ACL rule for the email client checks to see if the user has the itil role. If you grant users a custom role other than itil, then any such users will not see the email icon.
Push notifications

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices.

A push notification is a text message that appears on a user’s mobile device to alert them about something important or to ask them to perform an action. Starting with the Geneva release, your instance supports push notifications.

Figure 787: An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by taking action on related records. For example, you can have the instance send an approval request for a Change to a user, and let the user approve or deny the Change by clicking a response button on push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

- who to send the notification to
By default, the ServiceNow mobile application supports push notifications. But you can also develop your own push application and configure your instance to send push notifications to it.

**Push notification setup**

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- **Push notification setup with the ServiceNow mobile application** on page 2872

  **Note:** Push notifications for on-premise instances are not supported.

- **Push notification setup with a custom push application** on page 2872. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system works. For more information, see the APNs Overview in the *Local and Remote Notification Programming Guide* for Apple developers.

**Attention:** Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the *Local and Remote Notification Programming Guide* for Apple developers.

**The push notification system**

Several elements are involved in the push notification system.

- **Customer instance**: your instance.
- **Push proxy**: An instance that collects all push notifications that go to the ServiceNow mobile application and forwards them to the ServiceNow iOS application. If you create a custom push application, you do not use the push proxy.
- **Push provider**: The provider of push messages, which by default is the Apple Push Notification Service (APNs) for the ServiceNow mobile application.
- **Feedback provider**: The provider of feedback messages, which tell the instance what devices are no longer valid. By default, the Apple feedback server handles feedback messages for the ServiceNow mobile application.
- **Feedback proxy**: The ServiceNow instance that handles feedback messages from the Apple feedback server.
- **Push application on a mobile device**: The application, such as the ServiceNow mobile application. You can also build and customize your own push application.

**Push notification process**

The push notification process is as follows:

1. Activity on the instance triggers a push notification.
2. The instance looks for who to send the notification to and checks the user’s preferences to find their push device settings.
3. The instance sends the push notification to the push notification service, such as the Apple Push Notification Service (APNs). Optionally the instance can send the notification through a push proxy instance, which then forwards the notification to the APNs.
4. The push notification service sends the notification to the user’s push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID so that a response to the notification can be sent back to the correct instance.

5. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

6. The instance identifies a script to run to handle the response.

7. The script takes action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

This diagram shows the elements of the push notification system. Within the ServiceNow infrastructure are your instance, the optional push proxy instance, and the ServiceNow feedback proxy. External to ServiceNow are the APNs, and the user's mobile device, which includes the application that is registered to receive push notifications. See Push feedback on page 2872 for an explanation of the feedback servers.

Figure 788: The push notification system

Push notification responses

One of the benefits of push notifications is that users can take action on records in the instance by responding to a push notification.
The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

http://{instance_name}/api/now/v1/push/{application Name}/action/{action}

The application name is the push application the user is using. This must match the application name in the Push Application [sys_push_application] table. The action is the Sys ID of the action in the Push Notification Action Script [sys_push_notif_act_script] table.

Push feedback

*Feedback* refers to the information about failed message delivery and the push applications that can no longer receive push notifications.

The instance uses a scheduled job to pull feedback data every hour from the APNs. When the APNs determines that a device can no longer receive push messages, the corresponding device in the Push Installation [sys_push_installation] table is set to inactive, thereby making it unable to receive push notification messages. If the same device is again able to receive push notifications, the device receives the same token and a new record is inserted into the Push Notification Installation [sys_push_notif_app_install] table.

Push notification setup with the ServiceNow mobile application

If you are using the default ServiceNow mobile application, push notifications are set up similar to subscribable notifications.

**Note:** Push notifications with the ServiceNow mobile application are not supported in on-premise instances.

The process is as follows:

1. A user installs the ServiceNow mobile application and agrees to accept push notifications. The device then:
   - Obtains a token that identifies the device
   - Triggers the creation of a device in the user’s notifications preferences
   - Automatically subscribes the user to the push-specific notifications that are set up for the ServiceNow mobile app.

   When the instance receives the push notification acceptance message, it creates a record in the Push Notification Installation [sys_push_notif_app_install] table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

2. The system administrator sets up push notifications, just like they set up an email notification. Push notifications contain two parts:
   - The push message
   - The notification, which includes the push message

3. Users or administrators can verify the user's notification preferences to see if the user has a push device configured and that the user is subscribed to the relevant push notifications.

Push notification setup with a custom push application

If you are using your own mobile or push application, push notifications there are a number of steps to take in addition to setting up push notifications with the ServiceNow mobile application.

The process is as follows:
1. The push app developer creates a record in the Push Application [sys_push_application] table for the custom application. This record is what the instances uses to identify the device + push application combination necessary to identify a push notification recipient.

2. The push app developer creates push notification action scripts to tell the instance how to handle responses to push notifications.

3. The push app developer can also create a content payload in JSON for different types of push notifications. The content determines how a push notification appears on the push application, and whether or not the user can send a message in response to the push notification.

4. The system administrator sets up push notifications, and specifies the custom push app and, if desired, the content.

5. Users set up their push device on their user profile's notification preferences, just as they can set up email addresses or devices for SMS messages. Administrators can also set up these preferences on behalf of users.

Activate push notifications

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.snc.service_management_m) plugin active, push notification plugins are automatically activated.

Role required: admin

You must have the following plugins active on your instance:

- **Push Notification**: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- **Notification System Push Addon**: Adds support for push notifications to the existing notification system.

This plugin is installed in the push notification infrastructure:

- **Push Feedback**: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

1. In the HI Service Portal, click **Service Catalog > Activate Plugin**.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note**: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
3. Click Submit.

Installed with push notifications

Several types of components are installed with the push notifications plugins.

Tables installed with push notifications

These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Application [sys_push_application]</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Push Default Registration [sys_push_notif_default_reg]</td>
<td>Contains all of the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
<tr>
<td>Push Feedback [sys_push_feedback]</td>
<td>Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or a central instance that uses a REST call to tell your instance which push applications to deactivate.</td>
</tr>
<tr>
<td>Push Message Attribute Definition [sys_push_notif_msg_attr_def]</td>
<td>The attribute definitions used for push message content specification.</td>
</tr>
<tr>
<td>Push Message Attribute Value [sys_push_notif_msg_attr_val]</td>
<td>The values associated with push messages.</td>
</tr>
<tr>
<td>Push Notification [sys_push_notification]</td>
<td>The push notifications that the instance attempted to send to users.</td>
</tr>
<tr>
<td>Push Notification Action Script [sys_push_notif_act_script]</td>
<td>The scripts that the instances uses in response to an actionable push message.</td>
</tr>
</tbody>
</table>
### Push Notification Installation

**Table name**: [sys_pushnotif_app_install]  
**Description**: The devices with push apps where users agreed to receive push notifications. The records in this table are listed by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app. The Mobile Devices [sys_mobile_devices] table, which is installed with the Mobile UI plugin, contains all the user devices that logged into the instance with the ServiceNow mobile application.

### Push Notification Message

**Table name**: [sys_pushnotif_msg]  
**Description**: Messages customized for push notifications. These messages can be associated with a notification.

### Push Notification Message Content

**Table name**: [sys_pushnotif_msg_content]  
**Description**: The entire content, including JSON, for push messages.

### Push Platform

**Table name**: [sys_pushplatform]  
**Description**: The platforms that are supported for push notifications, and the maximum payload size.

#### Business rules installed with push notifications

These business rules are installed with push notifications.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>

Set up push notifications for the ServiceNow mobile app

Administrators can set up push notifications by creating push-specific notifications and associating them with standard platform notifications.

The **Push notification plugin** must be active.
Role required: admin

Follow these steps to set up push notifications that send content to users.

Create a push message

Before you create a push notification, create a push message with the actual message content.

Role required: admin

2. Fill out the fields on the form (see table).
3. Click Submit.
Table 742: Push Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
<tr>
<td>Push app</td>
<td>Select a push app that this message can be sent to.</td>
</tr>
<tr>
<td>Push Message Content</td>
<td>Select content layout for the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Values</td>
<td>Select the attributes that apply to this notification. The attributes on this form override those associated with the content layout.</td>
</tr>
</tbody>
</table>

Make sure that the relevant users have their push devices configured and that the users subscribe to the notification in the user's notification preferences. See Set up a mobile notification device for a user on page 2895, Select notifications on page 2898, and Subscribe to a notification message on page 2878.

Create a notification using a push message

Email administrators can create a notification that specifically sends a push notification.

Configure the push message and create a push message content before performing these steps.

Role required: admin

You can associate a push message with a standard notification.

1. Navigate to System Notification > Create Push Notification.
2. Fill out the notification form as necessary (see Create an email notification on page 2756 for descriptions of the form fields.
3. Click the What it will contain tab.
4. Next to Push Messages, click the lock icon and select a push message.
5. If you want this notification to be sent only as a push notification and not as any other type of notification, select Push Message Only.
6. Click Submit.

If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

Make sure that the relevant users have their push devices configured and that the users subscribe to the notification in the user's notification preferences. See Set up a mobile notification device for a user on page 2895, Select notifications on page 2898, and Subscribe to a notification message on page 2878.

Subscribe to a notification message

After setting up your devices, you are ready to subscribe to new messages or manage messages you have already received.
If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

**Note:** Filters that you apply to messages do not override the original filters that the administrator created for the notifications. Your filter conditions are evaluated after the original conditions are met. If the administrator's notification filter fails, your filter conditions are not evaluated. If neither an advanced filter nor a predefined filter is selected, you see all notifications that match the administrator's original filter conditions.

1. Navigate to **Self-Service > My Profile** to open your user profile.
2. Click the **Notification Preferences** related link.
3. On the Notification Preferences page, click the plus icon.
4. Fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification Message</td>
<td>Select a message from the list. Related fields appear for certain notifications. For example, if you select CI affected or Location affected, a field appears for selecting the CI or the location. Duplicate messages are not permitted on a device.</td>
</tr>
<tr>
<td>Device</td>
<td>Select the notification device for the message. The device that you are adding a notification for is selected by default, but you can change the device, if appropriate.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule for message delivery.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a notification filter to refine the notifications that you receive. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions in the administrator's notification filter. This field is not available when an advanced filter is configured.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select the check box to enable the condition builder and select the table to use. When you select the check box, the Filter field is replaced by the Table and Conditions fields.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you select the CI affected notification message, you might select the Incident [incident] or Change Request [change_request] table. This field appears when you check the Advanced filter check box.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to refine the notification.</td>
</tr>
</tbody>
</table>
If you do not specify a schedule or filter, the message is delivered when the event occurs and when the filter condition defined by the administrator is met. You can select a delivery schedule that is more convenient, create conditions that refine the notifications you receive, or select a predefined filter intended for reuse. For example, the default filter for a notification might send you a message when a high priority incident is opened for a particular CI. You can refine the message delivery options and add a filter that notifies you when those incidents are assigned to a particular assignment group.

5. Click **Save**.

---

**Set up push notifications for a custom push app**

Mobile application developers can set up a customized push app and configure components such as action scripts and notification layouts.

The **Push notification plugin** must be active.

Role required: admin or push_admin

Follow these steps to set up a push notification infrastructure using your own push application.

---

**Caution:** General system administrators do not need to configure these settings to use the ServiceNow mobile application with push messages. These instructions are intended for users who develop their own customized push application.

---

**Create a push application**

You must register your customized mobile application with your instance so it can receive push notifications.

Role required: admin or push_admin
Push notifications are application specific: they are sent to one type of mobile application, regardless of how many users have this application installed. By default, the ServiceNow mobile application is automatically set up and ready to use starting with the Geneva release. If you develop your own mobile application, you must create a record for it in the Push Application table.

1. Navigate to **System Notification > Email > Push Application**.
2. Fill out the fields on the form (see table).
3. Click **Submit**.
A push application is a mobile app that can receive push notifications from a ServiceNow instance. Create a mobile application record for your customized mobile app and specify how to handle push messages and feedback.

### Push Application Details

**Name:** ServiceNowPushApp  
**Application:** Global  
**Push:** REST API

</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Push</td>
<td>Select from the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Direct</strong>: Send push notifications directly to the push service without going through an intermediary. This is the recommended method. If you select this option, you need to specify a X.509 <strong>Certificate</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>REST API</strong>: Send push notifications through an intermediary instance, that in turn sends the notification to the APNs. The commutation between the two instances is via a REST message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>: do not enable push notifications for this application.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Select from the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Apple</strong>: Send push notifications directly to the APNs without going through an intermediary.</td>
</tr>
<tr>
<td></td>
<td>• <strong>REST API</strong>: Send push notifications through an intermediary instance, that in turn sends the notification to the APNs. The commutation between the two instances is via a REST message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>: Do not handle feedback for this push application.</td>
</tr>
<tr>
<td>Apple</td>
<td>The X.509 <strong>Certificate</strong> and <strong>Sandbox Certificate</strong> you created on the Apple notifications portal. The certificate allows a device to talk to the APNs. This option appears only if you select <strong>Direct</strong> for the <strong>Push</strong> field.</td>
</tr>

<td><strong>Push Notification Message Contents</strong> Select the content layout associated with this app.</td>
</tr>
<tr>
<td></td>
<td><strong>Push Default Registrations</strong> Select the notifications that you want automatically subscribed to users who use this application. Users are subscribed to only active notifications.</td>
</tr>
</tbody>
</table>
Create a push action

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the **Approval** field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the **JSON content**.

Role required: admin or push_admin

1. Navigate to **System Notification > Push > Push Action**.
2. Fill in the form fields (see table).
3. Click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the action.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the script.</td>
</tr>
</tbody>
</table>

See *Push notification example* on page 2889 for an example of a push action.

Create push message content

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

You must know how to use JSON with push messages.

Role required: admin or push_admin

The content layout defines the style of push notification that can be sent out. Push contents give you the opportunity to add content, such as a picture, as well as provide action buttons or icons. Use these in the script:

- **current**: the properties of the current record.
- **message**: the push message sent as the body of the entire push content.
- **attributes**: the object of the push message *attributes that you define*.

1. Navigate to **System Notification > Push > Push Message Content**.
2. Fill out the fields on the form (see table).
3. Click **Submit**.
Push notification message content specifies additional JSON content in the push notification payload that is sent to the push provider. Use this record to create the JSON content and specify the provider-specific values, such as a sound or badge.

The following variables are available for use in the script:

- `current`: access properties of the record that triggered this push notification, such as the fields on an incident record.
- `message`: access contents of the message that will be sent as the body of the push notification.
- `attributes`: access attributes defined for this push notification.

```javascript
var json = {
  "app": "default",
  "record": {
    "table": current.getTableName(),
    "sys_id": current.sys_id
  }
};
```
Table 745: Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the layout.</td>
</tr>
<tr>
<td></td>
<td>See the example scripts below.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Definitions</td>
<td>Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create an attribute definition on page 2886 for information on creating attributes.</td>
</tr>
</tbody>
</table>

The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
  "table" : current.getTableName(),
  "sys_id" : current.sys_id,
  "template" : {
    "type" : "2 button",
    "button1" : {
      "title" : "Approve",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "approve"
      }
    },
    "button2" : {
      "title" : "Decline",
      "action" : attributes.button_action,
      "parameters" : { "response" : "decline"
    }
  }
};
json;
```

Create an attribute definition

Push message attribute definitions allow you to create reusable properties for push message content specification.

Role required: admin or push_admin
Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

These attributes can be overridden by any *push message attribute values* that you create.

1. Navigate to **System Notification** > **Push** > **Push Message Content**.
2. Select a content layout record or script record.
3. In the Push Message Attribute Definition related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.

**Table 746: Push Message Attribute Definition form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
</tbody>
</table>
Create an attribute value or action for a push message

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Create default definitions on the Push Message Attribute Definitions related list of the Push Message Content form.

Role required: admin or push_admin

These push message attribute values override values that you set in an attribute definition on the Push Content form.

2. Select a message.
3. In the Push Message Attribute Values related list, click New.
4. Fill out the fields on the form (see table).
5. Click Submit.

See Push notification example on page 2889 for an example of a push attributes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Type</td>
<td>Select the type of attribute:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Action</strong>: An action to take on the instance, as defined by a script.</td>
</tr>
<tr>
<td></td>
<td>• <strong>String</strong>: An arbitrary string to send as part of the message content.</td>
</tr>
<tr>
<td></td>
<td>The string can specify items like a button label in the message.</td>
</tr>
<tr>
<td>Default Script</td>
<td>Select the mobile action script that tells the instance what to do when it</td>
</tr>
<tr>
<td></td>
<td>receives a response from the push notification. This option appears if you</td>
</tr>
<tr>
<td></td>
<td>select <strong>Action</strong> for the <strong>Type</strong>.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Specify an arbitrary string value to be placed in the attribute that is used</td>
</tr>
<tr>
<td></td>
<td>by the message content. For example, the string could specify a button</td>
</tr>
<tr>
<td></td>
<td>label. This option appears if you select <strong>String</strong> for the <strong>Type</strong>.</td>
</tr>
</tbody>
</table>
### Push notification example

This example illustrates a customized push notification, including customized push actions and content. In this example, you will learn how to create a push notification for incidents that are not assigned to anyone. This example assumes you created your own custom push application that is referred to in this example as **MyPushApp**. The notification will be sent to a user who can respond by accepting assignment to the incident or ignoring it.

#### The push actions

First you will create push actions that give the user options on how to respond to the push notification. In this example, create two actions: **assign to me** and **ignore**. The content of the actions is as follows:
• **Assign to me:**

```javascript
(function runAction(/*Optional GlideRecord*/ current) {
    if (current.getTableName() == "incident" && current.assigned_to == undefined) {
        current.comments = "I have self assigned this incident to myself";
        current.assigned_to = gs.getUser();
        current.update();
    }
})(current);
```

• **Ignore:**

```javascript
(function runAction(/*Optional GlideRecord*/ current) {
    gs.log(gs.getUser() + " ignored this record: " + current.number);
    //writes a message to the system log that the user ignored this incident.
})(current);
```

See *Create a push action* on page 2884 for specific steps on how to create these actions.

### The push content

Next, you will create the JSON content that specifies two buttons that the user will use to respond to the incident. The content is as follows:

```javascript
(function buildJSON(/*GlideRecord*/ current, /*String*/ message, /*Object*/ attributes) {
    var json = {};

    json = {
        "aps": {
            "sound": "default"
        },
        "record": {
            "table": current.getTableName(),
            "sys_id": current.sys_id
        },
        "action": {
            "button1_text": attributes.name_of_button1,
            "button1_action": attributes.action_of_button1,
            "button2_text": attributes.name_of_button2,
            "button2_action": attributes.action_of_button2
        }
    );
    return json;
})(current, message, attributes);
```

The content script specifies two labels and two actions, one for each button. You must create definitions for these. But later you will override these definitions with the actual button labels and actions on the push message. Here are the definitions:
The push message

Next you will create a push message that specifies the message that appears to the user: **Can you take on a new incident?**. The push message associates your custom application **MyPushApp** with the content you just created.
Figure 790: Push message example

The Push Message Attribute Values related list specifies the four items needed for the button label and the action the instance takes when the user clicks that button:
### Table 748: Push message attribute values

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_on_button2</td>
<td>Ignore</td>
<td>Ignore</td>
<td>The Ignore action is what you specified as a push action. This is associated with button 2.</td>
</tr>
<tr>
<td>action_on_button1</td>
<td>Assign to me</td>
<td>Assign to me</td>
<td>The Assign to me action is what you specified as a push action. This is associated with button 1.</td>
</tr>
<tr>
<td>name_of_button2</td>
<td>Ignore</td>
<td>none</td>
<td><em>Ignore</em> is the label the user sees for button 2.</td>
</tr>
<tr>
<td>name_of_button1</td>
<td>Assign to me</td>
<td>none</td>
<td><em>Assign to me</em> is the label the user sees for button 1.</td>
</tr>
</tbody>
</table>

**The push notification**

Finally, you will create a notification that is triggered when a new incident is unassigned. It is sent to a group named Incident Manager. You will then associate the push message that you just created with it. The notification is as follows:
Figure 791: Push notification example
Set up a mobile notification device for a user

When a user registers their mobile application to an instance, a notification device is automatically created for them in their notification preferences. You can still set up or modify mobile notification devices for your users.

If your users have the ServiceNow mobile application installed on their devices, you do not need to follow these instructions.

1. Navigate to User Administration > Users.
2. Select a user.
3. Click Notification Preferences.
4. Click New Device.
5. In the Type field, select Push.
6. In the Push app field, select the application that is already configured to handle push notification for the instance.

See Set up a notification device on page 2896 for more information on the other fields in this form.

You can also disable the push device for the user if the user should no longer receive push notifications.

**Note:** You do not need to disable the push device for the users who remove the push app or who no longer use their push device. The instance automatically deactivates their device in the Push Notification Installation table.

7. Subscribe to the push notifications or instruct the user to subscribe in their notification settings.

Failed push notification messages

Push notification delivery might fail for a number of reasons. You can view which messages failed and re-queue them to be sent out if necessary.

Role required: admin

**Note:** There is no way for the instance to guarantee or confirm push message delivery. See the [iOS developer library](https://developer.apple.com/library/mac/documentation/NetworkingInternetTrading/Conceptual/RemoteNotificationsPG/) for more information about how Apple handles push notifications.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:

- Apple iOS: **2,048 bytes**
- Google: **4,096 bytes**

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. See the [iOS Developer Library payload documentation](https://developer.apple.com/library/mac/documentation/NetworkingInternetTrading/Conceptual/RemoteNotificationsPG/Payloads.html) for more information on Apple payload limitations.

1. Navigate to System Logs > Push Notifications.

   By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:

   - **failure**: The message could not be sent.
   - **pending**: The message is queued and will be processed.
• **success**: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting **Re-queue failed push notifications** from the choice list.

3. If a number of push notifications continue to fail, consider increasing the value in the glide.push.notification.ttl_seconds property. See **Push notification properties** on page 2896 for more information.

### Push notification properties

Push notifications provides several properties to customize the setup.

Add these properties to the System Properties [sys_properties] table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.push.debug</td>
<td>Creates entries in the system log for push notification errors.</td>
<td>false</td>
</tr>
<tr>
<td>glide.push.feedback.debug</td>
<td>Creates entries in the system log for feedback sent by the APNs.</td>
<td>false</td>
</tr>
<tr>
<td>glide.push.notification.ttl_seconds</td>
<td>Specifies a time period after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the <strong>Push Notifications log</strong> for more information.</td>
<td>21600 seconds (6 hours)</td>
</tr>
</tbody>
</table>

### Subscription-based notifications

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification devices, such as mobile phones, that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

### Set up a notification device

You can add devices for a user to receive notifications. A **device** is a mobile device, email account, or voice message system that the user has access to.
Role required: admin

Notification devices include email addresses, service providers for SMS messages, and mobile applications.

1. Navigate to User Administration > Users.
2. Select a user.
3. Click Notification Preferences.
4. Click New Device.
5. Fill in the fields on the form (see table).
6. Click Submit.

---

**Table 750: New Device form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name of the device or account.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of device:</td>
</tr>
<tr>
<td></td>
<td>• Email: for email messages.</td>
</tr>
<tr>
<td></td>
<td>• SMS: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• Mobile: for push notifications.</td>
</tr>
<tr>
<td>Email address</td>
<td>The user’s email address.</td>
</tr>
<tr>
<td>Mobile application</td>
<td>The <em>mobile application</em> for push notifications.</td>
</tr>
</tbody>
</table>
## Select notifications

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

1. Navigate to **Self-Service > My Profile** to select your own notifications, or if you have admin access, navigate to **User > Administration Users** to select notifications for another user.
2. Click a user record to open it.
3. On the User form, click **Notification Preferences** under Related Links.

The notification preferences page appears. The preferences pages shows all the notifications available to the user and the devices that the user has configured, such as email, mobile phone, mobile device for push notifications. If a user does not have read-only access to the table on which the notification is based, the notification does not appear.

Every user has the **Primary email** device, where subscriptions to email notifications can be enabled.
4. Click the switch next to the notification to subscribe the user to it.

Modify notifications for a specific user device

After you set up the devices through which users can receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications you can receive.

Role required: admin

1. On the Notification Preferences page for a user, find the notification from the list of notifications.
2. Click Edit next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click Submit.
Notification Preferences

Get notified whenever actions that involve you occur. Leverage filters or sort the list to focus on them, or unsubscribe entirely from messages. You can also create new notifications.

**Primary email**

- Change assigned to me
- Change assigned to my group
- Email assigned to group (sc_task)
- Problem assigned to me

**Admin mobile phone**

No notifications set up, click the plus button to add.

Figure 792: Notification preferences for a user's device

**Table 751: Form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification Message</td>
<td>Select the notification. Related fields appear for certain notifications. For example, if you select <strong>CI affected</strong> or <strong>Location affected</strong>, a field appears for selecting the CI or the location. Duplicate messages are not permitted on a device.</td>
</tr>
<tr>
<td>Device</td>
<td>Modify the device if necessary.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
</tbody>
</table>
### Field Description

**Filter**
Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions in the administrator's notification filter. This field is not available when an advanced filter is configured.

**Advanced filter**
Select this option if you want to use the condition builder to create additional criteria. When you select the check box, the Filter field is replaced by the Table and Conditions fields.

**Table**
Select the table for the notification. For example, if you select the CI affected notification message, you might select the Incident [incident] or Change Request [change_request] table. This field appears when you check the Advanced filter check box.

**Conditions**
Define as many conditions as needed to limit the notifications you receive.

### Create a service provider
Administrators can configure service providers for devices that use SMS.

**Role required:** admin

Administrators also have the option of configuring how a device’s service provider affects the construction of the device’s email address.

1. Navigate to the Notification Service Provider [cmn_notif_service_provider] table by typing cmn_notif_service_provider.list in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click **Update**.
4. Click **Save** on the Notification Preferences page.
### Table 752: The Notification Service Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the <strong>Construction script</strong> field.</td>
</tr>
<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, <code>abc + current.phone_number + def@text.att.net</code> would construct an email address of <code>abc2223334444def@text.att.net</code>. <strong>NOTE:</strong> <code>Current</code> is a reference to the device, not the service provider, hence the <code>current.phone_number</code> variable that uses the device's <code>phone_number</code> value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device's specified phone number; for example: <code>PREFIX2223334444@text.att.net</code></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after <code>@</code> sign; for example: <code>2223334444@SUFFIX</code></td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider's <strong>Advanced script</strong>. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

**Select a service provider**

You can configure how a device's service provider affects the construction of the device's email address.

Role required: admin

1. Navigate to **User Administration** > **Users** and open any user's record.
2. Under Related Links, click **Notification Preferences**, and then click an SMS notification device.
3. If no SMS device is present, click **New Device** and configure one.
4. Select the appropriate service provider, and then click the reference icon for the Service provider field. The service providers are saved in the Notification Service Provider [cmnnotif_service_provider] table. Only active providers are visible.

The Notification Service Provider form provides the following fields:

Table 753: Selecting a service provider

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configured name of the service provider.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of device - in this case <strong>SMS</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this notification device.</td>
</tr>
<tr>
<td>Advanced notification</td>
<td>Removes all the previous options and displays the Advanced script field.</td>
</tr>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the Construction script field</td>
</tr>
</tbody>
</table>
Field | Input value
--- | ---
Construction script | Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + def@text.att.net would construct an email address of abc2223334444def@text.att.net.

*Note:* Current is a reference to the device, not the service provider, hence the `current.phone_number` variable that uses the device’s phone_number value.

SMS Provider Email Prefix | Places the provided text before the device's specified phone number (e.g. PREFIX2223334444@text.att.net).

SMS Provider Email suffix | Places the provided text after ‘@’ sign (e.g. 2223334444@SUFFIX)

Notification Device Variables | Additional, optional attributes of an SMS device used inside an SMS service provider's Advanced script. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.

---

**SMS notification advanced scripting**

You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

**Table 754: Objects and attributes**

<table>
<thead>

Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Mandatory field. This field does not display by default.
4. Select the Mandatory check box.

That notification is now locked in user preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule. In the user’s notification preferences, the control button for the mandatory notification is on and is read only.
Force a notification to be sent

To force a notification to be sent to the specified users, enable forced delivery.

Role required: admin

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the Notification field is set to Disable.

1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Force delivery field.
4. Select the Force delivery check box.
5. Click Update.

Unlike using the Mandatory option, forcing the delivery does not lock the user's preference or prevent the user from unsubscribing from the notification.

Add an unsubscribe link to an email message

You can add an Unsubscribe link to the bottom of any email body so users can unsubscribe from any subscription-based notification.

Role required: admin

- Paste the following code into an email notification or template:

```java
template.print(' '<a href="' + gs.getProperty('glide.servlet.uri') + 'unsubscribe.do?sysparm_notification=' + email_action.sys_id + '" Unsubscribe</a><br/>
');
```
Create a notification filter

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Role required: admin

For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. Notification filters are available for selection in the Filter field of a user's Notification Preferences form.

**Note:** The system applies the user's filter conditions after the administrator's conditions have been evaluated. If the administrator's conditions fail, the system ignores notification filters.

1. Navigate to System Notification > Email > Notification Filters and create a record.
2. In the Notification conditions related list of the new record, create and submit filter conditions on one or more tables.

3. Repeat the procedure to create additional conditions on other tables for this filter.
Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Role required: admin

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the Weekdays schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

1. Define schedules as needed using System Scheduler > Schedules > Schedules.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the Schedule field.
4. In the Schedule field, select the schedule for the device.
5. Click Submit.

Edit the schedule or filter of an existing notification message

Role required: admin

To edit the schedule or filter of an existing notification message:

1. In the Notification Preferences screen, click the message to edit.
   You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Click Update.

Notify

Notify allows you to integrate with telephony providers such as the Twilio service to manage phone calls and SMS messages from within your instance.

Notify with the Twilio service

Notify allows you to send and receive phone calls and SMS messages from your instance using the Twilio telephony service.

Notify automatically creates a TwiML application in the Twilio service and configures the application to use the instance as an endpoint. Phone numbers associated with the Twilio subaccount are imported to Notify.

Configure Notify with the Twilio service

You can configure Notify to use the Twilio telephony service.

You must have an SID and authentication token for an active Twilio subaccount.

Important: Ensure that each instance you configure Notify on uses a different Twilio subaccount. Each subaccount specifies a unique SID, authentication token, telephone numbers, and endpoint. Using the same subaccount across multiple instances may cause your Twilio service configuration to be overwritten.
Role required: notify_admin

1. Navigate to Notify > Twilio Configuration.
2. Enter your Account SID.
3. Enter your Auth Token.
4. Click Save.

A read-only list of phone numbers associated with this Twilio subaccount appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group the number belongs to.

**Note:** If you buy or release numbers on the Twilio subaccount, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the **Active** field set to false. Use only active phone numbers for inbound or outbound communication.

Phone numbers you import to Notify are stored on the Notify Phone Numbers [notify_number] table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

### Outbound communication requirements

Outbound communications initiated through Notify, such as phone calls and SMS messages must satisfy certain requirements.

These requirements apply to all outbound communications initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running, and cause an error to be logged. Set the glide.notify.debug property to true to create detailed error logs.

### Recipient number requirements

These requirements apply to any number that receives a Notify phone call or message.

- The number must be E.164 compliant
- The number must be different than the phone number used to initiate the call or message
- The number must not be a phone number used by Notify

### Number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Number groups allow you to provide consistent functionality in different geographic regions using local phone numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the **Notify Phone Numbers** related list on the Notify Phone Number Group form.

### Create a number group

Create a number group to organize Notify phone numbers and associate them with inbound and outbound workflows.
Role required: notify_admin

1. Navigate to Notify > Number Groups.
2. Click New.
3. Select workflows for incoming and outgoing calls and SMS messages.
   Incoming call workflows must run on the Notify Call [notify_call] table. Incoming and outgoing SMS
   workflows must run on the Notify Message [notify_message] or Global [global] tables.
4. Click Submit.

After creating a number group, associate numbers with that group to use the selected workflows.

Notify calls

As a Notify administrator, you can view a list of calls made to or from Notify.

To view a list of calls, navigate to Notify > Calls.

Call records are generated automatically when a user calls a Notify number, or when a user makes an
outbound call through Notify. You cannot create call records manually. You can delete call records.

Note: Deleting a call record may result in cascade deletion of related records.

How incoming Notify calls are processed

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity
[notify_wf_activity] table. Each notify_wf_activity record is associated with a single call. These records
store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity onExecute() function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a State value of
   execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record State changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the
   notify_wf_activity response_args field.
9. The notify_wf_activity State changes to complete.
10. The JSON data from the notify_wf_activity record is copied to the Last action field in the Notify call
    record that triggered the workflow.
11. The workflow invokes the onUpdate() function in executing activities.
12. The activity confirms that the associated notify_wf_activity record has completed, and changes the
    activity state to finished.
13. The workflow transitions to the next activity.
Notify conference calls

Notify allows you to connect multiple callers to a single conference call.

Conference call records are stored on the Notify Conference Call [notify_conference_call] table. Conference call participant records are stored on the Notify Participant [notify_participant] table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the Duration of a call are set automatically using business rules.

Notify administrators can manage conference call participants, such as by muting or kicking them.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: Join Conference Call Via SMS

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

**Mute or kick a conference call participant**

You can mute or kick conference call participants.

Role required: notify_admin

Before starting this procedure, ensure there is an active conference call with one or more participants.

1. Navigate to Notify > Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

You can unmute a muted participant but cannot add a kicked participant back to the conference call. A kicked participant may rejoin the conference call, such as by calling in again.

Using SMS with Notify

You can send and receive SMS messages using Notify.

You can send SMS messages using the Notify API sendSMS method, or using the send SMS workflow activity.

Inbound and outbound SMS messages are stored on the Notify Messages [notify_message] table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost as each message can incur a cost. Some mobile carries, such as Sprint, do not support concatenated SMS messages.

Notify workflow activities

Notify activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the Table field value is Notify Call [notify_call].

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the current.is_human variable, such as with an If workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.
**Note:** Do not add a **Timer** activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **None**. Notify controls which workflow to run based on the configured number groups.

Join Conference Call workflow activity

The **Join Conference Call** connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 755: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **join conference call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the **conference_call** scratchpad variable is not set.

**Scratchpad entries**

The activity uses the workflow scratchpad to read persistent values.
Table 756: Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the <strong>join conference call</strong> activity will log an error.</td>
</tr>
<tr>
<td></td>
<td>When initiating an outgoing call workflow using the Notify API <code>call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)</code> method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Call workflow activity

The **Call** activity makes outbound phone calls using a Notify workflow.

Input variables

Input variables determine the initial behavior of the activity.

Table 757: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the <strong>Phone number to call</strong> and <strong>Notify Number</strong> variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number <code>sys_id</code>, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code>.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.
You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

Send SMS workflow activity

The **Send SMS** activity sends short text messages to users' phones using Notify.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have an E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the <strong>Select variables</strong> box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>--------------</td>
<td>----------------</td>
</tr>
<tr>
<td><strong>To (script)</strong></td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format <code>{notify_number: \'...sys_id...\', users: [...], groups: [...], numbers: [...]}</code>. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if <strong>Advanced</strong> is selected.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

**Forward Call workflow activity**

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 759: Input variables**

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Phone number to call</strong></td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td><strong>Timeout (in seconds)</strong></td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td><strong>Record</strong></td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.
You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Table 760: Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the <strong>Finish key</strong> to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  1: {
    "say": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  2: {
    "say": "type 2 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as myCustomData in the example above.
**Conditions**

The conditions determine the transition that comes after this activity.

The input activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition Name to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format xx-XX:<Message>. For example, add fr-CA: for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
</tbody>
</table>
| workflow.scratchpad.menu<activity name> | The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes.  
For example, if the activity name is choices, you can access values from the menu using  
```javascript
var previousActivity = "choices";
var choicesMenu = workflow.scratchpad.menu[previousActivity];
var menuItem = choicesMenu[workflow.scratchpad.digits];
// Selects the menu item based on the caller's input.
var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.
``` |

**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.
Play workflow activity

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Table 762: Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity

The **Record** workflow activity records audio from a user on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Table 763: Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>
**Scratchpad Entries**

The activity uses the workflow scratchpad to store persistent values. The **record** activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.

**Table 764: Values written to scratchpad**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

**Reject workflow activity**

The **Reject** workflow activity rejects an incoming Notify call. You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 765: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as <strong>busy</strong>.</td>
</tr>
</tbody>
</table>

**Say workflow activity**

The **Say** activity plays a message, using text-to-speech, on a Notify call.

**Input variables**

Input variables determine the initial behavior of the activity.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message,</td>
</tr>
<tr>
<td></td>
<td>instead of using the <code>Text to say</code> and <code>Language</code> values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must</td>
</tr>
<tr>
<td></td>
<td>return a string that defines the language and the text to read. For</td>
</tr>
<tr>
<td></td>
<td>example, to play an English-language message, return `{language: 'en-US',</td>
</tr>
<tr>
<td></td>
<td>text: 'Text to read'}.</td>
</tr>
</tbody>
</table>

**Forward to Notify Client workflow activity**

The **Forward to Notify Client** workflow activity connects a phone call to a Notify WebRTC client.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect</td>
</tr>
<tr>
<td></td>
<td>to, instead of using the <code>User</code> variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script</td>
</tr>
<tr>
<td></td>
<td>should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.
Queue workflow activity

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Notify activity event handlers

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.

When a telephony provider such as the Twilio service broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

Creating Notify activities

Default Notify workflow generally perform a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the **onCompleted** function.

```javascript
onCompleted: function() {
  activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.

- Within the **onExecute** event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the notify_wf_activity table.
- Within the **onUpdate** event handler function, deserialize the NotifyAction object from the notify_wf_activity table and use this object to perform any other operations.
- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the **Reject** activity ends the call before the caller connects so the **onNoAnswer** function is never invoked from this activity.

**Note:** When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.
Table 768: Event handlers

<table>
<thead>
<tr>
<th>Handler</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td>onExecute</td>
<td>Runs when the activity first runs.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onUpdate</td>
<td>Runs when the call record associated with the workflow is updated.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onCompleted</td>
<td>Runs when a call ends.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onRinging</td>
<td>Runs when a call starts ringing.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onInProgress</td>
<td>Runs when both parties are connected on a call.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onNoAnswer</td>
<td>Runs when a call is not answered.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onBusy</td>
<td>Runs when a called number is busy.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onFailed</td>
<td>Runs when an error occurs.</td>
<td>All call-related activities</td>
</tr>
</tbody>
</table>

Notify languages

Notify supports multiple languages when using text-to-speech.

For example, when using the input or say workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Language [notify_language] table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

Notify on task

Notify allows you to send SMS alerts and initiate conference calls from any task record.

Notify on task functionality is available for all tables that extend the Task table, such as Incident, Problem, or Change.

All calls and messages made from tasks are initiated using a single Notify phone number. You can configure which phone number is used by setting the property glide.notify.task.phone_number.

Send an SMS message from a task

You can use Notify to send SMS alerts from a task record.

Role required: itil
Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers in number groups with SMS workflows. Also ensure the property glide.notify.task.phone_number is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change.
2. Click the Send SMS related link.
3. Select one or more Recipients to send the SMS to.
4. Enter the Message to send.
   The task record number is added to the message automatically.
5. Click Send.
   Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the SMS Messages related list. You may need to configure the form to add the related list.

Start a conference call from a task

You can use Notify to start conference calls from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers in number groups with phone call workflows. Also ensure the property glide.notify.task.phone_number is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change.
2. Click the Start conference call related link.
3. Select one or more Recipients to send the SMS to.
4. Click Start.
   Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the Conference calls related list. You may need to configure the form to add the related list.

Notify with incident alert

You can use Notify with Incident Alert to send SMS messages or start conference calls based on incident alerts.

Notify with incident alert requirements

Certain configuration steps are required to use Notify with Incident Alert.

To use notify with incident alert:

- Both Notify and Incident Alert must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property com.snc.iam.notify_number must be set to an active Notify number.
- This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

Note: The Conference Call Group number group is configured with conference call workflows by default.

Launch a conference call

As part of processing an incident alert, a conference call can be created between involved users.
Call participants can include:
- Those users who have been assigned specific responsibilities.
- Any required ad-hoc user contacts.
- Other involved parties who are not recorded as users, such as third-party contacts.

**Note:** Only one conference call at a time can be active for each incident.

1. Navigate to Incidents > Open.
2. Open the relevant incident alert.
3. Click the Initiate Conference Call related link.
4. Within the dialog box that appears, select the participants for the conference.

The dialog box displays the recommended and selected participants for the conference. All users from the User Contacts list in the incident alert are selected by default. If a rotation schedule exists for the Group Contacts, the primary and secondary on-call resources are shown in the Recommended list. This way, the current on-call persons can quickly be invited to join the conference call. Calls are placed to the number in the Mobile phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user's location and, if possible, converted into a valid E.164 number.

5. To select ad-hoc participants, do one of the following:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant’s phone number in the field beside the telephone icon.</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, click **OK**.
   
The conference call starts and a **Conference call initiated** message is displayed at the top of the Incident Alert form. Each user is called and can accept the call to join the conference. Several response types are possible from users invited to join the conference call, apart from **Accepted**.

7. Click the **Conference call initiated** message to see details of that conference call.
   
   When the final participant leaves the conference, the conference call closes.

**Note:** VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

**Viewing conference call information**

Conference calls are listed as system activities in the **Activity** section of the Incident Alert form and also are listed in the **Conference Calls** related list.
Figure 793: Conference bridge history
Send an SMS notification

Notify sends an SMS to the users defined as default contacts for the alert.

When you create a new incident alert, Notify sends an SMS notification to the users defined as default contact responsibilities for the alert.

This text message is sent to the user's mobile phone number:

IA<number>: a <Severity> severity <Event Type> incident alert for <CI Name> has been opened.

Administrators can modify the content of this message by editing the SMS on new Incident Alert business rule.

Notify with on-call scheduling

When using both Notify and On-call scheduling you can send scheduling notifications as SMS messages, in addition to emails.

Notify with on-call scheduling requirements

Certain configuration steps are required to use Notify with On-call scheduling.

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses that accept or reject an on-call assignment.
- You must configure any outbound SMS workflows, such as the On-Call: Assign by Acknowledgement workflow to use this Notify phone number to send SMS messages. Edit all Send SMS activities in these workflows to use this number as the From value.

Set up Notify with on-call scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

You must have activated the Notify and On-Call Scheduling plugins on your instance.

Role required: admin

Set up Notify with On-call scheduling for the first time, or migrate from On-call scheduling with NotifyNow.

1. Navigate to Notify > Numbers.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the Notify group field, select the On-Call Group.
   The On-Call Group is configured with the on-call workflow by default.
4. Navigate to Workflow > Workflow Editor.
5. Select the On-Call: Assign by Acknowledgement workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See KB0551603 for more information.
6. Click the workflow actions icon and select Checkout.
7. Select a Send SMS activity.
8. In the To (script) field, modify the getRecipientsAndNumberToSendFrom() function and uncomment the line //notify_number : getNotifyNumber(),.
9. Perform one of the following actions.
### Option | Description
--- | ---
**Specify a static number** | Within the `getRecipientsAndNumberToSendFromChange()` function, change `getNotifyNumber()` to the `sys_id` of the Notify phone number you selected in step 2.

**Specify a number procedurally** | Update the `getNotifyNumber()` function to return the `sys_id` of the Notify phone number you selected in step 2.

10. Repeat the previous 2 steps for each **Send SMS** activity on the workflow.

11. Click the workflow actions icon and select **Publish**.

12. Close the workflow editor interface.

13. Navigate to **On-Call Scheduling > Trigger Rules**.

14. Select a trigger rule that launches an assignment workflow.

15. In the **Trigger action** field, select **Workflow**.

16. In the **Trigger workflow** field, select the On-call: Assign by Acknowledgement workflow.

17. Click **Update**.

18. Repeat the previous 3 steps for each assignment trigger rule.
   - Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.

---

**On-call: assign by acknowledgement workflow**

The On-Call: Assign by Acknowledgement workflow is provided with Notify.

The workflow uses data from the escalation settings of rotas and rosters. Depending on these settings, the workflow iterates through the defined escalation chain and sends notifications by SMS or email to users asking them for incident assignment.

The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-call scheduling and Notify, the `message_number` column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

---

**Controlling the on-call communication channel with Notify**

You can configure On-call scheduling with Notify to always use a user's preferred communication channel.

If **Force communication channel** is specified in the **Escalation settings** for rosters, the preferred user device is used, either SMS or email.

If the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

The setting **Force communication channel** is only available if Notify is installed.
Key differences between on-call scheduling with NotifyNow and with Notify

There are several key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call: Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-call scheduling with Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Scripting Notify

You can use scripts with Notify to interact with calls and SMS messages, or to provide a custom client interface.

Notify

The Notify API allows you to interact with Notify calls and SMS messages using scripts.

Notify - getPhoneNumbers()
Get all phone numbers available to Notify, as an array.

Table 769: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 770: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of NotifyPhoneNumber objects, each object representing one phone number available to Notify.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate notify
var notify = new SNC.Notify();

// get all available phone numbers
var phoneNumbers = notify.getPhoneNumbers();

// iterate over phone numbers
for (var i = 0; i < phoneNumbers.size(); i++) {
  var number = phoneNumbers.get(i);
  //perform any actions using each phone number
}
Notify - call(String notifyPhoneNumber, String toPhoneNumber)
Make a call to an E.164-compliant phone number.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>The phone number to make the call from. This number appears as the caller ID.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>The phone number to call.</td>
</tr>
</tbody>
</table>

Table 772: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var from = '+14048007337';
var to = '+31646810495';

// set up call
new SNC.Notify().call(from, to);
```

Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)
Call a number to add that number to an active conference call.

This method is intended specifically for conference calls. To initiate calls between only two participants, use the call(String notifyPhoneNumber, String toPhoneNumber) method instead.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs. Ensure this workflow includes a join conference call activity to connect the user to the conference call.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>The phone number to call. Called numbers are added to the conference call.</td>
</tr>
</tbody>
</table>
### Table 774: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['#31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

// feedback
gs.log(gs.getMessage('set up a conference call with number {0} and (re)join code: {1}',
                        [ conferenceCall.getValue('number'),
                          conferenceCall.getValue('code') ]));
```

**Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody)**

Send an SMS text message to an E.164-compliant phone number.

This function creates a new record on the Notify Message [notify_message] table.

### Table 775: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>The Notify phone number to send this SMS from.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the SMS to.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>The SMS text.</td>
</tr>
</tbody>
</table>
Table 776: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the Notify Message [notify_message] record created by this function.</td>
</tr>
</tbody>
</table>

Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)
Send an SMS text message to an E.164-compliant phone number.
This function creates a new record on the Notify Message [notify_message] table and associates it with the source record.

Table 777: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>The Notify phone number to send this SMS from.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the SMS to.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>The SMS text.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

Table 778: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the Notify Message [notify_message] record created by this function.</td>
</tr>
</tbody>
</table>

Notify - getChildCallIDs(GlideRecord callRecord)
Get the sys_id values of calls that are children of a specified call.
Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.
Table 779: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A record on the Notify Call [notify_call] table.</td>
</tr>
</tbody>
</table>

Table 780: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>The sys_id values of all calls that are children of the specified call.</td>
</tr>
</tbody>
</table>

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecffffffffff28");
var notify = new SNC.Notify();
var childCallIDs = notify.getChildCallIDs(callRecord);
for(var callID in childCallIDs)
  //perform any operations with the child callID values
```

Notify - `getParentCallID(GlideRecord callRecord)`
Get the sys_id of a specified call's parent call.

Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.

Table 781: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A record on the Notify Call [notify_call] table.</td>
</tr>
</tbody>
</table>

Table 782: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the parent call record.</td>
</tr>
</tbody>
</table>

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecffffffffff28");
var notify = new SNC.Notify();
var parentCallID = notify.getParentCallID(callRecord);
```
Notify - `getTokens()`
Get client tokens for any installed telephony drivers for use in WebRTC or mobile clients.
This function uses the currently logged-in user record as the client.

### Table 783: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 784: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The client tokens, as a JSON string.</td>
</tr>
</tbody>
</table>

```javascript
// get Notify Client Tokens per active Notify Driver for the currently logged in user
var json = new SNC.Notify().getTokens();

// parse the json that was return into a tokens object
var tokens = JSON.parse(json);

// log line
gs.log('Notify Client Tokens for the currently logged in user');

// iterate over the driver tokens
for (var driver in tokens) {
    gs.log(driver + ' Driver token: ' + tokens[driver]);
}
```

Output:

Notify - `getTokens(GlideRecord record)`
Get client tokens for any installed telephony drivers for use in WebRTC or mobile clients.

### Table 785: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>GlideRecord</td>
<td>A record used to generate the client tokens.</td>
</tr>
</tbody>
</table>

### Table 786: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The client tokens. The value of the string depends on the GlideRecord parameter.</td>
</tr>
</tbody>
</table>
This example demonstrates getting Notify client tokens for every Notify group.

```javascript
// instantiate Notify
var notify = new SNC.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
  // generate Notify Client tokens per active Notify Driver
  for this group
    var json = notify.getTokens(notifyGroup);
    var tokens = JSON.parse(json);

    for (var driver in tokens) {
      gs.log(gs.getMessage("Notify Client token for
{0} driver and Notify Group '{1}': {2}",
[driver, notifyGroup.getValue('name'), tokens[driver]]));
    }
}
```

**Notify - getAvailableClients(String notifyNumber)**

Get a list of client sessions that are available to receive calls.

**Table 787: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyNumber</td>
<td>String</td>
<td>Any valid Notify phone number.</td>
</tr>
</tbody>
</table>

**Table 788: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of JSON objects with the following format:</td>
</tr>
<tr>
<td></td>
<td>[{ sys_id: &quot;...&quot;, // user's</td>
</tr>
<tr>
<td></td>
<td>sys_id</td>
</tr>
<tr>
<td></td>
<td>name: &quot;...&quot; // user's name }</td>
</tr>
</tbody>
</table>

**Notify - conferenceCall()**

Create a new conference call GlideRecord.
Table 789: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 790: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>A new Notify Call [notify_call] record for a conference call.</td>
</tr>
</tbody>
</table>

```javascript
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

// feedback
gs.log(gs.getMessage('set up a conference call with number {0} and (re)join code: {1}',
    [ conferenceCall.getValue('number'),
    conferenceCall.getValue('code') ]));
```

**Notify - queueCall(GlideRecord callRecord)**

Put a call into a queue.

Resume a queued call using the dequeueCall method.

Table 791: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A GlideRecord object on the Notify Call [notify_call] table with the call you want to put on hold.</td>
</tr>
</tbody>
</table>
Table 792: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var call = new GlideRecord('notify_call');
call.get('<call record sys_id>');
if (call.isValid()) {
    new SNC.Notify().queueCall(call);
}
```

**Notify - dequeueCall(GlideRecord callRecord)**
Resume a call after it was put in a queue.
Use this method to resume calls that were put in a queue with the queueCall method.

Table 793: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A GlideRecord object on the Notify Call [notify_call] table with the held call you want to resume.</td>
</tr>
</tbody>
</table>

Table 794: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var call = new GlideRecord('notify_call');
call.get('some sys_id');
if (call.isValid()) {
    new SNC.Notify().dequeueCall(call);
}
```

**Notify - kick(GlideRecord participant)**
Kick a specified user from a Notify conference call.

Table 795: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>A GlideRecord object containing the Notify Participant [notify_participant] to kick from the conference call.</td>
</tr>
</tbody>
</table>
Table 796: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var participant = new GlideRecord('notify_participant');
participant.get('<sys_id>');
if (participant.isValid()) {
    new SNC.Notify().kick(participant);
}
```

*Notify - forwardCall(GlideRecord call, String destination, String dtmf)*
Forward a call to connect that call with a different recipient.

Table 797: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call</td>
<td>GlideRecord or String</td>
<td>A Notify call record, or the telephony provider call ID.</td>
</tr>
<tr>
<td>destination</td>
<td>GlideRecord or String</td>
<td>A Notify phone number record, or an E.164-compliant phone number.</td>
</tr>
<tr>
<td>dtmf</td>
<td>String</td>
<td>A DTMF code to play upon connection.</td>
</tr>
</tbody>
</table>

Table 798: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**NotifyAction**

The NotifyAction API allows you to define actions to send to a telephony provider.
You add actions to a NotifyAction object by calling the respective `add` function for each type of action.
Each `add` function returns an Action object, such as a SayAction object for the `addSay()` function. Refer to each method example for information about returned objects.

*NotifyAction - addDial()*
Make an outbound call.
Table 799: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 800: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DialAction</td>
<td>The action added to the NotifyAction object. Use the DialAction object to define.</td>
</tr>
</tbody>
</table>

```javascript
var action = new SNC.NotifyAction();
var dial = action.addDial();
dial.setRecord(activity.vars.record);
dial.setClientRecord(activity.vars.user, "sys_user");
```

**NotifyAction - addGather()**

Present an interactive phone menu to the user.

Table 801: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 802: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatherAction</td>
<td>The action added to the NotifyAction object. Use the GatherAction object to define the menu settings and options to present to the user.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1);    // the user can type 1 digit
gather.setFinishKey('#');      // # or *, useful for > 1 digits
gather.setTimeout(10);          // time to enter answer, in seconds

// add first menu item
var usSay = gather.addSay();
usSay.setText('Press 1 for english');
usSay.setLanguage('en-US');
```
// add second menu item
var nlSay = gather.addSay();
nlSay.setText('Kies 2 voor Nederlands');
nlSay.setLanguage('nl-NL');

// add third menu item
var frSay = gather.addSay();
frSay.setText('Choisissez 3 pour le français.);
frSay.setLanguage('fr-FR');

// and finish off with an applause
var play = gather.addPlay();
play.setURL('http://www.wavsource.com/
snds_2015-04-12_5971820382841326/sfx/applause_y.wav');

NotifyAction - addHangUp()
End an active phone call.

Table 803: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 804: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HangUpAction</td>
<td>The action added to the NotifyAction object.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// hang up
notifyAction.addHangUp();

NotifyAction - addQueue()
Queue the call, putting it on hold.

Table 805: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 806: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QueueAction</td>
<td>The action added to the NotifyAction object. Use the QueueAction object to define the queue name, and queueing or dequeueing behavior.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');
```

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
var queue = notifyAction.addQueue();
queue.setDequeue(true);
```

**NotifyAction - addPlay()**

Play an audio file on the call.

Table 807: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 808: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PlayAction</td>
<td>The action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and number of times to loop the audio.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);
```
**NotifyAction - addReject()**
Reject an incoming call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 810: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RejectAction</td>
<td>The action added to the NotifyAction object. Use the RejectAction object to define the reason for rejecting the call.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'
```

**NotifyAction - addSay()**
Use text-to-speech to read text on the call.

Multiple languages are supported with text-to-speech. Available languages depend on the telephony provider.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 812: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SayAction</td>
<td>The action added to the NotifyAction object. Use the SayAction object to define the text and language to read.</td>
</tr>
</tbody>
</table>

This example demonstrates reading text in several languages.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
```
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kann auch deutsch sprechen');
deSay.setLanguage('de-DE');

NotifyAction - addSMS()
Send an SMS message.

When using this function with an active call, you do not need to call the setTo function on the returned SMSAction object. The SMS is automatically sent to the caller.

Table 813: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 814: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMSAction</td>
<td>The action added to the NotifyAction object. Use the SMSAction object to define the message text and the phone number to send the message to.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur adipiscing elit. ');
sms.setTo(number);

NotifyAction - fromJson(String json)
Deserializa a NotifyAction object from a JSON string.
### Table 815: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>json</td>
<td>String</td>
<td>A JSON string representation of a NotifyAction object.</td>
</tr>
</tbody>
</table>

### Table 816: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates deserializing a NotifyAction object.

```javascript
var json = ".... some json obtained from toJson ....";

// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// deserialize and reconstruct the notify action instance
notifyAction.fromJson(json);
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```

Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]} ***

*** Script: new serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]} ***

*** Script: the same: true ***
**NotifyAction - toJson()**

Serialize the NotifyAction object to a JSON string.

**Table 817: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 818: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON representation of this NotifyAction object.</td>
</tr>
</tbody>
</table>

This example demonstrates serializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add one or more notify actions
// ...

// and serialize to json
var json = notifyAction.toJson();
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```

Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]}***

*** Script: new serialization result: {"fClassName":"NotifyAction","fActions":"}***
NotifyAction - addConference()
Add a call to a Notify conference call.

Table 819: Parameters

<table>
<thead>
<tr>
<th>Name</th>

<td>ConferenceAction</td>
<td>The action added to the NotifyAction object. Use the ConferenceAction object to define the conference call name, and the behavior of the conference call when a participant joins or leaves.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber

The NotifyPhoneNumber API allows you to query information about a Notify phone number.

NotifyPhoneNumber - getDialCode()
Get the international dialing code for a Notify phone number.

Table 821: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 822: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>International phone code for a country.</td>
</tr>
</tbody>
</table>
Table 823: Parameters

<table>

<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 824: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The ID of the number within the telephony provider.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - `getNumber()`
Get the numerical phone number for a NotifyPhoneNumber.

Additional information about the method that does not belong in the short description.

Table 825: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 826: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>An E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - `getOwner()`
Get the telephony provider associated with this phone number.

Table 827: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 828: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td>The telephony provider associated with the number, such as the Twilio service.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - getTerritory()
Get the country associated with the phone number.

Table 829: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>

</tbody>
</table>

**Notify Client**

The Notify Client API allows you to use Notify telephony functionality, such as making and receiving calls, from a web browser.

Several Notify Client methods take a callback function as a parameter. Because Notify Client calls are made asynchronously, these methods cannot return a value directly. Use the callback function to parse the returned data, such as by assigning variables or making other API calls.

**Notify Client - Client(Object notifyConfig)**

Instantiate a new Notify WebRTC Client object.

<table>
<thead>
<tr>
<th>Table 845: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>notifyConfig</td>
</tr>
</tbody>
</table>

```javascript
var notifyConfig = {
    vendor: SNC.Notify.Vendor.TWILIO,
    callerId: 'xyz',
    autoReconnect: true,
    onReady: function() {},
    onOffline: function() {},
    onError: function( message ) {},
    onConnect: function( status ) {},
    onDisconnect: function() {},
    onIncoming: function( {from, to, callSid} ) {},
    onOutgoing: function( callSid ) {},
    onAccept: function() {},
    onMute: function() {},
    onUnmute: function() {},
    onCancel: function() {}
};
```
Notify Client - `call(Object identifier)`

Call a specified phone number or the phone number associated with a specified user.

### Table 846: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>Object</td>
<td>Enter a JSON object that provides either the phone number to call or the sys_id of a user record to get the phone number from.</td>
</tr>
</tbody>
</table>

**Note:** If you provide both a phone number and user sys_id, only the phone number is used.

### Table 847: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates passing a phone number as the function parameter.

```javascript
notifyClient.call({
    phoneNumber: "+18001112223"
});
```

This example demonstrates passing a user record sys_id as the function parameter.

```javascript
notifyClient.call({
    userId: "6816f79cc0a8016401c5a33be04be441"
});
```

Notify Client - `hangupCall()`

End the current call.
This example demonstrates mapping a client function to an interface button using jQuery.

```javascript
$j("#pickupCallBtn").on("click", function() {
    notifyClient.hangupCall();
});
```

**Notify Client - pickupCall()**
Brief description of the method.

Additional information about the method that does not belong in the short description.

**Table 850: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 851: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**Notify Client - mute(Boolean muted)**
Mute or unmute the current client.

Additional information about the method that does not belong in the short description.

**Table 852: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>muted</td>
<td>Boolean</td>
<td>Set this value to true to mute the current client, false to unmute.</td>
</tr>
</tbody>
</table>
**Notify Client - forwardCall(Object argument)**
Forward the current call to a different phone number or Notify client session.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>argument</td>
<td>Object</td>
<td>A JavaScript object detailing the number or Notify client to forward the call to.</td>
</tr>
</tbody>
</table>

This example demonstrates forwarding a call to a different phone number. The dtmf attribute allows you to send DTMF dial tones to the receiving number.

```javascript
var arg = {
  type: "number",
  id: "+17012345678",
  dtmf: "1234"
};
client.forwardCall(arg);
```

This example demonstrates forwarding a call to a different Notify client.

```javascript
var arg = {
  type: "userId",
  id: "6816f79cc0a8016401c5a33be04be441"
};
client.forwardCall(arg);
```

**Notify Client - sendDtmf(String digits)**
Send one or more DTMF-valid digits over the current call.
Table 856: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>digits</td>
<td>String</td>
<td>One or more DTMF-valid digits.</td>
</tr>
</tbody>
</table>

Table 857: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Notify client event handlers

Notify Client event handlers allow you to define scripted behavior for responding to events from a telephony provider such as the Twilio service.

Event handlers

A communication between the Notify WebRTC Client and a telephony provider is asynchronous. The client function calls, such as `notifyClient.call()` do not wait for a response from the telephony provider. Instead, event handler methods define how to respond to certain events from the telephony provider.

You can create event handler implementations when creating the Notify Client configuration object. Fully define the handlers in the configuration object before instantiating a Notify Client object.

onReady

The `onReady` function runs after you call the `init` function on the client object. The `onReady` function indicates that the WebRTC session is ready.

onOffline

The `onOffline` function runs if the WebRTC session is not active.

onError

The `onError` function runs if the client encounters an error.

This function exposes one parameter. Use this parameter when implementing the event handler function.

Table 858: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The error message text.</td>
</tr>
</tbody>
</table>
**onConnect**

The `onConnect` function runs when the client receives a call connection event for an incoming or outgoing call.

This function exposes one parameter. Use this parameter when implementing the event handler function.

**Table 859: Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>The call status, as a string constant.</td>
</tr>
</tbody>
</table>

*Note:* When evaluating call status, use the constants provided by `SNC.Notify.Status`.

```javascript
onConnect: function(status) {
    // webRTC receives a call connection event (incoming or outgoing).
    if (status == SNC.Notify.Status.OPEN) {
        setStatus(getTimeStamp() + " -- Successfully established call");
        showHangupButton(); // update the UI
    }
},
```

**onDisconnect**

The `onDisconnect` function runs when a call disconnects.

**onIncoming**

The `onIncoming` function runs when a call is made to the client and the telephony provider returns the parent call ID.

This function exposes these parameters as a single JSON object. Use these parameters when implementing the event handler function.

**Table 860: Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callInfo.from</td>
<td>String</td>
<td>The caller’s phone number.</td>
</tr>
<tr>
<td>callInfo.to</td>
<td>String</td>
<td>The called phone number.</td>
</tr>
</tbody>
</table>
### onIncoming

The `onIncoming` function runs when an incoming call is made from the client. This function exposes one parameter. Use this parameter when implementing the event handler function.

```javascript
onIncoming: function(callInfo) {
  gs.log('incomming call from : ' + callInfo.from);
  var gru = new GlideRecord('sys_user');
  gru.addQuery('phone', callInfo.from);
  gru.query(function() {
    while (gru.next()) { // there may be more than one person with same number?
      // fetch caller's info
      gs.log('caller : ' + gru.name);
    }
  });
},
```

### Table 861: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callInfo.callSid</td>
<td>String</td>
<td>The SID of the call from the telephony provider.</td>
</tr>
</tbody>
</table>

### onOutgoing

The `onOutgoing` function runs when an outgoing call is made from the client.

### onAccept

The `onAccept` function when the client accepts an incoming call.

### onMute

The `onMute` function runs when the client is muted.

### onUnmute

The `onUnmute` function runs when the client is unmuted.

### onCancel

The `onCancel` function runs if the caller cancels the call.
Notify client building a configuration object example

This example demonstrates how to construct the configuration object needed to instantiate a Notify WebRTC Client object.

The configuration object is a JSON object that specifies properties such as the telephony service provider and caller information, and event handler functions.

This sample code demonstrates how to create a simple configuration object.

```javascript
var notifyConfig = {
    vendor: SNC.Notify.Vendor.TWILIO, //Pass one of the supported vendor constants. Supported value is SNC.Notify.Vendor.TWILIO. Do not pass raw string values.
    callerId: '19991231234', //Pass a valid phone number to use as the caller ID. This number is usually provided by your telephony vendor.
    autoReconnect: true, //Pass true to automatically create a new WebRTC vendor session when the current session expires.
    onReady: function() {},
    onOffline: function() {},
    onError: function( message ) {},
    onConnect: function( status ) {},
    onDisconnect: function() {},
    onIncoming: function( {from, to, callSid} ) {},
    onOutgoing: function( callSid ) {},
    onAccept: function() {},
    onMute: function() {},
    onUnmute: function() {},
    onCancel: function() {}
};
```

Activate Notify

The Notify plugin (com.snc.notify) requires a separate subscription. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Notify activates these related plugins if they are not already active.

Table 862: Plugins for Notify

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number</td>
<td>Provide E-164 compliant phone number support.</td>
</tr>
<tr>
<td>[com.glide.phone_number]</td>
<td></td>
</tr>
</tbody>
</table>

To purchase a subscription, contact your ServiceNow account manager. After purchasing the subscription, activate the plugin within the production instance.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the Load demo data check box.
   
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.

**Migrating from legacy Notify**

When migrating to Notify from the legacy Notify functionality, several changes are made to the instance.

**Automatic changes**

Several automatic changes occur when you activate Notify if the legacy Notify functionality is already enabled.

- The legacy **Notify** application menu is removed.
- Two separators are added to the new **Notify** application menu, **Legacy Notify** and **Legacy Notify Admin**. New modules that replace the legacy **Notify** modules are added to these sections.

  **Note:** The added modules are not the same modules that were in the legacy **Notify** application menu. Any customizations made to the legacy Notify modules are not preserved.

- The notifynow_admin role allows access to Notify modules.
- The notify_admin role allows access to legacy Notify modules.
- All workflow activities from the legacy Notify application are moved to the **Legacy Notify** group.

**Legacy Notify**

Notify enables organizations with a Twilio account to send notifications using text and voice messages.

  **Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see **Notify** on page 2910.

It also allows conference calls between ServiceNow users to enable quick communications.

When Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident alert is raised in the incident alert management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.

Notify has been implemented for use within incident alert management. Refer to the Notify API documentation for details on how to implement Notify for use within other ServiceNow applications.

**Working with Legacy Notify**

Follow this process to enable and use Notify.

  **Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see **Notify** on page 2910.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within incident alert management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

View a Legacy Notify question

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

Role required: notifynow_admin

---

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to Notify > Questions.
2. Click the question **On-Call responsibility Accept/Reject** to see the question details.
3. Click the **Notify Response Choices** related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the **Response action** can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

**Create a question in legacy Notify**
Define a question that can be sent to users.

**Role required:** notifynow_admin

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see *Notify* on page 2910.

1. Navigate to **Notify > Questions**.
2. Click **New**.
3. Fill in the fields, as appropriate.

### Table 863: Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the <code>{ }</code> tags, for example, <code>{0}</code>. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from <code>{0}</code>. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, number, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example, short_description.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting <strong>New</strong>. Several examples of scripts are shown. Write your own script and click <strong>Submit</strong>.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Create a new response choice in legacy Notify
Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

1. Navigate to Notify > Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

Table 864: Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>

5. Click Submit.

View Legacy Notify messages

Applications implementing Notify, such as incident alert management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident alert has been created.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

1. Navigate to Notify > Messages.
2. Click a message to see the message details.
View Legacy Notify conversations

The Notify Conversation [notifynow_conversation] table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

Role required: notifynow_admin

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#) on page 2910.

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

1. Navigate to **Notify > Conversations.**
2. Click a conversation record to see the conversation details.

The State of the conversation can have one of the following values:
Table 865: Notify Conversation State Descriptions

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note:** The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

View Legacy Notify conference calls

Applications that use Notify, such as incident alert management, can launch and maintain conference calls between involved parties.

Role required: notifynow_admin

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

1. Navigate to **Notify > Conference Calls**.
   
   You can also access conference call information from the relevant record, such as the **Conference Calls** related list in an incident alert record.

2. Click a conference call in the list to view details.
3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
Legacy public conference calls
A Notify conference call can be public.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

The **Private** field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Alert Management, are public. You can create private calls using the Notify API `initiateConferenceCall` method.

When created, public conference calls generate an associated **Code** which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property `glide.notifynow.conference_call.code.pattern`. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

Administering Legacy Notify
An administrator can set up Notify, manage Notify properties and conference call participants.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

After the Twilio account is set up, perform the following to use that account with Notify:

• Associate the account with Notify
• Configure Twilio with ServiceNow endpoints

Associate a Twilio account in legacy Notify
Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

1. Navigate to Notify > Administration > Properties.
2. Enter the **AccountSID**, **AuthToken** and **phone number** values. These values can be obtained from the Twilio dashboard:

When the Twilio account details are entered in the **Notify Properties** page, the account status is updated.
3. [Optional] To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

**Note:** Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: `isSMSCapable` and `isVoiceCapable`.

---

**Configuring the Twilio service with endpoints in legacy Notify**

In order for the Twilio service to receive Notify commands, the Request URL field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the Request URL fields are blank.

Set these values from within the Twilio service dashboard.
Figure 794: Twilio Numbers Dashboard

The notifyusa values underlined in the image should be replaced with your ServiceNow instance name, for:

- Voice Request URL: https://notifyusa.service-now.com/NotifyNowCallProcessor.do

© 2017 ServiceNow. All rights reserved.
• Status Callback URL: https://notifyusa.service-now.com/NotifyNowCallStatusProcessor.do
• Messaging Request URL: https://notifyusa.service-now.com/NotifyNowSmsProcessor.do

View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

1. Navigate to Notify > Administration > Properties.
2. Fill in the fields.

Table 866: Notify Properties form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Twilio SMS and voice enabled phone number</td>
<td>The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Number of frequent conference call participants to be displayed</td>
<td>The number of people to display in the frequently called list.</td>
</tr>
<tr>
<td>Voice</td>
<td>The voice used for Notify communications. Select <strong>woman</strong> or <strong>man</strong> to provide female or male voice support for English, Spanish, French, German, and Italian. Select <strong>alice</strong> to provide female voice support for a wider range of languages.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

*Legacy Notify account status messages*

Account status messages are visible on the Notify Properties page.

Table 867: Account Status Message Descriptions

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>

<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>
Manage legacy Notify conference call participants

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

Role required: notifynow_admin

### Note:
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the Response field for the participant session to kicked.

1. Navigate to Notify > Conference Calls.
2. Select an active conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click the button for the action you want to perform, such as Mute to mute the participant.

You can perform these actions for multiple participants as a single operation using the Actions on selected rows choice list on the Notify Conference Call Participants related list.

Installed with Legacy Notify

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

### Note:
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify on page 2910.

### Tables

Notify adds or modifies the following tables.

#### Table 868: Tables

<table>
<thead>
<tr>
<th>Display Name [Table Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer [notifynow_answer]</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation [notifynow_conversation]</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session [notifynow_participant_session]</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant [notifynow_participant]</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question [notifynow_question]</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
</tbody>
</table>
### Display Name [Table Name]

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response_action [notifynow_response_action]</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice [notifynow_response_choice]</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages [notifynow_message]</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

## Properties

Notify adds the following system properties.

### Table 869: Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

## User Roles

Notify adds the following user roles.
Table 870: User Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifynow_admin</td>
<td>None</td>
<td>Administrator with privileges for Notify functionality.</td>
</tr>
</tbody>
</table>

UI Actions

Notify adds the following UI actions.

Table 871: UI Actions

<table>
<thead>
<tr>
<th>UI Action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate Conference Call</td>
<td>Incident Alert [incident_alert]</td>
<td>Adds a link to the Incident Alert form, if that plugin is activated, which displays a dialog box for starting a conference call with selected participants.</td>
</tr>
<tr>
<td>Invite to Conference Call</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Adds a link to the Notify Conference Call form which displays a dialog box for adding more users to an active conference call.</td>
</tr>
</tbody>
</table>

Script Includes

Notify adds the following script includes.

Table 872: Script Includes

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentAlertConferenceCall</td>
<td>A utility JavaScript Prototype class allowing users to initiate the conference call and add other users to the conference call. Should be used in conjunction with the slushbucket UI page (notifynow_participant).</td>
</tr>
</tbody>
</table>

Business Rules

Notify adds the following business rules.
### Table 873: Business Rules

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS on new Incident Alert</td>
<td>Incident Alert [incident_alert]</td>
<td>Sends an SMS to any default contacts added when an incident alert record is created.</td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Alert [incident_alert]</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>
<td>Update Conference Call Started IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call started by writing to an incident alert's comment field if the source record is from the incident_alert table.</td>
</tr>
<tr>
<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident alert's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>

### Workflow Activities

Notify adds the following workflow activities.

### Table 874: Workflow Activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Activity Name</td>
<td>Activity Category</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>

**Legacy Notify API**

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

**Note:** This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

**NotifyNow - getReadyState()**

Indicate whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
### Table 876: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```

#### NotifyNow - getStatus()

Get the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

### Table 877: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td>--------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```java
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)**

Initiate a new conference call.

**Table 879: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>

Table 880: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)

Initiate a new conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>
Table 882: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```java
// define phone number participants
var participants = ['+31205655548', '+31205655552', '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
    gs.log('adding user ' + user.getValue('name') + ' with phone number ' +
           user.getValue('mobile_phone') + ' to the participant array');
    participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
    // set up conference call
    var nn = new SNC.NotifyNow();
    var conferenceCall = nn.initiateConferenceCall(participants,
                                                   "testing 1 2", source);

    // check if the conference call was successfully created
    if (conferenceCall != null) {
        gs.log('started conference call: ' +
                conferenceCall.getUniqueValue());
    } else {
        gs.log('could not start the conference call :(');
    }
}
```

NotifyNow - isCallable(String participant)

Determine whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.
### Table 883: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

### Table 884: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fe9');
if (user.hasNext() && user.next())
gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));
```

### NotifyNow - isSMSCapable()

Check if the telephone number associated with the Twilio account is capable of sending SMS messages.

### Table 885: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 886: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```
NotifyNow - isSMSCapable(String userID)

Check if a user is able to send SMS messages.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

Table 888: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('&lt;user sys_id&gt;')) ? 'yes' : 'no'));
```

NotifyNow - isVoiceCapable()

Check if the telephone number associated with the Twilio account is capable of setting up phone calls.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 890: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

NotifyNow - isVoiceCapable(String userID)

Check if a user is able to make voice calls.
Table 891: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

Table 892: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' +
        ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ?
         'yes' : 'no'));

NotifyNow - kick(GlideRecord participant)
Remove a participant from a conference call.

Table 893: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

Table 894: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
NotifyNow - mute(GlideRecord participant)

Mute a participant on a conference call.

Table 895: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

Table 896: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```

NotifyNow - umute(GlideRecord participant)

Unmute a participant on a conference call.

Table 897: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

Table 898: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
paticipant.get(participantId);
if (participant.isValid()) {
```

© 2017 ServiceNow. All rights reserved. 2987
// unmute participant
result = new SNC.NotifyNow().unmute(participant);
gs.log('participant unmuted: ' + result);  
}

NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.
The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

Table 899: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

Table 900: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```javascript
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");

new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
  "b6b34500bf3111003cf5585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f", current,
  "Please answer this question");
```
This example uses dot-walking and specifies an email subject but no source record.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com", 
    "b6071733bf1111003cf585ce2c07390f", 
    "Please answer this question");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.
Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

**Table 902: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)**

Send an SMS message to an E.164-compliant mobile phone number.
Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

Table 904: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}
```

This example uses dot-walking and the current record as the source record.

```javascript
new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);
```

NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)

Send an SMS question.

Table 905: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>The question record to send or the sys_id of a question record.</td>
<td></td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>
Table 906: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

```
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
    // send the sms question
    var number = "+31612345678";
    var nn = new SNC.NotifyNow();
    nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}
```

NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Add ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the `participant` parameter and there is exactly one `sys_user` record that matches the phone number, that `sys_user` record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the `sys_user` record. If there are several `sys_user` records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to `sys_user` because the user is not known.

Table 907: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Table 908: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

```
// add a new participant by conference call sys_id (string) and phone number (string)
```
```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));

// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));
    // you could have added the user by sys_id as well:
    // nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id'));
} else {
    gs.log('no such user');
}

// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call');
}
```

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)

Convert a local phone number to an E.164-compliant phone number based on a user's location.

**Table 909: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>
Table 910: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

```javascript
var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(),
localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + '
  based on ' + user.getValue('name') + '
  \'s location (' + user.getValue('location') + ')');
```

**NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)**

Get all participants for a conference call.

Table 911: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

Table 912: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user = 
nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
   if (user.getValue('participant')) {
      gs.log('user: ' + user.getValue('sys_id'));
   } else {
      gs.log('phone number: ' +
      user.getValue('phone_number'));
   }
}
var nn = new SNC.NotifyNow();
var user =
nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37',
true);

while (user.hasNext() && user.next()) {
  if (user.getValue('participant')) {
    gs.log('user: ' + user.getValue('sys_id'));
  } else {
    gs.log('phone number: ' +
user.getValue('phone_number'));
  }
}

var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';

// get all participants
 gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
 gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
 gs.log('all conference call participants that are already in an
active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId,
false);
gs.log(user);

### NotifyNow - getFrequentlyCalledUsers(Number limit)

Return a number of frequently-called users, up to the limit parameter, in alphabetical order.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

© 2017 ServiceNow. All rights reserved.
Table 914: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);
while (fc.hasNext() && fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' + fc.getValue('sys_id'));}
```

**NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)**

Get a user's preferred E.164-compliant phone number for voice calls.

Table 915: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Table 916: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);
```

**NotifyNow - getPreferredE164SMSNumber(GlideRecord user)**

Get a user's preferred E.164-compliant phone number for SMS messages.

Table 917: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>
Table 918: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredEmailAddress(GlideRecord user)

Get a user's preferred email address

Table 919: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

Table 920: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);
```

Events

Event are special records the system uses to log when certain conditions occur and to take some kind of action in response to the conditions.

The system uses business rules to monitor for system conditions and to generate event records in the Event [sysevent] table, which is also known as the event log or event queue.

Event-generating business rules typically use this script logic:

If [some condition is true for the current record], then [add a specific event to the queue].

For example, here are some of the conditions in the incident event business rule:
• If a user adds a comment to an incident record, add an incident.commented event.
• If a user adds an incident record, add an incident.inserted event.
• If a user updates an incident record, add an incident.updated event.

Event-generating business rules use the GlideSystem `eventQueue` method to insert event records, which typically contain this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The unique name of event. Baseline event names include the record effected and the triggering action such as incident.commented.</td>
</tr>
<tr>
<td>Parm1</td>
<td>An event-specific parameter the system uses to pass record information to other parts of the system, such as a record Sys ID or a field value.</td>
</tr>
<tr>
<td>Parm2</td>
<td>Another event-specific parameter the system uses to pass record information to other parts of the system, such as a record Sys ID or a field value.</td>
</tr>
<tr>
<td>Table</td>
<td>The table to which the event applies. This is the same table on which the business rule ran.</td>
</tr>
<tr>
<td>Instance</td>
<td>The Sys ID of the record to which this event applies.</td>
</tr>
</tbody>
</table>

Scheduled jobs periodically read the event queue and forward them to the appropriate handler for processing. The handler uses information from event records to take some kind of action such as:

• Send a notification
• Run a script action
• Trigger a workflow activity

By default, the system provides events covering a broad view of application activity. If existing events do not meet your needs, you can create your own events to watch for specific changes to records.

**Event registry**

The events registry lists the events the system recognizes. Use registered events to automate other activities, such as script actions or notifications.

Events can be used to schedule actions or tasks to occur when conditions are fulfilled.

Examples:

• `kb.view` - an event triggered when a user views a Knowledge Base article, used to trigger the script action Knowledge View to create a Knowledge Use record every time an article is viewed.
• `incident.commented` - an event triggered when a user comments on an article, used by two incident commented email notifications.

Inactivity Monitors:

An inactivity monitor triggers an event if a record has not been updated for a defined length of time.
Script Actions:
Script actions are scripts which are triggered when an event is recorded in the log. In that way, scripts can be set to be performed whenever a particular activity occurs in the platform, rather than at a particular time (like scheduled jobs) or in response to particular conditions (like business rules).

Notifications:
Events are also used to trigger Email Notifications when an event is recorded in the log.

Event states
The event state describes where in the life cycle the event is.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>The system created the event and it is in the queue waiting to be processed.</td>
</tr>
<tr>
<td>Processed</td>
<td>The event successfully ran. An event does not necessarily trigger any further action when processed. Additional functionality must make use of the event.</td>
</tr>
<tr>
<td>Error</td>
<td>The event encountered an error during processing. This state is often caused by invalid event parameters. Reprocessing the event may resolve the error.</td>
</tr>
<tr>
<td>Transferred</td>
<td>The event was rotated to a different shard of the Event [sysevent] table. When an event is rotated, a duplicate record is created in an active shard to be processed. A scheduled job processes the event when it is next in the queue, but it is not possible to predict when this will happen as because several events may need to be processed before it. Therefore, you can reprocess the event. See Reprocess an event on page 3008.</td>
</tr>
</tbody>
</table>

Event logs
The event log records all system events that occur within the system.
This log provides the following information for all events that occur:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the event for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the event as listed in the Event Registry.</td>
</tr>
<tr>
<td>Parm1</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Parm2</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Table</td>
<td>Database table acted on for this event.</td>
</tr>
<tr>
<td>Processed</td>
<td>Date and time the event was processed This time reflects the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Processing time</td>
<td>Time taken to process this event, in milliseconds.</td>
</tr>
<tr>
<td>Queue</td>
<td>Processor queue name.</td>
</tr>
</tbody>
</table>

The incident events business rule

The incident events business rule comes with the system and defines a number of events that can be triggered by different actions in the Incident table.
This business rule defines several events, three of which are triggered after a record in the Incident table is inserted or updated. The first script is:

```java
if (current.operation() != 'insert' && current.comments.changes()) {
    gs.eventQueue("incident.commented", current, gs.getUserID(), gs.getUserName());
}
```

The condition in this script requires that a change be made to the Comments field in an existing (not inserted) incident record. If this condition is true, then the platform adds the incident.commented event to the event queue.

The second condition requires that a record be inserted before the event is added to the queue.

```java
if (current.operation() == 'insert') {
    gs.eventQueue("incident.inserted", current, gs.getUserID(), gs.getUserName());
}
```

```java
if (current.operation() == 'update') {
    gs.eventQueue("incident.updated", current, gs.getUserID(), gs.getUserName());
}
```

```java
if (!current.assigned_to.nil() && current.assigned_to.changes()) {
    gs.eventQueue("incident.assigned", current, current.assigned_to.getDisplayValue(), previous.assigned_to);
}
```

```java
if (!current.assignment_group.nil() && current.assignment_group.changes()) {
    gs.eventQueue("incident.assignedtogroup", current, current.assignment_group.getDisplayValue(), previous.assignment_group);
}
```
The third condition is true whenever the incident record is updated (including updates to the Comments field, as specified by the first script).

```java
if (current.operation() == 'update')
```

The then part of each script, the `gs.eventQueue` function, adds the event to the event queue. This statement uses the following syntax, set off with braces:

```java
gs.eventQueue("incident.updated", current, gs.getUserID(), gs.getUserName());
```

The `gs.eventQueue` function takes the following parameters:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the event triggered, set in quotation marks</td>
</tr>
<tr>
<td>Record</td>
<td>The record referenced when the condition in the script evaluates to true. Usually this is expressed as current, meaning the current record the business rule is working on. If the business rule is being triggered as part of a scheduled job, use a GlideRecord argument in its place.</td>
</tr>
<tr>
<td>Parm 1</td>
<td>An optional parameter you can use to pass system or record information with the event. For example, the GlideSystem API call <code>gs.getUserID()</code> passes the Sys ID of the user who acted on the current record as a string value. Other scripts can reference this string value as parm1 using the format <code>${event.parm1}</code>.</td>
</tr>
<tr>
<td>Parm 2</td>
<td>An optional parameter you can use to pass system or record information with the event. For example, the GlideSystem API call <code>gs.getUserName()</code> passes the user name of the user who acted on the current record. Other scripts can reference this string values as parm2 using the format <code>${event.parm2}</code>.</td>
</tr>
</tbody>
</table>

Sample scripts from the change events business rule

Several scripts are found in the baseline change events business rule.

This business rule defines events that fire after a change request is inserted or updated.

```java
if (current.operation() == 'insert') {
    gs.eventQueue("change.inserted", current, gs.getUserID(), gs.getUserName());
}
if (current.operation() == 'update') {
    gs.eventQueue("change.updated", current, gs.getUserID(), gs.getUserName());
}
if (!current.assigned_to.nil() && current.assigned_to.changes()) {
```
gs.eventQueue("change.assigned", current, current.assigned_to.getDisplayValue(), previous.assigned_to.getDisplayValue());

if (current.priority.changes() && current.priority == 1) {
    gs.eventQueue("change.priority.1", current, current.priority, previous.priority);
}

if (current.risk.changes() && current.risk == 1) {
    gs.eventQueue("change.risk.1", current, current.risk, previous.risk);
}

if (current.start_date.changes() || current.end_date.changes() || current.assigned_to.changes()) {
    if (!current.start_date.nil() && !current.end_date.nil() && !current.assigned_to.nil()) {
        gs.eventQueue("change.calendar.notify", current, current.assigned_to, previous.assigned_to);
    }

    // Remove from previous assigned to, due to assigned_to changing
    if (!previous.assigned_to.nil()) {
        if (!current.assigned_to.nil() && current.assigned_to.changes()) {
            gs.eventQueue("change.calendar.notify.remove", current, current.assigned_to, previous.assigned_to);
        }
    }

    // Remove old calendar from current assigned to, due to date changing
    else if (!current.assigned_to.nil()) {
        if (current.start_date.changes() && !previous.start_date.nil()) ||
            (current.end_date.changes() && !previous.end_date.nil()) {
                gs.eventQueue("change.calendar.notify.remove", current, current.assigned_to, current.assigned_to);
            }
    }
}

Create an event

If you do not find a suitable existing event, you can create your own.

Role required: admin

1. Navigate to System Policy > Events > Registry.
2. Click New and fill in the form.
3. Click the Business Rules related link.
4. If you are creating an event for a base system table, select the existing event business rule for the table.
   For example, select the sc request events business rule to create a custom Request event.
5. If you are updating an existing event business rule, add a new condition to the Script.
   The following sample script adds a request.commented event with the user's Sys ID as parm1 and the user's user name for parm2.

```javascript
if (current.operation() != 'insert' && current.comments.changes()) {
    gs.eventQueue('request.commented', current, gs.getUserID(), gs.getUserName());
```
© 2017 ServiceNow. All rights reserved.
6. If you are creating an event for a custom table, create a new business rule that runs after database operations. For example, this business rule defines several events for a custom application called Marketing Events.

Table 924: Sample event business rule

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Attendee Events</td>
</tr>
<tr>
<td>Table</td>
<td>Attendee [x_snc_marketing_ev_attendee]</td>
</tr>
<tr>
<td>Application</td>
<td>Marketing Events</td>
</tr>
<tr>
<td>Advanced</td>
<td>Selected</td>
</tr>
<tr>
<td>When</td>
<td>after</td>
</tr>
<tr>
<td>Insert</td>
<td>Selected</td>
</tr>
<tr>
<td>Update</td>
<td>Selected</td>
</tr>
<tr>
<td>Delete</td>
<td>Selected</td>
</tr>
<tr>
<td>Script</td>
<td>Add custom script that:</td>
</tr>
<tr>
<td></td>
<td>• Checks for one or more conditions on the current record.</td>
</tr>
<tr>
<td></td>
<td>• Calls the gs.eventQueue() method and specifies an event name.</td>
</tr>
<tr>
<td></td>
<td>See code sample.</td>
</tr>
</tbody>
</table>

**Note:** If you add Filter Conditions, Role conditions, or a Condition value, verify it runs the business rule when expected.

```javascript
(function executeRule(current, previous /*null when async*/) {
    //This function will be automatically called when this rule is processed.
    if(current.operation() == 'insert' &&
        current.marketing_event.changes()) {
        gs.eventQueue('x_snc_marketing_ev.attendee.added',
                       current,
                       current.marketing_event, current.email);
    }
    //Add event when marketing event changes
    if(current.operation() == 'update' &&
        current.marketing_event.changes()) {
        gs.eventQueue('x_snc_marketing_ev.attendee.deleted',
                       previous,
                       previous.marketing_event, previous.email);
        gs.eventQueue('x_snc_marketing_ev.attendee.added',
                       current,
                       current.marketing_event, current.email);
    }
    //Add event when attendee deleted
```
7. Register the event.

Create a script action or notification to process the event.

Script actions

You can use script actions to create server-side scripts that perform a variety of tasks, such as modifying a configuration item (CI), or managing failed login attempts. Script actions are triggered by events only.

Configuration

To create a new script action, navigate to System Policy > Events > Script Actions and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for your script action.</td>
</tr>
<tr>
<td>Event Name</td>
<td>Select the event to use for this script. If you do not find an event for your script action that suits your purpose, you can create a new one.</td>
</tr>
<tr>
<td>Application</td>
<td>The application that contains this script.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the script will be executed.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box (true) to enable this script action.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Create a statement for a condition under which this script should execute.</td>
</tr>
<tr>
<td>Script</td>
<td>Create a script that runs when the condition you define evaluates to true.</td>
</tr>
</tbody>
</table>

Two additional objects are available in this script:

- `event`: a GlideRecord - the sysevent that caused this to be invoked. If you wanted so get this first parameter on the event, you would use event.parm1 or event.parm2 for the second parameter. For the date/time of the event, use event.sys_created_on. To get the user ID that created the event (if there was a user associated), use event.user_id.
<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>• current: a GlideRecord - the event scheduled on behalf of (incident for example).</td>
<td></td>
</tr>
</tbody>
</table>

This is a sample of a script action that creates an email notification for Workflow activity:
Figure 796: Script action workflow

```
function sendWorkflowNotification() {
  // Get the activity that defines the information about the event
  var activity = new GlideRecord('wf_activity');
  if (activity.get(parts[0])) {
    return 0;
  }

  // The EmailAction does not know how to handle ${workflow...} constructs so we need to handle
  // these for it
  var context = new GlideRecord('wf_context');
  if (parts.length > 2) {
    context.set(parts[1]);
  }
  GlideController.putGlobal('context', context);
  var workflow = new Workflow().workflow.newWorkflowProxy();
  GlideController.putGlobal('workflow', workflow);
  var subject = workflow.activity vars subject;
  var message = workflow(activity vars .email);
  var emailAction = new GlideEmailAction();
  var email = new GlideRecord('sysevent_email_action');
```
Global events

Your instance has a global function called `global_events()` that triggers from a business rule when certain conditions occur.

This function triggers when your instance is:

- Inserting new records
- Updating existing records
- Adding comments to an existing record
- Assigning a record to a user
- Exceeding a record's inactive timer

For example, if you add the script `global.events(current)` to a business rule on the `change_request` table, the instance automatically configures the following events:

- `change_request.inserted`
- `change_request.updated`
- `change_request-commented`
- `change_request.assigned`
- `change_request.inactive`

The business rule for global events on the `change_request` table looks like this:

```
<table>
<thead>
<tr>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name:</td>
</tr>
<tr>
<td>Table:</td>
</tr>
<tr>
<td>Order:</td>
</tr>
<tr>
<td>Active:</td>
</tr>
</tbody>
</table>

Condition:
`script`:
`global_events(current);`
```

Figure 797: Change request tasks global business rule
Reprocess an event

You can fire the event again for testing or diagnostic purposes.

Role required: admin

1. Navigate to **System Logs > Events**.
2. Open an event.
   The event returns to the event queue.

Pass event parameters from a workflow to a notification

You can pass two event parameters that send information about a record or related records from a workflow to a notification.

Role required: admin

1. Navigate to **System Policy > Events > Registry** and define a new event to call.
2. Create the activity step that calls the event from your workflow and assign the two possible parameters.
   These parameters can be references or fields on the record that triggered the workflow, such as current.number for the request item number. You can also dot-walk to records in other tables. The event then sends the parameters information to the notification that it triggers.
3. Retrieve the parameters in the notification with email scripts by using event.parm1 and event.parm2.

   For example:

   ```javascript
   var string = event.parm1.toString();
   template.print(string);
   
   var id = event.parm1.toString();
   var gr = new GlideRecord('sc_req_item');
   gr.get('sys_id', id);
   if (gr.next()){
       // Do something.
   }
   ``

Contextual search

Contextual search allows you to configure fields on forms and record producers to automatically display knowledge search results based on the text entered in those fields.

Contextual search helps users deflect or quickly resolve their issues without involving the service desk operators. Contextual search can also include results from other sources such as a service catalog, allowing a user to directly order a catalog item from a search.
Contextual searches are enabled for incidents by default, providing incident deflection using knowledge and social Q&A questions. This default implementation includes contextual search results for forms, record producers, email notifications, and wizards.

To define a contextual search, first define a search context to set parameters, then define where the contextual search results are to appear: in forms, record producers, and wizards.

You must have the admin role to define contextual searches and to administer contextual search functions and properties.

### Define contextual search

You can add and configure contextual search functions for fields in forms, record producers, and wizards.

For example, you can add a new contextual search capability to the Service Desk Call form, linking search to the short description in that form. This automatically provides relevant knowledge to service desk staff when they respond to calls, helping to resolve these calls more quickly.

By default, the system provides contextual search for incident record producers and the Incident form to help with *incident deflection and resolution*.

### Contextual search process flow

Understand the steps you follow to define the contextual search process.

**Role required:** catalog_admin or admin

1. **Define a search context to be available in multiple locations, setting overall values and conditions for the search results displayed.**
   
   For example, define a search context for service desk calls that only displays search results from the Technical Solutions knowledge base.

2. **Define where the contextual search results are to appear.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Forms</strong></td>
<td>You can define knowledge to be associated whenever a problem record is created. For forms, you can also provide search results with email notifications sent when a record is created. For example, automatic notifications sent when an incident is created can include knowledge search results which may help the user who raised the incident resolve the issue independently.</td>
</tr>
<tr>
<td><strong>Record producers</strong></td>
<td>Define a Create New Incident record producer to trigger a search based on text entered in the Comments field. Display the search results at the bottom of the record producer.</td>
</tr>
<tr>
<td><strong>Wizards</strong></td>
<td>For example, if you have defined a wizard for creating incidents, you can add contextual search results to it.</td>
</tr>
</tbody>
</table>

- *Forms:*
- *Record producers:*
- *Wizards:*
Define search context

Create a search context to define a contextual search, with links to define which forms and record producers use that search.

For example, define a search context for service desk calls that only displays search results from your organization's Technical Solutions knowledge base.

1. Navigate to **Contextual Search > Search Contexts**.
2. Click **New**.
3. Fill in the fields, as appropriate.
Table 925: Name of form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the context.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary of the context.</td>
</tr>
<tr>
<td>Searcher</td>
<td>The searcher for this context, which determines the information source to search.</td>
</tr>
<tr>
<td></td>
<td>• Catalog only: searches service catalog items.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge and catalog: searches knowledge articles and service catalog items.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge and pinned knowledge: searches knowledge articles and pinned knowledge articles.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge only: searches knowledge articles only.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge, pinned knowledge and catalog: searches knowledge articles, pinned knowledge articles, and service catalog items.</td>
</tr>
<tr>
<td></td>
<td>• Pinned Knowledge only: searches pinned knowledge articles only.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box for activating the search context.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

5. Optional: Click **Set As Default** to make this the default context, used if a search query does not specify a context. For example, if a search query is invoked from a script without providing a context.

6. Use the related lists to further define the search context.

   • Record Producer Configurations: define which record producers use this context.
   • Table Configurations: define which forms use this context.
   • Wizard Configurations: define which wizards use this context.
   • Resource Configuration: define configurations to apply to the search context, such as restrictions on the results displayed.

Define contextual search for a form

Define contextual search for the form associated with a table.

You can define knowledge to be associated whenever a problem record is created. For forms, you can also provide search results with email notifications sent when a record is created. For example, automatic notifications sent when an incident is created can include knowledge search results which may help the user who raised the incident resolve the issue independently.
In the table configuration record, specify which fields on the form trigger a search. For example, a contextual search for the Incident table might display search results based on text entered in the Incident form Short description field.

1. In the Search Context form, open the Table Configurations related list and click New. Alternatively, navigate to Contextual Search > Table Configuration and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table name associated with the form. For example, Incident [incident] to display search results for Incident forms.</td>
</tr>
<tr>
<td>Note: The list shows only tables and database views that are in the same scope as the contextual search.</td>
<td></td>
</tr>
<tr>
<td>Search context</td>
<td>Name of the search context this table configuration applies to.</td>
</tr>
<tr>
<td>Results header text</td>
<td>Label for the search results area that appears on the form.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box for activating this context.</td>
</tr>
<tr>
<td>Results per page</td>
<td>Number of results to display per page.</td>
</tr>
<tr>
<td>Result action label</td>
<td>Label of the action button that appears when the user opens a search result record. By default, this is set to This Helped.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result action value</td>
<td>Internal value of the action button that appears when the user opens a search result record. By default, this is set to <strong>helped</strong>. This value is stored within the Relevant Document [cxs_relevant_doc] table.</td>
</tr>
<tr>
<td>Match condition</td>
<td>Conditions under which this search is enabled. For example, set <strong>[Active] [is] [true]</strong> to only enable the search on active records.</td>
</tr>
<tr>
<td>Enable search as</td>
<td>Allow you to define results to show for an additional user. See Search as different user on page 3017 for more details.</td>
</tr>
</tbody>
</table>

2. Right-click the form header and select **Save**.
3. Define which search fields to use contextual search with.
4. Optional: Define email configurations to include knowledge search results in email notifications sent.
5. Click **Update** to save and close the Table Configuration record.
6. Add the search results area to the form for the associated table.
   a) Navigate to the relevant form for that table. For example, navigate to **Incident > Open** and open an Incident form.
   b) Configure the form and add Contextual Search Results in the location where you want to display the results. For example, you might want to display the search results immediately after the text field the search is based on or at the bottom of the form.

### Define search fields on a form

Contextual searches are based on the content entered in selected search fields on forms. You can define multiple search fields for a form, with one field selected as the default.

Search results for the default field appear automatically in the Related Search Results section when you open a record. Search results in other associated fields only appear when you type content in those fields.

For example, in the base system the **Short description** is the default search field for the Incident form, so search results based on that field are displayed automatically.
### Incident - INC000055

- **Number:** INC000055
- **Caller:** Carol Coughlin
- **Location:**
- **Category:** None
- **Subcategory:** None
- **Configuration item:** SAP Sales and Distribution

  - **Configuration item:** SAP Sales and Distribution
  - **SAP Sales app is not accessible**

© 2017 ServiceNow. All rights reserved.
If the **Description** field is also defined as a search field on this form, search results only appear when you type content in that field.

1. Navigate to **Contextual Search > Table Configuration** and open the record.
2. Click **New** in the **Search Fields** related list.
3. Select the field to use and the order for that field.

**Note:** Only text fields can be selected.

4. Right-click the header and select **Save** to save the search field record.
5. Optional: If you have multiple search fields defined for that form, you can click **Set as Default** to select the new field as the default search field.

### Create an email notification for search results

Edit the email notification that is sent when the relevant record is created to include search results.

1. Navigate to Open the Table Configuration form for the table.
2. In the **Email Configurations** related list, click **New**.

![Image of Email Configuration form](image.png)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email notification</td>
<td>Email notification to use. For example, the default incident email notification provided is <strong>Incident opened for me</strong>.</td>
</tr>
<tr>
<td>User</td>
<td>Field identifying the user to receive the email. For example, <strong>Opened by</strong> if the email notification is sent to the user who created the record. This information is used to filter the search results included based on that user's access permissions, ensuring that the recipient can always access the information in the links provided.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Limit</td>
<td>Maximum number of results the email notification includes.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
4. Configure the email notification to use the contextual search.
   a) Navigate to **System Policy > Email > Notifications**.
   b) Open the email notification which will include the contextual search results.
   c) Add the following script to the notification
      
      Message: `${mail_script:cxs_EmailSearchResults}`

**Search as different user**

When you define contextual search for tables, you can choose to display search results as they would appear to a different user who performs the search.

For example, an HR administrator may want to display contextual search results, for a user who made an HR request, to find out why these results did not answer the user's query.

---

**Note**: The results for the user performing the search are based on that specific user's security access. Hence, the search result view for that user may have fewer entries than what that user can actually view.

---

1. Navigate to **Contextual Search > Table Configuration**.
2. Open a table configuration record.
3. In the **Search as** section of the form, fill in the fields as appropriate.
When enabled, Search As displays the search results that appear for the user defined in the Search As field.

Results appear in a separate tab next to the search results the current user sees.

Use Condition and Scripts to restrict when the other user’s results appear. Results appear if both checks evaluate to true:

- Condition in the Condition field evaluates to true, or the condition is empty.
- The script in the Script field evaluates to true, or sets the variable “answer” to true, or is empty.

<table>
<thead>
<tr>
<th>Enable search as</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Search as field</td>
<td>*</td>
</tr>
<tr>
<td>Results message</td>
<td></td>
</tr>
<tr>
<td>Condition</td>
<td></td>
</tr>
<tr>
<td>Script</td>
<td></td>
</tr>
</tbody>
</table>
Table 928: Search as configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable search as</td>
<td>Check box use search as functionality.</td>
</tr>
<tr>
<td>Search as field</td>
<td>The field on the table to identify the user to search as. You can only select User Reference fields.</td>
</tr>
<tr>
<td></td>
<td>For example, select Opened by to search as the user who opened the relevant record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Specify the conditions based on which the search as results are displayed.</td>
</tr>
<tr>
<td>Script</td>
<td>A condition script, enabling administrators to implement more powerful conditions.</td>
</tr>
<tr>
<td></td>
<td>For example, to restrict access to users that are members of a group, use gs.getUser().isMemberOf(&quot;&lt;group name&quot;).</td>
</tr>
</tbody>
</table>

**Note:** Both Condition and Script must evaluate to true for the results to be displayed.

**Note:** An empty script evaluates to true.

When an eligible user opens the form for this table and enters search terms, two tabs are displayed: one with the search results the user sees (My results), and one with the search results the other defined user sees (<User name>'s results).

**Define contextual search for record producer**

You can define a record producer to trigger a search based on text entered in the Comments field, and display search results at the bottom of the record producer.

For example, you can add contextual search to the Short description variable in the Ask a Question record producer to provide potential answers for users creating an incident using that record producer.

The default Create New Incident record producer implements contextual search. If you have customized this record producer, you can configure contextual search to link to a specific field on your record producer.

**Note:** Only one variable within a record producer can use contextual search.

1. Navigate to **Contextual Search > Search Contexts**.
2. Select the search context.
3. In the **Record Producer Configurations** related list, click **New**.
4. Complete the form.

Table 929: Configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record producer</td>
<td>Name of the record producer to add the search to.</td>
</tr>
<tr>
<td>Search context</td>
<td>Name of the search context to use.</td>
</tr>
<tr>
<td>Search variable</td>
<td>Variable within the selected record producer which uses the contextual search.</td>
</tr>
<tr>
<td>Results header text</td>
<td>Label for the search results area that appears on the record producer.</td>
</tr>
<tr>
<td>Result action label</td>
<td>Label of the action button that appears when the user opens a search result record. By default this is set to This Helped.</td>
</tr>
<tr>
<td>Result action value</td>
<td>Internal value of the action button that appears when the user opens a search result record. By default this is set to helped. This value is stored within the Relevant Document [cxs_relevant_doc] table.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Active | Check box for activating this record producer configuration.
Limit | Maximum number of items to display in the results area. By default, this is set to 10. To return an unrestricted number, leave this field blank.
Results per page | Number of results that are shown per page in the results area.

5. Click **Submit**.

**Define contextual search for wizard**

You can define contextual search for a wizard.

For example, if you have defined a wizard for creating incidents, you can add contextual search results to it.

---

**Note:** Wizards must be activated before you can use this functionality.

---

**Associate contextual search to a wizard**

You can associate contextual search to a text variable in a wizard to create a new wizard configuration record.

1. In the Search Context form, open the Wizard Configurations related list and click **New**. Alternatively, navigate to **Contextual Search > Wizard Configuration** and click **New**.
2. Fill in the fields, selecting an existing text variable to associate with contextual search.
3. Right-click the form header and select **Save**.
4. Click the **Add to Wizard** related link to associate the contextual search to the wizard.

**Add contextual search to wizard**

Update the wizard record to add the contextual search variable and implement contextual search.

1. Navigate to **System Wizards > Wizards**.
2. Open the wizard to be updated.
3. Define a new variable with **Type** set to **Macro** and **Macro** set to **cxs_wizard_search**.
4. Click **Submit**.

5. In the **Wizard Panels** related list, open the panel where you will add the macro variable.

   **Note:** Some types of panel may not allow variables.

6. On the **Variables** related list in the selected panel, click **Edit**.

7. Move the newly created macro from the **Collection** list to the **Variables List**.
8. Click **Save**.

By default, the Create Incident wizard includes contextual search linked to the **Please describe your symptoms** text variable.

### Apply configuration to search

You can apply configurations to define conditions for each search context. For example, you can configure the **catalog** search resource to only display search results from a specific service catalog.

1. In the **Search Context** form, open the **Resource Configuration** related list to show the resource configurations available for that context. The resource configurations available are based on the searcher selected for this search context.

2. Click the arrow icon beside the searcher name to expand the entry, showing which configuration properties are available.

4. Click **Update**.

**Contextual search roles**

Contextual search involves the following roles.

<table>
<thead>
<tr>
<th>Role title [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator [admin]</td>
<td>Access and use contextual search functions.</td>
</tr>
</tbody>
</table>

**Deflect and resolve incidents with knowledge**

Incident deflection and resolution with knowledge provides contextual search results.

Contextual search is provided for the following areas:

- Incident record producers: deflecting incidents by helping end users resolve issues before they raise an incident.
- Incident forms: helping service desk staff resolve incidents quickly by providing relevant knowledge.
- Incident email notifications: helping end users resolve their incidents themselves without requiring manual intervention from service desk staff.

You can run feedback reports to track where these search results are marked as helpful.

You must have the admin role to configure contextual search.

**Provide knowledge in an incident form**

The Incident form displays contextual search results based on text entered in the **Short Description** field. These search results provide targeted knowledge to the incident analyst.

If the user who raised the incident has indicated that a returned result was useful, the incident analyst can review this information in more detail to help resolve the incident more quickly.

You can **configure contextual search functionality** to change which fields are searched on or to add contextual search to other forms.

### Provide knowledge in incident record producer

Incident deflection provides self-service users with contextual knowledge when they create an incident using either the Create Incident record producer or the Something Broken ESS record producer.

Contextual search results appear based on text entered in the **Please describe your issue below** field of the Create Incident record producer, or in the Short description field of the Something Broken ESS record producer.

Users can indicate whether a search result is useful to them. If the knowledge provided resolved the incident, the user can cancel the record producer, which deflects the incident. The following scenario shows an example of this.

1. Navigate to the service catalog and select the **Can we help you?** category.
2. Select the **Create New Incident** catalog item to raise an incident.
   - The Create Incident record producer is displayed.

3. Contextual search then searches the text entered in the **Please describe your issue below** field to display knowledge results.
4. The user can click an entry in the results list to view the article.
5. The user can then indicate that the article helped, navigate to another article, or close the article.

6. If the knowledge provided helps resolve the issue, the user can cancel the incident record producer. The incident has been deflected. If the information did not fully resolve the issue, the user can still submit the incident.

You can configure contextual search functionality to adapt it to your organization’s incident record producers, or to add contextual search to other record producers. For example, customized incident record producers do not have contextual search enabled by default, so you can add contextual search to a customized record producer.

Provide knowledge in incident email notification

Contextual search results are included in email notifications that are sent to users who create a new incident.

This provides links to knowledge articles that may help users resolve their issues faster. For example, if a user raises an incident when the service desk staff is not available, the email notification provides knowledge links that may help the user.

By default, contextual search results are based on the short description in the incident. Within the automated email response, contextual search adds links to relevant knowledge articles.
For example:

1. Navigate to A customer sends an email to IT support with the subject *My laptop keeps crashing.*

2. An incident is created based on this email.

3. The email subject is inserted into the Short description field of the new incident.

4. The automated email notification sent to the user includes search results based on *My laptop keeps crashing.* For example, one article could be *How to upgrade your Windows version to stop your laptop crashing.*

5. The customer may then be able to use the returned results to resolve the incident.

---

**Note:**

The knowledge links provided are filtered to ensure the articles are accessible to the user who submitted the email.

---

By default, notifications provide three article links. You can configure notification options, such as changing the number of links provided with notifications, can be configured by administrators.

You can also configure contextual search functionality to match your organization’s email notifications or to use contextual search with notifications for other records.

**Attach an article**

If contextual search is available in a form that uses the knowledge search icon, that icon is removed to ensure there is only a single knowledge search mechanism for that form.

To retain the ability to attach a selected article to that form, an extra **Attach** button appears on the search results list, and an **Attach to incident** button appears on the displayed knowledge article.
Figure 800: Attach Button

Click the relevant button to attach that knowledge article to that incident, adding details of the knowledge article to the task.

Administer contextual search

You can configure contextual search functions. These procedures require the admin role.

Configure a property

Navigate to Contextual Search > Properties to view and edit contextual search properties.
### Table 933: Contextual search properties

<table>
<thead>
<tr>
<th>Property label [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default value for maximum number of search results returned for table and record producer configurations [com.snc.contextual_search.result.default.limit]</td>
<td>Set an upper limit on the number of search results displayed in record producers or forms using contextual search. By default, this is set to 10.</td>
</tr>
<tr>
<td>Number of milliseconds that a configured field will wait before triggering a search [com.snc.search.service.wait_time]</td>
<td>Set the amount of time after a user finishes typing before running a search based on the typed text. By default, this is set to 500 (half a second).</td>
</tr>
<tr>
<td>Records returned above this threshold will log warnings [com.snc.contextual_search.result.threshold]</td>
<td>Trigger a warning message within the system log whenever more than this number of results is returned in a search. This logging helps if you are experiencing performance issues because of large searches. By default, this is set to 10,000.</td>
</tr>
<tr>
<td>When a Form configuration is created a search field with a name matching this property will be automatically created [com.snc.contextual_search.widget.form.default_field]</td>
<td>Link the context search to the search field identified in this property whenever you create a new context search for a form. This eliminates the need to select the field in the form manually. By default, this is set to short_description, meaning that whenever you create a new context search for a form with a short_description field, that field is automatically selected as the field the context search acts on.</td>
</tr>
<tr>
<td>Collapse the search results widget when opening an existing record in a form [com.snc.contextual_search.widget.form.open_collapsed_existing_records]</td>
<td>When set to true, the search results widget will be collapsed when an existing record is opened.</td>
</tr>
</tbody>
</table>

**Note:** This applies only to existing records and not new records.

---

### Run a feedback report

A **This Helped** button appears in displayed knowledge articles, allowing users to mark an article as helpful for resolving the associated issue. You can report on searches where a knowledge article was marked as helpful to measure the effectiveness of the contextual search results.

For example, service desk managers can produce a report on user issues that were resolved without an incident being raised to help measure the benefits of incident deflection using knowledge. This information can help to create targeted knowledge based on trends.

For example, analyzing commonly-raised incidents then creating knowledge articles based around those incident can help resolve or deflect similar incidents in future.

1. Navigate to **Reports > View / Run**.
2. Select the report to run.

Reports available by default are:

- **Number of deflected incidents over the last 3 months**: A line chart displaying the total number of deflected incidents per month for the last 3 months.
• **Successful deflection articles by search term**: A grouped list of search terms and the knowledge articles that were marked as helpful.

• **Top 15 most helpful articles**: A bar chart showing the top 15 articles that have been marked as helpful.

---

**Note**: You can also run a report by navigating to and searching for the word **Relevant**.

---

You can create additional feedback information reports by querying feedback tables.

**View a searcher**

Searchers specify where to locate information for a contextual search, such as knowledge and catalog items.

Searcher records are read-only, but you should be aware of the searchers available so you can select the correct one when defining contextual searches.

1. Navigate to **Contextual Search > Searchers**, then open a record.
2. Use the Search Resources related list to inspect the sources which define the information areas to search.
   For example, incident deflection uses the **knowledge and catalog** searcher which includes knowledge and catalog resources.

   Search resources can also contain properties, refining the resource further. For example, the knowledge search resource contains a Sort order property to specify that the search results are returned sorted by relevance.
Query feedback information

The information captured when the user clicks the **This Helped** action button on the result window is stored in the following tables.

<table>
<thead>
<tr>
<th>Table [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relevant Document</td>
<td>Contains incident record references where users have indicated that a search result record was useful by clicking the <strong>This helped</strong> button</td>
</tr>
<tr>
<td>[cxs_relevant_doc]</td>
<td></td>
</tr>
<tr>
<td>Relevant Document Detail</td>
<td>Contains details of the search result record that users have indicated as useful or have attached to a form, as well as the search terms used to query the knowledge base.</td>
</tr>
<tr>
<td>[cxs_rel_doc_detail]</td>
<td></td>
</tr>
</tbody>
</table>

This feedback information is important for analyzing the effectiveness of the searches provided. You can create custom reports on this information by querying these tables.

Installed with contextual search

Activating the Contextual Search plugin installs the following components:

Business rules installed with contextual search

Contextual search adds the following business rules.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add variable to record producer</td>
<td>Record Producer Configuration [cxs_rp_config]</td>
<td>Contains script that adds contextual search to the selected variable on a record producer.</td>
</tr>
<tr>
<td>Add variable to wizard</td>
<td>Wizard Configuration [cxs_wizard_config]</td>
<td>Contains script that adds contextual search to the selected variable on a wizard.</td>
</tr>
<tr>
<td>Cascading delete for removed config</td>
<td>Table Configuration [cxs_table_config]</td>
<td>Deletes search fields when the related table configuration is deleted.</td>
</tr>
<tr>
<td>Check for duplicate</td>
<td>Table Configuration [cxs_table_config]</td>
<td>Avoids duplicate table configurations.</td>
</tr>
<tr>
<td>Check for duplicate</td>
<td>Email Configuration [cxs_table_email_config]</td>
<td>Avoids duplicate table email configurations.</td>
</tr>
<tr>
<td>Check for duplicate</td>
<td>Wizard Configuration [cxs_wizard_config]</td>
<td>Avoids duplicate wizard configurations.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check for duplicate</td>
<td>Record Producer Configuration [cxs_rp_config]</td>
<td>Avoids duplicate record producer configurations.</td>
</tr>
<tr>
<td>Check for invalid action values</td>
<td>Base UI Configuration [cxs_ui_config_base]</td>
<td>Checks for invalid action values against the related search configuration.</td>
</tr>
<tr>
<td>Create default search field</td>
<td>Table Configuration [cxs_table_config]</td>
<td>Creates a default search field when an insert or update is performed on a table configuration.</td>
</tr>
<tr>
<td>Create m2m_kb_task record on attach</td>
<td>Relevant Document Detail [cxs_rel_doc_detail]</td>
<td>Creates a knowledge base task record.</td>
</tr>
<tr>
<td>Delete m2m_kb_task record on remove</td>
<td>Relevant Document Detail [cxs_rel_doc_detail]</td>
<td>Deletes a knowledge base task record.</td>
</tr>
<tr>
<td>Display default context config message</td>
<td>Client Configuration [cxs_client_config]</td>
<td>Confirms the default search context configuration.</td>
</tr>
<tr>
<td>Display default field message</td>
<td>Search Field [cxs_table_field_config]</td>
<td>Confirms the default table field.</td>
</tr>
<tr>
<td>If searcher changes check interleaved</td>
<td>Search Context [cxs_context_config]</td>
<td>Check weather a search context needs to interleaved</td>
</tr>
<tr>
<td>Maintain context resource properties</td>
<td>Search Context [cxs_context_config]</td>
<td>Is used to update context properties</td>
</tr>
<tr>
<td>Make default</td>
<td>Search Context [cxs_context_config]</td>
<td>Sets the client configuration as the default.</td>
</tr>
<tr>
<td>Make default config</td>
<td>Search Field [cxs_table_field_config]</td>
<td>Sets the table field as the default.</td>
</tr>
<tr>
<td>Populate &quot;Order&quot; field</td>
<td>Search Field [cxs_table_field_config]</td>
<td>Sets the order for new search field configurations. Order will be set to the highest order in the list.</td>
</tr>
<tr>
<td>Remove related search field records</td>
<td>Table Configuration [cxs_table_config]</td>
<td>Removes related search fields when changes are made to a record producer</td>
</tr>
<tr>
<td>Remove related search field records</td>
<td>Record Producer Configuration [cxs_rp_config]</td>
<td>Removes related search fields when changes are made to a table.</td>
</tr>
<tr>
<td>Set &quot;Name&quot; field</td>
<td>Record Producer Configuration [cxs_rp_config]</td>
<td>Sets the name of a record automatically for record producers.</td>

<tr>
<td>cxs_TableFieldConfig</td>
<td>Configures records in the Search Field [cxs_table_field_config] table.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
### Tables installed with contextual search

Contextual search adds or modifies the following tables.

**Table 938: Tables installed with contextual search**

<table>
<thead>
<tr>
<th>Display Name [Table Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Search Resource [v_cxs_search_resource]</td>
<td>A virtual table that contains a list of available search resources used in configuration of searches.</td>
</tr>
<tr>
<td>Email Configuration [cxs_table_email_config]</td>
<td>Contains a list of email notifications configured to have contextual search results attached.</td>
</tr>
<tr>
<td>Record Producer Configuration [cxs_rp_config]</td>
<td>Contains a list of record producers configured to have contextual search.</td>
</tr>
</tbody>
</table>
| Relevant Document [cxs_relevant_doc] | Contains incident record references where users have indicated that a search result record was useful by clicking the **This helped** button. Significant fields include:  
  - **Displayed on**: Whether the contextual search results were shown on a table form or a record producer.  
  - **Session id**: The id of the search session that the action button was triggered for.  
  - **Helped with**: The record that the search result helped resolve. |
<table>
<thead>
<tr>
<th>Display Name [Table Name]</th>
<th>Description</th>
</tr>
</thead>
</table>
| Relevant Document Detail [cxs_rel_doc_detail] | Contains all the search result records which users have indicated were useful or have attached to a form, as well as the search terms used in the search query. Significant fields include:  
  - **Relevance**: The internal value of the action button (This helped or Attach).  
  - **Help document**: The search result that was marked as helped or attached.  
  - **Help document URL**: The URL to the article that was marked as helped or attached.  
  - **Search request**: The JSON object that was used by the search engine to perform the search.  
  - **Search term**: The search term that was used to initiate the search. |
| Search Context [cxs_context_config]       | Contains available search contexts for contextual search.                                                                                   |
| Search Field [cxs_table_field_config]     | Contains all form fields which have contextual search configured to it.                                                                       |
| Search Resource Context Configuration [cxs_res_context_config] | Contains conditions for this search context that will restrict the results returned to a user.                                               |
| Search Resource Context Property [cxs_res_context_config_prop] | Contains the property values for search resource context configuration.                                                                     |
| Search Resource Property [cxs_search_res_config_prop] | Contains the property values for search resource searcher configuration.                                                                     |
| Searcher Configuration [cxs_searcher_config] | Contains the details of available search configurations.                                                                                     |
| Table Configuration [cxs_table_config]     | Lists the tables configured for table configurations.                                                                                         |
| Wizard Configuration [cxs_wizard_config]   | Lists the tables configured for wizard configurations.                                                                                         |
| Base UI Configuration [cxs_ui_config_base] | Contains the common elements for the record producer, table, and wizard configurations.                                                      |
UI macros installed with contextual search

Contextual search adds the following UI macros.

**Table 939: UI macros installed with contextual search**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cxs_result</td>
<td>Represents a single search result when processed by cxs_results.</td>
</tr>
<tr>
<td>cxs_results</td>
<td>Processes the results returned by a contextual search.</td>
</tr>
<tr>
<td>cxs_results_header_email</td>
<td>Adds the header when sending contextual search results by email.</td>
</tr>
<tr>
<td>cxs_results_header_rp</td>
<td>Displays the header that is shown above the search results on record producers.</td>
</tr>
<tr>
<td>cxs_results_header_table</td>
<td>Displays the header that is shown above the search results on forms.</td>
</tr>
<tr>
<td>cxs_results_header_wizard</td>
<td>Displays the header that is shown above the search results wizards.</td>
</tr>
<tr>
<td>cxs_results_table</td>
<td>Processes the results returned by a contextual search.</td>
</tr>
<tr>
<td>cxs_results_vcr</td>
<td>Provides the pagination controls.</td>
</tr>
<tr>
<td>cxs_result_default</td>
<td>Represents a single search result where there is no specific macro for the source table.</td>
</tr>
<tr>
<td>cxs_result_email</td>
<td>Represents a single search result when the search results are being sent by email.</td>
</tr>
<tr>
<td>cxs_result_kb_knowledge</td>
<td>Represents a single search result returned from the kb_knowledge table.</td>
</tr>
<tr>
<td>cxs_result_sc_cat_item</td>
<td>Represents a single search result returned from the sc_cat_item table.</td>
</tr>
<tr>
<td>cxs_result_table</td>
<td>Represents a single search result for displaying on a form.</td>
</tr>
<tr>
<td>cxs_rp_search</td>
<td>Initiates a contextual search from a record producer.</td>
</tr>
<tr>
<td>cxs_table_search</td>
<td>Initiates a contextual search from a form.</td>
</tr>
<tr>
<td>cxs_wizard_search</td>
<td>Initiates a contextual search from a record producer.</td>
</tr>
</tbody>
</table>

UI policies installed with contextual search

Contextual search adds the following UI policies.
Table 940: UI Policies installed with contextual search

<table>
<thead>
<tr>
<th>UI Policy</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide Table field</td>
<td>Email Configuration [cxs_table_email_config]</td>
<td>Changes email configuration visibility to false and read only.</td>
</tr>
<tr>
<td>Hide table config field</td>
<td>Search Field [cxs_table_field_config]</td>
<td>Hides the table field on the form.</td>
</tr>
</tbody>
</table>

Web services

HTTP-based web services allow diverse applications to talk to each other. ServiceNow supports both inbound (provider) and outbound (consumer) web services.

**Direct inbound web services**

Inbound web services allow you to access and modify ServiceNow data using a client application.

- REST API on page 3045
- Scripted REST APIs on page 3222
- SOAP web service on page 3255
- CSV Web service on page 3380
- EXCEL web service on page 3379
- JSONv2 Web Service on page 3380
- PDF web service on page 3391
- RSS feed generator on page 3395
- XML web service on page 3391

**Other inbound web services**

- ODBC driver on page 3470
- Scripted SOAP web services on page 3345

**Outbound web services**

Outbound web services allow you to send SOAP and REST messages to external web service providers.

- Outbound SOAP web service on page 3434
- Outbound REST web service on page 3403

**Inbound web services**

Inbound web services, such as the REST API, allow you to interact with ServiceNow instance data using web service requests.

ServiceNow supports inbound web services using REST and SOAP.
Additional web services are also available that provide specific functionality, such as the PDF or RSS web services.

REST API

REST (REpresentational State Transfer) is a simple stateless architecture that generally runs over HTTP. The REST style emphasizes that interactions between clients and services are enhanced by having a limited number of operations. Flexibility is provided by assigning resources their own unique universal resource indicators (URIs). Because each operation (GET, POST, PUT and DELETE) has a specific meaning, REST avoids ambiguity.

The REST API is active by default in all instances.

RESTful web services offer administrators several advantages, including:

- Support for different HTTP methods to perform different actions
- Detailed response codes and header information
- Pagination support for large data sets
- Streaming data on GET requests

Getting started with the REST API

To become familiar with ServiceNow REST API support, review these example scenarios and test the REST API functionality.

In this tutorial you will use the REST API Explorer to test the REST API. The REST API Explorer allows you to discover ServiceNow REST APIs, quickly construct and execute requests, and view responses from ServiceNow REST APIs within your browser.

Before beginning, ensure your user account has the rest_api_explorer and web_service_admin roles. These roles are required to complete the example procedures.

Getting started with REST - access the REST API Explorer

View available REST API resources using the REST API Explorer.

Role required: web_service_admin, rest_api_explorer, or admin

You can browse available APIs, API versions, and methods for each API.

Navigate to System Web Services > REST API Explorer.
### Table API

Allows you to perform create, read, update and delete (CRUD) operations on existing tables

**Retrieve records from a table**

GET `https://<hostname>.service-now.com/api/now/table/tableName`

<table>
<thead>
<tr>
<th><strong>Prepare request</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Request Headers</strong></td>
</tr>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>Request Format</td>
</tr>
<tr>
<td>Response Format</td>
</tr>
<tr>
<td>Authorization</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Path Parameters</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td><strong>tableName</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Query Parameters</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>sysparm_query</td>
</tr>
<tr>
<td>sysparm_display_value</td>
</tr>
<tr>
<td>sysparm_exclude_reference_link</td>
</tr>
</tbody>
</table>
Getting started with REST - retrieve existing incidents

Use a GET request to view existing incident records.

Role required: web_service_admin, rest_api_explorer, or admin

Use the REST API Explorer to send the following request:

GET https://instance.service-now.com/api/now/v1/table/incident

1. In the top-left of the REST API Explorer, select **Table API** and **v1** version.
2. Click **Retrieve records from a table (GET)**.
3. In the **Path Parameters** section, select the Incident table.
4. Scroll to the bottom of the page and click **Send**.

The response includes incident records from the instance. The REST API Explorer limits queries to 10 records at a time, only the first 10 incident records appear. The response also includes a Link header that provides the URL to query the next 10 incident records.
Response

Status code: 200 OK

Headers
- Content-Encoding: gzip

  ]
}
Getting started with REST - create an incident record
Use a POST request to create a new record.

Role required: web_service_admin, rest_api_explorer, or admin

Use the REST API Explorer to send the following request:

POST https://instance.service-now.com/api/now/v1/table/incident

1. In the top-left of the REST API Explorer, click Create a record (POST).
2. In the Path Parameters section, select the Incident table.
3. In the Request Body section, click Add a field.
4. Select a field and specify a value for that field.
5. Optional: Click Add another field and specify an additional field to assign a value to.
   The request body updates automatically based on your entries, such as
   {"short_description":"Test incident creation through REST",
   "comments":"These are my comments"}
6. After constructing the request, click Send.
   The response includes a Location header that specifies where the incident was created and how to
   retrieve the incident. Record this header to use in the next part of this guide.
**Response**

- **Status code**: 201 Created

**Headers**
- Content-Encoding: gzip
- Content-Type: application/json
- Date: Tue, 08 Sep 2015 12:11:03 GMT
- Location: https://[redacted].servicenow.com/api/now/v1/table/incident/ba8f71b22b1a02006706b7219da154f
- Server: ServiceNow
- Transfer-Encoding: chunked

**Response Body**

```
"short_description": "Test incident creation through REST",
"order": "",
"sys_updated_by": "admin1",
"resolved_by": "",
"notify": "1",
"upon_reject": "cancel",
"approval_history": "",
"problem_id": "",
"work_notes": "",
"calendar_duration": "",
"close_code": "",
"sys_id": "ba8f71b22b1a02006706b7219da154f",
```

---

*Getting started with REST - read the inserted incident*

Use the Location header from the POST response to run a GET request.

Role required: web_service_admin, rest_api_explorer, or admin
Use the REST API Explorer to send the following request:

GET https://instance.service-now.com/api/now/v1/table/incident/(sys_id)

1. In the top-left of the REST API Explorer, click **Retrieve a record (GET)**.
2. In the **Path Parameters** section, select the Incident table.
3. In the **sys_id** field, enter the `sys_id` of the record you created.
   
   The `sys_id` appears as a 32-character string at the end of the POST response Location header.
4. Click **Send**.

   The response body contains a text representation of the record. You can control the format of the response, such as JSON or XML, using the **Response Format** field.
Getting started with REST - update the incident

Update the incident record using either a PUT or PATCH function.

Role required: web_service_admin, rest_api_explorer, or admin

Use the REST API Explorer to send the following request:
PUT https://instance.service-now.com/api/now/v1/table/incident/(sys_id)?sysparm_exclude_ref_link=true

1. In the top-left of the REST API Explorer, click Modify a record (PUT) or Update a record (PATCH).
2. In the Path Parameters section, select the Incident table.
3. In the sys_id field, enter the sys_id of the record you created.
4. In the Request Body section, click Add a field.
5. Select the Short description field and specify a new value.
6. Click Send.
7. Verify that the response contains the updated short_description value.
Getting started with REST - delete the incident

Delete the incident using a DELETE request.

Role required: web_service_admin, rest_api_explorer, or admin

Use the REST API Explorer to send the following request:

DELETE https://instance.service-now.com/api/now/v1/table/incident/(sys_id)

1. In the top-left of the REST API Explorer, click Delete a record (DELETE).
2. In the Path Parameters section, select the Incident table.
3. In the **sys_id** field, enter the sys_id of the record you created.
4. Click **Send**.
5. Verify that the response status code is 204.

![Response Table]

### Available REST APIs

The inbound REST API provides multiple endpoints and methods.

To view the the REST API resources available in your instance, along with the correct formats for the supported methods, navigate to **System Web Services > REST API Explorer**.

**REST API explorer**
The REST API Explorer uses information from your instance to provide you with a list of endpoints, methods, and variables that you can use to build and send a REST request.

After you build the request, the REST API Explorer provides code samples in multiple programming languages that you can use to send the request, and detailed request and response information.

Access the REST API Explorer by navigating to **System Web Services > REST API Explorer**. You must have the rest_api_explorer role to access the REST API Explorer.

**Warning:** The REST API Explorer interacts with data on the current instance. Use caution when working with requests that create, edit, or delete data on a production instance.

### Explore the REST API for a table

You can explore the REST API for a table directly from that table. Explore the API using the REST API Explorer to quickly construct and test REST requests for that table.
Role required: itil, personalize_dictionary, and rest_api_explorer

1. Navigate to any form or list.
2. Right-click the form or list header and select Configure > Table.
3. Click the Explore REST API related link.

The REST API Explorer opens, displaying the Table API for the selected table. If the table does not allow web service interaction, a warning appears instead.

Use the REST API Explorer to construct and test REST requests for the table.

REST API explorer elements
The REST API Explorer displays multiple elements that allow you to construct and test REST requests.
The Namespace, API, method, Request Headers and Path Parameters sections appear for all requests. Other sections may appear depending on the selected API and method.

Namespace, API, and method

The choice lists at the top of the REST API Explorer allow you to select an API, such as the Table API, Aggregate API, or Import Set API, and an API version. Available APIs depend on the selected Namespace. REST APIs provided by ServiceNow use the now namespace. Scripted REST Services may use a different namespace.

Links that appear below these choice lists display available methods for the selected API and version, such as the GET method for the Table API. Each method includes a brief description of the action that method performs. The REST API Explorer displays a sample endpoint and certain Request Elements based on the selected API and method.

Request headers

In the Request Headers section, specify the HTTP request and response headers and choose to send the request as yourself or as another user. If you select another user, enter the username and password.

To add a custom header, click Add custom header and specify the header name and value.

Path parameters

In the Path Parameters section, select the table to interact with. For the Import Set API, import staging tables are available. For the Table API and Aggregate API, all tables that allow web service interaction are available. For requests that interact with a single existing record, such as those that modify a record, the sys_id field allows you to specify the record.

Query parameters

In the Query Parameters section, define parameters to modify the request, such as the encoded query used to filter results when performing a Table API GET request.

The parameters that appear depend on the selected request method. To add custom query parameters, click Add query parameter and specify the parameter name and value. Refer to the documentation for each REST API method for detailed information about the available parameters.
Request body

In the Request Body section, define the body content of the request. This section appears for methods that insert or update data, such as PUT. The Request Format that you select in the Request Headers section determines the format you must use in the request body, such as JSON or XML.

You can build the request body by selecting fields, by manually writing the request body, or by uploading a binary file.

Use the Builder tab to build the request body using instance fields. Click Add a field, then select a field and specify a value. Available fields depend on the table you are adding data to.

Use the Raw tab to manually enter a request body.

Use the Binary tab to upload a binary file. This tab appears only for APIs that support binary file data, such as the Attachment API.

Code samples

You can obtain a code sample in various languages that you can use to send the request. Links for code samples appear at the bottom of the form. Click a link to view or copy the code sample for that language. The code samples change based on data you enter on the form. Code samples are available in these languages:

- ServiceNow Script
- cURL
- Python
- Ruby
- JavaScript
- Perl
- Powershell

Request and response details

After sending a request, the Request and Response sections appear providing detailed information including the full request URI, headers for both the request and response, the HTTP status code of the response, and the response body. Click Clear Response to hide this information.

When testing a request that returns a binary response, such as a file attachment, the REST API Explorer uses the browser default functionality to handle the file, such as by prompting you to download the file.

**Table API**
The Table API allows you to perform create, read, update, and delete (CRUD) operations on existing tables.

Version differences

The default version of the Table API is v2. You may notice the following differences between the current and previous versions.

- Version 1 of the Table API returns the error code 404 on a valid GET query that contains no results. Version 2 returns the success status code 200 and an empty array as the response body instead.

Table API - GET /now/table/{tableName}
This method retrieves multiple records for the specified table with proper pagination information.

**URL format**

Versioned URL: `/api/now/v2/table/{tableName}`
Default URL: `/api/now/table/{tableName}`

**Supported request parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_query</td>
<td>Encoded query used to filter the result set. For example: <code>(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)</code> The encoded query supports order by. To sort responses based on certain fields, use the ORDERBY and ORDERBYDESC clauses in sysparm_query. For example, <code>sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory</code> filters all active records and orders the results in ascending order by number first, and then in descending order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property glide.invalid_query.returns_no_rows. Set this property to true to return no rows on an invalid query.</td>
</tr>
</tbody>
</table>

**Note:** This property controls the behavior of all queries across the instance, such as in lists, scripts (GlideRecord.query()), and web service APIs.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation for reference and choice fields.</td>
</tr>
<tr>
<td></td>
<td>Based on this value, retrieves the display value and/or the actual value from the database.</td>
</tr>
<tr>
<td></td>
<td>• true  returns display values for all fields.</td>
</tr>
<tr>
<td></td>
<td>• false  returns actual values from the database.</td>
</tr>
<tr>
<td></td>
<td>If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td>• all  returns both actual and display values.</td>
</tr>
<tr>
<td>Note:</td>
<td>There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).</td>
</tr>
<tr>
<td>sysparm_fields</td>
<td>Comma-separated field names to return in the response.</td>
</tr>
<tr>
<td>sysparm_view</td>
<td>UI view to determine fields returned in the response.</td>
</tr>
<tr>
<td>Note:</td>
<td>If both sysparm_fields and sysparm_view are specified, the sysparm_fields parameter takes priority.</td>
</tr>
<tr>
<td>sysparm_limit</td>
<td>Limit to be applied on pagination. The default is 10000.</td>
</tr>
<tr>
<td></td>
<td>Unusually large sysparm_limit values can impact system performance.</td>
</tr>
<tr>
<td>sysparm_offset</td>
<td>Number of records to exclude from the query. Use this parameter to obtain more records than specified in sysparm_limit. For example, if sysparm_limit is set to 500, but there are additional records you want to query, specify a sysparm_offset value of 500 to get the second set of records. Do not pass a negative number in the sysparm_offset parameter.</td>
</tr>
<tr>
<td>sysparm_exclude_reference_link</td>
<td>Additional information provided for reference fields, such as the URI to the reference resource, is suppressed.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_read_replica_category</td>
<td>Category value to read data from read replicas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This parameter is not commonly used. The instance must have read replica support.</td>
</tr>
<tr>
<td>sysparm_suppress_pagination_header</td>
<td>Set this value to true to remove the Link header from the response. The Link header enables you to request additional pages of data when the number of records matching your query exceeds the query limit.</td>
</tr>
</tbody>
</table>

**Key-Value Pairs**

Alternative to using the sysparm_query parameter. You can filter a query using key-value pairs where the key is the name of a field. This functionality is available for GET queries.

For example, instead of using the parameter `&sysparm_query=active=true`, you can use `&active=true`. You can use the display value when the field is a choice or reference type field, such as `&state=closed` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, such as `&active=true&assigned_to=john.smith`.

---

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.

**Table 942: Request headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
### Table 943: Response headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
</table>
| Link      | REST message data can be split into multiple result sets rather than forcing the user to submit multiple requests. The header has different links available for the first set, previous set, next set, and the last set of records, where applicable. For example:  

https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=10000>;rel="next"  
https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=10000>;rel="prev"  
https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=0&sysparm_limit=10000>;rel="first"  
https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=2780&sysparm_limit=10000>;rel="last"  

**Note:** The limit parameter defaults to 10,000 records. This limit can be set to any value. Be aware, however, that an unusually large value can impact system performance. |
| X-Total-Count | Total count of records returned by the query. |

### Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see [REST API response codes](#).

**Table 944: Status codes**

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Request completed successfully. If a valid query returned no results, the response body contains only an empty result array.</td>
</tr>
</tbody>
</table>

### Sample cURL request

```bash
curl "https://instance.service-now.com/api/now/table/problem?
sysparm_limit=1" \
```
```json
{
    "result": [
        {
            "parent": "",
            "made_sla": "true",

            "work_notes_list": "",
            "business_service": "",
            "priority": "4",
            "sys_domain_path": "/",
            "time_worked": "",
            "expected_start": "",
            "rejection_goto": "",
            "opened_at": "2016-01-19 04:49:47",
            "business_duration": "1970-01-01 00:00:00",
            "group_list": "",
            "work_end": "",
            "approval_set": "",
            "wf_activity": "",
            "work_notes": "",
            "short_description": "Switch occasionally drops connections",
            "correlation_display": "",
            "delivery_task": "",
            "work_start": "",
            "assignment_group": "",
            "additional_assignee_list": "",
            "description": "Switch occasionally drops connections",
            "calendar_duration": "1970-01-01 00:02:17"
        }
    ]
}
```
Sample Python request

```python
# Need to install requests package for python
# easy_install requests
import requests

# Set the request parameters
url = 'https://instance.service-now.com/api/now/table/problem?sysparm_limit=1'

# Eg. User name="admin", Password="admin" for this code sample.
user = 'username'
pwd = 'password'

# Set proper headers
headers = {'Content-Type': 'application/json', 'Accept': 'application/json'}

# Do the HTTP request
response = requests.get(url, auth=(user, pwd), headers=headers)

# Check for HTTP codes other than 200
if response.status_code != 200:
    print('Status:', response.status_code, 'Headers:', response.headers, 'Error Response:', response.json())
    exit()

# Decode the JSON response into a dictionary and use the data
data = response.json()
print(data)
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
<response>
  <result>
    "close_notes": "updated firmware",
    "sys_class_name": "problem",
    "closed_by": "",
    "follow_up": "",
    "sys_id": "04ce72c9c0a8016600b57f75ac67b5b",
    "contact_type": "phone",
    "urgency": "3",
    "company": "",
    "reassignment_count": "",
    "activity_due": "",
    "assigned_to": "",
    "comments": "",
    "approval": "not requested",
    "sla_due": "",
    "comments_and_work_notes": "",
    "due_date": "",
    "sys_mod_count": "1",
    "sys_tags": "",
    "escalation": "0",
    "upon_approval": "proceed",
    "correlation_id": "",
    "location": ""
  }
}
```

Table API - POST /now/table/{tableName}
This method inserts one record in the specified table. Multiple record insertion is not supported by this method.

URL format

Versioned URL: /api/now/v2/table/{tableName}
Default URL: /api/now/table/{tableName}

Supported request parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation for reference and choice fields.</td>
</tr>
<tr>
<td></td>
<td>Based on this value, retrieves the display value and/or the actual value from the database.</td>
</tr>
<tr>
<td></td>
<td>• true returns display values for all fields.</td>
</tr>
<tr>
<td></td>
<td>• false returns actual values from the database.</td>
</tr>
<tr>
<td></td>
<td>• If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td>• all returns both actual and display values.</td>
</tr>
</tbody>
</table>

**Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see *Table API FAQs (KB0534905).*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_fields</td>
<td>Comma-separated field names to return in the response.</td>
</tr>
<tr>
<td>sysparm_view</td>
<td>UI view to determine fields returned in the response.</td>
</tr>
</tbody>
</table>

**Note:** If both sysparm_fields and sysparm_view are specified, the sysparm_fields parameter takes priority.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>sysparm_exclude_reference_link</td>
<td>Additional information provided for reference fields, such as the URI to the reference resource, is suppressed.</td>
</tr>
<tr>
<td>sysparm_input_display_value</td>
<td>Data insert or update operations.</td>
</tr>
<tr>
<td></td>
<td>For values in the request:</td>
</tr>
<tr>
<td></td>
<td>• true treats input values as display values and they are manipulated so they can be stored properly in the database.</td>
</tr>
<tr>
<td></td>
<td>• false treats input values as actual values and stored them in the database without manipulation.</td>
</tr>
</tbody>
</table>

**Note:**
- If this parameter is set to true, pay attention to input values, especially date values, as these are interpreted as being supplied via the user time zone preference and are transformed into UTC format.
- To set the value of an encrypted field, you must set this parameter to true. If this parameter is not set to true, values submitted to encrypted fields are not saved. Additionally, the requesting user must have the appropriate encryption context prior to submitting the request. Encrypted fields are hidden for users without the appropriate encryption context. For more information on display values and actual values, see Table API FAQs (KB0534905). For more information on field encryption see Use an encrypted text field on page 2532.

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.
### Table 946: Request headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-no-response-body</td>
<td>By default, responses include body content detailing the new record. Set this header to true in the request to suppress the response body.</td>
</tr>
<tr>
<td>Content-Type</td>
<td>The data format of the request body.</td>
</tr>
</tbody>
</table>

### Table 947: Response headers

Table API - GET /now/table/{tableName}/{sys_id}
This method retrieves the record identified by the specified sys_id from the specified table.

**URL format**

Versioned URL: /api/now/v2/table/{tableName}/{sys_id}
Default URL: /api/now/table/{tableName}/{sys_id}
Supported request parameters

**Table 949: Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation for reference and choice fields. Based on this value, retrieves the display value and/or the actual value from the database.</td>
</tr>
<tr>
<td></td>
<td>• true returns display values for all fields.</td>
</tr>
<tr>
<td></td>
<td>• false returns actual values from the database. If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td>• all returns both actual and display values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).</td>
</tr>
<tr>
<td>sysparm_fields</td>
<td>Comma-separated field names to return in the response.</td>
</tr>
<tr>
<td>sysparm_view</td>
<td>UI view to determine fields returned in the response.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If both sysparm_fields and sysparm_view are specified, the sysparm_fields parameter takes priority.</td>
</tr>
<tr>
<td>sysparm_exclude_reference_link</td>
<td>Additional information provided for reference fields, such as the URI to the reference resource, is suppressed.</td>
</tr>
</tbody>
</table>

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.

**Table 950: Request headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
### Table 951: Response headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

### Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see [REST API response codes](#).

#### Table 952: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Indicates the request completed successfully.</td>
</tr>
<tr>
<td>404</td>
<td>Indicates the record is not found or the requesting user does not have access to the record.</td>
</tr>
</tbody>
</table>

#### Sample cURL request

```bash
curl "https://instance.service-now.com/api/now/table/incident/a9e30c7dc61122760116894de7bcc7bd" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

```json
{
    "result": {
        "upon_approval": "",
        "location": {
            "link": "https://instance.service-now.com/api/now/table/cmn_location/105cf7f3c611227501e75e08b14a38ba",
            "value": "105cf7f3c611227501e75e08b14a38ba"
        },
        "expected_start": "",
        "reopen_count": "",
        "close_notes": "",
        "additional_assignee_list": "",
        "impact": "1",
        "urgency": "3",
        "correlation_id": "",
        "sys_tags": "",
        "sys_domain": {
            "link": "https://instance.service-now.com/api/now/table/sys_user_group/global",
            "value": "global"
        },
        "description": "",
        "group_list": "",
        "priority": "3",
        "delivery_plan": ""
    }
}
```
Sample Python request

```python
# Need to install requests package for python
# easy_install requests
import requests

# Set the request parameters
url = 'https://instance.service-now.com/api/now/table/incident/a9e30c7dc61122760116894de7bcc7bd'

# Eg. User name="admin", Password="admin" for this code sample.
user = 'admin'
pwd = 'admin'

# Set proper headers
headers = {"Content-Type":"application/xml","Accept":"application/xml"}

# Do the HTTP request
response = requests.get(url, auth=(user, pwd), headers=headers)

# Check for HTTP codes other than 200
if response.status_code != 200:
    print('Status:', response.status_code, 'Headers:', response.headers, 'Error Response:',response.json())
    exit()

# Decode the JSON response into a dictionary and use the data
data = response.json()
print(data)
```
Supported request parameters

Table 953: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation for reference and choice fields. Based on this value, retrieves the display value and/or the actual value from the database. • true returns display values for all fields. • false returns actual values from the database. If a value is not specified, this parameter defaults to false. • all returns both actual and display values.</td>
</tr>
<tr>
<td>sysparm_fields</td>
<td>Comma-separated field names to return in the response.</td>
</tr>
<tr>
<td>sysparm_view</td>
<td>UI view to determine fields returned in the response.</td>
</tr>
<tr>
<td>sysparm_exclude_reference_link</td>
<td>Additional information provided for reference fields, such as the URI to the reference resource, is suppressed.</td>
</tr>
</tbody>
</table>

**Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| sysparm_input_display_value | Data insert or update operations. For values in the request:  
• true treats input values as display values and they are manipulated so they can be stored properly in the database.  
• false treats input values as actual values and stored them in the database without manipulation.  

**Note:**  
• If this parameter is set to true, pay attention to input values, especially date values, as these are interpreted as being supplied via the user time zone preference and are transformed into UTC format.  
• To set the value of an encrypted field, you must set this parameter to true. If this parameter is not set to true, values submitted to encrypted fields are not saved. Additionally, the requesting user must have the appropriate encryption context prior to submitting the request. Encrypted fields are hidden for users without the appropriate encryption context. For more information on display values and actual values, see Table API FAQs (KB0534905). For more information on field encryption see Use an encrypted text field on page 2532. |

### Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.

**Table 954: Request headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>

Table API - PATCH /now/table/{tableName}/{sys_id}
This method updates the specified record with the request body.

URL format

Versioned URL: /api/now/v2/table/{tableName}/{sys_id}
Default URL: /api/now/table/{tableName}/{sys_id}

Supported request parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation for reference and choice fields. Based on this value, retrieves the display value and/or the actual value from the database.</td>
</tr>
<tr>
<td></td>
<td>• true returns display values for all fields.</td>
</tr>
<tr>
<td></td>
<td>• false returns actual values from the database.</td>
</tr>
<tr>
<td></td>
<td>• If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td>• all returns both actual and display values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).</td>
</tr>
<tr>
<td>sysparm_fields</td>
<td>Comma-separated field names to return in the response.</td>
</tr>
<tr>
<td>sysparm_view</td>
<td>UI view to determine fields returned in the response.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If both sysparm_fields and sysparm_view are specified, the sysparm_fields parameter takes priority.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_input_display_value</td>
<td>Data insert or update operations.</td>
</tr>
<tr>
<td></td>
<td>For values in the request:</td>
</tr>
<tr>
<td></td>
<td>• true treats input values as display values and they are manipulated so</td>
</tr>
<tr>
<td></td>
<td>they can be stored properly in the database.</td>
</tr>
<tr>
<td></td>
<td>• false treats input values as actual values and stored them in the</td>

Table API - DELETE /now/table/{tableName}/{sys_id}
This method deletes the specified record from the specified table.

**URL format**

Versioned URL: /api/now/v2/table/{tableName}/{sys_id}
Default URL: /api/now/table/{tableName}/{sys_id}

**Supported request parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see **REST API headers**.

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Table 963: Response headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Status codes**

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see **REST API response codes**.
<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204</td>
<td>Indicates the request completed successfully.</td>
</tr>
</tbody>
</table>

Sample cURL request
```bash
curl "https://instance.service-now.com/api/now/table/incident/d977b66a4f411200adf9f8e18110c7b2" \
  --request DELETE \
  --header "Accept:application/json" \
  --user 'admin':'admin'
```

Sample Python request
```python
#Need to install requests package for python
#easy_install requests
import requests
# Set the request parameters
url = 'https://instance.service-now.com/api/now/table/incident/d977b66a4f411200adf9f8e18110c7b2'
# Eg. User name="admin", Password="admin" for this code sample.
user = 'admin'
pwd = 'admin'
# Set proper headers
headers = {"Content-Type":"application/xml","Accept":"application/xml"}
# Do the HTTP request
response = requests.delete(url, auth=(user, pwd),
  headers=headers )
# Check for HTTP codes other than 200
if response.status_code != 200:
  print('Status:', response.status_code, 'Headers:',
  response.headers, 'Error Response:',response.json())
  exit()
# Decode the JSON response into a dictionary and use the data
data = response.json()
print(data)
None
```

Table API security
Access to tables via the REST API is restricted by BasicAuth.
ACLs defined for tables are enforced to restrict access to data.
Geneva

ServiceNow

ServiceNow Platform

To allow access to tables without any authentication and authorization, add the table name to
sys_public.list. ACLs defined on tables are still enforced, and it is the customer's responsibility to
deactivate ACLs on tables.
Tables protected with a role that requires elevated privileges, such as the security_admin role, are not
accessible using the Table API. Attempting to access one of these tables will return a 403 "User Not
Authorized" error.
Table API Ruby examples
Examples that demonstrate how to use the Table API with the Ruby language.

Example URLs
In the examples, replace myinstance.service-now.com with the URL of your instance.

GET (Specific Record)
#!/usr/bin/env ruby

Table API server-side JavaScript examples

Examples that demonstrate how to use the Table API with the server-side JavaScript.

**Example URLs**

In the examples, replace `myinstance.service-now.com` with the URL of your instance.

**GET**

```javascript
var request = new GlideHTTPRequest
    ('https://myinstance.service-now.com/api/now/table/incident');
request.setBasicAuth("admin","admin");
request.addHeader('Accept','application/json');

var response = request.get();
gs.log(response.getStatusCode());
gs.log(response.getBody());
```

**POST**

```javascript
var request = new GlideHTTPRequest
    ('https://myinstance.service-now.com/api/now/table/incident');
request.setBasicAuth("admin","admin");
request.addHeader('Accept','application/json');
request.addHeader('Content-Type','application/json');

var response = request.post({"short_description":"Test me"});
gs.log(response.getStatusCode());
gs.log(response.getBody());
```

**PUT**

```javascript
var request = new GlideHTTPRequest
    ('https://myinstance.service-now.com/api/now/table/incident/0fbbeddad47e1100a92e188eafa1dd60');
request.setBasicAuth("admin","admin");
request.addHeader('Accept','application/json');
request.addHeader('Content-Type','application/json');

var response = request.put({"short_description":"Test me update"});
gs.log(response.getStatusCode());
```
PATCH

```javascript
var request = new GlideHTTPRequest
    ('https://myinstance.service-now.com/api/now/table/incident/0fbbeddad47e1100a92e188eafa1dd60');
request.setBasicAuth("admin","admin");
request.addHeader('Accept','application/json');
request.addHeader('Content-Type','application/json');
request.addHeader('X-Http-Method-Override','PATCH');

var response = request.post({"short_description":"Test me patch update"});

gs.log(response.getStatusCode());
gs.log(response.getBody());
```

DELETE

```javascript
var request = new GlideHTTPRequest
    ('https://myinstance/api/now/table/incident/0fbbeddad47e1100a92e188eafa1dd60');
request.setBasicAuth("admin","admin");
request.addHeader('Accept','application/json');
request.addHeader('Content-Type','application/json');

var response = request.del();

gs.log(response.getStatusCode());
gs.log(response.getBody());
```

Table API cURL examples

Examples that demonstrate how to use the Table API with the cURL command language.

Example URLs

In the examples, replace `myinstance.service-now.com` with the URL of your instance.

GET

```bash
curl --user admin:admin \
--header "Accept: application/json" \
https://myinstance.service-now.com/api/now/table/incident
```

POST

```bash
curl --user admin:admin \
--header "Content-Type:application/json" \n--header "Accept: application/json" \
--request POST \
```
PUT

```bash
curl --user admin:admin \
--header "Content-Type:application/json" \
--header "Accept: application/json" \
--request PUT \
--data '{"short_description":"Test with CURL"}' \
https://myinstance.service-now.com/api/now/table/incident/bf1defe3d7031100261253b2b2520373
```

PATCH

```bash
curl --user admin:admin \
--header "Content-Type:application/json" \
--header "Accept: application/json" \
--request PATCH \
--data '{"short_description":"Test with CURL Patch"}' \
https://myinstance.service-now.com/api/now/table/incident/bf1defe3d7031100261253b2b2520373
```

DELETE

```bash
curl --user admin:admin \
--header "Content-Type:application/json" \
--header "Accept: application/json" \
--request DELETE \
https://myinstance.service-now.com/api/now/table/incident/bf1defe3d7031100261253b2b2520373
```

Additional Parameters

To improve the formatting of your JSON response, add `| grep }| python -mjson.tool`.

```bash
curl -i --user admin:admin \
--header "Accept: application/json" \
https://myinstance.service-now.com/api/now/table/incident | grep }| python -mjson.tool
```

Table API Java examples

Examples that demonstrate how to use the Table API with the Java language.

For these code samples, the following is assumed:

- The project includes `apache commons-httpclient`.
- The package declaration needs to be changed accordingly.
- This is a sample code snippet that shows how to get started; it is not recommended as production-ready code.

In the examples, replace `myinstance.service-now.com` with the URL of your instance.
GET

```java
package examples.rest.java;

import java.io.IOException;
import org.apache.http.HttpException;
import org.apache.http.HttpHost;
import org.apache.http.auth.AuthScope;
import org.apache.http.auth.UsernamePasswordCredentials;
import org.apache.http.client.CredentialsProvider;
import org.apache.http.impl.client.BasicCredentialsProvider;
import org.apache.http.util.EntityUtils;

public class GetAction {
    public static void main(String[] args) throws IOException, HttpException {
        GetAction restAction = new GetAction();
        restAction.getRequest();
    }

    public void getRequest() throws HttpException, IOException {
        CredentialsProvider credsProvider = new BasicCredentialsProvider();
        credsProvider.setCredentials(new AuthScope(new HttpHost("instance.service-now.com")),
                                   new UsernamePasswordCredentials("WebServiceUser",
                                   "WebServiceUserPassword"));
        CloseableHttpClient httpclient = HttpClients.custom().setDefaultCredentialsProvider(credsProvider).build();
        try {
            HttpGet httpget = new HttpGet("https://instance.service-now.com/api/now/table/incident");
            httpget.setHeader("Accept", "application/json");
            System.out.println("Executing request " +
            httpget.getRequestLine());
            CloseableHttpResponse response = httpclient.execute(httpget);
            try {
                System.out.println("----------------------------------------");
                System.out.println(response.getStatusLine());
                String responseBody = EntityUtils.toString(response.getEntity());
                System.out.println(responseBody);
            } finally {
                response.close();
            } finally {
                httpclient.close();
            }
        }
    }
}

Table API JavaScript examples
Examples that demonstrate how to use the Table API with the JavaScript language.

**JavaScript Examples**

**GET**

```javascript
function getAction()
{
    var client=new XMLHttpRequest();
    client.open("GET","/api/now/table/incident");
    client.setRequestHeader('Accept','application/json');
    client.onreadystatechange = function(){
        if(this.readyState == this.DONE){
            document.getElementById("response").innerHTML=this.status + this.response;
        }
    };
    client.send();
}
```

**POST**

```javascript
function postAction()
{
    var requestBody = '{"short_description":"Test insert"}';
    var client=new XMLHttpRequest();
    client.open("POST","/api/now/table/incident");
    client.setRequestHeader('Accept','application/json');
    client.setRequestHeader('Content-Type','application/json');
    client.onreadystatechange = function(){
        if(this.readyState == this.DONE){
            document.getElementById("response").innerHTML=this.status + this.response;
        }
    };
    client.send(requestBody);
}
```
PUT

```javascript
function putAction()
{
    var requestBody = '{"short_description":"Test update"}';
    var client=new XMLHttpRequest();
    client.open("PUT","/api/now/table/incident/70a503b1f1971100a92e33bc2fbe836b");
    client.setRequestHeader('Accept','application/json');
    client.setRequestHeader('Content-Type','application/json');
    client.onreadystatechange = function(){
        if(this.readyState == this.DONE){
            document.getElementById("response").innerHTML=this.status +
            this.response;
        }};
    client.send(requestBody);
}
```

PATCH

```javascript
function patchAction()
{
    var requestBody = '{"short_description":"Test update with Patch"}';
    var client=new XMLHttpRequest();
    client.open("PATCH","/api/now/table/incident/70a503b1f1971100a92e33bc2fbe836b");
    client.setRequestHeader('Accept','application/json');
    client.setRequestHeader('Content-Type','application/json');
    client.onreadystatechange = function(){
        if(this.readyState == this.DONE){
            document.getElementById("response").innerHTML=this.status +
            this.response;
        }};
    client.send(requestBody);
}
```

DELETE

```javascript
function deleteAction()
{
    var client=new XMLHttpRequest();
    client.open("DELETE","/api/now/table/incident/70a503b1f1971100a92e33bc2fbe836b");
    client.setRequestHeader('Accept','application/json');
    client.setRequestHeader('Content-Type','application/json');
    client.onreadystatechange = function(){
        if(this.readyState == this.DONE){
            document.getElementById("response").innerHTML=this.status +
            this.response;
        }};
    client.send();
}
```

Aggregate API

The Aggregate API allows you to compute aggregate statistics about existing table and column data.

For Aggregate API requests, you must have read access for all records in the table you query. If an ACL
prevents the requesting user from accessing any record in the table, the request returns a 403 Forbidden
error.

Aggregate API - GET /now/stats/(tableName)

This method retrieves records for the specified table and performs aggregate functions on the returned
values.

URL format

Versioned URL: /api/now/v1/stats/(tableName)
Default URL: /api/now/stats/{tableName}

## Supported request parameters

### Table 965: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| sysparm_query  | An encoded query. For example: 
  
  (sysparm_query=active=true)  
  (sysparm_query=caller_id=javascript:gs.getUserID()^active=true)  
  
  If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property glide.invalid_query.returns_no_rows. Set this property to true to return no rows on an invalid query. |
<p>| sysparm_group_by | Fields by which to group the returned data. You can specify multiple fields by separating each field with a comma, such as sysparm_group_by=priority, state. |
| sysparm_having | Additional query that enables you to filter the data based on an aggregate operation. The value for this parameter must follow the syntax aggregate^field^operator^value, such as count^priority^&gt;^3 to obtain the number of records within the query results with a priority greater than 3. You can specify multiple queries by separating each with a comma, such as count^state/^=1, avg^priority^&gt;^3. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_&lt;aggregate&gt;_fields</td>
<td>List of fields on which to perform each aggregate operation. You can specify multiple fields by separating each with a comma. For example, to get the average values from the duration and priority fields, use sysparm_avg_fields=duration,priority.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Specify this parameter, the sysparm_count parameter, or both for your query to return meaningful results. If neither parameter is passed, no aggregate operation is performed.</td>
</tr>
<tr>
<td>sysparm_count</td>
<td>Flag that determines whether to return the number of records returned by the query.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Specify this parameter, the sysparm_&lt;aggregate&gt;_fields parameter, or both for your query to return meaningful results. If neither parameter is passed, no aggregate operation is performed.</td>
</tr>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation when grouping by reference or choice fields. Based on this value, the query returns either the display value, the actual value in the database, or both.</td>
</tr>
<tr>
<td></td>
<td>- true returns display values for all fields.</td>
</tr>
<tr>
<td></td>
<td>- false returns actual values from the database. If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td>- all returns both actual and display values.</td>
</tr>
<tr>
<td></td>
<td>There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues as they are not read from the database and may reference other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).</td>
</tr>
</tbody>
</table>
Parameter | Description
---|---
sysparm_orderby | List of values by which to order grouped results. You can specify an order using a field or an aggregate. For example, if you specify `sysparm_orderby=AVG^state`, groups of results with lower average state values are returned first. You can also order by COUNT to arrange groups of records by the number of records in each group.

When you specify an order, groups are ordered in ascending order by default. Use `^DESC` to sort in descending order, such as `sysparm_orderby=state^DESC`.

Key-Value Pairs | An alternative to using the `sysparm_query` parameter. You can filter a query using key-value pairs where the key is the name of a field.

For example, instead of using the parameter `&sysparm_query=active=true`, you can use `&active=true`. You can use the display value when the field is a choice or reference type field, such as `&state=closed` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, such as `&active=true&assigned_to=john.smith`.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see [REST API headers](#).

**Table 966: Request headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Table 967: Response headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see [REST API response codes](#).
Table 968: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Indicates that the request completed successfully.</td>
</tr>
</tbody>
</table>

Available aggregate functions

You can specify which aggregate functions to perform by using either the sysparm_<aggregate>_fields parameter or sysparm_having=<aggregate>^field^operator^value parameter, substituting <aggregate> for one of these aggregate functions:

- `avg`
- `sum`
- `min`
- `max`

Sample cURL request

```bash
curl "https://instance.service-now.com/api/now/stats/incident?sysparm_avg_fields=reassignment_count%2Cbusiness_stc&sysparm_group_by=assignment_group" \
--request GET \
--header "Accept:application/json" \
--user 'admin':'admin'
```

```json
{
    "result": [  
        {
            "stats": {
                "avg": {
                    "business_stc": "804162.7143",
                    "reassignment_count": "1.0000"
                }
            },
            "groupby_fields": [
                {
                    "value": "",
                    "field": "assignment_group"
                }
            ]
        },
        {
            "stats": {
                "avg": {
                    "business_stc": "2037371.0000",
                    "reassignment_count": "1.5000"
                }
            },
            "groupby_fields": [
                {
                    "value": "287ee6feda9fe198100ada7950d0b1b73",
                    "field": "assignment_group"
                }
            ]
        }
    ]
}
```
{  
  "stats": {

    }  
  ]  
}  
}
Sample Python request

```
# Need to install requests package for python
# easy_install requests
import requests

# Set the request parameters
url = 'https://instance.service-now.com/api/now/stats/incident?sysparm_avg_fields=reassignment_count%2Cbusiness_stc&sysparm_group_by=assignment_group'

# Eg. User name="admin", Password="admin" for this code sample.
user = 'admin'
pwd = 'admin'

# Set proper headers
headers = {'Content-Type': 'application/json', 'Accept': 'application/json'}

# Do the HTTP request
response = requests.get(url, auth=(user, pwd), headers=headers)

# Check for HTTP codes other than 200
if response.status_code != 200:
    print('Status:', response.status_code, 'Headers:', response.headers, 'Error Response:', response.json())
    exit()

# Decode the JSON response into a dictionary and use the data
data = response.json()
print(data)
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
<response>
  <result>
    <stats>
      <avg>
        <business_stc>804162.7143</business_stc>
        <reassignment_count>1.0000</reassignment_count>
      </avg>
    </stats>
    <groupby_fields>
      <field>assignment_group</field>
      <value />
    </groupby_fields>
  </result>
  <result>
    <stats>
      <avg>
        <business_stc>2037371.0000</business_stc>
        <reassignment_count>1.5000</reassignment_count>
      </avg>
    </stats>
    <groupby_fields>
      <field>assignment_group</field>
      <value>287ee6fe9fe198100ada7950d0b1b73</value>
    </groupby_fields>
  </result>
  <result>
    <stats>
      <avg>
      </avg>
    </stats>
    <groupby_fields>
      <field>assignment_group</field>
      <value />
    </groupby_fields>
  </result>
</response>
```
Aggregate API examples
These examples demonstrate how to perform a REST query using cURL commands, and the data returned for each command.

Sample response formats

```json
{
  "result": {
    "stats": {
      "count": "6",
      "max": {
        "number": "INC0000053"
      }
    }
  }
}
```
Figure 801: JSON format

```xml
<?xml version="1.0" encoding="UTF-8"?>
<response>
  <result>
    <stats>
      <min>
        <priority>1</priority>
        <number>INC0000005</number>
      </min>
      <max>
        <number>INC0000050</number>
      </max>
      <count>9</count>
    </stats>
    <groupby_fields>
      <field>assignment_group</field>
      <value>Hardware</value>
    </groupby_fields>
  </result>
</response>
```
Figure 802: XML format

Specifying a query

You can specify a query by using either the sysparm_query parameter or key-value pairs.

Using sysparm_query:

curl -H "Accept:application/json" --user admin:admin
Using key-value pairs:

```curl
curl -H "Accept:application/json" --user admin:admin
    "http://<instance>.service-now.com/api/now/stats/incident?
    sysparm_count=true&sysparm_max_fields=number&sysparm_min_fields=number,priority&sysparm_query=active=true&assignment_group=software"
```

```json
{
    "result": {
        "stats": {
            "count": "6",
            "max": {
                "number": "INC0000053"
            },
            "min": {
                "priority": "1",
                "number": "INC0000015"
            }
        }
    }
}
```

**Figure 803: Response**

### Grouping results

You can group results by using the `sysparm_group_by` parameter.

```curl
curl -H "Accept:application/json" --user admin:admin
    "http://<instance>.service-now.com/api/now/stats/incident?
    sysparm_count=true&sysparm_max_fields=number&sysparm_min_fields=number,priority&sysparm_group_by=assignment_group"
```

```json
{
    "result": [ {
        "stats": {
            "count": "13",
            "max": {
                "number": "INC0000048"
            },
            "min": {
                "priority": "1",
                "number": "INC0000007"
            }
        },
        "groupby_fields": [ {
            "value": "",
            "field": "assignment_group"
        } ]
    }, {
        "stats": {
```
Figure 804: Response

Specifying a display value format

You can control if reference and choice field values appear as a sys_id, a label value, or both by using the `sysparm_display_value` parameter.

```
curl -H "Accept:application/json" --user admin:admin "http://<instance>.service-now.com/api/now/stats/incident?sysparm_count=true&sysparm_max_fields=number&sysparm_min_fields=number,priority&sysparm_group_by=assignment_group&sysparm_display_value=true"
```

```
{
    "result": [
        {
            "stats": {
                "count": "13",
                "max": {
                    "number": "INC0000048"
                },
                "min": {
                    "priority": "1",
                    "number": "INC0000007"
                }
            },
            "groupby_fields": [
                {
                    "value": "",
                    "field": "assignment_group"
                }
            ]
        }
    ]
}
```

```json
{
    "stats": {
        "count": "2",
        "max": {
            "number": "INC0000012"
        },
        "min": {
            "priority": "4",
            "number": "INC0000010"
        }
    },
    "groupby_fields": [
        {
            "value": "Database",
            "field": "assignment_group"
        }
    ]
},
{
    "stats": {
        "count": "9",
        "max": {
            "number": "INC0000050"
        },
        "min": {
            "priority": "1",
            "number": "INC0000005"
        }
    },
    "groupby_fields": [
        {
            "value": "Hardware",
            "field": "assignment_group"
        }
    ]
},
{
    "stats": {
        "count": "5",
        "max": {
            "number": "INC0000039"
        },
        "min": {
            "priority": "1",
            "number": "INC0000002"
        }
    },
    "groupby_fields": [
        {
            "value": "Network",
            "field": "assignment_group"
        }
    ]
},
{
    "stats": {
        "count": "12",
        "max": {
            "number": "INC0000055"
        },
        "min": {
            "priority": "1",
            "number": "INC0000001"
        }
    }
}
```
Ordering grouped fields

You can order groups of results based on the values in one or more specified fields by using the `sysparm_orderby` parameter.

```
curl -H "Accept:application/json" --user admin:admin
    "http://<instance>.service-now.com/api/now/stats/incident?
    sysparm_count=true&sysparm_max_fields=number&sysparm_min_fields=number,priority&sysparm_orderby=assignment_group^DESC"
```

```
{
  "result": [
    {
      "stats": {
        "count": "6",
        "max": {
          "number": "INC00000053"
        },
        "min": {
          "priority": "1",
          "number": "INC00000015"
        }
      },
      "groupby_fields": [
        {
          "value": "Software",
          "field": "assignment_group"
        }
      ]
    }
  ]
}
```

```json
] },
{
  "stats": {
    "count": "5",
    "max": {
      "number": "INC0000055"
    },
    "min": {
      "priority": "1",
      "number": "INC0000017"
    }
  },

      "priority": "1",
```
The Import Set API allows you to interact with import set tables.

The API transforms incoming data based on associated transform maps. The import set API supports synchronous transforms. The Import Set API mirrors the existing SOAP interface.

**Import Set API - POST /now/import/{tableName}**

This method inserts incoming data into a specified staging table and triggers transformation based on predefined transform maps in the import set table.

**URL format**

Versioned URL: `/api/now/v1/import/<staging table_name>`

Default URL: `/api/now/import/<staging table_name>`

**Supported request parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see [REST API headers](#).

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
Table 971: Response headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>The URL of the created resource.</td>
</tr>
</tbody>
</table>

**Status codes**

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see [REST API response codes](#).

Table 972: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>Indicates the import completed successfully.</td>
</tr>
</tbody>
</table>

**Transforming inserted records**

Transformation occurs synchronously. For each transform map that you define, the responses include transformation results such as information on the target records.

**Note:** The status_message and error_message fields on transformation scripts are processed and returned in response, along with any custom response fields.

**Sample cURL request**

```bash
curl "https://instance.service-now.com/api/now/import/imp_user"
  --request POST
  --header "Accept:application/json"
  --header "Content-Type:application/json"
  --data "{"first_name':'John','last_name':'Public','user_id':'john.public','email':'john.public@company.com'}"
  --user 'admin':'admin"
```

```json
{
  "import_set": "ISET0010001",
  "staging_table": "imp_user",
  "result": [
    {
      "transform_map": "User",
      "table": "sys_user",
      "display_name": "name",
      "display_value": "John Public",
      "record_link": "https://instance.service-now.com/api/now/table/sys_user/ea928be64f411200adf9f8e18110c777",
      "status": "inserted",
      "sys_id": "ea928be64f411200adf9f8e18110c777"
    }
  ]
}
```

**Attachment API**

The Attachment API allows you to upload and query file attachments.

You can upload or retrieve a single file with each request.

The Attachment API respects any system limitations on uploaded files, such as maximum file size and allowed attachment types. You can control these settings using the properties com.glide.attachment.max_size, 1024MB by default, and glide.attachment.extensions.

Attachment API - GET /now/attachment

This method gets the metadata for multiple attachments.

**URL format**

Versioned URL: api/now/v1/attachment

Default URL: api/now/attachment
### Supported request parameters

#### Table 984: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_query</td>
<td>An encoded query. Queries for the Attachment API are relative to the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td></td>
<td>For example: (sysparm_query=file_name=attachment.doc)</td>
</tr>
<tr>
<td></td>
<td>The encoded query provides support for order by. To sort responses based on certain fields, use the ORDERBY and ORDERBYDESC clauses in sysparm_query. For example, sysparm_query=ORDERBYfile_name^ORDERBYDESCtable_name orders the results in ascending order by name first, and then in descending order by table name.</td>
</tr>
<tr>
<td></td>
<td>If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property glide.invalid_query.returns_no_rows. Set this property to true to return no rows on an invalid query.</td>
</tr>
<tr>
<td><strong>Note:</strong> This property controls the behavior of all queries across the instance, such as in lists, scripts (GlideRecord.query()), and web service APIs.</td>
<td></td>
</tr>
<tr>
<td>sysparm_limit</td>
<td>Limit to be applied on pagination. The default is 10000.</td>
</tr>
<tr>
<td></td>
<td>Unusually large sysparm_limit values can impact system performance.</td>
</tr>
<tr>
<td>sysparm_offset</td>
<td>A number of records to exclude from the query. Use this parameter when you need to get more records than specified in sysparm_limit. For example, if sysparm_limit is set to 500, but there are additional records you want to query, you can specify a sysparm_offset value of 500 to get the second set of records.</td>
</tr>
<tr>
<td>sysparm_read_replica_category</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_suppress_pagination_header</td>
<td>Set this value to <code>true</code> to remove the Link header from the response. The Link header enables you to request additional pages of data when the number of records matching your query exceeds the query limit.</td>
</tr>
</tbody>
</table>

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see [REST API headers](#).

Attachment API - GET /now/attachment/{sys_id}/file
This method gets the binary file attachment with a specific sys_id value.

URL format

Versioned URL: api/now/v1/attachment/<attachment sys_id>/file
Default URL: api/now/attachment/<attachment sys_id>/file

Supported request parameters

Table 992: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id</td>
<td>The sys_id of the attachment record you want to get binary data from.</td>
</tr>
</tbody>
</table>

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.

Table 993: Request headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

Table 994: Response headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Attachment-Metadata</td>
<td>Metadata about the returned file, such as size, name, and file type.</td>
</tr>
</tbody>
</table>

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API response codes.
Table 995: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Indicates the query ran successfully.</td>

</tbody>
</table>

Sample cURL request

```bash
curl "https://instance.service-now.com/api/now/attachment/615ea769c0a80166001cf5f2367302f5/file" 
--request GET 
--header "Accept:*/*" 
--user 'admin':'admin'```

Binary response not shown.

Sample Python request

```python
# Need to install requests package for python
# easy_install requests
import requests

# Set the request parameters
url = 'https://instance.service-now.com/api/now/attachment/615ea769c0a80166001cf5f2367302f5/file'

# Eg. User name="admin", Password="admin" for this code sample.
user = 'admin'
pwd = 'admin'

# Set proper headers
headers = {'Content-Type':"application/xml","Accept":"*/*"}

# Do the HTTP request
response = requests.get(url, auth=(user, pwd), headers=headers)

# Check for HTTP codes other than 200
if response.status_code != 200:
    print('Status:', response.status_code, 'Headers:', response.headers, 'Error Response:',response.json())
    exit()

# Decode the JSON response into a dictionary and use the data
data = response.json()
print(data)
```

Binary response not shown.

Attachment API - POST /now/attachment/file

This method uploads a binary file specified in the request body as an attachment.
URL format

Versioned URL: /api/now/v1/attachment/file
Default URL: /api/now/attachment/file

Supported request parameters

Table 996: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_name (Required)</td>
<td>The name to give the attachment. This parameter is required to post an attachment.</td>
</tr>
<tr>
<td>table_name (Required)</td>
<td>The name of the table you want to attach the file to. This parameter is required to post an attachment.</td>
</tr>
<tr>
<td>table_sys_id (Required)</td>
<td>The sys_id of the record on the specified table that you want to attach the file to. This parameter is required to post an attachment.</td>
</tr>
<tr>
<td>encryption_context</td>
<td>The sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. If you do not specify this parameter, the attached file is not encrypted with any encryption context.</td>
</tr>
</tbody>
</table>

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.

Table 997: Request headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>

}
```
Attachment API - POST /now/attachment/upload
This method uploads a multipart file attachment.

**URL format**

Versioned URL: /api/now/v1/attachment/upload
Default URL: /api/now/attachment/upload

**Supported request parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>The multipart POST method does not accept any parameters. The table name and record sys_id values must be specified within the message body. See the POST multipart sample for an example of a multipart message.</td>
</tr>
</tbody>
</table>

**Important:** When using multipart POST, ensure the file content is contained in the final part of the message only. Earlier parts should contain only metadata such as table name and record sys_id.

**Headers**

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see REST API headers.

**Table 1001: Request headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>The content type of the request. Set this value to multipart/form-data when using the multipart POST method.</td>
</tr>
</tbody>
</table>

**Table 1002: Response headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>The URL of the new attachment.</td>
</tr>
</tbody>
</table>
Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API response codes.

Table 1003: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>Indicates the query ran successfully.</td>
</tr>
</tbody>
</table>

POST multipart mandatory values

When sending a multipart POST request to upload a file attachment, include attachment data in the message body, not in the URL parameters. You must specify these values in the message body:

Table 1004: Mandatory values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table you want to attach the file to.</td>
</tr>
<tr>
<td>record_sys_id</td>
<td>The sys_id of the record on the specified table that you want to attach the file to.</td>
</tr>
<tr>
<td>Content-Type</td>
<td>The Content-Type of the file, included in the message body for multipart uploads.</td>
</tr>
</tbody>
</table>

**Note:** The Content-Type must be defined within the file portion of the POST message, not within the form data. See the sample POST multipart message for an example of a multipart message.

Sample cURL request

```bash
curl "https://instance.service-now.com/api/now/attachment/upload" \
--request POST \
--header "Accept:application/json" \
--user 'admin':'admin'"\ 
--header "Content-Type:multipart/form-data" \
-F 'table_name=incident' -F 'table_sys_id=d71f7935c0a8016700802b64c67c11c6' -F 'encryption_context=undefined'-F 'uploadFile=\@ location of the file on file system'
```

```
{
  "result": {
    "table_sys_id": "d71f7935c0a8016700802b64c67c11c6",
    "size_bytes": "36597",
```
Sample Python request

```python
# This example uses the Python Requests Library and you will need to install requests package for python
# Documentation can be found at http://docs.python-requests.org/en/master/user/quickstart/
import requests
import pprint
import json

# Specify the Endpoint URL replacing instance with your ServiceNow Instance Name
url = 'https://instance.service-now.com/api/now/attachment/upload'

# Specify Parameters for File Being Uploaded, the table_name and table_sys_id should be replaced with values that make sense for your use case
payload = {'table_name': 'incident',
           'table_sys_id': '81f8915b6ba20028927416bf961971'}

# Specify Files To Send and Content Type. When specifying files to send make sure you specify the path to the file, in this example the file was located in the same directory as the python script being executed.
# it is important to specify the correct file type
files = {'file': ('issue_screenshot.JPG',
                  open('issue_screenshot.JPG', 'rb'), 'image/jpeg', {'Expires': '0'})}

# Eg. User name="admin", Password="admin" for this code sample. This will be sent across as basic authentication
user = 'admin'
pwd = 'admin'

# Set proper headers
headers = {'Accept': '*/*'}

# Send the HTTP request
response = requests.post(url, auth=(user, pwd), headers=headers, files=files, data=payload)
```
# Check for HTTP codes other than 201
if response.status_code != 201:
    print('Status:', response.status_code, 'Headers:',
    response.headers, 'Error Response:',response.json())
    exit()

# Print Response Details
print 'Response Status Code:', response.status_code

</tr>
</tbody>
</table>

Sample cURL request

```bash
curl "https://instance.service-now.com/api/now/attachment/615ea769c0a80166001cf5f2367302f5" \
--request DELETE \
--header "Accept:application/json" \
--user 'admin':'admin'
```

Sample Python request

```python
#Need to install requests package for python
#easy_install requests
import requests

# Set the request parameters
url = 'https://instance.service-now.com/api/now/attachment/615ea769c0a80166001cf5f2367302f5'

# Eg. User name="admin", Password="admin" for this code sample.
user = 'admin'
pwd = 'admin'

# Set proper headers
headers = {"Content-Type":"application/xml","Accept":"application/xml"}

# Do the HTTP request
response = requests.delete(url, auth=(user, pwd), headers=headers)

# Check for HTTP codes other than 200
if response.status_code != 200:
    print('Status:', response.status_code, 'Headers:', response.headers, 'Error Response:',response.json())
    exit()

# Decode the JSON response into a dictionary and use the data
data = response.json()
print(data)
```

Handling large attachments with the Attachment API

To upload or retrieve large attachments using the Attachment API you may need to configure the maximum transaction time.
Uploading or retrieving large attachments may take a long time depending on the attachment size and network speed. By default, if a transaction takes longer than 60 seconds, that transaction is cancelled and the error **Transaction cancelled: maximum execution time exceeded** appears.

If your integration routinely uploads or retrieves attachments greater than 50MB, increase the maximum transaction time to prevent transactions from being cancelled. An administrator can set the **Maximum duration** value of the REST Attachment API request timeout transaction quota.

**Performance Analytics API**

The Performance Analytics API allows you to query data about Performance Analytics scorecards.

The Performance Analytics API supports only the GET action. Performance Analytics queries never update records.

Performance Analytics API - GET /now/v1/pa/scorecards

This method retrieves Performance Analytics scorecard details.

**URL format**

- Versioned URL: /api/now/v1/pa/scorecards
- Default URL: /api/now/pa/scorecards

**Supported parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| sysparm_uuid      | Enter a colon-separated list of sys_id values to specify which indicators, breakdowns, and aggregates to query. The parameter follows this format:  
<indicator sys_id>[:breakdown sys_id]::<element sys_id>[:aggregate sys_id>  
The parameter must begin with the sys_id of an indicator record. Optionally, you can append the sys_id values of a breakdown and breakdown element to group the response based on the breakdown, and the sys_id of an aggregate to apply that aggregate. You can use a breakdown with an aggregate, or use only one.  

**Note:** If an indicator is configured to use a Default time series, all scorecards for that indicator use the selected aggregate.

See Performance Analytics API Examples for examples of fully-constructed sysparm_uuid values. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_breakdown</td>
<td>Enter the sys_id of a breakdown to return chart information organized as defined by the breakdown. For example, enter the sys_id of a priority breakdown to return separate task chart information for each priority value, such as Number of open incidents / Priority / 2 - High.</td>
</tr>
<tr>
<td>sysparm_include_scores</td>
<td>Set this parameter to true to return all scores for a scorecard. If a value is not specified, this parameter defaults to false and returns only the most recent score value.</td>
</tr>
<tr>
<td>sysparm_include_available_breakdowns</td>
<td>Set this parameter to true to return all available breakdowns for a scorecard. If a value is not specified, this parameter defaults to false and returns no breakdowns.</td>
</tr>
<tr>
<td>sysparm_include_available_aggregates</td>
<td>Set this parameter to true to return all available aggregates for a scorecard. If a value is not specified, this parameter defaults to false and returns no aggregates.</td>
</tr>
<tr>
<td>sysparm_display_value</td>
<td>Data retrieval operation for reference and choice fields. Based on this value, retrieves the display value and/or the actual value from the database.</td>
</tr>
<tr>
<td></td>
<td>• true returns display values for all fields.</td>
</tr>
<tr>
<td></td>
<td>• false returns actual values from the database. If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td>• all returns both actual and display values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).</td>
</tr>
<tr>
<td>sysparm_exclude_reference_link</td>
<td>Set this parameter to true to hide additional information provided for reference fields, such as the URI to the reference resource.</td>
</tr>
<tr>
<td>sysparm_favorites</td>
<td>Set this parameter to true to return only scorecards that are favorites of the querying user.</td>
</tr>
<tr>
<td>sysparm_key</td>
<td>Set this parameter to true to return only scorecards for key indicators.</td>
</tr>
<tr>
<td>sysparm_target</td>
<td>Set this parameter to true to return only scorecards that have a target.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_display</td>
<td>Set this parameter to <code>true</code> to return only scorecards where the indicator <strong>Display</strong> field is selected. Set this parameter to <code>all</code> to return scorecards with any <strong>Display</strong> field value. This parameter is true by default.</td>
</tr>
<tr>
<td>sysparm_contains</td>
<td>Enter a comma-separated list of names or descriptions to return only scorecards with a matching value.</td>
</tr>
<tr>
<td>sysparm_tags</td>
<td>Enter a comma-separated list of sys_id values to return only scorecards with a matching sys_id.</td>
</tr>
<tr>
<td>sysparm_per_page</td>
<td>Enter the maximum number of scorecards each query can return. By default this value is 10, and the maximum is 100.</td>
</tr>
<tr>
<td>sysparm_page</td>
<td>Specify the page number. For example, when querying 20 scorecards with the default sysparm_per_page value (10), specify a sysparm_page value of 2 to retrieve scorecards 11-20.</td>
</tr>
<tr>
<td>sysparm_sortby</td>
<td>Specify the value to use when sorting results. Valid values for this parameter are value, change, changeperc, gap, gapperc, duedate, name, order, default, group, indicator_group, frequency, target, date, trend, bullet, and direction. By default, queries sort records by value.</td>
</tr>
<tr>
<td>sysparm_sortdir</td>
<td>Specify the sort direction, ascending or descending. By default, queries sort records in descending order. Use sysparm_sortdir=asc to sort in ascending order.</td>
</tr>
<tr>
<td>sysparm_elements_filter</td>
<td>Specify the sys_id of an elements filter to apply that filter to the returned data.</td>
</tr>
<tr>
<td>sysparm_breakdown_relation</td>
<td>Specify the sys_id of a breakdown relation to break down the returned data using that relation. You can view available breakdown relations by setting the sysparm_include_available_breakdowns parameter to <code>true</code>.</td>
</tr>

Performance Analytics API security
You must meet certain requirements to access the Performance Analytics REST API.

Access to tables via the REST API is restricted by BasicAuth. ACLs defined for tables are enforced to restrict access to data.

To make queries using the Performance Analytics API, you must also have the pa_viewer role.

Performance Analytics API examples
These examples demonstrate how to perform a REST query using cURL commands, and show the data returned for each command. Each example builds upon the last, with later examples using the data returned by earlier examples.

Return all main scorecards

You can request a list of all scorecards for indicators that have a Display value set to true.

Command:

```bash
curl -v -u "admin:admin" -H "Accept:application/json" "https://instance.service-now.com/api/now/v1/pa/scorecards"
```

Response:

```json

Return the number of open incidents scorecard

You can query scorecards for a particular indicator by providing the sysparm_uuid parameter with an indicator sys_id value.

Command:

```
curl -v -u "admin:admin" -H "Accept:application/json" 
"https:///instance.service-now.com/api/now/v1/pa/scorecards? 
sysparm_uuid=fb007202d7130100b96d45a3ce6103b4"
```

Response:

```
{
  "result" : [
    {
      "change_formattted" : "",
      "key" : false,
      "value_unit" : "",
      "value_formattted" : "",
      "period_title" : null,
      "gapperc" : null,
      "gap" : null,
      "target" : null,
      "period" : null,
      "target_formattted" : "",
      "favorite" : false,
      "direction_label" : "Minimize",
      "uuid" : "fb007202d7130100b96d45a3ce6103b4",
      "name" : "Number of open incidents",
      "value_color" : 
"#000000",
      "frequency_label" : "Daily",
      "change" : null,
      "gap_formattted" : "",
      "gapperc_formattted" : "",

},
"description" : "Number of incidents open based on resolved date is empty."
}
[

Return the scorecard with all breakdowns and aggregates

You can query a list of available breakdowns and aggregates for an indicator by setting the sysparm_include_available_breakdowns and sysparm_include_available_aggregates parameters to true.

Command:

curl -v -u "admin:admin" -H "Accept:application/json" "https://instance.service-now.com/api/now/v1/pa/scorecards?sysparm_uuid=fb007202d7130100b96d45a3ce6103b4&sysparm_include_available_breakdowns=true&sysparm_include_available_aggregates=true"

Response:

{

Return the scorecard with breakdown relations

You can obtain the sys_id values for all breakdown relations associated with the scorecard using the sysparm_include_available_breakdowns parameter.
**Command:**

curl -v -u "admin:admin" -H "Accept:application/json" 
"https://<instance>.service-now.com/api/now/v1/pa/scorecards?sysparm_uuid=fb007202d7130100b96d45a3ce6103b4:baec0752bf130100b96dac808c0739ed:287ee6fe9e198100ada7950d0b1b73&sysparm_include_available_breakdowns=true"

**Response:**

```json
{
    "result": [
        {
            "value_formatted": "37",
            "indicator": {

            ]
        }
    ]
}
```
Return the scorecard broken down using a breakdown relation

You can break down the returned data by passing a breakdown relation sys_id in the sysparm_breakdown_relation parameter.
Command:

curl -v -u "admin:admin" -H "Accept:application/json" 
"https://<instance>.service-now.com/api/now/v1/pa/scorecards?
sysparm_uuid=fb007202d7130100b96d45a3ce6103b4:baec0752bf130100b96dac808c0739ed:db53580b0b550100b86d45a3ce6103b4:baec0752bf130100b96dac808c0739ed:db53580b0b550100b86d45a3ce6103b4

Response:

{
  "result": [

    }
  ]
}
Return the scorecard broken down by location

The Performance Analytics API returns geolocation data when available.

Command:

```
curl -v -u "admin:admin" -H "Accept:application/json" 
  "https://<instance>.service-now.com/api/now/v1/pa/scorecards? 
sysparm_uuid=fb007202d7130100b96d45a3ce6103b4&sysparm_breakdown=656d5662eb23310065deac6aa206fee7"
```

Response:

```
{
  "result": [
    {
      "element": {
        "display_value": "San Diego",
        "link": "https://<instance>.service-now.com/api/now/v1/table/cmnd_location/108752c8c611227501d4ab0e392ba97f",
        "value": "108752c8c611227501d4ab0e392ba97f",
        "longitude": -117.15726,
        "latitude": 32.71533
      },
      ...
    },
    {
      "element": {
        "display_value": "Florida",
        "link": "https://<instance>.service-now.com/api/now/v1/table/cmnd_location/8e3e85f037d02000044e0bfc8bcbe5d14",
        "value": "8e3e85f037d02000044e0bfc8bcbe5d14",
        "longitude": -95.71289,
        "latitude": 37.09024
      },
      ...
    }]
}
```

Return the scorecard with a filter

You can apply a filter to the scorecard data using the `sysparm_elements_filter` parameter with the sys_id of a Performance Analytics element filter record.

Command:

```
curl -v -u "admin:admin" -H "Accept:application/json" 
  "https://<instance>.service-now.com/api/now/v1/pa/scorecards? 
sysparm_uuid=fb007202d7130100b96d45a3ce6103b4&sysparm_breakdown=baec0752bf130100b96dac80379f2e6&sysparm_elements_filter=7b9eb563eb11020065deac6aa206fe11"
```
Response:

{
  "result": [
    {

Return the scorecard with an aggregate

You can apply the 7d running SUM aggregate to the scorecard using the sysparm_uuid value with the sys_id of the aggregate.

Command:

curl -v -u "admin:admin" -H "Accept:application/json" 
"https://instance.service-now.com/api/now/v1/pa/scorecards?
sysparm_uuid=fb007202d7130100b96d45a3ce6103b4:baec0752bf130100b96dac808c0739ed:db53a9290a0a650091abebccf833c6"

Response:

{
  "result" : [
    {
      "key" : false,
      "change_formatted" : "",
      "value_unit" : "",
      "value_formatted" : "",
      "period_title" : null,
      "aggregate" : {
        "display_value" : "7d running SUM",
        "link" : "https://instance.service-now.com/api/now/v1/table/pa_aggregates/89ea4c11d7001100ba986f14ce6103dc",
        "value" : "89ea4c11d7001100ba986f14ce6103dc"
      }
    }
  ]
}
Return the scorecard with priority breakdown

You can request broken down scorecard data by passing the sysparm_breakdown parameter. This example shows the Number of open incidents scorecard broken down by priority.

In this example, the [PA Incident] Daily Data Collection job must run at least once to populate the data.

Command:

```
curl -v -u "admin:admin" -H "Accept:application/json" 
  "https://instance.service-now.com/api/now/v1/pa/scorecards?sysparm_uuid=fb007202d7130100b96d45a3ce6103b4&sysparm_breakdown=0df47e02d7130100b96d45a3ce610399"
```

Response:

```
{
  "result" : [
    {
      "key" : false,
      "change_formatted" : "0",
      "changeperc" : 0,
      "changeperc_formatted" : "",

Return the scorecard with priority breakdown and available breakdowns

You can request broken down scorecard data by passing the sysparm_breakdown parameter, and a list of available breakdowns by passing the sysparm_include_available_breakdowns parameter. Passing both parameters in the same request allows you to query both sets of data using a single request.

In this example, the [PA Incident] Daily Data Collection job must run at least once to populate the data.

Command:
```
curl -v -u "admin:admin" -H "Accept:application/json" "https://instance.service-now.com/api/now/v1/pa/scorecards?sysparm_uuid=fb007202d7130100b96d45a3ce6103b4&sysparm_breakdown=0df47e02d7130100b96d45a3ce610399&sysparm_include_available_breakdowns=true"
```

Response:
```
{
    "result" : [ {
        "key" : false,
        "direction" : 2,

Return the scorecard for priority 1 incidents

You can apply a breakdown by appending the breakdown and breakdown element sys_id values to the sysparm_uuid parameter. In this example, the data is broken down to show priority 1 incidents.
Command:

```
curl -v -u "admin:admin" -H "Accept:application/json"
  "https://instance.service-now.com/api/now/v1/pa/scorecards?
sysparm_uuid=fb007202d7130100b96d45a3ce6103b4:0df47e02d7130100b96d45a3ce610399:e5900140200331007665978299a805f3"
```

Response:

```
{
  "result": [
    {

**Return the scorecard for priority 1 database incidents**

You can apply multiple breakdowns by appending multiple breakdown sys_ids to the sysparm_uuid parameter. In this example, the data is broken down by priority to show priority 1 incidents, and by category to show database incidents.

**Command:**

```bash
curl -v -u "admin:admin" -H "Accept:application/json" "https://instance.service-now.com/api/now/v1/pa/scorecards?sysparm_uuid=fb007202d7130100b96d45a3ce6103b4:0df47e02d7130100b96d45a3ce610399:e5900140200331007665978299a805f3:1f918835d7231100b96d45a3ce6103fe:9e418d40200331007665978299a805c1"
```

**Response:**

```json

User Role Inheritance API

The User Role Inheritance API allows you to see the roles that a specific user inherited.

A user’s role can be directly granted, inherited from other roles, or inherited from groups.

You must have the user_admin role to access this API.

User Role Inheritance API - GET /global/user_role_inheritance

This method retrieves the roles the user has and determines what was inherited.

URL format

Versioned URL: api/global/v1/user_role_inheritance

Default URL: api/global/user_role_inheritance

Supported parameters

Table 1012: Supported parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_sysid</td>
<td>The Sys ID of the user.</td>
</tr>
</tbody>
</table>
Status codes

Table 1013: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Indicates the query ran successfully.</td>
</tr>
</tbody>
</table>

Sample request

The response body shows you this information about the user's role:

- **user_name**: the username for the Sys ID you queried.
- **from_role**: the roles that are either granted directly or inherited from other roles.
- **from_group**: the roles that are inherited from groups that have roles.

The following is an example using modified demo data:

```
{
    "result": {
        "user_name": "abel.tuter",
        "from_group": [
            "[Azure Operators]/sn_azure.operator",
            "[Azure Operators]/sn_azure.operator/sn_azure.user"
        ],
        "from_role": [
            "/snc_internal",
            "/cloud_user",
            "/cloud_user/pa_viewer",
            "/cloud_user/sn_azure.user",
            "/cloud_user/aws_user"
        ]
    }
}
```

**IdentifyReconcile API**

The IdentifyReconcile API uses the Identification and Reconciliation framework to minimize creation of duplicate CIs and to reconcile CI attributes by only accepting information from authorized sources when updating the CMDB.

**IdentifyReconcile API - POST**

Insert or update configuration items in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

**URL format**

- Versioned URL: `/api/now/v1/identifyreconcile`
- Default URL: `/api/now/identifyreconcile`
Supported request parameters

Table 1014: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_data_source</td>
<td>Identifies the source of the CI information. This must be one of the choice values defined for the discovery_source field of the cmdb_ci table.</td>
</tr>
</tbody>
</table>

Headers

Table 1015: Request headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Specify application/json</td>
</tr>
<tr>
<td>Content-Type</td>
<td>Specify application/json</td>
</tr>
</tbody>
</table>

Table 1016: Response headers

Input payload

A JSON formatted string of configuration items to be added or updated. Each input string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs.

The possible name-value pairs within the items list are:

- className - the sys_class_name of the CI to be created or updated.
- values:{ } - the field information for the CI as name-value pairs, where the name is the field name.
- lookup:[{}] - a list of records with each item having name-value pairs like the items list.

The possible name-value pairs within the relations list are:

- parent - index of the parent item in the dependency relation
- child - index of the child item in the dependency relation
- type - the relationship type. This is one of the name field values from the cmdb_rel_type table.

Sample input payload

The sample input is a JSON string that contains a list of configuration items and a list of relationships that exist between these configuration items.

```json
{"items": [ {"className":"cmdb_ci_web_server",
  "values": {"name":"apache linux den 200",
  "running_process_command": "xyz"},
```
"running_process_parameters": "abc",
"tcp_port": "3452"},
{"className": "cmdb_ci_linux_server",
 "values": {"name": "linux100", "ram": "2048"}},

{"relations": [{"parent": "0", "child": "1", "type": "Runs on::Runs"}]}

**Response payload**

A JSON formatted string that is a list of results for the configuration items in the input string. Each result string is in the format 'items: [{},], relations: [{}]', where each item within the items and relations lists contains name-value pairs.

The possible name-value pairs within the items list are:

- **className** - the sys_class_name for the CI to be updated or created.
- **operation**, which is one of INSERT, UPDATE, UPDATE_WITH_UPGRADE, UPDATE_WITH_DOWNGRADE, UPDATE_WITH_SWITCH, DELETE, NO_CHANGE
- **sysId** - the sys_id of the CI that was updated or created.
- **relatedSysIds** - a list of sys_id values of CIs used during lookup based identification.
- **identifierEntrySysId** - sys_id of identifier entry used during matching.
- **errors** - a list of errors in the format of (error, message string), where error can be ABANDONED, INVALID_INPUT_DATA, IDENTIFICATION_RULE_MISSING, IDENTIFICATION_RULE_FOR_LOOKUP_MISSING, NO_LOOKUP_RULES_FORDEPENDENT_CI, NO_CLASS_NAME_FOR_INDEPENDENT_CI, MISSING_DEPENDENCY, MULTIPLE_DEPENDENCIES, MULTIPLE_DUPLICATE_RECORDS, RELATION_CHAIN_ENDS_ATQUALIFIER, QUALIFICATION_LOOP, TYPE_CONFLICT_INQUALIFICATION, MULTI_MATCH, REQUIREDATTRIBUTE_EMPTY, RECLASSIFICATION_NOT_ALLOWED
- **duplicateIndices** - a list of indexes of items that are duplicates of the current item.
- **identificationAttempts** - a list of attempts in the format of (attributes, identifierName, attemptResult, searchOnTable) where
  - **attributes** - the attributes used during identification
  - **identifierName** - the CI identifier to which this identifier belongs
  - **attemptResult** - one of SKIPPED, NO_MATCH, MATCHED, MULTI_MATCH
  - **searchOnTable** - the table searched during the identification process.

The possible name-value pairs within the relations list are:

- **className** - the relationship CI's class name and is always cmdb_rel_ci
- **operation** - one of INSERT, UPDATE, NO_CHANGE
- **sysId** - the sys_id of the relationship CI inserted or updated

**Sample responses**

Line feeds have been added for presentation.

```json
{"items": [{"className": "cmdb_ci_web_server",
 "operation": "UPDATE",
 "sysId": "5f8af237c0a8010e01a932999468b83a",
 "identifierEntrySysId": "8985a23ec3f00200d8d4bea192d3ae08"},
```

Status codes

Table 1017: Status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Indicates the request completed successfully.</td>
</tr>
</tbody>
</table>

REST API version

REST API URIs may specify a version number, such as /api/now/v1/table/(tablename) or no version number, such as /api/now/table/(tableName).

URIs with a version number provide a consistent interface that is guaranteed to maintain backwards compatibility in future ServiceNow releases. For example, if the default response format for a particular HTTP method changes in a release, versioned URIs continue to use the previous format.

By specifying a version number in your URIs, you can ensure that future updates to the REST API do not negatively impact your integration. URIs that do not specify a version number use the most recent REST API behavior available with your instance version, which may change when you upgrade.

REST API security

By default, the REST API uses basic authentication or OAuth to enforce access controls to web resources. ACLs defined for tables are enforced to restrict access to data.

The user ID that is used for authentication is subject to access control in the same way as an interactive user. Each request requires the proper authentication information. Ensure each request includes an Authorization header with the credentials you want to use. There is no support for inbound mutual authentication.
To allow access to tables without any authentication and authorization, add the table name to sys_public.list. ACLs defined on tables are still enforced, and it is the customer’s responsibility to deactivate ACLs on tables.

REST supports cookies for binding to the existing session.

For Aggregate API requests, you must have read access for all records in the table you query. If an ACL prevents the requesting user from accessing any record in the table, the request returns a 403 Forbidden error.

REST API roles
Certain roles are required for inbound REST operations.

Table 1018: Inbound REST API roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>web_service_admin</td>
<td>Can access the System Web Services application menu and the REST modules.</td>
</tr>
</tbody>
</table>

**Note:** To perform database operations using REST, you must have any roles needed to access the target tables.

Attachment API role requirements
The user record used to authenticate Attachment API requests must have certain roles.

To create attachments, the user record used to authenticate the HTTP request with ServiceNow must have any roles required to create Attachment [sys_attachment] records, and also have any roles required to read and write records on the target table, such as the itil role to add attachments to incident records.

By default there is no single role allowing a user to add attachments. You can create a role to explicitly allow adding attachments, then assign this role to the user account being used to make the request.

REST API table access
All tables, including base system tables, global tables, and scoped tables are accessible via web services by default.

You must fulfill any other web service security requirements, such as basic authentication and ACLs to access tables via web services.

You can control direct web service access to tables using the **Allow access to this table via web services** check box on the table application access settings. This check box must be selected to allow web service interaction with the table.

**Note:** The application access fields controlling CRUD operations, such as Can read or Can create do not apply to web service requests.

REST API CORS support
The REST API supports cross-origin resource sharing (CORS) security.

CORS support allows you to define which domains can access each REST API. By defining a CORS rule, you can whitelist a domain to allow cross-origin requests from that domain. Cross-origin requests cannot be made from domains without a CORS rule.

**Note:** CORS support applies only to REST APIs, including scripted REST web services. Other web service APIs, such as the SOAP API, do not support CORS.
You can configure CORS to allow access to only certain APIs, HTTP methods, and headers from other domains. For example, you can limit requests to the Table API from a specific domain to allow only GET operations.

To view the CORS rules defined on your instance, navigate to **System Web Services > CORS Rules**. You can disable CORS support for an instance by setting the property glide.rest.cors.enabled to false. When false, no CORS evaluation is performed on incoming REST requests. This property is true by default.

Define a CORS rule
You can define a CORS rule to control which domains can access specific REST API endpoints.

Role required: web_service_admin

1. Navigate to **System Web Services > CORS Rules**.
2. Click **New**.
3. Populate the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REST API</td>
<td>Select the REST API this CORS rule applies to, such as the Table API.</td>
</tr>
<tr>
<td>Domain</td>
<td>Enter the domain that this CORS rule applies to. This CORS rule is evaluated against requests from the specified domain.</td>
</tr>
<tr>
<td></td>
<td>You can specify a domain pattern or an IP address. When using a domain pattern you can specify a single wildcard to match incoming origin headers.</td>
</tr>
<tr>
<td>HTTP Methods</td>
<td>Select the HTTP methods allowed. Only the selected methods can be called from the specified domain.</td>
</tr>
<tr>
<td>HTTP Headers</td>
<td>Enter a comma-separated list of HTTP headers to send in the response. Specified headers are added to the Access-Control-Expose-Headers header.</td>
</tr>
<tr>
<td>Max age</td>
<td>Enter the number of seconds to cache the client session. After an initial CORS request, further requests from the same client within the specified time do not require a preflight message. If you do not specify a value, the default value of 0 indicates that all requests require a preflight message.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

CORS domain requirements
When you define a CORS rule, the value you enter in the Domain field must meet certain requirements. Each CORS rule supports a single wildcard to match incoming Origin headers.
Requirements

The value you enter in the Domain field on the CORS Rule form must meet the following requirements.

- Begins with HTTP:// or HTTPS://.
- Is a domain pattern or IP address.
- Ends with alphanumeric characters preceded by a period, such as .com.
- Includes at most a single wildcard character immediately following the scheme and hierarchical portion of the domain pattern.

Wildcard

You can use a single wildcard character (*) in the domain pattern. Use this wildcard immediately following the scheme and hierarchical portion of the domain pattern, such as http://*.domain.com to include all subdomains. The wildcard must immediately follow the scheme and hierarchical portion of the domain pattern. If you use an IP address instead of domain pattern, you must enter the full IP address without a wildcard.

Note: You cannot use multiple wildcards, or specify a wildcard without a domain pattern. Values such as * or *.* are not supported.

Domain matching

When evaluating the Origin header in a request, ServiceNow prioritizes CORS rules that match the domain pattern exactly. If no exact match is found, the next closest match is used.

For example, if there are rules for the domain patterns http://*.blog.mysite.com and http://*.mysite.com, a request from http://alice.blog.mysite.com will match the http://*.blog.mysite.com pattern.

Examples of valid and invalid domains

<table>
<thead>
<tr>
<th>Valid domain</th>
<th>Invalid domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>http://*.ms.net</td>
<td>https://*com</td>
</tr>
<tr>
<td>https://*.ms.com</td>
<td>http://*..com</td>
</tr>
<tr>
<td><a href="http://192.168.1.1">http://192.168.1.1</a></td>
<td>http://*.168.1.126</td>
</tr>
<tr>
<td>http://*.service-now.com</td>
<td><a href="http://blog.*.service-now.com">http://blog.*.service-now.com</a></td>
</tr>
<tr>
<td>http://*.com</td>
<td>http://*com</td>
</tr>
</tbody>
</table>

REST API supported headers

The REST API provides support for various headers. Some headers are mandatory for specific APIs and HTTP methods.
Data format headers

The Accept and Content-Type request headers are required for proper data formatting for requests that contain a request body or response body. These request headers support the following values:

- **Accept**: application/json, application/xml
- **Content-Type**: application/json, application/xml

**Note:** The Attachment API accepts all Content-Type values (/*). Specify the file content type when uploading an attachment. The content type is stored with file metadata allowing other tools to correctly identify and parse the file.

POST, PUT, PATCH, and DELETE operations require you to provide both headers. GET operations require only the Accept header. Failing to provide the required headers results in a 400 Bad Request error.

Other headers

All requests may contain an authentication header that specifies the user credentials to authenticate with. You can override the HTTP method, such as GET or POST, by setting the X-http-method-override header.

REST API HTTP response codes

REST Messages sent to a ServiceNow instance return a specific HTTP response code.

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Message</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Success</td>
<td>Success with response body.</td>
</tr>
<tr>
<td>201</td>
<td>Created</td>
<td>Success with response body.</td>
</tr>
<tr>
<td>204</td>
<td>Success</td>
<td>Success with no response body.</td>
</tr>
<tr>
<td>400</td>
<td>Bad Request</td>
<td>The request URI does not match the APIs in the system, or the operation failed for unknown reasons. Invalid headers can also cause this error.</td>
</tr>
<tr>
<td>401</td>
<td>Unauthorized</td>
<td>The user is not authorized to use the API.</td>
</tr>
<tr>
<td>403</td>
<td>Forbidden</td>
<td>The requested operation is not permitted for the user. This error can also be caused by ACL failures, or business rule or data policy constraints.</td>
</tr>
<tr>
<td>404</td>
<td>Not found</td>
<td>The requested resource was not found. This can be caused by an ACL constraint or if the resource does not exist.</td>
</tr>
<tr>
<td>405</td>
<td>Method not allowed</td>
<td>The HTTP action is not allowed for the requested REST API, or it is not supported by any API.</td>
</tr>
</tbody>
</table>
Dot-walking in REST API requests

You can use dot-walking when specifying the sysparm_query or sysparm_fields parameters in requests to REST APIs that support those parameters.

**Note**: The Import Set API does not support dot-walking.

### Dot-walking in sysparm_query

You can filter queries using related record values by dot-walking in the sysparm_query parameter. For example, you can retrieve all incident records where the incident **Company** has a specific **Stock symbol** value.

https://<instance>.service-now.com/api/now/table/incident?sysparm_query=company.stock_symbol=NYX

### Dot-walking in sysparm_fields

You can view field values from multiple tables by dot-walking in the sysparm_fields parameter. For example, you can retrieve the **Name**, **Sys_id**, and **Department** of each user that has certain roles, as well as the role **Name**.

The request runs on the User Roles [sys_user_has_role] table which defines a many-to-many relationship between users and roles. The response includes field values from the User [sys_user] and Roles [sys_user_role] tables.

https://<instance>.service-now.com/api/now/table/sys_user_has_role?sysparm_fields=role%2Crole.name%2Cuser%2Cuser.name%2Cuser.sys_id%2Cuser.department&sysparm_query=role%3D3d43716d0f6002003a2d47bce1050e0d%5EORrole%3Dac73b52d0f6002003a2d47bce1050e0d&sysparm_display_value=true

```json
{
    "result": [
        {
            "user.name": "Fred Johnson",
            "user.sys_id": "f5a3716d0f6002003a2d47bce1050ed4",
            "role.name": "support",
            "user.department": {
                "display_value": "Accounting",
                "link": "https://<instance>.service-now.com/api/now/table/cmn_department/5b3b1530f58c2003a2d47bce1050e96"
            },
            "role": {
                "display_value": "support",
                "link": "https://<instance>.service-now.com/api/now/table/sys_user_role/3d43716d0f6002003a2d47bce1050e0d"
            }
        }
    ]
}
```
Debugging REST queries

You can debug REST queries by reviewing the session debug log.

When the property glide.rest.debug is true, all REST processing is logged in the session debug log.

REST Logging includes processing durations, headers, and the request body. Prolonged use of this property can affect performance, so it is best to use it while debugging REST processing, and then set the property back to false.

Sample log output

Scripted REST APIs

The Scripted REST APIs feature allows application developers to build web service APIs.

You can define service endpoints, query parameters, and headers for a scripted web service API, as well as scripts to manage the request and response.

Scripted REST APIs generally follow the REST architecture, but may be customized to use different conventions.

The following podcast offers additional information on the use of Scripted REST APIs.

Scripted REST core concepts

Review the Scripted REST APIs core concepts before creating your own APIs.

**Scripted REST API URIs**

Scripted REST API URIs depend on the namespace and API ID, and optionally the version, of the web service.

The API URI, excluding the instance URL, appears in the Resource path and Default resource path fields for scripted REST resource records. The Default resource path field appears only for resources with the default API version.

URIs used by Scripted REST APIs follow these formats:

- `https://instance.service-now.com/api/(name_space)/(api_id)/(resource_path)`
- `https://instance.service-now.com/api/(name_space)/(version)/(api_id)/(resource_path)`

In these URIs:

- `(name_space)` is a read-only value. For web services in the global scope, the name space is the value of the property glide.appcreator.company.code. For web services in a scoped application, the name space is the scope name, such as `x_company_appname`.

© 2017 ServiceNow. All rights reserved.
• (api_id) is the value of the API ID field on the scripted REST API record. By default this value is based on the service name.

• (resource_path) is the relative path defined for the resource. Specifying a relative resource path allows you to have multiple resources using the same HTTP method, such as GET, in one web service. For example, an resource may specify the path /{id} when the web service has only one GET resource, or /user/{id} and /message/{id} when the web service has different resources for requesting user and message records.

• (version) is the version of the API to access if the API uses versioning, such as v1. You can access the default version of a versioned API by using the URI without a version number.

**Scripted REST API roles**

Certain roles are required to work with scripted REST API records. Roles required to access each API depend on the API implementation.

The following roles are required to work with scripted REST API records.

These roles are not required to access a scripted REST API endpoint. The REST API author can define security requirements for each API and API resource.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service administrator [web_service_admin]</td>
<td>Users with this role can read, create, modify, and delete Scripted REST APIs and web service resources.</td>
<td>none</td>
</tr>
</tbody>
</table>

**Scripted REST API query parameters**

Query parameters define values that requesting users can pass with a request.

When creating a scripted REST API you can specify which parameters are available and which are mandatory for each request. You can access request parameters in scripted REST API scripts using the request object queryParams field.

**Scripted REST API versioning**

Scripted REST APIs may be versioned, allowing you to test and deploy changes without impacting existing integrations.

**Enable versioning**

By default, new scripted REST APIs are not versioned. To enable versioning, click Enable versioning on the Scripted REST API form.

**Note:** To continue supporting non-versioned URLs after enabling versioning, select a version as the default version.

**Default version**

A version may be marked as default. Specifying a default version allows users to access that version using a web service URL without a version number.

If more than one active version is marked as default, the latest default version is used as the default.
**Add a version**

To add a new version to a scripted REST service, click **Add new version** on the Scripted REST API form.

When you add a new version, you can copy resources from an existing version.

**Scripted REST API access controls**

Scripted REST APIs use REST_Endpoint type ACLs to define access controls.

As a user with the web_service_admin role, you can define access controls for scripted REST APIs and scripted REST API resources.

A scripted REST API or scripted REST resource may require users to submit basic authentication credentials and pass an ACL check. A requesting user must satisfy at least one of the ACLs. It is not necessary to satisfy all selected ACLs.

Scripted REST service ACLs must have the **Type** value **REST_Endpoint**.

**Scripted REST API security matrix**

There are multiple possible security configurations for scripted REST APIs.

Use this table to identify the scripted REST API security configuration that best suits your needs, and the field values to implement that configuration.

### Table 1022: Scripted REST API security

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Scripted REST API</th>
<th>Scripted REST Resource</th>
<th>Requires authentication</th>
<th>Requires ACL authorization</th>
<th>ACLs</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default ACLs</strong></td>
<td>Any value</td>
<td>False</td>
<td>Any value</td>
<td>Any value</td>
<td></td>
</tr>
<tr>
<td>The resource is public. No authentication or ACL is required.</td>
<td>Any value</td>
<td>True</td>
<td>False</td>
<td>Any value</td>
<td></td>
</tr>
<tr>
<td>The resource requires basic authentication only. No ACL is required.</td>
<td>No ACL selected</td>
<td>True</td>
<td>True</td>
<td>No ACL selected</td>
<td></td>
</tr>
<tr>
<td>The resource requires basic authentication only. No ACL is required.</td>
<td>Any value</td>
<td>True</td>
<td>True</td>
<td>One or more ACLs selected</td>
<td></td>
</tr>
<tr>
<td>An ACL selected in the resource record is required.</td>
<td>One or more ACLs selected</td>
<td>True</td>
<td>True</td>
<td>No ACL selected</td>
<td></td>
</tr>
</tbody>
</table>

**Scripted REST API error objects**

Scripted REST APIs include error objects that allow you to respond to a request with a standard HTTP error message when an error occurs during request processing.
You can use error objects in scripted REST API resources to alert requesting clients of errors. Use error objects to respond to incoming requests, not to catch errors within your server-side code.

## Error response format

The content type of the response depends on the request Accept header. If the Accept header specifies an unsupported format, such as image/jpeg, the error response uses JSON.

Error responses follow this format:

```
{
   "error": {
      "message": "My error message",
      "detail": "My details"
   },
   "status": "failure"
}
```

The numeric status code, such as 404, is included in the response Status code header, not in the response body.

### Sending scripted REST API errors

Scripted REST APIs provide multiple ways to send an error in a response to a requesting client. The **Script** field on the Scripted REST Resource form provides a process function template. You can send an error response by returning an error object, or using the process function response parameter. Either option returns the same error to the requesting client.

### Returning an error

You can send an error by returning an error object.

```
(function process(request, response) {
   // request is bad
   return new sn_ws_err.BadRequestError('My error message');
})(request, response);
```

### Setting a response error

You can send an error by calling the `setError` function on the response parameter.

```
(function run(request, response) {
   // request is bad
   responseBuilder.setError(new sn_ws_err.BadRequestError()); // Constructor parameter is optional
})(request, response);
```

### Available error objects

Multiple error objects are available in scripted REST API scripts to report error information to requesting clients.
Error namespace

All scripted REST API error objects use the sn_ws_err namespace. When instantiating a new error object, use this namespace, such as in `var error = new sn_ws_err.BadRequestError()`.

Predefined errors

Predefined error objects allow you to easily communicate an error based on standard HTTP error codes. You can set an optional error message in the object constructor.

<table>
<thead>
<tr>
<th>Error Object</th>
<th>Description</th>
<th>Status Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>BadRequestError</td>
<td>Indicates an error in the request, such as incorrect syntax.</td>
<td>400</td>
</tr>
<tr>
<td>NotFoundError</td>
<td>Indicates a requested resource is not available.</td>
<td>404</td>
</tr>
<tr>
<td>NotAcceptableError</td>
<td>Indicates the Accept header value passed in the request is incompatible with the web service.</td>
<td>406</td>
</tr>
<tr>
<td>ConflictError</td>
<td>Indicates that there is a conflict in the request, such as multiple conflicting updates.</td>
<td>409</td>
</tr>
<tr>
<td>UnsuppotedMediaTypeError</td>
<td>Indicates the request media type is not supported by the web service.</td>
<td>415</td>
</tr>
</tbody>
</table>

```javascript
(function run(request, response) {
  // request is bad
  return new sn_ws_err.BadRequestError('My error message');
})(request, response);
```

Customizable ServiceError

The ServiceError object allows you to define your own error response. You can set the status code, error message, and error details using a ServiceError object. Use the ServiceError object when none of the predefined errors meet your needs.

The ServiceError object exposes these functions for setting values:
Table 1024: Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>setStatus(Number status)</td>
<td>Use this function to set the numeric status code for the error.</td>
<td>500</td>
</tr>
<tr>
<td>setMessage(String message)</td>
<td>Use this function to set a short error message.</td>
<td>An empty string</td>
</tr>
<tr>
<td>setDetail(String detail)</td>
<td>Use this function to set the detailed error description.</td>
<td>An empty string</td>
</tr>
</tbody>
</table>

```javascript
(function run(request, response) {
    var myError = new sn_ws_err.ServiceError();
    myError.setStatus(410);
    myError.setMessage('My error Message');
    myError.setDetail('Here are the details about this error');
    return myError;
})(request, response);
```

Create a scripted REST API

Create a scripted REST API to define web service endpoints.

Role required: web_service_admin

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Click **New**.
3. Enter a **Name** for the service.
   The **API ID** is set automatically based on the **Name**. You can modify the **API ID** if needed.
4. Click **Submit**.

After you create the API, configure the service as needed such as by creating resources, assigning ACLs, or specifying supported request and response formats.

*Create a scripted REST API resource*

Create a scripted REST API resource to define the HTTP method, the processing script, and to override settings from the parent service.

There must be a Scripted REST API defined before you can create resources.

Role required: web_service_admin

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Select a scripted REST API record.
3. In the **Resources** related list, click **New**.
4. Enter a **Name**.
   The resource name affects the URI for sending requests to the API.
5. Select the **HTTP method** this resource implements, such as **GET**.
6. In the **Script** field, define how the operation parses and responds to requests.
7. Optional: Override settings from the parent REST API as needed, such as by specifying different security settings or valid content types.
8. Optional: On the **Documentation** tab, provide a **Short description** explaining how to access the resource.
   
   This information appears when exploring this resource using the REST API Explorer.

9. Click **Submit**.

After creating the resource, you can associate headers and query parameters.

**Define scripted REST API headers**

Define scripted REST API headers to control which headers the API accepts and can respond with.

There must be a Scripted REST API defined before you can create headers.

Role required: web_service_admin

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Select a scripted REST API record.
3. In the **Request Headers** related list, click **New**.
4. Enter a **Header name**.
5. Optional: Select **Is required** to make this header mandatory for all requests to associated scripted REST resources.
6. Enter a **Short description** and **Example value** to explain how to use the header.
7. Click **Submit**.

After defining available headers, associate the headers with a scripted REST resource.

**Define available query parameters**

Define available query parameters to control what values a requesting user can pass in the request URI.

Role required: web_service_admin

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Select a scripted REST API record.
3. In the **Query Parameters** related list, click **New**.
4. Specify the **Query parameter name**.
5. Optional: Select **Is required** to make this parameter mandatory for all requests to associated scripted REST resources.
6. Enter a **Short description** and **Example value** to explain how to use the parameter.
7. Click **Submit**.

After defining available query parameters, associate the parameters with a scripted REST resource.

**Configure a scripted REST API to require an ACL**

Configure a scripted REST API to require that requesting users satisfy an ACL.

Role required: web_service_admin

Requests to scripted REST APIs respect platform ACLs. The requesting user must meet any table ACL requirements to access instance data. Additionally, you can configure the scripted REST API to require a specific ACL.

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Select a scripted REST API record.
3. In the **Default ACL** field, select one or more ACLs that have a **Type** value of **REST_Endpoint**.
   
   A requesting user must satisfy at least one of the selected ACLs. It is not necessary to satisfy all selected ACLs.
4. Click **Update**.

You can override the API security settings for each individual resource.
Configure a scripted REST API resource to require an ACL

As a user with the web_service_admin role, you can configure a scripted REST API resource to require ACLs.

Role required: web_service_admin or admin

Resources inherit security settings from the parent API by default. Define custom security settings for a specific resource to override the inherited settings.

1. Navigate to System Web Services > Scripted REST APIs.
2. Select a scripted REST API record.
3. In the Resources related list, select a resource.
4. In the Security tab, select the Requires authentication check box.
   
   This check box must be selected to require an ACL. Clear this check box to allow unauthenticated requests to access the resource, even if the parent REST service requires an ACL.
5. Select the Requires ACL authorization check box.
6. In the ACL field, select one or more ACLs that have a Type value of REST_Endpoint.
   
   Selecting an ACL for an resource overrides any ACLs selected for the parent web service. Leave this field blank to use the ACLs selected for the parent web service.

Enable versioning for a scripted REST API

Enable versioning for a scripted REST API to provide multiple versions of the API while maintaining compatibility with existing integrations.

There must be a Scripted REST API defined before you can enable versioning.

Role required: web_service_admin

1. Navigate to System Web Services > Scripted REST APIs.
2. Select a scripted REST API record.
3. Click Enable versioning.
   
   The Enable versioning pop up appears. The Make version v1 default check box is selected by default.
4. Optional: Clear the Make version v1 default check box to enable versioning without a default version.
   
   Versioned APIs without a default version are accessible only by using the version-specific URI. Make version v1 default, or select a different version as default after you enable versioning.
5. Click OK.
   
   The Versioning embedded list is added to the Scripted REST API form. You can add new versions or control which version is default from this list.

Add a version to a scripted REST API

Add a new version to a versioned scripted REST API to define new API behavior without impacting older versions.

There must be a Scripted REST Service that has versioning enabled before you can add a new version.

Role required: web_service_admin

1. Navigate to System Web Services > Scripted REST APIs.
2. Select a scripted REST service record.
3. Click Add new version.
   
   The Add new version pop up appears.
4. Optional: Select Make this version the default to configure the REST service to use the new version as the default version.
5. Optional: In the Copy existing resources from version choice list, select an existing version to copy all resources from that version to the new version.
6. Click OK.

Controlling request and response content type
You can control which content types are allowed in scripted REST API requests and responses.

You can set default values for the service using the **Default supported request formats** and **Default supported response formats** fields. These fields define acceptable values users can pass in the Content-Type and Accept request headers respectively. If a requesting user specifies an Accept or Content-Type header not supported by the service or resource, the instance responds with an HTTP error code 406 or 415.

You can override these values for each resource using the **Supported request formats** and **Supported response formats** on the Scripted REST Resource form.

**Note:** The **Supported request formats** field only appears for PUT, POST, and PATCH resources.

You can use wildcard values when specifying valid content types.

If no accepted content types are specified, scripted REST web services support Application/json, Application/xml, and Text/xml by default.

**Important:** If the request body format is not Application/json, Application/xml, or Text/xml, use only the request body `dataStream` field to access the request body. Using request body `data`, `dataString`, `nextEntry()`, or `hasNext()` with a non-default format will result in a 500 error response.

When sending a binary type in a response, you must set the response content type and write the binary stream directly using a RESTAPIResponseStream object. You can access this object by calling `getStreamWriter()` on the response object.

Controlling maximum request size
You can specify the maximum file size allowed in a scripted REST API request payload.

The file size limit applies when accessing any of the following variables or functions from a RESTAPIRequestBody object.

- `data`
- `dataString`
- `nextEntry()`
- `hasNext()`

Accessing these variables or functions with a request payload that exceeds the maximum size causes the service to respond with error code 400.

The file size limit does not apply when accessing the `dataStream` variable.

**Maximum request size properties**

Several properties control the maximum allowed request size. Add these properties to the System Properties [sys_properties] table to specify a maximum request size.
### Explore scripted REST APIs

You can browse scripted REST APIs using the REST API Explorer and view documentation provided by scripted REST API creators.

The REST API must be active and must specify at least one resource to appear in the REST API Explorer.

You can provide additional information about scripted REST APIs, API resources, request headers, and query parameters. The **Short description** field from these records appears on the REST API Explorer when viewing the appropriate API and resource. You can also provide a **Documentation link** URL in the scripted REST API record to direct users to more detailed documentation. Users can access this URL by clicking **API documentation** in the REST API Explorer.

### Scripted REST APIs good practices

Follow these guidelines when designing and implementing Scripted REST APIs.

**Follow REST API conventions**

Use REST API standards to provide a consistent and easy to use interface for clients.

REST API conventions define specific behavior for each type of method. Use the following guidelines as a starting point for designing your API.

- **GET** operations only query data. A GET request should never modify data.
- **POST** operations create new records but do not modify existing records.
- **PUT** and **PATCH** operations modify existing records.
- **DELETE** operations destroy records.

**Use versioning to control changes to your API**

Use versioning to implement new functionality and avoid breaking existing integrations.

When you introduce significant functionality changes to your API, create a new version of the API first. Do not introduce behavior that will break existing integrations in a published version.

Using versioning allows you to implement significant changes to your API without breaking existing clients. You can then release the new version of the API for new clients while allowing existing clients to upgrade at their own pace.

Encourage clients to use a version-specific API, or configure the API without a default version to force clients to specify a version. You can also make new, optional behavior available by adding an optional parameter to an existing version.

**Return an informative HTTP status code**

Return a status code that informs the requestor of the success or failure of the request.

Return an HTTP status code that helps the client understand the result of the request. Use the following guidelines for common status codes.

---

**Table 1025: Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.rest.scripted.max_inbound_content_length_mb</td>
<td>10</td>
<td>The maximum size, in megabytes, for a scripted REST request body that is not gzipped.</td>
</tr>
<tr>
<td>glide.rest.scripted.max_inbound_gzip_content_length_mb</td>
<td>1</td>
<td>The maximum size, in megabytes, for a scripted REST request body that is gzipped.</td>
</tr>
</tbody>
</table>
Table 1026: Common status codes

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Indicates that the request was completed successfully.</td>
</tr>
<tr>
<td>201</td>
<td>Indicates that a record was created successfully.</td>
</tr>
<tr>
<td>204</td>
<td>Indicates that a record was deleted successfully.</td>
</tr>
<tr>
<td>40X (401, 404)</td>
<td>Status codes in the 400 range indicate a client error, such as 400 for invalid request syntax.</td>
</tr>
<tr>
<td>50X (500, 503)</td>
<td>Status codes in the 500 range indicate that a server error occurred. The client request may have been valid or invalid, but a problem occurred on the server that prevented it from processing the request.</td>
</tr>
</tbody>
</table>

*Return useful error information*

Provide the client with enough information in error messages to allow them to understand the problem without having to refer to your API documentation.

An error response should include a helpful error message, as well as an error status code.

For example, when a client queries a record that does not exist, you can return the error message “The specified record does not exist. Ensure that a record with the ID of <id value> exists in the application.” along with a 404 status code.

The Scripted REST APIs feature includes several preconfigured error objects you can use for commonly-encountered errors, and a customizable ServiceRequest error object you can use when the preconfigured error objects do not meet your needs.

*Enforce and test access controls*

Enforce existing access controls and require additional access to modify data.

In addition to requiring authentication to access the API, require authorization to access data. Use the GlideRecordSecure API in your Scripted REST API scripts. This API ensures that access controls defined on the underlying data are applied for the requesting user.

Require additional access controls for operations that modify data. Requests such as PUT, POST, and DELETE should require a higher level of access than GET. Configure these API resources to require a more strict ACL.

Test your access controls, both authentication and authorization, before releasing the API.

*Build tests to verify functionality*

Build tests that verify your Scripted REST web services functionality as part of your development process.

Use repeatable tests to ensure that your API functions the way you expect it to. Testing also helps ensure that changes you make do not affect the expected API behavior after you release a version. You can use a REST client application that supports automated testing, such as Postman, to facilitate testing.

Tests should validate the response code, headers, and body content as appropriate for each resource you implement. You can also use tests to validate authentication requirements, and to confirm that errors return useful responses.

RESTAPIRequest

A RESTAPIRequest object allows you to access scripted REST API request details in scripts.
**Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

**RESTAPIRequest - body**

The body of the request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>RESTAPIRequestBody</td>
<td>The body of the request. You can access data from the body object using the RESTAPIRequestBody API.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body; // Returns instance of RESTAPIRequestBody
```

**RESTAPIRequest - pathParams**

The path parameters passed in the request URI.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathParams</td>
<td>Object</td>
<td>The path parameters as a script object. Available path parameters depend on the web service configuration.</td>
</tr>
</tbody>
</table>

In this example, the scripted REST API endpoint follows this format: `https://instance.service-now.com/api/now/myservice/{tableName}/{id}`. The request being processed uses this URL: `https://instance.service-now.com/api/now/myservice/myApp_table/1234`.

```javascript
var pathParams = request.pathParams;
var tableName = pathParams.tableName; // ‘myApp_table’
var id = pathParams.id; // ‘1234’
```

**RESTAPIRequest - queryParams**

The query parameters from the web service request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryParams</td>
<td>Object</td>
<td>The query parameters from the web service request.</td>
</tr>
</tbody>
</table>

```javascript
```
In this example, the request being processed uses this URL: https://<instance_rest_endpoint>?active=false&name=now. Note the active and name parameters.

```javascript
var queryParams = request.queryParams;
var isActiveQuery = queryParams.active; //false
var nameQueryVal = queryParams.name; //"now"
```

RESTAPIRequest - queryStr
The entire query added to the endpoint URI.

### Table 1030: Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryString</td>
<td>String</td>
<td>The entire query for the request.</td>
</tr>
</tbody>
</table>

In this example, the request being processed uses this URL: https://<instance_rest_endpoint>?active=false&name=now. Note the query active=false&name=now.

```javascript
var query = request.queryString; //"active=false&name=now"
```

RESTAPIRequest - uri
The request URI, excluding domain information.

### Table 1031: Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>The request URI, excluding domain information.</td>
</tr>
</tbody>
</table>

In this example, the request being processed uses this URL: https://instance.service-now.com/api/now/table/myTable?active=false&name=now.

```javascript
var query = request.uri; //"api/now/table/myTable"
```

RESTAPIRequest - url
The entire request URL.

### Table 1032: Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>The entire request URL.</td>
</tr>
</tbody>
</table>
In this example, the request being processed uses this URL:
> https://instance.service-now.com/api/now/table/myTable?
> active=false&name=now.

```javascript
var query = request.url; //"https://instance.service-now.com/
> api/now/table/myTable?active=false&name=now"
```

**RESTAPIRequest - headers**
All headers from the request.

### Table 1033: Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headers</td>
<td>object</td>
<td>All headers from the request, and their values.</td>
</tr>
</tbody>
</table>

```javascript
var headers = request.headers;
var acceptHeader = headers.Accept;
var myCustomHeader = headers.myCustom;
var specialHeader = headers['special - header'];
```

**RESTAPIRequest - getHeader(String header)**
Get the value of a specific header from the web service request.

### Table 1034: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header</td>
<td>String</td>
<td>The name of the header, such as accept or content-type.</td>
</tr>
</tbody>
</table>

### Table 1035: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var acceptHeader = request.getHeader('accept');
```

**RESTAPIRequest - getSupportedResponseContentTypes()**
Get the content types specified in the request Accept header.
### Table 1036: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1037: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of string values where each string is a content type, such as application/json.</td>
</tr>
</tbody>
</table>

**Output:**

**RESTAPIRequestBody**

A RESTAPIRequestBody object allows you to access the body content of a scripted REST API request in scripts.

The format of a RESTAPIRequestBody object may be JSON or XML, depending on the content-type header value from the request.

**Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

Single entry example-request-body in JSON format.

```json
{
   "name": "user1",
   "id": 1234,
   "roles": [
      {
         "name": "admin"
      },
      {
         "name": "itil"
      }
   ]
}
```

Multiple entry example-request-body in JSON format.

```json
[{
   "name": "user1",
   "id": 1234,
   "roles": [
      {
         "name": "admin"
      },
      {
         "name": "itil"
      }
   ]
}]
```
Important: If the request body format is not Application/json, Application/xml, or Text/xml, use only the request body `dataStream` field to access the request body. Using request body `data`, `dataString`, `nextEntry()`, or `hasNext()` with a non-default format will result in a 500 error response.

**RESTAPIRequestBody - data**
The content of the request body.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object or Array</td>
<td>The request content. This can be a single object or an array of objects depending on the request.</td>
</tr>
</tbody>
</table>

```javascript
var entry;
var id;
var requestBody = request.body;
var requestData = requestBody.data; // May be an array or a single object
if (requestData instanceof Array) {
  entry = requestData[0].name; // 'user1'
  id = requestData[0].id; // '1234'
} else {
  entry = requestData.name; // 'user1'
  id = requestData.id; // '1234'
}
```

**RESTAPIRequestBody - dataStream**
The content of the request body, as a stream.
Table 1039: Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataStream</td>
<td>Object</td>
<td>The content of the request body. You can pass the stream to a separate API, such as to create an attachment from the request or forward the request to a different endpoint.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
var requestString = requestBody.dataStream;
```

**RESTAPIRequestBody - dataString**
The content of the request body, as a String.

Table 1040: Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataString</td>
<td>String</td>
<td>The content of the request body.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
var requestString = requestBody.dataString;
```

**RESTAPIRequestBody - hasNext()**
Determine if there are additional entries in the request body.
Use this method with the nextEntry() method to iterate over multiple request body entries.

Table 1041: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1042: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>True if there are additional entries available. This method returns true only once if the request contains a single entry.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
```
requestBody.hasNext(); // returns true if the request contains a single entry or multiple entries

// calling second time
requestBody.hasNext(); // returns false if the request contains a single entry, or true if the request contains multiple entries

**RESTAPIRequestBody - nextEntry()**
Retrieve one entry from the request body as a script object.
Use this method with the hasNext() method to iterate over multiple request body entries.

**Table 1043: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 1044: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>A single entry from the request body.</td>
</tr>
</tbody>
</table>

```
var requestBody = request.body;
var requestEntry = requestBody.nextEntry(); // returns available entry if there is only one entry, or the first entry if there are multiple.
var name = requestEntry.name; // ‘user1’

// Calling second time
requestEntry = requestBody.nextEntry(); // returns undefined if there is only one entry, or the second entry if there are multiple.
```

This example demonstrates using hasNext() with nextEntry().

```
var requestBody = request.body;
while(requestBody.hasNext()){
    var entry = requestBody.nextEntry();
}
```

**RESTAPIResponse**

A RESTAPIResponse object allows you to build a RESTful response to a scripted REST API request.

**Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.
RESTAPIResponse - `getStreamWriter()`
Get the ResponseStreamWriter for this response, allowing you to write directly to the response stream.

Set the content type and status code using the `setHeaders` and `setStatus` functions prior to calling the `getStreamWriter` function. If you do not set a status code, the status code defaults to 200.

### Table 1045: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1046: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTAPIResponseStream on page 3243</td>
<td>The ResponseStreamWriter for this response. You can use this object to write directly to the response stream.</td>
</tr>
</tbody>
</table>

```javascript
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getStreamWriter();
```

RESTAPIResponse - `setBody(Object body)`
Set the body content to send in the web service response.

### Table 1047: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>Object</td>
<td>The response body, as a JavaScript object. The body content is automatically serialized to JSON or XML depending on the value of the Accept header passed in the request.</td>
</tr>
</tbody>
</table>

### Table 1048: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var body = {};
body.name = "incident";
body.number = "1234";
body.caller = {"id": "user1"};
```
response.setBody(body);
var bodyArray = [];
var body = {};
body.name = "incident";
body.number = "1234";
body.caller = {"id":"user1"};
bodyArray.push(body);
response.setBody(bodyArray);

**RESTAPIResponse - setHeaders(Object headers)**
Set the headers for the web service response.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headers</td>
<td>Object</td>
<td>A JavaScript object listing each header and the value to assign that header.</td>
</tr>
</tbody>
</table>

**RESTAPIResponse - setLocation(String location)**
Assign a value to the Location header in the web service response.

See the *W3 Location header documentation* for more information about this header.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>String</td>
<td>An absolute URI to redirect the response recipient to.</td>
</tr>
</tbody>
</table>

Table 1050: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
RESTAPIResponse - setStatus(Number status)
Set the status code number for the web service response.

Table 1053: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Number</td>
<td>The status code to send in the response, such as 200 to indicate success. Passing a non-numerical value, such as a string, causes the status code to default to 0.</td>
</tr>
</tbody>
</table>

Table 1054: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
response.setStatus(200);
```

RESTAPIResponse - setHeader(String header, String value)
Assign a value to a REST service response header.

Table 1055: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header</td>
<td>String</td>
<td>The header you want to set.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign the specified header.</td>
</tr>
</tbody>
</table>

Table 1056: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
responseBuilder.setHeader("Location","<URI>");
```
RESTAPIResponse - contentType(String contentType)
Assign a value to the Content-Type header in the web service response.

You must set a response content type before writing the response. The content type is set automatically for string responses, based on the request Accept header value.

Setting an invalid content type causes the response to default to JSON. Failing to set a content type results in a status code 500 error when sending a binary response.

See the W3 Content-Type header documentation for more information about this header.

**Table 1057: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentType</td>
<td>String</td>
<td>The content type of the response body, such as application/json.</td>
</tr>
</tbody>
</table>

**Table 1058: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
responseBuilder.setContentType('application/json');
```

RESTAPIResponse - setError(Object error)
Configure the response to return an error.

**Table 1059: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Object</td>
<td>An error object.</td>
</tr>
</tbody>
</table>

**Table 1060: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Output:

RESTAPIResponseStream
A RESTAPIResponseStream object allows you to write directly to the scripted REST API response stream.
**Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

RESTAPIResponseStream - writeStream(Object stream)
Write an input stream to the response stream.

You must set the content type and status code before calling the `writeStream()` method or the response will fail. You cannot modify these values after calling the `writeStream()` method.

### Table 1061: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>Object</td>
<td>An attachment or a response stream from a third-party service.</td>
</tr>
</tbody>
</table>

### Table 1062: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

It is the responsibility of the script author to obtain the stream from a third-party service.

```java
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getStreamWriter();
var attachmentStream = new GlideSysAttachmentInputStream(<sys id of attachment>);
writer.writeStream(attachmentStream);
```

RESTAPIResponseStream - writeString(String data)
Write string data to the response stream.

You must set the content type and status code before calling the `writeString()` method or the response will fail. You cannot modify these values after calling the `writeString()` method.

### Table 1063: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>String</td>
<td>The string to add to the response data.</td>
</tr>
</tbody>
</table>
Table 1064: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getWriter();
var body = {
  name: 'user1',
  id: 1234,
  roles: [
    { name: 'admin' },
    { name: 'itil' }
  ]
};
writer.writeString('{"name":"user","id":"1234"}');
writer.writeString(JSON.stringify(body));
```

Scripted REST API examples

Multiple examples are available demonstrating how to create and use scripted REST APIs.

*Scripted REST API example - script samples*

These examples demonstrate how to create various resource scripts for a scripted REST API.

**Query parameters GET example**

This example demonstrates how to get query parameter values from a request.

```javascript
/**
 * GET - Sample Request API - Query Params
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
  var uri = request.uri;
  var url = request.url;
  var queryParams = request.queryParams;
  var customHeader = request.getHeader('X-Custom');

  return {
    "uri": uri,
    "url": url,
    "queryParams": queryParams,
    "customHeader": customHeader
  };
})(request, response);
```
Path parameters GET example

This example demonstrates how to get path parameter values from a request.

```javascript
/**
 * GET - Sample Request API - Path Params
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
    var uri = request.uri;
    var url = request.url;
    var path = request.pathParams;

    return {
        "uri": uri,
        "url": url,
        "path_params": path,
        "path.id": path.id
    };
})(request, response);
```

Script include GET example

This example demonstrates how to use a script include to provide a response. By using a script include you can reuse common code and maintain readability in the REST service scripts.

```javascript
/**
 * GET - Sample Request API - Script Include
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
    var responseObj = global.SampleDataUtil.getSampleJSON();
    return responseObj;
})(request, response);
```

String POST example

This example demonstrates how to parse a POST message with a string body and send a response based on the request.

```javascript
/**
 * POST - Sample Request API - dataString
 * sample usage:
 * var requestBody = request.body;
 * var requestString = requestBody.dataString;
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
    var requestBody = request.body;
    var requestString = requestBody.dataString;
    return {"requestString": requestString};
})(request, response);
```
**Binary POST example**

This example demonstrates how to parse a POST message with a binary body and send a response based on the request.

```javascript
/**
 * POST - Sample Request API - Body
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response)
{
    var body = request.body.data;
    //do any additional processing on the request body, such as inserting a new record.
    return {
       "body.id": body.id
    }
})(request, response);
```

**Not acceptable error example**

This example demonstrates how to respond with a not acceptable error. Use this error type when the request Accept header value is not supported by the web service.

```javascript
/**
 * Sample Not Acceptable Error Sample
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response)
{
    response.setError(new sn_ws_err.NotAcceptableError('sample error message'));
})(request, response);
```

**Bad request error example**

This example demonstrates how to respond with a bad request error. Use this error type to indicate a mistake in the request syntax.

```javascript
/**
 * Bad Request Error Sample
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response)
{
    response.setError(new sn_ws_err.BadRequestError('sample error message'));
})(request, response);
```

**Conflict error example**

This example demonstrates how to respond with a conflict error. Use this error type in the event of multiple conflicting requests, such as multiple updates to the same record.

```javascript
/**
 * Error Response: Conflict Error Sample
 */
```
Not found error example

This example demonstrates how to respond with a not found error. Use this error type if the requested resource does not exist or is unavailable.

```javascript
/**
 * Error Response: Not Found Error Sample
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response)
 {
   response.setError(new sn_ws_err.NotFoundError('sample error message'));
 })(request, response);
```

Unsupported media type error example

This example demonstrates how to respond with an unsupported media type error. Use this error type to indicate that the Content-Type of the request is unsupported.

```javascript
/**
 * Error Response: Unsupported Media Type Error Sample
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response)
 {
   response.setError(new sn_ws_err.UnsupportedMediaTypeError('sample error message'));
 })(request, response);
```

Service error example

This example demonstrates how to respond with a generic service error. The ServiceError object allows you to define the status code, message, and error detail. Use a ServiceError if the predefined error types do not meet your needs.

```javascript
/**
 * Error Response: Custom Error Sample
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response)
 {
   var myError = new sn_ws_err.ServiceError();
   myError.setStatus(418);
   myError.setMessage("I am a Teapot");
   myError.setDetail("Here are the details about this error");
   response.setError(myError);
 })(request, response);
```
Scripted REST resource script example

This sample REST API resource script parses the name and id values from the request body and returns those values in the response.

```javascript
/**
 * POST - Sample Request API - Body
 */
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
  var body = request.body.data,
  id0,name0,id1,name1;
  name0 = body[0].name; // 'user0'
  id0 = body[0].id; // '1234'
  name1 = body[1].name; // 'user1'
  id1 = body[1].id; // '5678'

  return {
    "id": id0,
    "name": name0,
    "id1": id1,
    "name1": name1
  }
})(request, response);
```

Requests

The API can accept both XML and JSON requests.

<table>
<thead>
<tr>
<th>JSON Request</th>
<th>XML Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>POST /api/sn_demo_api/v1/example/ body HTTP/1.1</td>
<td>POST /api/sn_demo_api/v1/example/ body HTTP/1.1</td>
</tr>
<tr>
<td>Content-Type: application/json</td>
<td>Content-Type: application/xml</td>
</tr>
<tr>
<td>Accept: application/json</td>
<td>Accept: application/json</td>
</tr>
<tr>
<td>Host: &lt;instance&gt;.service-now.com</td>
<td>Host: &lt;instance&gt;.service-now.com</td>
</tr>
<tr>
<td>Connection: close</td>
<td>Connection: close</td>
</tr>
<tr>
<td>Content-Length: 91</td>
<td>Content-Length: 91</td>
</tr>
<tr>
<td>[</td>
<td>&lt;request&gt;&lt;entry&gt;</td>
</tr>
<tr>
<td>{ &quot;name&quot;: &quot;user0&quot;,</td>
<td>&lt;name&gt;user0&lt;/name&gt;</td>
</tr>
<tr>
<td>&quot;id&quot;: 1234</td>
<td>&lt;id&gt;1234&lt;/id&gt;</td>
</tr>
<tr>
<td>},</td>
<td>&lt;/entry&gt;</td>
</tr>
<tr>
<td>{</td>
<td>&lt;entry&gt;</td>
</tr>
<tr>
<td>&quot;name&quot;: &quot;user1&quot;,</td>
<td>&lt;name&gt;user1&lt;/name&gt;</td>
</tr>
<tr>
<td>&quot;id&quot;: 5678</td>
<td>&lt;id&gt;5678&lt;/id&gt;</td>
</tr>
<tr>
<td>}</td>
<td>&lt;/entry&gt;</td>
</tr>
<tr>
<td>]</td>
<td>&lt;/request&gt;</td>
</tr>
</tbody>
</table>
Responses

Both requests specify application/json as the Accept header value. This causes either response to use JSON formatting, even if the request content type is XML.

HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Tue, 04 Aug 2015 15:20:44 GMT
Server: ServiceNow
Connection: close
Set-Cookie: BIGipServerpool_<Instance>=880838154.47166.0000; path=/

{"result":{"id":1234,"id1":5678,"name":"user0","name1":"user1"}}

Scripted REST API example - streaming vs object serialization

These examples demonstrate how to send a JSON response using streaming and using default object serialization.

Streaming vs object serialization

When sending a response, you can send a response as a stream or serialize an object. There are advantages and disadvantages to either approach. Pick a technique based on the needs of your integration.

Generally, if the response object is simple, can be represented as XML or JSON, and is a consistent size, use object serialization. If using a format other than XML or JSON, or if the size of the response varies, use streaming.

Streaming the response

Using a streaming responses provides advantages in response time, instance performance, and content flexibility, but adds additional complexity to the script. When using streaming, you are responsible for formatting the response, setting the response status, and setting the Content-Type header. When streaming a response, the requesting user receives a response quickly because the entire response does not need to be created before starting streaming.

This example demonstrates a Scripted REST Resource script that returns an array of incident records using streaming.

```javascript
/**
 * Sample Scripted REST Resource that returns custom JSON objects with properties from Incident GlideRecords
 * This sample uses ServiceNow JavaScript API to query incident records
 * and then iterates over those records to build and stream a custom JSON object that
 * includes some values from the incidents
 */
(function runOperation(/*RESTServiceRequest*/ request, /*RESTServiceResult*/ response) {
  var writer = response.getOutputStream(),
      hdrs = {},
      table = 'incident',
      record_limit = 100,
      gr = new GlideRecord(table);
```
```javascript
// start building response object
writer.writeString("{"results":[");

// iterate over incident records and build JSON representations to be streamed out.
while (gr.next()) {
    var incidentObj = {};
    incidentObj.number = gr.number + '';
    incidentObj.short_description = gr.short_description + '';
    writer.writeString(global.JSON.stringify(incidentObj));

    if (gr.hasNext()) {
        writer.writeString(",");
    }
}

// close the response object
writer.writeString("]"));
})(request, response);
```

A request to this resource returns the following response.

```json
// sample response
/*
HTTP/1.1 200 OK
Content-Type: application/json
Server: ServiceNow

// sample response number of records returned has been truncated for this example

{
 "results": [
 |
 | "number": "INC0011301",
 | "short_description": "lorem ipsum short description 0 my new incident"
 |
 | "number": "INC0011302",
 | "short_description": "lorem ipsum short description 1 my new incident"
 |
 | "number": "INC0011303",
 | "short_description": "lorem ipsum short description 2 my new incident"
 |
 | "number": "INC0011304",
```
Building an object

Using object serialization allows you to take advantage of ServiceNow provided serialization and content negotiation. When serializing an object instead of streaming, the entire object must be created and serialized before the client receives a response. This may delay the response, or require a large amount of system resources if the response object is very large. Object serialization is available only for XML or JSON responses. Responses using a different format must use streaming.

This example returns the same Incident data as the streaming example, but collects all of the response data in an array before sending the response.
* Sample Scripted REST Resource returns an array of custom JSON objects that include 2 incident properties.
* This sample uses ServiceNow JavaScript API to query incident records and then iterates
* over those records building a custom JSON object that includes 2 values from the incident records.
* note that because we are returning a simple JSON object we can rely on built in serialization
* to set the content-type header as well as response status. The 'result_arr' object will not be returned
* until it has been completely built and stored
*/
(function runOperation(/*RESTServiceRequest*/ request, /*RESTServiceResult*/ response) {
  var table = 'incident',
      record_limit = 100,
      result_arr = [],
      gr = new GlideRecord(table);

  gr.setLimit(record_limit);
  gr.query();

  // iterate over incident records and build JSON representations to be streamed out.
  while (gr.next()) {
    var incidentObj = {};
    incidentObj.number = gr.number + '';
    incidentObj.short_description = gr.short_description + '';
    result_arr.push(incidentObj);
  }

  return result_arr;
})(request, response);

A request to this resource returns the following response.

/*
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Server: ServiceNow

// sample response number of records returned has been truncated for this example
{
  "result": [{
    "short_description": "lorem ipsum short description 0 my new incident",
    "number": "INC0011301"
  },
  {
    "short_description": "lorem ipsum short description 1 my new incident",
    "number": "INC0011302"
  },
  {
    "short_description": "lorem ipsum short description 2 my new incident",
    "number": "INC0011303"
}]
*/
Scripted REST API example - streaming file attachments
This example demonstrates how to send an image attachment to a requesting user as a binary stream.

```javascript
/ **
* Sample Scripted REST Resource that returns a stream of
binary representing an attachment
* This sample uses ServiceNow JavaScript API
GlideSysAttachmentInputStream to get an attachment as a stream then
* users WriteStream to stream the response.
*/
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
  var hdrs = {},
      attachment_sys_id = '1852fd52471321009db4b5b08b9a71a9';

  hdrs['Content-Type'] = 'image/jpeg';
  response.setStatus(200);
  response.setHeaders(hdrs);

  var writer = response.getOutputStream();
  var attachmentStream = new GlideSysAttachmentInputStream(attachment_sys_id);
  writer.writeStream(attachmentStream);
})(request, response);
```
A request to this resource returns the following response.

```plaintext
// sample response
/*
HTTP/1.1 200 OK
Set-Cookie: glide_session_store=SYSTEM; Expires=Fri, 30-Oct-2015 21:57:00 GMT; Path=/; HttpOnly
Content-Type: image/jpeg
Transfer-Encoding: chunked
Date: Fri, 30 Oct 2015 21:26:59 GMT
Connection: close
Server: ServiceNow

<binary response body excluded from this sample>
*/
```

**SOAP web service**

The SOAP Web Services provided by ServiceNow are WS-I compliant, as outlined in the WS-I Basic Profile 1.0.

**Concepts and Terminology**

- **Provider** - publishes web service for clients to invoke (consume)
- **Consumer** - invokes / consumes published web service
- **Standards**
  - **WSDL**
    - Web Service Description Language
    - XML document describing functions, arguments, data schema, and endpoint (where / how to invoke the service, URL)
    - WSDL only necessary when generating SOAP envelope programmatically
  - **SOAP**
    - Simple Object Access Protocol
    - XML document usually HTTP posted to web service endpoint described in WSDL
    - SOAP:Envelope / SOAP:Header / SOAP:Body
  - **HTTP**
    - Hyper-Text Transfer Protocol
    - POST vs GET - Web Service is POSTed
    - XML vs. Form POST - Web Service is XML

**Web Service Provider**

ServiceNow publishes its underlying table structures and associated data with the following Web Service methods:

- **Direct Web Services**: Use a URL query to request a ServiceNow table's WSDL.
Web Service Import Sets: Use import tables and transform maps to automate Web Service requests to ServiceNow tables.

Scripted Web Services: Use custom JavaScript to execute Web Service requests.

**Note:** SOAP messages are sent with the assumption that the recipient is XML compliant. No encoding is applied to the SOAP message.

**SOAP direct web service API functions**

The standard SOAP API is a set of small, globally defined functions that can be performed on a targeted resource.

The targeted resource (or table) is defined in the URL by the format `https://<instance name>.service-now.com/<table name>.do`.

<tr>
<td>insertMultiple</td>
<td>Creates multiple new records for the table targeted in the URL. To enable multiple inserts, activate the <strong>Web Service Insert Multiple Plugin</strong>.</td>
</tr>
<tr>
<td>update</td>
<td>Updates an existing record in the targeted table in the URL, identified by the mandatory <code>sys_id</code> field.</td>
</tr>
<tr>
<td>deleteRecord</td>
<td>Deletes a record from the targeted table by supplying its <code>sys_id</code>.</td>
</tr>
<tr>
<td>deleteMultiple</td>
<td>Delete multiple records from the targeted table by example values.</td>
</tr>
</tbody>
</table>

---

*Data Retrieval API*

Data Retrieval API method summaries and descriptions.
### Table 1068: Data Retrieval API

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getKeys</td>
<td>Query the targeted table by example values and return a comma delimited <code>sys_id</code> list.</td>
</tr>
<tr>
<td>getRecords</td>
<td>Query the targeted table by example values and return all matching records and their fields.</td>
</tr>
<tr>
<td>get</td>
<td>Query a single record from the targeted table by <code>sys_id</code> and return the record and its fields.</td>
</tr>
<tr>
<td>aggregate</td>
<td>Query using and aggregate functions SUM, COUNT MIN, MAX and AVG. To enable the aggregate functions, activate the <a href="http://www.service-now.com/incident">Aggregate Web Service Plugin</a>.</td>
</tr>
</tbody>
</table>

**getKeys**

Query the targeted table by example values and return a comma delimited `sys_id` list.

**Input fields**

Any field value in the targeted table.

**Output fields**

A SOAP response element `sys_id` that contains a comma delimited list of `sys_id` values.

**Sample SOAP messages**

**Sample SOAP request**

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <inc:getKeys>
      <category>hardware</category>
    </inc:getKeys>
  </soapenv:Body>
</soapenv:Envelope>
```

**Sample SOAP response**

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <getKeysResponse>
    </getKeysResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
Language-specific sample messages

For language-specific `getKeys` samples, refer to the following topics:

- **Perl SOAP::Lite**
- **Java Apache Axis2**
- **Python**

**getRecords**

Query the targeted table by example values and return all matching records and their fields.

**Input fields**

Any field value in the targeted table.

**Output fields**

The `getRecordResponse` element may contain one or more `getRecordsResult` elements that encapsulate elements representing the field values of records matching the query.

**Sample SOAP messages**

**Sample SOAP request**

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <inc:getRecords>
      <number>INC0000002</number>
    </inc:getRecords>
  </soapenv:Body>
</soapenv:Envelope>
```

**Sample SOAP request using an encoded query to filter where incident number is INC00000001 or INC00000002**

```xml
  <soapenv:Header/>
  <soapenv:Body>
  </soapenv:Body>
</soapenv:Envelope>
```
Sample SOAP response that contains 1 record

```
  <soapenv:Header/>
  <soapenv:Body>
    <getRecordsResponse>
      <getRecordsResult>
        <caller_id>5137153cc611227c000b9d1bd8cd2007</caller_id>
        <caller_id.email>david.loo@service-now.com</caller_id.email>
        <closed_at/>
        <number>INC0000002</number>
        <opened_at>2009-12-14 23:07:12</opened_at>
        <short_description>Can't get to network file shares</short_description>
      </getRecordsResult>
    </getRecordsResponse>
  </soapenv:Body>
</soapenv:Envelope>
```

Sample SOAP response that contains more than 1 record

```
  <soapenv:Header/>
  <soapenv:Body>
    <getRecordsResponse>
      <getRecordsResult>
        <caller_id>5137153cc611227c000bbd1bd8cd2006</caller_id>
        <caller_id.email>rick.berzle@yourcompany.com</caller_id.email>

        <opened_at>2009-12-10 22:53:02</opened_at>
      </getRecordsResult>
    </getRecordsResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
Language-specific sample messages

For language-specific getRecords samples, refer to the following topics:

- Perl SOAP::Lite
- Java Apache Axis2
- Python

get

Query a single record from the targeted table by sys_id and return the record and its fields.

Input fields

An element <sys_id> identifying the sys_id of the record to be retrieved.

Output fields

A getResponse element encapsulating all field values for the record retrieved.

Sample SOAP messages

Sample SOAP request

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <inc:get>
      <sys_id>46e18c0fa9fe19810066a0083f76bd56</sys_id>
    </inc:get>
  </soapenv:Body>
</soapenv:Envelope>
```

The resulting response of a get function call looks like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <getResponse xmlns="http://www.service-now.com/incident">
      <active>1</active>
    </getResponse>
  </soap:Body>
</soap:Envelope>
```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <getResponse>
      <number>INC10055</number>
      <opened_at>2007-09-18 00:32:09</opened_at>
      <opened_by>46bac3d6a9fe1981005f299d979b8869</opened_by>
      <priority>0</priority>

      <priority>0</priority>
      <reassignment_count>0</reassignment_count>
      <severity>0</severity>
    </getResponse>
  </soap:Body>
</soap:Envelope>

Language-specific sample messages

For language-specific get samples, refer to the following topics:

Perl SOAP::Lite
Java Apache Axis2
Python

aggregate
Query a table using an aggregate function including SUM, COUNT, MIN, MAX, and AVG.

**Note:** Functionality described here requires the Aggregate Web Service plugin.

Input fields

Any element of the target table. In addition, one or more of the aggregate functions (SUM, COUNT, MIN, MAX, and AVG).

A GROUP BY and a HAVING clause may also be added.

Output fields

An aggregateResponse element encapsulating all field values for the record retrieved.
Sample SOAP messages

Sample SOAP request using COUNT aggregate function.

```xml
<?xml version="1.0" encoding="UTF-8"?>
encoding/"
    xmlns:SOAP-ENV="http://schemas.xmlsoap.org/
soap/envelope/"
 xmlns:m="http://www.service-now.com"
 xmlns:tns="http://www.service-now.com/map"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
SOAP-ENV:encodingStyle="http://
schemas.xmlsoap.org/soap/encoding/">
<SOAP-ENV:Body>
<aggregate>
<COUNT>number</COUNT>
<active>true</active>
</aggregate>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

The resulting response of a COUNT aggregate function call looks like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
soap/envelope/"
    xmlns:SOAP-ENC="http://schemas.xmlsoap.org/
soap/encoding/"
 xmlns:m="http://www.service-now.com"
 xmlns:tns="http://www.service-now.com/map"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
SOAP-ENV:encodingStyle="http://
schemas.xmlsoap.org/soap/encoding/">
<SOAP-ENV:Body>
<aggregateResponse>
<aggregateResult>
<avg>2.7200</avg>
</aggregateResult>
</aggregateResponse>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Sample SOAP request using AVG aggregate function with a GROUP BY clause.

```xml
<?xml version="1.0" encoding="UTF-8"?>
soap/envelope/"
    xmlns:SOAP-ENC="http://schemas.xmlsoap.org/
soap/encoding/"
 xmlns:m="http://www.service-now.com"
 xmlns:tns="http://www.service-now.com/map"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
SOAP-ENV:encodingStyle="http://
schemas.xmlsoap.org/soap/encoding/">
<SOAP-ENV:Body>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
The resulting response of a AVG aggregate function call with a GROUP BY clause looks like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
  xmlns:m="http://www.service-now.com"
  xmlns:tns="http://www.service-now.com/map"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
  <SOAP-ENV:Body>
    <aggregateResponse>
      <aggregateResult>
        <avg>1.0000</avg>
        <category>database</category>
      </aggregateResult>
      <aggregateResult>
        <avg>3.0000</avg>
        <category>hardware</category>
      </aggregateResult>
      <aggregateResult>
        <avg>3.0000</avg>
        <category>inquiry</category>
      </aggregateResult>
      <aggregateResult>
        <avg>2.0000</avg>
        <category>network</category>
      </aggregateResult>
      <aggregateResult>
        <avg>2.6923</avg>
        <category>software</category>
      </aggregateResult>
    </aggregateResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
Sample SOAP request using an encoded query to filter the aggregate:

```xml
<?xml version="1.0" encoding="UTF-8"?>
xmlns:m="http://www.service-now.com"
xmlns:tns="http://www.service-now.com/map"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
  <SOAP-ENV:Body>
    <aggregate>
      <COUNT>number</COUNT>
      <active>true</active>
      <__encoded_query>number=INC0000001^ORnumber=INC0000002</__encoded_query>
    </aggregate>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Sample aggregate request using HAVING to narrow the results.

HAVING takes four fields. Each field is delimited by "^": the aggregate type, the field of the aggregate, the operation type, and the value to compare.

More than one HAVING can be added to the request, so you can use HAVING expressions, but there is no support for OR.

```xml
<?xml version="1.0" encoding="UTF-8"?>
xmlns:m="http://www.service-now.com"
xmlns:tns="http://www.service-now.com/map"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
  <SOAP-ENV:Body>
    <aggregate>
      <COUNT>sys_id</COUNT>
      <GROUP_BY>internal_type</GROUP_BY>
      <HAVING>COUNT^*^>^10</HAVING>
      <HAVING>COUNT^*^<^20</HAVING>
      <COUNT>sys_id</COUNT>
      <active>true</active>
    </aggregate>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
Table 1069: Data Modification API

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert</td>
<td>Creates a new record for the table targeted in the URL.</td>
</tr>
<tr>
<td>insertMultiple</td>
<td>Creates multiple new records for the table targeted in the URL. To enable multiple inserts, activate the Web Service Insert Multiple Plugin.</td>
</tr>
<tr>
<td>update</td>
<td>Updates an existing record in the targeted table in the URL, identified by the mandatory sys_id field.</td>
</tr>
<tr>
<td>deleteRecord</td>
<td>Deletes a record from the targeted table by supplying its sys_id.</td>
</tr>
<tr>
<td>deleteMultiple</td>
<td>Delete multiple records from the targeted table by example values.</td>
</tr>
</tbody>
</table>

**Insert**

Creates a new record for the table targeted in the URL.

**Input fields**

All fields from the targeted table, excluding system fields. Fields configured as mandatory in the System Dictionary are reflected in the WSDL with the attribute minOccurs=1.

**Output fields**

Table 1070: Insert method output fields

<table>
<thead>
<tr>
<th>Table type</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular</td>
<td>The sys_id field and the display value of the target table (table) are returned.</td>
</tr>
</tbody>
</table>
| Import set     | The sys_id of the import set row, the name of the transformed target table (table), the display_name for the transformed target table, the display_value of the transformed target row, and a status field, which can contain inserted, updated, or error.  

There can be an optional status_message field or an error_message field value when status=error.  
When an insert did not cause a target row to be transformed (skipped because a key value is not specified), the sys_id field will contain the sys_id of the import set row, rather than the targeted transform table. |
### Sample SOAP messages for a regular table

The following example shows an insert that specifies the short description only:

```xml
<?xml version="1.0" encoding="ISO-8859-1"?>
    xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
    xmlns:m="http://www.service-now.com"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
    <SOAP-ENV:Body>
        <insert xmlns="http://www.service-now.com">
            <short_description xsi:type="xsd:string">This is a test</short_description>
        </insert>
    </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

The resulting response looks like this:

```xml
<?xml version="1.0" encoding="ISO-8859-1"?>
    xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
    xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:m="http://www.service-now.com"
    xmlns:tns="http://www.service-now.com/incident"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <SOAP-ENV:Body>
        <insertResponse xmlns="http://www.service-now.com">
            <sys_id>6b06494fc611227d00b5f87caf618831</sys_id>
        </insertResponse>
    </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

### Language-specific sample messages

For language-specific `insert` samples, refer to the following topics:
insertMultiple
Creates multiple new records for the table targeted in the URL.

**Input fields**

The `insertMultiple` element may contain 1 or more record tags that contains all fields from the targeted table, excluding system fields. Limit the number of records inserted in a single operation to no more than 200. You can gradually increase this number with subsequent exports if the increase does not negatively impact instance performance.

**Output fields**

The `insertMultipleResponse` tag is followed by 1 or more record tags that contains:

**Table 1071: Insert method output fields**

<table>
<thead>
<tr>
<th>Table type</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular</td>
<td>The <code>sys_id</code> field and the display value of the target table (<code>table</code>) are returned.</td>
</tr>
<tr>
<td>Import set</td>
<td>The <code>sys_id</code> of the import set row, the name of the transformed target table (<code>table</code>), the <code>display_name</code> for the transformed target table, the <code>display_value</code> of the transformed target row, and a <code>status</code> field, which can contain <code>inserted</code>, <code>updated</code>, or <code>error</code>. There can be an optional <code>status_message</code> field or an <code>error_message</code> field value when <code>status=error</code>. When an insert did not cause a target row to be transformed (skipped because a key value is not specified), the <code>sys_id</code> field will contain the <code>sys_id</code> of the import set row, rather than the targeted transform table.</td>
</tr>
<tr>
<td>Import set with multiple transforms</td>
<td>The response from this type of insert will contain multiple sets of fields from the regular import set table insert wrapped in a <code>multiInsertResponse</code> parent element. Each set will contain a <code>map</code> field, showing which transform map created the response.</td>
</tr>
</tbody>
</table>

Sample SOAP messages for a regular table

The following example shows an insert that specifies the short description only:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
xmlns:inc="http://www.service-now.com/incident">
  <soapenv:Header/>
  <soapenv:Body>
    <inc:insertMultiple>
      <record>
        <short_description>this is test 1</short_description>
      </record>
      <record>
        <short_description>this is test 2</short_description>
      </record>
      <record>
        <short_description>this is test 3</short_description>
      </record>
    </inc:insertMultiple>
  </soapenv:Body>
</soapenv:Envelope>
```

The resulting response looks like this:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
xmlns:inc="http://www.service-now.com/incident">
  <soapenv:Header/>
  <soapenv:Body>
    <insertMultipleResponse>
      <insertResponse>
        <sys_id>168160ad4a36231200a89091281dc803</sys_id>
        <number>INC0055180</number>
      </insertResponse>
      <insertResponse>
        <sys_id>1681622e4a36231200a8909115e5c388</sys_id>
        <number>INC0055181</number>
      </insertResponse>
      <insertResponse>
        <sys_id>1681626e4a36231200a89091fa3c0aa8</sys_id>
        <number>INC0055182</number>
      </insertResponse>
    </insertMultipleResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
Sample SOAP messages for an import set table

The following example shows an insert that specifies the short description only:

```
  <soapenv:Header/>
  <soapenv:Body>
    <imp:insertMultiple>:</imp:insertMultiple>
      <imp:record>
        <imp:message>one</imp:message>
        <imp:uuid>a</imp:uuid>
      </imp:record>
      <imp:record>
        <imp:message>two</imp:message>
        <imp:uuid>b</imp:uuid>
      </imp:record>
      <imp:record>
        <imp:message>three</imp:message>
        <imp:uuid>c</imp:uuid>
      </imp:record>
    </imp:insertMultiple>
  </soapenv:Body>
</soapenv:Envelope>
```

The resulting response looks like this:

```
  <soapenv:Header/>
  <soapenv:Body>
    <insertMultipleResponse>
      <insertResponse>
        <sys_id>1296b3a0a0b5b73e966fbf9b7acde</sys_id>
        <table>incident</table>
        <display_name>number</display_name>
        <display_value>INC0010033</display_value>
        <status>ignored</status>
        <status_message>No field values changed</status_message>
      </insertResponse>
      <insertResponse>
        <sys_id>1296b48e0a0b5b62513bb5974a7d96</sys_id>
        <table>incident</table>
        <display_name>number</display_name>
        <display_value>INC0010034</display_value>
        <status>ignored</status>
        <status_message>No field values changed</status_message>
      </insertResponse>
      <insertResponse>
        <sys_id>1296b58b0a0b5b468f534659538b9a</sys_id>
        <table>incident</table>
        <display_name>number</display_name>
        <display_value>INC0010035</display_value>
        <status>ignored</status>
        <status_message>No field values changed</status_message>
      </insertResponse>
    </insertMultipleResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
update

Updates an existing record in the targeted table in the URL, identified by the mandatory **sys_id** field.

**Input fields**

All fields from the targeted table, excluding system fields, which will be used for updating the existing record. The **sys_id** field is used to locate the existing record.

**Output fields**

Returns the **sys_id** of the record that was updated.

**Sample SOAP messages**

**Sample SOAP request**

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <inc:update>
      <sys_id>46e18c0fa9fe19810066a0083f76bd56</sys_id>
      <short_description>this is updated</short_description>
    </inc:update>
  </soapenv:Body>
</soapenv:Envelope>
```

**Sample SOAP response**

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <updateResponse>
      <sys_id>46e18c0fa9fe19810066a0083f76bd56</sys_id>
    </updateResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
Language-specific sample messages

Perl SOAP::Lite
Java Apache Axis2
Microsoft .NET
Python

deleteRecord
Delete a record from the targeted table by supplying its sys_id.

Input fields

An element <sys_id> identifying the sys_id of the record to be retrieved.

Output fields

A <count> element within the deleteRecordResponse parent element indicating the number of records deleted, this will always equal to "1" for deleteRecord.

Sample SOAP messages

Sample SOAP request

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <inc:deleteRecord>
      <sys_id>46e18c0fa9fe19810066a0083f76bd56</sys_id>
    </inc:deleteRecord>
  </soapenv:Body>
</soapenv:Envelope>
```

Sample SOAP response

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <deleteRecordResponse>
      <count>1</count>
    </deleteRecordResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
Language-specific sample messages

Perl SOAP::Lite
Java Apache Axis2
Microsoft .NET
Python

deleteMultiple
Delete multiple records from the targeted table by example values.

Input fields

All fields from the targeted table, including system fields, are used in query-by-example (QBE) fashion to locate records to be deleted. Query example fields can have special prefixes to constrain the search function.

Output fields

A <count> element within the deleteRecordResponse parent element indicating the number of records deleted.

Sample SOAP messages

Sample SOAP request

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <inc:deleteMultiple>
      <category>hardware</category>
    </inc:deleteMultiple>
  </soapenv:Body>
</soapenv:Envelope>
```

Sample SOAP response

```xml
  <soapenv:Header/>
  <soapenv:Body>
    <deleteMultipleResponse>
      <count>6</count>
    </deleteMultipleResponse>
  </soapenv:Body>
</soapenv:Envelope>
```

Python

WSDL

All ServiceNow tables and import sets dynamically generate WSDL XML documents that describe its table schema and available operations.

You can get a WSDL format by issuing a URL targeting a ServiceNow table with the WSDL parameter, for example:

https://myinstance.service-now.com/incident.do?WSDL

All dynamically generated and served ServiceNow WSDL accessible via HTTP is available for use under the terms defined in the Open Source Initiative OSI - Apache License, Version 2.0 license agreement.

Apache License, Version 2.0

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that
is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License.

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution.

You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

1. You must give any other recipients of the Work or Derivative Works a copy of this License; and
2. You must cause any modified files to carry prominent notices stating that You changed the files; and
3. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

4. If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions.

Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks.

This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty.

Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability.

In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability.

While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

Direct web services

A direct web service is available for any table in the system provided the correct access control is setup.

The supported format of the incoming message is document style literal XML SOAP documents (Document/Literal). To retrieve the direct web service WSDL description and XML schema, point to the relative URL of <tablename>.do?WSDL. For example, to retrieve the WSDL for the Incident table on the online demo system, use the following URL:

https://<instance name>.service-now.com/incident.do?WSDL

Using forms to limit or extend the query response

On occasion, there is a need to limit the number of field values being returned from a SOAP query (get or getRecords) invocation.

Specifying a form view has the effects of:

1. limiting the response elements to contain only the fields on the view
2. specifying reference record field values from referenced fields eg. caller_id.email, this will cause the value of the caller’s email to be returned in the SOAP response

To enable form views for SOAP queries, you may configure the property com.glide.soap.view to be the name of the view you wish to use for all SOAP query response (the default is soap_response). You may also specify the view name as a URL parameter sysparm_view=<view name> when making the SOAP call, for example:

https://<instance name>.service-now.com/incident.do?SOAP&sysparm_view=ess

If a specified view name does not exist, the default behavior is to respond with all fields.

Direct web services extended query parameters

The following parameters, when specified as elements of input parameters to SOAP query functions such as get, getKeys, and getRecords, has the additional behavior of filtering and modifying the results that are returned.

Note: Extended query element names are preceded by two underscore characters.
Table 1072:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>__encoded_query</td>
<td>Specify an encoded query string to be used in filtering the returned results. The encoded query string format is similar to the value that may be specified in <code>asysparm_query</code> URL parameter. You may refer to the encoded query building example in the RSS feed generator examples.</td>
<td><code>&lt;__encoded_query&gt;active=true^category='hardware'&lt;/__encoded_query&gt;</code></td>
</tr>
<tr>
<td>__order_by</td>
<td>Instruct the returned results to be ordered by the specified field</td>
<td><code>&lt;__order_by&gt;prioriy&lt;/__order_by&gt;</code></td>
</tr>
<tr>
<td>__order_by_desc</td>
<td>Instruct the returned results to be ordered by the specified field, in descending order</td>
<td><code>&lt;__order_by_desc&gt;opened_date&lt;/__order_by_desc&gt;</code></td>
</tr>
<tr>
<td>__exclude_columns</td>
<td>Specify a list of comma delimited field names to exclude from the result set</td>
<td><code>&lt;__exclude_columns&gt;sys_created_on, __exclude_columns&gt;</code></td>
</tr>
<tr>
<td>__limit</td>
<td>Limit the number of records that are returned</td>
<td><code>&lt;__limit&gt;100&lt;/__limit&gt;</code></td>
</tr>
<tr>
<td>__first_row</td>
<td>Instruct the results to be offset by this number of records from the beginning of the set. When used with __last_row has the effect of querying for a window of results. The results are inclusive of the first row number.</td>
<td><code>&lt;__first_row&gt;250&lt;/__first_row&gt;</code></td>
</tr>
<tr>
<td>__last_row</td>
<td>Instruct the results to be limited by this number of records from the beginning of the set, or the __start_row value when specified. When used with __first_row has the effect of querying for a window of results. The results are less than the last row number, and does not include the last row.</td>
<td><code>&lt;__last_row&gt;500&lt;/__last_row&gt;</code></td>
</tr>
<tr>
<td>__use_view</td>
<td>Specify a Form view by name, to be used for limiting and expanding the results returned. When the form view contains deep referenced fields eg. caller_id.email, this field will be returned in the result as well</td>
<td><code>&lt;__use_view&gt;soap_view&lt;/__use_view&gt;</code></td>
</tr>
</tbody>
</table>
Return display value for reference variables

When you query a record using a get or getRecords function the instance returns all fields associated with that record. The fields are often reference fields that contain a sys_id for a record on another table.

Use one of these options if you want the display value for the field to be returned instead of the sys_id:

1. Add the property glide.soap.return_displayValue to your system properties, and every SOAP request will return a display value for a reference field.

2. Add the parameter displayvalue=true to your SOAP request URL, and SOAP requests with that parameter will return a display value for a reference field as a string, instead of the sys_id. The SOAP URL would look as follows: https://<instance name>.service-now.com/incident.do?displayvalue=true&SOAP

3. Add the parameter displayvalue=all to your SOAP request URL, and SOAP requests with that parameter will return a display value for a reference field, in addition to the sys_id. The response element name for the display value field will be prefixed with dv_ such as dv_caller_id.

Retrieving journal entries using direct web services

To get the contents of a journal field, make a second soap request against the sys_journal_field table to pull the appropriate journal records back for the record in question.

The URL for the WSDL would be in the following format

https://instance-name.service-now.com/sys_journal_field.do?WSDL

To retrieve the journal entries, you will first need to query the incident for its sys_id value and then supply it as the element_id value in a getRecords call. To sepcify records only for the "comments" field, specify the value "comments" for the element field. For example, a SOAP request would look like the following.

   >
   <soapenv:Header />
   <soapenv:Body>
   <sys:getRecords>
   <element>comments</element>
   <element_id>9d385017c611228701d22104cc95c371</element_id>
   </sys:getRecords>
   </soapenv:Body>
   </soapenv:Envelope>

Retrieving choice fields using direct web services

To retrieve or set choice fields, use the choice Value not the Label.

For example, if you want to retrieve a list of all closed incidents use the numerical value for Closed, which is 7 by default.

<state>7</state>

To see a list of choice values:

1. Navigate to the form containing the choice field. For example, navigate to Incident > Open and select an incident.

2. Right-click the choice value field and select Configure Dictionary (Personalize Dictionary in versions prior to Fuji). For example, configure the dictionary for the State field.

3. From the Choices related list, note the value for the label you want to query. For example, note that the Closed choice has a value of 7.
Persisting an HTTP session across all SOAP calls

In circumstances when a SOAP client makes many calls in a short amount of time, you may want to re-use a single HTTP session for all SOAP calls.

Each SOAP call creates a new user session that persists until it expires. To create a single user session and re-use it for all inbound SOAP calls, develop your SOAP client following these guidelines:

- Use a module like HTTP::Cookies to create a "cookie jar".
- Save the cookies returned by ServiceNow after each request (handled automatically by HTTP::Cookies).
- Re-send the cookies in the cookie jar with each subsequent request.

**Note:** If you have enabled the session rotation high security setting, it will immediately invalidate the JSESSIONID returned from the server with the first response header. The second response includes a new JSESSIONID.
In Perl, you can automatically save and send cookies with the following code:

```perl
use HTTP::Cookies;

# We want to store and re-send cookies
my $cookies = HTTP::Cookies->new(ignore_discard => 1);

my $soap = SOAP::Lite

# Set the cookie jar
$soap->transport->cookie_jar($cookies);
```

**Compatibility for clients generated from WSDL**

Review these guidelines for service namespaces.

### Specifying a Unique Namespace for each Table

The property `glide.wsdl.definition.use_unique_namespace` ensures that each table's Direct Web Service WSDL has a unique targetNamespace attribute. This property is true by default, which requires a table's Direct Web Service WSDL to use a targetNamespace value of `http://www.service-now.com/<table name>`. When false (or when the property is not present), all tables use the same targetNamespace value of `http://www.service-now.com`. Since all tables also share the same operation names, a Web Service client attempting to consume more than one ServiceNow Web Service would be unable to differentiate between requests between multiple tables. Using a unique targetNamespace value allows Web Services clients to distinguish requests between multiple tables.

For example, the Direct Web Service WSDL for the incident table uses this targetNamespace value.

```xml
<wSDL:definitions xmlns:xsd= "http://www.w3.org/2001/XMLSchema"
    xmlns:soap = "http://schemas.xmlsoap.org/soap/encoding/"
    xmlns:soapenc = "http://schemas.xmlsoap.org/soap/encoding/"
    xmlns:wsdl = "http://schemas.xmlsoap.org/wsdl/">
    <wsdl:types>
        <xsd:schema elementFormDefault = "unqualified"
            targetNamespace = "http://www.service-now.com/incident"
        >
        </xsd:schema>
    </wsdl:types>
</wSDL:definitions>
```

### Setting Namespace Requirements

ServiceNow's WSDL schema by default declares an attribute of `elementFormDefault="unqualified"`. This attribute indicates whether or not locally declared elements must be qualified by the target namespace in an instance document. If the value of this attribute is 'unqualified', then locally declared elements should not be qualified by the target namespace. If the value of this attribute is 'qualified', then locally declared elements must be qualified by the target namespace.

However, this is incompatible with the way clients generated from WSDL (.NET, Axis2, webMethods, etc.) process the embedded schema, it removes the schema namespace as a result, making the web service response unparseable.

To overcome this compatibility issue, a boolean property called `glide.wsdl.schema.UnqualifiedElementFormDefault` is introduced. This property has the value of `true` by default, setting it to `false` will make clients generated from WSDL able to parse the return value of the web service invocation. You can modify this property using the Web Services properties page at **System Properties > Web Services**.
Allowing Duplicate Service Names

By default, service names from dynamically generated WSDL are unique and have the following format:

\[\text{ServiceNow}_<\text{table name}>\]

To allow duplicate service names, administrators can set the glide.wsdl.unique_service_name property to \textit{false}. Create the property if it does not exist.

**Direct web services Perl example - querying all incidents 5 records at a time**

This example query queries all incidents, orders by the number field, and retrieves the first 5 records.

You can easily extend this example to retrieve a set of predefined records, \textit{n} number of records each query, simulating a \textit{windowed} querying client. Using a \textit{windowed} query mechanisms overcomes the default limitation of only getting a maximum of 250 records per query.

```perl
#!/usr/bin/perl -w
use SOAP::Lite; # basic auth using the ITIL user
sub SOAP::Transport::HTTP::Client::get_basic_credentials { return 'itil' => 'itil'; }
# specify the endpoint to connect
my $soap = SOAP::Lite
  -> proxy('https://<instance name>.service-now.com/incident.do?SOAP');
my $method = SOAP::Data->name('getRecords')
  ->attr({xmlns => 'http://www.service-now.com/'});
# get all incidents with a window of 5, starting at row 0, and less than row 5 (total of 5 records)
my @params = ( SOAP::Data->name(__first_row => '0') );
push(@params, SOAP::Data->name(__last_row => '4') );
# the last row number can also be taken as the 'limit' offset by the starting first row
# order by the number field
push(@params, SOAP::Data->name(__order_by => 'number') );
my $result = $soap->call($method => @params);
print_results($result);

sub print_results { my ($result) = @_; my %keyHash = %{ $result->body->{'getRecordsResponse'} }; my $i = 0;
my $size = @{$keyHash{'getRecordsResult'}};
for ($i=0; $i<$size; $i++) {
    my %record = %{$keyHash{'getRecordsResult'}[$i]};
    print "------------------------------ $i ----------------------------
";
    foreach my $kk (keys %record) {
        # print only the number of the incident
        if ($kk eq "number") {
            print "$kk=$record{$kk}\n";
        }
    }
}
```

© 2017 ServiceNow. All rights reserved. 3281
SOAP web service import sets

Web Service Import Sets compliment Direct Web Services and Scripted Web Services to provide a web service interface to Import Sets tables.

This type of web service will transform the incoming data synchronously based on the associated Transform Maps by default.

SOAP web services security

ServiceNow enforces web service security using a combination of basic authentication challenge/response over the HTTP protocol and system level access control using contextual security.

Administrators can control what system resources web services users can access by granting them one of the SOAP roles.

**SOAP roles**

To use SOAP web services, you must have the appropriate role for the operation you want to perform.

Additionally, you must have any other roles required to access the target tables.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>soap</td>
<td>Can perform all SOAP operations.</td>
</tr>
<tr>
<td>soap_create</td>
<td>Can insert new records.</td>
</tr>
<tr>
<td>soap_delete</td>
<td>Can delete existing records.</td>
</tr>
<tr>
<td>soap_ecc</td>
<td>Can query, insert, and delete records on the Queues [ecc_queue] table.</td>
</tr>
<tr>
<td>soap_query</td>
<td>Can query record information.</td>
</tr>
<tr>
<td>soap_query_update</td>
<td>Can query record information and update records.</td>
</tr>
<tr>
<td>soap_script</td>
<td>Can run scripts that specify a .do endpoint. This role is required for running Scripted Web Services.</td>
</tr>
<tr>
<td>soap_update</td>
<td>Can update records.</td>
</tr>
<tr>
<td>import_admin</td>
<td>Can manage all aspects of Import Sets and imports. Required for access to the sys_import_set_row table.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>import_transformer</td>
<td>Can manage Import Set Transform Maps and run transforms. Required for access to the sys_import_set_row table.</td>
</tr>
</tbody>
</table>

Default web services role requirements

By default, a set of processor access control list (ACL) rules require users to have the soap role in order to make WSDL, XSD, and XML Schema requests.

If you want change these role requirements, you can deactivate the ACL rules.

Figure 807: Web service processor ACLs

Configure SOAP security

Administrators can configure web service security for inbound SOAP requests made to the ServiceNow instance.

Role required: admin

You can also set up web service security to use different certificates for different web service clients. By enabling web service security, you can prevent man-in-the-middle attacks.

**Note:** After you configure a WS-security profile or a security policy, validation is performed on all incoming SOAP requests, including from the MID Server or ODBC driver. Disable validation for these types of requests by marking the service accounts as internal integration users.

1. **Upload a certificate to the instance.**
2. **Create a WS-security profile.**
3. **Create a security policy.**
   Security policies define which WS-security profiles are used to evaluate a particular web service request. If no policy is defined, all WS-security profiles are used to evaluate all requests.
4. **Set the value of the property glide.soap.default_security_policy to the name of the new security policy.**

**Basic authentication for web services**

Enforce basic authentication for web services to require a username and password with a web service request.
To enforce basic authentication for the user associated with the instance for each WSDL or SOAP message request, administrators can set the property `glide.basicauth.required` to `true`.

When enabled, each WSDL and SOAP request must contain an "Authorization" header as specified in the Basic Authentication protocol.

Because web services requests are non-interactive, ServiceNow always requires the Authorization header during a request.

**Note:** Basic Authentication refers to local credentials or LDAP authentication, if configured.

Supplying basic authentication information with every request (whether or not it is required) has the added advantage that ServiceNow can associate web service invocations with the user supplied in the basic authentication credentials. For example, when creating an Incident record, the journal fields lists the user ID contained in the basic authentication header instead of the default Guest user.

### Basic authentication code samples

Samples of basic authentication code for several programming languages and versions.

#### Perl and the SOAP::Lite libraries

To supply basic authentication when using Perl and the SOAP::Lite libraries, you can implement the following function:

```perl
sub SOAP::Transport::HTTP::Client::get_basic_credentials {
    return 'user_name' => 'password';
}
```

#### C# .NET VS 2005 or older

When using C# .NET VS 2005 or older, you can take advantage of the Credentials object. For example:

```csharp

service.ServiceNow proxy = new service.ServiceNow();
service.get getService = newservice.get();
getService.getResponse getServiceResponse = new service.getResponse();

try
{
    proxy.Credentials = cred;
    getService.sys_id = "bf522c350a0a140701972dbf876f1610";
    getServiceResponse = proxy.get(getService);
    catch (Exception ex) { }
```

#### C# .NET VS 2008

When using C# .NET VS 2008, you can take advantage of the ClientCredentials object. For example:

```csharp
Demo_Incident.ServiceNowSoapClient client = new Test08WebService.Demo_Incident.ServiceNowSoapClient();
client.ClientCredentials.UserName.UserName = "admin";
client.ClientCredentials.UserName.Password = "admin";
```
Then in your app.config file look for the following and change "None" to "Basic":

```xml
<transport clientCredentialType="None" proxyCredentialType="None" realm="" />
```

**VB .NET**

When using VB .NET taking advantage of the Credentials object would look like the following:

```vb
Sub Main()
    Dim cred As New System.Net.NetworkCredential("user_name", "password")
    Dim proxy As New VB_Democm.incident.ServiceNow
    Dim getIncident As New VB_Democm.incident.get
    Dim getResponse As New VB_Democm.incident.getResponse
    proxy.Credentials = cred
    getIncident.sys_id = "[your sysID here]"
    getResponse = proxy.get(getIncident)
End Sub
```

The resulting response when Basic Authentication is turned on and no credentials are supplied looks like this:

```html
<html>
<head>
<title>Apache Tomcat/5.0.28 - Error report</title>
<style>   <!--
H1 {font-family:Tahoma,Arial,sans-serif;color:white;background-color:#525D76;font-size:22px;}
H2 {font-family:Tahoma,Arial,sans-serif;color:white;background-color:#525D76;font-size:16px;}
H3 {font-family:Tahoma,Arial,sans-serif;color:white;background-color:#525D76;font-size:14px;}
BODY {font-family:Tahoma,Arial,sans-serif;color:background-color:white;}
B {font-family:Tahoma,Arial,sans-serif;color:background-color:black;}
P {font-family:Tahoma,Arial,sans-serif;background:white;color:black;font-size:12px;}
A {color: black;}
A.name {color: black;}
HR {color: #525D76;}
-->
</style>
</head>
<body>
<h1>HTTP Status 401 -</h1>
<p>HTTP Status 401 -</p>
<p>This request requires HTTP authentication (</p>
</body>
</html>
```
WS-Security
Validate signed web services requests with WS-security.

ServiceNow supports WS-Security 1.1 to validate signed web services requests. Enable WS-Security to:

• Verify SOAP messages originate from a known sender
• Verify SOAP messages have not been altered in transit

Note: ServiceNow does not use WS-Security as an encryption mechanism. ServiceNow relies on the HTTPS protocol to encrypt all communications.

WS-Security is intended to work in conjunction with basic authentication. When ServiceNow receives a SOAP message, it reviews the basic authentication header to determine if the SOAP user has rights to the instance. It reviews the WS-Security header to determine the validity of the incoming message. Requests affected by attacks such as a man-in-the-middle attack have an invalid WS-Security header and are blocked.

Enable WS-Security verification
Administrators can enable Web Services Security (WSS) verification from the Web Services system properties.
Role required: web_service_admin or admin

1. Navigate to System Web Services > Properties.
2. For Require WS-Security header verification for all incoming SOAP requests, select Yes.
3. Click Save.
4. Create a WS-security profile.
5. Update the user record for the MID Server and ODBC driver to mark these users as internal integration users.
6. Download and install the latest MID Server and ODBC driver.
7. To validate SOAP request signatures, upload the remote web service's certificate as a JKS and create the web service's WSS Username Token Profile.

Note: Because ServiceNow's WSS implementation does not verify the CA certificate, you do not need to upload the web service's CA certificate.

Mark service accounts as internal integration users
Allow internal integration communications to bypass the WSS authentication requirement by marking their user accounts as internal integration users.
Role required: admin

Enabling WSS requires authentication for all SOAP requests including internal integration communications such as the MID Server, ODBC Driver, Remote Update Sets, and high availability cloning. SOAP requests for these internal integration communications cannot implement WSS due to technical implications. If your instance uses these SOAP interfaces, you can allow them to bypass the WSS authentication requirement by marking their user accounts as internal integration users.

1. Navigate to User Administration > Users.
2. Select the user account for the MID Server or ODBC Driver.
3. Configure the form to add the Internal Integration User field.
4. Select the **Internal Integration User** check box.
5. Click **Update**.

WS-Security profiles
A WS-security profile determines how ServiceNow authenticates a web services message when WS-security is enabled.

ServiceNow can authenticate web services requests with the following mechanisms:

<table>
<thead>
<tr>
<th>Authentication mechanism</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate verification</td>
<td>ServiceNow authenticates the web services request by verifying the certificate associated with the request. Verifying the request's certificate requires uploading the requestor's certificate and certificate authority.</td>
</tr>
<tr>
<td>User credentials</td>
<td>ServiceNow authenticates the Web Services request by verifying the user credentials associated with the request. ServiceNow can either verify that the request's credentials match an existing ServiceNow user's credentials or that the request's credentials match a username and password provided in the profile record.</td>
</tr>
</tbody>
</table>

Specify the authentication mechanism you want to use when you create a new WS-security profile.

The WS-Security Profiles module lists the WS-security profiles that are currently in effect.

Create a new WS-Security profile
Create a new WS Security profile to define how ServiceNow authenticates a Web Services message when WS-Security is enabled.

Role required: web_service_admin or admin

1. Navigate to **System Web Services > WS Security Profiles**.
2. Click **New**.
3. Fill in the WS-Security Profile form (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the security profile.</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>X509</strong> to verify the request's certificate. Select <strong>Username</strong> to verify the request's user credentials.</td>
</tr>
<tr>
<td>Run as user</td>
<td>Select the ServiceNow user the instance will impersonate if authentication succeeds and the <strong>Bind Session</strong> field is selected. All web services requests will be attributed to this user. For example, if you select the <strong>System Administrator</strong> user then the instance treats all web services operations as being done by the system administrator. Make sure the user you select has appropriate SOAP privileges if you are using the glide.soap.strict_security high security setting. This field is only visible when the type is <strong>X509</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the instance checks security profiles. The instance checks all security profiles when processing an incoming SOAP request. If a request fails any security profile authentication requirement, the instance stops processing additional security profiles and fails the request.</td>
</tr>
<tr>
<td>Bind Session</td>
<td>Select this check box to have the instance impersonate the user listed in the <strong>Run as user</strong> field. You should only set this field for one profile at a time. If multiple profiles have this field selected, ServiceNow impersonates the user from the last successfully authenticated WS-Security profile. If no profile has this field selected, ServiceNow impersonates the user provided with the basic authentication headers or impersonates the default user (Guest).</td>
</tr>
<tr>
<td>X509 Certificate</td>
<td>Select the certificate record containing the certificate for web service requests. ServiceNow only validates the request signature. It automatically trusts the certificate's certificate authority (CA). This field is only visible when the type is <strong>X509</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Profile action</td>
<td>Select how you want the instance to authenticate the user credentials. Select <strong>Authenticate with user</strong> if you want the instance to authenticate the request based on an existing user record. The request’s credentials must match values in an existing user record. Select <strong>Specify user to authenticate</strong> if you want to list a user name and password combination that all web services requests must meet. The request's credentials must match the user name and password you list. This field is only visible when the type is <strong>Username</strong>.</td>
</tr>
<tr>
<td>User field to match UserName</td>
<td>Select the column from the User [sys_user] table containing the value you want match against the request's UserName. For example, if you select <strong>Email</strong> then the request UserName header must contain an email address matching an existing ServiceNow user. This field is only visible when the profile action is <strong>Authenticate with user</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name that all web services requests must contain. This field is only visible when the profile action is <strong>Username</strong>.</td>
</tr>
<tr>
<td>User password</td>
<td>Enter the password that all web services requests must contain. This field is only visible when the profile action is <strong>Username</strong>.</td>
</tr>
</tbody>
</table>

4. **Click Submit.**

**WSS X.509 Token Profile**

Use the X.509 framework for a WSS X.509 security profile.

An X.509 certificate is used to validate a public key that is used to sign the incoming SOAP message. It specifies a binding between a public key and a set of attributes that includes (at least) the following:

- subject name
Geneva    ServiceNow    ServiceNow Platform

- issuer name
- serial number
- validity interval

Use the **X.509 authentication framework** as defined by the *Web Services Security: SOAP Message Security specification*.

Upload the certificate and reference it in the **X509 Certificate** field. If this is a bound session, select the user to impersonate when the WS-Security authentication succeeds.

![WSS X.509 Security Profile](image)

**Figure 809: WSS X.509 Security Profile**

**WSS UsernameToken Profile**

When specifying the X.509 Token Profile, you can also supply a UsernameToken in the SOAP request.

A UsernameToken is used as a means of identifying the requestor by "username", and optionally using a password (or shared secret, or password equivalent) to authenticate that identity to ServiceNow.

There are two ways to authenticate a UsernameToken:

1. **Authenticate with existing ServiceNow user credentials.**
   
   ![Authenticate with existing ServiceNow user credentials](image)

   **Figure 810: Authenticate with existing ServiceNow user credentials**

   Use the username of the incoming SOAP request to look up a user in ServiceNow by the specified User field to match the UserName value. The password value in the incoming UsernameToken is used to authenticate the request. When the **Bind session** option is selected, the user that authenticates successfully will be used for the session.

2. **Authenticate with specified user credentials.**
Figure 811: Authenticate with specified user credentials

Authenticate using login credentials unrelated to users in the User table. When the Bind session option is selected, the user that is specified in the Run as user field will be used for the session.

Note: The UsernameToken Profile cannot be used independent of the X.509 Token Profile.

Example WS-Security SOAP envelope header

An example of a valid WS-Security SOAP envelope header.

```xml
<SOAP-ENV:Header>
      MIIEgzCCA2ugAwIBAgILAQAAAAABLOZQMtEwDQYJKoZIhvcNAQEFBQAwQDEXMBUGA1UEChMOQ3liZXJ0cnVzdCBJbmMxJTAjBgNVBAMTH1NlcnZpY2UtTm93IFBhcn3uZXIgRGV2ZwcG1lbnQwggEiMA0GCSqGSIb3DQEBAQUAA4IBDwAwggEKAoIBAQCvctcRiBz6kGnN9uyhtcSDNS1uCW6FgtnTbTDUvw2nG1NAy9iEvwTpSTG3eELOOFBCuLeYx5281n+cj72v+zCwi/rZcbEPj8oWLyVAOqJTHgrzhdjboVDM/zU8bvAXcw6foCUDFKkc64W7C4yHpBdfW4JT7FBGQ3LEudq80Up+TFETEvRE3jRgy9f92TKD7MN5vKzyhz2xZLOpIN5HJix19juNjMgLwugqTGO4yZSUcItc1jgCyU0+f0NXKgh0QRHeNpwcqWbbJvLBry9ysbo613UAYCQ09hrRnT7VaPvfiueUvulopap04Kei1iL8aMUAEUDtKfi1AbqRIIQ5AgMBAAGjgFFMIIBqTAfBgNVH

SOAP security policies

The Enhanced Web Service Provider - Common plugin adds the SOAP Security Policies module to the System Web Services application.

This module allows administrators to set the following security policies.

- Enable or disable signing SOAP requests when consuming an external web service
- Specify the authentication requirements SOAP requests must meet when communicating over WS-Security.

Activate the Enhanced Web Service Provider - Common plugin
Administrators can activate the Enhanced Web Service Provider - Common plugin to enable unsigned WS-Security requests and specify what authentication requirements SOAP requests have.

Role required: admin

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

3. Optional: If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.

Installed with the Enhanced Web Service Provider - Common plugin

The following components installed with the Enhanced Web Service Provider - Common plugin.

The Enhanced Web Service Provider - Common plugin installs the following components:

<table>
<thead>
<tr>
<th>Component Type</th>
<th>Component Installed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module</td>
<td>Web Services Security Profiles</td>
<td>The plugin adds this module to the System Web Services application.</td>
</tr>
<tr>
<td>System Property</td>
<td>glide.soap.default_security_policy</td>
<td>Specifies the default security policy to use when enforcing Web Services-Security (WSS) for inbound requests.</td>
</tr>
</tbody>
</table>

Certificates required for signed SOAP requests

In order to sign SOAP requests for WS-Security communications, ServiceNow requires the following certificates.

- The X.509 certificate from the requester
- The X.509 CA certificate of the certificate authority who signed the requester’s certificate

Create a new security policy

Administrators can specify which security profiles WS-Security communications must meet by creating a new security policy.

Role required: web_service_admin or admin

2. Click New.
3. Fill out the SOAP Security Policy form (see table).
Table 1077: SOAP Security Policy form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the security policy. Use this name to set the default security policy with the glide.soap.default_security_policy property.</td>
</tr>
<tr>
<td>Type</td>
<td>Select whether the SOAP security policy applies to inbound or outbound traffic.</td>
</tr>
<tr>
<td>Required to Sign SOAP Request</td>
<td>Select this checkbox to require signed SOAP requests. Clear the checkbox to allow unsigned SOAP requests. When enabled, the instance will produce an error for any SOAP request that does not include a valid signature. When disabled, the instance still verifies any signature included with a SOAP request.</td>
</tr>
<tr>
<td>Authenticate</td>
<td>Select if a SOAP request must authenticate against all security profiles or at least one security profile.</td>
</tr>
<tr>
<td>Security Profiles</td>
<td>Select the security profiles you want to apply to this SOAP security policy. You must select at least one security profile.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Specify requirement for signed SOAP requests

Use a SOAP security policy to specify whether the instance requires signed SOAP requests for all inbound SOAP traffic.

Role required: web_service_admin or admin

By default, all inbound SOAP traffic must be signed. Administrators may want to disable this policy and allow unsigned SOAP requests to ServiceNow web services.

1. Navigate to **System Web Services > SOAP Security Policies**.
2. Select the **Default Policy**.
3. Clear the **Required to Sign SOAP Request** check box (selected by default) to disable the requirement.
4. Click **Update**.

SOAP default security policy

Administrators can specify the SOAP security policy an instance uses with the system property glide.soap.default_security_policy.

The glide.soap.default_security_policy system property specifies the name of the SOAP security policy the instance uses when enforcing Web Services-Security (WSS) for inbound requests.
Table 1078: SOAP default security policy settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Default value</td>
<td>Default Security Policy</td>
</tr>
<tr>
<td>Location</td>
<td>Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

Set the SOAP default security policy
Set the SOAP default security policy.
Role required: web_service_admin or admin

1. Navigate to System Web Services > Properties.
2. In the Security Policy to enforce if WS-Security is enabled field, enter the default security policy to use when enforcing WS-security.
3. Click Save.

WS-Security error logging
The glide.processor.debug.SOAPProcessor system property allows error messages about WS-security to be displayed in the transaction log.

The system property glide.processor.debug.SOAPProcessor enables (true) or disables (false) debugging messages for SOAP processing such as certificate and keystore checks.

Table 1079: glide.processor.debug.SOAPProcessor fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Default value</td>
<td>false</td>
</tr>
<tr>
<td>Location</td>
<td>Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

WS-Security error messages
An instances produces one of the following error messages when it encounters an issue with a WS-security SOAP message.

Table 1080: WS-security error messages

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Security Policy Selected. Select an Inbound policy for Inbound Requests.</td>
<td>The default policy name is set to an outbound policy. Set the default policy name to an inbound security policy.</td>
</tr>
<tr>
<td>SOAP request not Signed. Policy requires signing.</td>
<td>The SOAP security policy requires signing and the inbound SOAP request is not signed. Either specify a different SOAP security policy or provide the SOAP request with a proper signature.</td>
</tr>
<tr>
<td>Error</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>No profiles to authenticate.</td>
<td>The selected Security policy either does not have any security profiles (X509 or UserNameToken) or the security profiles are inactive. Verify at least one security profile is active.</td>
</tr>
<tr>
<td>Unable to verify signed request.</td>
<td>The inbound SOAP request contains an invalid signature. The SOAP request changed after being signed.</td>
</tr>
<tr>
<td>Failed to extract principal(s) from request.</td>
<td>The SOAP request has either been tampered or was not well formed. ServiceNow cannot extract credentials to authenticate the request.</td>
</tr>
<tr>
<td>Failed to authenticate WS-security, unknown type.</td>
<td>The SOAP request contains an unsupported security profile. Resend the request with a supported security profile type: X509 or UsernameToken.</td>
</tr>
<tr>
<td>Failed to authenticate WS-security.</td>
<td>ServiceNow failed to authenticate against the provided profile credentials. Verify that the SOAP request is using the proper credentials.</td>
</tr>
</tbody>
</table>

**Strict security for web services**

Strict security for web services requires that users meet Contextual Security requirements to access instance resources.

By default, basic authentication for web services only determines whether a user is authorized to access the instance with a SOAP connection. Once authorized, any user can access any table published as a web service.

The system property **Enforce strict security on incoming SOAP requests** changes this behavior and requires that users meet Contextual Security requirements to access instance resources from web services.

With this property enabled, only users that have the proper SOAP role and also meet the Access control rules on page 2498 conditions for a given table and operation can perform that operation from a SOAP connection.

Enforce strict security for inbound SOAP

Strict security for web services requires that users meet Contextual Security requirements to access instance resources.

Role required: admin

**Note:** ServiceNow does not support digital certificates, digital signatures, or other digested token methods in SOAP web service calls.

To enforce strict security for web services connections:

1. Navigate to System Properties > Web Services.
2. Select Yes for Enforce strict security on incoming SOAP requests.
**Mutual authentication for web services**
ServiceNow supports mutual authentication for outbound web services.

*Mutual authentication* is not available for inbound web services.

**Overriding the SOAP endpoint**

The SOAP endpoint address where the SOAP message is posted is consistent with the endpoint of the WSDL.

In some cases, however, the WSDL may reference an incorrect endpoint URL. If this happens, it is necessary to over-ride the generated URL by creating the property `com.glide.soap_address_base_url` to contain the new URL. You may have to add the property manually as this is not an out-of-box property.

For instance, a generated SOAP endpoint may look like this:

```
https://instance.service-now.com/incident.do?SOAP
```

You can specify a property to define the endpoint such that it goes through a proxy by setting the property:

```
com.glide.soap_address_base_url = "https://myproxy.mycompany.com/service-now/"
```

This will result in the endpoint being generated to appear as:

```
https://myproxy.mycompany.com/service-now/incident.do?SOAP
```

**Enabling HTTP compression**

By default, the SOAP request is accepted un-compressed and the result of the request is returned un-compressed.

To enable HTTP compression using [gzip] when sending in your SOAP request, set the following HTTP header:

```
Content-Encoding: gzip
```

To receive the SOAP response compressed using [gzip] send in your SOAP request with the following HTTP header:

```
Accept-Encoding: gzip
```

**Debugging incoming SOAP envelope**

To capture incoming SOAP envelope XML in the system log, add the property `glide.processor.debug.SOAPProcessor` with a value of `true`. 
When enabled, this property adds the incoming SOAP envelope in the **Message** field of the system log (**System Logs > All**). Disable this debugging feature as soon as you are finished so that the log is not overwhelmed with excessive and unnecessary debugging information.

**Preventing empty elements in SOAP messages**

By default, an instance does not omit empty elements, elements with NULL or NIL values, from SOAP messages.

To prevent SOAP responses from containing empty elements, an administrator can create a system property called `glide.soap.omit_null_values` and set the value to **true**. This behavior is compliant with the WSDL as all elements in a SOAP message have a minOccurs=0 attribute and are therefore optional. In addition, this behavior prevents the instance from creating inefficient SOAP messages containing a large number of empty elements.

Set this property to **false** to allow SOAP messages to search for existing fields with empty values. For example, if an administrator wants to search for incidents with an empty **Assigned to** field from a SOAP message, then the SOAP message must be able to send an empty value for this field.

**Note:** Changing the value of this property may cause unintended actions in existing web service integrations. Administrators are strongly encouraged to carefully test the new behavior to ensure that existing integrations process empty elements as expected.

**Insert related records using SOAP**

Support is available for inserting hierarchical data into tables or web service import set tables. The hierarchical data in the Insert API is automatically mapped to related records of the targeted table.

Role required: admin

Create and set the property `glide.web_service.hierarchical` to **true**.

The client of the API can also override this value by invoking the SOAP web service with the URL parameter `hierarchical=true`.

For example, when a related list is created for the incident table called `u_custom_comments`:  

© 2017 ServiceNow. All rights reserved.  3299
Figure 813: Hierarchical Incident

And `u_comment_items` is created as a related list for `u_custom_comments`:
Figure 814: Hierarchical Custom Comments

**WSDL Schema with related records**

When a WSDL for the target Incident table is requested with an additional parameter of hierarchical=true, the WSDL schema for the Insert function will reflect available related records that may participate in the hierarchical data payload.

For example, the insert portion of the schema of the incident table, when requested with hierarchical=true displays its hierarchy as follows:

https://instance.service-now.com/incident.do?WSDL&hierarchical=true
<xsd:element name="insert">
  - <xsd:complexType>
    - <xsd:sequence>
      <xsd:element minOccurs="0" name="active" type="xsd:boolean"/>
      <xsd:element minOccurs="0" name="activity_due" type="xsd:string"/>
      <xsd:element minOccurs="0" name="approval" type="xsd:string"/>
      <xsd:element minOccurs="0" name="approval_history" type="xsd:string"/>

    </xsd:sequence>
  </xsd:complexType>
</xsd:element>

Figure 815: WSDL Schema

...
The WSDL above shows the incident table having a related table `u_custom_comments` that itself has a related table `u_comment_items`.

**Hierarchical SOAP Message**
When the SOAP message is constructed from the hierarchical web service described by the WSDL and invoked, it will create the incident, `u_custom_comments`, and `u_comment_items` records.

**Endpoint URL**

https://instance.service-now.com/incident.do?SOAP&hierarchical=true
Request

```xml
<soapenv:Envelope
   xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
   xmlns:inc="http://www.service-now.com/incident">
   <soapenv:Header/>
   <soapenv:Body>
      <inc:insert>
         <short_description>test hierarchical</short_description>
         <u_custom_comments>
            <u_comment>comment 1</u_comment>
            <u_comment_type>travel</u_comment_type>
            <u_comment_items>
               <u_name>name 1</u_name>
               <u_value>value 1</u_value>
            </u_comment_items>
         </u_custom_comments>
      </inc:insert>
   </soapenv:Body>
</soapenv:Envelope>
```

Response

```xml
<soapenv:Envelope
   xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
   xmlns:inc="http://www.service-now.com/incident">
   <soapenv:Header/>
   <soapenv:Body>
      <insertResponse>
         <sys_id>8422ebe7c0a8006e7d23848c2dc8ba47</sys_id>
         <number>INC0010001</number>
      </insertResponse>
   </soapenv:Body>
</soapenv:Envelope>
```

SOAP session management and reporting

A SOAP session is a Glide session established with an instance by any external SOAP client, such as a web services client application, a ServiceNow MID Server, or the ServiceNow ODBC driver.

SOAP sessions are included in the list of user sessions at User Administration > Logged in users.
SOAP sessions are identified by the ?SOAP URLs.

**SOAP session properties**

Certain properties control how SOAP sessions are maintained.
### Table 1081: SOAP session properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.soap.invalidate_session_timeout</td>
<td>The duration, in seconds, that an active session will remain open. After this duration is reached, the instance deactivates the session and reclaims any system resources. If the client sends another request after the timeout duration is reached, the instance will establish a new session. This property accepts values between 5 seconds and 1200 seconds (20 minutes).</td>
</tr>
</tbody>
</table>
|                                              | • Type: integer  
|                                              | • Default value: 60  
|                                              | • Location: Add to the System Properties [sys_properties] table |

**Long-running SOAP request support**

The ServiceNow platform supports long-running SOAP requests by preventing socket timeouts due to inactivity of the network connection while the requests are in process.

This functionality improves the efficiency of the ODBC driver when requesting large numbers of records, doing aggregate queries, or using order by expressions that require sorting.

By default, ServiceNow provides timeout protection for Web Services clients provided by ServiceNow such as the ODBC driver and the MID Server. You can add timeout protection to customer developed Web Services with the parameters described below.

**Timeout Protection**

Web Services clients receive a 307-Temporary Redirect to keep long sessions alive and prevent a timeout due to socket inactivity. A 307-Temporary Redirect causes Web Services clients which support the status code to repeat their last request to the location specified in the HTTP location header. The value of the location header sent by ServiceNow is the same URL that the Web Services client originally specified. The use of 307-Temporary Redirects is WS-I compliant.

A Web Service request that exceeds the timeout limit (glide.soap.request_processing_timeout) can only receive a 307-Temporary Redirect when all of these are met:

- The value of glide.soapprocessor.allow_long_running_threads is true  
- The request includes a redirectSupported=true URL parameter  
- The Request is session-aware (supports HTTP cookies)

If any of these conditions is not met, the Web Service client receives a 408 Request Timeout error.

**Note:** To ensure that applications experience a socket timeout rather than a 408 Request Timeout, set the glide_soap_request_processing_timeout property to a value larger than the shortest socket timeout setting in effect for the connection between the application and the ServiceNow instance (300 seconds for hosted instances).
Properties

The following properties control long-running SOAP processes:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.connection.timeout</td>
<td>Specify the maximum number of milliseconds an outbound HTTP request (such as Web Services) has to finish processing before the connection times out.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 100000 (100 seconds)</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
<tr>
<td>glide.http.timeout</td>
<td>(Web Service Consumer Plugin) Specifies the maximum number of milliseconds to wait before an outbound transaction times out.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 175000 (175 seconds)</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
<tr>
<td>glide.soap.request_processing_timeout</td>
<td>Specify the maximum number of seconds an inbound SOAP request has to finish processing before the connection times out. This property computes a default value from the value of the property glide.http.timeout divided by 1000.</td>
</tr>
<tr>
<td></td>
<td>This property accepts values between 5 seconds and 1200 seconds (20 minutes).</td>
</tr>
<tr>
<td></td>
<td>Customers might have network infrastructure (such as proxy servers) in place which implement a shorter timeout. In this case, a socket timeout may occur unless this property is set to a shorter value. In general, you should set this property to a value several seconds less than the shortest socket inactivity timeout in effect anywhere in the network path between the client application and the ServiceNow instance.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 60</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td>glide.soapprocessor.allow_long_running_threads</td>
<td>Enables or disables a 307-Temporary Redirect. The default setting is true (enabled).</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.soapprocessor.max_long_running_threads</td>
<td>Controls the maximum number of long-running SOAP threads which can run at any one time. The default value for this property is determined dynamically based on the number of SOAP semaphores configured. It should not be necessary to change this value.</td>
</tr>
</tbody>
</table>

**Viewing a SOAP session log**

Role required: admin

1. Navigate to User Administration > Logged in users.

![Logged in Users](image)

2. Open an active SOAP session to see the transactions log.

The SOAP session is marked as inactive within 60 seconds of the last transaction.

**AttachmentCreator SOAP web service**

Attaching documents to records in ServiceNow can be achieved by sending a SOAP message targeting the ecc_queue table.

**Important:** The AttachmentCreator SOAP web service is not recommended. Instead, use the REST Attachment API on page 3146 to manage attachments with web services.

Using the AttachmentCreator SOAP web service, you can attach a single document to a message that is a maximum of 5 MB. The following is an example of a URL or target end point: `https://instance_name.service-now.com/ecc_queue.do?SOAP`
### Table 1083: ecc_queue Fields for Attachment Creation

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>The name of the agent sending in the request, this can be any value since it is not used for processing.</td>
<td>AttachmentCreator</td>
</tr>
<tr>
<td>topic</td>
<td>The topic of the queue record, this value must be set to &quot;AttachmentCreator&quot; to trigger the attachment creation</td>
<td>AttachmentCreator</td>
</tr>
<tr>
<td>name</td>
<td>This field must contain a &quot;:&quot; delimited value of the file name, and its content-type</td>
<td>file_name.xls:application/vnd.ms-excel</td>
</tr>
<tr>
<td>source</td>
<td>This field must contain a &quot;:&quot; delimited value of the target table and its sys_id</td>
<td>incident:dd90c5d70a0a0b39000aac5ae704ae8</td>
</tr>
<tr>
<td>payload</td>
<td>This field must contain the Base 64 encoded string representing the object to be attached</td>
<td>the base 64 encoded string</td>
</tr>
</tbody>
</table>

Sending in the values described in the table above will attach an Excel file to the incident table for the record located by the sys_id "dd90c5d70a0a0b39000aac5ae704ae8"

### Security

Like all other HTTP based web services available on the platform, the AttachmentCreator SOAP web service is required to authenticate using basic authentication by default. The user ID that is used for authentication will be subjected to access control in the same way as an interactive user.

To create attachments, the SOAP user must have any roles required to create Attachment [sys_attachment] records, as well as the soap_create role, and any roles required to read and write records on the target table, such as the itil role to add attachments to incident records. By default there is no single role allowing you to add attachments. You can create a role to explicitly allow adding attachments, then assign this role to the SOAP user.

### File type security

You can control what file types users can attach by setting the glide.attachment.extensions and glide.security.file.mime_type.validation properties.

For these properties to apply to the AttachmentCreator web service, the property glide.attachment.enforce_security_validation must be set to true. This property is true by default.
Example SOAP Message

The following is an example of a SOAP message that would take a text file "john1.txt" of mime-type: text/plain and attach it to an Incident with a GUID of: e6eed6950a0a3c59006f32c8e3ff3cf9. Note the payload is the base64 encoding of the file itself.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
 xmlns:ecc="http://www.service-now.com/ecc_queue">
 <soapenv:Header />
 <soapenv:Body>
  <ecc:insert>
   <agent>AttachmentCreator</agent>
   <topic>AttachmentCreator</topic>
   <name>john1.txt:text/plain</name>
   <source>incident:e6eed6950a0a3c59006f32c8e3ff3cf9</source>
   <payload>SSB3b25kZXIgaWYgc2hlIGtub3ducyB3aGF0IHNoZSdzIGRvaW5nIG5vdy4K</payload>
  </ecc:insert>
 </soapenv:Body>
</soapenv:Envelope>
```

Example Node.js Script

The following example Node.js script adds an attachment to an incident record. Run this script from a client computer, not an instance.

```javascript
/**
 * Node.js to ServiceNow attachment upload via SOAP
 * Andrew Venables andrew.venables@servicenow.com
 * July 2014
 * Version 1.0
 *
*/

var soap = require('soap'), // https://github.com/vpulim/node-soap
    mime = require('mime'), // https://github.com/broofa/node-mime
    fs = require('fs');

var WSDL_FILENAME = 'ecc_queue.xml'; // Goto https://instancename.service-now.com/ecc_queue.do?WSDL and save a copy of the WSDL locally for simplicity
var DIRECTORY_CONTAINING_FILES = '/Users/andrew.venables/Documents/Uploads'; // Local path to the directory containing all the files we want to upload
var USERNAME = 'andy.venables'; // An admin user account on the instance
var PASSWORD = 'MY_PASSWORD'; // Password for above account
var TARGET_TABLE = 'incident'; // Target table to attach the files to
var TARGET_SYS_ID = '9d385017c611228701d22104cc95c371'; // Target record / sys_id to attach the files to. OOTB INC0000002

var files_to_upload; // Global that will contain our list of files to be uploaded
var pos = 0; // Global pointer for our position in the files_to_upload list

// Create a SOAP client to use to post to the instance
```
soap.createClient(WSDL_FILENAME, function(err, client) { // Node uses callbacks
  if (err) console.error(err);

  // Set the username and password
  client.setSecurity(new soap.BasicAuthSecurity(USERNAME, PASSWORD));

  // Read all the files in our source directory, will include . and..
  files_to_upload = fs.readdirSync(DIRECTORY_CONTAINING_FILES);

  console.log('Files to upload: ' + files_to_upload.length + '\n');

  // Start iterating through the list of files to upload
  next(client);
});

// Process the next file in the files_to_upload array
// This is a neat way of dealing with Node and its expectation of callbacks
function next(client) {

  // Check we haven't reached the end
  if (pos >= files_to_upload.length) return;

  // Get the next file to upload
  var file_name = files_to_upload[pos];

  // Increment the pointer to the next file
  pos++;

  console.log(pos + '/'+ files_to_upload.length+ ' - Uploading file: ' +
             file_name);

  // A blank file is the end of the list
  if (file_name == '') return;

  // Skip to the next file as this one is invalid
  if (file_name == '.' || file_name == '..' || file_name.indexOf('.') == 0)
    next(client);

  // Get the file type using an module called mime
  var file_type = mime.lookup(file_name);
  console.log('   of type: ' + file_type);

  var file_payload;
  // Load the file into a buffer
  fs.readFile(DIRECTORY_CONTAINING_FILES + '/' + file_name, function(err,
                 the_data) {
    if (err) console.error(err);

    // Encode the buffer to base64
    file_payload = new Buffer(the_data, 'binary').toString('base64');

    // Set the parameters before we call the Web Service
    var parameters = {
      'agent': 'AttachmentCreator',
      'topic': 'AttachmentCreator',
      'name': file_name+':'+file_type,
      'source': TARGET_TABLE+':'+TARGET_SYS_ID,
      'payload': file_payload
    };

    console.log('      sending...')
    // Make the Web Service call, remember node likes callbacks
client.insert(parameters, function(err, result) {
    if (err) console.error(err);
    console.log(result);
    // This file is done, next!
    next(client);
});

Example Perl Script

The following example Perl script will create an attachment to an incident record.

use MIME::Base64;
use strict;
use SOAP::Lite;

# the ServiceNow instance
my $SNC_HOST = "https://instance_name.service-now.com";
my $base64;
my $buf;

# upload and attach a file on the local disk, base 64 encode it into a string first
open(FILE, "~/Users/davidloo/Desktop/test_files/number_test.xls") or die "$!";
binmode FILE; #preserves file formatting on Windows
while (read(FILE, $buf, 60*57)) {
    $base64 .= encode_base64($buf);
}

# call the sub routine to attach
attach_incident();

sub attach_incident {
    # target the ecc_queue table
    my $soap = SOAP::Lite-&gt;proxy("$SNC_HOST/ecc_queue.do?SOAP");
    $soap-&gt;{transport}-&gt;{proxy}-&gt;{ssl_opts}-&gt;{verify_hostname} = 0;
    my $method = SOAP::Data-&gt;name('insert')-&gt;attr({xmlns =&gt; 'http://www.service-now.com/'});

    # set the ecc_queue parameters
    my @params = (SOAP::Data-&gt;name(agent =&gt; 'AttachmentCreator'));
    push(@params, SOAP::Data-&gt;name(topic =&gt; 'AttachmentCreator'));

    # identify the file name and its mime type
    push(@params, SOAP::Data-&gt;name(name =&gt; 'number_test.xls:application/vnd.ms-excel'));

    # attach to the incident, specifying its sys_id
    push(@params, SOAP::Data-&gt;name(source =&gt; 'incident:dd90c5d70a0b39000aac5ae704ae8'));

    # set the payload to be the base 64 encoded string representation of the file
    push(@params, SOAP::Data-&gt;name(payload =&gt; $base64));

    # invoke the web service
    my $result = $soap-&gt;call($method =&gt; @params);
Perl API

The Perl API provides a library of Perl classes and sub routines for programmatic access to the platform and its applications. The API utilizes the SOAP web service interface of the platform.

For more information on the Perl programming language, see [www.perl.org](http://www.perl.org).

Perl API system requirements
This Perl API requires a minimum Perl version and several modules.

The ServiceNow Perl API requires Perl 5.8 (or later) with the following modules installed:

- SOAP::Lite (prerequisites [http://soaplite.com/prereqs.html](http://soaplite.com/prereqs.html)) 0.71 or later
- Crypt::SSLeay
- IO::Socket::SSL
- File::Basename
- MIME::Types
- MIME::Type
- MIME::Base64

**Attention:** Certain versions of the Perl API may not be compatible with the ServiceNow software and may cause 443 connection errors. ServiceNow recommends against using versions 5.14.2, 5.13.6, and 5.16.1 of Perl.

**Install the Perl API**
Download and install the Perl API.

1. Download the Perl API.
The Perl API is available for use under the terms defined in the Open Source Initiative OSI - Apache License, Version 2.0 license agreement.

Apache License, Version 2.0

Apache License
Version 2.0, January 2004

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding...
communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License.

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution.

You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

1. You must give any other recipients of the Work or Derivative Works a copy of this License; and
2. You must cause any modified files to carry prominent notices stating that You changed the files; and
3. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
4. If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such
Derivative Works as a whole, provided Your use, reproduction, and
distribution of the Work otherwise complies with the conditions stated
in this License.

5. Submission of Contributions.

Unless You explicitly state otherwise, any Contribution intentionally
submitted for inclusion in the Work by You to the Licensor shall be
under the terms and conditions of this License, without any additional
terms or conditions. Notwithstanding the above, nothing herein shall
supersede or modify the terms of any separate license agreement you may
have executed with Licensor regarding such Contributions.

6. Trademarks.

This License does not grant permission to use the trade names,
trademarks, service marks, or product names of the Licensor, except as
required for reasonable and customary use in describing the origin of
the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty.

Unless required by applicable law or agreed to in writing, Licensor
provides the Work (and each Contributor provides its Contributions) on
an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either
express or implied, including, without limitation, any warranties or
conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR
A PARTICULAR PURPOSE. You are solely responsible for determining the
appropriateness of using or redistributing the Work and assume any risks
associated with Your exercise of permissions under this License.

8. Limitation of Liability.

In no event and under no legal theory, whether in tort (including
negligence), contract, or otherwise, unless required by applicable
law (such as deliberate and grossly negligent acts) or agreed to in
writing, shall any Contributor be liable to You for damages, including
any direct, indirect, special, incidental, or consequential damages of
any character arising as a result of this License or out of the use or
inability to use the Work (including but not limited to damages for loss
of goodwill, work stoppage, computer failure or malfunction, or any and
all other commercial damages or losses), even if such Contributor has
been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability.

While redistributing the Work or Derivative Works thereof, You may
choose to offer, and charge a fee for, acceptance of support, warranty,
indemnity, or other liability obligations and/or rights consistent with
this License. However, in accepting such obligations, You may act only
on Your own behalf and on Your sole responsibility, not on behalf of
any other Contributor, and only if You agree to indemnify, defend, and
hold each Contributor harmless for any liability incurred by, or claims
asserted against, such Contributor by reason of your accepting any such
warranty or additional liability.

2. Unpack the archive into a directory.
3. Run the installation commands.
Note: Make sure you are a privileged user on the system.

perl Makefile.PL
make
test
make install

After installing, you can find documentation for this module with the perldoc command.

perldoc ServiceNow

Perl API architecture
This reference explains the Perl API architecture.

...
**ServiceNow.pm**

At the top most of the class hierarchy is the **ServiceNow.pm** module. This module provides direct subroutines that delegate down into subroutines of the object heirarchy, providing a convenient calling convention if object oriented Perl programming is not a desired practice.

**ITIL Objects**

The next layer of the class hierarchy contains the ITIL Objects for example **Incident.pm**, and **Change.pm**. These objects extend the **Task.pm** object which inherits from the **GlideRecord.pm** object.

**Configuration.pm**

To use the Perl API, the programmer instantiates a **Configuration.pm** object and sets the service endpoint as well as the login credentials to use the API. For example:

```perl
my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndpoint("https://instance_name.service-now.com/");
my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
```

**Connection.pm**

The **Connection.pm** class defines the interfaces for making the SOAP calls to the platform. The default implementation uses the SOAP::Lite module, if you wish to implement your own SOAP interface, you can override this class with your own and implement the following subroutines:

- `new`
- `open`
- `send`
- `close`

**Note:**

If running behind a firewall, edit **Connection.pm** to specify information about the HTTP proxy.

In **Connection.pm**, change the line:

```perl
$me->{'SOAP'} = SOAP::Lite->proxy($CONFIG->getSoapEndPoint($target));
```

to:

```perl
$me->{'SOAP'} = SOAP::Lite->proxy($CONFIG->getSoapEndPoint($target),
    proxy => ['https' => 'http://myproxy.mycompany.com/']);
```

Substitute the appropriate proxy URL.

**Perl API classes**

The Perl API includes multiple classes.
# API

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow.pm</td>
<td>A class that contains data querying, creation, and modification subroutines for all the ITIL objects. It is a convenient entry point to the API without using the object oriented ITIL objects directly</td>
</tr>
</tbody>
</table>

## ITIL objects

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident.pm</td>
<td>The incident class, extends Task, which extends GlideRecord. Maps to the <strong>incident</strong> table.</td>
</tr>
<tr>
<td>Problem.pm</td>
<td>The problem class, extends Task, which extends GlideRecord. Maps to the <strong>problem</strong> table.</td>
</tr>
<tr>
<td>Change.pm</td>
<td>The change request class, extends Task, which extends GlideRecord. Maps to the <strong>change_request</strong> table.</td>
</tr>
<tr>
<td>Request.pm</td>
<td>The service request class, extends Task, which extends GlideRecord. Maps to the <strong>sc_request</strong> table.</td>
</tr>
<tr>
<td>RequestedItem.pm</td>
<td>The service request item class, extends Task, which extends GlideRecord. Maps to the <strong>sc_req_item</strong> table.</td>
</tr>
<tr>
<td>SC_Task.pm</td>
<td>The service request task class, extends Task, which extends GlideRecord. Maps to the <strong>sc_task</strong> table.</td>
</tr>
<tr>
<td>Task.pm</td>
<td>The task class extends GlideRecord. Maps to the <strong>task</strong> table.</td>
</tr>
<tr>
<td>Ticket.pm</td>
<td>The ticket class, extends Task, which extends GlideRecord. Maps to the <strong>ticket</strong> table.</td>
</tr>
</tbody>
</table>

## Other

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration.pm</td>
<td>The API configuration class, this class must be passed to the constructor of the other API classes. It defines the SOAP endpoint as well as the credentials to use for API access.</td>
</tr>
<tr>
<td>GlideRecord.pm</td>
<td>The class behind all table access classes.</td>
</tr>
<tr>
<td>Connection.pm</td>
<td>The Connection class implements the web service access layer in an interface that can be overridden. By default, it uses the SOAP::Lite package for web services support.</td>
</tr>
<tr>
<td>Class</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval.pm</td>
<td>The approval class extends GlideRecord. Maps to the <code>sysapproval_approver</code> table.</td>
</tr>
<tr>
<td>Dictionary.pm</td>
<td>The dictionary class extends GlideRecord. Maps to the <code>sys_dictionary</code> table.</td>
</tr>
<tr>
<td>Attachment.pm</td>
<td>The attachment class extends GlideRecord. Used to add attachments to the other objects.</td>
</tr>
</tbody>
</table>

**Perl API ServiceNow**

The ServiceNow perl module is a collection of Perl subroutines that provides convenient and direct access to the ServiceNow platform.

**ServiceNow Perl API constructor**

This page lists the constructor for the ServiceNow Perl API.

### new

**new(Configuration object, optional Instance ID)**

Example:

```perl
$config = ServiceNow::Configuration->new();
$SN = ServiceNow->new($config);
```

Sets up an instance of the ServiceNow object using a Configuration object and an optional Instance ID.

**ServiceNow Perl API subroutines**

The ServiceNow Perl API includes multiple subroutines.

#### Incident

<table>
<thead>
<tr>
<th>createIncident</th>
<th>createIncident(optional parameters)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>$number = $SN-&gt;createIncident({&quot;short_description&quot; =&gt; &quot;this is the short description&quot;);</td>
</tr>
<tr>
<td></td>
<td>Create an incident. Returns an incident number upon success. On failure returns undef.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>queryIncident</th>
<th>queryIncident(Reference to named parameters hash of Incident fields and exact values)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>@results = $SN-&gt;queryIncident({'number' =&gt; 'INC0000054'});</td>
</tr>
<tr>
<td></td>
<td>Query for Incidents matching specified criteria. Returns an array of incident records.</td>
</tr>
<tr>
<td>Method</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>updateIncident</td>
<td>Update a ServiceNow incident Returns undef on failure, all other values indicate success.</td>
</tr>
<tr>
<td>closeIncident</td>
<td>Close a ServiceNow Incident and optionally update field values. Returns the incident number on success, undef on failure.</td>
</tr>
<tr>
<td>reopenIncident</td>
<td>Reopen a closed ServiceNow incident. Returns the incident number on success, undef on failure.</td>
</tr>
<tr>
<td>reassignIncident</td>
<td>Reassign a ServiceNow Incident to a new assignment_group.(and optionally specify an assigned_to) Returns the incident number on success, undef on failure.</td>
</tr>
</tbody>
</table>

**updateIncident**

```perl
$ret = $SN->updateIncident($number, {$field => $value});
```

Example:

```
Update a ServiceNow incident
```

**closeIncident**

```perl
$number = $SN->closeIncident($number, {$field => $value});
```

Example:

```
Close a ServiceNow Incident and optionally update field values. Returns the incident number on success, undef on failure.
```

**reopenIncident**

```perl
my $ret = $SN->reopenIncident('INC99999');
```

Example:

```
Reopen a closed ServiceNow incident. Returns the incident number on success, undef on failure.
```

**reassignIncident**

```perl
my $ret = $SN->reassignIncident('INC99999', 'SOME_GROUP');
my $ret = $SN->reassignIncident('INC99999', 'SOME_GROUP', 'username');
```

Example:

```
Reassign a ServiceNow Incident to a new assignment_group.(and optionally specify an assigned_to) Returns the incident number on success, undef on failure.
```
## Ticket

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| createTicket | createTicket(Reference to named parameters hash of ticket fields and values) | Example: my $number = $SN-
>createTicket({"category" => "hardware"});Create a ServiceNow ticket associated with an incident. Returns a ticket number upon success. On failure returns undef. |
| updateTicket | updateTicket(The ticket number , Reference to named parameters hash of ticket fields and values to update) | Example: my $ret = $SN-
>updateTicket($number, {$field => $value});Returns undef on failure, all other values indicate success. |
| queryTicket  | queryTicket(Reference to named parameters hash of Incident fields and exact values) | Example: my @tickets = $SN-
>queryTicket({'number' => $number});Query for tickets matching specified criteria. Reference to array of hashes of all matching tickets, undef on failure or if no records found. |
| closeTicket  | closeTicket(Ticket number, {$field => $value})                                | Example: my $ret = $SN-
>closeTicket($number);
my $ret = $SN-
>closeTicket($number, {"comments" => "ticket closed"});Close a ServiceNow ticket and optionally specify work effort. Returns the ticket number on success, undef on failure. |
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reopenTicket</td>
<td>Reopen a closed ServiceNow ticket. Returns the ticket number on success, undef on failure.</td>
</tr>
<tr>
<td>Example:</td>
<td>my $ret = $SN- &gt;reopenTicket('TKT99999');</td>
</tr>
<tr>
<td>reassignTicket</td>
<td>Reassign a ServiceNow ticket to a new assignment_group. Returns the ticket number on success, undef on failure.</td>
</tr>
<tr>
<td>Example:</td>
<td>my $ret = $SN- &gt;reassignTicket('TKT99999', 'SOME_GROUP');</td>
</tr>
<tr>
<td></td>
<td>my $ret = $SN- &gt;reassignTicket('TKT99999', 'SOME_GROUP', 'username');</td>
</tr>
</tbody>
</table>

### RequestedItem / Request

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createRequestedItem</td>
<td>Create a Service Catalog RequestedItem (and indirectly the associated Request and Tasks). Returns a RequestedItem number upon success. On failure returns undef.</td>
</tr>
<tr>
<td>Example:</td>
<td>my $req = $SN- &gt;createRequestedItem('CITM10000', 'username', {'description' =&gt; 'Some description', 'group' =&gt; 'SOME_GROUP'});</td>
</tr>
</tbody>
</table>
### queryRequestedItem

**queryRequestedItem** *(Reference to named parameters hash of RequestedItem fields and exact values)*

**Example:**

```perl
my $requestedItems = $SN->queryRequestedItem({'number' => 'SOME_RI_NUMBER'});
```

Query for RequestedItems matching specified criteria. Reference to array of hashes of all matching RequestedItem, undef on failure or if no records found.

### queryRequest

**queryRequest** *(Reference to named parameters hash of Request fields and exact values)*

**Example:**

```perl
my $requests = $SN->queryRequest({'number' => 'SOME_REQUEST_NUMBER'});
```

Query for Requests matching specified criteria. Reference to array of hashes of all matching Request, undef on failure or if no records found.

---

## Task

### createTask

**createTask** *(optional parameters)*

**Example:**

```perl
$number = $SN->createTask({"short_description" => "this is the short description"});
```

Create a task record. Returns a task number upon success. On failure returns undef.

### closeTask

**closeTask** *(task number, optional work effort in seconds)*

**Example:**

```perl
my $ret = $SN->closeTask($number);
my $ret = $SN->closeTask($number, {field => $value});
```

Close a ServiceNow Task and optionally update field values. Returns true on success, undef on failure.
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reopenTask</td>
<td>Reopen a closed ServiceNow Task. Returns true on success, undef on failure.</td>
</tr>
<tr>
<td>reassignTask</td>
<td>Reassign a ServiceNow Task to a new assignment_group. Returns true on success, undef on failure.</td>
</tr>
<tr>
<td>updateTask</td>
<td>Update a ServiceNow Task. Returns true on success, undef on failure.</td>
</tr>
</tbody>
</table>

**Example for reopenTask**

```perl
my $ret = $SN->reopenTask('TASK99999');
```

**Example for reassignTask**

```perl
my $ret = $SN->reassignTask('TASK99999', 'SOME_GROUP');
my $ret = $SN->reassignTask('TASK99999', 'SOME_GROUP', 'username');
```

**Example for updateTask**

```perl
my $ret = $SN->updateTask($number, {$field => $value});
```
### queryTask

queryTask(reference to named parameters hash of Task fields and exact values)

Example:

```perl
my @tasks = $SN->queryTask({'number' => $number});
foreach my $task (@tasks) {
    print "Incident number: $task->{'number'}\n";
    print "Assignent Group: $task->{'assignment_group'}\n";
    print "Opened by: $task->{'opened_by'}\n";
    print "SD: $task->{'short_description'}\n";
    print "TW: $task->{'time_worked'}\n";
}
```

Query for Tasks matching specified criteria. Array of hashes of all matching Tasks, undef on failure or if no records found.

### Journal

#### queryJournal

queryJournal(Incident/Ticket/Task number, optional journal field name)

Query for journals entries for the specified incident, ticket or task. Return array of hashes of all matching Journals, undef on failure or if no records found. There will be one hash per per journal entry, 'value' will contain the journal entry string, 'element' will be the name of the field (e.g. 'comments', 'work_notes', etc.)

#### appendJournal

appendJournal(Incident/Ticket/Task number, field name, journal text)

Example:

```perl
my $ret = $SN->appendJournal("INC99999", 'comments', "some comment text");
```

Append a journal entry to the specified journal field of an incident, ticket, or task. Returns true on success, undef on failure.
### Approval

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryApproval</td>
<td>queryApproval(reference to named parameters hash of approval fields and exact values)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>my @approvals = $SN-&gt;queryApproval({'approver' =&gt; 'username'});</td>
</tr>
<tr>
<td></td>
<td>Query for approvals Return array of hashes of all matching approvals, undef on failure or if no records found.</td>
</tr>
<tr>
<td>approve</td>
<td>approve(sys_id of the approval, approval state, optional comment text)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>my $ret = $SN-&gt;approve($sys_id, 'Approved');</td>
</tr>
<tr>
<td></td>
<td>my $ret = $SN-&gt;approve($sys_id, 'Rejected', &quot;Please do something else&quot;);</td>
</tr>
</tbody>
</table>

### Dictionary

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryFields</td>
<td>queryFields(table, optional boolean)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>my @fields = $SN-&gt;queryFields('incident');</td>
</tr>
<tr>
<td></td>
<td>List all the fields of an Incident, Request, RequestedItem or Task. Returns a reference to a hash of fields in the specified table type. The hash key is the field name, and the hash value is a hash reference to attributes about the field: 'mandatory', 'hint', 'label', 'reference' and 'choice'. Returns undef on failure. If getchoices is true then 'choices' is a reference to a hash containing individual choices, keyed by choice value and containing choice 'label' and 'hint'.</td>
</tr>
</tbody>
</table>
Creating an Incident

```perl
#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndPoint("https://demoi1.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");
my $SN = ServiceNow->new($CONFIG);
my $number = $SN->createIncident(
    "short_description" => "this incident was created from the Perl API", "category" => "hardware") ;
print $number ."\n";
```

Querying an Incident

```perl
#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndPoint("https://demoi1.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");
my $SN = ServiceNow->new($CONFIG);
my @incidents = $SN->queryIncident({'number' => 'INC00002'});
my $count = scalar(@incidents);
print "number of incidents=": $count ."\n";
foreach my $incident (@incidents) {
    print "Incident number: $incident->{'number'}\n";
    print "Assignent Group: $incident->{'assignment_group'}\n";
    print "Opened by: $incident->{'opened_by'}\n";
    print "Opened by DV: $incident->{'dv_opened_by'}\n";
    print "SD: $incident->{'short_description'}\n";
    print "TW: $incident->{'time_worked'}\n";
    print "\n";
}
```

Querying Journal fields

```perl
#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
my $CONFIG = ServiceNow::Configuration->new();
```
Perl API GlideRecord

ServiceNow Perl API - GlideRecord perl module is an object representation of a GlideRecord object used to access your ServiceNow instance.

### Constructor

<table>
<thead>
<tr>
<th>Constructor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new</td>
<td>new(Configuration object, Table name, optional caller object)</td>
</tr>
</tbody>
</table>

```perl
$config = ServiceNow::Configuration->new();
$glideRecord = ServiceNow::GlideRecord->new($config, 'incident', $me);
```

Constructor. Access to the ServiceNow Glide Record object. The caller object is optional unless creating a Class that inherits GlideRecord (See any class in ServiceNow/ITIL for example).

### Subroutines

<table>
<thead>
<tr>
<th>Subroutines</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert</td>
<td>insert(optional hash argument)</td>
</tr>
</tbody>
</table>

Example:

```perl
$glideRecord->insert();
```

Inserts glide record into Table. Returns sys id.

<table>
<thead>
<tr>
<th>setValue</th>
<th>setValue(name, value)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;setValue('caller_id', '56');</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Subroutines</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addQuery</td>
<td>Sets element within Glide Record with name to specified value. Will not effect the GlideRecord within the Table until inserted or updated.</td>
</tr>
<tr>
<td>addQuery</td>
<td>addQuery(name, value)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;addQuery('number','INC1000014');</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;query();</td>
</tr>
<tr>
<td></td>
<td>Refines query to include only the Glide Records with field name=value.</td>
</tr>
<tr>
<td>query</td>
<td>query(optional hash arguments)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;query();</td>
</tr>
<tr>
<td></td>
<td>Returns all Glide Records in the Table with specified query. Step through the Records with the next() call.</td>
</tr>
<tr>
<td>next</td>
<td>next()</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>if($glideRecord-&gt;next());</td>
</tr>
<tr>
<td></td>
<td>while($glideRecord-&gt;next());</td>
</tr>
<tr>
<td></td>
<td>Steps through the results of Glide Record query. Returns TRUE if more elements exist.</td>
</tr>
<tr>
<td>update</td>
<td>update(optional hash arguments)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;setValue('name','value');</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;update();</td>
</tr>
<tr>
<td></td>
<td>Updates Glide Record in table with the Glide Record object. Changes to Glide Record object will not take effect until updated or inserted. Returns sys_id of record on success, undef of failure.</td>
</tr>
<tr>
<td>getValue</td>
<td>getValue(name)</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>$glideRecord-&gt;getValue($name);</td>
</tr>
<tr>
<td></td>
<td>Get value of element name in GlideRecord. Returns string value of element.</td>
</tr>
</tbody>
</table>
Subroutines

<table>
<thead>
<tr>
<th>Subroutine</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>getDisplayValue</td>
<td>getDisplayValue(name)</td>
<td>$glideRecord-&gt;getDisplayValue($name);</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Gets display value of element name in GlideRecord. A display value would be the string name, instead of the sys_id in the case of a reference field, or the string value instead of the number value in the case of choice fields.</td>
</tr>
</tbody>
</table>

Perl API task

ServiceNow Perl API - task module is an object representation of a Task in the ServiceNow platform.

The Perl API task provides subroutines for querying, updating, and creating tasks. Task is the parent class of Incident, Problem, Change, SC_Task and Ticket. These child classes inherit subroutines from this class.

Constructor

new(Configuration);

Example:

```perl
$task = ServiceNow::ITIL::Task->new($CONFIG);
```

This example takes a configuration object and manufactures a Task object connected to the ServiceNow instance.

Perl API task subroutines

The Perl API task provides subroutines for querying, updating, and creating tasks.

Subroutines

<table>
<thead>
<tr>
<th>Subroutine</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>create(optional parameters)</td>
<td>$task-&gt;create();</td>
</tr>
<tr>
<td></td>
<td>Creates and inserts Task/Incident/Ticket/SC_Task record into the respective table. Returns the number of created record on success, undef on failure.</td>
<td></td>
</tr>
<tr>
<td>close</td>
<td>close(number of record, optional parameters)</td>
<td>$task-&gt;close('INC1000312');</td>
</tr>
<tr>
<td></td>
<td>Sets the state of Task/Incident/Ticket/SC_Task to closed and updates the respective table. Returns the number of created</td>
<td></td>
</tr>
</tbody>
</table>
### Perl API Incident

An object representation of an incident in the ServiceNow platform. Provides subroutines for querying, updating, and creating incidents.

#### Incident module

ServiceNow Perl API - Incident perl module

#### Creating an Incident

```perl
#!/usr/bin/perl -w

use ServiceNow;
use ServiceNow::Configuration;
use ServiceNow::ITIL::Incident;
```
my $CONFIG = ServiceNow::Configuration->new();

$CONFIG->setSoapEndPoint("https://demoi1.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

# setting incident values as a hash map in the insert argument
my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
my $sys_id = $incident->insert({"short_description" => "this incident was created from the Perl API", "category" => "hardware"});
print $sys_id . "\n";

# setting incident values by making setValue calls to the incident object
$incident = ServiceNow::ITIL::Incident->new($CONFIG);
$incident->setValue("short_description", "this incident was created from the Perl API - 2");
$incident->setValue("category", "hardware");
$sys_id = $incident->insert();
print $sys_id . "\n";

### Querying for Incidents

#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
use ServiceNow::ITIL::Incident;

my $CONFIG = ServiceNow::Configuration->new();

$CONFIG->setSoapEndPoint("https://demoi1.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
$incident->addQuery("assignment_group", "Service Desk");
$incident->addQuery("category", "Hardware");
$incident->query();
while($incident->next()) {
    print "number=" . $incident->getValue("number") . "\n";
    print "sd=" . $incident->getValue("short_description") . "\n";
    print "opened_by Display Value= " . $incident->getDisplayValue("opened_by") . "\n";
    print "opened_by sys_id= " . $incident->getValue('opened_by');
}

### Adding an attachment to a newly created Incident

#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
use ServiceNow::ITIL::Incident;

my $CONFIG = ServiceNow::Configuration->new();

$CONFIG->setSoapEndPoint("https://demoi1.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
$incident->setValue("short_description", "test incident for attachment 2");
$incident->insert();
$incident->attach("/Users/davidloo/Desktop/test_files/number_test.xls");

**Constructor**

**new**

ew(Configuration);

Example:

$incident = ServiceNow::ITIL::Incident->new($CONFIG);

Takes a configuration object and manufactures an Incident object connected to the ServiceNow instance.

**Subroutines inherited from Task.pm**

- attach
- close
- create
- queryJournal
- reassign
- reopen

**Subroutines inherited from GlideRecord.pm**

- addQuery
- getValue
- getDisplayValue
- setValue
- next
- insert
- query
- update

**Subroutines**

**close**

close(number, hashmap);
Example:

```perl
$incident->close($number)
```

Close an incident and update values described in the hash map passed in.

### reopen

`reopen(number, hashmap);`

Example:

```perl
$incident->reopen($number);
```

Re-open a closed incident and update values described in the hash map passed in.

### createProblem

`createProblem();`

Create a problem ticket from an incident and associate it. Returns the sys_id of the newly created problem ticket.

### createChange

`createChange();`

Create a change request from an incident and associate it. Returns the sys_id of the newly created change request.

**Perl API change**

An object representation of a change in the ServiceNow platform. Provides subroutines for querying, updating, and creating change requests.

### Constructor

`new`

`new(Configuration);`

Example:

```perl
$change = ServiceNow::ITIL::Change->new($CONFIG);
```

Takes a configuration object and manufactures an Change object connected to the ServiceNow instance.

### Subroutines inherited from Task.pm

- attach
- close
- create
- queryJournal
- reassign
• reopen

Subroutines inherited from GlideRecord.pm

• addQuery
• getValue
• getDisplayValue
• setValue
• next
• insert
• query
• update

PerI API problem
An object representation of a problem in the ServiceNow platform. Provides subroutines for querying, updating, and creating problems.

Constructor - new

new(Configuration);

Example:

$problem = ServiceNow::ITIL::Problem->new($CONFIG);

Takes a configuration object and manufactures a Problem object connected to the ServiceNow instance.

Subroutines inherited from Task.pm

• attach
• close
• create
• queryJournal
• reassign
• reopen

Subroutines inherited from GlideRecord.pm

• addQuery
• getValue
• getDisplayValue
• setValue
• next
• insert
• query
• update

Perl API request
An object representation of a request in the ServiceNow platform. Provides subroutines for querying, updating, and creating service catalog requests.

**Description**

An object representation of a request in the ServiceNow platform. Provides subroutines for querying, updating, and creating service catalog requests.

**Constructor**

```
new
new(Configuration);
```

Example:

```
$request = ServiceNow::ITIL::Request->new($CONFIG);
```

Takes a configuration object and manufactures a Request object connected to the ServiceNow instance.

**Subroutines inherited from Task.pm**

- attach
- close
- create
- queryJournal
- reassign
- reopen

**Subroutines inherited from GlideRecord.pm**

- addQuery
- getValue
- getDisplayValue
- setValue
- next
- insert
- query
- update

**Subroutines**

**createRequest**

```
createRequest(user);
```

Create a service request for the specified user.
Perl API requested item

<table>
<thead>
<tr>
<th>ServiceNow Perl API Module</th>
<th>Description</th>
<th>Constructor</th>
<th>Subroutines inherited from Task.pm</th>
<th>Subroutines inherited from GlideRecord.pm</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequestedItem</td>
<td>An object representation of a Requested Item in the ServiceNow platform. Provides subroutines for querying, updating, and creating Service Catalog requested item.</td>
<td>new(Configuration); Example: $req_item = ServiceNow::ITIL::RequestedItem-&gt;new($CONFIG);</td>
<td>attach, close, create, queryJournal, reassign, reopen</td>
<td>attach, close, create, query, update</td>
</tr>
</tbody>
</table>

**System Requirements**
The ServiceNow Perl API requires Perl 5.8 with the following modules installed:
- SOAP::Lite (prerequisites [http://soaplite.com/prereqs.html](http://soaplite.com/prereqs.html)) 0.71 or later
- Crypt::SSLeay
- IO::Socket::SSL

**Perl API dictionary**
An object representation of a dictionary record in the ServiceNow platform. Provides subroutines for querying, updating, and creating sys_dictionary.

**Dictionary module**
ServiceNow Perl API - dictionary module

**new**

new(Configuration);
Example:

```perl
$dic = ServiceNow::ITIL::Dictionary->new($CONFIG);
```

Takes a configuration object and manufactures a Dictionary object connected to the ServiceNow instance
queryFields

queryFields(table name, optional boolean choice)

Example:

```perl
$sys_dictionary->queryFields('incident');
```

Returns an array of hashes containing each field for specified table. If choice is specified then get choice values for each of the choice fields and put them into the hash element 'choices'.

Perl API configuration

<table>
<thead>

Perl API attachment
The ServiceNow Perl API - Attachment perl module is an object representation of an Attachment in the ServiceNow platform. Provides subroutines for creating an attachment and attaching to an existing record.

Constructor - new

ew(Configuration);

Example:

$task = ServiceNow::Attachment->new($CONFIG);

Takes a configuration object and manufactures an Task object connected to the ServiceNow instance

Subroutines - create

create(path, table_name, sys_id)  

Example:

$attachment->create("/Users/davidloo/Desktop/test_files/number_test.xls", "incident", "9d385017c611228701d22104cc95c371");
Creates an attachment from a file on the local disk, to an existing record defined by table_name and sys_id
Returns the sys_id of the ecc_queue record, undef if failed

Perl API service catalog task

<table>
<thead>
<tr>
<th>ServiceNow Perl API Module</th>
<th>Description</th>
<th>Constructor</th>
<th>Subroutines inherited from Task.pm</th>
<th>Subroutines inherited from GlideRecord.pm</th>
</tr>
</thead>
</table>
| SC_Task                    | An object representation of a Service Request Task in the ServiceNow platform. Provides subroutines for querying, updating, and creating sc_task. | new(Configuration); Example:

```perl
$sc_task = ServiceNow::ITIL::RequestedItem->new($CONFIG);
```
| attach                      | addQuery    |
| close                       | getValue    |
| create                      | getDisplayValue |
| queryJournal                | setValue    |
| reopen                      | next        |
|                             | insert      |
|                             | query       |
|                             | update      |

System Requirements

The ServiceNow Perl API requires Perl 5.8 with the following modules installed:

- SOAP::Lite (prerequisites http://soaplite.com/prereqs.html) 0.71 or later
- Crypt::SSLLeay
- IO::Socket::SSL

Perl API ticket

<table>
<thead>
<tr>
<th>ServiceNow Perl API Module</th>
<th>Description</th>
<th>Constructor</th>
<th>Subroutines inherited from Task.pm</th>
<th>Subroutines inherited from GlideRecord.pm</th>
</tr>
</thead>
</table>
| Ticket                     | An object representation of a Ticket in the ServiceNow platform. Provides subroutines for querying, updating, and creating tickets. | new(Configuration); Example:

```perl
$ticket = ServiceNow::ITIL::Ticket->new($CONFIG);
```
| attach                      | addQuery    |
| close                       | getValue    |
| create                      | getDisplayValue |
| queryJournal                | setValue    |
| reopen                      | next        |
|                             | insert      |
|                             | query       |
|                             | update      |
## Approval

An object representation of an Approval record in the ServiceNow instance. Provides subroutines for querying, updating, and creating approvals.

### System Requirements

The ServiceNow Perl API requires Perl 5.8 with the following modules installed:

- SOAP::Lite (prerequisites [http://soaplite.com/prereqs.html](http://soaplite.com/prereqs.html)) 0.71 or later
- Crypt::SSL
- IO::Socket::SSL

### Constructor

```perl
new(Configuration);
```

**Example:**

```perl
$approvals = ServiceNow::ITIL::Approval->new($CONFIG);
```

Takes a configuration object and manufactures an Approval object connected to the ServiceNow instance.
Table 1085: Subroutines

<table>
<thead>
<tr>

</tbody>
</table>

Perl API examples
This reference provides examples of the Perl API.

Using the ServiceNow.pm module

Creating an incident:

```perl
#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndPoint("https://<instance name>.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");
my $SN = ServiceNow->new($CONFIG);
my $number = $SN->createIncident({"short_description" => "this incident was created from the Perl API", "category" => "hardware"});
print $number . "\n";
```

Querying an Incident:

```perl
#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndPoint("https://<instance name>.service-now.com/");
$CONFIG->setUserName("admin");
```
$CONFIG->setUserPassword("admin");

my $SN = ServiceNow->new($CONFIG);

my @incidents = $SN->queryIncident({'number' => 'INC00002'});
my $count = scalar(@incidents);
print "number of incidents=
" . $count . "\n"

foreach my $incident (@incidents) {
    print "Incident number: $incident->{'number'}\n";
    print "Assignent Group: $incident->{'assignment_group'}\n";
    print "Opened by: $incident->{'opened_by'}\n";
    print "Opened by DV: $incident->{'dv_opened_by'}\n";
    print "SD: $incident->{'short_description'}\n";
    print "TW: $incident->{'time_worked'}\n";
}

Querying Journal fields:

#!/usr/bin/perl -w

use ServiceNow;
use ServiceNow::Configuration;

my $CONFIG = ServiceNow::Configuration->new();

$CONFIG->setSoapEndPoint("https://<instance name>.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

my $SN = ServiceNow->new($CONFIG);

my @journals = $SN->queryJournal('INC00002');

print $journals[0]->{'element'} . " = " . $journals[0]->{'value'} . "\n"
print $journals[1]->{'element'} . " = " . $journals[1]->{'value'} . "\n";

Using the ITIL Objects

Creating an Incident:

#!/usr/bin/perl -w

use ServiceNow;
use ServiceNow::Configuration;
use ServiceNow::ITIL::Incident;

my $CONFIG = ServiceNow::Configuration->new();

$CONFIG->setSoapEndPoint("https://<instance name>.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

# setting incident values as a hash map in the insert argument
my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
my $sys_id = $incident->insert({"short_description" => "this incident was created from the Perl API", "category" => "hardware"});
print $sys_id . "\n";

# setting incident values by making setValue calls to the incident object
$incident = ServiceNow::ITIL::Incident->new($CONFIG);
$incident->setValue("short_description", "this incident was created from the Perl API - 2");
$incident->setValue("category", "hardware");
$sys_id = $incident->insert();
print $sys_id . "\n";

Querying for Incidents:

#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
use ServiceNow::ITIL::Incident;

my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndPoint("https://<instance name>.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
$incident->addQuery("assignment_group", "Service Desk");
$incident->addQuery("category", "Hardware");
$incident->query();
while($incident->next()) {
    print "number=" . $incident->getValue("number") . "\n";
    print "sd=" . $incident->getValue("short_description") . "\n";
    print "opened_by Display Value= " . $incident->getDisplayValue("opened_by") . "\n";
    print "opened_by sys_id= " . $incident->getValue('opened_by');
}

Adding an attachment to a newly created Incident:

#!/usr/bin/perl -w
use ServiceNow;
use ServiceNow::Configuration;
use ServiceNow::ITIL::Incident;

my $CONFIG = ServiceNow::Configuration->new();
$CONFIG->setSoapEndPoint("https://<instance name>.service-now.com/");
$CONFIG->setUserName("admin");
$CONFIG->setUserPassword("admin");

my $incident = ServiceNow::ITIL::Incident->new($CONFIG);
$incident->setValue("short_description", "test incident for attachment 2");
$incident->insert();
$incident->attach("/Users/davidloo/Desktop/test_files/number_test.xls");

Scripted SOAP web services

Scripted SOAP Web Services allow a ServiceNow administrator to create new web services that are not addressed by the system.
You can define input and output parameters for the web service and use JavaScript to perform operations. Though this feature is very powerful, use Direct Web Services or Web Service import sets instead whenever possible since they are simpler to implement and maintain.
Security

When *strict security* is enforced on a system, the HTTP authenticated user must have the *soap_script* role to execute the scripted web service.

Creating a new web service

When the Web Services Provider - Scripted plugin is activated, a new module Scripted Web Services is available under the System Web Services application.

![System Web Services](image)

**Figure 818: Scripted web service module**

Click the module to display a list of example scripted Web Services.

<table>
<thead>
<tr>
<th>Name</th>
<th>Active</th>
<th>Short description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetProperty</td>
<td>true</td>
<td>Get a property value</td>
</tr>
<tr>
<td>GetTransactionCount</td>
<td>true</td>
<td>Get the number of transactions</td>
</tr>
<tr>
<td>OrderBlackBerry</td>
<td>true</td>
<td>Order a BlackBerry</td>
</tr>
</tbody>
</table>

**Figure 819: Sys web service**

**Example 1: Retrieving a system property**

The first step is to define the incoming and return parameters. This is done by adding an entry to the Input Parameters and Output Parameters. These parameters are used to construct and present a meaningful WSDL, and they do not add to the functionality of processing the actual Web Service itself.
The parameters are referenced in the script of the Web Service. Any of the input parameters are retrieved using the following syntax:

```javascript
var a = request.property;
```

The output parameters are set by using the following syntax:

```javascript
response.property = "ABC";
```

The following example demonstrates how to retrieve a system property and return it as part of the SOAP response. The example shows how to create a custom scripted Web Service to do something specific that the base ServiceNow system direct Web Services cannot.
Figure 821: Get property

Example 2: Ordering a Blackberry

Direct Web Services in ServiceNow operate on tables and their data, while the following example shows how to initiate a business solution, such as ordering a Blackberry, by invoking a scripted Web Service. The following input and output parameters will support the Blackberry example:
This script shows how to use the above parameters to add a Blackberry to the service catalog shopping cart and order it. The request number is returned in the request_number field of the SOAP response.

```javascript
var cart = new Cart();
var item = cart.addItem('e2132865c0a8016500108d9cee411699');
cart.setVariable(item, 'original', request.phone_number);

// set the requested for
var gr = new GlideRecord("sys_user");
gr.addQuery("user_name", request.requested_for);
gr.query();
if (gr.next()) {
    var cartGR = cart.getCart();
    cartGR.requested_for = gr.sys_id;
    cartGR.update();
}

var rc = cart.placeOrder();
response.request_number = rc.number;
```

**Global Variables**

To facilitate custom processing of incoming SOAP requests, the following global variables are available in the script context:

2. `soapRequestXML`: a string object representing the incoming SOAP envelope XML.
3. `request`: a Javascript object containing mapped values (mapped to input parameter names) of the incoming SOAP envelope.
4. `response`: a Javascript object which allows the script programmer to customize the response values. See [Customize Response](#)
Customize response
Follow this example in order to customize and have control over the XML payload of the SOAP response.

1. Create a customized XML document using the `XMLDocument` script include object.
2. Set its document element to the variable `response.soapResponseElement` in a scripted web service.

For example, the following scripted web service script:

```javascript
var xmldoc = new XMLDocument("<myResponse></myResponse>");
xmldoc.createElement("element_one", "test"); // creates the new element at the document element level if setCurrent is never called
xmldoc.createElement("element_two", "new2 value"); // calling without a value will create a new element by itself
var el = xmldoc.createElement("element_three");
xmldoc.setCurrent(el); // this is now the parent of any new elements created subsequently using createElement()
xmldoc.createElement("newChild", "test child element");
response.soapResponseElement = xmldoc.getDocumentElement();
```

Is used to accept the following request:

```xml
<soapenv:Envelope
 xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
 xmlns:tes="http://www.service-now.com/TestCustomResponse">
 <soapenv:Header/>
 <soapenv:Body>
  <tes:execute/>
 </soapenv:Body>
</soapenv:Envelope>
```

Which will respond with the following SOAP response:

```xml
<soapenv:Envelope
 xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
 xmlns:tes="http://www.service-now.com/TestCustomResponse">
 <soapenv:Header/>
 <soapenv:Body>
  <myResponse>
   <element_one>test</element_one>
   <element_two>new2 value</element_two>
   <element_three>
    <newChild>test child element</newChild>
   </element_three>
  </myResponse>
 </soapenv:Body>
</soapenv:Envelope>
```

WSDL support will need to be created externally. The SOAP endpoint will need to be referred back to the scripted web service in question.

Static WSDL
A static WSDL allows you to define a custom WSDL for web service requests.

Certain web service clients require SOAP access to ServiceNow through a specific Web Service Description Language (WSDL) format. This required format may differ from the standard ServiceNow WSDL format. In these cases you can create a static WSDL that matches the required format.

Create a scripted web service
To use a static WSDL, create a scripted web service.
Role required: web_service_admin or admin

1. Navigate to **System Web Service > Scripted Web Services.**
2. Click **New.**
3. Enter a **Name** for the scripted web service such as FakeStockValue.
4. Enter a **Script** for the web service to run.
5. Click **Submit.**

Scripted web service example
This example demonstrates the processing script for the FakeStockValue web service.

```javascript
var vProcessor = new FakeStockValue(soapRequestXML);

var responseElement = vProcessor.process(); if (responseElement != null) {
    response.soapResponseElement = responseElement;
} else {
    response.soapResponseElement = vProcessor.generateSoapFault("unknown error");
}
```

Create a static WSDL
Create a static WSDL with the required format to override the standard WSDL for your scripted web service.

Role required: web_service_admin or admin

1. Navigate to **System Web Services > Static WSDL.**
2. Create a static WSDL record using the same name as the scripted web service, such as FakeStockValue.
3. Enter the custom WSDL into the **WSDL** field.
4. Click **Submit.**

Static WSDL example
This example demonstrates the FakeStockValue WSDL.

```xml
<?xml version= "1.0" ?>
<definitions name = "StockQuote"
targetNamespace = "http://example.com/stockquote.wsdl"
xmlns:tns = "http://example.com/stockquote.wsdl"
xmlns:xsd1 = "http://example.com/stockquote.xsd"
xmlns:soap = "http://schemas.xmlsoap.org/wsdl/soap/"
xmlns = "http://schemas.xmlsoap.org/wsdl/"
>

<types><schema targetNamespace = "http://example.com/stockquote.xsd"
xmlns = "http://www.w3.org/2000/10/XMLSchema">
<element name = "TradePriceRequest">
<complexType><all>
<element name = "tickerSymbol" type = "string" /></all></complexType>
</element>
<element name = "TradePrice">
<complexType><all>
<element name = "price" type = "float" /></all></complexType>
</element>
</schema></types>

<message name = "GetLastTradePriceInput">
<part name = "body" element = "xsd1:TradePriceRequest" />
</message>

<message name = "GetLastTradePriceOutput">
<part name = "body" element = "xsd1:TradePrice" />
</message>

<portType name = "StockQuotePortType">
<operation name = "GetLastTradePrice">
<input message = "tns:GetLastTradePriceInput" />
<output message = "tns:GetLastTradePriceOutput" />
</operation>
</portType>

<binding name = "StockQuoteSoapBinding" type = "tns:StockQuotePortType">
<soap:binding style = "document" transport = "http://schemas.xmlsoap.org/"

```
Create a static WSDL script include

Create a script include to define the majority of the code used to process static WSDL requests.

Role required: script_include_admin or admin

By implementing the majority of the custom functionality in a script include, you can reuse the script include in multiple areas.

1. Navigate to System UI > Script Includes.
2. Click New.
3. Enter a Name for the script include that matches the name of the static WSDL, such as FakeStockValue.
4. Enter the script include code in the Script field.
5. Click Submit.

Static WSDL script include example

This example demonstrates the FakeStockValue script include that implements much of the static WSDL behavior.

```javascript
var FakeStockValue = Class.create();

FakeStockValue.prototype = {
  initialize : function(requestXML) {
    //Use some backend XML utilities...you could use string tools if you wish
    this.xmlutil = Packages.com.glide.util.XMLUtil;
    //converting the string to an XML Document
    this.fSoapDoc = new XMLDocument(requestXML);
  },

  process : function() {
    var soapBody = this.fSoapDoc.getNode("/Envelope/Body");
    //Our WSDL was formatted to have the only first child element be the function
    var funcNode = this.xmlutil.getFirstChildElement(soapBody);
    var nodeName = this.xmlutil.getNodeNameNS(funcNode);

    //If the function for this SOAP request is TradePriceRequest, perform the necessary actions
    if (nodeName == "TradePriceRequest") {
      return this.fakeOutTradePriceRequest(funcNode);
    }

    //Couldn't find any supported functions in this SOAP request
    return this.generateSoapFault("un-supported API call: " + nodeName);
  },

  fakeOutTradePriceRequest : function (funcNode) {
    //Create the beginnings of our XML response
  }

};
```
var r = new XMLDocument("<GetLastTradePriceOutput xmlns='https://www.service-now.com/vws/FakeStockValue'/>");

// Do the necessary actions here...we're going to get the USER ID of the user
// Used to make this SOAP call. Then we will return the stock symbol they were asking about
var usersysid = gs.getUserID();
var gr = new GlideRecord("sys_user");
gr.get(usersysid);
var username = gr.user_name;
var quoteSymbol = this.xmlutil.getText(funcNode);
// Create a "message" element to store our response message
var message = username + ", You were looking for a quote on "+quoteSymbol;
return r.createElement("message", message);

}

initialize function

The initialize function takes the XML request string and converts it to an XML Document object that you can navigate and manipulate using libraries. Alternatively, you can leave the XML request as a string and navigate it using regular expressions.

process function

The process function is called by the scripted web service. This function grabs the first child element in the XML after the body element. The WSDL uses this child element to determine which function to use. In this WSDL there is only one possible function but most WSDLs provide many functions. If more functions were available, there would be more "if" statements that tested the first child element for the various function names.

fakeOutTradePriceRequest function

The fakeOutTradePriceRequest function is the implementation of the only available function in the WSDL. This function looks up the user that the SOAP request authenticated as and retrieves the user_name then returns it to the SOAP client. The fakeOutTradePriceRequest function could be expanded to perform useful activities, such as looking up a stock symbol and returning the last traded price.
**generateSoapFault function**

The `generateSoapFault` function returns a SOAP error that can be called if there are problems.

Use the static WSDL

Load the static WSDL into a SOAP client to make requests to the SOAP web service.

The web service client provides

- The FakeStockValue project.
- The StockQuoteBinding web service.
- The GetLastTradePrice SOAP function. This function generates request records when run.

![FakeStockValue](image)

### Figure 823: Loaded WSDL

You can change the default request XML in the static WSDL to include a stock symbol.

```xml
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
xmlns:stoc="http://example.com/stockquote.xsd">
  <soapenv:Header/>
  <soapenv:Body>
    <stoc:TradePriceRequest>IBM</stoc:TradePriceRequest>
  </soapenv:Body>
</soapenv:Envelope>
```

Submitting a SOAP request to this web service endpoint returns the following to the requesting SOAP client.

```xml
  <SOAP-ENV:Body>
    <GetLastTradePriceOutput xmlns="https://www.service-now.com/vws/FakeStockValue">
      <message>admin2, You were looking for a quote on IBM</message>
    </GetLastTradePriceOutput>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

### Inbound web service examples

Inbound web service examples demonstrate how to access ServiceNow web services.

#### Java Apache Axis2 web services client examples

Examples demonstrating an integration with Axis2 Version 1.4.
Requirements

- An "elementFormDefault" value of qualified means that an unqualified element is in the default namespace defined on an ancestor. If it is "unqualified" then an unqualified element is in the empty namespace (xmlns=""). The default is "unqualified".
- To Resolve the Axis Client deserialization failure you should go to System Properties > Web Services and uncheck the property that sets the elementFormDefault attribute of the embedded XML schema to the value of unqualified. Save the property setting and regenerate your Axis2 client code if your client code was generated before changing this property.

````java
public class Insert {
    public static void main ( String args [ ] ) { try {
        HttpTransportProperties. Authenticator basicAuthentication = new HttpTransportProperties. Authenticator ( ) ;
        basicAuthentication. setUsername ( "admin" ) ;
        basicAuthentication. setPassword ( "admin" ) ;

        ServiceNowStub proxy = new ServiceNowStub ( ) ;
        proxy._getServiceClient ( ). getOptions ( ). setProperty (org. apache. axis2. transport. http. HTTPConstants. AUTHENTICATE,
        basicAuthentication ) ;

        ServiceNowStub. Insert inc = new ServiceNowStub. Insert ( ) ;
        ServiceNowStub. InsertResponse resp = new ServiceNowStub. InsertResponse ( ) ;

        inc. setAssigned_to ( "Christen Mitchell" ) ;
        inc. setCategory ( "hardware" ) ;
        inc. setPriority ( BigInteger. ONE ) ;
        inc. setDescription ( "The WI_FI in the reception area is down" ) ;
        inc. setCaller_id ( "Joe Employee" ) ;

        resp = proxy. insert (inc ) ;

        System. out. println ( "New Incident: " + resp. getNumber ( ) ) ;
    } catch ( Exception e ) { System. out. println (e. toString ( ) ) ;}
```
Java Apache Axis2 web services client examples update
An example of an Axis Client program that calls the getKeys function to query all incidents where the category is Hardware.

getKeys

A list of sys_id is returned as a result:

```java
package com.service_now.www;

public class DemoClient {
    public static void main(String args[]) { try {
        ServiceNowStub proxy = new ServiceNowStub();
        ServiceNowStub.GetKeys getInc = new ServiceNowStub.GetKeys();
        ServiceNowStub.GetKeysResponse resp = new ServiceNowStub.GetKeysResponse();
        getInc.setActive(true);
        getInc.setCategory("hardware");
        proxy._getServiceClient().getOptions().setProperty(
            org.apache.axis2.transport.http.HTTPConstants.CHUNKED,
            Boolean.FALSE);
        resp = proxy.getKeys(getInc);
        String[] keys = resp.getSys_id();
        System.out.println("Key: " + keys[0]);
    } catch (Exception e) {
        System.out.println(e.toString());
    }
}
```

getRecords

```java
package com.service_now.www;

import com.service_now.www.ServiceNowStub.GetRecordsResult_type0;

public class GetRecords {
    /**
     * @param args
     */
    public static void main(String[] args) { try {
        ServiceNowStub proxy = new ServiceNowStub();
        ServiceNowStub.GetRecords incidents = new ServiceNowStub.GetRecords();
        incidents.setActive(true);
        incidents.setCategory("hardware");
        incidents.setSys_created_on("> 2009-06-08 10:30:00");
```
proxy._getServiceClient ( ). getOptions ( ). setProperty (org.apache.axis2.transport.http.HTTPConstants.CHUNKED, Boolean.FALSE);

result = proxy.getRecords (incidents);
GetRecordsResult_type0 [ ] keys = result.getGetRecordsResult ( );

for ( int key = 0 ; key < keys.length ; key ++ ) {
    System.out.println ( "Key: " + keys[0].getSys_id ( ) ) ;
} } catch ( Exception e ) {
    System.out.println (e.toString ( ) ) ;
}

Java Apache Axis2 web services client examples advanced
Examples showing how to construct and use an Axis2 client to consume a ServiceNow Web Service.

Axis is essentially a SOAP engine -- a framework for constructing SOAP processors such as clients, servers, or gateways. The current version of Axis is written in Java. This content is intended for system admins with a light development background in Java. To begin you would need Java JDK version 1.4.2 or higher and Axis2 version 1.0 or higher.

Create a Java Project

This example uses Eclipse SDK Version: 3.4.2 for managing the source code and executing the web request. Eclipse is not required.

• Open Eclipse and from the menu select File > New > Project > Java Project.
• Give the project a name.
• Verify that the correct JRE is specified.
  • If using wsdl2java run "java -version" on the command line and this will be the version to specify for the project specific JRE.
  • If using the Axis2 Codegen plugin use default JRE.
Create a Java Project

Create a Java project in the workspace or in an external location.

Project name: TestWebService

Contents

- Create new project in workspace
- Create project from existing source

Directory: /glide/workspace/TestWebService

JRE

- Use default JRE (Currently 'JVM 1.4.2 (MacOS X Default)')
- Use a project specific JRE: JVM 1.6.0
- Use an execution environment JRE: J2SE-1.4

Project layout

- Use project folder as root for sources and class files
- Create separate folders for sources and class files

Working sets

- Add project to working sets

Working sets: 

Finish
Generate your Axis2 client code

- From a command line in the bin directory of the axis folder:

  ```
  ./wsdl2java.sh -uri https://<instance name>.service-now.com/incident.do?WSDL -o /glide/workspace/TestWebService/
  ```

- In the above example:
  - The "-uri" is either the path where you have saved a copy of the wsdl to either ".wsdl" or ".xml", or the URL the WSDL resides at.
  - The "-o" is the path where you want the files to be written out to. If not specified, the files will be written out to the current bin location.

- In Eclipse refresh the project and the generated Stub and CallbackHandler should now be displayed

  ![Figure 826: Axis Stub](image)

Basic Authentication

```java
HttpTransportProperties.Authenticator basicAuthentication = new HttpTransportProperties.Authenticator();
basicAuthentication.setUsername("admin");
basicAuthentication.setPassword("admin");
...
ServiceNowStub proxy = new ServiceNowStub();
...
proxy._getServiceClient().getOptions().setProperty(org.apache.axis2.transport.http.HTTPConstants.AUTHENTICATE, basicAuthentication);
```

Compatibility with Axis2 Versions 1.1 and higher

Chunking support is only available in HTTP Version 1.1. By default chunking is enabled in Axis2.xml for versions 1.1 and higher. ServiceNow does not support Chunking, so you will need to disable chunking at deployment time or at runtime.
• Deployment time: One can disable HTTP chunking by removing or commenting out the following element from Axis2.xml

```xml
<parameter name= "Transfer-Encoding" >chunked</parameter>
```

• Runtime: User can disable the chunking using following property set in Client or Stub, versions 1.1.1 and higher only

```java
options.setProperty (org.apache.axis2.transport.http.HTTPConstants.CHUNKED, Boolean.FALSE);
```

### Creating Unique Packages

You can use the Axis2 parameter namespace2package (ns2p) to create unique package names. The parameter uses this format:

```bash
<Axis path>\bin\wsdl2java.bat -u -p cr2 -ns2p <namespace>=<package name> -uri <wsdl to convert>
```

For example:

```bash
<Axis path>\bin\wsdl2java.bat -u -p cr2 -ns2p http://www.service-now.com/change_request=my.change_request -uri change_request
```

### Microsoft .NET web services client examples

Examples demonstrating an integration with Microsoft .NET Web Services Client.

### Requirements

.NET 2.0 Versions and Higher:

- An "elementFormDefault" value of qualified means that an unqualified element is in the default namespace defined on an ancestor. If it is "unqualified" then an unqualified element is in the empty namespace (xmlns=""), The default is "unqualified".
- To Resolve the .NET Client deserialization failure you should go to System Properties > Web Services and uncheck the property that sets the elementFormDefault attribute of the embedded XML schema to the value of unqualified. Save the property setting and recreate your WSDL Reference.cs class. See Also "Compatibility with Clients generated from WSDL" below.
Figure 827: Element Form Default Property

Example insert using Visual Basic .NET
A sample Visual Basic .NET program that inserts a core_company record.

```vbnet
Public Class Class1
    Shared Sub Main()
        Dim proxyCompany As New core_company.localhost.ServiceNow()

        Dim companyInsert As New core_company.localhost.insert()

        Dim companyInsertResponse As core_company.localhost.insertResponse

        With companyInsert
            .name = "Test Company SKF 2"
            .contact = "SKF"
            .customer = True
            .customerSpecified = True
        End With

        companyInsertResponse = proxyCompany.insert(companyInsert)

        Console.WriteLine(companyInsertResponse.sys_id)
    End Sub End Class
```

Sample Visual Basic .NET project
Perl web services client examples
Examples demonstrating an integration with a Perl web services client.

Note: The following examples require the usage of the Perl language and the SOAP::Lite package.

System Requirements

- Perl 5.8
  - SOAP::Lite (prerequisites http://soaplite.com/prereqs.html)
  - Crypt::SSLeay
  - IO::Socket::SSL

insert

The following example will insert a record into the Incident table.

```perl
#!/usr/bin/perl -w
#
# declare usage of SOAP::Lite
use SOAP::Lite;
#
# specifying this subroutine, causes basic auth to use# its credentials when# challenged
sub SOAP::Transport::HTTP::Client::get_basic_credentials{
  # login
  as the itil userreturn 'itil' =>'itil';
}
#
# declare the SOAP endpoint here
my $soap= SOAP::Lite->proxy('https://myinstance.service-now.com/incident.do?SOAP');
#
# calling the insert function
my $method= SOAP::Data->name('insert')-
attr({xmlns =>'http://www.service-now.com/'});
#
# create a new incident with the following short_description and
# category
my @params=( SOAP::Data->name(short_description =>'This is an
# example short description'));push @params, SOAP::Data->name(category
# =>'Hardware');
#
# invoke the SOAP call
my $result=$soap->call($method=@params);
#
# print any SOAP faults that get returned
print_fault($result);# print the SOAP response that get return
print_result($result);
#
# convenient subroutine for printing all resultssub print_result
  (my $result)=@_
  if($result->body&&$result->body->{'insertResponse'}){
    my %keyHash=%{$result->body->{'insertResponse'}};
    foreach my $k(keys %keyHash){print "name=$k   value=
    $keyHash{$k}\n";}
  }
#
# convenient subroutine for printing all SOAP faultssub print_fault
  (my $result)=@_
  if($result->fault){print "faultcode=".$result->fault-
# ('faultcode')."\n";print "faultstring=".$result->fault-
# ('faultstring')."\n";print "detail=".$result->fault->('detail')."\n";}
```

© 2017 ServiceNow. All rights reserved. 3363
**insert (With XML payload)**

The following is an example of inserting a record into the ecc_queue table where the payload field is an XML document. This is done using the Perl language and the SOAP::Lite package, the XML document creation uses the XML::Writer package:

```perl
#!/usr/bin/perl -w
use SOAP::Lite ( +trace => all, maptype => {} );
use SOAP::Lite;
use XML::Writer;
use XML::Writer::String;

## Get parameters passed by OVO notification
$OVMSG{id}=$ARGV[0];
$OVMSG{node_name}=$ARGV[1];
$OVMSG{node_type}=$ARGV[2];
$OVMSG{date_created}=$ARGV[3];
$OVMSG{time_created}=$ARGV[4];
$OVMSG{date_received}=$ARGV[5];
$OVMSG{time_received}=$ARGV[6];
$OVMSG{application}=$ARGV[7];
$OVMSG{msg_group}=$ARGV[8];
$OVMSG{object}=$ARGV[9];
$OVMSG{severity}=$ARGV[10];
$OVMSG{operator_list}=$ARGV[11];
$OVMSG{msg_text}=$ARGV[12];
$OVMSG{instruction}=$ARGV[13];

sub SOAP::Transport::HTTP::Client::get_basic_credentials{return 'itil' =>'itil';}

my $soap = SOAP::Lite->proxy('http://<instance name>.service-now.com/ecc_queue.do?SOAP');

my $method = SOAP::Data->name('insert') ->attr({xmlns => 'http://www.service-now.com/'});

# get all incidents with category Network
my @params = (SOAP::Data->name(agent =>'OVO_Notification'));
push(@params, SOAP::Data->name(queue =>'input'));
push(@params, SOAP::Data->name(name =>'HP Openview OVO Notification'));
push(@params, SOAP::Data->name(source =>$OVMSG{id}));

my $s = XML::Writer::String->new();
my $writer = new XML::Writer(OUTPUT => $s);

#$writer->xmlDecl();$writer->startTag('notification');

write_element('id');
write_element('node_name');
write_element('node_type');
write_element('date_created');
write_element('time_created');
write_element('date_received');
write_element('time_received');
write_element('application');
write_element('msg_group');
write_element('object');
write_element('severity');
write_element('operator_list');
write_element('msg_text');
write_element('instruction');

$writer->endTag('notification');

$writer->end;

sub write_element {my $label=shift;my $value=$OVMSG{$label};$writer->startTag($label);if($value){$writer->characters($value);$writer->endTag($label);}}
push(@params, SOAP::Data->name(payload =>$s->value()));

print $soap->call($method=>@params)->result;
```
=== Response to the ''insert''===

```xml
<?xml version="1.0" encoding="UTF-8"?><soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <insertResponse xmlns="http://www.service-now.com/ecc_queue">
      <sys_id>1a5ad50e0a0a021101bef2e07705f87a</sys_id>
      <name>HP Openview OVO Notification</name>
    </insertResponse>
  </soap:Body>
</soap:Envelope>
```

**update**

```perl
#!/usr/bin/perl -w
use SOAP::Lite (?trace => all, maptype => {}); use SOAP::Lite;
sub SOAP::Transport::HTTP::Client::get_basic_credentials { return 'itil' => 'itil'; }
my $soap = SOAP::Lite->proxy('http://localhost:8080/glide/incident.do?SOAP');
my $method = SOAP::Data->name('update')->attr({xmlns => 'http://www.service-now.com/'});
# update incident by sys_id
my @params = ( SOAP::Data->name(sys_id => 'e8caedcbc0a80164017df472f93e9ed1'));
push(@params, SOAP::Data->name(short_description => 'this is a new description'));
my $result = $soap->call($method => @params);
print_fault($result);
print_result($result);
sub print_result { my($result) = @_;
  if($result->body && $result->body->{'updateResponse'} ) {
    my %keyHash = $result->body->{'updateResponse'};
    foreach my $k (keys %keyHash) {
      print "name=$k   value=$keyHash{$k}\n";
    }
  }
}
sub print_fault { my($result) = @_;
  if($result->fault) {
    print "faultcode=".$result->fault->{'faultcode'}."\n"
    print "faultstring=".$result->fault->{'faultstring'}."\n"
    print "detail=".$result->fault->{'detail'}."\n";
  }
}
```

**getKeys**

The following is an example of retrieving a list of keys for records of Incident where status is Network.

```perl
#!/usr/bin/perl -w
use SOAP::Lite (?trace => all, maptype => {}); use SOAP::Lite;
sub SOAP::Transport::HTTP::Client::get_basic_credentials { return 'itil' => 'itil'; }
my $soap = SOAP::Lite->proxy('http://<instance name>.service-now.com/incident.do?SOAP');
```
my$method= SOAP::Data->name('getKeys')->attr({xmlns =>'http://www.service-
    now.com/'});

# get all incidents with category Networkmy@params=( SOAP::Data-
    ->name(category =>'Network'));

print$soap->call($method=>@params)->result;

get

The following is an example of retrieving an Incident record using its sys_id value

#!/usr/bin/perl -w#use SOAP::Lite ( +trace => all, maptype => {} );use SOAP::Lite;

sub
    SOAP::Transport::HTTP::Client::get_basic_credentials{return 'itil' =>'itil';}

my$soap= SOAP::Lite->proxy('http://<instance name>.service-now.com/
    incident.do?SOAP');

my$method= SOAP::Data->name('get')->attr({xmlns =>'http://www.service-
    now.com/'});

# get incident by sys_idmy@params=( SOAP::Data->name(sys_id
    =>'9d385017c611228701d22104cc95c371'));

my%keyHash=%{$soap->call($method=>@params)->body->{'getResponse'}};

# iterate through all fields and print themforeach my$k(keys%keyHash)
    {print "$k=$keyHash{$k}\n";}

getRecords

To query for an Incident using its incident number value:

#!/usr/bin/perl -w#use SOAP::Lite ( +trace => all, maptype => {} );use SOAP::Lite;

sub
    SOAP::Transport::HTTP::Client::get_basic_credentials{return 'itil' =>'itil';}

my$soap= SOAP::Lite->proxy('http://<instance name>.service-now.com/
    incident.do?SOAP');

my$method= SOAP::Data->name('getRecords')->attr({xmlns =>'http://
    www.service-now.com/'});# get incident by numbermy@params=( SOAP::Data-
    ->name(number =>'INC10001'));

my%keyHash=%{$soap->call($method=>@params)->body->{'getRecordsResponse'}-
    >{'getRecordsResult'});

# iterate through all fields and print themforeach my$k(keys%keyHash)
    {print "$k=$keyHash{$k}\n";}

© 2017 ServiceNow. All rights reserved. 3366
getRecords (Returning Multiple Results)

The following is an example of retrieving and displaying an array of Incident records by querying all incidents that have a category of "Network".

```perl
#!/usr/bin/perl -w
use SOAP::Lite (+trace => all, maptype => {});
sub SOAP::Transport::HTTP::Client::get_basic_credentials { return 'itil' => 'itil'; }
my $soap = SOAP::Lite->proxy('http://<instance name>.service-now.com/incident.do?SOAP');
my $method = SOAP::Data->name('getRecords')->attr({xmlns => 'http://www.service-now.com/'});
# get incident by sys_id
my @params = (SOAP::Data->name(category => 'Network'));
my %keyHash = %{$soap->call($method => @params)->body->{'getRecordsResponse'}};
my $i = 0; my @size = @{$keyHash{'getRecordsResult'}}; for ($i = 0; $i < @size; $i++) { my %record = @{$keyHash{'getRecordsResult'}}[$i]; print "------------------------------ $i ----------------------------
";
foreach my $kk (keys %record) { print "$kk = $record{$kk} \n"; }
```

deleteRecord

```perl
#!/usr/bin/perl -w
use SOAP::Lite (+trace => all, maptype => {});
sub SOAP::Transport::HTTP::Client::get_basic_credentials { return 'itil' => 'itil'; }
my $soap = SOAP::Lite->proxy('http://localhost:8080/glide/incident.do?SOAP');
my $method = SOAP::Data->name('deleteRecord')->attr({xmlns => 'http://www.service-now.com/'});
# delete incident by sys_id
my @params = (SOAP::Data->name(sys_id => '46f67787a9fe198101e06dfcf3a78e99'));
my $result = $soap->call($method => @params);
print_fault($result);
print_result($result);
sub print_result { my ($result) = @_; if ($result->body && $result->body->{'deleteRecordResponse'}) { my %keyHash = %{$result->body->{'deleteRecordResponse'}};
foreach my $k (keys %keyHash) {
print "name = $k   value = $keyHash{$k} \n"; }
}
sub print_fault { my ($result) = @_; }
```
Python web services client examples
Examples demonstrating an integration with a Python web services client.

Requirements
The following examples require the installation of the following Python modules:

- fpconst [http://pypi.python.org/pypi/fpconst/0.7.2](http://pypi.python.org/pypi/fpconst/0.7.2)
- PyXML [http://pyxml.sourceforge.net/topics/](http://pyxml.sourceforge.net/topics/)

insert
This is an example of inserting an incident.

```python
#!/usr/bin/python
from SOAPpy import SOAPProxy
import sys

def createincident (params_dict):
    # instance to send to
    instance = 'demo'

    # username/password
    username = 'itil'
    password = 'itil'

    # proxy - NOTE: ALWAYS use https://INSTANCE.service-now.com, not https://www.service-now.com/INSTANCE for web services URL from now on!
    proxy = 'https://%s:%s@%s.service-now.com/incident.do?SOAP' % (username, password, instance)
    namespace = 'http://www.service-now.com/
    server = SOAPProxy (proxy, namespace)

    # uncomment these for LOTS of debugging output
    #server.config.dumpHeadersIn = 1 #server.config.dumpHeadersOut = 1
    #server.config.dumpSOAPOut = 1 #server.config.dumpSOAPIn = 1

    response = server. insert (impact = int (params_dict ['impact']) , urgency = int (params_dict ['urgency']) , priority = int (params_dict ['priority']) , category =params_dict ['category'] , location =params_dict ['location'] , caller_id =params_dict ['user'] , assignment_group =params_dict ['assignment_group'] , assigned_to =params_dict ['assigned_to'] , short_description =params_dict ['short_description'] , comments =params_dict ['comments'] )

    return response

values = { 'impact': '1', 'urgency': '1', 'priority': '1', 'category': 'High', 'location': 'San Diego', 'user':
```
'fred.luddy@yourcompany.com', 'assignment_group': 'Technical Support', 'assigned_to': 'David Loo', 'short_description': 'An incident created using python, SOAPpy, and web services.', 'comments': 'This a test making an incident with python. Isn't life wonderful?'}

new_incident_sysid = createincident(values)
print "Returned sysid: " + repr(new_incident_sysid)

getKeys

This is an example of executing getKeys on the demo instance using basic authentication.

#!/bin/env python
# use the SOAPpy module from SOAPpy import SOAPProxy

username, password, instance = 'admin', 'admin', 'demo'

server = SOAPProxy(proxy, namespace)
response = server.getKeys(category = 'Network')
print response.sys_id.split(',')

getRecords

In this example, we get an incident, querying for category == "Network" (with basic authentication).

#!/bin/env python
# use the SOAPpy module from SOAPpy import SOAPProxy

username, password, instance = 'admin', 'admin', 'demo'

server = SOAPProxy(proxy, namespace)
response = server.getRecords(category = 'Network')

for record in response:
    for item in record:
        print item

get

In this example, we get an incident record by sys_id (with basic authentication).

#!/bin/env python
# use the SOAPpy module from SOAPpy import SOAPProxy

username, password, instance = 'admin', 'admin', 'demo'
Advanced

This is an example of advanced Python script that reads a log file for a keyword invalid spi and creates an ECC Queue record where the payload is set to an alert of XML format.

```python
#!/bin/env python

# kevin.pickard@service-now.com  2008.07.03  initial creation

from SOAPpy import SOAPProxy  
from xml.dom.minidom import getDOMImplementation
import sys, os, socket, pickle, re

# instance to send to
instance = 'demo'

# username/pass
username = 'admin'
password = 'admin'

# log file to watch
syslogfile = '/var/log/cisco.log.ksp'

# state file
statefile = '/tmp/syslog_ecc.state-test'

# ECC queue values
soapagent = 'SOAPpy'
ecctopic = 'PIX Error: '
ecccname = 'Invalid SPI: '
eccsource = 'Syslog'

# regex string to match
matchstring = 'invalid spi'

try:
    state = open (statefile , 'r' )
    lastbyte = pickle.load (state )
    state. close () except:
    lastbyte = 0

    #print 'DEBUG: lastbyte = '+str(lastbyte)

try:
    log = open (syslogfile , 'ro' ) except:
    errortopic = 'Script Error'
    errorname = 'Unable to open log file '+syslogfile+ '.
    errorpayload = 'This message was generated due to an error condition encountered in a script. The name of the script is '+ os. path. basename ( sys. argv [ 0 ] )+ ' on server '+ socket. gethostname ()+ ' .'  

    proxy = 'https://'+username+ ':'+password+ '@'+instance+ '.service-now.com/ecc_queue.do?SOAP'  
    namespace = 'http://www.service-now.com/'
```
server = SOAPProxy (proxy, namespace)
server.config.dumpSOAPOut = 1
server.config.dumpSOAPIn = 1
response = server.insert (agent=soapagent, topic=errortopic, name=errorname, source=sys.argv[0], payload=errorpayload)
sys.exit(1)

if lastbyte != 0:
    try:
        log.seek(lastbyte) except IOError:
            pass

loglines = log.readlines()
lastbyte = log.tell()
log.close()

state = open(statefile, 'w')
pickle.dump(lastbyte, state)
state.close()

# regex out the line
matchedlines = []
for line in loglines:
    if re.search(matchstring, line) != None:
        matchedlines.append(line)

if len(matchedlines) == 0:
    sys.exit(0)

proxy = 'https://' + username + ':' + password + '@' + instance + '.service-now.com/

namespace = 'http://www.service-now.com/'

server = SOAPProxy (proxy, namespace)  # server.config.dumpSOAPOut = 1
# server.config.dumpSOAPIn = 1

entriestosend = {}
for line in matchedlines:
    device = line.split()[3]
    sourceip = line.split()[-1]
    entriestosend[sourceip] = [device, line]

for key, value in entriestosend.iteritems():
    impl = getDOMImplementation()
    newdoc = impl.createDocument(None, "log_line", None)
    top_element = newdoc.documentElement
    text = newdoc.createTextNode(value[1])
    top_element.appendChild(text)

response = server.insert (agent=soapagent, topic=ecctopic+value[0], name=eccname+key, source=eccsource, payload=value[1])

Web services C Sharp .NET end to end tutorial

Examples demonstrating how to use .NET to consume a ServiceNow web service.

This tutorial will show you how to configure ServiceNow correctly to receive a web service request from your .NET client, as well as how to consume our web services using C# .NET.
Configure C# with .NET
Configure web services within ServiceNow.

1. To configure web services within ServiceNow, access the **System Properties > Web Services** module.

   This module displays the system properties that are specific to web services within your instance. For security reasons, you will want to make sure that you require basic authorization for incoming SOAP requests. This ensures that only authenticated users will be able to make any web services calls, whether it be via web service import sets or inserting/deleting/querying via direct web services.

![Web Services](image)

   **Please edit your changes and press Save**

   **Customization Properties for Web Services**

   **Require basic authorization for incoming RSS requests**
   - [ ] Yes | No

   **Require basic authorization for incoming SOAP requests**
   - [ ] Yes | No

2. This next step is very important if you are using .NET as a client to connect to ServiceNow. You must set the `elementFormDefault` property to false.

   This property defines how the WSDLs are qualified. Of course, if you do not consume our WSDL and just create the XML manually, then this property is irrelevant.

   `[For further documentation, follow this URL: http://wiki.servicenow.com/index.php?title=Web_Services]`
   - [ ] Yes | No

---

*Call a web service in visual studio .NET*

Call a web service using Visual Studio 2008.

In this example, we will be using Visual Studio 2008. First, create a new Windows Form Application for this example.
Figure 829: Dot net project

On the resulting form, we created a richTextBox (which we named 'richTextBoxResult') and a button (named buttonResult).
Use a service reference in a C Sharp integration

Use a wizard to add a service reference for a C Sharp integration.

Go to the Solutions Explorer and select Service References > Add Service Reference. A wizard will appear asking for an address. Use: https://<instance name>.service-now.com/incident.do?WSDL. Accept the defaults for the rest of the wizard.

Open the app.config file and change the Security mode to “Transport” and the clientCredentialType and proxyCredentialType to “Basic”
Use a web reference in a C Sharp integration

Use a wizard to add a web reference for a C Sharp integration.

Go to the Solutions Explorer and select Service References > Add Service Reference. A wizard will appear. At the bottom of the form, there is an Advanced button. Click on it and click on the Add Web Reference button at the bottom of the new wizard page. This will start the Web Reference wizard. For the URL, use: https://<instance name>.service-now.com/incident.do?WSDL and name the web reference, 'WebReference1'. Accept the defaults for the rest of the wizard.

C Sharp integration source code

After defining the source code, insert it.

Now we are ready to insert the code. Double-click on the Send Web Service button on your form to open the backend code to the form that has been created. Here is the code to insert a record into the demo instance and to read the response.

```csharp
using System;
using System.Collections.Generic;
using System.ComponentModel;
using System.Data;
using System.Drawing;
using System.Linq;
using System.Text;
using System.Windows.Forms;

namespace ExampleWebServiceForWiki
{
    public partial class FormMain : Form
    {
        public FormMain()
        {
            InitializeComponent();
        }

        private void buttonSend_Click(object sender, EventArgs e)
        {
            /* SERVICE REFERENCE-SPECIFIC CODE
             ServiceReference1.ServiceNowSoapClient soapClient = new ServiceReference1.ServiceNowSoapClient();
             soapClient.ClientCredentials.UserName.UserName = "itil";
             soapClient.ClientCredentials.UserName.Password = "itil";
             ServiceReference1.insert insert = new ExampleWebServiceForWiki.ServiceReference1.insert();
             ServiceReference1.insertResponse response = new ExampleWebServiceForWiki.ServiceReference1.insertResponse();
             // END OF SERVICE REFERENCE CODE */
```
C Sharp integration results
If you have followed the tutorial correctly, you should receive the result whether you used a Service Reference or a Web Reference.

If you have followed this tutorial correctly, you should receive the following result whether you used a Service Reference or a Web Reference.

Figure 832: Dot net tutorial results
Troubleshoot a null response in a C Sharp integration
Receiving a null response from ServiceNow's web service.

If you are receiving a "null" response from your web service in your client code, then you may have missed the step in this tutorial for setting the elementFormDefault setting to "False". Here is a quick video tutorial that shows you how to do this.

Remember to recompile your code against the WSDL after you have changed this setting and saved it.

Retrieve a large number of records using SOAP
By default, a single SOAP request can retrieve a maximum of 250 records.

SOAP relies on Extensible Markup Language (XML) as its message format, and usually relies on other Application Layer protocols (most notably Remote Procedure Call (RPC) and HTTP) for message negotiation and transmission. SOAP can form the foundation layer of a web services protocol stack, providing a basic messaging framework upon which web services can be built.

Because of the verbose XML format, SOAP can be considerably slower than other transport methods. Therefore, sending a large amount of data via SOAP is inefficient and is discouraged. Because of this, ServiceNow has imposed a hard-limit of 250 records that can be retrieved at any time in a single query. You may find that this limit poses some technological challenges for your integration design.

**SOAP strategies**
Retrieve the information that you need and make your integration more efficient.

Use filters to limit the number of results
One of the best ways to make your web service calls fit within the 250 record limit is to think about the design of your integrating application.

For example, let's assume that we are making an incident form in C# to show a user the incidents that are assigned to him.

**Problematic Approach**
The C# application makes a soap call to retrieve all of the incidents within ServiceNow. The application would then store the results locally in memory. When the user decides to view the incidents that are assigned to him, the application loops the the internal array and displays the incidents that are assigned to the user.
**A Better Approach**

The C# application makes a soap call to retrieve all of the incidents within ServiceNow that are assigned to the logged-in user. The results are stored locally in memory. When the user decides to view the incidents that are assigned to him, the application shows all the results to the user.

**The Best Practice**

The C# application makes no SOAP call initially. When a logged-in user decides to view the incidents that are assigned to him, the application presents him with the choice of viewing active, closed, etc. It gives him the ability to filter the results that he wants to see before the SOAP call is even made. Then, the user is only presented with the results that he wished to view.

Use a local data store to pull data from

If a large amount of data needs to be queried often, and the data does not need to be real-time, perform a sync of the ServiceNow table that you're interested in with your integrating application's data store.

**Data push**

- Using a scheduled job, ServiceNow can generate a csv/xml from a report and have it emailed to a specific location. The receiver might have a trigger to take the email attachment, parse it, and populate an internal table from which the application can communicate when the data is needed.
- Using a schedule job, ServiceNow can generate a csv/xml from a report and FTP it to an public FTP/FTPS location. The integrating product would consume this csv file on a regular basis and populate an internal table from which the application can communicate when the data is needed.

**Note:** Currently, the platform does not provide a method for extracting very large amounts of data and sending the output to an FTP server. However, a customization to perform that function is described at [here](#). The customization was developed for use in specific ServiceNow instances, and is not supported by ServiceNow Customer support. The method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Data pull**

Using a cron job, a machine internal to your network can make a wget call to pull csv/xml data from any table within ServiceNow. The integrating product would consume this csv/xml file on a regular basis and populate an internal table from which the application can communicate when the data is needed. Examples of the wget command that would be used:

- wget --user=itil --password=itil --no-check-certificate https://<instance name>.service-now.com/incident_list.do?CSV
- wget --user=itil --password=itil --no-check-certificate https://<instance name>.service-now.com/incident_list.do?XML

Use Java/C#/PHP code to fetch the XML data using basic authentication

If a local data store is not an option, another way to get the data is to call the CSV/XML processor directly and then parse the results.

Use the resulting data in a similar manner as you would a direct SOAP call. An example of this in PHP:
//This example is in PHP

$user = "itil";
$pass = "itil";
$userPass = $user.':'.$pass;

$ch = curl_init();
curl_setopt($ch, CURLOPT_URL, 'https://<instance name>.service-now.com/incident_list.do?CSV');
curl_setopt($ch, CURLOPT_HEADER, 0);
curl_setopt($ch, CURLOPT_RETURNTRANSFER, 1);
curl_setopt($ch, CURLOPT_FOLLOWLOCATION, true);
curl_setopt($ch, CURLOPT_HTTPAUTH, CURLAUTH_BASIC);
curl_setopt($ch, CURLOPT_USERPWD, $userPass);
$data = curl_exec($ch);
$info = curl_getinfo($ch);

if ($output === false) {
    $output = "No cURL data returned for $addr ["." $info['http_code']]. ""]";
    if (curl_error($ch))
        $output .= "\n". curl_error($ch);
    print $output;
} else{
    echo $data;
} 
curl_close($ch);

EXCEL web service

The platform supports programmatic retrieval of Excel binary formatted data through an HTTP GET request.

The request is triggered by use of a URL parameter EXCEL. For example, to retrieve a list of incidents and save them to an Excel file, issue an HTTP GET to the following URL:

https://instance_name.service-now.com/incident.do?EXCEL

The Content-Disposition HTTP header in the response displays the file name and extension of the resulting file. In the example, it will be "incident.xls".

EXCEL web service parameters

Use URL parameters to customize and filter the response.

**sysparm_query**

Enter an encoded query string in this parameter. The parameter filters the data using the encoded query before returning the Excel file. The following request filters the list to return only incidents that are active:

https://instance_name.service-now.com/incident.do?
EXCEL&sysparm_query=active=true
**sysparm_view**

The value of this URL parameter indicates which list view to use to limit the field values that are returned. For example, to use the "ess" view:

```
https://instance_name.service-now.com/incident.do?EXCEL&sysparm_view=ess
```

**CSV Web service**

An administrator can retrieve CSV data using an HTTP GET request.

Trigger a request using a CSV URL parameter. For example, to retrieve a list of incidents and save them to a CSV file, issue an HTTP GET to the following URL: `https://instance_name.service-now.com/incident.do?CSV`

The Content-Disposition HTTP header in the response indicates the file name and extension of the extract; "incident.csv" in the example.

**CSV Web service parameters**

The following URL parameters customize and filter the CSV content that is returned by an HTTP GET request.

**sysparm_query**

Enter an encoded query string in this parameter. Use the parameter to filter the data using the encoded query before returning the CSV content. The following request filters the list to return only active incidents:

```
https://instance_name.service-now.com/incident.do?CSV&sysparm_query=active=true
```

**sysparm_view**

The value indicates which view to use to limit the field values that are returned. For example, to use the "ess" view:

```
https://instance_name.service-now.com/incident.do?CSV&sysparm_view=ess
```

**Adding data to tables by posting a CSV file**

You can create new data by posting a CSV file directly to a table.

The CSV file headers must match the field columns in the targeted table.

**JSONv2 Web Service**

The ability to describe sets of data in JSON format is a natural extension to the JavaScript language. ServiceNow supports a web service interface that operates on the JSON object as the data input and output format.

The JSONv2 web service is provided by a platform-level processor similar to the services for SOAP, WSDL, CSV, Excel, and XML. Like those services, the JSON web service is triggered by a standalone JSONv2 URL parameter. For example:

```
https://<instance name>.service-now.com/mytable.do?JSONv2
```
Having the JSON object available as a data format for web services means that you can create (insert), update, and query any data in the system using the JSON object format, and get results in the JSON object format.

**Security**

Like all other HTTP-based web services available on the platform, the JSONv2 web service is required to authenticate using basic authentication by default. The user ID that is used for authentication is subjected to access control in the same way as an interactive user.

**JSON object format**

The JSON object is built in two structures.

- A collection of name/value pairs. In various languages, this is realized as an object, record, struct, dictionary, hash table, keyed list, or associative array.
- An ordered list of values. In most languages, this is realized as an array, vector, list, or sequence.

In its simplest form, a JSON object is just a comma delimited set of name/value pairs. For example:

```json
{"name one":"value one","name two":"value two"}
```

The following is a sample of a single record array of incidents in JSON:

```json
{"records": [
{"closed_by":null,
"__status": "success",
"category":"inquiry",
"escalation":"0",
"state":"1",
"location":null,
"reassignment_count":"0",
"time_worked":null,

"active":null,
"opened_by":null
]}
```
The following is a record array of incident responses with an error.

```json
{
  "records": [
    {
      "__error": {
        "message": "Invalid Insert into: incident",
        "reason": "Data Policy Exception: Short description is mandatory"
      },
      "__status": "failure",
      "active": "true",
      "activity_due": "",
      "approval": "not requested",
      "approval_history": "",
      "approval_set": "",
      "assigned_to": "",
      "assignment_group": "d625dccec0a8016700a222a0f7900d06",
      "business_duration": "",
      "business_stc": "",
```
```
JSON response status

JSONv2 requests may return one of several response statuses.

**JSON Success Response**

Each JSON success response includes a record array containing the records retrieved by the given action. Each JSON object contains one or more metadata elements, prefixed with __, regarding the status for the action on each record, as illustrated in the previous examples. The JSON success responses use the following syntax:

```
__status
"__status": "<value>"
```

where <value> is success or failure.

__error

When the `status` element returns failure, the `error` element is added to identify the error and reason.

```
"__error": { "message": "<error value>", "reason": "<reason value> " }
```

where `<error value>` is the error message text and `<reason value>` is the reason the error was triggered.

**JSON Failure Response**

Each JSON failure response contains only the error and reason elements, which indicate the error message and more details about the error. Generally, this indicates that the whole JSON operation failed and no records can be processed.

For example:

```
{"error":"Cannot update with empty sysparm_query","reason":null}
```

**Setting the number of rows returned**

The following system property controls how many rows JSON returns with each query.
Table 1086: Setting the Number of Rows Returned

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.processor.json.row_limit</td>
<td>Specify the maximum number of rows a JSON query returns.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 10,000</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties</td>
</tr>
</tbody>
</table>

Requiring basic authentication for incoming JSONv2 requests

The following system property controls whether basic authentication is required for incoming JSONv2 requests.

Table 1087: Requiring Basic Authentication for Incoming JSONv2 Requests

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.basicauth.required.jsonv2</td>
<td>Enables (true) or disables (false) requiring basic authentication for incoming JSONv2 requests.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties</td>
</tr>
</tbody>
</table>

Action parameters

Action parameters are separate and different from data parameters because they specify the action to take when the JSON object parameter is part of an HTTP GET or POST request.

The parameters can also be specified as a field in the supplied JSON object. They have the effect of triggering an action in the case of sysparm_action, or filtering the results of an update or query in the case of sysparm_query.

**sysparm_action**

The following are the valid values for sysparm_action and the corresponding action triggered by the API.

Table 1088: Data Retrieval

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getKeys</td>
<td>Query the targeted table using an encoded query string and return a comma delimited list of sys_id values.</td>
</tr>
<tr>
<td>getRecords</td>
<td>Query the targeted table using an encoded query string and return all matching records and their fields.</td>
</tr>
</tbody>
</table>
**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get</td>
<td>Query a single record from the targeted table by specifying the <code>sys_id</code> in the <code>sysparm_sys_id</code> URL parameter, and return the record and its fields.</td>
</tr>
</tbody>
</table>

**Table 1089: Data Modification**

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert</td>
<td>Create one or more new records for the table targeted in the URL.</td>
</tr>
<tr>
<td>insertMultiple</td>
<td>Create multiple new records for the table targeted in the URL.</td>
</tr>
<tr>
<td>update</td>
<td>Update existing records in the targeted table in the URL, filtered by an encoded query string.</td>
</tr>
<tr>
<td>deleteRecord</td>
<td>Delete a record from the table targeted in the URL by specifying its <code>sys_id</code> in the <code>sysparm_sys_id</code> URL parameter.</td>
</tr>
<tr>
<td>deleteMultiple</td>
<td>Delete multiple records from the table targeted in the URL, filtered by an encoded query string.</td>
</tr>
</tbody>
</table>

**sysparm_query**

Specify an encoded query string to be used in `get`, `getRecords`, `update` or `deleteMultiple` `sysparm_action` value.

**sysparm_view**

Specify a form view to customize the return values for `get` and `getRecords` function calls. When using a view, the query returns only the fields defined in the view, including referenced values. If there is no view name, or if the view name is not valid, then the query returns all field names that are marked active in the dictionary.

**sysparm_sys_id**

Specify a target `sys_id` during a `get` or `delete` function call (`sysparm_action` value).

**sysparm_record_count**

Specify an integer value to limit the number of records retrieved for this request. Note that this value is capped by the `glide.processor.json.row_limit` system property.
**displayvalue**

Get the display value of a reference field, if any are in the record. For example, the Incident record can have an `assigned_to` field that is a reference to a user record. Instead of sending the `sys_id` of the user record, the user name is sent.

The `displayvalue` parameter can have three values: `true`, `false`, or `all`.

- **true**: All the references fields show the display value instead of `sys_id`.
- **false** (default): All reference fields show `sys_ids`.
- **all**: The display value and the `sys_id` are shown. For example, the `assignedto` field in the Incident record is sent back as `assigned_to:1234556, dv_assigned_to:Fred Luddy`.

**displayvariables**

Set this boolean value to **true** during a get or getRecords function call to retrieve all variables attached to this record.

**Data retrieval API**

Query for data by issuing an HTTPS GET request to the instance.

By default, a GET request is interpreted as a get function if a `sysparm_sys_id` parameter is present. Otherwise, it is interpreted as a getRecords function. You can also specify a URL parameter `sysparm_action=get`. Query responses are always encapsulated by a records hash of records, where each individual record's values are themselves hashed by field name.

**Return Display Value for Reference Variables**

When you are getting a record from a `get` or `getRecords` function, all the fields associated with that record are returned. The fields are often reference fields that contain a `sys_id` for another table. The base system behavior is to return the `sys_id` value for those fields. To have the display value for the field returned, use one of these options:

- Add the property `<tt>glide.json.return_displayValue</tt>` to the system properties, and every JSON request will return a display value for a reference field.
- Add the parameter `displayvalue=true` to the JSON request URL and JSON requests with that parameter will return a display value instead of the `sys_id` for a reference field. The JSON URL would look like this:

  ```
  https://<instance name>.service-now.com/incident.do?
  JSON&sysparm_action=getRecords&sysparm_query=active=true^category=hardware&displayvalue=true
  ```

- Add the parameter `displayvalue=all` to the JSON request URL and JSON requests with that parameter return a display value and the `sys_id` for a reference field. The response element name for the display value field will be prefixed with `dv_`, for example `dv_caller_id`.

**Return Display Variables**

Use the `display variables` parameter to return an array of variables associated with a service catalog item record when using a `get` or `getRecords` function. The variables are expressed hierarchically. A variable container has the container's variables in its children field.
To get display variables, add the parameter displayvariables=true to the JSON request URL. The JSON request URL would look like:

```plaintext
https://<instance name>.service-now.com/sc_req_item.do?
JSONv2&sysparm_action=getRecords&
sysparm_query=active=true^short_description=Laptop%20preconfigured%20for%20developers&displayvariables=true
```

White space has been added to the following example for clarity:

```json
```

**Control the order of records**

You can control the order that records appear in the JSON response. To set an order, use the ORDERBY or ORDERBYDESC clauses in the URL encoded query. For example,

```plaintext
sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory
```

filters all active records and orders the results in ascending order by number first, and then in descending order by category. For more information, see Encoded query strings.

**getKeys**

Get the sys_id of multiple records by specifying an encoded query string in the sysparm_query parameter.

```plaintext
https://<instance name>.service-now.com/incident.do?
JSONv2&sysparm_action=getKeys&sysparm_query=active=true^category=hardware
```

**get**

Get a record directly by specifying the sys_id in a sysparm_sys_id parameter.

```plaintext
https://<instance name>.service-now.com/incident.do?
JSONv2&sysparm_sys_id=9d385017c611228701d22104cc95c371
```
Optionally, you may also specify the `sysparm_action` parameter:

```
https://<instance name>.service-now.com/incident.do?
JSONv2&sysparm_action=get&sysparm_sys_id=9d385017c611228701d22104cc95c371
```

**getRecords**

Get all records by specifying an encoded query string in the `sysparm_query` parameter.

```
https://<instance name>.service-now.com/incident.do?
JSONv2&sysparm_action=getRecords&sysparm_query=active=true^category=hardware
```

**Data modification API**

Modify data using the JSON web service by sending an HTTPS POST request to the instance.

The HTTP POST must contain a `sysparm_action` parameter to indicate the type of action to be performed, with the incoming JSON object post in the body.

**Note:** The content-type of the POST should be application/json. It cannot be application/x-www-form-urlencoded or multipart/form-data.

**insert**

Create a new record in ServiceNow. The JSON object has to be POSTed as the body (content-type is usually application/json, although not enforced). The response from the record creation is a JSON object of the incident that was created.

For example, posting the following JSON object:

```
{ "short_description": "this is a test", "priority": "1" }
```

to the following URL:

```
https://your_instance.service-now.com/incident.do?
JSONv2&sysparm_action=insert
```

creates an incident.

Optionally, you may also specify the `sysparm_action` in the JSON object. The parameter inside the JSON object takes precedence over the URL parameter. For example:

```
{ "sysparm_action": "insert", "short_description": "this is a test", "priority": "1" }
```

**insertMultiple**

To create multiple new records in ServiceNow, the input JSON object for the insert function must be an array. The response from the record creation is a JSON object of the incidents that were created. For example, the following JSON object:

```
{ "records" : [ { "short_description" : "this was inserted with python using JSON 1" , "priority" : "1 - Critical" , "impact" : "1" , "caller_id" : "Fred Luddy" } , { "short_description" : "this was inserted with
```
posted to one the following URLs:

https://<instance name>.service-now.com/incident.do?JSONv2&sysparm_action=insert
https://<instance name>.service-now.com/incident.do?JSONv2&sysparm_action=insertMultiple

creates two incidents. Note the fields described as an array value for the records field.

**update**

Update a record or a list of records filtered by an encoded query string specified by the sysparm_query URL parameter. The JSON object has to be posted as the body (content-type is usually application/json, although not enforced). The response from the record creation is an array of JSON objects representing the records that were updated.

For example, posting the following JSON object:

```json
{"short_description":"this was updated with python", "priority": "3", "impact": "1"}
```

to the following URL:

https://instance_name.service-now.com/incident.do?JSONv2&sysparm_query=priority=3&sysparm_action=update

updates all incidents with priority 3, and sets the values specified by the JSON object.

**deleteRecord**

Delete a single record from the targeted table, identified by a sysparm_sys_id parameter. The parameter may be encoded in the input JSON object or given as a URL parameter.

For example, posting:

```json
{"sysparm_sys_id":"fd4001f80a0a0b380032ffa2b749927b"}
```

to the following URL:

http://instance_name.service-now.com/incident.do?JSONv2&sysparm_action=deleteRecord

deletes the incident record identified by the sys_id fd4001f80a0a0b380032ffa2b749927b.

**deleteMultiple**

Delete multiple records from the targeted table, filtered by an encoded query string specified in the sysparm_query URL parameter. The filter may also be encoded in the input JSON object.

For example, posting:

```json
{"sysparm_query":"short_description=this was updated with python"}
```
to the following URL:

```
http://instance_name.service-now.com/incident.do?JSONv2&sysparm_action=deleteMultiple
```
deletes all incident records where the `short_description` field contains the value "this was updated with python".

**PDF web service**

The ServiceNow platform supports programmatic retrieval of PDF data through an HTTP GET request. The request is triggered when you use the `PDF` URL parameter.

For example, to retrieve a list of "incidents" and save to a PDF file, issue an HTTP GET to the URL:

```
https://instance_name.service-now.com/incident_list.do?PDF
```

The "content-disposition" HTTP header in the response indicates the file name and extension of the extract. In the example, it will be "incident.pdf"

**Note:** For PDF export, there is a distinction between targeting a table and targeting its list. To generate a PDF of a list of records, suffix the target with "_list". To target a single record, you must specify the `sys_id` parameter to identify the record for which you are generating the PDF.

**PDF web service parameters**

The following URL parameters customize and filter the PDF content that is returned by an HTTP GET request.

### `sysparm_query`

The value of the `sysparm_query` parameter is an encoded query string. Use the parameter to filter the data using the encoded query before returning the PDF content. The following request filters the list to return only active incidents:

```
https://instance_name.service-now.com/incident.do?PDF&sysparm_query=active=true
```

### `sysparm_view`

The value of the `sysparm_view` parameter specifies which list view to use to limit the field values that are returned. For example, to use the "ess" view, use:

```
https://instance_name.service-now.com/incident.do?PDF&sysparm_view=ess
```

**To generate a list,** use:

```
https://instance_name.service-now.com/incident_list.do?PDF&sysparm_view=ess
```

**XML web service**

The ServiceNow platform supports programmatic retrieval of XML data through a URL query (HTTP GET request).

The request is triggered by use of a URL parameter. The following XML-based export formats from a URL query are supported.
Table 1090: XML-based export formats

<table>
<thead>
<tr>
<th>Export Processor</th>
<th>URL Syntax</th>
<th>Example URL</th>
</tr>
</thead>
</table>

An example XML document retrieved using a URL with the following pattern https://instancename.service-now.com/change_request.do?XML is displayed below. Access control is protected using Basic Authentication.

```xml
<xml>
  <change_request>
    <description>Please install new Cat. 6500 in Data center 01</description>
    <category>Hardware</category>

XML web service parameters

ServiceNow supports the URL parameters, sysparm_query and useUnloadFormat, to customize and filter the response you get.

Table 1091: XML web service parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_query</td>
<td>The value for this URL parameter is that of an encoded query string and when used, will filter the data using the encoded query before returning the XML file. The following request will filter the list to only return &quot;incidents&quot; that are active:</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>useUnloadFormat</td>
<td>This parameter indicates that the XML format that is returned to be of an unload format. The unload format is the same format you get when you from a list in the UI, you right-click a list header and select <strong>Export &gt; XML &gt; .</strong> The unload-formatted XML can be imported back into the instance by administrators of your system. To enable the unload format from a URL, use the useUnloadFormat=true URL parameter. For example: <a href="https://instance_name.service-now.com/incident.do?XML&amp;useUnloadFormat=true">https://instance_name.service-now.com/incident.do?XML&amp;useUnloadFormat=true</a></td>
</tr>
</tbody>
</table>

Using tyhe URL parameter produces an XML format that looks like:

```xml
<unload unload_date="2010-03-12 17:48:30">
  <incident action="INSERT_OR_UPDATE">
    <description/>
    <category>inquiry</category>
    <due_date/>
    <comments/>
    <knowledge>false</knowledge>
    <business_stc>15261</business_stc>
    <active>false</active>

    ...
  </incident>
</unload>
```
RSS web service

RSS (Rich Site Summary) is a format for delivering web-based information that changes regularly.

RSS feed generator

ServiceNow supports the dynamic generation of RSS feeds.

Much like our Web Services implementation, the retrieval of an RSS feed representation of information is simply done by specifying an RSS parameter at the end of the URL to a table list. For example, the following will return a list of all incidents in RSS 2.0 format:

Adding a Query

To associate a query to the list so that a filtered list is returned, use the sysparm_query parameter. For example, the following will return a list of all incidents where the priority field is 1 (Critical):

```url
https://<instance name>.service-now.com/incident.do?
sysparm_query=priority=1&RSS
```

If you have a multi part query then you would separate the parts with the ^ character. For example to get all priority 1 incidents with a category of software you would:

```url
https://<instance name>.service-now.com/incident.do?
sysparm_query=priority=1^category=software&RSS
```

If you want to query on a field that is a reference to another file then you need to use javascript to resolve the reference to the other file. For example, the assigned_to field in incident is a reference to a user record. If you wanted to find all the incidents assigned to "ITIL User" then you would do the following:

```url
https://<instance name>.service-now.com/incident.do?
sysparm_query=assigned_to=javascript:GetIDValue('sys_user','ITIL%20User')&RSS
```

Note: You can in most cases simply append "&RSS" to a URL that you generate in the UI or that of your favorite module. The easiest way to get the URL is to simply click the last breadcrumb from the list view. After appending "&RSS" then you can use this URL in your RSS feed reader.
Limiting results with a view

The description element in the returned RSS xml is constructed using the view as specified in the URL, when no view is specified, the default no-name view is used.

To change this format, specify the sysparm_view parameter on the URL. For example, the following request will return the incidents list. However the result will be restricted to only the fields available in the ess view:

https://<instance name>.service-now.com/incident.do?sysparm_query=priority=1&sysparm_view=ess&RSS

Additionally, the RSS item title can be modified using the sysparm_title_view URL parameter. When specified, the item title will be constructed using the fields specified in the view. For example:

Formatting results

The description element in the returned RSS xml can be formatted by setting the URL parameter sysparm_format=true and specifying the format string in the property glide.rss.description_format.

By default, when the URL parameter is present, the description element will be formatted to contain the field label and value using the following format string:

<b>{1}</b>: {2}<br/>

- {0} - field name
- {1} - field label
- {2} - field value

This default format string can be overridden using the property glide.rss.description_format. An example of the formatted RSS feed can be seen in the following screen capture from Firefox:
To enforce basic authentication on each request for an RSS feed, set the property glide.basicauth.required.rss to true. RSS request would have to contain the Authorization header as specified in the Authentication protocol. Because the request is non-interactive, we always require the Authorization header during a request.

**Note:** If you plan to disable RSS basic authentication, make sure that tables in the platform have the right ACL entries to protect from unauthorized access.

To specify basic authentication on the URL, put the username and password pair separated by a colon in front of the server name before an @ character. For example, to submit the demo credentials for the ITIL user, use the following URL.

```
https://itil:itil@<instance name>.service-now.com/incident.do?RSS
```

Some older browsers, such as Microsoft IE 7 do not support direct URL authentication. If the site uses basic authentication, Internet Explorer automatically prompts users for a user name and a password. In some cases, users can click the Remember my password box in the prompt to save their credentials for later visits to that site.

**RSS title override**

You may optionally override the automatically generated title of the RSS feed by added the sysparm_title parameter to the request URL.
For example, you can specify the title *Priority One Incidents* using the following request URL.

```plaintext
https://<instance name>.service-now.com/incident.do?
sysparm_query=priority=1&sysparm_view=ess&RSS=sysparm_title=Priority%20One%20Incidents
```

This will produce results as follows:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<rss version="2.0">
  <channel>
    <title>Priority One Incidents</title>
    <link>http://www.service-now.com/demo/nav_to.do?url=incident.do?sysparm_query=priority=1</link>

```

**Figure 835: RSS Out**

**RSS feed reader**

Create a scrolling RSS feed reader using a UI page.

You must create a feed parser using an RSS API, such as the Google Feed API.

Developer's guide: http://code.google.com/apis/ajaxfeeds/documentation/

**Scrollable areas**

A scrollable area is a div where contents scroll from the bottom up over time.

You can scroll any HTML content, and anything inside the scroller is operational HTML with functioning links and images.
To make a scrollable areas, wrap the scrolling content inside of a scrollable_area tag, likely in a UI Page:

```xml
<g:scrollable_area height="100px">
  <g2:evaluate var="jvar_temp" expression="var kb = new GlideRecord('kb_knowledge');="/>
  <g:inline template="kb_section.xml"/>
</g:scrollable_area>
```

The system will then create a 100 pixel high div and the contents will automatically scroll from bottom to top. If you have a 1000 pixel high block of text, for example, you'll see the top 100 pixels and then pixels 2-101, then 3-102, etc. Once it reaches the top it'll wrap back around to the bottom.

This sample code will create a scroller with a list of priority 1 incidents.

```xml
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:glide="null">
  <g2:evaluate var="jvar_inc">
    var inc = new GlideRecord('incident');
    inc.addActiveQuery();
    inc.addQuery('priority',1);
    inc.query();
  </g2:evaluate>

  <g2:scrollable_area height="100px">
    <table border="0" cellspacing="2" cellpadding="0" width="100">
      <j2:while test="$[inc.next()]">
        <j2:set var="jvar_inc_link" value="incident.do?sys_id=$[inc.sys_id]"/>
        <j2:set var="jvar_inc_list_link" value="incident_list.do?sysparm_query=active=true"/>
        <tr>
          <td>
            <a href="$[jvar_inc_link]">
              <IMG SRC="images/services.png" style="padding-right:10px"></IMG>
            </a>
            <a href="$[jvar_inc_link]" style="padding-right:10px;color:blue">$[inc.number]</a>
          </td>
          <td>$[inc.short_description]</td>
        </tr>
      </j2:while>
    </table>
    <tr>
      <td align="center" colspan="2"><a href="$[jvar_inc_list_link]" style="color:blue">View all active incidents</a></td>
    </tr>
  </g2:scrollable_area>
</j:jelly>
```

Add scrolling elements in forms
You can add scrolling areas to forms as well as UI pages.

1. Create a UI Macro with the script.
2. Create a Formatter to reference the script.

Priority 1 incidents example
This example scrolling element demonstrates how to create a UI macro to a scrolling list of priority 1 incidents.
Use the following example code:

```xml
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
 xmlns:g2="null">
  <g2:evaluate var="jvar_inc">
    var inc = new GlideRecord('incident');
    inc.addActiveQuery();
    inc.addQuery('priority',1);
    inc.query();
  </g2:evaluate>

  <div style="background-color:DDDDDD; padding-left:10px; line-height:19px;
    border:2px white solid" width="100%" nowrap="true">
    Priority 1 Incidents:
    <input id="make_spacing_ok" style="visibility:hidden;width:0px;"
      title=""/>
  </div>
  <g2:scrollable_area height="100px" width="100%">
    <j2:while test="${inc.next()}">
      <j2:set var="jvar_inc_link" value="incident.do?sys_id=${inc.sys_id}"/>
      <j2:set var="jvar_inc_list_link" value="incident_list.do?sysparm_query=active=true"/>
      <span style="line-height: 10px; padding-left:10px">
        <a href="${jvar_inc_link}"
          style="padding-right:10px; color:blue">${inc.number}</a>
        ${inc.short_description}<br style="line-height:5px"/>
      </span>
    </j2:while>
  </g2:scrollable_area>
</j:jelly>
```

Navigate to **System UI > Formatters** and create a Formatter that refers to the UI Macro above.

**Add a scrolling news panel to your homepage**

To add a scrolling news panel to your homepage:

1. Navigate to a homepage.
2. Click **Add Content** to get a list of possible content types.
3. Click **Scrollers** in the leftmost box of the add content dialog.
4. Click the news scroller.
5. Click **Add** to add it on your page.
News in the scroller
The news scroller gets its news list by going to the Knowledge Base and querying the short descriptions of any items there with a topic of "News".

To add news, go to the Knowledge Base and add new entries with a topic of "News".

Style Control

If you want to make a headline standout in the news scroller, use HTML tags on the short description. For example, enter `<b>My Bold Test</b>` and My Bold Test will appear in the scroller.

Note: The property glide.ui.escape_text must be false to use HTML formatting.

Scrolling News Panel Notes and Limitations

Scrollable news panels offer a way for you to display high impact news items on your users home pages in an eye catching scrolling news display.

- Scrolling is currently always from the bottom to the top.
- Scrolling is 1 pixel a at a time every 100 ms.
- You can have as many scrollable areas on a screen as you want (they get system generated unique names).
- Works in Internet Explorer and Firefox.
- If the object you are scrolling is shorter than the scrollable area, it still scrolls.
- If you mouse over a scrollable area, it stops scrolling (so you can click something without chasing it as it scrolls).

RSS feed reader example
An example of how to set up an RSS feed reader using a CNN RSS feed.

Step 1. Create UI Page

Set up a UI page named 'render_gadget_widgetRSS' with the following HTML

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide"xmlns:j2 = "null" xmlns:g2 = "null" ><style
   type = "text/css" >
   #feedControl .gf-title {
     color:#0000ff;
   }
 </style>
<g2:scrollable_area height = "100px" ><div id = "feedControl"
  >Loading...</div><script type = "text/javascript" >
google.load("feeds", "1");

function initialize() {
```

© 2017 ServiceNow. All rights reserved. 3401
var feedControl = new google.feeds.FeedControl();
feedControl.addFeed("http://rss.cnn.com/rss/cnn_topstories.rss", "CNN");
feedControl.setLinkTarget(google.feeds.LINK_TARGET_BLANK);
feedControl.setNumEntries(5);
feedControl.draw(document.getElementById("feedControl"));
}

if(typeof google == "undefined" || navigator.appName == "Microsoft Internet Explorer"){
    //Give us some time to load the script
    setTimeout('initialize()',1500);
}
else{
    initialize();
}
</script></g2:scrollable_area></j:jelly>

### Step 2. Create UI Widget

Create a new javascript widget under 'System UI > Widgets' with the following script. You can replace the 'RSS Feed Sample' line with the title of your widget. 'widgetRSS' should be replaced with whatever comes after 'render_gadget_' in the name of your UI page.

```javascript
function sections () { return { 'RSS Feed Sample' : { 'type' : 'widgetRSS' } } };

function render () { var type = renderer.getPreferences().get( "type" );
    var gf = new GlideForm(renderer.getGC(), "render_gadget_" + type, 0);
    gf.setDirect( true );
    gf.setRenderProperties(renderer.getRenderProperties()); return gf.getRenderedPage(); }

function getEditLink () { return "sys_ui_page.do?
    sysparm_query=name=render_gadget_" + renderer.getPreferences().get( "type" ); }
```

### Step 3. Create Global UI Script

Create a UI script under System UI > UI Scripts with the following script. Select the Global checkbox on the UI Script form. The script must include your Google API key.

```javascript
document.write('<script type="text/javascript" src="https://www.google.com/jsapi?key=your_instance_api_key_here"></script>');
document.write('<script type = "text/javascript" >google. load ( "feeds" , "1" );</script >');
```

You can now navigate to your homepage and add the widget. Below is a sample showing what the widget looks like.
Web services security

Web services security is enforced using a combination of basic authentication challenge/response for the HTTP protocol and system-level access control using the Contextual Security Manager.

To enforce basic authentication on each Web Service request, each request must contain the **Authorization** header as specified in the **Basic Authentication** protocol. Because the request is non-interactive, the **Authorization** header is required in a request.

There is an added advantage when you supply basic authentication information whether or not it is required: the data that is created or updated as a result of the Web service invocation is done on behalf of the user supplied in the basic authentication credentials. For example, when creating an Incident record, the **journal** fields will contain the user ID of basic authenticated user, instead of the default "Guest" user.

Outbound web services

Outbound web services allow you to access remote endpoints and perform web service requests from a ServiceNow instance.

Outbound REST web service

ServiceNow outbound REST functionality allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

A REST message can be sent by a REST workflow activity or by using the RESTMessageV2 script API. You can run REST messages from a MID Server which allows the message to communicate with REST providers on an internal network.

ServiceNow REST functionality is flexible enough to accommodate many web service APIs. Be sure you are familiar with your web service and the parameters it accepts before attempting to define a REST message in ServiceNow.

The following video tutorial demonstrates how to configure outbound REST web service messages to consume third-party web services from the ServiceNow platform.

REST message elements

An outbound REST message is composed of several elements, such as the endpoint and HTTP methods. A REST message contains the following elements:
Create a REST message

You can send requests to a REST web service endpoint by creating a REST message record.

Role required: web_service_admin

1. Navigate to System Web Services > REST Message.
2. Click New.
3. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this message.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Enter the endpoint that this REST message is sent to. The endpoint value may include variables using the format <code>${variable}</code>.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Authentication type | Select the type of authentication to use, if any, and the profile record that contains the user credentials.
Outbound REST supports basic authentication and OAuth 2.0. Outbound REST supports mutual authentication with basic authentication only.
Authentication configured here is inherited by the associated HTTP methods. You can configure authentication for each method which overrides any authentication setting at the message level.

HTTP Headers | Double-click a row in the HTTP Headers embedded list to define the header Name and Value.
The web service provider determines which headers are supported or required.
See List of HTTP Header Fields for a list of HTTP header fields.

4. **Click Submit.**

   ServiceNow saves the record and automatically creates HTTP methods (get, put, post, and delete).

After creating the REST message, you can define new HTTP methods and run a request.

*Define a REST message HTTP method*

Define an HTTP method such as GET or POST to send a request to a web service provider.

Role required: web_service_admin

When you create a REST message record, several default HTTP methods are automatically created using settings inherited from the REST message record, such as the **Endpoint**. You can create additional HTTP methods or modify the default HTTP methods to implement new behavior.

1. **Navigate to System Web Services > Outbound > REST Message.**
2. **Select a REST message you want to define an HTTP method for.**
3. **In the HTTP Methods related list, click New.**
4. **Enter the Method you want to implement, such as GET or POST.**
5. **Enter the Endpoint this HTTP method should access.**
   - The endpoint value may include variables using the format ${variable}.
6. **Right-click the form header and select Save.**

   After creating the HTTP method, you can override the security settings from the parent REST message, configure HTTP headers, add variables, or test the method. For PUT, POST, and PATCH methods you can define a message body.

*Testing REST message HTTP methods*

After configuring an HTTP method for an outbound REST message, you can test it to ensure that the request is valid and the response returns as expected.

To test an HTTP method, click the **Test** related link on the HTTP Method form.
Each test run displays the response status, such as 200 for a successful GET request, the full endpoint URL, any parameters passed in the request, and the response body.

**Note:** Fields on the Test Runs form are for information only; changes to these fields do not apply to the REST message or HTTP method. Do not modify these values when testing different REST message configurations. Instead, update the REST message or HTTP method, then run a new test.

If the HTTP method includes variables, the **Test value** for each variable in the **Variable Substitutions** related list is used when testing the method.

Completed test runs for an HTTP method appear in the **Test Runs** related list.

**Define a REST message HTTP header**

Define an HTTP header for a REST message or HTTP method to send that header with REST requests.

Role required: web_service_admin

You can specify an HTTP header for a REST message, or for an HTTP method. Headers defined for a REST message apply to all HTTP methods for that REST message. If you specify the same header for both a REST message and a child HTTP method, the value defined for the HTTP method overrides the value from the parent REST message.

1. Navigate to **System Web Services > REST Message**.
2. Select a REST message.
3. Optional: To specify a header for an HTTP method instead of the REST message, in the **HTTP Method** related list, select an HTTP method.
4. Select the **HTTP Request** tab.
5. In the **HTTP Headers** embedded list, click **Insert a new row**.
6. Enter the name of the header, such as Content-Type or Accept.
   
   Supported headers depend on the REST web service provider you want to connect to. Refer to the documentation for your web service provider to identify which headers are valid or required.

   7. Click on the **Value** field for the new row and enter the value you want to assign this header.

   You can use a variable in the format ${variable} instead of a static value. You can assign a value to the variable when sending a REST request.

8. Click **Update**.

**Sending outbound REST messages through a MID Server**

You can configure a REST message HTTP method to be sent through a MID Server.

By using a MID Server, the request can reach an endpoint that is behind a firewall or within a private network.

To configure an HTTP method to use a MID Server, select a MID Server in the **Use MID Server** field on the HTTP Method form. The instance must have an active MID Server to use this functionality.

**Using special characters in URLs**

A REST function URI or function variable may use special characters, such as pipe (|) characters.

When using these characters in a REST message, use URL encoding to escape these characters. For example, to use a parameter value of user|title, enter user%7Ctitle. Entering special characters directly may cause the REST message to fail and display the response Invalid uri <URI>: Invalid query.

**Outbound REST authentication**

Outbound REST messages support multiple types of authentication.

Different web service providers may require a specific type of authentication.

Outbound REST supports the following authentication formats.
Authentication requirements

Outbound REST supports mutual authentication only when using basic authentication. Mutual authentication is not available with OAuth 2.0.

OAuth 2.0 can be used only with messages that are not configured to use a MID Server. You cannot send OAuth 2.0 authenticated messages through a MID Server.

When scripting new REST messages configured with authentication you must use the RESTMessageV2 API. The legacy RESTMessage APIs do not support current authentication formats.

Configure a REST message with basic auth
You can configure an outbound REST message to provide basic authentication credentials with each request.

Role required: web_service_admin

Before starting this procedure, ensure there is a REST Message record that you want to configure to use basic auth.

Note: Ensure any scripts that call this REST message use the RESTMessageV2 API. The RESTMessageV2 API is required to send authenticated REST messages via scripts.

1. Navigate to System Web Services > Outbound > REST Message.
2. Select a REST message record.
3. In the Authentication type field, select Basic.

Note: The Basic (Simple) choice appears on REST message records configured to use basic authentication prior to the Geneva release. This choice is intended for compatibility with older REST messages and should not be used for REST messages created in the Geneva release or later.

4. In the Basic auth profile field, select the basic authentication profile that contains the credentials you want to send.
5. Click Submit.

Test the REST message to ensure you receive the expected response. You can optionally specify different authentication settings for each HTTP method related to this REST message, overriding the parent REST message settings.

Create a basic auth profile
Create a basic auth profiles to specify basic authentication credentials for one ore more REST messages.

Role required: web_service_admin

1. Navigate to System Web Services > REST Message.
2. Select a REST message record.
3. In the Authentication type field, select Basic.
4. In the Basic auth profile field, click the reference lookup icon.
5. Click New.
6. Enter a descriptive Name for the profile.
7. Enter the Username and Password you want to send as basic authentication credentials.
8. Click Submit.

Configure a REST message to use this basic auth profile.

**Configure a REST message with OAuth**

You can configure an outbound REST message to send OAuth credentials with the request.

Role required: web_service_admin and oauth_admin

Before starting this procedure, ensure:

- There is a REST Message record that you want to configure to use OAuth.
- There is an OAuth provider set up in the OAuth application registry with the OAuth client information to use.
- The OAuth provider has an associated OAuth 2.0 profile.
- The REST message HTTP Methods are not configured to use a MID Server.

**Note:** Ensure any scripts that call this REST message use the RESTMessageV2 API. The RESTMessageV2 API is required to send authenticated REST messages via scripts.

1. Navigate to **System Web Services > Outbound > REST Message**.
2. Select a REST message record.
3. In the **Authentication type** field, select **OAuth 2.0**.
4. In the **OAuth profile** field, select the OAuth 2.0 profile that specifies the credentials you want to send.
5. Right-click the form header and select **Save**.
   An info message appears at the top of the form indicating that you must request a new OAuth token.
6. Click the **Get OAuth Token** related link.
   Depending on your OAuth provider, a separate window from your provider may appear asking for confirmation before providing a token. Complete any steps required by the provider to obtain the token.

Test the REST message to ensure you receive the expected response. You can optionally specify different authentication settings for each HTTP method related to this REST message, overriding the parent REST message settings.

### Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API

This tutorial explains how to use an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information.

The procedures detailed in this tutorial require the oauth_admin and web_service_admin roles. Ensure you have both of these roles before starting this tutorial.

### OAuth 2.0 tutorial - configure the Google service as an OAuth provider

Use the Google Developer Console to set up an OAuth 2.0 provider.

Role required: None

This procedure is performed within the Google Developer Console. You must have a Google account to access this console.

Configure the Google service in order to obtain a client ID and client secret, and specify your ServiceNow instance URL as the OAuth redirect URL.

**Note:** This information describes the state of the Google Developer Console and Contacts API as of July 22, 2015. Changes made after that date may not be included in this document.

1. Navigate to the Google Developer Console ([https://console.developers.google.com](https://console.developers.google.com)).
2. Log in using your Google credentials.
3. Click **Select a project**.
4. Click **Create a project**.
5. Enter a **Project name**.
6. Click **Create**.
   After Google creates the project, the project dashboard appears.
7. Navigate to **APIs & auth > APIs**.
8. Select the **Contacts API**.
9. Click **Enable API**.
10. Navigate to **APIs & auth > Credentials**.
11. Click **Create new Client ID**.
12. Ensure the **Web application** radio button is selected and click **Configure consent screen**.
13. Enter a descriptive **Product name**.
   This name appears when you authorize the OAuth token in your instance.
14. Click **Save**.
15. In the **Create Client ID** window, add the OAuth redirect URI for your instance to the **Authorized redirect URIs** field.
   This URI follows the format `https://<instance>.service-now.com/oauth_redirect.do`
16. Click **Create Client ID**.
   The client ID information appears.
17. Record the **Client ID** and **Client secret** values.
   You will need these values to configure the Google service as an OAuth provider in your instance.

OAuth 2.0 tutorial - create an OAuth provider and profile
Set up the Google service as an OAuth provider in ServiceNow by entering your client information, Google API URLs, and configuring the OAuth profile.

Role required: oauth_admin
You must have configured the Google service as an OAuth provider and recorded your **Client ID** and **Client Secret** values.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. Select **Connect to a third party OAuth Provider**.
4. Enter a **Name** for the OAuth provider. For this example, use **Google**.
5. Enter the **Client ID** and **Client Secret** that you obtained from Google.
6. Set the **Default Grant type** to **Authorization Code**.
   This URL must match the redirect URL provided to Google.
10. In the **Token Revocation URL** field, enter `https://accounts.google.com/o/oauth2/revoke`.
11. Right-click the form header and select **Save**.
   A new OAuth Entity Profile record is created.
12. In the **OAuth Entity Scopes** embedded list, add a new row with the **Name** and **OAuth scope** values set to `https://www.googleapis.com/auth/contacts.readonly`.
13. Right-click the form header and select **Save**.
14. In the **OAuth Entity Profiles** embedded list, select the automatically-created profile.
15. In the OAuth Entity Profile Scopes embedded list, add a new row and select the Google contacts API read-only scope.

16. Click Update.

OAuth 2.0 tutorial - create a REST message
Create a REST message and associated HTTP method to contact the Google service using the OAuth 2.0 profile.

Role required: web_service_admin and oauth_admin
You must have configured an OAuth provider and profile using the Google API information and your OAuth credentials.

1. Navigate to System Web Services > REST Message.
2. Click New.
3. Enter a descriptive Name.
4. In the Endpoint field, enter https://www.google.com/m8/feeds/contacts/default/full.
   By using default instead of a specific username, the Google API uses the OAuth credentials to determine which account to get information from.
5. In the Authentication tab, set the Authentication type to OAuth 2.0.
6. In the OAuth profile field, select the Google contacts OAuth profile.
7. Right-click the form header and select Save.
8. Click the Get OAuth Token related link to request an authorization token from Google using the configured client ID and secret.
9. In the Request for Permission window that appears, click Accept to grant access to your Google contacts.
   The token acquired is not directly accessible in your instance.
10. In the HTTP Methods related list, select the GET method.
11. Leave the HTTP method Authentication type as -- None -- to use the OAuth profile from the parent REST message record.
12. On the HTTP Request tab, add a new row to the HTTP Headers related list with a Name of GData-Version and a Value of 3.0.
13. Right-click the form header and select Save.
14. Click the Test related link.
   The test result should display an HTTP Status of 200, and the result of the contacts API call.

Outbound REST mutual authentication
Mutual authentication causes the web service provider and consumer to authenticate with each other before communicating.

ServiceNow supports mutual authentication for outbound web services. Mutual authentication is not available for inbound web services or for outbound web services that use a MID Server.

Variable substitution in outbound REST messages
You can use variables when creating outbound REST messages and assign values to those variables when performing a request.

Variables are allowed in the Endpoint URL, HTTP Header and HTTP Query Parameter Value fields, and the Content field for POST and PUT methods.

The syntax for variables is ${variable_name}. The REST message substitutes this variable with the parameter values provided when the method runs. For example, if the REST message Endpoint is http://myserver.mycompany.com/offices/${id}, a parameter named id must exist and contain a value that can be used when the method runs.
You can assign a value to variables when running the request using the RESTMessageV2 API
`setStringParameter` and `setStringParameterNoEscape` methods.

When testing an HTTP method that includes variables, the **Test value** for each variable in the **Variable Substitutions** related list is used.

**Generate REST message variables**

You can automatically populate the list of variable substitutions, based on variables defined in several REST message HTTP method fields.

Role required: `web_service_admin`

Before starting this procedure, create a REST Message record with at least one HTTP method that uses variables.

1. Navigate to **System Web Services > REST Message**.
2. Select a REST Message record.
3. Select a method from the **HTTP Methods** related list.
4. Click the **Auto-generate variables** related link.
   - The **Variable Substitutions** related list is automatically populated for any variables defined in the HTTP Method **Endpoint** field and the **HTTP Headers** and **HTTP Query Parameters** embedded lists.
   - For POST and PUT messages, variables defined in the **Content** field are also used.

You can use the REST Message workflow activity to send the message, or click **Preview Script Usage** to get a sample script. The sample script includes a `setStringParameter` call for each defined variable substitution that allows you to assign a value to the variable in your script.

**Scripting outbound REST**

You can call REST methods from any place in the platform where scripting is allowed.

For example, you can return data from a REST endpoint using a business rule when an event is triggered. Create a script from scratch or let the REST message preview feature create the script based on content and parameters you provide in the method record.

**Generate a REST message script preview**

You can generate an example script to send a REST message based on content and parameters you provide in the method record.

Role required: `web_service_admin` or `admin`

Generate an example script and use it as a starting point when scripting outbound REST messages.

1. Navigate to **System Web Services > REST Message**.
2. Select a REST message record.
3. In the **HTTP Methods** related list, select an HTTP method record.
4. Ensure the HTTP method is configured as needed, including any variables.
5. Save the record.
6. In the Variable Substitutions related list, assign a value to each variable.
7. Under Related Links, click **Preview script usage**.
   - The instance displays the script that the REST message generated for this method.
8. Copy this script and modify it as needed to use elsewhere in the instance.

Refer to the RESTMessageV2 and RESTResponseV2 APIs for more information on available scripting methods. Outbound REST scripting examples are also available.

**RESTMessageV2**

The RESTMessageV2 API allows you to send outbound REST messages using JavaScript.

Use the RESTResponseV2 API to manage the response returned by the REST provider.

You can use this API in scoped applications, or within the global scope.

**RESTMessageV2 - RESTMessageV2()**

Instantiates an empty RESTMessageV2 object.

When using an object instantiated this way, you must manually specify an HTTP method and endpoint.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```
var sm = new sn_ws.RESTMessageV2();
```

**RESTMessageV2 - RESTMessageV2(String name, String methodName)**

Instantiates a RESTMessageV2 object using information from a REST message record.

You must have a REST message record defined before you can use this constructor.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the REST message record.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>methodName</td>
<td>String</td>
<td>The name of the HTTP method to use, such as GET or PUT.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> The PATCH method is not supported. Use PUT or POST instead.</td>
</tr>
</tbody>
</table>

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
```

RESTMessageV2 - execute()
Send the REST message to the endpoint.

**Table 1096: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 1097: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTResponse</td>
<td>The response returned by the REST provider.</td>
</tr>
</tbody>
</table>

```
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute(); //Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
```

RESTMessageV2 - executeAsync()
Send the REST message to the endpoint asynchronously. The instance does not wait for a response from the web service provider when making asynchronous calls.

**Table 1098: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Table 1099: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTResponse</td>
<td>The response returned by the REST provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync(); // Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
response.waitForResponse(60); // In seconds. Wait at most 60 seconds to get response from ECC Queue/Mid Server // Might throw exception timing out waiting for response in ECC queue.
```

```javascript
RESTMessageV2 - getEndpoint()
Get the URL of the endpoint for the REST message.
```

### Table 1100: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1101: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL of the REST web service provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getEndpoint();
```

```javascript
RESTMessageV2 - getRequestBody()
Get the content of the REST message body.
```

### Table 1102: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 1103: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>the REST message body.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var body = sm.getRequestBody();
```

RESTMessageV2 - getRequestHeader(String headerName)
Get the value for an HTTP header specified in the REST message.
By default, this method cannot return the value for a header set automatically by the system. To grant this method access to all headers, set the property glide.http.log_debug to true.

Table 1104: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>The request header you want to get the value for.</td>
</tr>
</tbody>
</table>

Table 1105: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var header = sm.getRequestHeader("Accept");
```

RESTMessageV2 - getRequestHeaders()
Get HTTP headers that were set by the REST client and the associated values.
This method does not return headers set automatically by the system. To configure this method to return all headers, set the property glide.http.log_debug to true.

Table 1106: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 1107: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var headers = sm.getRequestHeaders();
```

RESTMessageV2 - setBasicAuth(String userName, String userPass)
Sets basic authentication headers for the REST message.

Setting security values using this method overrides basic authentication values defined for the REST message record.

Table 1108: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userName</td>
<td>String</td>
<td>The username you want to use to authenticate the REST message.</td>
</tr>
<tr>
<td>userPass</td>
<td>String</td>
<td>The password for the specified user.</td>
</tr>
</tbody>
</table>

Table 1109: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setBasicAuth("username","password");
```

RESTMessageV2 - setEccCorrelator(String correlator)
Associate outbound requests and the resulting response record in the ECC queue. This method only applies to REST messages sent through a MID Server.

The correlator provided populates the Agent correlator field on the ECC queue record for the response. Provide a unique correlator for each outbound request to associate the correct results in the ECC queue with the request when designing asynchronous automation through a MID Server.
### Table 1110: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>correlator</td>
<td>String</td>
<td>A unique identifier</td>
</tr>
</tbody>
</table>

### Table 1111: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance", "get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccCorrelator("unique_identifier");
```

RESTMessageV2 - `setEccCorrelator(String name, String value)`

Override a value from the database by writing to the REST message payload. This method only applies to REST messages sent through a MID Server.

Use this method when a value from the REST message in the database is invalid, such as when the endpoint URL is longer than the maximum REST endpoint field length. You can set only the endpoint URL using this method by passing `source` as the name parameter.

### Table 1112: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the parameter, such as <code>source</code>.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign to the specified parameter.</td>
</tr>
</tbody>
</table>

### Table 1113: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance", "get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccParameter("source", "http://very.long.endpoint.url");
```

RESTMessageV2 - `setEndpoint(String endpoint)`

Set the endpoint for the REST message.
By default, the REST message uses the endpoint specified in the REST message record. Use this method to override this default. You must call this method when using the `RESTMessageV2 - RESTMessageV2()` on page 3412 constructor with no parameters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>String</td>
<td>The URL of the REST provider you want to interface with.</td>
</tr>
</tbody>
</table>

Table 1115: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2();
sm.setEndpoint("http://web.service.endpoint");
```

**RESTMessageV2 - setHttpMethod(String method)**

The HTTP method this REST message performs, such as GET or PUT.

You must set an HTTP method when using the `RESTMessageV2 - RESTMessageV2()` on page 3412 constructor with no parameters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>String</td>
<td>The HTTP method to perform.</td>
</tr>
</tbody>
</table>

**Note:** The PATCH method is not supported. Use PUT or POST instead.

Table 1117: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2();
sm.setHttpMethod("post");
```

**RESTMessageV2 - setHttpTimeout(Number timeoutMs)**
Set the amount of time the REST message waits for a response from the web service provider before the request times out.

**Table 1118: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutMs</td>
<td>Number</td>
<td>The amount of time, in milliseconds, before the call to the REST provider times out.</td>
</tr>
</tbody>
</table>

**Table 1119: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setHttpTimeout(6000);
```

**RESTMessageV2 - setMIDServer(String midServer)**
Configure the REST message to communicate through a MID Server.

**Table 1120: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>midServer</td>
<td>String</td>
<td>The name of the MID Server to use. Your instance must have an active MID Server with the specified name.</td>
</tr>
</tbody>
</table>

**Table 1121: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setMIDServer("mid_server_name");
```

**RESTMessageV2 - setMutualAuth(String profileName)**
Set the mutual authentication protocol profile for the REST message.
Setting a protocol profile using this method overrides the protocol profile selected for the REST message record.

### Table 1122: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profileName</td>
<td>String</td>
<td>The Name of the protocol profile to use for mutual authentication.</td>
</tr>
</tbody>
</table>

### Table 1123: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setMutualAuth("mutual_auth_profile_name");
```

**RESTMessageV2 - setQueryParameter(String name, String value)**

Append a parameter to the end of the request URL with the form name=value.

For example, the code

```java
setQueryParameter(“sysparm_query”,“active=true^ORDERBYnumber^ORDERBYDESCcategory”);
```

appends the text sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory to the request URL.

### Table 1124: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the URL parameter to pass.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign the URL parameter.</td>
</tr>
</tbody>
</table>

### Table 1125: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.RESTMessageV2();
//Set up message, including endpoint and authentication
sm.setQueryParameter("sysparm_query","active=true^ORDERBYnumber^ORDERBYDESCcategory");
```
RESTMessageV2 - setRequestBody(String body)
Set the body content to send to the web service provider when using PUT or POST HTTP methods.

When you set the body content using this method, variables in the body are not substituted for parameters from the REST message function record. You must explicitly define all values within the REST message body.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>String</td>
<td>The request body to send.</td>
</tr>
</tbody>
</table>

Table 1127: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Update user","post"); //Might throw exception if message doesn't exist or not visible due to scope.
var body = "<Message body content>";
sm.setRequestBody(body);
```

RESTMessageV2 - setRequestHeader(String name, String value)
Set an HTTP header in the REST message to the specified value.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the header.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign to the specified header.</td>
</tr>
</tbody>
</table>

Table 1129: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setRequestHeader("Accept","Application/json");
```

RESTMessageV2 - setStringParameter(String name, String value)
Set a REST message function variable with the specified name from the REST message record to the specified value.

XML reserved characters in the value are converted to the equivalent escaped characters. Use `setStringParameterNoEscape` to set a variable without escaping XML reserved characters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the REST message variable. This parameter must be defined in the REST message record before you can assign a value to it.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign the variable.</td>
</tr>
</tbody>
</table>

**Table 1131: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameter("s","NOW");
```

**RESTMessageV2 - setStringParameterNoEscape(String name, String value)**

Set a REST message function variable with the specified name from the REST message record to the specified value.

This method is equivalent to `setStringParameter` but does not escape XML reserved characters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the REST message variable. This parameter must be defined in the REST message record before you can assign a value to it.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign the variable.</td>
</tr>
</tbody>
</table>
Table 1133: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameterNoEscape("s","NOW");
```

RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName)

Configure the REST message to save the returned response body as an attachment record.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read and write attachment records, as well as any roles required to read and write records on the table specified in the tableName parameter.

The response body does not need to be a binary file to be saved as an attachment. Response bodies using text formats, such as JSON or XML can also be saved. If the instance fails to save the attachment, call `getErrorMessage()` on the related RESTResponseV2 object for error details.

### Table 1134: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Specify the table that contains the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>recordSysId</td>
<td>String</td>
<td>Specify the sys_id of the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>fileName</td>
<td>String</td>
<td>Specify the file name to give to the saved file.</td>
</tr>
</tbody>
</table>

### Table 1135: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
(function sampleRESTMessageV2() {
  try{
    var request = new sn_ws.RESTMessageV2();
    request.setHttpMethod('get');

    var attachment_sys_id = '<attachment_record_sys_id>',
                            tablename = 'incident',
                            recordSysId = '<incident_sys_id>',
                            response,
                            httpResponseStatus,
```
```javascript
filename = '<filename>'; //endpoint - ServiceNow REST Attachment API
request.setEndpoint('https://<instance_name>.service-now.com/api/now/attachment/' + attachment_sys_id + '/file');
request.setBasicAuth('<username>', '<password>');

//RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName)
request.saveResponseBodyAsAttachment(tablename, recordSysId, filename);

response = request.execute();
httpResponseStatus = response.getStatusCode();

gs.print(" http response status code: " + httpResponseStatus);
} catch(ex){
    var message = ex.getMessage();
gs.print(message);
}
})();
```

**RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName, String encryptContext)**

Configure the REST message to save the returned response body as an encrypted attachment record.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read and write attachment records, as well as any roles required to read and write records on the table specified in the tableName parameter.

The response body does not need to be a binary file to be saved as an attachment. Response bodies using text formats, such as JSON or XML can also be saved. If the instance fails to save the attachment, call getErrorMessage() on the related RESTResponseV2 object for error details.

**Table 1136: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Specify the table that contains the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>recordSysId</td>
<td>String</td>
<td>Specify the sys_id of the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>fileName</td>
<td>String</td>
<td>Specify the file name to give to the saved file.</td>
</tr>
<tr>
<td>encryptContext</td>
<td>String</td>
<td>Specify the sys_id of an encryption context. The saved file is encrypted using this context.</td>
</tr>
</tbody>
</table>
Table 1137: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

RESTMessageV2 - setRequestBodyFromAttachment(String attachmentSysId)
Set the request body using an existing attachment record.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read attachment records.

Table 1138: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentSysId</td>
<td>String</td>
<td>The sys_id of the Attachment [sys_attachment] record you want to send in this REST message.</td>
</tr>
</tbody>
</table>

Table 1139: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

(function sampleRESTMessageV2() {
    try {
        var request = new sn_ws.RESTMessageV2();
        request.setHttpMethod('post');
        request.setEndpoint('<web service endpoint URL>');
        request.setRequestBodyFromAttachment('<attachment sys_id>');
        var response = request.execute();
        var httpResponseStatus = response.getStatusCode();
        gs.print("http response status_code: " + httpResponseStatus);
    }
    catch (ex) {
        var message = ex.getMessage();
        gs.print(message);
    }
})();

RESTMessageV2 - setAuthenticationProfile(String type, String profileId)
Set the credentials for the REST message using an existing basic auth or OAuth 2.0 profile.
Table 1140: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>String</td>
<td>The type of authentication profile to use. Valid values are 'basic' to use basic authentication, or 'oauth2' to use OAuth 2.0.</td>
</tr>
<tr>
<td>profileId</td>
<td>String</td>
<td>The sys_id of an authentication profile record. When using basic auth, specify the sys_id of a Basic Auth Configuration [sys_auth_profile_basic] record. When using OAuth 2.0, specify the sys_id of a OAuth Entity Profile [oauth_entity_profile] record.</td>
</tr>
</tbody>
</table>

Table 1141: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var requestBody;
var responseBody;
var status;
var sm;
try{
  // Might throw exception if message doesn't exist or not visible due to scope.
  sm = new sn_ws.RESTMessageV2("Yahoo Finance", "get");

  //set auth profile to an OAuth 2.0 profile record.
  sm.setAuthenticationProfile('oauth2', '1234adsf12321231123qasdfs');

  sm.setStringParameter("symbol", "NOW");
  sm.setStringParameterNoEscape("xml_data", "<data>test</data>");
  //In milliseconds. Wait at most 10 seconds for response from http request.
  sm.setHttpTimeout(10000);

  //Might throw exception if http connection timed out or some issue with sending
  //request itself because of encryption/decryption of password.
  response = sm.execute();
  responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
  status = response.getStatusCode();
} catch(ex) {
  responseBody = ex.getMessage();
  status = '500';
} finally {
```

© 2017 ServiceNow. All rights reserved.
```javascript
requestBody = sm ? sm.getRequestBody():null;
```

RESTResponseV2
The RESTResponseV2 API allows you to use the data returned by an outbound REST message in JavaScript code.

A RESTResponseV2 object is returned by the RESTMessageV2 functions execute() and executeAsync().

You can use this API in scoped applications, or within the global scope.

RESTResponseV2 - getBody()
Get the content of the REST response body.

Use this function when you want to get the request body as text content. Do not use this method when saving the response as a binary attachment. If a RESTMessageV2 object called the saveResponseBodyAsAttachment(...) function, using getBody() on the associated RESTResponseV2 object will cause an error. When saving the response as an attachment, if the outbound REST message fails, call getErrorMessage() on the response to retrieve the body content.

Table 1142: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1143: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The REST response body.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var responseBody = response.getBody();
```

RESTResponseV2 - getCookies()
Get all cookies included in the response.

Table 1144: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 1145: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The list of cookies. Iterate through the list to perform operations on each cookie.</td>
</tr>
</tbody>
</table>

```javascript
var cookies = response.getCookies();
var i;
for(i=0;i<cookies.size();i++) {
    gs.print('cookie: ' + cookies.get(i));
}
```

Output:
- JSESSIONID=4135AA97A5D12DA22EF614AA2B0CAFD8.node20; Path=/; Secure;
  HttpOnly
- SABASESSIONID=370152970.36895.0000; path=/

**RESTResponseV2 - getErrorCode()**
Get the numeric error code if there was an error during the REST transaction.

This error code is specific to the ServiceNow platform, it is not an HTTP error code. Provide this error code if you require assistance from ServiceNow Customer Support.

Table 1146: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1147: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The numeric error code, such as 1 for socket timeout.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var errorCode = response.getErrorCode();
```

**RESTResponseV2 - getErrorMessage()**
Get the error message if there was an error during the REST transaction.
### Table 1148: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1149: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The error message.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var errorMsg = response.getErrorMessage();
```

**RESTResponseV2** - **getHeader(String name)**
Get the value for a specified header.

### Table 1150: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the header that you want the value for, such as Set-Cookie.</td>
</tr>
</tbody>
</table>

### Table 1151: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var headerVal = response.getHeader("Content-Type");
```

**RESTResponseV2** - **getHeaders()**
Get all headers returned in the REST response and the associated values.
Table 1152: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1153: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var headers = response.getHeaders();
```

RESTResponseV2 - getQueryString()
Get the fully-resolved query sent to the REST endpoint.

This query contains the endpoint URL as well as any values assigned to variables in the REST message. Use this method only with responses to direct requests. This method is not supported for requests sent asynchronously, or requests sent using a MID server.

Table 1154: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1155: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The fully-resolved query.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var queryString = response.getQueryString();
```

RESTResponseV2 - getResponseAttachmentSysid()
Get the sys_id value of the attachment created from the response body content.

If the RESTMessageV2 object associated with this response called the saveResponseBodyAsAttachment(...) function, use getResponseAttachmentSysid() to get the
sys_id of the created attachment record. Use this function when you want to perform additional operations with the new attachment record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1157: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the new attachment record.</td>
</tr>
</tbody>
</table>

RESTResponseV2 - getStatusCode()

Get the numeric HTTP status code returned by the REST provider.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1159: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The numeric status code returned by the REST provider, such as 200 for a successful response.</td>
</tr>
</tbody>
</table>

var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get");  // Might throw exception if message doesn't exist or not visible due to scope. var response = sm.execute(); var statusCode = response.getStatusCode();

RESTResponseV2 - haveError()

Indicate if there was an error during the REST transaction.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 1161: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if there was an error, false if there was no error.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var error = response.haveError();
```

`RESTResponseV2.waitForResponse(Number timeoutSecs)`
Set the amount of time the instance waits for a response from the web service provider.
This method overrides the property glide.rest.outbound.ecc_response.timeout for this REST response.

Table 1162: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutSecs</td>
<td>Number</td>
<td>The amount of time, in seconds, to wait for this response.</td>
</tr>
</tbody>
</table>

Table 1163: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync();
response.waitForResponse(60);
```

**Direct RESTMessageV2 example**
You can send a REST message directly to the endpoint.

In this example, the script sends a REST message requesting a stock quote and waits for a response.
If there is no response from the web service provider, or if the specified REST message record is unavailable, the script throws an error, handled in this example by the try-catch block.

```javascript
var requestBody;
var responseBody;
var status;
var sm;
try{
    sm = new sn_ws.RESTMessageV2("Yahoo Finance", "get"); // Might throw exception if message doesn't exist or not visible due to scope.
    response = sm.executeAsync();
    response.waitForResponse(60);
} catch (err) {
    console.error(err);
}
```
sm.setBasicAuth("admin","admin");
sm.setStringParameter("symbol", "NOW");
sm.setStringParameterNoEscape("xml_data","<data>test</data>");
sm.setHttpTimeout(10000); //In milliseconds. Wait at most 10 seconds for response from http request.
response = sm.execute();//Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
status = response.getStatusCode();
catch(ex) {
    responseBody = ex.getMessage();
    status = '500';
}
finally {
    requestBody = sm ? sm.getRequestBody():null;
}
gs.info("Request Body: " + requestBody);
gs.info("Response: " + responseBody);
gs.info("HTTP Status: " + status);

**Recordless RESTMessageV2 example**
You can use the RESTMessageV2() constructor with no parameters to define a REST message entirely in the script.

When using this constructor you must provide an endpoint and HTTP method. In this example, the script creates an empty REST message and sets the values needed to insert an incident record.

```
var restMessage = new sn_ws.RESTMessageV2();
restMessage.setBasicAuth("admin", "admin");
restMessage.setHttpMethod("post");
restMessage.setEndpoint("http://<instance>.service-now.com/api/now/table/incident");
restMessage.setRequestBody("{"short_description": "Test incident"}");
var response = restMessage.execute();
```

**Asynchronous RESTMessageV2 example**
This example describes how to send an asynchronous REST message using the RESTMessageV2 API.

You can send a REST message asynchronously. When you send an asynchronous message the instance does not wait for a response before proceeding. You must handle waiting for a response within your code.

```
var requestBody;
var responseBody;
var status;
var sm;
try{
    sm = new sn_ws.RESTMessageV2("Yahoo Finance", "get"); // Might throw exception if message doesn't exist or not visible due to scope.
    sm.setBasicAuth("admin","admin");
    sm.setStringParameter("symbol", "NOW");
    sm.setStringParameterNoEscape("xml_data","<data>test</data>");
    response = sm.executeAsync(); //Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
    response.waitForResponse(60); // In seconds. Wait at most 60 seconds to get response from ECC Queue/Mid Server //Might throw exception timing out waiting for response in ECC queue.
```
RESTMessageV2 MID server example

You can send a REST message through a MID Server.

By sending the message through a MID Server, you can access endpoints that are behind a firewall or within a private network. All REST messages sent through a MID Server are asynchronous.

```javascript
var requestBody;
var responseBody;
var status;
var sm;
try{
    sm = new sn_ws.RESTMessageV2("Yahoo Finance", "get");  // Might throw exception if message doesn't exist or not visible due to scope.
    sm.setBasicAuth("admin","admin");
    sm.setStringParameter("symbol", "NOW");
    sm.setStringParameterNoEscape("xml_data","<data>test</data>");
    sm.setMIDServer('mid_server_name');
    response = sm.execute(); // Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.

    response.waitForResponse(60);// In seconds. Wait at most 60 seconds to get response from ECC Queue/Mid Server //Might throw exception timing out waiting for response in ECC queue.

    responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
    status = response.getStatusCode();
} catch(ex) {
    responseBody = ex.getMessage();
    status = '500';
} finally {
    requestBody = sm ? sm.getRequestBody():null;
}

gs.info("Request Body: " + requestBody);
gs.info("Response: " + responseBody);
gs.info("HTTP Status: " + status);
```

Outbound SOAP web service

The SOAP Message module can be used to develop, prototype, and save outbound SOAP messages that can be reused in business rules and scripts.

You can use outbound SOAP messages in scripts using the SOAPMessageV2 API and the SOAPResponseV2 API. Examples detailing how to script outbound SOAP are available.
Outbound SOAP video tutorial

The following video tutorial demonstrates how to configure outbound SOAP web service messages to consume third-party web services from an instance.

SOAP message

Information needed to send SOAP requests is stored in SOAP message records.

Information needed to send SOAP requests is stored in SOAP message records. Each record specifies an endpoint for the request, the required format of the request as a web services description language (WSDL) file, authentication information, and a list of functions that can run against the endpoint.

Create a SOAP message

Create a SOAP message to define the remote endpoint, WSDL, and authentication settings.

Role required: web_service_admin

1. Navigate to System Web Services > SOAP Message.
2. Click New.
3. Enter a Name to identify the SOAP message.
4. Specify a WSDL using one of these options:
   - To download and use an online WSDL source, select the Download WSDL check box and enter the URL for the WSDL in the WSDL field.
   - To enter the WSDL directly, clear the Download WSDL check box, and then copy and paste the WSDL XML into the WSDL XML field.
5. If the endpoint is protected by basic authentication, select the Use basic auth check box and enter the credentials.
6. If the endpoint requires mutual authentication, select the Enable mutual authentication check box and select a Protocol profile to use for mutual authentication.
7. Click Submit.

This image shows an example of a SOAP message that connects to a demo instance of ServiceNow.
### SOAP Message

<table>
<thead>
<tr>
<th>Name</th>
<th>Created By</th>
<th>Created</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>demo1 incident</td>
<td>dico</td>
<td>2010-03-31 17:30:58</td>
<td>Sample ServiceNow direct web service</td>
</tr>
</tbody>
</table>

#### SOAP Message Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>SOAP action</th>
<th>Envelope</th>
<th>Lock</th>
<th>Updated</th>
</tr>
</thead>
</table>

Actions on selected rows...
SOAP message functions

After you create a SOAP message record, you can click Generate sample SOAP messages to populate the SOAP Message Functions related list.

The instance creates these functions by reading the supplied WSDL definition.
Figure 837: Soap message function

```xml
 xmlns:ns1="http://www.service-now.com/">
  <SOAP-ENV:Body>
    <ns1:insert>
      <short_description xsi:type="xsd:string">${short_description}</short_description>
    </ns1:insert>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
The **SOAP action**, **SOAP endpoint**, and **Envelope** fields should be populated automatically based on the WSDL definition. The **Envelope** defines the message to send to the endpoint. In this example, the **Envelope** values have this format:

```xml
... <!-- optional -->
<short_description xsi:type="xsd:string">String</short_description>
... 
```

To submit a specific value, enter the value directly in the appropriate XML tag. In this example, to set the **Short description** for a record, enter:

```xml
...
<short_description xsi:type="xsd:string">This is the short description</short_description>
... 
```

**Variable substitution in outbound SOAP**

To use variable substitution, use the format `${<variable_name>}` instead of defining a specific value.

```xml
...
<short_description xsi:type="xsd:string">${short_desc}</short_description>
... 
```

To test variable substitution after you have modified the SOAP envelope with the variables, define values for the variables in the SOAP Message Parameters related list. For example, click **New** and enter the following information:

![Soap message parameters](Image)

**Figure 838: Soap message parameters**

**SOAP envelope variables**

Variables within the SOAP **Envelope** allow you to set values dynamically when sending the SOAP message.

When a SOAP message is generated, the variable names depend on the XML structure surrounding the variable. By default, the XML elements two levels above the variable determine the variable name.

For example, the structure `<A><B><C>${B.C}</C></B></A>` produces the variable `${B.C}`.

These properties control the behavior of variables in the SOAP envelope.
### Table 1164: Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Type</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.soap.outbound.include_variable_context</td>
<td>Controls if variable names include higher-level XML elements. Set this property to false to only use the lowest-level XML element to determine the variable name, such as ${C} instead of ${B.C}.</td>
<td>true/false</td>
<td>true</td>
</tr>
<tr>
<td>glide.soap.outbound.variable_context_depth</td>
<td>Controls the number of higher-level XML elements to include in variable names. For example, when this property value is set to 3, the structure <code>&lt;A&gt;&lt;B&gt;&lt;C&gt;${A.B.C}&lt;/C&gt;&lt;/B&gt;&lt;/A&gt;</code> produces the variable ${A.B.C}.</td>
<td>integer</td>
<td>2</td>
</tr>
</tbody>
</table>

**Test the SOAP message**

Test a SOAP message to validate the configuration before using the message in an integration.

To test the SOAP message, click the **Test** related link. You are redirected to a test result form as shown below.
Figure 839: Soap message test

You can see the original SOAP request message, the resulting HTTP status code, and the SOAP response in this screen. You can also click the Rerun test related link to resubmit the SOAP request.

**Note:** A test SOAP message will time out after 60 seconds if a response is not received.

*Use a SOAP message in a script*

Preview and reuse the script to send the SOAP message.

After you have developed and tested the SOAP message, click the Preview script usage related link in the SOAP Message Function form. The dialog box displays an example of how you can invoke the SOAP message from a script.
Figure 840: Soap message sample script

You can manipulate the resulting XML response body with `XMLDocument` or with `gs.getXMLText` and `gs.getXMLNodeList`.

Send a SOAP message through a MID server
When creating SOAP message functions, you can configure the function to be sent through a MID Server. There must be a running MID Server associated with your instance to use this functionality. All SOAP messages sent through a MID Server are performed asynchronously.
By specifying a MID Server, all SOAP requests that use this SOAP message are sent through that MID Server. You can override the selected MID Server by using the `setMIDServer(mid server)` API call in a script.

Create a SOAP message from a WSDL that references an external XSD file

Create a SOAP message from a WSDL and external XSD file.

Role required: web_service_admin

This task includes example WSDL and XSD files for a weather forecast SOAP message. Your WSDL and XSD file will vary.

1. Navigate to System Web Services > SOAP Message and create a new record.
2. Clear the Download WSDL check box.
3. Paste the content of the WSDL into the WSDL XML field.
4. Save the record.
5. In the SOAP Message Imports related list, click New.
6. Paste the content of the XSD file into the **External Document** field.
7. Set the **Schema Location** field to `db://<name of the referenced XSD file>.xsd`.
   Specifying the schema location allows the instance to know the location of the referenced XSD file.
8. Click **Submit**.
9. Click **Generate sample SOAP messages**.

**Example WSDL and XSD files**

```xml
<?xml version="1.0" encoding="utf-8"?>
  xmlns:soapenc="http://schemas.xmlsoap.org/soap/encoding/
  xmlns:mime="http://schemas.xmlsoap.org/wsdl/mime/
  schemas.xmlsoap.org/wsd1/soap/" xmlns:wssn="http://www.w3.org/2001/XMLSchema"
  xmlns:soap12="http://schemas.xmlsoap.org/wsdl/soap12/
  xmlns:http="http://schemas.xmlsoap.org/wsdl/http/
  targetNamespace="http://www.webservicex.net"
  xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
  <wsdl:documentation xmlns:wsdl="http://schemas.xmlsoap.org/
    wsdl/" Get one week weather forecast for valid zip code or Place
  name in USA</wsdl:documentation>
  <wsdl:types>

Demonstration video
This video shows examples of creating and sending SOAP messages.
The script example in this video uses the version one SOAPMessage API.

Connectivity details
For the ServiceNow-initiated SOAP requests to successfully communicate with the web service provider inside a remote network, the ServiceNow instance must have HTTP or HTTPS access to the SOAP endpoint at the provider.

Like any integration, such as LDAP, web services, or JDBC, the SOAP endpoint may reside behind a firewall that is blocking inbound communication from the instance. If this is the case, you need to make network changes to allow this connectivity into your network. You can either modify the firewall and ACL rules to allow the instance IP address, configure the SOAP message to use a MID Server, or implement a VPN tunnel to allow the instance communication into your network.

Note: A common misconception is that because asynchronous SOAP requests are routed through the ECC queue, they are always sent through a MID Server. This is not the case. Asynchronous SOAP requests only use a MID Server when configured to do so.

Outbound SOAP security
You can authenticate outbound SOAP messages using several different security protocols.
The security protocol you should use depends on the requirements of the web service provider. Mutual authentication is supported for outbound web services.

Basic authentication
If the endpoint requires a user name and password, you can provide credentials using basic authentication.

1. Navigate to System Web Services > Outbound > SOAP Message.
2. Select a SOAP message record.
3. In the SOAP Message Functions related list, select a function.
4. Select Use basic auth.
5. Enter a user name in the Basic auth user ID field.
6. Enter the password for that user in Basic auth user password.
7. Click Update.

Set web service security
You can sign outbound SOAP messages using a key store and trusted server certificate saved on the instance.
Role required: admin

1. Upload a key store certificate with a Type of Java Key Store or PKCS12 Key Store.
2. Upload the trusted server certificate for the key store certificate.
4. Select a SOAP message record.
5. In the SOAP Message Functions related list, select a function.
7. In the Key store field, select the Java or PKCS12 key store you uploaded.
8. In the Key store alias field, enter the alias that identifies the public and private key pair.
9. In the Key store password field, enter the password you assigned the key store record.
10. In the Certificate field, select the trusted certificate for the selected key store.
11. Click Update.

Mutual authentication
ServiceNow supports mutual authentication for outbound web services.

Mutual authentication is not available for inbound web services.

Configure SOAP with a proxy

Certain properties provide support for SOAP requests to use a web proxy server.

Table 1165: SOAP properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.proxy_host</td>
<td>The proxy server hostname or IP address</td>
<td>proxy.company.com, 192.168.34.54</td>
</tr>
<tr>
<td>glide.http.proxy_port</td>
<td>The port number for the proxy server</td>
<td>8080, 9100</td>
</tr>
<tr>
<td>glide.http.proxy_username</td>
<td>If the proxy server is authenticating using user name and password, enter a value for this property</td>
<td>proxyuser</td>
</tr>
<tr>
<td>glide.http.proxy_password</td>
<td>If the proxy server is authenticating using user name and password, enter a value for this property</td>
<td>password</td>
</tr>
</tbody>
</table>

SOAPMessageV2

The SOAPMessageV2 API allows you to send an outbound SOAP message using JavaScript.

Use the SOAPResponseV2 API to manage the response returned by the SOAP provider.

You can use this API in scoped applications, or within the global scope.

SOAPMessageV2 - execute()
Send the SOAP message to the endpoint.
Table 1166: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1167: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAPResponseV2 on page 3464</td>
<td>The response returned by the SOAP provider.</td>
</tr>
</tbody>
</table>

var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote");  // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();  // Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.

SOAPMessageV2 - executeAsync()
Send the SOAP message to the ECC queue.

SOAP messages in the ECC queue are processed by the SOAPClient business rule.

By default, this business rule does not run asynchronously. To configure this business rule to run asynchronously, set the **When** value to Async and add current.update() to the end of the **Script**. The instance does not wait for a response from the web service provider when sending a message through the ECC queue.

Table 1168: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1169: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAPResponseV2 on page 3464</td>
<td>The response returned by the SOAP provider.</td>
</tr>
</tbody>
</table>

**Note:** Attempting to use the SOAP response object before the response has been processed may result in a timeout error.

var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote");  // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync();

`SOAPMessageV2.getEndpoint()`  
Get the endpoint for the SOAP message.

**Table 1170: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 1171: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL of the SOAP web service provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getEndpoint();
```

`SOAPMessageV2.getRequestBody()`  
Get the content of the SOAP message body.

**Table 1172: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 1173: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The SOAP message body.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getRequestBody();
```

`SOAPMessageV2.getRequestHeader(String headerName)`  
Get the value for an HTTP header specified by the SOAP client.

By default, this method cannot return the value for a header set automatically by the system. To grant this method access to all headers, set the property glide.http.log_debug to true.
### Table 1174: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>The request header you want to get the value for.</td>
</tr>
</tbody>
</table>

### Table 1175: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var header = sm.getRequestHeader("Accept");
```

#### SOAPMessageV2 - getRequestHeaders()

Get HTTP headers that were set by the SOAP client and the associated values.

This method does not return headers set automatically by the system. To configure this method to return all headers, set the property glide.http.log_debug to true.

### Table 1176: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1177: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getRequestHeaders();
```

#### SOAPMessageV2 - setBasicAuth(String userName, String userPass)

Set basic authentication headers for the SOAP message.

Setting basic authentication headers using this method overrides basic authentication values defined in the SOAP message record.
### Table 1178: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userName</td>
<td>String</td>
<td>The username to use when authenticating the SOAP message.</td>
</tr>
<tr>
<td>userPass</td>
<td>String</td>
<td>The password for the specified user.</td>
</tr>
</tbody>
</table>

### Table 1179: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote");  // Might throw exception if message doesn't exist or not visible due to scope.
sm.setBasicAuth("username","password");
```

**SOAPMessageV2 - setEccCorrelator(String correlator)**

Associate outbound requests and the resulting response record in the ECC queue.

This method only applies to SOAP messages sent through a MID Server. The correlator provided populates the **Agent correlator** field on the ECC queue record for the response. Provide a unique correlator for each outbound request to associate the correct results in the ECC queue with the request when designing asynchronous automation through a MID Server.

### Table 1180: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>correlator</td>
<td>String</td>
<td>A unique identifier.</td>
</tr>
</tbody>
</table>

### Table 1181: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote");  // Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccCorrelator("unique_id");
```

**SOAPMessageV2 - setEccParameter(String name, String value)**

Override a value from the database by writing to the SOAP message payload.
This method only applies to SOAP messages sent through a MID Server. Use this method when a value from the SOAP message in the database is invalid, such as when the endpoint URL is longer than the maximum SOAP endpoint field length.

These are valid values for the name parameter.

- **source**: the endpoint URL.
- **name**: the SOAP message function to run.

### Table 1182: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the ECC parameter.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign to the specified ECC parameter.</td>
</tr>
</tbody>
</table>

### Table 1183: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote");  
// Might throw exception if message doesn't exist or not visible  
due to scope.  
sm.setEccParameter("source","http://very.long.endpoint");
```

**SOAPMessageV2 - setEndpoint(String endpoint)**

Set the endpoint for the SOAP message.

By default, the SOAP message uses the endpoint specified in the SOAP message record. Use this method to override the default. You must call this method when using the `SOAPMessageV2()` constructor with no parameters.

### Table 1184: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>String</td>
<td>The URL of the SOAP web service provider you want to interface with.</td>
</tr>
</tbody>
</table>
Table 1185: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2();
sm.setEndpoint("http://web.service.endpoint");
```

SOAPMessageV2 - `setHttpTimeout(Number timeoutMs)`
Set the amount of time the SOAP message waits for a response from the web service provider before the request times out.

Table 1186: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutMs</td>
<td>Number</td>
<td>The amount of time to wait for a response from the web service provider, in milliseconds.</td>
</tr>
</tbody>
</table>

Table 1187: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setHttpTimeout(6000);
```

SOAPMessageV2 - `setMIDServer(String midServerName)`
Configure the SOAP message to be sent through a MID Server.
By default, the SOAP message uses the MID Server specified in the SOAP message function record. Use this method to override the default.

Table 1188: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>midServerName</td>
<td>String</td>
<td>The name of the MID Server you want to send the SOAP message through. Your instance must have an active MID Server with the specified name.</td>
</tr>
</tbody>
</table>
### Table 1189: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**SOAPMessageV2 - setMutualAuth(String profileName)**

Set the mutual authentication protocol profile for the SOAP message.

Setting a protocol profile using this method overrides the protocol profile selected for the SOAP message record.

### Table 1190: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profileName</td>
<td>String</td>
<td>The name of the protocol profile to use for mutual authentication.</td>
</tr>
</tbody>
</table>

### Table 1191: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote");  // Might throw exception if message doesn't exist or not visible due to scope.
sm.setMutualAuth("auth_profile_name");
```

**SOAPMessageV2 - setRequestBody(String requestBody)**

Set the body content to send to the web service provider.

When you set the body content using this method, variables in the body are not substituted for parameters from the SOAP message function record. You must explicitly define all values within the SOAP message body.

### Table 1192: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestBody</td>
<td>String</td>
<td>The body of the SOAP message.</td>
</tr>
</tbody>
</table>
### Table 1193: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var body = "<SOAP message body>";
sm.setRequestBody(body);  
```

**SOAPMessageV2 - setRequestHeader(String headerName, String headerValue)**

Set an HTTP header in the SOAP message to the specified value.

### Table 1194: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>The name of the header.</td>
</tr>
<tr>
<td>headerValue</td>
<td>String</td>
<td>The value to assign to the specified header.</td>
</tr>
</tbody>
</table>

### Table 1195: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setRequestHeader("Accept","Application/json");  
```

**SOAPMessageV2 - setSOAPAction(String soapAction)**

Define the SOAP action this SOAP message performs.

The WSDL for your web service provider lists SOAP actions you can perform. You must call this method when using the `SOAPMessageV2()` constructor with no parameters.

### Table 1196: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>soapAction</td>
<td>String</td>
<td>The SOAP action this SOAP message performs.</td>
</tr>
</tbody>
</table>
Table 1197: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2();
sm.setSOAPAction("GetQuote");
//construct SOAP message by specifying endpoint and auth
sm.execute();
```

**SOAPMessageV2 - setStringParameter(String name, String value)**
Set a variable with the specified name from the SOAP message record to the specified value.
XML reserved characters in the value are converted to the equivalent escaped characters.

Table 1198: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the SOAP message variable.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign to the specified variable.</td>
</tr>
</tbody>
</table>

Table 1199: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameter("symbol","NOW");
```

**SOAPMessageV2 - setStringParameterNoEscape(String name, String value)**
Set a variable with the specified name from the SOAP message record to the specified value.
This method is equivalent to setStringParameter but does not escape XML reserved characters.

Table 1200: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the SOAP message variable.</td>
</tr>
</tbody>
</table>
### Table 1201: Returns

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign to the specified variable.</td>
</tr>
</tbody>
</table>

### Table 1202: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keystoreId</td>
<td>String</td>
<td>The sys_id of the Java or PKCS12 key store to use.</td>
</tr>
<tr>
<td>keystoreAlias</td>
<td>String</td>
<td>The alias that identifies the public and private keys.</td>
</tr>
<tr>
<td>keystorePassword</td>
<td>String</td>
<td>The password assigned to the key store record.</td>
</tr>
<tr>
<td>certificateId</td>
<td>String</td>
<td>The sys_id of the trusted server certificate.</td>
</tr>
</tbody>
</table>

### Table 1203: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
SOAPMessageV2 - SOAPMessageV2()
Instantiates an empty SOAPMessageV2 object.

When using an object instantiated this way, you must manually specify a SOAP action and endpoint.

### Table 1204: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2();
```

SOAPMessageV2 - SOAPMessageV2(String soapMessage, String soapFunction)
Instantiate a SOAPMessageV2 object from a SOAP message record and a function associated with that record.

Values such as the endpoint, authentication, or MID Server settings from the SOAP message record apply to this object.

### Table 1205: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>soapMessage</td>
<td>String</td>
<td>The SOAP message record you want to use as the base for this object.</td>
</tr>
<tr>
<td>soapFunction</td>
<td>String</td>
<td>The SOAP function you want to execute. Available SOAP functions depend on the WSDL supplied by the web service provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
```

**Asyncronous SOAPMessageV2 example**
You can send a SOAP message asynchronously.

When you send an asynchronous message the instance does not wait for a response before proceeding. You must handle waiting for a response within your code.

```javascript
var requestBody;
var responseBody;
```
var status;
var sm;
try{
    sm = new sn_ws.SOAPMessageV2("StockQuote", "GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope
    sm.setBasicAuth("admin","admin");
    sm.setStringParameter("symbol", "NOW");
    sm.setStringParameterNoEscape("xml_data","<data>test</data>");
    response = sm.executeAsync(); // Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password
    response.waitForResource(60); // In Seconds, Wait at most 60 seconds for response from ECC Queue/Mid Server // Might throw exception timing out waiting for response in ECC queue
    responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
    status = response.getStatusCode();
} catch(ex) {
    responseBody = ex.getMessage();
    status = '500';
} finally {
    requestBody = sm ? sm.getRequestBody():null;
}
gs.info("Request Body: " + requestBody);
gs.info("Response: " + responseBody);
gs.info("HTTP Status: " + status);

Direct SOAPMessageV2 example
You can send a SOAP message directly to the endpoint.

In this example, the script sends a SOAP message requesting a stock quote and waits for a response. If there is no response from the web service provider, or if the specified SOAP message record is unavailable, the script throws an error, handled in this example by the try-catch block.

var requestBody;
var responseBody;
var status;
var sm;
try{
    sm = new sn_ws.SOAPMessageV2("StockQuote", "GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope
    sm.setBasicAuth("admin","admin");
    sm.setStringParameter("symbol", "NOW");
    sm.setStringParameterNoEscape("xml_data","<data>test</data>");
    sm.setHttpTimeout(10000) // In Milli seconds. Wait at most 10 seconds for response from http request.
    response = sm.execute(); // Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password and stuff
    responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
    status = response.getStatusCode();
} catch(ex) {
    responseBody = ex.getMessage();
    status = '500';
} finally {
    requestBody = sm ? sm.getRequestBody():null;
}
gs.info("Request Body: " + requestBody);
gs.info("Response: " + responseBody);
Recordless SOAPMessageV2 example
You can use the SOAPMessageV2() constructor with no parameters to define a SOAP message entirely in the script.

When using this constructor you must provide an endpoint and SOAP action. In this example, the script creates an empty SOAP message and sets the values needed to insert an incident record.

```javascript
var s = new sn_ws.SOAPMessageV2(); //create an empty SOAP message
s.setBasicAuth('admin','admin');
s.setSOAPAction('http://www.service-now.com/incident/insert'); //set the SOAP action to perform
s.setEndpoint('http://<instance>.service-now.com/incident.do?SOAP'); //set the web service provider endpoint
var response = s.execute();
var xmldoc = new XMLDocument(response.getBody());
var incident_sysid = xmldoc.getNodeText('//sys_id');
```

SOAPMessageV2 MID server example
You can send a SOAP message through a MID Server.

By sending the message through a MID Server, you can access endpoints that are behind a firewall or within a private network. All SOAP messages sent through a MID Server are asynchronous.

```javascript
var requestBody;
var responseBody;
var status;
var sm;
try{
    sm = new sn_ws.SOAPMessageV2("StockQuote", "GetQuote");  // Might throw exception if message doesn't exist or not visible due to scope
    sm.setBasicAuth("admin","admin");
    sm.setStringParameter("symbol", "NOW");
    sm.setStringParameterNoEscape("xml_data","<data>test</data>");
    sm.setMIDServer('mid_server_name');
    response = sm.execute();//Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password and stuff
    response.waitForResponse(60);// In Seconds, Wait at most 60 seconds to get response from ECC Queue/Mid Server //Might throw exception timing out waiting for response in ECC queue

    responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
    status = response.getStatusCode();
} catch(ex) {
    responseBody = ex.getMessage();
    status = '500';
} finally {
    requestBody = sm ? sm.getRequestBody():null;
} 
gs.info("Request Body: " + requestBody);
gs.info("Response: " + responseBody);
gs.info("HTTP Status: " + status);
```
SOAPResponseV2

The SOAPResponseV2 API allows you to use the data returned by an outbound SOAP message in JavaScript code.

A SOAPResponseV2 object is returned by the SOAPMessageV2 functions execute() and executeAsync(). You can use this API in scoped applications, or within the global scope.

**SOAPResponseV2 - getBody()**

Get the content of the SOAP response body.

```javascript
var body = response.getBody();
```

**Table 1206: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 1207: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The SOAP response body.</td>
</tr>
</tbody>
</table>

**SOAPResponseV2 - getErrorCode()**

Get the numeric error code if there was an error during the SOAP transaction. This error code is specific to the ServiceNow platform, it is not an HTTP error code. Provide this error code if you require assistance from ServiceNow Customer Support.

```javascript
var errorCode = response.getErrorCode();
```

**Table 1208: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 1209: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The numeric error code, such as 1 for a socket timeout.</td>
</tr>
</tbody>
</table>

```javascript
var errorCode = response.getErrorCode();
```

**SOAPResponseV2 - getErrorMessage()**

Get the error message if there was an error during the SOAP transaction.
Table 1210: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1211: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The error message.</td>
</tr>
</tbody>
</table>

```javascript
var errorMsg = response.getErrorMessage();
```

SOAPResponseV2 - `getHeader(String name)`
Get the value for a specified HTTP header.

Table 1212: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the header that you want the value for, such as Set-Cookie.</td>
</tr>
</tbody>
</table>

Table 1213: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var headerVal = response.getHeader("Accept");
```

SOAPResponseV2 - `getHeaders()`
Get all HTTP headers returned in the SOAP response and the associated values.

Table 1214: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Table 1215: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

```javascript
var headers = response.getHeaders();
```

**SOAPResponseV2 - getStatusCode()**
Get the numeric HTTP status code returned by the SOAP provider.

### Table 1216: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1217: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The numeric status code returned by the SOAP provider, such as 200 for a successful response.</td>
</tr>
</tbody>
</table>

```javascript
var statusCode = response.getStatusCode();
```

**SOAPResponseV2 - haveError()**
Indicate if there was an error during the SOAP transaction.

### Table 1218: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 1219: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if there was an error, false if there was no error.</td>
</tr>
</tbody>
</table>

```javascript
var error = response.haveError();
```
SOAPResponseV2 - waitForResponse(Number timeoutSecs)
Set the amount of time the instance waits for a response from the web service provider.
This method overrides the property glide.soap.outbound.ecc_response.timeout for this SOAP response.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutSecs</td>
<td>Number</td>
<td>The amount of time, in seconds, to wait for this response.</td>
</tr>
</tbody>
</table>

Table 1221: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
response.waitForResponse(60);
```

SOAPResponseV2 - getCookies()
Get all cookies included in the response.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1223: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The list of cookies. Iterate through the list to perform operations on each cookie.</td>
</tr>
</tbody>
</table>

```javascript
var cookies = response.getCookies();
var i;
for(i=0;i<cookies.size();i++) {
    gs.print('cookie: ' + cookies.get(i));
}
```

Output:
- JSESSIONID=4135AA97A5D12DA22EF614AA2B0CAFD8.node20; Path=/; Secure; HttpOnly
- SABASESSIONID=370152970.36895.0000; path=/
Outbound web services mutual authentication

Mutual authentication establishes trust by exchanging Secure Sockets Layer (SSL) certificates.

Before connecting to a server, the client requests an SSL certificate. The server responds by requesting that the client send its own certificate. Both respond by validating the certificates of the other and sending acknowledgments before initiating an HTTPS connection. Mutual authentication is not available when making outbound web service calls through a MID Server.

As an administrator, you can enable mutual authentication by defining a protocol profile for connections that require mutual authentication. Protocol profiles allow you to associate a specific certificate record with a protocol, such as HTTPS.

For example, you can create a protocol profile called https for one-way SSL and another called myhttps with a certificate for mutual authentication. You can then make an HTTPS web service request by calling myhttps://<externalendpoint.com> if the end point requires mutual authentication, or https://<externalendpoint.com> if it does not.

Note: This feature enables mutual authentication only on outbound HTTPS connections, such as SOAP, REST, or direct HTTPS calls. ServiceNow does not support mutual authentication for inbound requests or for outbound requests sent through a MID Server.

Create a protocol profile

You can create a protocol profile for outbound web services, such as to enable mutual authentication.

Role required: admin

2. Click New.
3. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>Enter a unique name to identify this protocol, such as myhttps. The protocol name allows you to differentiate between normal HTTPS connections and HTTPS connections that use this protocol profile.</td>
</tr>
<tr>
<td>Default port</td>
<td>Enter the port number for connections that use this protocol.</td>
</tr>
<tr>
<td>Check box</td>
<td>Select a certificate with a Type value of Java Key Store or PKCS12 Key Store to send to the web service provider. An administrator must set up a key store and generate certificates for the client and server.</td>
</tr>
</tbody>
</table>

Enable mutual authentication

You can configure a SOAP or REST message for mutual authentication using a protocol profile
Role required: web_service_admin or admin

1. Navigate to System Web Services > SOAP Message or System Web Services > REST Message.
2. Select a message record.
3. Select the Use mutual authentication check box.
4. In the Protocol profile field, select a protocol profile configured for mutual authentication.
5. Click Update.

HTTP Connection Management Properties

Connection pooling is controlled by three properties.

The default values for these properties are appropriate for most customers. The Glide properties are dynamic, meaning that changes to these properties will take effect immediately. No outage or restart is required to update the values.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.use_connection_mgr</td>
<td>Switches connection pooling on and off. To disable the new behavior (not recommended) set glide.http.use_connection_mgr to false.</td>
<td>true</td>
</tr>
<tr>
<td>glide.http.connection_mgr.max_connections</td>
<td>Controls the total number of permitted HTTP(S) connections outbound from the ServiceNow ITSA Suite instance. This is an instance-wide value.</td>
<td>20</td>
</tr>
<tr>
<td>glide.http.connection_mgr.max_connections_per_host</td>
<td>Controls how many of the glide.http.connection_mgr.max_connections can communicate in parallel with any particular host. If the maximum setting for any of these values is reached during normal operations, a script or background thread may have to wait briefly to obtain a connection.</td>
<td>4</td>
</tr>
</tbody>
</table>

HTTP Connection Management Properties

</tbody>
</table>

### ODBC driver

The ServiceNow ODBC driver allows an ODBC client to connect to the ServiceNow platform for reporting. The ServiceNow ODBC driver allows an ODBC client to connect to the ServiceNow platform for reporting. The driver is compliant to version 3.52 of the Microsoft ODBC core API conformance. The ServiceNow ODBC driver uses the ServiceNow web services support for a query-only interface. The ODBC driver supports only **SELECT** statements or read-only functions, and does not modify your instance data. Because the ODBC driver uses the web services interface, platform-wide access control (ACL) is enforced and data security is in place.

This video demonstrates how to configure Microsoft SQL Linked Server with the ODBC driver.

This video demonstrates how to troubleshoot Microsoft SQL Linked Server permissions running out-of-process.

The ODBC driver has these limitations:

- The ODBC driver supports only **SELECT** statements or read-only functions, and does not modify your instance data.
- There is no supported way to use the ODBC driver with a Java client application or with a Java JDBC-ODBC bridge.

**Note:** Versions older than 1.0.7.3 of the ODBC Driver are no longer supported.

### Getting started with ODBC

The ServiceNow Open Database Connectivity (ODBC) driver provides read-only access to the database associated with your ServiceNow instance.

A ServiceNow user with the admin role can perform these procedures.

This video demonstrates how to install, configure, and test the ServiceNow **ODBC driver** on page 3470, which provides read-only access to the database associated with your ServiceNow instance.

Before downloading and installing the ODBC driver, **review the requirements** to ensure your configuration is compatible.
Create an ODBC user - getting started

The ODBC driver communicates with your ServiceNow instance as a specific user. Create a user account for the ODBC driver to use.

1. Navigate to **User Administration > Users**.
2. Click **New**.
3. In the User ID field, enter `odbc.user`.
4. Enter a Password for this user.
5. Click **Submit**.
6. In a separate browser session, confirm that this user is able to log in to your ServiceNow instance.

Set a user permission

Since the ODBC driver communicates with the instance using SOAP, the user account must have the `soap_query` role.

The soap role also provides query access through SOAP, but allows additional actions that are not available through ODBC, such as insert or update.

The user account must also be able to read records on the tables you want to query. For example, to query incident records, the ODBC user must have read permission for the Incident table. You can create a new role, for example a role called ODBC, grant that role to the ODBC user, and configure ACL rules to allow users with that role to query the Incident table.

**Create the ODBC role and grant the required roles**
How to create the ODBC role and grant the ODBC user the required roles.

1. Navigate to **User Administration > Roles**.
2. Click **New**.
3. In the Name field, enter `ODBC`.
4. Click **Submit**.
5. Navigate to **User Administration > Users**.
6. Select the ODBC user account you created.
7. In the Roles related list, click **Edit**.
8. Use the slushbucket to add the ODBC and soap_query roles.

**Define an ACL rule for the ODBC role**
How to define ACL rules for the ODBC role.

1. Elevate the session permissions so you can create ACL rules.
2. Navigate to **System Security > Access Controls (ACL)**.
3. Click **New**.
4. From the Operation choice list, select **read**.
5. From the Name choice list, select `Incident [incident]`.
   Leave the second Name choice list as None.
6. Right-click the form header and select **Save**.
7. In the Requires role related list, click **Edit**.
8. Use the slushbucket to add the ODBC role.
Install the ODBC driver

You must have administrator-level access for the Windows computer onto which you want to install the ODBC driver.

1. Download the ODBC driver version compatible with your computer's operating system and the application you are using to query the database.
   
   The ODBC driver is available as 32-bit or 64-bit. Most applications require the 32-bit ODBC driver even if the operating system is 64-bit.

2. Right-click the executable you downloaded and select Run as Administrator to start the setup wizard.

3. Follow the instructions on the setup wizard. The default values are usually appropriate.

Configure the ODBC driver - getting started

Configure the ODBC driver using the ODBC management console.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC Management Console.

2. Expand the Console Root tree to: OpenAccess SDK 6.0 Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters

3. Double-click the DataSourceIPProperties attribute.

4. Change the Value to the URL of your ServiceNow instance, such as https://<instance>.service-now.com. If integrating the ODBC driver with Edge Encryption, change the Value to the URL of your encryption proxy. See Integrate Edge Encryption with the ODBC driver for more information.

5. Click OK.

Test the ODBC driver - getting started

Use the ODBC Administrator application to confirm you are able to connect to the instance.

Role required: admin

1. In Windows, navigate to Start > Programs > ServiceNow ODBC > ODBC Administrator.

2. Select the System DSN tab, and then select the ServiceNow data source.

3. Click Configure.

4. Click Test Connect in the ODBC Driver Setup dialog box.

5. Enter odbc.user as the Data Source User Name and the ODBC user's password as the Data Source Password.

6. Click OK.

   The application displays a screen to indicate if the connection was successful.

Installing the ODBC driver

Review setup requirements, download the ODBC driver installer, and install the driver to a computer.

You can install the ServiceNow ODBC driver on Microsoft Windows computers. To install the ODBC driver, set up an ODBC user in your ServiceNow instance, then download and install the ODBC driver. If you already have the ODBC driver installed, you can upgrade to the newest version.

ODBC driver installation requirements

You can install the ServiceNow ODBC driver on Microsoft Windows computers.
To install the ODBC driver, set up an ODBC user in your ServiceNow instance, then download and install the ODBC driver. If you already have the ODBC driver installed, you can upgrade to the newest version.

Requirements

Ensure your configuration meets these requirements before installing the ODBC driver.

Table 1225: Requirements

<table>
<thead>
<tr>
<th>Category</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active user</td>
<td>The user record on the instance used to perform the queries.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The account used to connect to the instance by the ODBC driver must be defined on the instance. Accounts using single sign-on are not supported by the ODBC driver.</td>
</tr>
<tr>
<td>The soap_query role</td>
<td>The user you use to query the database must have the soap_query role if the instance uses the glide.soap.strict_security high security setting.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Do not enable WS-Security for all SOAP requests by setting the glide.soap.require_ws_security system property. It is incompatible with the ODBC driver. Enabling this setting blocks both ODBC driver and MID Server connections. Instead, use basic authentication.</td>
</tr>
<tr>
<td>Target Table ACLs</td>
<td>The user you use to query the database must have read access for the tables that you want to query.</td>
</tr>
<tr>
<td>Target Table Web Service Access</td>
<td>The table you want to query must allow web service interaction. You can enable web service interaction using the application access settings.</td>
</tr>
<tr>
<td>Operating System</td>
<td>The ServiceNow ODBC driver supports installation on the following operating systems:</td>
</tr>
<tr>

### Category

**Hardware**
- RAM: 1 GB minimum
- Disk space: 135 MB for installation. 200 MB for writing cache files during usage.

**Account**
The Windows account used for the installation must have local Administrator rights to install an ODBC driver.

**Networking**
During usage, the ODBC driver requires HTTPS (port 443) connectivity to the ServiceNow instance. The communication between the ODBC driver and the ServiceNow instance uses standard SOAP web services.

**End User License Agreement**
Read the End User License Agreement for the ServiceNow ODBC driver.

---

**ODBC driver supported software**
The following table lists the operating systems and reporting applications compatible with each version of the ODBC driver.

<table>
<thead>
<tr>
<th>Driver Version</th>
<th>Operating System</th>
<th>Microsoft Excel</th>

The ODBC driver provides only basic support for Informatica. Use the ODBC driver with Informatica only for simple operations. Thoroughly test integrations with Informatica before using them in a production environment.
Create an ODBC user

All ODBC queries must be performed as a ServiceNow user. This user must have the soap role and any other roles that are required to read the tables you want to query. An administrator can create a user within the ServiceNow instance for ODBC queries:

1. Create a new user.
2. Give the new user the soap_query role.
3. Give the user any roles needed to view records on the tables you want to query.
   - You may need to create a role with the appropriate ACLs if one does not already exist.
   - It is good practice to grant this user the itil role when querying Task tables.

Downloading the ODBC driver

The ODBC driver is available from the ServiceNow Knowledge Base.

To download the ODBC driver, navigate to [KB0540707](#).

If you do not have access to the Knowledge Base, contact your ServiceNow administrator.

If this is the first time the driver is installed, the installer will be in first time installation mode and prompt for the driver to be installed. Install only one version of the ODBC Driver on a computer. If the ODBC driver was previously installed, the installer will be in upgrade mode and prompt for removal of the previous driver first.

**Note:** Versions older than 1.0.7.3 of the ODBC Driver are no longer supported.

Run ODBC driver setup

Install the ODBC driver for the first time.

1. Right-click the executable and select **Run as Administrator** to launch the installer.
You are presented with the following InstallShield dialog box.

2. Click **Next**.
3. Read and accept the End User License Agreement.
4. Select the target directory for installing the ServiceNow ODBC driver.
   The default directory is C:\Program Files\Service-now\ODBC.
5. Specify the following parameters, which are required to create an ODBC data source that can be used to create a DSN.
   - **Data Source Name**: a short name to identify this data source.
   - **Description**: a short description of the driver. The driver's version number is appended at the end of this value.
   - **Service Name**: the name that can be selected in the **Service Name** field of the ODBC Administrator.
   - **Service Data Source**: the name that can be selected in the **Service Data Source** field of the ODBC Administrator.

   Usually the default values are appropriate.
6. Select the **Program Folder** to create links for the driver. This is the program folder that appears under the **Start** menu.
The installation creates the following links in the menu.

- **Interactive SQL (ODBC):** an interactive SQL command window for directly testing SQL statements.
- **Management Console:** a Microsoft MMC snap-in for configuring default properties for the ODBC driver.
- **ODBC Administrator:** a Microsoft ODBC Administrator program.

The driver code is copied to the target folder.
A progress bar appears.

7. When prompted, click Finish to complete the installation.

**Upgrading the ODBC driver**

If you have previously installed an older version of the ODBC driver, run the installer to uninstall the previous version, and then run the installer again to upgrade.

To check the build date and time of the ODBC driver, use **CheckVersion** located in the Service-Now \ODBC\ip\tools folder. This is an executable Windows host script that reports the build date and time of the current ODBC driver. Use it to assist ServiceNow Technical Support to determine which build of the ODBC driver is running. If the **CheckVersion** tool is absent, the ODBC driver is out of date; upgrade to the current version. To check the version of an older ODBC driver, see the previous version information.

---

**Note:** The ODBC installation also has a Service-Now\ODBC\tools folder, which is not the correct path for the CheckVersion tool.

1. Right-click the executable and select **Run as Administrator**.
2. Click **OK** when prompted to uninstall the current driver, which is required for the upgrade.

A list appears, displaying the existing ODBC DSN names that you have previously created. You have the option to delete them.

3. Select **Yes** to remove all previous DSNs or **No** to keep them for use with the upgraded driver.

An ODBC DSN is a connection *handle* to use the ODBC driver in an application. For more information from Microsoft, see:

4. After removing the previous ODBC driver, double-click the executable again to run the installer. Then, follow the steps in *Installing the ODBC driver*. If you encounter errors when uninstalling the ODBC driver, refer to the *troubleshooting uninstalling ODBC* knowledge article.

After installing the ODBC driver, configure it to connect to your ServiceNow instance.

**Configure the ODBC driver**

After installing the ODBC driver, configure it to connect to your ServiceNow instance and to communicate through a proxy server if applicable, and set properties to control ODBC behavior.

After the driver is installed, configure it for your instance. The driver is preconfigured to connect to https://demoodbc.service-now.com using the DSN ServiceNow. There are two ways to configure connectivity for the driver.

- Configure the global default used by all newly created DSNs.
- Configure each new DSN with its own connection.

To integrate the ODBC driver with Edge Encryption, see *Integrate Edge Encryption with the ODBC driver*. 
Configure the global DSN default

Configure the global default used by all newly created DSNs.

A default DSN is preloaded with the ODBC driver installation ServiceNow data source. This preloaded DSN connects using the default connection URL, which is set to https://demo.service-now.com. To change the global default for the instance URL:

1. In Windows, navigate to **Start > Programs > ServiceNow ODBC > Management Console**.
2. Expand the Console Root tree using the following path:
   
   OpenAccess SDK 6.0 Manager\<installation location>\Services\ServiceNow_ODBC \Data Source Settings\ServiceNow\IP Parameters

3. Double-click the **DataSourceIProperties** attribute for the ServiceNow data source setting to open the Properties dialog box.
4. Change the value to the URL of your instance, using the following format, and then click **OK**:
   
   https://<your instance>.service-now.com

© 2017 ServiceNow. All rights reserved. 3482
Create a new DSN

Using the ODBC driver and the ServiceNow data source, you can create an unlimited number of DSNs configured to connect with different instance URLs.

This allows the flexibility of selecting the target instance for your ODBC connection by DSN name. As an option during installation or upgrade, you can elect to keep the DSNs when you uninstall.

1. In Windows, navigate to Start > Programs > Service-now ODBC > ODBC Administrator.
2. To create a system DSN, select the **System DSN** tab, and then click **Add**.
3. Select ServiceNow ODBC driver 32-bit from the list, and then click Finish.

4. Configure the driver and its connection URL by specifying the url= parameter value in the Custom Properties field. For example:

   url=https://myinstance.service-now.com
5. Click OK.

You can now use the new driver.

Using a connection string

You can specify a connection string instead of defining a DSN.

The connection string must follow this format:

```
Driver=ServiceNow ODBC driver 32-bit;ServiceName=ServiceNow_ODBC;UID=youruser;PWD=yourpassword;ServerDataSource=ServiceNow <instance>.service-now.com
```

The driver name varies depending on if you use the 32-bit or 64-bit version of the ODBC driver. To determine your driver name:

1. In Windows, navigate to Start > Programs > Service-now ODBC > ODBC Administrator.
2. Select the System DSN tab.
3. Note value in the Driver column for the ServiceNow data source.

Configure the logging level of the ODBC driver

You can configure the logging level of the ODBC driver.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC > Management Console.
2. [ODBC version 1.0.8] Within the management console, navigate to `<your_installation_directory> > Services > ServiceNow_ODBC > Service Settings > IP Parameters.

3. [ODBC version 1.0.8] Change the value of the `ServiceJVMOptions` attribute to the desired logging level.

4. Within the management console, navigate to `<your_installation_directory> > Services > ServiceNow_ODBC > Service Settings > Logging.

5. Change the value of the `ServiceDebugLogLevel` by selecting all available check boxes.
6. In Windows, navigate to **Start > Programs > ServiceNow ODBC > ODBC Administrator**.
7. In the ODBC Administrator, select the **Tracing** tab.
8. Navigate to the path in the **Log File Path** field and delete the old log file, if it exists.
9. Click Start Tracing Now.
10. Enable SOAP debugging for your ServiceNow instance.

**ODBC via proxy servers**

The ODBC driver can be configured to route its HTTP SOAP requests via an HTTP proxy server. Setting up a proxy server gives you the option to control access to the ServiceNow instance from the proxy server, and potentially allows a network configuration that can monitor usage statistics. However, because the proxy server intercepts the ODBC driver's requests to your ServiceNow instance, it will degrade the performance of the driver.

**Note:** This feature is recommended for use with ODBC driver builds dated 7/15/2011 or later.

To enable the use of proxy servers, the custom properties for proxy server settings must be defined first for the data source. After that, these properties can be overridden by specific ODBC DSNs. To do this, run the ODBC Management Console.
Figure 842: ODBC proxy

The following custom properties configure the ODBC proxy server.

**Table 1227: Configure ODBC to use proxy servers**

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy_host</td>
<td>The proxy server host name or IP address.</td>
<td>proxy.company.com</td>
</tr>
<tr>
<td>proxy_port</td>
<td>The proxy server port number.</td>
<td>8080</td>
</tr>
<tr>
<td>proxy_user_name</td>
<td>The proxy server user name or id, used in an authenticating proxy configuration.</td>
<td>odbc_user</td>
</tr>
</tbody>
</table>
### Setting ODBC properties

The following properties customize connectivity and optimize the query behavior of the ODBC driver.

#### ODBC Administrator Properties

These properties are specified in the ODBC Data Source Administrator for the DSN or in the **Custom Properties** field of the login dialog box.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BatchSize</strong></td>
<td>During fetching of results from the instance, this batch size configures the number of records to fetch for every request. Typically, the default is an optimal number for normal sized rows. If an error occurs during fetching of records that indicates this value should be lowered, you can modify it to optimize memory usage versus performance.</td>
<td>2000</td>
</tr>
<tr>
<td><strong>url</strong></td>
<td>This is the ServiceNow instance URL or endpoint. It should indicate the URL to the ServiceNow instance you want to connect to.</td>
<td><a href="https://demo.service-now.com">https://demo.service-now.com</a></td>
</tr>
<tr>
<td><strong>EnablePassThrough</strong></td>
<td>During processing of aggregate functions, enabling pass through mode allows directly calling Aggregate Web Service for optimized and speedy response. Whenever possible, this mode should be left enabled.</td>
<td>true</td>
</tr>
<tr>
<td>Property Name</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>debug</td>
<td>By default, debugging messages are not produced. Set <code>debug</code> to <code>true</code> when you operate the ODBC driver from the ISQL console window to write all HTTP-related network communication traffic to the console window. When using this option, set <code>gzip</code> to <code>false</code> so that data is not compressed. Otherwise, the data is unreadable.</td>
<td><code>false</code></td>
</tr>
<tr>
<td>gzip</td>
<td>By default, data sent over the network is compressed. Set <code>gzip</code> to <code>false</code> when using the <code>debug</code> parameter to write network communication to the ISQL console so that data is not compressed.</td>
<td><code>true</code></td>
</tr>
<tr>
<td>timeout</td>
<td>Specifies the socket inactivity timeout value in seconds.</td>
<td>175</td>
</tr>
<tr>
<td>retries</td>
<td>Number of times to retry the failing request in the event of a socket timeout error.</td>
<td>0</td>
</tr>
<tr>
<td>mode</td>
<td>The query mode used to parse complex where clauses. You can configure the ODBC driver query mode to use either AND or OR operators. While the OR operator provides the greatest compatibility with complex queries, the AND operator is usually more efficient and results in fewer database operations.</td>
<td><code>or</code></td>
</tr>
</tbody>
</table>

If you need to use more than one of these properties in your connection, concatenate the settings with a semicolon (:) delimiter. For example, the following string sets the URL to a specific instance and changes the batch size to 200 records.

```
url=https://demo1234.service-now.com;BatchSize=200
```

**ODBC management console properties**

You can access these properties from the ODBC Management Console available in the Windows Start menu at **ServiceNow ODBC > Management Console**.
### Table 1229: ODBC Management Console Properties

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceJVMOptions (Service\Service Settings\IP Parameters)</td>
<td>JVM command line properties and option. For example, to change the maximum Java heap size, modify the -Xmx150m parameter.</td>
<td>-Xms64m -Xmx150m</td>
</tr>
<tr>
<td>DataSourceIPProperties (OpenAccess SDK 6.0 Manager&lt;installation location&gt;\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters)</td>
<td>Global default of the instance URL for all ODBC connections. For more flexibility, you may also create new DSNs with default URL configurations.</td>
<td><a href="https://demo.service-now.com">https://demo.service-now.com</a></td>
</tr>
</tbody>
</table>

### Service JVM options

You can specify these values within the ServiceJVMOptions parameter in addition to standard JVM arguments such as -Xmx.

### Table 1230: Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>-DLOG_FILE_NAME</td>
<td>The location of the ODBC log file. This property is available starting with the ODBC driver 1.0.7.1 release.</td>
<td>${user.home}\AppData\Local\ServiceNow\odbc\logging\odbc.log</td>
</tr>
<tr>
<td>-DLOG_LEVEL</td>
<td>The logging level used when writing to the ODBC log file. You can specify the logging level using Logback levels, such as TRACE, INFO, or ERROR. This property is available starting with the ODBC driver 1.0.8 release.</td>
<td>INFO</td>
</tr>
</tbody>
</table>

### Instance properties

An administrator can configure these properties by adding a property or modifying an existing one in the ServiceNow instance.

### Table 1231: Instance Properties

<table>
<thead>
<tr>
<th>Property name</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.db.max.aggregates</td>
<td>The maximum number of rows returned by aggregate functions.</td>
<td>100000</td>
</tr>
</tbody>
</table>
### Test the ODBC driver

After configuring the ODBC driver, test that the driver can connect to the ServiceNow ITSA Suite instance as the ODBC user and can query data from a target table.

To test the connection, run the ODBC Administrator program.

1. In Windows, navigate to **Start > Programs > ServiceNow ODBC > ODBC Administrator**. The ServiceNow ODBC data source is installed as a system data source.
2. Select the **System DSN** tab, and then select the **ServiceNow** data source.
3. Click **Configure**.

   ![ODBC Data Source Administrator](image)

4. Click **Test Connect** in the ODBC driver Setup dialog box.
5. Enter the login credentials.
These are the usual ServiceNow ITSA SuiteLogin credentials for the ODBC user you created.
6. Click **OK** to log in to the data source.
7. Click **OK** again when the success message appears.

**Enable debug logging**

If you experience unexpected behavior when using the ODBC driver, you can enable debug logging and generate debug logs to help identify the issue.

Debug logs can be useful when submitting an incident with ServiceNow Customer Support.

When you enable debug logging, note the version and bitness (32 bit or 64 bit) of the installed ODBC driver, the Windows operating system, and the client application you are using with the ODBC driver.

To generate debug logs, follow these steps.

1. Close all active applications that may use the ODBC driver.
2. Navigate to one of these paths, based on your operating system.
   - For Windows 7: `C:\Users\<user_name>\AppData\Local\ServiceNow\odbc\logging`
Geneva ServiceNow ServiceNow Platform

- For Windows XP and earlier: C:\Program Files\ServiceNow\ODBC\%LOCALAPPDATA%\ServiceNow\odbc\logging

3. Delete any existing log data to ensure you only log relevant information.
4. Run a query that produces the unexpected behavior, then immediately close the application and review the log files.

Test a query

To verify that the user has the appropriate permissions to send requests to the instance using ODBC, run a query using Interactive SQL.

For testing, use a query that returns exactly one record, such as a query using the Number value of a record.

1. In the ServiceNow ITSA Suite instance, navigate to Incident > All.
2. Record the Number of an incident record.
3. On the computer where the ODBC driver is installed, navigate to Start > Programs > ServiceNow ODBC > Interactive SQL.
4. Enter connect "odbc.user"*"password"@ServiceNow and press the enter key.
5. Enter the following text, substituting the incident number you recorded.
   ```
   select short_description from incident where number='<incident number>';
   ```
6. Press the enter key.

The instance should respond with the short description of the incident record.

ODBC troubleshooting

Review these troubleshooting resources to resolve issues with the ODBC driver.

For troubleshooting information, see the Knowledge Base articles troubleshooting ODBC driver issues and troubleshooting common ODBC error messages.

Querying table and column names

You can get a list of accessible tables and columns, based on the read ACLs for the querying user.

The following query will return the names of all tables that the querying user has read access for:

```
select * from oa_tables;
```

After you know the name of the table you want to query, you can query the names of all columns that the user has read access for. The querying user must have read access for both the table and the columns.

```
select * from oa_columns where table_name='table_name';
```

**Note:** The `oa_tables` and `oa_columns` tables are internal ODBC tables. These tables are accessible only via the ODBC Driver.

ODBC behavior

After testing the ODBC driver you can use it to query your instance database from a variety of client applications.

ODBC aggregate functions

The ODBC driver supports aggregation functions.
The ODBC driver attempts to download the data and apply the aggregate functions locally. The following aggregate functions are supported by the ODBC driver.

- COUNT
- SUM
- MIN
- MAX
- AVG

Activate the Aggregate Web Services plugin to improve the performance of aggregate queries through the ODBC driver.

**ODBC dates and times**

How the ODBC driver expresses dates and times.

Date and time values returned by the ODBC driver are expressed in the local time zone of the application using the driver, not the ServiceNow instance time zone.

**Field length in SQL queries**

The ODBC driver limits the field length in SQL queries to the maximum length defined by the ServiceNow dictionary entry.

Role required: admin

If the data coming from the ODBC source exceeds the field size of the dictionary entry, ServiceNow truncates the query output to fit the field size. You can increase the field size to avoid truncating data.

1. Increase the maximum length in the dictionary entry for the field in question.
2. Reconnect the ODBC driver to pick up the change.

**Note:** By default, the ODBC driver uses the VARCHAR data type to store query string output. When strings become very large (roughly 16000 characters), the ODBC driver uses the LONGVARCHAR data type instead. It is important to keep in mind, however, that the LONGVARCHAR data type has a more limited set of SQL commands that can be executed on it. For example, it does not support queries using scalar data.

**ODBC display values**

Some examples of how to use and work with ODBC display values are shown here.

**Display values in Choice and Reference columns**

When querying a column of type Choice or Reference, an additional column with the prefix `dv_` is available that contains the display value. For example, you can select `dv_caller_id` to return the `sys_user.name` display value of the reference field from an incident record without making another request to the `sys_user` table.
Display values in filter conditions

Display values can also be used in a filter condition. The ODBC driver optimizes the query condition and processes the filter on the server, for example, querying on the display value of `sys_user` for the `caller_id` field of an incident by using the `dv_caller_id` field name.

```
ISQL> select number, dv_caller_id, caller_id from incident;
number dv_caller_id caller_id
------ ---------- -------
INC0000009 Rick Berzle 5137153cc611227c000bbd1bd8cd2006
INC00000010 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
INC00000011 Don Goodliffe 9ee1b13dc6112271007f9d0efdb9cd0
INC00000012 Don Goodliffe 9ee1b13dc6112271007f9d0efdb9cd0
INC00000013 Joe Employee 681ccaf9c0a8016400b98a6818d57c7
INC00000014 Bow Ruggeri f298d2d2c611227b0106c6be7f154bc8
INC00000015 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
INC00000016 Bow Ruggeri f298d2d2c611227b0106c6be7f154bc8
INC00000017 Joe Employee 681ccaf9c0a8016400b98a6818d57c7
INC00000018 Taylor Vreeland 46bac3d6a9fe1981005f299d479b8669
INC00000019 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
```

Figure 844: Display values in filter conditions

Display values in aggregate queries

Aggregate queries can also take advantage of display values if you specify them in the group by or where clause, for example, grouping on the `caller_id` field of an incident, as well as specifying a filter for it. The query is optimized by passing through to the server.

```
ISQL> select number, dv_caller_id, caller_id from incident where dv_caller_id = 'Fred Luddy';
number dv_caller_id caller_id
------ ---------- -------
INC0000010 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
INC0000015 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
INC0000019 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
INC0000027 Fred Luddy 5137153cc611227c000bbd1bd8cd2005
```
Figure 845: Display values in aggregate queries

ODBC and client applications

See the following pages for examples of how to use the ODBC driver to create data sources from other applications.

Use interactive SQL with ODBC

Run the interactive SQL application for quick verification of connectivity and to test query results without using a full application.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC > Interactive SQL (ODBC).
2. Enter the following command to connect to the ServiceNow ITSA Suite instance. Select the appropriate user credentials in the format: ID*password@DSNName. The password cannot contain special characters.

```
CONNECT odbcuser*password@ServiceNow
```
3. Issue a `SELECT` SQL command, such as:

```
SELECT NUMBER, short_description FROM incident;
```

Make sure to include the semicolon at the end of your query statement. You will be presented with a 'Cont>' prompt otherwise.
Specify the maximum number of rows returned

By default, ServiceNow only returns 100 rows of data with each iSQL query. If you need to return more rows of data, set the maxrows parameter for the iSQL session.

To return all rows set maxrows to zero:

```
maxrows 0
```

To return more than 100 rows set maxrows to a higher value. For example, to return 500 rows:

```
maxrows 500
```

**Note:** If running the Interactive SQL console from a shortcut, you must modify the shortcut Target to include the -maxrows parameter with the desired value.
SQL support
The ODBC driver embeds a third party SQL/ODBC engine from DataDirect, a division of Progress Software.

See the DataDirect SQL Reference for information on proper SQL syntax.

**Note:** The ServiceNow ODBC driver only supports `SELECT` statements. The driver ignores other SQL statements such as `CREATE` and `ALTER`. 
ODBC driver in SQL Server

Use the ServiceNow ODBC driver in SQL Server as a Linked Server.

Using the ODBC driver in SQL Server as a **Linked Server** allows SQL Server to query tables from a ServiceNow instance directly via the ODBC driver. Only use the procedures described with SQL Server 2008 and 2012. Other versions of SQL Server may cause unexpected behavior. If you encounter unexpected behavior, refer to the [troubleshooting linked server Knowledge Base article](#).

**Required Permissions**

Additional information on the required permissions for SQL Server Linked Servers can be found [on the MSDN blog](#).

**Note:** Review this information if you encounter permission errors with SQL Server.

**ODBC SQL Server video tutorials**

Watch video tutorials about configuring and troubleshooting the ODBC driver with a SQL Linked Server.

**Configuring Microsoft SQL Linked Server with the ODBC driver**

**Troubleshooting Microsoft SQL Linked Server permissions**

*Configure SQL Server*

The following example configuration was performed on SQL Server 2008, installed on Windows Server 2008.

1. Right-click the SQL Server Management Studio application and select as **Run as Administrator**.
2. Log in to the database to which you want to link.
3. Right-click **Server Objects > Linked Servers**.
4. Click **New Linked Server**.
5. Enter the following values in the dialog.
   - **Linked server:** SERVICENOW. This is the name of the Linked Server.
   - **Provider:** Microsoft OLE DB Provider for ODBC drivers
   - **Product name:** ServiceNow. This is an identifier. Enter any value that is appropriate.
   - **Data source:** ServiceNow. This is the name of your DSN.
6. Select **Security** from the Select a page list, and then enter the following security values:

1. For a login connection, select **Be made using this security context**.
2. Enter the user name and password for connecting to the ServiceNow instance.
3. Click **OK**.
7. Navigate to Server Objects > Linked Server > Providers and double-click Microsoft OLE DB Provider for ODBC drivers.
8. Select the following options.

- Nested Queries
- Level zero only
- Support 'Like' operator

Tip:
ServiceNow recommends running the third-party provider in the out-of-process mode setting (AllowInProcess=FALSE). If you run the provider in-process (within the same process as SQL Server), then any issues with the provider can affect the SQL Server process, which in turn could result in crashing SQL server.
### Provider Options - Microsoft DLE DB Provider for ODBC Drivers

#### Provider options:

<table>
<thead>
<tr>
<th>Enable</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Dynamic parameter</td>
</tr>
<tr>
<td></td>
<td>Nested queries</td>
</tr>
<tr>
<td></td>
<td>Level zero only</td>
</tr>
<tr>
<td></td>
<td>Allow inprocess</td>
</tr>
<tr>
<td></td>
<td>Non transactional updates</td>
</tr>
<tr>
<td></td>
<td>Index as access path</td>
</tr>
<tr>
<td></td>
<td>Disallow adhoc access</td>
</tr>
<tr>
<td></td>
<td>Supports &quot;Like&quot; operator</td>
</tr>
</tbody>
</table>

#### Linked servers using this provider:

- **SERVICENOW**

⚠️ These options are applied to all linked servers that use this provider.
9. Test your connection by selecting the newly created linked server SERVICENOW and selecting Test connection.

10. Execute the following query in a query builder window to retrieve some results.

```sql
SELECT * FROM OPENQUERY (SERVICENOW , 'select number, short_description from incident')
```

Number Precision Errors
You may encounter precision errors querying for decimal or number field values using the OPENQUERY syntax with the ODBC driver. In this case, use the Cast syntax to convert the precision. For example:

```sql
SELECT * FROM OPENQUERY (SERVICENOW , 'select Cast(sys_mod_count as Decimal(38,0)), number, short_description from incident')
```

SQL Server Connection String
To use the ODBC driver directly in SQL Server 2008, specify the connection string in the following format.

```
Dsn=ServiceNow;uid =username;pwd =password
```

**Note:** The latest SQL Server 2008 patches are required for the ability to specify a connection string in the user interface, via the SQL import wizard.

**Using sp_addlinkedserver**

The following example creates a linked server named "ServiceNow ODBC" that uses the Microsoft OLE DB Provider for ODBC (MSDASQL) and the data_source parameter.

```
EXEC sp_addlinkedserver
  @server  = N 'ServiceNow ODBC' ,
  @srvproduct  = N '' ,
  @provider  = N 'MSDASQL' ,
  @datasrc  = N 'ServiceNow';
GO
```

After creating the linked server, you must update its properties to specify the login credentials.

**Use the ODBC driver in Excel**

After installing the ODBC driver and its associated DSN, use it in Excel as a data source provider.

1. In Excel open the **Data** tab.
2. Under **From Other Sources** open **From Microsoft Query**.
3. Select **ServiceNow** as your database (the default DSN name).
4. Clear the **Use the Query Wizard to create/edit queries** check box.

**Note:** The Excel Query Wizard does not support the listing of columns from a table name that contain an underscore (_). Clearing this check box uses the Query Builder instead, which supports the use of this character.
5. Supply the ServiceNow user name and password that was pre-configured during the ODBC driver configuration procedure.

6. Select a table from the ServiceNow instance and click Add.

7. Close the dialog box.

8. Select the table columns from which the Query Builder will retrieve data. Use the list above the table, or type the names directly into the columns, and then press Enter.

9. To retrieve the data and create the Excel record, click the Return Data icon or select File > Return Data to Microsoft Office Excel.

Use the ODBC driver in Crystal Reports

After installing the ODBC driver and its associated DSN, use it in Crystal Reports as a data source provider.

**Note:** Crystal Reports includes the configuration file `CRConfig.xml` that contains the JVM minimum heap size (Xms) and maximum heap size (Xmx) values. When configuring the ODBC driver with Crystal Reports, ensure the ODBC driver uses the same minimum and maximum JVM heap size as Crystal Reports. If these values do not match, update the ODBC driver settings, not the Crystal Reports settings.

1. Create a new Standard Report

2. Create a new connection using the ServiceNow DSN
3. Select a table from the list of available tables
4. Select the available fields from the selected table
5. Click **Finish** to render the report
<table>

ODBC driver good practices

Follow these practices when using the ODBC driver to avoid common pitfalls and ensure optimal performance.

Avoid joins in queries

SQL joins used to combine tables negatively impact performance.

Use database views instead of joins when you need to query data from multiple tables. Database views perform essentially the same function as joins, while reducing the affect on system performance.

A number of useful database views are installed with the Database Views plugin, and administrators can create new database views.

Avoid views that reference themselves

When you use a view, ensure that it does not reference itself.

Calling a self-referencing view causes queries to loop and may result in a stack overflow error.

Avoid Top N statements

Statements that follow the format `SELECT TOP N`, such as `select top 10 number from incident;` impact instance performance.

| Note: This recommendation applies to the ODBC driver version 1.0.9 and earlier. Select Top N queries have improved performance starting with the 1.0.10 version. |

Instead of using this type of statement, construct queries that include a where clause so the ODBC driver pulls data in smaller batches based on indexed fields. For example, use `select number from incident where sys_updated_on = '<today's_date>';`.

Use `datadd` or `datediff` on literal values only

Avoid using the `datadd` and `datediff` statements when the result cannot be transformed to a literal value in the where clause.

Failing to return a literal value causes the driver to query all records from the table before filtering them, which may affect query performance.

Use the following example to determine when to use `datadd` or `datediff`. In the efficient query, the statement is transformed to `select number from incident where closed_at= '2015-05-05';`, allowing the driver to query fewer records from the instance.

<table>
<thead>
<tr>
<th>Table 1232: Example queries</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Inefficient query</strong></td>
</tr>
<tr>
<td><code>select number from incident</code></td>
</tr>
<tr>
<td><code>where datadd(day, curdate(), closed_at)=-1;</code></td>
</tr>
</tbody>
</table>

Reuse one session for multiple queries

When performing multiple queries, establish a connection to the instance before performing any queries and reuse this connection for all of the queries.

For example, if you use a `for` loop to iterate through multiple queries, establish the connection outside of the `for` loop, then perform each query within the `for` loop using the established connection.
Perform load testing

The ODBC driver uses SOAP message calls to execute queries. Use a load testing tool such as SoapUI to perform web services stress testing.

Be sure to include active user sessions during the load testing to better simulate production environment usage. If your SOAP load test performs poorly, contact support to request additional dedicated SOAP semaphores to manage your anticipated ODBC traffic.

Use an efficient WHERE clause

In queries with a WHERE clause that references a table column, always format the WHERE clause so that the column name appears before (to the left of) the condition.

For example, if you want to select all incidents that are active, the following is the correct way to write the query in order to improve performance:

```sql
select * from incidents
where active = 1
```

This same query using the following format may give invalid results or return an error:

```sql
select * from incident
where 1 = active
```

Use consistent timezones in queries

When you are performing time/date-bounded queries, ensure that both the client and users are set to the same timezone in order to avoid time lapses.

GlideRecord performs filtering based on the instance timezone and the ODBC client is filtered based on the Windows timezone. The result is an intersection of the two timezones which can cause a loss of queried information if these timezones do not match.

Workflows

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts. The graphical workflow editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

Getting started with workflow

The graphical workflow editor provides a drag-and-drop interface for automating multi-step processes across the platform.

Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts.

The workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog.

When an activity completes, the workflow transitions to the next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item; if the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical workflow editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:

1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete.

Workflow activities

A workflow activity contains instructions that are processed by the workflow.

Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:
Transitions

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the Change Approved script to the Change Task activity:

Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:
Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow > Workflow Editor. For information about using the editor, see Create a workflow on page 3537.

Workflow editing

The Workflow Editor is a user interface for defining workflows.

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:
Figure 849: Standard change

Workflow interface

You interact with the workflow editor through several different elements of the window: the canvas, the canvas tabs, the title bar, the palette, and the palette tabs.

- **Canvas tabs**: Contains tabs for accessing workflows being edited or created.
- **Title bar**: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- **Canvas**: Provides the working surface for creating new workflows or editing existing ones.
- **Palette tabs**: Contains tabs for accessing activities being edited or created.
- **Palette**: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.
Figure 850: Workflow user interface

Workflow canvas

The tabs on the workflow canvas allow a workflow designer to move between open workflows and access other resources.

The editor opens with the Welcome tab, which displays related help links and videos for basic workflows and Orchestration (when Orchestration is activated). From this tab, you can open articles in the ServiceNow Knowledge Base, user community conversations, live feed postings, and user documentation.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow on page 3537.
**Note:** If your organization blocks users from viewing YouTube videos, you can remove the video channel from either the workflow or Orchestration welcome pages using the procedure in *Remove a blocked video channel* on page 3534.
Workflow palette

The default workflow palette contains workflow activities and existing workflows you can use as subflows. The basic workflow palette contains these tabs:

- **Workflows**: Displays existing workflows and provides controls for creating new ones.
- **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

**Workflows tab**

The **Workflows** tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.

![Figure 852: Workflows tab in the palette](image)

**Core tab**

The **Core** tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see Add an activity to a workflow on page 3755.
Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.
Controls on the right side of the title bar manage the workflow.

- **Workflow Properties**: Opens the current workflow's properties form.

- **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.

- **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see *Workflow Validation*.

- **Help**: Opens documentation to help you create the workflow.

**Workflow menu**

Click the menu icon in the title bar for additional options to configure the workflow.
These menu options are available:

<table>

<tr>
<td>Edit Inputs</td>
<td>Opens the Workflow Inputs list of variables that the workflow can accept when used as a subflow. For more information, see Invoke a subflow in a workflow on page 3557.</td>
</tr>
<tr>
<td>Edit Stages</td>
<td>Opens the Workflow Stages list. For more information, see Workflow stages on page 3587. For tables with a column of Type = Workflow.</td>
</tr>
</tbody>
</table>

Remove a blocked video channel

If your organization blocks users from downloading the videos on the Workflow and Orchestration welcome pages, you can remove the videos.

The instructional videos on the workflow and Orchestration welcome pages are hosted on YouTube. Some organizations block viewing videos from this site. You can follow this procedure to remove the videos from either welcome page.

1. Navigate to System UI > UI Pages.
2. Open the workflow_editor_welcome record.
3. From the HTML field, remove the lines shown here for one or both of the welcome pages and update the record.

   - Basic workflow

   ```html
   <div id = "workflowchannel" class="widget-cotent">
      <h3 class="widget-header"> ${gs.getMessage('Channel')} </h3>
   
   <div class="widget-link">
   </div>
   
   <iframe src="https://www.youtube.com/embed?list=PLCoMiTb5WX3o_ksSvCnhk1AfAh4yZOZ1Yz" width="525" height="380" frameborder="0" allowfullscreen="true"></iframe>
   </div>
   ```
- **Orchestration**

```html
<div id="orcheschannel" class="widget-content">
  <h3 class="widget-header"> ${gs.getMessage('Channel')}</h3>
  <div class="widget-link">
  </div>
  <iframe src="https://www.youtube.com/embed?list=PLCOmiTb5WX3o6xH1f0Z0Xm" width="525" height="380" frameborder="0" allowfullscreen="true"></iframe>
</div>
```
UI Page - workflow_editor_welcome

Name: workflow_editor_welcome
Category: General
Application: Global
Description: Welcome page for workflow editor

```html
</li>
</ul>
</div>
</div>

<div class="content-body">
  <div class="widget-container">
    <h3 class="widget-header">${gi.getMessage('Channel')}</h3>
    <div class="widget-link">
    </div>
    <iframe src="http://www.youtube.com/embed/8CZHsbSkX1k?rel=0" width="525" height="390" frameborder="0" allowfullscreen="true"></iframe>
  </div>
</div>

<div class="widget-container">
  <h3 class="widget-header">${gi.getMessage('Community')}</h3>
  <div class="widget-link">
    <a target="_new" href="https://community.servicenow.com/discussions/createsupportinput.jsp?al=containerType=GMO&containerId=2015">Start a Dialog</a>
  </div>
</div>

<iframe src="${serviceNowURL}/render_gadget_widgetWorkflowRSS.do?sysparm_nostack=true" width="525" height="390" frameborder="0" allowfullscreen="true" scrolling="no"></iframe>
</div>
</div>
</body>

```
Create a workflow

Automate a multi-step process by creating a workflow with the workflow editor.

- You must have the workflow_admin or workflow_creator role to use the workflow editor.
- If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 3652 before creating the workflow.

1. Navigate to Workflow > Workflow Editor.
   The Welcome tab of the Workflow Editor opens. It links to workflow documentation and other related resources. If ServiceNow Orchestration is activated, the welcome screen contains resources for that feature as well.

2. On the Workflows tab in the palette, click the + icon in the upper right corner.
   A simplified version of the New Workflow form opens.

3. Fill in the Name and Table fields
4. [Optional] Add a Description.

5. [Optional] Do one of the following:
   a) If the Conditions UI section is displayed, specify a Condition if needed and edit the fields.
      (The Conditions UI section shows only if the selected table supports conditions for launching workflows. For example, if you select the sc_req_item table, conditions are not applicable and the Conditions UI section is not displayed.)
   b) If the Stages UI section is displayed, check that the State rendering and Stage order fields contain the correct information. (The Stages UI section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the Stages UI section is displayed.)

6. Click Submit.

   The new workflow is created with the Begin and End activities connected by a single transition.

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Add a workflow activity on page 3549, Validate a workflow from the workflow editor on page 3549, and Publish a workflow on page 3551.

8. To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Create a workflow from a table

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 3652 before creating the workflow.

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.
2. Right-click in the column header and select Configure > Workflows.
The Workflow Versions on that table appear in a list.

3. Click New.
   The Workflow Version opens in New Workflow view. The Table field is filled in with the table you selected in step 1 and is read-only.

4. Enter Name.

5. [Optional] Enter Description.

6. [Optional] Edit conditions fields as necessary.

7. Click Submit.
   The new workflow is added to the Workflow Versions list.

8. Click the workflow Name.
   The new workflow is created with the Begin and End activities connected by a single transition.
9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see *Add a workflow activity* on page 3549, *Validate a workflow from the workflow editor* on page 3549, and *Publish a workflow* on page 3551.

10. [Optional] To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

### Create a workflow for a new service catalog item

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* on page 3652 before creating the workflow.

1. Navigate to **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. At the top of the form, next to **Catalog Items**, click **New**.

   The Catalog Item form opens.

3. Add a **Name**.
4. Next to the **Workflow** field, click the lookup icon.
5. Next to Workflow at the top, click **New**.
The Workflow version dialog opens in the New Workflow View. The **Table** field is set to **Requested Item (sc_req_item)** and is read-only.

6. Add a **Name**.

7. [Optional] Add a **Description**.

8. [Optional] Change the stage information as necessary.

9. Click **Submit**.
The new workflow is created with the **Begin** and **End** activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
    For more information, see *Add a workflow activity* on page 3549, *Validate a workflow from the workflow editor* on page 3549, and *Publish a workflow* on page 3551.

11. To change advanced settings for the workflow, click the **Properties** icon.

12. Click **Update**.
    If you close the workflow editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the **Workflow** field. Hover over the information icon to view a read-only summary of the workflow.

### Create a workflow for an SLA Definition

Automate a multi-step process by creating a workflow from an SLA definition.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* on page 3652 before creating the workflow.

1. Open a list of SLA definitions. For example *Facilities > SLA Definitions* or *Service Level Management > SLA Definitions*.

2. At the top of the form, next to **SLA Definitions**, click **New**.

3. Select **Contract SLA** or **Service Offering SLA**.
   The SLA Definition or Service Offering SLA form opens.

4. Next to the **Workflow** field, click the lookup icon.

5. Next to **Workflow** at the top, click **New**.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter Name.
7. [Optional] Enter Description
8. [Optional] Edit conditions fields as necessary.
9. Click Submit.
   The new workflow is created with the Begin and End activities connected by a single transition.
10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.

For more information, see Add a workflow activity on page 3549, Validate a workflow from the workflow editor on page 3549, and Publish a workflow on page 3551.

11. [Optional] To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Workflow properties

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- Name
- Table
- Description
- If condition matches
- Condition

If you click Diagrammer view in Related Lists, the following UI sections are available in the dialog box:

- General
- Conditions
- Inputs
- Activities
- Application
- Schedule
- Stages
- Estimated Runtime
## General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select <strong>Global</strong> to run the workflow on all tables.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checked out</td>
<td>[Read-only] When the workflow was checked out. Automatically set by the <strong>Checkout</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>[Read-only] The user who has this workflow checked out. This value is automatically set by the <strong>Checkout</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td>[Read-only] Check box to indicate whether the workflow has been published. Automatically set by the <strong>Publish</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>

## Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as sc_req_item, that does not require a condition.
If condition matches

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When the condition evaluates to true, the workflow launches an active context:</td>
</tr>
<tr>
<td>• <strong>None</strong>: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.</td>
</tr>
<tr>
<td>• <strong>Run the Workflow</strong>: The default value. The workflow engine starts the workflow if the information in the <strong>Condition</strong> field matches a record that is inserting into the table.</td>
</tr>
<tr>
<td>• <strong>Run if no other workflows match yet</strong>: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as <code>short_desc</code> contains <code>test</code>. A new workflow, which has <strong>If condition matches</strong> is set to <strong>Run if no other workflows match yet</strong>, only runs if none of the four workflows have started running on the Incident record.</td>
</tr>
</tbody>
</table>

**Condition**

A condition builder for specifying workflow conditions that trigger the behavior selected from the **If condition matches** list.

**Order**

Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions.

---

**Inputs**

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>

**Activities**

The Activities section enables you to set activity pinning and maximum activity count.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Activity pinning             | List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity updates (pinning) on page 3650. The possible options are:  
  - **Set by activity**: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.  
  - **Pin all activities**: Pins all activities in the workflow to their current version.  
  - **Unpin all activities**: Allows all activities in the workflow to be updated. |
<p>| Max activity count           | The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery based on</td>
<td>The schedule type for this workflow. Possible types are:</td>
</tr>
</tbody>
</table>
|                       | • **User-specified duration**: Duration based on a user-specified value. This is the default schedule type.  
|                       | • **Relative duration**: Duration calculated from a preconfigured schedule, such as 8-5 weekdays. |
| Expected time         | User-defined interval. This field is visible when the schedule type is **User-specified duration**. |
| Schedule              | Preconfigured schedule that determines when this workflow runs.             |
| Timezone              | Time zone for this instance.                                               |

### Stages

The Stages section appears if you select a table with **Type = Workflow**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Displays the workflow stage progress on the selected table. Optionally, select <strong>Stage rendering</strong> and <strong>Stage orders</strong> schemes to customize the appearance of the stage field. The default values cover typical scenarios.</td>
</tr>
<tr>
<td>Stage rendering</td>
<td>The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see <strong>Workflow stage renderers</strong> on page 3628.</td>
</tr>
<tr>
<td>Stage order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select <strong>Computed</strong> to let the workflow engine compute the stage order from the order of execution in the workflow. Select <strong>User Specified</strong> to use the <strong>Order</strong> field from that <strong>Workflow stages</strong> on page 3587.</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields..</td>
</tr>
<tr>
<td>Duration</td>
<td>Time allocated for the specific stage.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select <strong>Computed</strong> to let the workflow engine compute the stage order from the order of execution in the workflow. Select <strong>User Specified</strong> to use the <strong>Order</strong> field from that <strong>Workflow stages</strong> on page 3587.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
</tbody>
</table>

### Estimated Runtime

The **Estimated Runtime** section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see *Workflow run time metrics* on page 3670.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires ERT</td>
<td>Check box to indicate that this workflow requires an estimated runtime configuration.</td>
</tr>
<tr>
<td></td>
<td>You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.</td>
</tr>
<tr>
<td>Estimated Run Time</td>
<td>The initial estimate for the workflow’s run time.</td>
</tr>
<tr>
<td>Number of data points</td>
<td>[Read only] The number of times the system has compared the estimated run time to an actual run time result.</td>
</tr>
<tr>
<td>Outlier Percentage Threshold for ERT</td>
<td>[Required] The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see <em>Outlying workflow run times</em> on page 3670.</td>
</tr>
</tbody>
</table>

### Add a workflow activity

Activities determine the functionality of the workflow.

When they are created, all workflows contain **Start** and **End** activities.

For more information, see *Workflow activities* on page 3676.

1. Open a workflow.
2. Check out the workflow.
3. **Drag a workflow activity** from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

### Validate a workflow from the workflow editor

You can manually validate a workflow from the workflow editor.

Role required: workflow_admin
Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.

1. Open the workflow to validate in the workflow editor.
   When the workflow is loaded, the workflow validator icon appears in the toolbar.

2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.

<table>
<thead>
<tr>
<th>Type</th>
<th>Level</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>ValidateLowestCommonTable</td>
<td>info</td>
<td>The lowest common table in this workflow is.</td>
</tr>
<tr>
<td>ValidateTransitionIn</td>
<td>info</td>
<td>All activities in this workflow have at least one inbound transition.</td>
</tr>
<tr>
<td>ValidateInputVarUpdateSetDependencies</td>
<td>info</td>
<td>There were no input Variable Update Set dependency issues found.</td>
</tr>
<tr>
<td>ValidateDanglingTransition</td>
<td>info</td>
<td>There are no unattached transitions in this workflow.</td>
</tr>
<tr>
<td>ValidateParentFlow</td>
<td>warn</td>
<td>This workflow version ([Item Designer - Approvals] is required as a subflow in 1 other workflows.</td>
</tr>
<tr>
<td>ValidateScriptForCurrentDotUpdate</td>
<td>info</td>
<td>The JavaScript in this workflow has no instances of 'currentDotUpdate'</td>
</tr>
<tr>
<td>ValidateWorkflowHasColumn</td>
<td>info</td>
<td>Workflow columns are valid.</td>
</tr>
</tbody>
</table>
Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation on page 3589.

To publish a workflow:

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select Publish.

If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

Ending workflows with multiple branches

A workflow is complete when it reaches the End activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a Join activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

![Figure 856: Workflow with uncompleted branch](image)

For both branches to complete, add a Join activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The Incomplete condition of the a Join activity is met only if one of the branches cannot be completed.
Edit a published workflow

You can edit a published workflow after you check it out.

**Note:** You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

1. Navigate to **Workflow > Workflow Editor**.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select **Checkout**.
   
   A new version of the workflow is created and assigned to you.
   
   If you are in a different domain than the published workflow, the new workflow version is created in your domain.

After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.

1. **Validate a workflow from the workflow editor** on page 3549
2. **Publish a workflow** on page 3551

Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The **Workflows** tab in the Workflow Editor contains a list of the workflows available for use as subflows.
Figure 858: Workflows available to use as subflows

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a Loading message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Subflows and the Create Task activity

If a workflow contains a Create Task activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

**Note:** An alternative to creating duplicate subflows that use the Create Task activity is to add a Run Script activity to the workflow that creates a task with a script.
Figure 860: The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

**Note:** You can also use the *Return Value* activity in the subflow to return values to the parent workflow. Make sure to have a *Return Value* on every ending transition path.

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

**Note:** Subflows on the Requested Item [sc_req_item] table in the Service Catalog cannot accept variables from parent workflows.

**Define inputs for a subflow**

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

All inputs are stored in the Variables [var_dictionary] table.

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select Edit Inputs.
3. In the Workflow Inputs window, click New.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.
5. Click **Submit**.

*Invoke a subflow in a workflow*

Use this procedure to add a subflow to a workflow.

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the **Workflows** tab to the parent workflow.
3. In the **New Activity** dialog box, define the variables defined by the subflow's **Inputs**.
   These fields can accept both static values or variables in the following format:
   
   \( ${\text{variable_name}} \)

4. Click **Submit**.
   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the **Inputs** definition.

*Prepare a subflow*

This example describes the process of preparing a subflow for use in a parent workflow.

1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.

   ![Edit Inputs Menu]

3. In the Workflow Inputs window, click **New** in the **Variables** list.
4. Add a new variable depending on the type of values that it is going to store. The following example sets up a string value.

5. Click **Submit**.

6. Close the **Workflows Inputs** dialog.

7. Create a **Run Script** activity on the subflow.
   - Set the value from the parameter to a field on the current form. This is important because the **Notification** activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the **Description** field.
     
     ```
     current.description = workflow.inputs.bluesubvariable;
     ```
   - Create a new field on the request form but do not display the field. This serves as temporary storage.
8. Create a **Notification** activity on the subflow. Use `$description` in the subject to return the value from the field.
This is what the subflow would look like:
Prepare a workflow to use a subflow

After you create a subflow, use this procedure to prepare the parent workflow.

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.
   In the following example, the variable is named **Blue Main Variable**.

   ![Variable creation interface]

2. Click **Submit**.

3. Insert a **Run Script** activity to return the value from a field to the newly created variable.
   In this example, the value of the **Short Description** field is returned and given to the newly created variable.

   ```script
   workflow.scratchpad.bluemainvariable = current.short_description;
   ```
4. Click **Submit**.

5. In the subflow activity, set the **Blue Sub Variable** to pass the `bluemainvariable` to the `bluesubvariable`.

   ```plaintext
   workflow.scratchpad.bluemainvariable = current.short_description;
   ```

   This is what the main workflow looks like:
Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity.

These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

1. Navigate to Workflow > Activity Definitions.
2. Select a workflow activity, such as Approval - User.
3. In the Activity Variables section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

Note: If defining a new activity variable that is dependent on another activity variable, put the prefix “vars.” before the name of the parent activity variable. For example, if the child field is dependent on a field named parent, put the value vars.parent in the Dependent field.

To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

activity.vars.variable_name = new_variable_value

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

Note: There is a specific kind of input variable for any workflow that is declared against the table Requested Item [sc_request_item]. To understand the use of these variables see Workflow catalog variables on page 3565.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

1. Navigate to Workflow > Workflow Editor.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select Edit Inputs.
4. Select an existing variable or click New.
Note the **Column name** field. Use this value when accessing the variable from a script.

Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

The input variables are available to use in scripts. To access an input variable from a script:

```javascript
var input  = workflow. variables. variableName //get the workflow variable identified by column name.
```

### Assigning values to variables from outside of workflow

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```javascript
//Declare an instance of workflow.js
var wf  = new Workflow ( ) //Get the workflow id
var  wfId  = wf. getWorkflowFromName ( "Workflow Name" ) ;
//Start workflow, passing along name : value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of workflow
wf. startFlow (wfId , null , "Workflow Name" , {input_var_name : input_var_value } ) ;
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
//Declare an instance of workflow.js
var wf  = new Workflow ( )
//Get the workflow id
var  wfId  = wf. getWorkflowFromName ( "Workflow Name" ) ;
//Start workflow, passing along object containing name/value pairs mapping to inputs expected by the workflow
var vars  = { } ;
vars. input_var_name1 = input_var_value1 ;
vars. input_var_name2 = input_var_value2 ;
// add as many variables as your workflow is expecting, then pass the object
wf. startFlow (wfId , null , "Workflow Name" , vars ) ;
```

### Assigning Values for Subflow Inputs from inside of a Main Workflow

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see **Workflows used as subflows**.
Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```javascript
var readValue = workflow.inputs.variable_name;
```

Workflow catalog variables

Workflows that are associated with the Requested Item [sc_req_item] table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.

Scope

For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item [sc_request_item], and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

Declaration

You can declare requested item catalog variables at the catalog item level or at a global level.

You can declare global catalog variables using the workflow editor context menu.

Also see, Global variable declaration option 2.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out a workflow that runs against the Requested Item [sc_req_item] table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.

Global variable declaration option 2

You can declare global catalog variables using the Service Catalog.

1. Navigate to Service Catalog > Item Variables.
2. The list of variables that appears in the workspace has a default filter of Cat Item != <blank>. Change the filter to Cat Item = <blank> and run the query.
   The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click New to create a new variable.
4. Leave the Cat Item field blank.
5. Select the Global field blank.
6. Click Submit.

Also see, Global variable declaration option 1.

© 2017 ServiceNow. All rights reserved. 3565
Catalog item specific variable declaration option 1
You can declare a catalog item-specific variable.

These variables are only available to the catalog item referenced in the Cat Item field on the variable record.

1. Navigate to Service Catalog > Catalog Variables > Item Variables.
   Note the list of variables that appears in the workspace has a default filter of Cat Item != <blank>.
2. Enter or select a catalog item in the Cat Item reference field.
   Selecting a Cat Item restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click Submit.
   Also see, Catalog item specific variable declaration option 2.

Catalog item specific variable declaration option 2
You can declare a catalog item-specific variable directly from a catalog item record.

Creating a catalog variable in this way automatically sets the Cat Item reference to the catalog item selected.

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. Select or create an a catalog item.
   Note the Variables related list. All variables declared using this related list have a Cat Item reference value of the current catalog item.
3. From the Variables related list, click New.
4. Ensure that the Cat Item field correctly references the catalog item previously selected or created.
5. Go to or open the Question section or tab.
6. Add a Question.
7. Add a Name.
   Variable names should not include white space and cannot begin with a number.
8. Click Submit.
   Also see, Catalog item specific variable declaration option 1.

Display
Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the Maintain Items module and in the Item Variable modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the Catalog Task activity in the form of a slushbucket at the bottom of the Catalog Task activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of Catalog Task when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the Catalog Task activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

Access and assignment
The Catalog Item Variables are available and assigned to a specific Catalog Task activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.
To access the values of a Catalog Item Variable inside a script:

```javascript
var gr = current; // or create and query a new GlideRecord
var itemVariable = gr.variables[variableName]; // access the service catalog variable identified by the variable name.
var itemValue = itemVariable.getGlideObject().getValue();
var itemQuestion = itemVariable.getGlideObject().getQuestion().getLabel();
```

**Workflow scratchpad**

The *scratchpad* is a special field on a workflow context that allows workflow activities to communicate data to subsequent activities.

The scratchpad is available within the workflow as a variable (*scratchpad*), and variables in the scratchpad are available as properties on that variable. Using the scratchpad requires at least two activities in a workflow: the sending activity, which writes data to the scratchpad, and the follow-up activity, which uses this data.

The scratchpad can hold variables of any JavaScript data type that can be represented as JSON. These data types include primitives such as *String* or *Boolean*, or JavaScript objects such as *Object*, *Array*, and *Date*. You cannot add functions or scriptable Java objects, such as *GlideRecord*, to the scratchpad. For an alternative method of using the scratchpad with scriptable Java objects, see *Scriptable Java objects* on page 3569.

The properties of supported JavaScript objects can be objects or arrays themselves. For a description of the data types supported in a scratchpad variable, see *Introducing JSON*.

**Workflow scratchpad variables**

The scratchpad is a space in the workflow context to store and share string based variables (as *name:value* pairs) between instances of activities within an executing instance of a workflow.

The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

**Declaration**

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```javascript
workflow.scratchpad.variableName = variableValue;
```

**Display**

There is no way to view the contents of the scratchpad.

**Access and Assignment**

As stated in the Declaration section:

```javascript
workflow.scratchpad.variableName = variableValue;
```
or:

```javascript
var myValue = workflow.scratchpad.variableName;
```

**Store multiple data types in the workflow scratchpad**

The workflow scratchpad can store multiple data types.

Data types the scratchpad can store include:
- Primitives such as integers, boolean values, or strings.
- JavaScript objects such as user data.
- Scriptable Java objects such as GlideRecord or GlideDateTime.

Add primitives to the workflow scratchpad

You can add any primitive value to the scratchpad.

```javascript
// numbers
workflow.scratchpad.maxdays = 100;
workflow.scratchpad.pi = 3.14159267;

// booleans
workflow.scratchpad.canSave = true;
workflow.scratchpad.isHoliday = isHoliday( new Date() );

// string
workflow.scratchpad.next_holiday = 'Christmas';
```

Add JavaScript objects to the workflow scratchpad

You can add any JavaScript object to the scratchpad if the object can be represented as JSON.

Whenever possible, group related values into a single JavaScript object and add this object to the scratchpad instead of storing each value individually.

```javascript
// complex JavaScript object
var joe = {
    name: 'Joe Watkins',
    age: 45,
    job: 'Electrical Engineer',
    contact: ['760-555-1212', 'joew@fastereng.net'],
    vaction: { start: new Date("October 12, 2013"), days: 5 }
}

passUserToAnotherActivityViaScratchpad( joe );

function passUserToAnotherActivityViaScratchpad(usr) {
    workflow.scratchpad.user = usr;
}
```

Format JavaScript objects

When writing JavaScript objects to the scratchpad, maintain the standard JSON format and do not attempt to express the objects as strings.

Expressing a JavaScript object as a string is unnecessary and requires additional parsing. The workflow scratchpad can serialize and deserialize data to and from any JavaScript primitive, array, or object. This example shows objects stored incorrectly as strings.

```javascript
var user1 = "{ 'name':'Joe', age:12 }";
var user2 = "{ 'name':'Mary', age:42 }";
workflow.scratchpad.users = [user1, user2];
```
This second example shows the recommended way to store JavaScript objects.

```javascript
var user1 = { 'name':'Joe', age:12 }; 
var user2 = { 'name':'Mary', age:42 }; 
workflow.scratchpad.users = [user1, user2];
```

**Scriptable Java objects**

A scriptable Java object is any Java object that is accessible through JavaScript, such as GlideRecord or GlideDateTime.

Any workflow activity can access scriptable Java objects, but any scriptable Java object declared within an activity is available only to that activity. Do not store scriptable Java objects as scratchpad variables. Instead, store primitive data from the Java object that a follow-up activity can use to reconstruct the Java object, such as the object **Name** or unique **ID**.

**Forwarding a single-row GlideRecord object**

When forwarding a single row of data from a GlideRecord object, store the sys_id of that row on the scratchpad.

In this example, the sending activity instantiates a GlideRecord object from a passed Incident **Number**. The activity then updates the **Short description** of that incident and adds the sys_id of the incident to the scratchpad.

```javascript
// assume that 'incidentNumber' comes from a workflow input variable, activity variable, or other source.
// read the row into a glide record.
var grIncident = new GlideRecord('incident');
grIncident.get('number', incidentNumber);
grIncident.short_description = 'IMPORTANT: needs attention');
grIncident.update();

// write this row to the scratchpad for the next activity:
workflow.scratchpad.incidentId = gr.getUniqueValue();
```

The follow-up activity then uses the sys_id value passed in the `workflow.scratchpad.incidentId` scratchpad variable to instantiate a new GlideRecord object for that row.

```javascript
// re-read the incident in the follow-up activity: 
var grIncident = new GlideRecord('incident');
grIncident.get( workflow.scratchpad.incidentId );
```

**Forwarding a multi-row GlideRecord object**

When passing multiple rows from a GlideRecord object, pass the query used to generate the GlideRecord.

In this example, the sending activity writes enough information about a GlideRecord object to the scratchpad for the follow-up activity to recreate the GlideRecord object.

```javascript
function passJoesIncidentsToProcessingActivity() { 
  // first find Joe User 
  var joeUser = new GlideRecord('sys_user'); 
  if (!joeUser.get('name', 'Joe User')) { 
    workflow.debug('User: Joe User not found'); 
    return; 
  }
  
  // read the row into a glide record. 
  var grIncident = new GlideRecord('incident'); 
  grIncident.addQuery('caller', joeUser.getUniqueValue() );
  grIncident.query();
}```
sendQueryGR('joesIncidents', grIncident);
}

// send any filtered GR to another activity via scratchapd
function sendQueryGr(variableName, gr) {
    workflow.scratchpad[variableName] = grDescriptor(gr);
}

function grDescriptor(gr) {
    return {
        sys_id: gr.getUniqueValue(), // current row, if applicable
        table: gr.getTableName(),
        query: gr.getEncodedQuery()
    }
}

The follow-up activity then duplicates the original GlideRecord query using the scratchpad values.

// Re-query in the follow-up activity:
var gr = reloadQuery('joesIncidents');

function reloadQuery(variableName) {
    var grDescriptor = workflow.scratchpad[variableName];
    var gr = new GlideRecord(grDescriptor.table);
    gr.addEncodedQuery(grDescriptor.query);
    gr.query();

    // [Optional] seek to the same row
    while (gr.next()) {
        if (gr.getUniqueValue() == grDescriptor.sys_id)
            return;
    }
    workflow.debug(grDescriptor.table + ':' + grDescriptor.sys_id + ' - record not found');
}

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.
Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

```
var myVarValue = current.getElement(nameOfTheField);
```

or

```
var myVarValue = current.fieldName;
```

or

```
current.variableName.setValue( "A Variable Value"");
```

Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration [sysevent_register] table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the registered_events column of the Workflow Executing Activity [wf_executing] table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a Run Script activity. In this case, the event, such as cancel, is passed to all records in the Workflow Executing [wf_executing] table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.

Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches.

If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands [wf_command] table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

Workflow events in the base system

Several workflow events are available in the base system.
<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the onActivityComplete event handler.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for wf_executing.notify_termination, then set the value to true (activity.notify_termination = true) during the onExecute event.</td>
<td>Workflow Engine, Process Terminations</td>
<td>Current thread, current mutex</td>
<td>Join activity</td>
</tr>
<tr>
<td>otherEvent</td>
<td>String value used by the Join activity to respond to an otherEvent.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about an otherEvent that has completed.</td>
<td>The Join activity transitions from n number of preceding activities. These preceding activities all create a wf_executing record, which causes a check to see if the record already exists. If the Join already exists, then the Join created by the executing transition sets the wf_executing record for deletion.</td>
<td>Join activity</td>
<td>Current thread, current mutex</td>
<td>Join activity, onOtherEvent event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>---------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------</td>
</tr>
<tr>
<td>timer</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Allows wf_executing records to be informed about a timer activity that has completed and has fired the timer event.</td>
<td>The <strong>Timer</strong> activity schedules a job that calls a script. The script calls fireEvent (wf_executing, timer).</td>
<td><strong>Timer</strong> activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td><strong>Timer activity, onTimer event handler</strong></td>
</tr>
<tr>
<td>execute</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Informs a record in the wf_executing table with the initial state of <strong>Executing</strong> to proceed with its primary work.</td>
<td>The workflow engine, for each transition executed, creates an executing record with a state of <strong>Executing</strong>. Once created, the executing record is put in a queue for processing. For each item in the queue, the Rhino globals are established, the activity definition that drives the executing record is instantiated, and the <code>run()</code> function is called. When the state of a record is <strong>Executing</strong>, this function always calls <code>onExecute</code>.</td>
<td><strong>Workflow engine, via the WFAActivity Handler</strong></td>
<td>Current thread, current mutex</td>
<td>All activities, <strong>onExecute event handler</strong></td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
<td>--------------------</td>
<td>------------------------------------------------------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>execute (specific to Lock)</td>
<td>String value used by the Lock activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td>Informs a Lock activity schedules a job with a script that uses the workflow script include's fireEvent(wf_executing, 'execute') method.</td>
<td>Lock activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Lock activity, onExecute event handler</td>
<td></td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs Approval Coordinator both registers for the event and triggers the event. The child approvals have listeners that determine their approval state.</td>
<td>Approval Coordinator triggers the event during its onExecute event</td>
<td>Current thread, current mutex</td>
<td>Approval Coordinator, Approval - User, and Approval - Group all have onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column</td>
<td></td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>cancel (from within activity definitions)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>Informs all wf_executing records in a context that the workflow is being canceled.</td>
<td>The <strong>End</strong> activity uses the global workflow.broadcastEvent('cancel') to interrupt the currently running wf_executing records. This changes the state of those records to <strong>Cancelled</strong>.</td>
<td>End activity</td>
<td>Current thread, current mutex</td>
<td>All activities, <strong>onCancel</strong> event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>cancel (outside current context)</td>
<td>String value used by workflow activities to respond to a request for cancellation. This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all workflow records in a context that the workflow is being canceled. The event is managed via the <code>onCancel</code> event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the.</td>
<td>Any script can call cancel on a known executing context via the workflow script include. For example, var w = new Workflow(); w.cancel(context); //where context is a GlideRecord of the context to be canceled.</td>
<td>Any script include, scheduled job, UI action, or other source</td>
<td>Current thread, private mutex</td>
<td>All activities, <code>onCancel</code> event handler</td>
<td></td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>stop (see End activity)</td>
<td>The End activity checks for this event.</td>
<td>If the stop event is the current event, then the cancel operation of the End activity is bypassed.</td>
<td>Only in the End activity.</td>
<td>Any script can trigger or broadcast the stop event via a script include or workflow Run Script activity</td>
<td>Current thread, current mutex</td>
<td>This event is used by the End activity to exclude the Cancel activity and allow a workflow to end, even if canceled.</td>
</tr>
<tr>
<td>listener</td>
<td>String value that the workflow (subflow) activity triggers as an event.</td>
<td>When a main workflow calls a subflow, the workflow keeps the ID of the subflow's context in the scratchpad. When the subflow is complete, it triggers the listener event via a business rule.</td>
<td>The listener event is passed to the parent context on completion of a subflow and is managed by the onListener action of the workflow activity.</td>
<td>Business rule that is triggered by the update of a workflow that has a parent</td>
<td>Current thread, current mutex</td>
<td>This event is used by a subflow to inform its parent flow that it is complete. The parent workflow will react to this event and continue.</td>
</tr>
<tr>
<td>probe_complete</td>
<td>String value triggered in the workflow by an Orchestration activity indicating that the MID Server has completed a task.</td>
<td>The probe_complete event is triggered from Orchestration sensor processors via the workflow helper function handleEventById.</td>
<td>Event used to restate a workflow that is waiting for the MID Server to process a task or activity</td>
<td>Orchestration activities</td>
<td>Worker thread, private mutex</td>
<td>Orchestration activities</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>pause</td>
<td>String value sent to a workflow from an SLA to pause the <strong>Timer</strong> activity.</td>
<td>When an SLA is paused, the SLA workflows must be paused if there is a timer running.</td>
<td>Use is exclusive to the SLA timer</td>
<td>SLA</td>
<td>Business rule thread, private mutex</td>
<td><strong>Timer</strong> activity</td>
</tr>
<tr>
<td>resume</td>
<td>String value used by the <strong>Timer</strong> activity to resume a paused timer (see pause).</td>
<td>When an SLA is resumed, the SLA workflows must be resumed as well.</td>
<td>Use is exclusive to the SLA timer.</td>
<td>SLA</td>
<td>Business rule thread, private mutex</td>
<td><strong>Timer</strong> activity</td>
</tr>
</tbody>
</table>

*Glide events relative to workflows*

Workflow uses several Glide events.

**Table 1235: Workflow Glide events**

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert</td>
<td>Global event set upon the insert of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Starts workflows that are associated with the current GlideRecord either by reference, as in request items and SLA timers, or by conditions associated with the GlideRecord's table.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is start. Workflows can also be started manually using a script.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of insert</td>
</tr>
<tr>

</tbody>
</table>

Workflow stages

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident [incident] table has an Incident state field that indicates progress, but the service catalog uses the Stage field.

To indicate the workflow's progress through the possible stage values, the interface updates the Stage field selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's Stage field.
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities. If an activity is active, then the stage is shown with the state of In progress. If an activity is in the Pending or Completed state, the stage reflects this state.

Workflow stage sets

You can create stage sets that are named groups of stages commonly used together. These stage sets can be used in any number of workflows on different tables.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a Stage field, defined in the workflow properties, to indicate the workflow's progress through the possible stage values.

Updates to workflow stage values

During an upgrade, the system makes changes to the Value field of records in the Workflow Stage [wf_stage] table.

The following changes are made:

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support internationalization of choice lists and enable workflows to display translated text in the Stage field.
Workflow validation

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

Validate a workflow from the workflow editor

You can manually validate a workflow from the workflow editor.

Role required: workflow_admin

Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.

1. Open the workflow to validate in the workflow editor.

   When the workflow is loaded, the workflow validator icon appears in the toolbar.

2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.
Validate a workflow from the Workflow Version form

You can generate a workflow validation report from the Workflow Version form.

Role required: workflow_admin

1. Navigate to Workflow > Administration > Workflow Versions.
2. Select a workflow to validate.

Highlighting critical errors

The graphical workflow editor highlights critical errors when a workflow is loaded.
In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical workflow editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.

![Diagram of workflow with missing subflow]

**Figure 863: Validate missing subflow**

**Validations at publishing**

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary.

When validation error messages appear, click the validate icon in the graphical workflow editor to see the error report.

**Validation warning**

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.
Publish Confirmation

Validation warning. Click the validation button in the toolbar to get details:

Validate Summary - Workflow version contains Warnings - Total checks performed:15 (Info:13, Warn:2, Critical:0)

Publish this workflow with warnings?

Cancel  OK

Figure 864: Validation warning

Validation failure

A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Figure 865: Validation failure

Workflow validation report

The validation report summarizes the results of each separate workflow validation.

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
Figure 866: Workflow validation report

Header summary

The header of the validation report summarizes the entire validation run against the specified workflow.

- **Validate Summary**: The overall score reflects the most severe notification level encountered during the validation.
- **Total checks performed**: The total number of validations run is also broken down to show the number at each notification level.
Report columns

The body of the report displays the results of each individual validation check that was performed. The columns are **Type**, **Level**, and **Message**. You can sort and filter these columns as you would any list.

Levels

<table>
<thead>
<tr>
<th>Name</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Info</td>
<td>Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its executability. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

Message

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

Workflow validator

ServiceNow offers several workflow validators for workflow designers to test their workflows.

This page lists all available workflow validators. See Workflow validation on page 3589 for information on using workflow validators and Workflow validation report on page 3592 to see the type of information that is returned.

**ValidateTransitionOut**

The **ValidateTransitionOut** validator finds activity conditions with no exit transitions.

**Validation summary**

- **Risk:** Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** All conditions have transitions.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains <condition count> activity conditions without an output transition.
- **Suggested Action:** If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

**Troubleshooting**

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the **Notification** and **Timer** activities both execute at the start of...
the workflow. The Timer is the entity that decides when the workflow ends. In this situation, executing the Notification, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the Notification activity as a Warning that the designer can ignore.

Figure 867: Condition with no valid transition

In the second example, the Notification activity has no exit transition. The designer missed this because of the layout. The transition from the Timer activity passes behind the Notification activity and appears to connect the exit from the Notification activity to the End. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow’s designer intended for the Notification activity to transition to the End.

Figure 868: No condition out

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

ValidateTransitionIn

The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.
Validation summary

- **Risk:** Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose:** Find activities that do not have inbound transitions.
- **Severity Level:** Warning.
- **Valid Result:** Valid.
- **Valid Message:** All activities in this workflow have at least one inbound transition.
- **Invalid Result:** Invalid.
- **Invalid Message:** This workflow contains <activity count> activity conditions without an input transition.
- **Suggested Action:** Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

Troubleshooting

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from **Set Values** does not stop at **Approval - User** (there is no arrow end). Instead, that transition goes directly to **End**. As a result, **Approval - User** cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.

![Diagram of workflow with transition issue](image)

**Figure 869: TransitionIn invalid**

© 2017 ServiceNow. All rights reserved. 3597
This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.

**ValidateDanglingTransition**

The **ValidateDanglingTransition** validator finds and reports any transitions that do not terminate on an activity.

---

**Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

---

**Warning:** This is a critical error that prevents a workflow from running.

---

**Validation summary**

- **Risk:** A workflow with dangling transitions will silently hang a workflow with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** Valid
- **Invalid Result:** Invalid
- **Invalid Message:** Invalid
- **Suggested Action:** Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** None

---

**Troubleshooting**

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the **ValidateDanglingTransition** validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record's transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record's workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to **Workflow > Administration > Workflow Version**.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select **Configure > Related Lists**, move **Workflow Activity-->Workflow Version** from the **Available** list to the **Selected** list, and click **Save**.
5. In the **Workflow Activities** related list, select the activity cited in the validator.
6. In the Workflow Activity form, view the **Workflow Transitions** section or tab and identify the transition in that list that has no value or a null value in the **To** column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The **Critical** warning should disappear. The workflow should execute as expected on the next appropriate transaction.

**ValidateSubflows**

The **ValidateSubflows** validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

![Warning](icon) **Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** This workflow contains <count> valid subflows.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains <invalid count> invalid subflow(s) of <total subflow count> total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.

- **Publishable:** No
- **Runnable:** No
- **Related Information:** *Workflows used as subflows* on page 3552

**Troubleshooting**

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the **ValidateSubflows** validator is when a workflow:

- Is checked out to User A.
- Is a subflow in a parent workflow being run by User B.
- Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.
Another scenario addressed by the **ValidateSubflow** validator is when a workflow:

- Is a subflow in a parent workflow being run by any user.
- Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

**Note:** You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

**Determine whether a workflow can run**

To determine if a workflow can run:

1. In the navigation filter, enter `wf_workflow.list`.
   A list of workflows appears.
2. Open one of the workflows from the list.
3. In the **Versions** related list, check for all of the following:
   a) There is only one workflow version in a state of Checked out and Checked out by.
   b) There is only one version and it is not checked out. This version must be both Active and Published. (You may need to personalize the list and add the **Active** column.)
   c) If there are multiple versions, only one is Published.

These checks determine the only two conditions under which a workflow can run:

- A checked out version of a workflow is available for the user who has it checked out.
- A valid, published version of a workflow is available for all users who have permission to run the workflow.

Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the subflow's published and active states.

**ValidateScriptForCurrentDotUpdate**

The **ValidateScriptForCurrentDotUpdate** validator finds workflow activities with scripts that use the `current.update()` function.

Calling `current.update()` causes significant performance delays in transaction processing and might cause an instance to hang.

**Validation summary**

- **Risk:** At best, a workflow that uses `current.update()` in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** The JavaScript in this workflow has no instances of 'current.update()'.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
Problems with current.update() in workflow scripts

A workflow initiates execution in one of these ways:

- Script Engine: If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
- Script: Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling startFlow().

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the update() of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls current.update() on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on update() on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

Troubleshooting

This validator detects the use of current.update() in any of the editable script fields. Do not call current.update() from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

ValidateLowestCommonTable

The ValidateLowestCommonTable validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item [sc_req_item] table is the lowest table in a workflow containing a Catalog Task activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

Note: This validator provides information only. It does not indicate an error or warning condition.
Validation summary

- **Risk:** This validator informs only and has no risk associated with it.
- **Severity Level:** Data/Information
- **Valid Result:** Valid
- **Valid Message:** The lowest common table in this workflow is `<table_name>`.
- **Invalid Result:** N/A (informational only)
- **Invalid Message:** N/A (informational only)
- **Suggested Action:** None
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** *Tables and classes* on page 1417, *Workflow activities* on page 3676

**ValidateTableChange**
The *ValidateTableChange* validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request [change_request] table but has a *Catalog Request* activity on the canvas is invalid, since the activity is not compatible with the selected table.

Validation summary

- **Risk:** If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- **Severity Level:** Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- **Valid Result:** Valid
- **Valid Message:** All activities are valid for the newly selected table
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- **Suggested Action:** Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** *Workflow activities* on page 3676

Troubleshooting

Navigate to *Workflow > Administration > Activity Definitions.* Note the *Table* column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.
When a workflow is set to the Global [global] table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

**ValidateParentFlow**
The **ValidateParentFlow** validator reports any workflows that use the workflow as a subflow.

**Validation summary**

- **Risk:** There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Currently `<workflow version name>` is not a subflow.
- **Invalid Result:** None
- **Warning Message:** This workflow version (`<workflow version name>`) is required as a subflow in `<workflow version count>` other workflows.
- **Suggested Action:** Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** *Workflows used as subflows* on page 3552

**Troubleshooting**

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of *input variables*. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

**ValidateSingleEnd**
The **ValidateSingleEnd** validator finds and identifies multiple *End* activities in a single workflow.
Multiple **End** activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

**Validation summary**

- **Risk:** If the execution paths to the *End* activities are not mutually exclusive, then the first *End* encountered completes the workflow and cancels all other executing activities.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** This workflow contains 1 End activity.
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of ends> End activities.
- **Suggested Action:** Remove extraneous *End* activities that are not intended as part of the design.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

**Troubleshooting**

As soon as an **End** activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second *End* activity that is still executing. Those executing activities are canceled as part of the *End* activity's clean up actions. Therefore, the results of designing workflows with multiple *Ends* must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple *End* activities. In the following example, the paths to the two *Ends* are mutually exclusive execution paths. If this was a large workflow, with many activities between **Branch** and the second *End*, the value of the multiple ends becomes apparent. Tracing a **No** response from **User is invalid** to a single *End* behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the **End** after the **Notification** activity terminates the workflow.
Figure 870: Mutually exclusive execution paths

The next example has multiple End activities in execution paths that are not mutually exclusive. A Yes response from User is valid causes the Set Values activity to finish immediately. By reaching its End activity first, this execution path cancels the Approval for Apps and the DB Task activities, which might not be the desired outcome. If the paths are all expected to complete before End, the activities should come to a Join (as in the previous example) that transitions to a single End.
Note: To add the second End, right-click to copy the original End activity and paste it onto the canvas. In most cases, a single End is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

ValidateUpdateSetDependencies
The ValidateUpdateSetDependencies validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

Validation summary

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
• **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  
  • Ensure that all update sets migrate concurrently.
  • Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.

• **Publishable:** Yes
• **Runnable:** Yes
• **Related Information:** *Workflow movement with update sets* on page 3652

**Troubleshooting**

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

• A published subflow is in a different update set than the parent workflow and that update set is In progress.
• A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

**Example**

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the *String* type in Workflow A to a *Reference/User* type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
**Risks**

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

**Possible solutions**

**Solution 1**

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

**Solution 2**

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to **System Update Sets > Local Update Sets**.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the **Customer Updates** related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the **Update set** field.
   - If this field is not on the Customer Update form, **configure the form** and add the field.
6. Click **Update**.
   - The ServiceNow ITSA Suite moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

---

*ValidateUpdateSetParentDependencies*

The **ValidateUpdateSetParentDependencies** validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.
Validation summary

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
- **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.

- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets on page 3652

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

Solution 2

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The ServiceNow ITSA Suite moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateInputVarUpdateSetDependencies

The ValidateInputVarUpdateSetDependencies validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently In progress.
Validation summary

- **Risk:** Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
- **Purpose:** Determine whether input variables that belonged to this workflow were deleted in a different update set.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Input Variable Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** There are input variables that have been deleted and logged in a different update set.
- **Suggested Action:** If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets on page 3652

Troubleshooting

Workflow input variables get individual entries in the Customer Update related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal on page 3656 when the validator issues this warning.

ValidateWorkflowEndStages

The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- **Risk:** The stage indicator will not show the workflow is completed.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow end stages are valid.
- **Invalid Result:** invalid
- **Invalid Message:** End activity A found with invalid stage “S.”
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities on page 3676
**Troubleshooting**

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

*ValidateWorkflowStageColumn*

The *ValidateWorkflowStageColumn* validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

**Validation summary**

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** Warning
- **Info Summary:** Stage warnings found.
- **Invalid Messages:**
  - Table T does not have a column named C.
  - Workflow for table T has stages, but no stage column.
  - Table T has a stage column "C," but no stages are set by activities.
  - Workflow on table T has stage column "C" that is not type=workflow.

- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities on page 3676, Workflow stages

**Troubleshooting**

To check the stage column:

1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting **Properties**.
3. View the **Stages** tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

*ValidateWorkflowStateValues*

The *ValidateWorkflowStateValues* validator checks a number of stage aspects in workflow activities for correctness.

This validator has multiple possible error messages.
Validation summary

- **Risk**: The stage indicators may not display appropriate information.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: Workflow stage values are valid.
- **Invalid Result**: invalid
- **Warning summary**: Stage warnings found.
- **Invalid Messages**:
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y
- **Suggested Action**: If this is not by design, make the appropriate changes.
- **Publishable**: Yes
- **Runnable**: Yes
- **Related Information**: Workflow activities on page 3676

Troubleshooting

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by clicking the menu icon and selecting **Edit Stages**.
3. Check the names and values.
   
   Ensure that the names and values are unique and are not empty.

4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Workflow Stages

![Workflow Stages](image)

**Figure 872: Validate Workflow State Values**

Tip: Make a list of which activities assign which stages.

**Workflow concepts**

You can do many things using the workflow editor.

- Modify core *activities* and *conditions*.
- *Create custom activities* and reuse the data for other workflows.
- Download activity packs from the ServiceNow Store and create packs for upload.
- *Edit workflows* graphically.
• Define transitions between workflow activities.
• For the table that corresponds to the workflow, customize business rules.
• Summarize workflow progress through stages.
• Validate workflows to identify potential problems.
• Publish workflows for other users.
• Edit multiple tables without needing to directly modify them.

Workflow stages

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident [incident] table has an Incident state field that indicates progress, but the service catalog uses the Stage field.

To indicate the workflow's progress through the possible stage values, the interface updates the Stage field selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's Stage field.

![Stage field](image)

Figure 873: Service Catalog Stage field with icons

After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities. If an activity is active, then the stage is shown with the state of In progress. If an activity is in the Pending or Completed state, the stage reflects this state.

How stage values are derived

Stage values are derived from various sources in the interface.

Stage values are derived from the following sources:
• **Choices for Stage column**: Choices defined for the column selected as the **Stage** column for the workflow.

• **Default stages for table**: Stages defined in the Stage Default [wf_stage_default] table for the table selected.

• **Workflow-specific stages**: Applied only to the workflow for which they were defined in the Workflow Stage [wf_stage] table.

• **Stage values in existing records**: Values from the designated **Stage** column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named **Stage**, then the progress of the workflow appears in any list view containing the **Stage** column.

![Figure 874: Stages in a list](image)

Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of **In progress**. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.
Example

If the workflow table is Request Item [sc_req_item], then the stage field is automatically set to the Stage column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry [sys_dictionary] table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed

When you edit available activity stages in the workflow editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the Stages list in workflow activities.
**Note:** If you are creating a workflow with a table other than Request Item [sc_req_item], you must select a **Stage field** in the workflow properties for the workflow to have stages.

**Use workflow stages**

You can add or modify workflow stages.

1. Navigate to **Workflow > Workflow Editor**.
2. Create a new workflow by clicking **New** or open an existing workflow.
3. In the Workflow Properties form, if the table is not the Requested Item [sc_req_item] table, select a field to display stages in the **Stage** field property.

*Available fields* depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a **Stage** field in their dialog box.

Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

When an activity starts with a specified stage, the platform updates the **Stage** field with the current value. In workflows run against the Requested Item [sc_req_item] table, the `sc_req_item.stage` field is defined as a workflow type field.

When displaying the stages for a workflow on the Requested Item [sc_req_item] table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an **In progress** state. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select **Edit Stages**. Again, these stage values are combined with the choices, defaults, and existing values.

*Workflow stages example*

To optimize the use of stages, you can assign a stage to multiple activities in a workflow.
For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:

- Approval
- Order
- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a stage Set.
   - You can create a new set by clicking New, typing a name, and clicking Submit.
4. Select a corresponding Table.
5. Click **Submit**.
   The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

Add a stage to an existing workflow

If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages**.
4. In the Workflow Stages list, click **New**.
5. On the Workflow Stage form, fill in the fields as appropriate.
   Do not use a **Name** or **Value** field value that already exists in the base system.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>The default duration for the stage. Currently not used.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. Publish the workflow.

Add a stage to a workflow activity

After stages are added to a workflow, you can assign them to the workflow activities.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the **Stage** field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click **Update**.

Translate workflow stages

You can provide translations for workflow stage names so the names appear in the language selected for the instance.

The instance must already have **Internationalization support** on page 965 installed.

Language-specific text appears in **workflow fields** displayed in a list, **workflow stage sets**, and the workflow editor for users with that language selected. Language-specific text does not automatically appear when displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.
You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

1. Set the interface language to French.
2. Navigate to Workflow > Workflow Editor.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select Edit Stages.
5. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.
6. Confirm that the workflow stages display the French text.

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages [wf_stage] table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to French.
2. In the application navigation filter, enter wf_stage.list.
3. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.

Workflow stage sets

You can create stage sets that are named groups of stages commonly used together. These stage sets can be used in any number of workflows on different tables.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a Stage field, defined in the workflow properties, to indicate the workflow's progress through the possible stage values.

Create a new stage set

You can create a new stage set by creating a stage set record and adding stage set entries manually. Create a stage set record only when you want additional stages that are not available on the table by default.

1. Navigate to Workflow > Stage Sets.
2. Click New.
3. Enter a Name that indicates the purpose of the stage set.
   For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.
4. Click Submit.
5. Open the new stage set record.
6. In the Stage Set Entries related list, click New.
   Each stage set entry can be used as the Stage for an activity in a workflow that uses this stage set.
7. Enter a Name that indicates the stage name to appear in workflow fields.
8. Enter a Value to use when referencing the entry, such as in a script.
9. Click Submit.
10. In the Stage Set Entries related list, ensure that each entry has a unique Order value.
    Enter a low value for stages that should appear early in the workflow and a higher value for later stages.
The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

- *Add a stage set to a workflow* on page 3624
- *Add default stages for a table* on page 3620

*Import stages from a choice list*

You can import the choice list values of a workflow field as stages for a workflow.

Create a choice list as follows:

- Add a custom field of Type *Workflow* to the table.
- Configure the custom field to use a choice list.
- If you are creating a new field, set the *Choice List type* to *Display without --None--* and create the choices for the newly created field.

For more information, see *Create a workflow stage field* on page 3625.

1. Navigate to *Workflow > Workflow Editor*.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select *Properties*.
4. In the Workflow Properties dialog box, click the *Stages* tab.
5. From the **Stage field** list, verify that the correct workflow field is selected.
6. In the Related Links section, click **Import Stages from Choice List**.
7. In the dialog box asking you to confirm that you want to import the choice list, click **OK**.
8. Click **Update**.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

- [Add a stage set to a workflow](#) on page 3624
- [Add default stages for a table](#) on page 3620

**Export a stage set from a workflow**

You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Export to Stage Set**.
5. Enter a unique **Name** for the new stage set.
6. Click **OK**.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

- [Add a stage set to a workflow](#) on page 3624
- [Add default stages for a table](#) on page 3620

**Add a stage set to a workflow**

You can add any number of stage sets to an existing workflow.

When multiple stage sets have stage set entries with the same **Value**, the stage appears on the workflow only once.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Import from Stage Set**.
5. Select the stage set.
6. Click **Ok**.
7. Import additional stage sets as needed for the workflow.

After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see [Add a stage to a workflow activity](#) on page 3621.

**Use a default stage set**

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to **Workflow > Default Stages (by table)**.
2. Click **New**.
3. Select a **Table**.
4. Select the **Set** you want to assign to the selected table.
5. Click **Submit**.

Create a workflow stage field

Workflows can provide a summary of workflow progress by updating any field of the **Workflow** type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Role required: admin

In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see *Workflow stages* on page 3587.

To create a workflow stage field:

1. Navigate to **Workflow > Default Stages (by table)**.
2. Right-click near a column header and select **Configure > List Layout**.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the **Type** set to **Workflow**.
   For detailed steps, see *Add a new field to a table* on page 783.
5. Click **Save**.
6. Right-click the field label and select **Configure Dictionary**.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select **Dropdown with --None--** from the **Choice** list.
9. Click **Update**.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.
    - To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the **Stage field** selected in the workflow properties. For detailed steps about importing a choice list, see *Import stages from a choice list* on page 3623.
    - The **Value** of each choice must match the **Value** of the corresponding workflow stage.
• Do not use spaces in the **Value** field for either choices or stages. Use underscores in place of spaces.
• Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

For detailed steps on defining choice lists, see *Define an option for a choice list* on page 843.

11. To see workflow stages as icons, add the field to the list layout of the workflow table.
   For detailed steps, see *Configure the list layout* on page 672.

After you create or update the workflow field:

- Unless the workflow uses the Requested Item [sc_req_item] table, ensure that the workflow field is selected from the **Stage field** list in the workflow properties. For detailed steps, see *Select a stage field* on page 3626. If a workflow uses the Requested Item table, the stage field is automatically set to the **Stage** field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

**Select a stage field**

A **Stage field** allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see *Create a workflow stage field* on page 3625.

Unless the workflow uses the Requested Item [sc_req_item] table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the **Stage** field of the table and cannot be changed.

To add or edit a workflow stage field:

1. Navigate to **Workflow > Workflow Editor**.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **General** tab.
5. In the **Table** list, verify that the table containing the workflow field is selected.
6. Click the **Stages** tab.
7. From the **Stage field** list, select the workflow field.
8. Click **Update**.

**Workflow field icons**

A workflow stage field displays icons to indicate the workflow stage.

Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Current active step</td>
</tr>
</tbody>
</table>
Stage tooltips
Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.

Table 1245: Stage renderers and tooltip behavior

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a <strong>Waiting for Approval</strong> stage, the tooltip displays the name of the approver. A tooltip does not appear when a user points to other stage icons.</td>
</tr>
</tbody>
</table>
If you do not want the approver’s name included in the tooltip, navigate to System Properties > Service Catalog and clear the **Show the current pending approver’s name in the stage widget mouseover** check box.

![Figure 875: Property for displaying pending approver’s name](image)

**Workflow stage renderers**

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other renderers</td>
<td>When a user expands the stage field, the activity state is displayed in parentheses next to the stage, for example, <strong>In progress</strong> or <strong>Pending - has not yet started</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.

**Workflow-driven**

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the
workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

**Main flow**

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

**Linear**

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more **Condition workflow activities** on page 3703. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.
Figure 876: Linear main flow

Figure 877: Linear subflow

The linear renderer displays all these stages in one workflow field. The parent workflow specifies the Waiting for approval, Fulfillment, and Completed stages. The subflow specifies the Delivery and Waiting for Task, and Delivery OK stages.

Progress bar

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.
The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

Figure 878: Workflow field progress bar

**Legacy**

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the `WorkflowIconsSCR` script include to define which icons to use, add the attribute `icons=WorkflowIconsSCR` to the **Attributes** field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute `icons=WorkflowIconsStages`.

The legacy renderer works with all tables except the Requested item [sc_req_item] table. In this case, use the requested item renderer instead.

**Requested item**

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item [sc_req_item] table.

Select a stage renderer

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Consider the following when selecting a stage renderer:

- Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.
Table 1246: Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear</td>
<td>• The parent workflow and all subflows must modify the same current record.</td>
</tr>
<tr>
<td></td>
<td>• In the properties for all subflows, the <strong>Stage field</strong> value for all subflows must match that of the parent workflow.</td>
</tr>
<tr>
<td></td>
<td>• The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.</td>
</tr>
<tr>
<td></td>
<td>• On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows.</td>
</tr>
<tr>
<td>Main flow</td>
<td>• The workflow contains subflows.</td>
</tr>
<tr>
<td></td>
<td>• You do not want or need to reveal the details about the subflows.</td>
</tr>
<tr>
<td>Progress bar</td>
<td>• The workflow properties must have a <strong>Stage ordering</strong> value of <strong>User-defined</strong></td>
</tr>
<tr>
<td></td>
<td>• There must be workflow stages within the workflow.</td>
</tr>
<tr>
<td></td>
<td>• Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the <strong>Value</strong> and <strong>Order</strong> fields.</td>
</tr>
</tbody>
</table>

To select a stage renderer:

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage rendering** list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select **Legacy** for either one.
   - If you want to use the linear renderer, make sure you select **Linear** in the properties for the parent workflow and all subflows.
6. Click **Update**.

**Workflow fields with deleted records**

Workflow fields may indicate when a record required by the workflow is deleted.

After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see *Restore a deleted record and reference* on page 1626.

![Workflow fields with deleted records](image)

**Figure 879: Workflows with missing records**

The previous image shows a list with several workflows. The top request has an associated request item, but the item does not have an associated workflow context. The bottom request does not have an associated request item.

**Workflow versions**

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

---

**Note:** Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other's workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.
Workflow scope

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the workflow editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

**Note:** Any script that is created in the workflow editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment. See **Application scope**.

For information on how to configure the scope for a workflow, see **Workflow properties** on page 3544.
Workflows and domain separation

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- **Workflow [wf_workflow]**: used for delegated administration or process separation.
- **Workflow Version [wf_workflow_version]**: used for delegated administration or process separation.
- **Workflow Context [wf_context]**: used for data separation.

**Note:** The Workflow Version table [wf_workflow_version] table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The workflow editor displays a workflow's domain in the title bar after the workflow name.

---

**Figure 880: Workflow editor domain**

---

Workflows and delegated administration

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow records in the Workflow [wf_workflow] and Workflow Version [wf_workflow_version] tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user's domain. This new version is a unique record in the Workflow [wf_workflow] table. After the user publishes this new workflow, other users in the child domain use the
new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Service Catalog Request workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Service Catalog Request workflow and specifies that all Service Catalog requests over $750 require approval. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where requests over $500 require approval. The MSP creates another version of the Service Catalog Request workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

Workflows and data separation

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.
Figure 882: Workflow and data separation

Workflow records in the Workflow Contexts [wf_contexts] table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows in a child domain, child domains cannot see data upwards.
in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other's service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request's approval history.

Workflow permissions

When a user starts a new workflow, the workflow runs with that user's domain and credentials.

The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

Workflow engine operation order

The workflow engine runs in a predefined order relative to business rules and database operations.

The Run after bus. rules run workflow property defines if a workflow is Default or Deferred.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see Execution order of scripts and engines on page 470.
Before business rules (order <1000)
Do not use current.update() here

Default workflows
Do not use current.update()

Before business rules (order >=1000)
Do not use current.update()

Database operation (insert, update, delete)
The current record is inserted or updated at the end of the database operation.

After business rules (order <1000)
Use current.update() if there is no deferred workflow

Deferred workflows
Do not use current.update()

Always use current.update().
Workflow caching

The workflow engine caches commonly-used published workflows to improve performance.

Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to Workflow > Administration > Properties and modify the value of the The max number of models that will be concurrently held in the LRU cache (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables.

Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

Table 1247: Workflow tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td></td>
</tr>
<tr>
<td>Column Renderer [column_renderer]</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Version [wf_versionable]</td>
<td>Tracks different versions of element definitions [wf_element_activity].</td>
</tr>
<tr>
<td>Workflow [wf_workflow]</td>
<td>The master records of workflows.</td>
</tr>
<tr>
<td>Workflow Context [wf_context]</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Workflow Execution [wf_workflow_execution]</td>
<td>Synthetic “current” records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Instance [wf_workflow_instance]</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Version [wf_workflow_version]</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Activities</td>
<td></td>
</tr>
<tr>
<td>Activity Variables [wf_activity_variable]</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Workflow Activity [wf_activity]</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity Definition [wf_activity_definition]</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Workflow Executing Activity [wf_executing]</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
</tbody>
</table>

Workflow components
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element Provider [wf_element_provider]</td>
<td>Template definitions for custom activities.</td>
</tr>
<tr>
<td>Variable [item_option_new]</td>
<td></td>
</tr>
<tr>
<td>Workflow Condition [wf_condition]</td>
<td>All of the defined conditions in workflows.</td>
</tr>
<tr>
<td>Workflow Queued Command [wf_command]</td>
<td>Temporary internal storage for workflows that are currently executing.</td>
</tr>
<tr>
<td>Workflow SC Variable [wf_variable]</td>
<td>The Service Catalog variables for a workflow.</td>
</tr>
<tr>
<td>Workflow Schedule [wf_workflow_schedule]</td>
<td>Definitions of the times to run specific workflows.</td>
</tr>
<tr>
<td>Workflow Transition [wf_transition]</td>
<td>All of the defined transitions in workflows.</td>

<tr>
<td>Workflow Log Entry [wf_log]</td>
<td>All of the events and history of the workflow.</td>
</tr>
<tr>
<td>Workflow Transition History [wf_transition_history]</td>
<td>The history of executed transitions.</td>
</tr>
<tr>
<td>Stages</td>
<td></td>
</tr>
<tr>
<td>Stage Default [wf_stage_default]</td>
<td>Definitions of default stage fields for tables to use.</td>
</tr>
<tr>
<td>Stage Set [stage_set]</td>
<td>A named set of stages that can be used to populate workflow stages for multiple workflows.</td>
</tr>
<tr>
<td>Stage Set Entry [stage_set_entry]</td>
<td>The stages that belong to a named stage set.</td>
</tr>
<tr>
<td>Stage Set for Table [stage_set_table]</td>
<td>Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click Default Stages (by table) in the menu.</td>
</tr>
<tr>
<td>Workflow Stage [wf_stage]</td>
<td>Definitions of stages used by workflows.</td>
</tr>
</tbody>
</table>

**Workflow administration**

Tailor workflows exactly the way you want them.

**Workflow roles**

Certain roles are required to use workflows.
Table 1248: Workflow roles

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity creator [activity_creator]</td>
<td>Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.</td>
</tr>
<tr>
<td>Web service administrator [web_service_admin]</td>
<td>Accesses and uses REST and SOAP messages in the Orchestration activity designer. Creates and edits custom activities that use the REST web service and SOAP web service templates.</td>
</tr>
<tr>
<td>Workflow administrator [workflow_admin]</td>
<td>Creates, edits, publishes, and deletes graphical workflows.</td>
</tr>
<tr>
<td>Workflow creator [workflow_creator]</td>
<td>Creates new graphical workflows.</td>
</tr>
<tr>
<td>Workflow publisher [workflow_publisher]</td>
<td>Publishes graphical workflows.</td>
</tr>
</tbody>
</table>

Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

Viewing a workflow context

Workflow contexts can be found in two places:

- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow > All Contexts and selecting an active context.

Displaying workflow progress

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.
- **Show Timeline** displays the workflow context as a *timeline*.
- **Show Workflow** displays the workflow context in the graphical workflow editor.

**Graphical interface**

To view the workflow context in the graphical workflow editor interface, click the **Show Workflow** link from either the workflow context record or the current record.

![Graphical interface of workflow](image)

**Figure 884: Show workflow**

In the top right hand corner are two controls:
<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Refresh" /></td>
<td>Refreshes the workflow context.</td>
</tr>
<tr>
<td><img src="image" alt="Question Mark" /></td>
<td>Displays a key of the colors used in the workflow to denote the state of activities and transitions:</td>
</tr>
</tbody>
</table>

### Execution order

Tooltip text in the workflow context graphical view displays the execution order of individual activities. This can be useful when troubleshooting.

1. Navigate to Workflow > Live Workflows > Active Contexts or All Contexts.
2. Open the context you want to examine.
3. Click **Show Workflow**.
4. Point to a finished or executing activity.
   A tooltip appears, showing error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Canceling a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context State to Canceled. Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

To cancel an active workflow:

1. Navigate to Workflow > Active Contexts.
2. Select a workflow context record.
3. Select the Cancel related link.
A confirmation window appears.

4. Click OK.
   The Wait for Cancel window appears. The workflow engine attempts to cancel the workflow gracefully.

   If the workflow does not respond to the cancel command, the Force Cancel window appears.
5. Click **Force cancel** to interrupt the thread the workflow is actively executing or click **Continue waiting** to continue waiting for the workflow to cancel gracefully.

**Warning:** Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

---

**Cancel a workflow with the `cancelContext(context)` script**

To cancel an executing workflow, you can use the `cancelContext(context)` script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

See the ServiceNow Developers site for API information.

**Defining an on-cancel script**

Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The `sys_id` of the workflow context is available in this script using the `context_sys_id` variable.

To define this script:

1. Navigate to **Workflow > Workflow Versions**.
2. Select a workflow version that you have checked out. Workflow versions that are not checked out are not editable.
3. Edit the **On-cancel script** field. You may need to **configure the form** to add this field.
4. Click **Update**.

This example script adds a comment to a Requested Item `[sc_req_item]` record indicating the workflow for that request has been canceled.

```javascript
var grContext = new GlideRecord("wf_context");
grContext.get(context_sys_id);
var grReq = new GlideRecord("sc_req_item");
```
Scheduling a workflow

In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as Create Task or Catalog Task are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow > Scheduled Workflows and click New. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>- Daily: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>- Weekly: On a particular day of the week.</td>
</tr>
<tr>
<td></td>
<td>- Monthly: On a particular day of the month</td>
</tr>
<tr>
<td></td>
<td>- Periodically: After every set duration.</td>
</tr>
<tr>
<td></td>
<td>- Once: At one specific date and time.</td>
</tr>
<tr>
<td>Time</td>
<td>For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.</td>
</tr>
<tr>
<td>Day</td>
<td>For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>For periodical workflows, the interval between workflows, beginning from the Starting date and time.</td>
</tr>
</tbody>
</table>
Geneva ServiceNow ServiceNow Platform

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting</td>
<td>For periodical workflows, the first date and time to run the workflow. For scheduled workflows run once, the date and time to run the workflow.</td>
</tr>
</tbody>
</table>

Workflow activity updates (pinning)

Workflow administrators can *pin* a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

*Note:* Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.

Workflow activity level pinning

Set pinning at the activity level to control versioning for that activity only.

Role required: workflow_admin

The activity uses this setting unless it is overridden by a different setting in a workflow.

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow containing the activity whose version you want to control.
3. Check out the workflow.
4. Right-click the activity and select one of these options from the context menu:
   - **Pin Activity:** Prevents the activity from automatically updating when a new version is available. Pinned activities are labeled *Out of date* when a new version is available.
   - **Unpin Activity:** Allows the activity to automatically update to the latest version. Unpinned activities are updated when a new version is available.
5. Publish the workflow.

Workflow level pinning

Pinning at the workflow level overrides individual settings for all activities in that workflow.

Role required: workflow_admin

This action does not change the setting on the activity itself, which might use a different setting in another workflow. The default setting in the workflow properties uses the pinning setting of each activity.

1. Navigate to Workflow > Workflow Editor.
2. Open a workflow and check it out.
3. Click the properties icon in the title bar.
4. In the Activities section, select one of the following options in the Activity pinning field:
   - **Set by activity:** Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.
   - **Pin all activities:** Pins all activities in that workflow to their current version.
• **Unpin all activities**: Allows all activities in that workflow to be updated.

5. Publish the workflow.

Out of date workflow activities

Pinned activities become out of date when a new version of the activity is downloaded from the ServiceNow Store.

The workflow editor highlights a pinned activity with an orange indicator when it is out of date. Also, the **Out of date** option on the properties form is selected. To update a pinned activity, workflow designers must manually update the activity.

Figure 886: Activity out of date

Updated workflow activities

The workflow editor indicates when activities have been updated.

The workflow editor displays a green indicator when:

• An unpinned activity has been updated automatically
• A pinned activity has been updated manually
Manually update a workflow activity

You must manually update pinned activities.

Role required: workflow_admin

The workflow editor displays an orange indicator when the activity is out of date. To manually update an activity:

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow containing an activity you want to manually update.
3. Check out the workflow.
4. Right-click a pinned activity and select Update Activity.
5. Publish the workflow.

Workflow movement with update sets

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow [wf_workflow] record and only retain the latest version with the update type of Workflow.

Workflow update set migration use case - simple

Create a new workflow with no dependencies and then migrate the workflow in an update set.

1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.

A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

Workflow update set migration use case - subflow dependency (success)
Successfully edit and migrate an existing workflow and its dependent subflow.
1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published and migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.

Workflow update set migration use case - subflow dependency (failure)
Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.
1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published, but has not been migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.
5. User A completes Update Set C and migrates it to the production instance.
6. Update Set C commits with warnings.
7. Workflow A is invoked on the production instance with the following results:
   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.

To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies on page 3606.
Workflow update set migration use case - subflow dependency (risk)

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a **User ID**.
   
   **Note:** Assume that Workflow B was previously published and migrated to the production instance.
4. User A uses the return value of Workflow B to generate approvals.
5. User B selects Update Set D.
6. User B checks out Workflow B (the subflow in Workflow A).
7. User B modifies the return value of the workflow by changing it from a **User ID** to a **String Message**.
8. User A publishes Workflow A.
   
   **Note:** A dialog box displays warnings associated with Workflow A and encourages User A to validate the workflow before publishing.
9. User A cancels publishing and validates Workflow A.
10. User A is warned that Workflow B was modified by a user in a different update set.
11. User A ignores this warning and publishes Workflow A.
    
    **Note:** A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
12. User A completes Update Set C and migrates it to the production instance.
13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.
14. User B publishes Workflow B.
   
   **Note:** User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See ValidateUpdateSetDependencies on page 3606 to understand the parameters of update set warnings.
15. User B finally publishes Workflow B.
    
    **Note:** A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.
16. User B completes Update Set D and migrates it to the production instance.

17. Update Set D commits without warnings.

18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

Input variable movement

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables [var_dictionary] table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

Input variable movement use case - two input variables

An existing workflow already contains two input variables.

1. User A checks out the workflow.

2. User A adds two input variables.

   ServiceNow adds to the current update set one customer update record for each new variable.

   The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.

3. User A publishes the workflow.

   There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.

4. Verify variables included in a specific workflow on page 3655.

5. User A completes the update set.

6. Adding Input Variables - Success

   User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.

   • The two existing input variables are already present because of the earlier version.
   • The system adds the two new input variables when the user commits the update set.
   • The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
   • The new published workflow version uses all four variables.
   • The user tests the new workflow version and it runs as expected.

Verify variables included in a specific workflow

Follow the steps in this page to verify the variables that are included in a specific workflow.

1. Navigate to System Update Sets > Local Update Sets.

2. Select the active update set.

3. Select the customer update entry for the workflow.

4. View the XML Payload.

5. Search for the name of one of the columns or search for var_dictionary.
There is one var_dictionary entry for each input variable.

**Input variable removal**
Deleting workflow input variables, like insert and update actions, creates a customer update record in a user's current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

**Input variable removal risk**
An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.
   The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.
4. User A continues working on other features in Update Set A that need to be moved to production.
5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.
   The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

**Input variable removal solution**
When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published.

---

**Note:** If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

**Input variable removal prevention**
Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See ValidateUpdateSetDependencies on page 3606 for more details.

**Avoiding duplicate workflows**
Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

**Commit a workflow in an update set**
Follow the steps in this page to commit a workflow in an update set.

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.

3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.
   
   In the first migration, there are no prior versions.

4. Workflow A - Version 1 becomes the only published version of the workflow.

Update set migration example

It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.

2. Update Set B is created.

3. Update Set C is created.

4. Workflow A - Version 2 is published in Update Set B.

   A customer update record is added to Update Set B with the Version 2 payload.

   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.

5. Update Set B is completed.

6. Workflow A - Version 3 is published in Update Set C.

   A customer update record is added to Update Set C with the Version 3 payload.

   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.

7. Update Set C is completed.

8. Update Set C is migrated and committed to the production instance.

   Workflow A - Version 1 is set to unpublished.

   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.

   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

Update set migration risk

Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.

3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.

   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

Set the maximum number of workflow activities

Limit the number of executing activities contained in your workflow to prevent runaway processing loops.

The number of executing activities in a workflow context is the sum of the entries in the activity history list and the currently executing activities. When the workflow reaches the maximum number of executing activities allowed by this setting, the workflow stops. The default maximum setting is 100. Use a setting that is at least 10% greater than the total number of executing activities you anticipate in your workflow.
Make sure you include activities such as Turnstile and Rollback To that cause the workflow to repeat processing.

To change the maximum number of workflow activities:

1. Navigate to Workflow > Workflow Editor.
2. Check out a workflow.
3. In the title bar, click the Workflow Properties icon.
4. Click the Activities tab.
5. In the Max activity count field, enter a value that accommodates the expected number of executing activities for the workflow.
6. Click Update.

Workflow timelines

The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline’s perspective for a more granular view of the data.

**Note:** Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

Use a timeline

By default, the timeline displays all activities and transitions requested when first opened.

Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select a context.
3. In Related Links, click Show Timeline to display the timeline for the entire context.

   The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.
4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click **Max**.

5. Use the starting and ending calendar fields to select the timeline perspective.
These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.
1. Move the slider from right to left to view all the spans on a long timeline.

2. Adjust the end points of the slider to make arbitrary changes to the magnification.
   A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.
   Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity.
   This action highlights the activity in the activity pane.
9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.

10. Double-click a span to display a history record for that activity. History records show information such as the State and the starting and ending times.
Timeline for a selected activity

You can display a partial workflow timeline.

1. Navigate to **Workflow > Live Workflows > Active Contexts**.
2. Open a Workflow Context record.
3. On the **Workflow Activity History** related list, select one or more individual activities.
4. Click **Show Timeline** from the action menu.
   
   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.
5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:

   **Note:** You might use this feature to display a subflow's context with the parent workflow context.

   1. Navigate to **Workflow > Live Workflows > History**.
   2. Select individual history items from the list.
   3. Select the **Show Timeline** option from the actions menu.

      History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is **Multiple Contexts**. The timeline draws only the activities and relationships of the history items selected.

---

**View subflows in a workflow timeline**

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.
Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
- Notification
Available error information

This information is available in a tooltip when you point to a workflow activity in an error state. This table also shows which activities support error exits.

Table 1249: Available error information

<table>
<thead>
<tr>
<th>Activity</th>

Tracking errors

Error handling provides visual cues within the workflow, error descriptions for activities in pop-ups, and detailed log records.

Error handling makes error detection and troubleshooting easier.

Table 1250: Error cues

<table>
<thead>
<tr>
<th>Cue</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Banners</td>
<td>Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.</td>

| Execution order  | Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting. | To view the order in which a workflow activity was executed:  
1. Navigate to Workflow > Live Workflows > Active Contexts or All Contexts.  
2. Open the context you want to examine.  
3. Click Show Workflow.  
4. Hover the cursor over a finished or executing activity.  
   A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state. |
<table>
<thead>
<tr>
<th>Cue</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflow log</td>
<td>View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.</td>
<td>To view the activity by name, navigate to Workflow &gt; Administration &gt; Properties and enable the Log workflow debug messages property. In this example, an activity named Manager approval (Approval - User) contains a script that is missing a semicolon.</td>
</tr>
</tbody>
</table>

Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select **Add condition** from the context menu.
4. Add a condition exit with the following values:
   - **Name:** Error
   - **Condition:** activity.state=='faulted'
5. Click **Submit**.
   The **Error** exit appears on the activity.
6. Connect the **Error** exit to another activity for handling the error state, such as **Notification** or **Log Message**.

---

**Reconfigure an approval condition**

Approval activities react differently to script errors than the other activities.

Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as **Skipped**, which can appear to be an **Approved** state. To prevent this from happening, reconfigure the **Approved** exit as follows:

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the **Approved** exit.
3. Add the following script to the **Condition** field:
   ```javascript
   && activity.state != 'faulted'
   ```
   This prevents the activity from continuing down the normal path in an error state and ensures that **Skipped** or **Approved** is the desired state.
4. Click **Update**.
Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.

Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.

For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

To collect run time metrics for a workflow:

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Estimated Runtime tab.
5. To enable the collection of run time metrics, check that the Requires ERT option is selected.
6. Open a configuration from the Estimated Run Time column.
7. In Estimated Run Time, enter an initial estimate for the workflow's run time.
   The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. For more information, see Workflow estimated run time updates on page 3671. Workflow designers can also manually update this field.
8. In the Outlier Percentage Threshold for ERT field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time. For more information, see Workflow estimated run time updates on page 3671.
   The system uses a default value of 20.
9. Click Update.

Outlying workflow run times

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the Estimated Run Time and Outlier Percentage Threshold for ERT values in the workflow properties. These values are used in the following formulas.

Table 1251: Formulas for computing workflow outlier ranges

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td>Estimated Run Time * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td>(Estimated Run Time - Outlier Value) to (Estimated Run Time + Outlier Value)</td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>
When a workflow runs within the outlier range, its estimated run time is automatically updated. If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

Workflow estimated run time updates

When a workflow runs within the outlier range, its estimated run time is automatically updated. The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a GlideDateTime.

For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10 seconds</td>
<td>10 seconds</td>
<td>10 seconds</td>
</tr>
<tr>
<td>2</td>
<td>12 seconds</td>
<td>11 seconds</td>
<td>11 seconds</td>
</tr>
<tr>
<td>3</td>
<td>9 seconds</td>
<td>10.333 seconds</td>
<td>10 seconds</td>
</tr>
</tbody>
</table>

**Note:** Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

Troubleshoot workflows

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

Execution path troubleshooting in timelines

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.
Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add gauges to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Role required: workflow_admin

The different levels of access are:

- **View**: View the dashboard and refresh gauges.
- **Customize**: Refresh, add, delete, and rearrange gauges.

On the Workflow Operations Dashboard, you can click gauge elements to view the records they represent. You can also add workflow gauges that are not displayed by default.

1. To view the Workflow Operations Dashboard, navigate to **Workflow > Operations > Workflow Operations Dashboard**.

   The default gauges on the dashboard include:
   - Workflow contexts providing run time metrics
   - Active workflows started during a specified time period
   - Workflows run between yesterday and today
   - Workflows by state for the current month
   - Aged workflow contexts for the past month
2.

To find and add more workflow gauges, click the **Add Content** icon ( ) in the upper left corner of the dashboard.

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

**Workflow gauges**

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

<table>
<thead>
<tr>
<th>Table 1252: Workflow gauges</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ERT Dashboard Controls &gt;</strong></td>
<td></td>
</tr>
<tr>
<td>Outlier Finished Workflows for ERT (Percentage Outlier)</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>Outlier Long Running Workflows for ERT (Percentage Outlier)</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td><strong>Workflow Dashboard &gt;</strong></td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>
</tr>
<tr>
<td><strong>Gauges &gt; Workflow Context</strong></td>
<td></td>
</tr>
<tr>
<td>Number of Active Workflows Started Hourly Over Time (Yesterday)</td>
<td>Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).</td>
</tr>
<tr>
<td>Outlier Finished Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Contexts</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
<tr>
<td>Workflows Run Between Yesterday and Today (by Table)</td>
<td>Displays workflows that have run in the last day grouped by table name.</td>
</tr>
</tbody>
</table>
Execution history table

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state. Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

1. Run the workflow.
2. Navigate to Workflow > All Contexts.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the Workflow Activity History related list.
5. Right-click an activity and select Workflow Debug > Toggle Execution Path Highlighting from the context menu.

All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.

6. Right-click a rollback activity and select Workflow Debug > Toggle Rollback Highlighting from the context menu.

The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

Note: The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.
   You can clear individual rollback paths or all rollback highlighting.

Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing [wf_workflow_timing] table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Role required: admin

*Add a property using sys_properties.list* on page 1411 with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
</tbody>
</table>
Workflow activities

A workflow activity defines an individual action that a workflow performs, such as adding a record or sending a notification. An activity can succeed or fail and the outcome can determine what the workflow does next.

Each activity has properties you can set to determine the details of how the activity behaves.

For information about configuring different types of activities, see *Workflow activities reference* on page 3676.

Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read *Approval and rollback workflow activities* on page 3680.

Table 1253: Approval and rollback activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Action workflow activity</td>
<td>The Approval Action activity performs an approval action on the current task.</td>

<td>The <strong>Forward to Notify Client</strong> workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
<tr>
<td>Call workflow activity on page 2915</td>
<td>The <strong>Call</strong> activity makes outbound phone calls using a Notify workflow.</td>
</tr>
<tr>
<td>Join Conference Call workflow activity on page 2914</td>
<td>The <strong>Join Conference Call</strong> connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td>Send SMS workflow activity on page 2916</td>
<td>The <strong>Send SMS</strong> activity sends short text messages to users’ phones using Notify.</td>
</tr>
<tr>
<td>Queue workflow activity on page 2923</td>
<td>The <strong>Queue</strong> activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

**Notification activities**

Notification workflow activities notify users of events that occur during the workflow.

Table 1256: Notification activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event workflow activity on page 3719</td>
<td>The <strong>Create Event</strong> activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td>Notification workflow activity on page 3720</td>
<td>The <strong>Notification</strong> activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>

**Timer activities**

Timer activities pause workflows for set periods of time.

Table 1257: Timer activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Percentage Timer workflow activity on page 3721</td>
<td>The <strong>SLA Percentage Timer</strong> activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Timer workflow activity on page 3722</td>
<td>The <strong>Timer</strong> activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>

**Task activities**

Task activities create and modify workflow tasks.
### Table 1258: Task activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Worknote workflow activity on page 3727</td>
<td>The Add Worknote activity adds text to the Worknotes field of the current incident record.</td>
</tr>
<tr>
<td>Attachment Note workflow activity on page 3727</td>
<td>The Attachment Note activity adds a comment to a journal field containing a link that points towards an attachment.</td>
</tr>
<tr>
<td>Catalog Task workflow activity on page 3728</td>
<td>The Catalog Task activity creates a service catalog task record.</td>
</tr>
<tr>
<td>Create Task workflow activity on page 3731</td>
<td>The Create Task activity generates a record on any of the tables that extend Task [task].</td>
</tr>
</tbody>
</table>

### Utility activities

Utility workflow activities provide controls over the path of the workflow and other useful tools.

### Table 1259: Utility activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch workflow activity on page 3734</td>
<td>The Branch activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td>Join workflow activity on page 3735</td>
<td>The Join activity unites multiple execution paths into one transition.</td>
</tr>
<tr>
<td>Lock workflow activity on page 3735</td>
<td>The Lock activity prevents other instances of this workflow from continuing past this activity until the lock is released.</td>
</tr>
<tr>
<td>Log Message workflow activity on page 3738</td>
<td>The Log Message activity writes a message to the workflow log.</td>
</tr>
<tr>
<td>Log Trace Message workflow activity on page 3738</td>
<td>The Log Trace Message activity writes a trace message to the workflow log.</td>
</tr>
<tr>
<td>REST Message workflow activity on page 3738</td>
<td>The REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.</td>
</tr>
<tr>
<td>Return Value workflow activity on page 3739</td>
<td>The Return Value activity returns a value to a parent workflow, when run from a subflow.</td>
</tr>
<tr>
<td>Run Script workflow activity on page 3740</td>
<td>The Run Script activity runs a script you provide.</td>
</tr>
<tr>
<td>Set Values workflow activity on page 3740</td>
<td>The Set Values activity sets values on the current record.</td>
</tr>
<tr>
<td>SOAP Message workflow activity on page 3740</td>
<td>The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.</td>
</tr>
</tbody>
</table>
### Turnstile workflow activity
The Turnstile activity limits how many times a workflow can pass through the same point.

### Unlock workflow activity
The Unlock activity releases a lock that was previously placed by the Lock activity.

### Subflow activities
Subflow activities run and manage workflows from a parent workflow.

**Table 1260: Subflow activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parallel Flow Launcher workflow activity</strong></td>
<td>The Parallel Flow Launcher activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>

### Activities provided with Orchestration
The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

### Templates provided for creating custom activities
If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see

### Approval and rollback workflow activities
Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the Approval - User and Approval Action activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read Approval workflow activities and approval engines on page 3762.

**Approval Action workflow activity**
The Approval Action activity performs an approval action on the current task.
Use this activity to mark the current task record as approved or rejected.

*Note:* When an **Approval Action** activity is used to mark a task approved, the activity marks all pending approvals as **No Longer Required**. This activity behaves differently from **Set Values** or **Run Script** when used to set the **Approval** field’s value.

**Results**

The result value of the activity is the final approval disposition selected by the approver. The result value can be **Approved** or **Rejected**. A workflow designer can assign a result value using the `activity.result` variable from within a script field of the activity.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1261: Approval Action activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Mark task approved</td>
</tr>
<tr>
<td></td>
<td>• Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>• Mark task requested</td>
</tr>
<tr>
<td></td>
<td>• Disregard pending approvals</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition runs after this activity.

**Table 1262: Approval Action activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to move to the next workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.
Table 1263: Approval Action activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval Coordinator workflow activity**

The Approval Coordinator activity manages the overall approval that results from one or more approval activities contained within it.

The Approval Coordinator contains one or more Approval - User, Approval - Group and Manual Approval activities. It waits for all approval activities contained within it before deciding whether it should complete with a result of approved or rejected.

When the Approval Coordinator activity completes, it sets all pending approvals created by any of the contained activities to No Longer Required. If a workflow calls a single user as an approver more than once, such as when a user is both a product- and an executive-approver, it skips any approvals for that user after the first.

**Results**

The result value of the Approval Coordinator activity depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

Input variables determine the initial behavior of the activity.
## Table 1264: Approval Coordinator activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Any child activity to be approved:</strong> Any child activity (User, Group, or Manual Approval) that completes with a result of approved causes the Approval Coordinator activity to complete with a result of approved. Indicate what happens when any of the child activities completes with a result of rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reject the approval:</strong> Immediately complete the Approval Coordinator activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Wait for other responses before deciding:</strong> Wait until we get other responses from other child activities before making an approval or rejection decision. This allows users to change their mind until a decision is made. In addition, if Wait for is set to <strong>Any child activity to approve</strong> then a single child activity completion with a result of approved will cause the Approval Coordinator activity to complete with a result of approved even if other child activities have completed with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• <strong>All child activities to be approved:</strong> All child activities of the Approval Coordinator activity must complete with a result of approved to cause the Approval Coordinator activity to complete with a result of approved. Indicate what happens if any of the child activities completes with a result of rejected. (Options are described in previous bullet point.)</td>
</tr>
<tr>
<td></td>
<td>• <strong>The first approval or rejection from any child activity:</strong> The first child activity that completes with a result of approved or rejected causes the Approval Coordinator activity to complete with the same result.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Condition based on script:</strong> Call a script to determine how to manage an approval or rejection.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Approval script | If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable **answer** to **approved** or rejected to indicate the overall approval status for this approval. When called, the following variable is available to the script:

```plaintext
counts.total = total number of child approval activities that are part of this approval
counts.approved = # of child approval activities that approved so far
counts.rejected = # of child approval activities that rejected so far
counts.requested = # of child approval activities that are pending approval
```
State | Description
---|---
Cancelled | This activity, or the workflow that contains this activity, was canceled.
Error | A JavaScript error occurred. Review the logs for error details.

**Approval - Group workflow activity**

The **Approval - Group** activity creates approval records for each member of a specified group.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the **Wait For** field.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions taken by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1267: Approval - Group activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the group approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity’s approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>An approval from each group:</strong> Any user from each group can approve and the first approval from each group causes the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• <strong>An approval from any group:</strong> Any user from any group can approve and the first approval from any group causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• <strong>An approval from everyone from all groups:</strong> All users from all groups must approve to cause the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• <strong>First response from each group:</strong> The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
</tr>
</tbody>
</table>

Indicate what happens when any user rejects their approval request. Options are:

• **Reject the approval:** Immediately complete the activity with a result of rejected.

• **First response from any group:** The first approval or rejection from any user in any group causes the activity to complete with a result of approved or rejected.

• **Condition based on script:** Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When anyone rejects</td>
<td>A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reject the approval</strong>: Immediately complete the activity with a result of <strong>rejected</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Wait for other responses before deciding</strong>: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: If Wait for is set to <strong>Anyone to approve</strong>, then a single approval causes the activity to complete with a result of <strong>approved</strong>, even if one or more users reject.</td>
</tr>
<tr>
<td>Groups</td>
<td>The groups whose approval will be requested. A particular group can be selected, or the tree icon can be used to select a group field from the current record. A user approval for each member of the group is automatically created when a Group approval record is created. If no group is selected, the activity automatically sets the approval to <strong>Approved</strong>.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to write a script for determining additional users to request approvals from. Use the <strong>Additional groups script</strong> to customize group approvals.</td>
</tr>
<tr>
<td>Due date based on</td>
<td>The due date fields are used to determine the values to use for setting <strong>Expected Start Time</strong> and <strong>Due Date</strong> for the task. The type determines how the due date is computed:</td>
</tr>
<tr>
<td></td>
<td>• <strong>A user specified duration</strong>: The duration is based on a user specified value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A relative duration</strong>: The duration is calculated from a relative duration (such as End of Next Business Day).</td>
</tr>
<tr>
<td></td>
<td>• <strong>A date/time or duration field</strong>: The duration is based on the value of a field on the current record.</td>
</tr>
<tr>
<td></td>

**Conditions**

The following conditions determine which transition runs after this activity.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - User workflow activity**

The **Approval - User** activity creates one or more individual user approvals.

**Results**

The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
Input variables

Table 1270: Approval - User activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when <strong>Time zone based on</strong> is <strong>A time zone field</strong>.</td>
</tr>
<tr>
<td><strong>Additional approvers script</strong></td>
<td>If the <strong>Advanced</strong> check box is selected, this script is called to determine any additional user approvals to be created. The script needs to set the variable <strong>answer</strong> to a comma-separated list of user ids and group ids or an array of user and group ids to add as approvers. For example:</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>answer = [];</td>
</tr>
<tr>
<td></td>
<td>answer.push('id1');</td>
</tr>
<tr>
<td></td>
<td>answer.push('id2');</td>
</tr>
</tbody>
</table>
### Approval Script

If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable **answer** to approved or rejected to indicate the approval status for this approval. When called, the following information is available:

```plaintext
counts.total = total number of users that are part of this approval
counts.approved = # of users that approved so far
counts.rejected = # of users that rejected so far
counts.requested = # of users that are pending approval
counts.not_requested = # of users that are not pending approval
counts.not_required = # of users that approval is not required
```

### Conditions

The following conditions determine which transition runs after this activity.

**Table 1271: Approval - User activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.
Table 1272: Approval - User activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Generate workflow activity

The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The Generate activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The State to Pending
  - The Expected Start Date
  - The Due Date

- If it is an approval activity, creates the approvals and sets:
  - The approval State to Not Requested
  - The Expected Start Date
  - The Due Date

Expected start dates and due dates are calculated based on the Expected Duration of all of the tasks and approvals between the Generate activity and the activity being updated. In the case of a branched path (between a Branch and Join activity), the longer duration will be used for any post-branch activities.

The Generate activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the Generate activity, select the Skip during generate check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the Skip during generate check box selected:

- Rejected (for any of the approval activities)
- No condition of If activity
- Continue condition of Turnstile activity
- Incomplete condition of Join activity
Input variables

Input variables determine the initial behavior of the activity.

Table 1273: Generate activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the <strong>Generate</strong> activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
<tr>
<td>Generate tasks</td>
<td>If selected, tasks are created when running the <strong>Generate</strong> activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1274: Generate activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>
Example

Figure 894: Generate workflow

In this example, the following approvals are generated:

- Approval-2
- Approval-3

Approval-4 is skipped since the Rejected condition of Approval-3 has Skip during generate selected.

Here is an example of using the Generate activity that describes the expected start and due dates:
In this example, if the **Generate** activity is run on Jan 1, 2016, the following expected start dates and due dates would be set for the generated tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 1 (1 day)</td>
<td>Jan. 1, 2016</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
</tr>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 3 is 2 days</td>
<td>Task 4 ends the latest before the Join</td>
</tr>
<tr>
<td>Task 3 (2 days)</td>
<td>Jan. 1, 2016</td>
<td>Jan. 3, 2016</td>
<td>Task 4 is 2 days</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Jan. 5, 2016</td>
<td>Task 5 ends the latest before the Join</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the **Join** is Task 3/Task 4.

**Manual Approvals workflow activity**

The **Manual Approvals** activity watches and manages any approvals that users add manually outside of the workflow process.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of **approved**. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow. The workflow waits for the approval to be closed before proceeding.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled
• Error

Input variables

Input variables determine the initial behavior of the activity.

Table 1275: Manual Approvals activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Any manual user or group approval</strong>: Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• <strong>All manual user or group approvals</strong>: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• <strong>The first response from any manual approval</strong>: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When anyone rejects</td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reject the approval</strong>: Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Wait for other responses before deciding</strong>: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
<tr>
<td></td>
<td>In addition, if <strong>Wait for</strong> is set to <strong>Anyone to approve</strong> then a single approval will cause the activity to complete with a result of approved even if one or more users reject.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.

</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1277: Manual Approvals activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Rollback To workflow activity**

The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

**Note:** The **Rollback** activity is deprecated starting with the Eureka release. Use the **Rollback To** activity instead.

**Rollback To** determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. **Rollback To** then marks all the approvals that have transitioned between the rollback and the transitioned to activity as **Not Yet Requested** and the tasks as either **Open** or **Pending**.

Use the **Rollback To** activity for all workflows in which multiple rollbacks are required. **Rollback To** has no variables.

**Conditions**

The conditions determine which transition runs after this activity.

**Table 1278: Rollback To activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>

<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Condition workflow activities**

Condition activities provide conditional branching and logical operations for workflows.

*If workflow activity*

The *If* activity checks a condition or script to determine if a *Yes* or *No* transition should be taken.

If the workflow creator specifies both the *Condition* and the *Advanced* script, both must evaluate successfully for activity to take the *Yes* transition.

**Results**

The workflow designer can assign a result value using `activity.result` from within the *Script* field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- Yes
- No

**Input variables**

The following variables determine the behavior of the activity.
Table 1280: If activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the <strong>Yes</strong> transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the <strong>Advanced</strong> check box. You may then enter a script that is evaluated. If your script sets the variable answer to yes, then the <strong>Yes</strong> transition is taken. Otherwise, the <strong>No</strong> transition is taken.</td>
</tr>
</tbody>
</table>

**Conditions**

The following conditions determine which transition comes after the activity.

Table 1281: If activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the <strong>Advanced</strong> script, if specified, returns yes.</td>
</tr>
<tr>
<td>No</td>
<td>Taken when either the condition does not match or the <strong>Advanced</strong> script, if specified, returns no.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1282: If activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Switch workflow activity**

The **Switch** activity checks if the value of a passed field or variable is equivalent to one of several case values.
The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a **Variable** or **Field** to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the **Condition** field of the activity condition, the workflow progresses through that activity condition.

**Results**

The variable or field selected in the **Variable** or **Field** activity variable determines the possible result values.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Select <strong>Variable</strong> or <strong>Field</strong> as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
| **Variable or Field**| Select the source of the value compared against the switch activity conditions. The field label and available options depend on the **Type** selection.  
  • **Variable**: select any service catalog variable.  
  • **Field**: select any field from the **Table** defined in the workflow properties. |

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Example**

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.

![Figure 896: Switch activity example](image)

The **Field** selected is the incident **Assigned to** field.
If the value of the Assigned to field of the workflow-triggering incident is Service Desk or Field Services, the workflow populates values on the incident record before continuing. If the Assigned to value is Hardware, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see Manage workflow activity conditions on page 3759 and Activity result value on page 3761.
The **Wait for condition** workflow activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see *Timer workflow activities* on page 3721.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.

### Note:

---

**Figure 898: Hardware group condition**

**Wait for condition workflow activity**

The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see *Timer workflow activities* on page 3721.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.
A Wait for condition activity should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as ‘changed,’ try inserting a one-second timer.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. The activity transitions when the result value is true.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the <code>answer</code> variable to true.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Wait for WF Event workflow activity**

The **Wait for WF Event** activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the `workflow.fireEvent('eventName')` API call.
Results
The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

Input variables
The following variables determine the behavior of the activity.

Table 1287: Wait For WF Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

States
The activity state tells the workflow engine what to do with the activity.

Table 1288: Wait For WF Event activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Notify workflow activities
Notify activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the `notify_call` table. Call-related Notify activities can be added only to workflows where the `Table` field value is `Notify Call [notify_call]`.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an `If` workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

Note: Do not add a `Timer` activity between multiple Notify activities that interact with active phone calls.
**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **None**. Notify controls which workflow to run based on the configured number groups.

*Forward Call workflow activity*

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1289: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

*Input workflow activity*

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Table 1290: Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the <strong>Finish key</strong> to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  1: {
    "say": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  2: {
    "say": "type 2 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as myCustomData in the example above.

**Conditions**

The conditions determine the transition that comes after this activity.

The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition value** to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.
Table 1291: Values written to scratchpad

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using `var previousActivity = &quot;choices&quot;; var choicesMenu = workflow.scratchpad.menu[previousActivity]; var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller’s input. var selectedValue = menuItem.myCustomData; //get the custom data for the selected menu item.</td>
</tr>
</tbody>
</table>

Hangup workflow activity

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

Play workflow activity

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

Table 1292: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the <strong>play</strong> activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.
You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity
The Record workflow activity records audio from a user on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

Reject workflow activity

The Reject workflow activity rejects an incoming Notify call.

You can use the reject activity to disconnect only calls that have not yet been answered. Use the hang up activity to disconnect calls that have been answered.
Input variables

Input variables determine the initial behavior of the activity.

Table 1295: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity

The Say activity plays a message, using text-to-speech, on a Notify call.

Input variables

Input variables determine the initial behavior of the activity.

Table 1296: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. For example, to play an English-language message, return {language: 'en-US', text: 'Text to read'}.</td>
</tr>
</tbody>
</table>

Forward to Notify Client workflow activity

The Forward to Notify Client workflow activity connects a phone call to a Notify WebRTC client.

Input variables

Input variables determine the initial behavior of the activity.

Table 1297: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
</tbody>
</table>
### Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

**Call workflow activity**

The **Call** activity makes outbound phone calls using a Notify workflow.

### Input variables

Input variables determine the initial behavior of the activity.

#### Table 1298: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the <strong>Phone number to call</strong> and <strong>Notify Number</strong> variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.
You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

*Join Conference Call workflow activity*

The **Join Conference Call** connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1299: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **join conference call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

**Scratchpad entries**

The activity uses the workflow scratchpad to read persistent values.
**Table 1300: Values read from scratchpad**

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the <a href="#">join conference call</a> activity will log an error. When initiating an outgoing call workflow using the Notify API <code>call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)</code> method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

**Send SMS workflow activity**

The **Send SMS** activity sends short text messages to users’ phones using Notify.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1301: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **Message** | Enter the message to send. You can add field values from the current record by using the **Select variables** box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used.  
Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning. |
| **To (script)** | Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message.  
The script should return a JavaScript object with the format `{notify_number: '\...sys_id...\', users: [...], groups: [...], numbers: [...]}`.  
Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers.  
This field appears only if **Advanced** is selected. |

**Conditions**

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

*Queue workflow activity*

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

**Notification workflow activities**

Notification workflow activities notify users of events that occur during the workflow.

*Create Event workflow activity*

The **Create Event** activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.
Results

**Finished:** the activity added the event to the event queue.

Input variables

Table 1302: Create Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>The first parameter of the event.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this parameter is a string value, it must be within quotes (&quot; &quot;).</td>
</tr>
<tr>
<td>Parameter 2</td>
<td>The second event parameter.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this parameter is a string value, it must be within quotes (&quot; &quot;).</td>
</tr>
</tbody>
</table>

Notification workflow activity

The **Notification** activity sends an email or SMS message to specified users or groups.

Input variables

Table 1303: Notification activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The users who will be recipients of the email.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>The members of the groups that will be recipients of the email.</td>
</tr>
<tr>
<td>Advanced</td>
<td>If selected, the script in the <strong>To (script)</strong> field is called to specify additional recipients of the email.</td>
</tr>
<tr>
<td>To (script)</td>
<td>If <strong>Advanced</strong> is selected, this script is called and should set the variable <em>answer</em> to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.</td>
</tr>

</tr>
</tbody>
</table>
### States

The activity state tells the workflow engine what to do with the activity.

**Table 1304: Notification activity states**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the run function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

### Timer workflow activities

Timer activities pause workflows for set periods of time.

**SLA Percentage Timer workflow activity**

The **SLA Percentage Timer** activity pauses the workflow for a duration equal to a percentage of an SLA.

A workflow must run on the Task SLA table to use this activity.

### Results

**Table 1305: SLA Percentage Timer activity results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.
Table 1306: SLA Percentage Timer activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>The duration to pause the workflow for, as a percentage of the current SLA</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1307: SLA Percentage Timer states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is in this state very briefly while initializing, after which it immediately changes to <strong>Waiting</strong>.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the SLA reaches the specified percentage. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Timer workflow activity**

The **Timer** activity pauses the workflow for a specified period of time.

This duration can be an absolute time value or a relative value based on a defined schedule. It is best to adjust the **Duration** so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see **wait for condition**.

**Results**

Table 1308: Timer activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration.</td>
</tr>
</tbody>
</table>
## Input variables

Input variables determine the initial behavior of the activity.

### Table 1309: Timer activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer based on</td>
<td>How the timer duration is computed. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>A user specified duration</strong>: The duration is based on the <em>Duration</em> fields, such as days and hours.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A relative duration</strong>: The duration is based on the <em>Relative duration</em> (such as End of Next Business Day) and <em>Wait</em> fields.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A date/time or duration field</strong>: The duration is based on the <em>Field</em> value and the <em>Wait</em> field.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Script</strong>: The duration is based on a script that returns the number of seconds.</td>
</tr>
<tr>
<td>Duration</td>
<td>The specific number of days and hours to wait before proceeding to the next activity in the workflow. This field is available only when Timer based on is <strong>A user specified duration</strong>.</td>
</tr>
<tr>
<td>Relative duration</td>
<td>The general number and length of business days to wait before progressing to the next workflow activity. This field is available only when Timer based on is <strong>A relative duration</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>The date/time or duration field that contains the elapsed wait-time before moving to the next workflow activity. This field appears when the Timer based on is <strong>A date/time or duration field</strong>.</td>
</tr>
<tr>
<td>Script</td>
<td>The script that sets ‘answer’ to the number of seconds for the duration. This field is available only when Timer based on is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Wait                  | An additional timer adjustment when Timer based on is A relative duration or A date/time or duration field. The options are:  
  • The full duration: No modification of the calculated duration.  
  • A % of the duration: The duration is adjusted by multiplying the number of seconds by the (Percentage / 100).  
  • Some time before: The duration is shortened by the Time before days and hours.  
  • Some time after: The duration is lengthened by the Time after days and hours. |
| Percentage            | The Wait percentage value when Timer based on is A relative duration or A date/time or duration field.                                                                                             |
| Time before           | The modifier time value when Wait is Some time before.                                                                                                                    |
| Time after            | The modifier time value when Wait is Some time after.                                                                                                                   |
| Schedule based on     | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  • This workflow's schedule: The schedule uses workflow context date, time, and an optional Time zone based on value.  
  • A specific schedule: The schedule uses a pre-defined Schedule and an optional Time zone based on value.  
  • A schedule field: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule              | The pre-defined Schedule from a list. This field available only when Schedule based on is A specific schedule.                                                               |
| Schedule field        | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when Schedule based on is A schedule field. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time zone based on</td>
<td>The time zone for calculating the duration. The time zone may be based on:</td>
</tr>
<tr>
<td></td>
<td>• <strong>No time zone</strong>: Default. Workflow uses the GMT time zone.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A specific time zone</strong>: A predefined Time zone.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A time zone field</strong>: A Time zone field to track time duration from a field on the form.</td>
</tr>
<tr>
<td>Time zone</td>
<td>The predefined time zone. This field is available only when <strong>Time zone based on</strong> is <strong>A specific time zone</strong>.</td>
</tr>
<tr>
<td>Time zone field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when <strong>Time zone based on</strong> is <strong>A time zone field</strong>.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Table 1310: Timer activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The <strong>Timer</strong> activity is in this state very briefly while initializing, after which it immediately changes to <strong>Waiting</strong>.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Example

You can use a **Timer** activity to pause the workflow until the end of the business day.
Figure 899: Timer example

In this example, the script evaluates the time between the `now` variable and the `eod` variable. The `eod` variable is defined, in 24 hour time, as 4:00 PM. The script then sets the `answer` variable to the difference between these variables, in seconds, and logs a message.

```javascript
// get now and calc end of day (4:00pm)
var now = new Date();
var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);
answer = (eod.getTime() - now.getTime()) / 1000;
```
Task workflow activities

Task activities create and modify workflow tasks.

Task activities are only available when the workflow runs on a table that extends Task.

*Add Worknote workflow activity*

The **Add Worknote** activity adds text to the Worknotes field of the current incident record.

A workflow must run on the Incident table to use this activity.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

*Attachment Note workflow activity*

The **Attachment Note** activity adds a comment to a journal field containing a link that points towards an attachment.

Attachments added to a record from this activity do not appear at the top of a record, but open a URL containing the content. This activity allows the use of irregular HTML tags to reference attachments, specifically the **[code]** tag. Entries in a journal field that use irregular HTML do not work if the glide.ui.allow_deep_html_validation property is true (It is set to false by default).

**Results**

- **Finished**: the activity added the attachment to the record.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>A journal field to note the attachment. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>none</strong> (defaults to Work Notes)</td>
</tr>
<tr>
<td></td>
<td>• <strong>Additional Comments</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Work notes</strong></td>
</tr>
<tr>
<td>Attachment Name</td>
<td>The name of the attachment in the URL. This name appears on the attachment at the top of the form.</td>
</tr>
</tbody>
</table>
### Catalog Task workflow activity

The **Catalog Task** activity creates a service catalog task record.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item `[sc_req_item]` table.

### Results

You can assign a result value using `activity.result` from within a script field of the activity. The final **State** value of the catalog task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

### Input variables

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority</td>
<td>The Priority that is assigned to the task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
</tbody>
</table>
| Due date based on      | The due date fields are used to determine the values to use for setting **Expected Start Time** and **Due Date** for the task. The type determines how the due date is computed:  
  - **A user specified duration**: The duration is based on a user specified value.  
  - **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).  
  - **A date/time or duration field**: The duration is based on the value of a field on the current record.  
  - **Script**: The duration is returned by a script. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>The specific number of days and hours. This field is available only when <strong>Due date based on</strong> is <strong>A user specified duration</strong>.</td>
</tr>
<tr>
<td>Relative duration</td>
<td>The general number and length of business days. This field is available only when <strong>Due date based on</strong> is <strong>A relative duration</strong>.</td>
</tr>
<tr>
<td>Due date field</td>
<td>The date/time or duration field. This field appears when the <strong>Due date based on</strong> is <strong>A date/time or duration field</strong>.</td>
</tr>
<tr>
<td>Due date script</td>
<td>The script that sets 'answer' to the number of seconds for the duration. This field is available only when <strong>Due date based on</strong> is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Schedule based on</td>
<td>The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>This workflow's schedule</strong>: The schedule uses workflow context date, time, and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A specific schedule</strong>: The schedule uses a pre-defined <strong>Schedule</strong> and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A schedule field</strong>: The schedule uses a value from a table and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td>Schedule</td>
<td>The predefined <strong>Schedule</strong> from a list. This field available only when <strong>Schedule based on</strong> is <strong>A specific schedule</strong>.</td>
</tr>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when <strong>Schedule based on</strong> is <strong>A schedule field</strong>.</td>
</tr>
<tr>
<td>Time zone based on</td>
<td>The time zone for calculating the duration. The time zone may be based on:</td>
</tr>
<tr>
<td></td>
<td>• <strong>No time zone</strong>: Default. Workflow uses the GMT time zone.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A specific time zone</strong>: A predefined <strong>Time zone</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>A time zone field</strong>: A <strong>Time zone field</strong> to track time duration from a field on the form.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Time zone</td>
<td>The predefined time zone. This field is available only when Time zone based on is A specific time zone.</td>
</tr>
<tr>
<td>Time zone field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when Time zone based on is A time zone field.</td>
</tr>
<tr>
<td>Task value from</td>
<td>The values used to create the task may either come from:</td>
</tr>
<tr>
<td></td>
<td>• Fields: a predefined set of fields including Fulfillment group, Assigned to, Short description and Instructions.</td>
</tr>
<tr>
<td></td>
<td>• Template: an existing template for the selected task table.</td>
</tr>
<tr>
<td></td>
<td>• Values: values that you specify using a Set Values widget.</td>
</tr>
<tr>
<td>Fulfillment group</td>
<td>The group that is responsible for completing the task.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The user that is responsible for completing the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description for the task.</td>
</tr>
<tr>
<td>Instructions</td>
<td>The task instructions for the user to complete prior to closing the task. These instructions appear in the Description field.</td>
</tr>
<tr>
<td>Advanced</td>
<td>If selected, the Advanced script is called to allow for additional task values to be set.</td>
</tr>
<tr>
<td>Advanced Script</td>
<td>Set additional values for the task in this script. Use the variable task when setting additional values. This script is run after the task values are set using the Fields, Template or Values you have specified. For example:</td>
</tr>
<tr>
<td></td>
<td>task.short_description = current.short_description;</td>
</tr>
<tr>
<td>Variables on Task Form</td>
<td>A slush-bucket of optional catalog variables to include. The variables here are displayed in the Catalog Task form in a field called Variable Editor. If no variables are defined in the field on the Catalog Task activity, the Variable Editor field in the Catalog Task form is not visible.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.
### Table 1314: Catalog Task activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Create Task workflow activity**

The **Create Task** activity generates a record on any of the tables that extend Task [task].

If the **Wait for completion** check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

**Note:** If a workflow contains a **Create Task** activity that has executed on the current record, additional **Create Task** activities in the workflow or in subflows cannot create new task records. To create additional tasks in this situation, you can add a **Run Script workflow activity** on page 3740 activity to the workflow that creates a task with a script.

### Results

You can assign a result value using `activity.result` from within a script field of the activity. By default, the final **State** value of the task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

### Input variables

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Task Activity Settings</td>
<td>The following fields specify the behavior of the Create Task Activity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Task type</td>
<td>The type of task to create. Select from the corresponding task table for the workflow.</td>
</tr>
<tr>
<td>Priority</td>
<td>The priority that is assigned to the task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
</tbody>
</table>

**Create Task Record Settings**

The following fields specify the field values that this activity sets for the task it creates.

<table>
<thead>
<tr>
<th>Task values from</th>
<th>The values used to create the task may either come from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Fields</td>
<td>a predefined set of fields including <strong>Fulfillment group</strong>, <strong>Assigned to</strong>, <strong>Short description</strong> and <strong>Instructions</strong>.</td>
</tr>
<tr>
<td>- Template</td>
<td>an existing template for the selected task table.</td>
</tr>
<tr>
<td>- Values</td>
<td>values that you specify using a Set Values widget.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Fulfillment group</th>
<th>The group that is responsible for completing the task.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigned to</td>
<td>The user that is responsible for completing the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description for the task.</td>
</tr>
<tr>
<td>Instructions</td>
<td>The task instructions for the user to complete prior to closing the task. These instructions appear in the <strong>Description</strong> field.</td>
</tr>
</tbody>
</table>

**Task template**

Only appears when **Task values from** is set to **Template**.

A template that is used to fill in values for the task.

**Set values**

Only appears when **Task values from** is set to **Values**.

A widget that is used to specify values for any fields of the task.

**Advanced**

If selected, the **Advanced script** is called to allow for additional task values to be set.

**Advanced Script**

Set additional values for the task in this script. Use the variable `task` when setting additional values. This script is run after the task values are set using the **Fields**, **Template** or **Values** you have specified. For example:

```plaintext
task.short_description = current.short_description;
```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Task Schedule</strong></td>
<td></td>
</tr>
</tbody>
</table>
| Due date based on | The due date fields are used to determine the values to use for setting **Expected Start Time** and **Due Date** for the task. The type determines how the due date is computed:  
  - **A user specified duration**: The duration is based on a user specified value.  
  - **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).  
  - **A date/time or duration field**: The duration is based on the value of a field on the current record.  
  - **Script**: The duration is returned by a script. |
| Duration | The specific number of days and hours. This field is available only when **Due date based on** is **A user specified duration**. |
| Relative duration | The general number and length of business days. This field is available only when **Due date based on** is **A relative duration**. |
| Due date field | The date/time or duration field. This field appears when the **Due date based on** is **A date/time or duration field**. |
| Due date script | The script that sets 'answer' to the number of seconds for the duration. This field is available only when **Due date based on** is **Script**. |
| Schedule based on | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  - **This workflow's schedule**: The schedule uses workflow context date, time, and an optional **Time zone based on** value.  
  - **A specific schedule**: The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value.  
  - **A schedule field**: The schedule uses a value from a table and an optional **Time zone based on** value. |
| Schedule | The predefined **Schedule** from a list. This field available only when **Schedule based on** is **A specific schedule**. |
### Field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when Schedule based on is A schedule field.</td>
</tr>
<tr>
<td>Time zone based on</td>
<td>The time zone for calculating the duration. The time zone may be based on:</td>
</tr>
<tr>
<td></td>
<td>• No time zone: Default. Workflow uses the GMT time zone.</td>
</tr>
<tr>
<td></td>
<td>• A specific time zone: A predefined Time zone.</td>
</tr>
<tr>
<td></td>
<td>• A time zone field: A Time zone field to track time duration from a field on the form.</td>
</tr>
<tr>
<td>Time zone</td>
<td>The predefined time zone. This field is available only when Time zone based on is A specific time zone.</td>
</tr>
<tr>
<td>Time zone field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. This field is available only when Time zone based on is A time zone field.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Table 1316: Create Task activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Utility workflow activities

Utility workflow activities provide controls over the path of the workflow and other useful tools.  

*Branch workflow activity*

The **Branch** activity splits the workflow into multiple transition paths from a single activity.
The Branch activity provides a single **Always** condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity. You can also add conditions to selectively transition to one or more activities.

**Note:** Branching can affect the behavior of rollback activities. See *Rollback To workflow activity* on page 3764 for more information.

**Join workflow activity**
The **Join** activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a **Join** activity, any subsequent activities execute twice.

To add Join to the canvas, click **Submit**. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

**Results**

Provide an Incomplete transition out of a **Join** whenever it is possible for any predecessor activities to follow a transition path that does not lead to the **Join** activity.

**Table 1317: Join activity results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td><strong>Join</strong> exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the <strong>Join</strong>.</td>
</tr>
<tr>
<td>Incomplete</td>
<td><strong>Join</strong> exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the <strong>Join</strong> activity.</td>
</tr>
</tbody>
</table>

**Lock workflow activity**
The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the **Unlock** activity. The lock may also be released when the **Max duration** is reached.

When an instance of the workflow reaches the **Lock** activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until **Max attempts** has been reached.

**Note:** We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not
specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.

Figure 900: Example of Lock Activity Preceded by Timer Activity
Results

Table 1318: Lock activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock Max attempts times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

Table 1319: Lock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

</tr>
</tbody>
</table>

Log Message workflow activity
The Log Message activity writes a message to the workflow log.
Use this activity to add entries to the workflow's log for debugging or tracing purposes.

Input variables
Input variables determine the initial behavior of the activity.

Table 1321: Log Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.</td>
</tr>
</tbody>
</table>

Log Trace Message workflow activity
The Log Trace Message activity writes a trace message to the workflow log.
The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity on page 3738 activity.

REST Message workflow activity
The REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.
The REST Message activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

Note: If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.

Input variables

Table 1322: REST Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REST Message</td>
<td>Name of the REST message to run. This is a reference field to the REST Message [sys_rest_message] table (System Web Services &gt; Outbound &gt; REST Message).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method [sys_rest_message_fn] table (System Web Services &gt; Outbound &gt; REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
<tr>
<td>Variables</td>
<td>Values to use for variables defined in the HTTP Method record. Use the following format for the string: name1=value1, name2=value2, ... For example, use name=${nameValue}, id=${idValue} where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box for using a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable.</td>
</tr>
</tbody>
</table>

**Return Value workflow activity**

The **Return Value** activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see *Workflows used as subflows* on page 3552.

Use this activity within a subflow to store data that the parent flow can access. The **Return Value** activity adds the data from the subflow's **value** variable to the parent workflow's **scratchpad**.
Scratchpad entries

The activity uses the workflow scratchpad to read and write persistent values.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow value variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a Map return value to variable that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

Run Script workflow activity

The Run Script activity runs a script you provide.

**Note:** All changes to current are automatically updated. You do not need to call current.update().

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

Set Values workflow activity

The Set Values activity sets values on the current record.

The variables are loaded from the current record.

**Note:** Using the Set Values activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the Approval Action activity.

SOAP Message workflow activity

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP to run this activity.
## Input variables

Table 1325: SOAP Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: namel=value1, name2=value2, . . .</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, Workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>

<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the <strong>Use MID Server</strong> check box. The workflow ignores this parameter if the <code>use_midserver</code> parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the <code>activity.output</code> object.</td>
</tr>
</tbody>
</table>

**Turnstile workflow activity**

The **Turnstile** activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the *Rollback To workflow activity* on page 3702 activity.

**Results**

You can assign a result value using the `activity.result` variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The <code>Allowed iterations</code> value is greater than the number of times the workflow accessed this activity.</td>
</tr>
<tr>
<td>Cancel</td>
<td>The workflow accessed this activity more times than the <code>Allowed iterations</code> value.</td>
</tr>
</tbody>
</table>

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity.

Table 1328: Turnstile activity conditions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1329: Turnstile activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is triggered.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Unlock workflow activity

The Unlock activity releases a lock that was previously placed by the Lock activity.

To release a lock, specify the same lock key that was specified in the Lock activity. If the Lock activity had a Duration specified, and that duration has already passed, the lock will already be released.

Input variables

Input variables determine the initial behavior of the activity.
Table 1330: Unlock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a Lock activity. For more information, see Lock activity.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1331: Unlock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished</td>
<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

Subflow activities workflow activity

Subflow activities run and manage workflows from a parent workflow.

Parallel Flow Launcher workflow activity

The Parallel Flow Launcher activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

Note: The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

Note: Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches of no more than 500 at a time.

Activity variables

Activity variables determine the initial behavior of the activity.

Table 1332: Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the activity.</td>
</tr>
<tr>
<td>Stage</td>
<td>The stage to display when the workflow reaches the activity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Inputs</td>
<td>Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must match those used by the subflow that this activity launches. For a detailed example, see Parallel Flow Launcher Example.</td>
</tr>
<tr>
<td>Parallel Flow Launcher selection</td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>The workflow to run.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check Advanced, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See WorkflowCoordinator object on page 3747 for more information.</td>
</tr>
<tr>
<td>Parallel Flow Launcher iteration</td>
<td>Specify parameters to tune the performance of batched workflows.</td>
</tr>
<tr>
<td>Count</td>
<td>If not specified by an inputs set, Count determines the number of subflows executed in parallel from this activity. If the Advanced option is not selected, ensure that this field is populated with a valid number.</td>
</tr>
<tr>
<td>Max flows</td>
<td>The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Parallel Flow Launcher Process</td>
<td></td>
</tr>
<tr>
<td>Process flow complete</td>
<td>To specify a script that runs after each subflow completes, check Process flow complete. If you check this field, a text box labelled Flow complete appears, where you can enter the script to run.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Flow complete        | The script that runs each time a subflow finishes. This field is available when the **Process flow complete** option is selected.  

The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more information, see **Completed subflow values in scripts** on page 3748.  

The variable “flow” is available to this script. It is an object that contains the following information about the flow that is finishing:  

- **flow.output (String)**: The value that the subflow returns to the parent if it executed a Return Value activity before ending.  
- **flow.index (Number)**: The zero-relative index of the subflow that finished.  
- **flow.contextId (String)**: The sys_id of the workflow context for the completed subflow.  
- **flow.inputs (Object)**: The inputs that were passed to the subflow when its context was created and started.  
- **flow.status (String)**: The final state of the context. This corresponds to the **state** column in the subflow context record, which has possible values of **executing**, **finished**, **cancelled**, or **faulted**. (Since the flow is completed, it cannot be **executing** at this point.) |

**Parallel Flow Launcher Split**

| Process finished | To specify a script that runs after all subflows have finished, check **Process finished**. If you check this field, a text box labelled **Finished Script** appears where you can enter the script to run. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:  

```javascript
for (var i = 0; i < coordinator.getNumFlows(); i++)
    writeFlowResultsToTable( i, coordinator.getFlow(i) );
``` |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished script</td>
<td>The script that runs after all subflows launched by the activity are complete. You can use variables that contain completed flow information in this script. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>```javascript</td>
</tr>
<tr>
<td></td>
<td>for (var i = 0; i &lt; coordinator.getNumFlows(); i++)</td>
</tr>
<tr>
<td></td>
<td>writeFlowResultsToTable( i,</td>
</tr>
<tr>
<td></td>
<td>coordinator.getFlow(i) );</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>This field is available when Process finished is selected.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity. To view an activity's state, point to the activity. A pop-up window shows the State and Result of the activity. If the activity is in an error state, the pop-up window provides a brief Fault Description.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>

**WorkflowCoordinator object**

A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

When using a WorkflowCoordinator object, you can create a Parallel Flow Launcher activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the Advanced activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the save(variableName) function on the WorkflowCoordinator object. You can reference the object using the value passed in the variableName parameter. For example, you can create a WorkflowCoordinator object in a Run Script activity, save the object using `<object>.save('coord')`, and then call this object by entering coord in the Workflow activity variable of a subsequent Parallel Flow Launcher activity.
• Define the WorkflowCoordinator within the **Workflow** activity variable. Add the `javascript:` identifier at the beginning of the script. The *Parallel Flow Launcher example* on page 3748 shows how to use a WorkflowCoordinator object in this way.

• Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

**Completed subflow values in scripts**

The *Parallel Flow Launcher* activity exposes additional variables you can use in scripts.

**Table 1334: Additional variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coordinator</td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the <strong>Finished script</strong> to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the <code>WorkflowCoordinator.load('&lt;Activity&gt;')</code> function. For example, to load the WorkflowCoordinator object from a <em>Parallel Flow Launcher</em> activity called <em>Launch Subflows</em>, enter <code>var coord = WorkflowCoordinator.load('Launch Subflows');</code> in a later activity.</td>
</tr>
</tbody>
</table>
| flow | The subflow launched by the activity that completed most recently. You can use this variable in the **Flow complete** script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use `var flow = coord.getFlow(i);` where `i` is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:  
  • `index`: the numerical index of this subflow based on the order it was launched  
  • `workflow`: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow  
  • `inputs`: any input values provided to the launched subflow  
  • `status`: status of the subflow context  
  • `output`: the value returned by the subflow  
  • `contextid`: the sys_id of the workflow context for the subflow |

__Parallel Flow Launcher example__
This example shows how to use the **Parallel Flow Launcher** activity with an array of input values and with a WorkflowCoordinator object.

**Sample workflow**

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

![Flowchart](image)

**Figure 901: Parallel flow launcher business case**

**Provision the application nodes**

The first **Parallel Flow Launcher** activity launches the **Provision Node** subflow four times. The activity passes a unique IP address to each subflow from an array in the **Inputs** variable. The scripts defined in the **Flow complete** and **Finished script** variables write log messages regarding the status of the subflows.
Activity Properties: Parallel Flow Launcher

Name: Provision application nodes

Stage:

Inputs:

- [u_host: '192.168.0.10'],
- [u_host: '192.168.0.20'],
- [u_host: '192.168.0.30'],

Advanced:

Workflow: Provision Node

Count:

Max flows: 25

Max simultaneous: 5

Process flow complete:

Flow complete:

```javascript
// To access the flow that completed, use the 'flow' variable.
var flowOutput = flow.output;

workflow.debug("Provision Node Finished. Context: " + flow.contextId);
```

Process finished:

Finished script:

```javascript
// To access the set of completed workflows use the 'coordinator' variable.
var flowResult = coordinator.getFlow(1).output;

workflow.debug("All Nodes Provisioned");
```

Update
Add nodes to the load balancer

The second **Parallel Flow Launcher** activity uses WorkflowCoordinator objects to specify which subflows to run. The `coordinator` variable stores the completed flow information from the previous **Provision Nodes** activity. The script then retrieves the IP address and port for each node that was provisioned. The `coord2` WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the `coord2` WorkflowCoordinator object runs the **SetupDNS** subflow once to configure the load balancer.

```javascript
var coordinator = WorkflowCoordinator.load("Provision Nodes");
var coord2 = new WorkflowCoordinator(
    workflow: 'Add Node to Load Balancer'
);
for (var i = 0; i < coordinator.getNumFlows(); i++) {
    var ip = coordinator.getInput(i).ip;
    var port = coordinator.getOutput(i);
    coord2.add(
        ip: ip,
        port: port
    );
}
var loadBalancerIP = "10.0.20.10";
coord2.add( (ip: loadBalancerIP, hostname: "www.snow1.net", 'SetupDNS');
coord2;
```

![Figure 903: Specifying which subflows to run](image)

Subflows and the Create Task activity

If a workflow contains a **Create Task** activity that has executed on the current record, additional task activities in the workflow might not execute as expected. This can happen when the same subflow containing a **Create Task** activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the **Create Task** activity again, the system reopens the first task activity instead and does not create an additional task.

---

**Note:** An alternative to creating duplicate subflows that use the **Create Task** activity is to add a **Run Script** activity to the workflow that creates a task with a script.
Figure 904: The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Figure 905: Running different subflows containing the Create Task activity

View workflow activity descriptions

Tooltips are available for workflow activities to help you understand how to use each activity.

1. To view an activity description in the workflow editor, point to the icon for the activity in the palette.
To modify activity descriptions, navigate to **Workflow > Administration > Activity Definitions** and edit the **Description** field.

**Note:** To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the **Activity Properties** window.

**Elements in workflow activity definitions**

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See **Workflow activities** on page 3676 for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.
Table 1335: Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible activity.result value. The activity result usually determines which condition the activity transitions through.</td>
</tr>
<tr>
<td>Scratchpad entries</td>
<td>Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See Activity variables on page 3563 for more information.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

   The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

   If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
Figure 906: Unavailable activities and approval engines

3. Create any additional conditions needed for the activity and ensure that all exits are connected.

4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

**Note:** All activity descriptions have a Table value. If this value is Global, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.
Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity. All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

Note:
Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
     - Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.
3. To remove a transition, click to highlight it, and then press **Delete**.

### Custom activity transitions

Controls on the **Approval - User** activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of **Approved** or **Rejected**.

Transitions defined using this method do not become a permanent feature of the **Approval - User** activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

### Manage workflow activity conditions

Activities contain default conditions that determine which transitions are followed.

For example, the **Approval - User** activity has two conditions, **Approved** and **Rejected**.

---

**Figure 908: Example of activity conditions**
You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

1. Right-click the activity and select **Add Condition** from the context menu.
2. In the **New Workflow Condition** dialog box, fill in the fields as appropriate (see table).

Table 1336: New Workflow Conditions form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>• <strong>current</strong>: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>• <strong>activity.result</strong>: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>• <strong>activity</strong>: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>activity.vars</strong>: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the <strong>Generate activity</strong> does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select **Reorder Conditions**.
   A dialog box appears, with a list of the available conditions.
5. Drag the conditions to a new position in the list.
6. Click OK.

**Activity result value**

The result value specified by an activity controls the condition through which the activity transitions. Use the result value as part of the Condition field in the activity. For example, if the Condition field of an Approval - User activity contains `activity.result == 'rejected'`, the activity transitions through that condition when a rejection is received from the approver. Result values are set in the Script field of the activity definition.

**Duplicate a workflow activity**

You can duplicate an activity used in a workflow, including all the configured properties.

1. Right-click the activity and select Copy Activity from the context menu.
   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add transitions.
Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activities are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals on page 451.

![Figure 910: Unavailable approval activities]

To turn approval engines off for the table, navigate to the System Properties > Approval Engines and change the setting for the table to Turn engines off.
**Figure 911: Turn off approval engines**

Correct a skipped approval workflow activity

While a workflow is in an active context, an approval activity can skip to the next activity.
An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a *dot-walked* field, such as `current.opened_by.department.manager`, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

1. Navigate to **Workflow** > **Live Workflows** > **All Contexts**.
2. Click the date and time in the **Started** column for the workflow that is incorrectly processing approval activities.
3. In **Related Links**, click **Show Workflow**.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see *Debugging Business Rules* on page 3839.
   - Point to each processed approval activity to find activities where the **State** is **Finished** and **Result** is **Skipped**.
5. Navigate to **Workflow** > **Workflow Editor** and open the workflow.
6. Double-click the skipped approval activity.
7. Click **Users** or **Groups**.
8. Assign an active user or group for the approval activity. For more information, see *Workflow error handling* on page 3664.

**Rollback To workflow activity**

When conditions in a workflow triggers a **Rollback To** activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to **Not Requested**.
- Tasks are reset to either **Open** or **Pending**. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The **Rollback To** activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Rollback To workflow activity behavior**

The **Rollback To** workflow activity transitions directly to the activity specified by the transition line arrow.

Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin

(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the **Workflow Transition History** related list and look at the **Rolled back** column.

The **Rollback To** activity (7) updates the following activities:

- (8) Task 1: reset to **Open**
- (9) Task 2: reset to **Pending**
- (10) Approval 1: reset to **Not Yet Requested**
Using variables in Notify workflow activities

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

Table 1337:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Activity</td>
<td>Notes</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------</td>
</tr>
<tr>
<td>Input</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Play</td>
<td>Supports variable substitution in the URL field only.</td>
</tr>
<tr>
<td>Forward call</td>
<td>Supports variable substitution in the Phone number field only.</td>
</tr>
</tbody>
</table>

**Scratchpad variables**

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax `${variable_name}`. You do not need to include either workflow.scratchpad or activity.scratchpad before the variable name. For example, to use the variable `activity.scratchpad.langCode = 'en-US'`, call `${langCode}` within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format `${object.value}`. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name: 'john.smith'}` by calling `${user.name}`.

**The digit variable**

The **Input** activity exposes the `${digit}` variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

**Use multiple timer activities in one workflow**

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:

- workflow.scratchpad.endTime
- workflow.scratchpad.realStartTime
- workflow.scratchpad.retroactiveSecsLeft

**Publish a custom workflow activity**

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks Publish, which makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click Checkout. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out
activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the workflow editor palette.

**Note:** Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.

---

**Locked versions**

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the workflow editor, selects the checked-out version, and selects **Force Checkout**, and then **Publish**.

---

**Timeline Visualizations**

A timeline visualization is a representation of an organization's activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties: a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.

Activating timeline visualizations adds the predefined CIO Roadmap timeline visualization, which shows your organization's projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.

---

**Activating Timeline Visualization**

An administrator can activate the Timeline Visualization plugin to access the functionality. The Project Management plugin is activated if it is not already active.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
3. Optional: If available, select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.
Create a Timeline Visualization

Timeline administrators set up timeline visualizations for the organization’s leaders by creating a timeline that provides visual representations of the organization's operational and strategic activities. Additionally, they create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.

- To create a timeline visualization, navigate to **Timeline Visualization > Create New** and create a new record (see table for field descriptions).
### Table 1338: Timeline visualization configuration form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
<tr>
<td>Panel table</td>
<td>Table that provides the records displayed as lanes and panels in the timeline.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the visualization.</td>
</tr>
<tr>
<td>Relationship field</td>
<td>Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field.</td>
</tr>
<tr>
<td>Show slider</td>
<td>Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.</td>
</tr>
<tr>
<td>Panel name</td>
<td>Field from the Panel table that contains the values displayed in the panel body.</td>
</tr>
<tr>
<td>Panel date</td>
<td>Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in 2D view. These dates also determine placement of panels on a lane. Only date and date-time fields are available on the choice list.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that sets (selected) or removes (cleared) the default status of a visualization when you have more than one defined for a specific table. Applications that include a visualization use the default visualization.</td>
</tr>
</tbody>
</table>
### Table 1339: Timeline visualization configuration filtering and sorting form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [Name] [is not] [IT] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [Name] [z to a].</td>
</tr>
<tr>
<td>Panel condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in 2D and 3D view visualizations. For example, if you set [State] [is one of] [Pending, Open, Work in Progress] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Label 1</td>
<td>Values to be color coded. The values available are determined by the <strong>Panel color key</strong> field. For example, the CIO Roadmap is based on the Project table and has the <strong>Panel color key</strong> set to the <strong>State</strong> field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the <strong>Default color</strong>.</td>
</tr>
<tr>
<td>Label 2</td>
<td></td>
</tr>
<tr>
<td>Label 3</td>
<td></td>
</tr>
<tr>
<td>Label 4</td>
<td></td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1</td>
<td>Colors that correspond to each of the <strong>Label</strong> field values. For example, if <strong>Label 1</strong> is the Pending state, and <strong>Color 1</strong> is red, then panels for projects in the pending state are red.</td>
</tr>
<tr>
<td>Color 2</td>
<td></td>
</tr>
<tr>
<td>Color 3</td>
<td></td>
</tr>
<tr>
<td>Color 4</td>
<td></td>
</tr>
</tbody>
</table>

Create a Timeline Visualization view

The Timeline Visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.

You can create one Timeline Visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

1. Navigate to **Incident > All**.
2. Open an incident.
3. Right-click the form header and select **Configure > Form Layout**.
4. Under **Form view and section**, go to the **View name** field and select **New**.
5. Enter **timeline visualization** in the **View name** field.
6. Click **OK** to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the **Available** and **Selected** columns.
8. Click **Save**.
Use Timeline Visualization

Timeline Visualization provide a high-level view of an organization’s strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application also installs the CIO Roadmap, a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.

Lanes

Lanes appear in 3D view only.

A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

Markers

Markers appear in 3D view only.

Markers are horizontal lines that cross all lanes and identify a transition to the next month.

Panels

A panel in 2D view always represents a single record, while panels in 3D view may represent one or more records.

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.

Figure 914: 3D panel

Figure 915: 2D panel

In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser's print option. In 3D view,
panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.

Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

To view additional information about a panel:

• Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
• Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

Personalize timeline visualizations

How to personalize timeline visualizations.

To personalize a timeline visualization, open the Settings pane and click Configure. Complete the form as appropriate (see table).
Table 1341: Timeline visualization personalization form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane conditions</td>
<td>* <strong>Condition builder</strong> used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [Name] [is not] [IT] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [Name] [z to a].</td>
</tr>
</tbody>
</table>

Figure 916: Visualization personalization
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in the visualization. For example, if you set [State] [is one of] [Pending, Open, Work in Progress] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>
| Panel color key     | Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form.  

The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped.  

Examples of other fields that are suitable for this selection include Priority, Risk, and Approval. |
| Label 1          | Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped.  

You can set specific colors for up to four values from the selected field. Other values are shown in the Default color. |
| Label 2          | |
| Label 3          | |
| Label 4          | |
| Default color    | Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color. |
| Color 1          | Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red. |
| Color 2          | |
| Color 3          | |
| Color 4          | |

**Note:**

If the **Max items per lane** field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.
Settings pane

The Settings pane appears in both the 2D and 3D views.

Element names in the Settings pane vary based on the table and fields used to create the visualization.

Figure 917: CIO roadmap settings pane

The Settings pane contains the following elements:
### Table 1342: Settings pane elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
<tr>
<td>View <code>&lt;table&gt;</code> List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a Show all <code>&lt;records&gt;</code> button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

### Timeline visualization components

The components that appear in a timeline visualization depend on whether you are viewing it in 2D or 3D view.

Components can include **panels**, **lanes**, **markers**, and the **Settings pane**.
Figure 918: CIO roadmap 2D
Use the slider and slider track

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

---

**Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.

Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a
large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.

View timeline visualization

How to view the CIO Roadmap timeline visualization.

1. Navigate to Project > Projects > All.
2. Scroll to the bottom of the list and click the Timeline Visualization related link.

By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click All. If a timeline visualization exists for the application's table, a Timeline Visualization related link appears.

Work with timeline visualizations

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

Table 1343: 2D views

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

Table 1344: Navigating stacked panels

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the stack up or down to view other panels.</td>
</tr>
</tbody>
</table>
The following options are available for navigating in 3D view.

Table 1345: 3D view

<table>
<thead>
<tr>
<th>Option</th>

</tr>
</thead>
<tbody>
<tr>
<td>Up and down navigation arrows</td>
<td>Click the arrows in a stack to view additional panels for the same month. Arrows do not appear if there are no additional panels to view.</td>
</tr>
</tbody>
</table>

Timeline visualizations key terms

Key Terms

- Lane: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.
- Panel: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.
- Summary view: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.
- Marker: A bar indicating the start of a month in a 3D timeline visualization.
- Slider: A tool used to control the time period seen in a 3D visualization.
- Slider track: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.
Figure 920: CIO Roadmap 2d
Planning Your Timeline Visualization

Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.

Timeline visualizations roles

The following roles can access timeline visualizations.

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline administrator [timeline_admin]</td>
<td>Create and edit timeline visualization pages and view timeline visualizations.</td>
</tr>
</tbody>
</table>
### Timeline User

**Description:**
View timeline visualizations. Timeline user access is also granted to users with the `project_manager` and `project_user` roles.

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline user [timeline_user]</td>
<td>View timeline visualizations. Timeline user access is also granted to users with the <code>project_manager</code> and <code>project_user</code> roles.</td>
</tr>
</tbody>
</table>

---

## Installed with Timeline Visualizations

The following components are installed with timeline visualizations:

- Tables
- Plugins
- UI Policies
- Script Includes
- Client Scripts
- Business Rules

Demo data is available with timeline visualization.

### Tables

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization [roadmap_page]</td>
<td>Stores all available timeline visualizations.</td>
</tr>
<tr>
<td>Personalize Timeline [roadmap_user_page]</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>

### Plugins

Timeline visualization activates the following plugin, if it is not already active.

<table>
<thead>
<tr>
<th>Plugin Name</th>
<th>Plugin ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Management</td>
<td>com.snc.project_management_v3</td>
<td>Tools that aid in planning, organizing, and managing projects by applying basic task management processes.</td>
</tr>
</tbody>
</table>

### UI Policies

Timeline visualization adds the following UI policy.
### Script Includes

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization [roadmap_page] table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
<tr>
<td>RoadmapUtil</td>
<td>API to generate data for lanes and panels.</td>
</tr>
</tbody>
</table>

### Client Scripts

Timeline visualization adds the following client scripts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Allows changing the color fields for the item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Allows changing the field name for item_color_key whenever there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>
Business Rules

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Checks if another visualization is already set as default when user sets a new visualization as the default.</td>
</tr>
</tbody>
</table>

Self-service

The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

Service catalog requests

This page contains links to content on service catalog requests.

Add new request items

Use ServiceNow's web-based interface to add new items to a request.

Only an administrator or a user with the catalog_admin role can add a new item to a submitted request. Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog > Open Records > Requests and open an existing request.
2. Click Add New Item.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click OK.

Amazon EC2 instance request from the Service Catalog

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

Request an instance

1. Navigate to Self-Service > Service Catalog.
2. Select Amazon EC2 Instance from the Request Application Infrastructure category.
3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.
   See the specifications for Large and Small instances in Amazon EC2 Instance Types.
4. Type a reason for the request.
5. Click **Order Now** to order the instance.

The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.
Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

**Terminate an instance**

1. Navigate to Service Catalog > Routine Changes > Terminate Amazon EC2 Instance.
   
   A list appears displaying the instances that are assigned to you.
2. Select an instance from the list and click Order.
   
   This list does not support multi-line selection, and there is no undo feature.

**Check-out redirect property**

A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to false, which redirects the view to the Order Status form when the requester clicks Order Now. When this property is set to true, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in Cloud Management > Administration > Properties.

**Delete request items**

Use ServiceNow's web-based interface to delete items from a request.

All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog > Open Records > Requests and open an existing request.
2. In the Requested Items related list, select the check box beside the item to delete.
3. In the Actions choice list, select Delete.
ServiceNow recalculates the price and delivery date for the order.

Place a request

Use ServiceNow's web-based interface for ordering predefined goods and services.

1. Navigate to **Self-Service > Service Catalog**.

   The default catalog view organizes items in categories and subcategories.

2. Select an item to order.

   **Note**: Some items are order guides, which combine related items for easier ordering. For example, an order guide called **New Employee Hire** presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

   The order screen requests any additional information that's needed, such as the requester's name or location and the date the item is needed. It also displays the item's delivery time after approval.
3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click **Order Now** when the order is complete.
   ServiceNow displays a confirmation screen for your order:
You can view the order's progress in the **Stage** column.

### Note:
It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

### Self-Service HR portal

From the Self-Service HR Portal, you can get HR benefit and policy information, and request help from the HR team.
Figure 922: HR Portal
From the HR Portal, you can take the following actions.

- Search for HR knowledge articles that answer your questions. As you type, articles are suggested based on keywords.
- Open your HR profile from the link under My Stuff. You can update fields that are not disabled in your HR profile.
- View your HR requests, approvals (if you are an approver), and organization chart.
- Submit HR questions and requests that are not answered in HR knowledge articles.
- Open a chat window with an HR specialist. An administrator must enable the HR chat queue for the link to appear.
- Send an email to HR to create your request.

Note: The HR Portal page does not work in Microsoft Internet Explorer 8. Use the HR Catalog module to submit an HR case.

Submit a request from the HR Portal

You can open the HR Portal to submit questions and request help from the HR team.

There are three types of HR requests in the Get Help list on the HR Portal.

**Ask a benefit question**
Use this link when you have a question about your organization's benefits or policies. There are a number of predefined topics, such as 401K or retirement, or you can ask a general question.

**Make a request**
Use this link when action is needed, such as changing your HR profile information or requesting a leave of absence.

**Change employee status**
Use this link for onboarding new employees or offboarding employees who are leaving the organization. Typically, HR managers request employee status changes. Employees who do not have authority to create employee status change requests see a blank page.

1. Navigate to Self-Service > HR Portal.
2. Under Get Help, select the type of request to submit.
3. Select the item to request.
   The Short description is filled out, and a list of related knowledge articles based on keywords in the text appears below the text field where you enter additional information, such as your question.
4. Review the knowledge articles that appear, and if your question or request is resolved, exit the form. Otherwise, continue with the remaining steps.
5. Answer the questions in the request form.
   Questions vary depending on the item selected. Mandatory fields have a red asterisk (*) beside them.
6. Click Submit.
   The page refreshes to display your open HR cases. A link to the case appears at the top of the page, and, if the case was automatically assigned, a message tells you who the case was assigned to.

Submit a case from the HR catalog

You can submit HR cases from the HR catalog.

1. Navigate to Self-Service > HR Catalog.
2. Select the appropriate category and item.
3. Answer the questions in the request form.
   Questions vary depending on the item selected. Mandatory fields have a red asterisk (*) beside them.

4. Click **Submit**.
   The case is submitted to HR for processing. A link to the case appears at the top of the page, and, if
   the case was automatically assigned, a message tells you who the case was assigned to.

View your open HR cases

You can view your open HR cases from the HR Portal.

1. Navigate to **Self-Service > HR Portal**.
   You can also navigate to **Self-Service > My Requests**, however, the list that appears contains all of
   your open requests, not just HR cases.

2. Click **My open cases** under **My Stuff**.

3. Click the case number to see its details.
   Based on keywords in the **Short description** field, a list of knowledge articles may appear below the
   activity section. Review the articles for a resolution to your question or request.

4. Optional: Enter comments or change the priority if necessary.

5. Optional: To view your manager in a hierarchy, scroll to **Related Links** and click **Show employee org chart**.
   Click the back arrow on the upper left to return to the case.

6. If you made changes, click **Update**.

View request status

Use ServiceNow's web-based interface to view the status of a request.

1. Navigate to **Self-Service > Requested Items**.

2. Click your order number to view details.

3. View the order's progress in the **Stage** field.

Customize homepages

If you are assigned at least one role in the system, you can create a customized homepage that you can
see when you log in.

The content on your homepage comes from a variety of sources, such as graphs and charts generated
from a report, application modules, a service catalog category, the scrolling news widget, which is the
News knowledge category.

1. Navigate to **Self-Service > Homepage**.

2. Add any item to the homepage by clicking the add content icon ( ) or the **Add content** link at
   the top.
   A window will open that lets you select from a number of different homepage items you can add.
   Some items pertain to specific features and applications, such as CMS content blocks and the Work
   Management dispatch map. So the list of items varies depending on what is active on your system.

3. Reposition elements on your homepage by dragging and dropping them to a new location.

4. To remove a homepage item, click the [X] on the right side of the item's header.
Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

1. Click the **Delete page** link at the bottom of the homepage.

2. Click **Ok** to confirm the deletion.

How Help the Help Desk identifies devices

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found.

These queries attempt to match devices using the three criteria listed here, in this order. Updates to an existing CI require only a single match as the list is evaluated. For example, if a device's name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the cmdb_ci_computer table#
- MAC address in the cmdb_ci_network_adapter table
- Computer name in the cmdb_ci_computer table

**Note:** Discovery Identifiers are incompatible with Help the Help Desk queries.

Script Include

The script include **CIIdentifierForHelpDesk** provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. *Do not* modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Running Help the Help Desk

Help the Help Desk is a tool that enables users to populate the CMDB automatically with information about their Windows computer. Help the Help Desk is a small Web application that downloads and runs locally, using a login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more.
To detect all system software successfully on a 64-bit machine, make sure to run the Help the Help Desk script from a 64-bit browser. A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

1. On your instance, navigate to **Self Service > Help the Help Desk**.
2. Click **Start the Scan to Help the Help Desk**.
   
   You are prompted to run or save the `discovery.hta` script.
3. If your browser is Internet Explorer, run the script. If you are using any other browser, click **Save** and save the script to the local machine.
4. To execute the saved script, double click the file.
   
   The script runs a series of WMI queries to gather information about the Windows machine. When it is done, the data is sent back to your ServiceNow instance and used to populate the configuration database (CMDB).

### Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals and tasks assigned or sent to you, and to receive copies of all email notifications sent to you.

**Note:** Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

**Note:** Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications.

### Add the Delegates Related List to a user profile

By default, the delegates related list is hidden from the User Profile form. An administrator or a user with the personalize_form role must add the delegates related list to the User Profile form.

1. Navigate to **Self Service > My Profile**.
2. Configure the form and add the **Delegates->User** related list.

<table>
<thead>
<tr>
<th>Delegate related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delegates-&gt;Delegates</td>
<td>Shows a list of users for whom the current user is a delegate. For example, if the current user is the ITIL User, the list shows users where Delegate = ITIL User.</td>
</tr>
<tr>
<td>Delegates-&gt;User</td>
<td>Shows a list of users who are delegates of the current user. For example, if the current user is the ITIL Admin, the list shows delegates where User = ITIL Admin.</td>
</tr>
</tbody>
</table>

### Delegate approvals and tasks to another user

If a user is out of the office, s/he can delegate responsibilities to other users for a period of time.

1. Navigate to **Self Service > My Profile**.
2. In the **Delegates** related list, click **New**.

3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the check boxes. You can delegate:
   - Approvals: The delegate can approve items on your behalf.
   - Assignments: The delegate can view and work on tasks assigned to you.
   - CC Notifications: The delegate receives a copy of email notifications sent to you, except those marked Meeting Invitation.
   - Meeting Invitations: The delegate receives a copy of email notifications sent of the type Meeting Invitation.

If the list is not visible, configure the form to add the **Delegate->User** related list.
Note: You must select an active user as your delegate. The instance only delegates to active users.

A sample delegation looks like this:

![Delegate view](image)

Note: If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see "Incident assigned to you" emails, so make sure they know they are a delegate.

Scripts

Use scripts to extend your instance beyond standard configurations. With scripts, you may automate processes, add functionality, integrate your instance with an outside application and more.

APIs (Application Programming Interfaces) provide classes and methods that you can use in scripts to define functionality. ServiceNow provides APIs as JavaScript classes, web services, and other points of connection for integrations. Note that you cannot access commonly used JavaScript objects (such as DOM or Window). Jelly scripts are also used in some modules. Jelly is used to turn XML into HTML and may include both client-side and server-side scripts.

Scripts may be server-side (run on the server or database), client-side (run in the user's browser) or on the MID server.

A variety of classes are available for use in scripts. The classes are grouped by those used for Client scripts on page 3900, REST APIs, global server scripts, and scoped server scripts. For detailed information on the classes and methods available, see the developer portal.

Note: When you are writing scripts, you cannot use reserved words.

It is recommended that you be familiar with JavaScript coding before you begin customizing your instance, and with Jelly if you intend to deploy Jelly scripts. The following topics provide general information, procedures, and contexts for scripting in the platform.

- Glide class overview on page 3953
- Syntax editor on page 3816
- Execution order of scripts and engines on page 470
When developing scripts for scoped applications, you must use the scoped APIs, which include scoped versions of the Glide APIs. The scoped Glide APIs do not provide all the methods included in the global Glide APIs, and you cannot call a global Glide API in a scoped application.

Script functions

Scripts can be used in many places. The most important detail is whether the script runs on the client or the server.

<table>
<thead>
<tr>
<th>Script</th>
<th>Function</th>
<th>Runs on</th>
</tr>
</thead>
</table>
| Access Control | Determines whether access will be granted for a specified operation to a specific entity.  
                  | - type of entity being secured  
                  | - operation being secured  
                  | - unique identifier describing the object  
                  | Can be defined by roles, conditional expressions or scripts.  | server - script and any condition run on the server |
| Ajax Scripts  | Enables the client to get data from the server to dynamically incorporate into a page without reloading the whole page.  
                  | - Ajax Client Scripts request that information be returned, or that action be taken, or sometimes both  
                  | - Ajax Server Scripts fulfill Ajax Client Script requests  | client - Ajax Client Scripts run on the client  
<pre><code>              |                                                              | server - Ajax Server Scripts run on the server |
</code></pre>

| UI Policies | Defines the behavior and visibility of fields on a form.                 | • client - scripts in the "execute if true" field or "execute if false" field run on the client  
• server - all conditions run on the server |
|             | • mandatory                                                               |                                                                         |
|             | • visible                                                                 |                                                                         |
|             | • read only                                                               |                                                                         |
|             | Use UI Policies rather than client scripts whenever possible.             |                                                                         |
|             | • UI Policies are always attached to one table                            |                                                                         |
|             | • UI Policies often have a condition which must be true in order for them to run |                                                                         |
| UI Properties | Designates what the instance will look like.                           | • server - properties set on the server  
• client - the results get rendered on the client  
no scripts |
| UI Scripts | Contains client scripts stored for re-use. Only used when called from other scripts.  
Not recommended for use. | client |
| Validation Scripts | Validates that values are in a specified format.                      | client |
|             | For example, a validation script can verify that the only value allowed in a specific field is an integer. | |
| Workflow Editor | Used to create or change a workflow. Scripts can be run at any point in a workflow, or different scripts can be run at different points.  
Scripts also can be found inside every workflow activity and can be modified (although do so with extreme caution). | server - script and any conditions run on the server |
Execution order of scripts and engines

Scripts, assignment rules, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

**Note:** Client-based code that executes in the browser, using Ajax or running as Javascript, will always execute before the form submission to the server.

The order of execution is as follows:

1. _Before_ business rules: Scripts configured to execute before the database operation with an order less than 1000.
2. _Before_ engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)
3. _Before_ business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The data base operation (insert, update, delete).
5. _After_ business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. _After_ engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. _After_ business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.
Scripting of field types

Table 1348: Scripting of field types

<table>
<thead>
<tr>
<th>Type</th>
<th>Evaluates to in script</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The string</td>
<td>&quot;dog&quot; &gt; &quot;dog&quot;</td>
</tr>
<tr>
<td>Decimal</td>
<td>A number with up to two decimal points</td>
<td>12.34 &gt; 12.34</td>
</tr>
<tr>
<td>Integer</td>
<td>A number with zero decimal points</td>
<td>12 &gt; 12</td>
</tr>
<tr>
<td>True / False</td>
<td>true or false</td>
<td></td>
</tr>
<tr>
<td>Date</td>
<td>A date formatted as yyyy-mm-dd</td>
<td>2008-11-04</td>
</tr>
<tr>
<td>Date-time</td>
<td>A day and time formatted as yyyy-mm-dd hh:mm:ss</td>
<td>2008-11-04 06:46:20</td>
</tr>
<tr>
<td>Duration</td>
<td>A date that is equal to January 1st 1970 00:00:00 + the amount of time of the duration being stored</td>
<td><img src="image" alt="Duration Example" /></td>
</tr>
<tr>
<td>Choice</td>
<td>Returns the contents of the value field for the sys_choice record associated with that choice. See: Choice List for more information on returning the value associated with a particular item in a choice list.</td>
<td>&gt; &quot;2&quot; (Note that this value is is a string)</td>
</tr>
<tr>
<td>Journal</td>
<td>Returns a string of all entries made to that journal field. See Journal Fields for scripting of journal type fields</td>
<td>The web server is down &gt; The web server is down</td>
</tr>
</tbody>
</table>

Note: This date corresponds to the system time zone. If a different user time zone has been specified, the date and time value may appear different for that user.
Use business rules and client scripts to control field values

Implement both business rules and client scripts for a field to enable users to set record values properly using both forms and lists, and to see immediate changes to the values in forms as edits are made.

The problem with using only a client script or a business rule to control updates to a field is that fields can be changed on either a form or a list. Client scripts and UI policies run on forms only (client-side) and do not apply to list editing. Allowing list editing with client scripts running on fields in a form can result in incorrect data being saved to the record. For systems in which client scripts or UI policies apply to forms, either disable list editing or create appropriate business rules or access control to control the setting of values in the list editor. A side effect of this is that security measures implemented in client scripts are easy to circumvent. The user only needs to edit the field in a list.

Business rules on a form are not dynamic, the user must update the record for the change to be seen. This makes using client scripts the preferred method for controlling field values on forms.

When using both a business rule and client script to control field values, the update behavior is the same across the system. This means that updated values are not different depending on whether a list of form is used to make the change. This means that the same functionality must be implemented twice, once in a client script and once in a business rule or access control.

**Example 1**

An organization has a client script that sets the email address for a user to `first.last@company.com`. The administrator likes this because he can see the email address immediately when he enters the user's information. The administrator then performs a bulk import of users from a spreadsheet containing the users' first and last names. His expectation is that each user's email address will be set automatically, as they are when he edits the form. Since the client script runs only on the form (the interface to the record), it has no effect on data imported into the record from outside that interface, and no email addresses are created. To solve this problem, the administrator implements a business rule that runs when the import occurs and creates the email addresses.
Example 2

An organization wants to hide the **Priority** field on an incident form if the assignment group is Development. They create a UI policy on the incident form to do this, but their users can still see and edit the **Priority** field using the list editor. To rectify this, apply an access control to prevent read access to the **Priority** field when the assignment group is Development.

Using NULL as a field value

The string **NULL** has a particular role in scripts and is a reserved word.

A string containing the term **NULL** should not be used as a field value in import set **transform maps** or anywhere in the **First name** or **Last name** fields. The reserved word is **NULL** in all capital letters. A field with the value **Null** or **null**, for example, is acceptable. **NULL** should only be used to clear out a particular field.

Set a duration field value

Some examples of JavaScript that can be used to set the value of a duration field.

**Note:** Negative duration values are not supported.

The `dateDiff()` method

The **dateDiff(start, end, false)** method in **GlideSystem** enables you to set the duration value using a given start date/time and end date/time. An example to set the duration for the time a task was opened would be:

```
current.calendar_duration = gs.dateDiff(current.opened_at.getDisplayValue(), current.closed_at.getDisplayValue(), false);
```

The boolean value at the end of the call indicates the type of duration value to return:

- **false** = return the duration value
- **true** = return the difference between the two times in seconds; returned as a character or string value.

If you want to work with the value returned as a number to be used in date or duration aritmetic then use code similar to the following to convert the string value returned to a millisecond value:

```
var time = gs.dateDiff(<start_field>.getDisplayValue(), gs.nowDateTime(), true);
time = parseFloat(time) * 1000;
```

If you wanted to set a duration to the amount of time between some event and NOW, the code would be:

```
<duration_field> = gs.dateDiff(<start_field>.getDisplayValue(), gs.nowDateTime(), false);
```

The time values presented to `dateDiff()` are expected to be in the user's timezone and in the user's format. For any date or date/time field in the SNC database, use `getDisplayValue()` in GlideRecord to properly format the data.

If you want to do your own calculations and set the value of a duration field the best way would be to use `setDisplayValue()` to set the value for the field. For a duration field, `setDisplayValue()` expects a character string value with a format of **ddd hh:mm:ss** where **ddd** is the number of days for the duration.
For example, to set the duration field called \textit{u\_time\_to\_assign} in the current record to a value of 3 days 4 hours 30 minutes and 14 seconds you would:

\begin{verbatim}
current.u_time_to_assign.setDisplayValue('3 04:30:14');
\end{verbatim}

**Setting a default value of a duration field**

Setting the default value for a duration field is similar to the method used above.

**Setting the value of a duration field in a client script**

This script sets a duration field value in a client script. Replace \textit{u\_test\_duration} with the field name from your instance.

\begin{verbatim}
g_form.setValue('<duration_field>','11 01:02:03');
\end{verbatim}

**Calculating a duration and setting that value using a client script**

Here's an example of how to use the \texttt{gs.dateDiff} function to return a value and populate it using a client script. Create an \texttt{onChange} client script that includes the following code. You can modify this script if you need the calculation to happen in an \texttt{onLoad} script or some other way.

\begin{verbatim}
function onChange(control, oldValue, newValue, isLoading)
{var strt = g_form.getValue('<start_field>');var end =
 g_form.getValue('<end_field>');var ajax =new GlideAjax('AjaxDurCalc');
 ajax.addParam('sysparm_name','durCalc');
 ajax.addParam('sysparm_strt',strt);
 ajax.addParam('sysparm_end',end);
 ajax/XMLWait();var answer = ajax.getAnswer();
g_form.setValue('<duration_field>', answer);}
--Create a system script include file called \texttt{AjaxDurCalc} that handles the request. It may be reused for other functions as well.

var AjaxDurCalc =Class.create();
AjaxDurCalc.prototype= Object.extendsObject(AbstractAjaxProcessor,{
durCalc:function(){return
 gs.dateDiff(this.getParameter('sysparm_strt'),this.getParameter('sysparm_end'),false);}})
\end{verbatim}

**Changing the Duration Field Value**

If you manipulate a duration value with addition/subtraction of some amount of time then you can use the functions that allow you to get and set the numeric value of the duration. A unit of measure for a duration numeric value is milliseconds. Below is an example that adds 11 seconds the \textit{duration} field in the current record.

\begin{verbatim}
var timems = current.duration.dateNumericValue();
timems = timems + 11*1000;
current.duration.setDateNumericValue(timems);
\end{verbatim}
Format the Resolve Time

To format the Resolve Time or the Business Resolve Time fields as durations, which displays them as a duration instead of a large integer, add the following attribute to those fields:

```
format=glide_duration
```

Modify the dictionary entry for the field and add the attribute. If there is already an attribute there, multiple attributes must be separated by commas.

Set the Maximum Unit of Measurement

The `max_unit` dictionary attribute defines the maximum unit of time used in a duration. For example, if `max_unit=minutes`, a duration of 3 hours 5 minutes 15 seconds displays as 185 minutes 15 seconds. To set the maximum unit of duration measurement add the following dictionary attribute to the `duration` field:

```
max_unit=<unit>
```

Using regular expressions in scripts

Starting with Eureka Patch 5, an enhanced regex engine replaced the native JavaScript regex engine. JavaScript regular expressions automatically use the enhanced regex engine, which provides improved performance and supports all behaviors of standard regular expressions as defined by Mozilla JavaScript. The enhanced regex engine continues to support using Java syntax in regular expressions.

The `SNC.Regex` API is not available for scoped applications. When moving from Eureka Patch 4 and earlier versions, you should change your scripts to remove the `SNC.Regex` API and use standard JavaScript regular expressions.

For more information on JavaScript regular expressions, see the Mozilla JavaScript documentation on regular expressions and `RegExp`.

Using Java syntax in JavaScript regular expressions

The enhanced regex engine includes an additional flag to allow Java syntax to be used in JavaScript regular expressions.

Regular expressions with the additional flag work in all places that expect a regular expression, such as `String.prototype.split` and `String.prototype.replace`. To use Java syntax in a regular expression, use the Java inline flag `j`, for example `/(?ims)ex(am)ple/j`
### Table 1349: Extended regular expression flags

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>j</td>
<td>Defines a regular expression that executes using the Java regular expression engine. It can be used to access Java-only features of regular expressions (such as look behind, negative look behind) or to use Java regular expressions without translating them into JavaScript regular expressions. For example: [\text{var _regex = /ex(\text{am})ple/j;}]</td>
</tr>
</tbody>
</table>

#### Convert SNC Regex expressions to enhanced regex expressions

When you upgrade to Eureka Patch 5 or later releases, you should convert scripts that use the SNC.Regex API to use regular JavaScript expressions.

1. From the original expression, such as: \(\text{SNC.Regex("/expr/is")};\), create a new regular expression object using the pattern with the slashes stripped.

   ```javascript
   new RegExp('expr');
   ```

2. Move the `SNC.Regex` flags to the start of the expression using Java’s inline flag special construct.

   ```javascript
   new RegExp('(\text{is})expr');
   ```

3. Add the `j` flag to the `RegExp` to tell the engine to treat the expression as a Java expression.

   ```javascript
   new RegExp('(\text{is})expr', 'j');
   ```

   **Note:** If you know that the script being converted does not use Java syntax, it is not necessary to use the `j` flag.

4. Add the `g` flag to handle multiple matches or a global replace.

   ```javascript
   new RegExp('(\text{is})expr', 'jg');
   ```

#### Using SNC.Regex

```javascript
var r = new SNC.Regex('/world/');
var str = 'helloworld';
var replaced = r.replaceAll(str, 'there');
// replaced == 'hellothere'
```

#### Using a JavaScript regular expression

```javascript
var r = new RegExp('world', 'jg');
var str = 'helloworld';
var replaced = str.replace(r, 'there');
// replaced == 'hellothere'
```
Syntax editor

The syntax editor provides support for editing JavaScript scripts.

The syntax editor has these features.

- JavaScript syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes
- JavaScript support
- Script macros for common code shortcuts

This feature requires the Syntax editor plugin.

Figure 923: JavaScript editor

Context-sensitive API help

The syntax editor can display context-sensitive API information.

Context-sensitive help includes the ability to:

- List script elements that are valid at the cursor's location. The system displays suggestions in a pop-up window.
- Add a selected script element at the cursor's location. If the cursor is within or adjacent to a partial entry, the system completes the entry with the selected script element.
- View API documentation for a selected suggestion.
- View the expected parameters and format of the current script element.

If the cursor is adjacent to a text string, the system searches for script elements that start with this text string. For example, while the cursor is within or adjacent to the string GlideR, the system displays script elements such as:

- GlideRecord
- GlideRecordSecure
Context-sensitive suggestions are based on script type. For example, when working on a business rule, only suggestions from the server API and objects such as current and previous display. When working on a client script, the system only displays suggestions from the client API.

Syntax editor JavaScript support

The syntax editor provides editing functions to support editing JavaScript scripts.

**JavaScript editing functions**

<table>
<thead>
<tr>
<th>Icon</th>

### JavaScript editing tips

- To fold a code block, click the minus sign beside the first line of the block. The minus sign only appears beside blocks that can be folded. To unfold the code block, click the plus sign.
- To insert a fixed space anywhere in your code, press Tab.
- To indent a single line of code, click in the leading white space of the line and then press Tab.
- To indent one or more lines of code, select the code and then press Tab. To decrease the indentation, press Shift + Tab.
- To remove one tab from the start of a line of code, click in the line and press Shift + Tab.

### JavaScript resources

Scripts use ECMA 262 standard JavaScript. Helpful resources include:

- Mozilla: [http://developer.mozilla.org/en/docs/Core_JavaScript_1.5_Reference](http://developer.mozilla.org/en/docs/Core_JavaScript_1.5_Reference)
- History and overview: [http://javascript.crockford.com/survey.html](http://javascript.crockford.com/survey.html)

### Syntax editor keyboard shortcuts and actions

The syntax editor offers keyboard shortcuts and actions to assist in writing code.

#### Table 1350: Syntax editor keyboard shortcuts and actions for writing code

<table>

</table>

1. In the **Script** field, type `help`.
2. Press Tab.

**Navigate to a line number**

When the syntax editor is disabled, users can navigate to a specific line in the code using the Go to line icon (⏏).

1. Click the Go to line icon (⏏). A text field appears.
   
   **Note:** This icon is not available when the editor is enabled.

2. Enter a number in the field and then press **Enter**.

**Script syntax error checking**

All script fields provide controls for checking the syntax for errors and for locating the error easily when one occurs. The script editor places the cursor at the site of a syntax error and lets you search for errors in scripts by line number.
The script editor notifies you of syntax errors in your scripts in the following situations.

- Save a new record or update an existing record. A banner appears at the bottom of the editor showing the location of the first error (line number and column number), and the cursor appears at the site of the error. Warnings presented at `Save` or `Update` show only one error at a time.

- Click the syntax checking icon before saving or updating a record. A banner appears at the bottom of the editor showing the location of all errors in the script, and the cursor appears at the site of the first error.
Figure 926: Script syntax error

Searching for errors by line

To locate the exact position of the error in a large script, click the Go to line icon.

This feature is particularly useful when you are encounter a syntax error in a log file rather than in the ServiceNow record itself. In this case, you can navigate to the record and search for errors by line number. In the dialog box that appears, enter the line number of an error, and then click OK. Your view moves to the site of the error, and the cursor marks the correct line and column.

**Note:** For this feature to function, you must disable the Syntax Editor.

Figure 927: Go to script error
Syntax editor macros

Script macros provide shortcuts for typing commonly used code. To insert macro text into a script field, enter the macro keyword followed by the Tab.

vargr

- **Description**: Inserts a standard GlideRecord query for a single value.
- **Output**:

```javascript
var gr = new GlideRecord('');
gr.addQuery('name', 'value');
gr.query();
if (gr.next()) {
    
}
```

vargror

- **Description**: Inserts a GlideRecord query for two values with an OR condition.
- **Output**:

```javascript
var gr = new GlideRecord('');
var qc = gr.addQuery('field', 'value1');
qc.addOrCondition('field', 'value2');
gr.query();
while (gr.next()) {
    
}
```

for

- **Description**: Inserts a standard recursive loop with an array.
- **Output**:

```javascript
for (var i=0; i< myArray.length; i++) {
    //myArray[i];
}
```

info

- **Description**: Inserts a GlideSystem information message.
• **Output:**

```javascript
gs.addInfoMessage("";
```

**method**

• **Description:** Inserts a blank JavaScript function template.

• **Output:**

```javascript
/

* Description:

* Parameters:

* Returns:

: function() {

},
```

**doc**

• **Description:** Inserts a comment block for describing a function or parameters.

• **Output:**

```javascript
/**

* Description:

* Parameters:

* Returns:

*/
```

---

**Script macro maintenance**

Administrators can define new script macros or modify existing script macros.

Role required: admin

Script macros provide shortcuts for typing commonly used code. Several script macros are available by default. Administrators can define new or modify existing script macros.

1. Navigate to **System Definition > Syntax Editor Macros.**
2. Click **New** or select the macro to edit.
3. Define the macro details with the fields listed in the table below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Macro keyword text users type to insert macro text.</td>
</tr>
<tr>
<td>Comments</td>
<td>Description of the macro. This text appears when the user types help.</td>
</tr>
</tbody>
</table>
Syntax editor plugin

Syntax editor plugin enables use of the syntax editor.

The syntax editor enables the following features for all script fields:

- JavaScript syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes
- Code editing functions
- Code syntax checking
- Script macros for common code shortcuts

![JavaScript syntax editor](image)

Figure 928: JavaScript syntax editor

The syntax editor can be disable/enable by modifying the glide.ui.javascript_editor property in the sys_properties.list. In addition, administrators can configure the syntax editor to show error and warning indicators next to a line of code that contains an error by modifying the glide.ui.syntax_editor.show_warnings_errors property. For information on the sys_properties.list, refer to Available system properties.

**Note:** Administrators can disable or enable the syntax editor for all users, regardless of user preference.

Session debug

Enable session debugging to display debugging messages in the user interface.
After being enabled, session debugging is active for the duration of the user session or until disabled. The system provides the following session debugging options.

**Table 1352: Session debug options**

<table>
<thead>
<tr>
<th>Debug option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable All</td>
<td>Displays all available debugging messages.</td>
</tr>
<tr>
<td>Disabled All</td>
<td>Stops displaying all debugging messages.</td>
</tr>
<tr>
<td>Debug Business Rule</td>
<td>Display debugging messages for business rules. If there are business rules from multiple applications affecting a table or record, the system displays which application the business rule comes from.</td>
</tr>
<tr>
<td>Debug Business Rule (Details)</td>
<td>Displays debugging messages for business rules and any changes made by business rules. If there are business rules from multiple applications affecting a table or record, the system displays which application the business rule comes from.</td>
</tr>
<tr>
<td>Debug Log</td>
<td>Displays all log entries.</td>
</tr>
<tr>
<td>Debug SQL</td>
<td>Displays debugging messages for SQL queries.</td>
</tr>
<tr>
<td>Debug SQL (Detailed)</td>
<td>Displays debugging messages for SQL statements and any changes made by SQL statements.</td>
</tr>
<tr>
<td>Debug Security</td>
<td>Displays debugging messages for access controls. If there are access controls from multiple applications affecting a table or record, the system displays which application the access controls come from.</td>
</tr>
<tr>
<td>Debug Escalations</td>
<td>Displays debugging messages for SLA and SLO escalations.</td>
</tr>
<tr>
<td>Debug Text Search</td>
<td>Displays debugging messages for search result relevance and indexing.</td>
</tr>
<tr>
<td>Debug UI Policies</td>
<td>Displays debugging messages for UI policies.</td>
</tr>
<tr>
<td>Disable UI Policies Debug</td>
<td>Stops displaying debugging messages for UI policies.</td>
</tr>
<tr>
<td>Debug Data Policies</td>
<td>Displays debugging messages for data policies.</td>
</tr>
<tr>
<td>Debug Quotas</td>
<td>Displays debugging messages for transaction quotas.</td>
</tr>
<tr>
<td>Debug Homepage Render</td>
<td>Displays debugging messages for homepages.</td>
</tr>
<tr>
<td>Debug Scopes</td>
<td>Displays debugging messages for entering or exiting application scopes when running script objects.</td>
</tr>
</tbody>
</table>
### Debugging applications

Application developers can display debug messages about configuration records to help them troubleshoot issues.

The system offers the following debugging options to help application developers determine how applications affect configuration records.

<table>
<thead>
<tr>
<th>Debugging option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug Business Rule</td>
<td>Use this module to determine which application's business rules are running against tables. The system only displays application information if business rules from different application scopes run on the same table.</td>
</tr>
<tr>
<td>Debug Business Rule (Details)</td>
<td>Use this module to determine the results of running business rules against tables. The system only displays application information if business rules from different application scopes run on the same table.</td>
</tr>
<tr>
<td>Debug Security</td>
<td>Use this module to determine which application's access controls apply to a given table or record.</td>
</tr>
<tr>
<td>Debug Scopes</td>
<td>Use this module to determine the application scope context in which a script runs. Since one script can call another script it is possible to have multiple application scope context changes while running a series of scripts.</td>
</tr>
<tr>
<td>Enable Session Debug</td>
<td>Use this related link to enable the generation of log messages for a particular application. Application scripts that use GlideSystem logging methods will generate output to the log at the indicated verbosity level.</td>
</tr>
</tbody>
</table>

When multiple applications contribute to the debug output, the system adds a new section called **Apps** to the display a list of the applications writing to the session log. Clicking on the check box next to the application name hides or displays the application's associated debug messages.
Figure 929: Sample application debug output of business rules

Debugging scopes

Application developers can use the **Debug Scopes** module to display information about when the system switches between custom applications to run server-side scripts.

When enabled, the system displays a message whenever the system switches to a custom application to run a server-side script.
Geneva    ServiceNow    ServiceNow Platform

Figure 930: Sample debug scopes output from the incident table

Every time the system runs a server-side script object it enters the script's scope context. When the script finishes running, the script exits the scope context. The debugging messages track changes to the script scope context.

The debugging message displays a greater than character > each time the system enters a script object's context, and displays a less than character < every time the system exits a script object's context. In cases where one script calls another the debugging message adds another greater than character to the path for each call. For example, if a business rule calls a script include, which in turn calls another script object there would three characters in the path such as:

```
> Entering scope [x_app_one]
>> Entering scope [x_app_two]
>>> Entering scope [x_app_three]
```

**Note:** The system does not display entering or exiting messages for script objects in the global scope.

Application developers may want to enable other debugging options to in conjunction with this option to see information about the possible source of the server-side script such as Debug Business Rule.

**Debugging Business Rules**

Debugging business rules can be achieved with resources available in the ServiceNow product.
1. Tools
The first step in the process is to identify tools which will help you figure out what’s wrong.

<table>
<thead>
<tr>
<th>Debugging Tool</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Dictionary</td>
<td>Navigate to System Definition &gt; Dictionary. The dictionary provides a list of</td>
</tr>
<tr>
<td></td>
<td>all tables within your instance and can be invaluable when trying to locate</td>
</tr>
<tr>
<td></td>
<td>information.</td>
</tr>
<tr>
<td>System Log</td>
<td>Navigate to System Logs &gt; System Log. You can place alert statements in your</td>
</tr>
<tr>
<td></td>
<td>business rule which can write information to the log.</td>
</tr>
<tr>
<td>Debug Business Rule (Details)</td>
<td>Navigate to System Diagnostics &gt; Debug Business Rule (Details). This debugg-</td>
</tr>
<tr>
<td></td>
<td>ing module displays the results business rules. Use this module to see if</td>
</tr>
<tr>
<td></td>
<td>conditions are being met and values are being set as expected.</td>
</tr>
<tr>
<td>Alert Messages</td>
<td>There are several system functions which will allow you to print messages to</td>
</tr>
<tr>
<td></td>
<td>the page, the field or the log file. See Scripting Alert, Info, and Error</td>
</tr>
<tr>
<td></td>
<td>Messages.</td>
</tr>
<tr>
<td>Business Rule Examples</td>
<td>Sometimes you can find what you’re looking for in scripts others have written,</td>
</tr>
<tr>
<td></td>
<td>including business rule error messages, or by building an OR query.</td>
</tr>
<tr>
<td>GlideRecord Information</td>
<td>This is the basic syntax used to query the database for information. See</td>
</tr>
<tr>
<td></td>
<td>Using GlideRecord to Query Tables. GlideRecord also includes Aggregation</td>
</tr>
<tr>
<td></td>
<td>Support.</td>
</tr>
</tbody>
</table>

2. Variables
The next step is to gain some insight into the behavior of your business rule. For every action except an insert you will more than likely use a query to get your record(s).

```javascript
var rec = new GlideRecord('incident');
rec.addQuery('active',true);
rec.query();
while (rec.next()) {
    gs.print(rec.number + ' exists');
}
```

To verify whether your query is actually returning records you can use `gs.addInfoMessage` to display information at the top of the screen.

```javascript
var rec = new GlideRecord('incident');
rec.addQuery('active',true);
rec.query();
gs.addInfoMessage("This is rec.next: " + rec.next());
while (rec.next()) {
    gs.print(rec.number + ' exists');
}
```
If your query returns no records you will see this:

```
This is rec.next: false
```

Use this technique to verify every variable within your business rule contains expected values.

Tip: If necessary, break your script down into individual pieces and verify each piece works separate from the whole and then put them all back together one step at a time.

3. Locating Information

The last step is to make sure you know where to find the information your rule is looking for.

In the ServiceNow application, one table can extend another table. This means when searching for information, you might need to query the parent table for the extended table’s sys_id to find what you seek.

Example A good example is the sc_task table, which extends the task table. The script below queries the extended table (sc_task) for the current sys_id and then query the parent table (task) for records with the matching sys_id, and then prints out the work notes field.

```javascript
var kids = new GlideRecord('sc_task');
kids.query();
gs.addInfoMessage("This is requested item number: " + current.number);
gs.print("This is the requested item number: " + current.number);

while (kids.next()) {
    var parents = new GlideRecord('task');
    parents.addQuery('sys_id', '=?', kids.sys_id);
    parents.query();

    while(parents.next()) {
        gs.addInfoMessage("This is task number: " + parents.number);
        gs.print("This is task number: " + parents.number);
        gs.addInfoMessage("These are the work notes: " + parents.work_notes);
        gs.print("These are the work notes: " + parents.work_notes);
    }
}
```

### Debugging classifications

You must add a system property to enable classification debugging.

#### Debugging classifications

The resulting log entries list the name of each classifier that runs, along with all the names and values that are available to the criteria in the classifier. To log debugging information about classifications, add the following system property:
<table>
<thead>
<tr>
<th>System Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.discovery.debug.classification</td>
<td>Enables debugging information for process classification.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default Value:</strong> false</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location:</strong> Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

Field Watcher

The Field Watcher tool tracks and displays all actions that the system performs on a selected form field. Administrators can use the field watcher to figure out what happens to the field and how the value of the field changes when an event such as the firing of a business rule or enforcement of a data policy, takes place. Administrators can also impersonate non-admin users to debug what happens when those users make changes on an instance. Only one field can be watched at a time. Non-admin users with the impersonator role have access to the field watcher feature.

How the Field Watcher Works

The Field Watcher tool logs activity when any of the following events occur on a field:

• The default value is set on the field.
• User access rights for the field change due to an ACL or dictionary setting.
• A data policy prevents the value from being set.
• A reference qualifier query of the field value executes.
• A UI policy changes a field to or from read-only, visible, mandatory, or editable.
• A dependent value in another field restricts field choices.
• The value of the field is set or changed based on:
  • Assignment rules
  • Actions from an engine, such as the workflow engine
  • Business rules
  • User entries
  • Client scripts
  • UI actions

**Note:** The field watcher works only on form fields. It cannot be used on list fields. Also, field watcher is not available on password-protected fields or encrypted fields.

Use Field Watcher

1. Navigate to the form for which you want to view field-level debugging information.
2. Activate Field Watcher by right-clicking any field label on a form and select **Watch - '<field name>'**.

The debug icon ( ![Debug Icon](debug_icon.png) ) appears next to the field label. From this point on, the Field Watcher records every action taken on the selected field. For example, if you are watching a Priority field, if the priority...
is changed from Moderate to Low and the record is updated, the Field Watcher will display information about that change.

3. View the Field Watcher log by clicking the debug icon. A new pane opens at the bottom of the screen, showing a Field Watcher tab. It may also show tabs for JavaScript Logging and JavaScript Debugger.

4. Click the Field Watcher tab, if needed.

5. Stop watching a field by right-clicking the field and selecting Unwatch - <field name>. To watch another field, right-click that field and select Watch - <field name>.

6. Clear the Field Watcher log by clicking the clear log button.

7. Resize the Field Watcher pane by dragging the splitter bar up or down. Dragging the splitter bar to the bottom of the screen closes the Field Watcher pane. Reopen the pane by clicking the debug icon again.

Field Watcher tab details

The Field Watcher displays field information and configuration options. The left-side of the Field Watcher tab shows the following information for the watched field.

- **Table**: table to which the field belongs.
- **Element**: field label.
- **Type**: type of data stored in the field.
- **Dependent**: field on which the current field depends.
- **Reference**: table from which the field’s value originates, if applicable.
- **Reference Qual**: reference qualifiers that may be restricting data on the field.
- **Attributes**: attributes on the field as specified in the dictionary entry for that field.

On the right-side of the Field Watcher tab, select the types of activity information you want to see for the selected field. Clear the check box for any type of information that is not needed.

**Viewing information for the watched field**

When information for a watched field is changed and the record is updated, the Field Watcher tab displays relevant information at the bottom.

### Figure 931: Field watcher viewing data

Field watcher information includes:

- **Timestamp**: time the field was changed using the HH:MM:SS (ms) format.
  - Orange text: server-side changes, such as ACLs.
  - Blue text: client-side changes, such as client scripts.

- **Type of object that changed the field and its associated name**: The type of item that changed on the field; for example, CLIENT SCRIPT, BUSINESS RULE, or ACL. In the case of scripts, business rules, or other configuration-type fields, field watcher displays the name of the script or business rule that changed the field, if any. Click the name to go directly to the record for that item.

- **Old and new values**: The old and new values for the field, if the value changed. Field watcher does not record the value if it was inserted in the form by default at the time the record was created.

- **Additional information**: Call tracing information, such as the name of the script engine or workflow that changed the field. Click the plus icon to expand the selection.
Watching a hidden field

Administrators may need to watch a hidden field.

1. Use the dictionary to determine the column name of the field.
2. Elevate privileges to the security_admin role.
3. Navigate to **System Definition > Scripts Background**.
4. In Run script (JavaScript executed on server), enter the following command:

   ```javascript
   gs.getSession().setWatchField("hidden_field");
   ```

   Replace `hidden_field` with the column name of the hidden field.
5. Navigate to the form containing the missing field.
   
   The Field Watcher tab output contains information about the hidden field.

Example: Watching the incident priority

The following example shows what happens to the Priority field on the incident form when both the Impact and Urgency fields change.

The Incident form has two client-side data lookups change the priority. Additionally, server-side ACLs and the data lookup engine fire when the record is saved. Finally, a client-side UI policy sets the Priority field back to read-only, which is the default setting.

**Table 1355: Watching the Incident Priority**

<table>
<thead>
<tr>
<th>Original Values</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority: 1 - Critical</td>
<td></td>
</tr>
<tr>
<td>Impact: 1 - High</td>
<td></td>
</tr>
<tr>
<td>Urgency: 1 - High</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>First Change</th>
<th></th>
</tr>
</thead>
</table>

1. The user changes the Impact value to 3 - Low.
2. The priority automatically changes to 3 - Moderate based on the Priority Lookup data lookup definition used by default in ServiceNow incidents.

**Note**: At this point, the record has not been saved.

<table>
<thead>
<tr>
<th>Second Change</th>
<th></th>
</tr>
</thead>
</table>
**Original Values**

1. The user changes the Urgency value to 2 - Medium.
2. The priority automatically changes to 4 - Low based on the same Priority Lookup data lookup definition.
3. The user saves the record by right-clicking the form header and choosing Save.

---

**Figure 932: Field watcher example**

**Note:** The values that change from 1 to 3, and then from 3 to 4, refer to the numerical values in the choice list.

**Tutorials**

The following video demonstrates how to perform field-level debugging with the field watcher.
**JavaScript log**

JavaScript that runs on the browser, such as client scripts, can include a call to jslog() to send information to the JavaScript Log. Users with the admin role can access this log.

1. Open the JavaScript log by navigating to the appropriate location for your version of the UI.

<table>
<thead>
<tr>
<th>UI16</th>
<th>1. Click the gear icon in the banner frame.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2. Click the Developer section.</td>
</tr>
<tr>
<td></td>
<td>3. Toggle the JavaScript Log and Field Watcher switch.</td>
</tr>
<tr>
<td>UI15</td>
<td>1. Click the gear icon in the banner frame.</td>
</tr>
<tr>
<td></td>
<td>2. Click JavaScript Log and Field Watcher.</td>
</tr>
<tr>
<td>UI11</td>
<td>Click the debug icon ( <img src="image" alt="debug icon" />) in the banner frame.</td>
</tr>
</tbody>
</table>

A new pane opens at the bottom of the screen. It shows the JavaScript Log tab and may also show the Field watcher tab.

2. If needed, select the JavaScript Log tab.

3. Click the clear icon ( ![clear icon](image)) to clear the contents of the log, as needed.

**Debug UI policies**

Enabling the glide.ui.ui_policy_debug property lets you monitor the processing of UI actions.

Here are some sample log events from an incident policy that sets fields to read-only if the incident_state is closed.

```plaintext
GlideFieldPolicy: Evaluating condition
GlideFieldPolicy:       incident_state (7) = 7 -> true
GlideFieldPolicy: --->>> TRUE
GlideFieldPolicy: Setting opened_at disabled to true
GlideFieldPolicy: Setting opened_by disabled to true
GlideFieldPolicy: Setting closed_at disabled to true
GlideFieldPolicy: Setting closed_by disabled to true
GlideFieldPolicy: Setting company disabled to true
```

**Writing to the debug log**

To write to the debug log in your client-side JavaScript, or UI policies, make a call to the global function jslog().

An example of using jslog() in JavaScript:

```javascript
function logData (r ) {
    lastLogDate  = r. responseXML. documentElement. getAttribute
    ( "last_log_entry" ) ; var items  = r. responseXML. getElementsByTagName
    "log" ) ;
    jslog ( "response=" + r. responseText ) ; }
```
Additionally, when client scripts run, the name of the client script and timing information is displayed. This can be useful in determining which scripts are running and whether they are impacting performance.

**JavaScript debug window**

The JavaScript debug window appears in a bottom pane of the user interface when an administrator turns on debugging.

Use the debug window to access these tools.

- **JavaScript Log**: JavaScript that runs on the browser, such as client scripts, can include a call to `jslog()` to send information to the JavaScript log.
- **Field Watcher**: a tool that tracks and displays all actions that the system performs on a selected form field.

![JavaScript Log and Field Watcher](image)

**Figure 933: JavaScript debug window**

**Using the JavaScript debug window**

The JavaScript debug window enables access to the JavaScript Log and the Field Watcher tools.

The steps to access the JavaScript debug window depend on which UI version you are using.

1. Open the JavaScript debug window by navigating to the appropriate location for your version of the UI.

| UI16          | 1. Click the gear icon in the banner frame.  
|              | 2. Click the Developer section.  
|              | 3. Toggle the JavaScript Log and Field Watcher switch. |

| UI15          | 1. Click the gear icon in the banner frame.  
|              | 2. Click JavaScript Log and Field Watcher. |
Click the debug icon ( ✗ ) in the banner frame.

The JavaScript debug window opens at the bottom of the screen. The tab that is currently active in the window is the last tab that was active when the window was closed.

2. Click a tab to use one of the debug window features.
   - JavaScript Log
   - Field Watcher

Server scripts

Server scripts run on the server or database. They can change the appearance or behavior of ServiceNow or run as business rules when records and tables are accessed or modified.

Server-side Glide APIs (Application Programming Interfaces) provide classes and methods that you can use in scripts to perform server-side tasks.

Immediately invoked function expressions

An immediately invoked function expression (IIFE) is both declared and invoked within the same script field.

The system uses immediately invoked function expressions when a script runs in a single context, such as in a transform map script. Functions that run from multiple contexts use script includes instead.

By enclosing a script in an immediately invoked function expression you can:
   • Ensure the script does not impact other areas of the product, such as by overwriting global variables.
   • Pass useful variables or objects as parameters.
   • Identify function names in stack traces.
   • Eliminate having to make separate function calls.

An immediately invoked function expression follows this format:

```javascript
(function functionName(parameter){
    //The script you want to run
})(value);//Note the parenthesis indicating this function should run.
```

You can declare functions within the immediately invoked function expression. These inner functions are accessible only from within the immediately invoked function expression.

```javascript
(function functionName(parameter){
    function helperFunction(parameter){//return some value
        var value = helperFunction(parameter);//Valid function call.
        //perform any other script actions
    })('value');

    var value2 = helperFunction(parameter);//Invalid. This function is not accessible from outside the self-executing function.
}
```
Business rules

A business rule is a server-side script that runs when a record is displayed, inserted, updated, or deleted, or when a table is queried.

Use business rules to accomplish tasks like automatically changing values in form fields when certain conditions are met, or to create events for email notifications and script actions.

Note: Business rules can make use of scripts to take actions on records in the database. However, there are several other scripting options available on the platform, such as client scripts and UI actions.

How business rules work

To configure business rules, you first need to determine when the business rule should run and what action it should take.

When business rules run

Business rules run based on two sets of criteria:

- The time that the business rule is configured to run relative to a record being modified or accessed.
- The database operation that the system takes on the record.

The following options are provided to determine the time the business rule should run:

Table 1356: Time the business rule should run

<table>
<thead>
<tr>
<th>Option</th>
<th>When the rule runs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Before</td>
<td>After the user submits the form but before any action is taken on the record in the database.</td>
</tr>
<tr>
<td>After</td>
<td>After the user submits the form and after any action is taken on the record in the database.</td>
</tr>
<tr>
<td>Async</td>
<td>When the scheduler runs the scheduled job created from the business rule. The system creates a scheduled job from the business rule after the user submits the form and after any action is taken on the record in the database.</td>
</tr>
<tr>
<td>Display</td>
<td>Before the form is presented to the user, just after the data is read from the database.</td>
</tr>
</tbody>
</table>

Note: Asynchronous business rules do not have access to the previous version of a record. Therefore, the changes(), changesTo(), and changesFrom() GlideElement methods do not work with async rules.

The following options are provided to determine the database operation that the system takes on the record:
Table 1357: Database operation that the system takes on the record

<table>
<thead>
<tr>
<th>Option</th>
<th>When the rule runs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert</td>
<td>When the user creates a new record and the system inserts it into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>When the user modifies an existing record.</td>
</tr>
<tr>
<td>Query</td>
<td>Before a query for a record or list of records is sent to the database. Typically you should use <code>query</code> for before business rules. See <a href="#">Before-Query</a> example.</td>
</tr>
<tr>
<td>Delete</td>
<td>When the user deletes a record.</td>
</tr>
</tbody>
</table>

This image shows when different types of business rules run:

![Business rule processing flow](image)

**Figure 934: Business rule processing flow**

**Note:** Business rules apply consistently to records regardless of whether they are accessed through forms, lists, or web services. This is one major difference between business rules and client scripts, which apply only when the form is edited.
Business rule actions

Business rules can perform a variety of actions. Common types of actions are:

- Changing field values on a form that the user is updating. Field values can be set to specific values available for that field, values copied from other fields, and relative values determined by the user's role.
- Displaying information messages to the user.
- Changing values of child tasks based on changes to parent tasks.
- Preventing users from accessing or modifying certain fields on a form.
- Aborting the current database transaction. For example, if certain conditions are met, prevent the user from saving the record in the database.

Administrators can set field values, create information messages, and abort transactions without writing a script.

Business rules in scoped applications

Every business rule is assigned to either a private application scope or to the global scope.

The types of business rules you can create and how you can access those rules varies depending on the scope of the business rule and the scope of the table it runs on.

Note: The term **global** can refer to two different aspects of a business rule: the table it runs on and the scope it runs in. Business rules can either run on specific tables or be global. In addition, they can be in the global scope or in a private application scope.

Business rules on specific tables

Most business rules run on a specific table, which is defined in the **Table** field. You can create business rules on tables in the same scope and on tables that allow configuration records from another application scope.

For tables that are in a different scope than the business rule record, the types of rules are limited.

- You can create a rule where **When is async** with any of the following options:
  - **Insert**, **Update**, and **Delete** database operations. You cannot select **Query**.
  - **Set field values** actions and scripts (the **Script** field).
- You can create a rule where **When is before** with any of the following options:
  - **Insert**, **Update**, and **Delete** database operations. You cannot select **Query**.
  - **Set field values** actions only. You cannot write scripts and you cannot abort the database transaction.
- You cannot create any other types of business rules on tables in a different scope.

Business rules on specific tables cannot be accessed by other business rules or scripts.

Global business rules

Warning: Consider using script includes instead of global business rules. Script includes load only on request while global business rules load on every page in the system.
Global business rules are business rules where the **Table** field is set to **Global**. Global business rules may be accessible on multiple tables and from other scripts, depending on their scope protection. For a global business rule, define the scope protection by setting the **Accessible from** field:

- **This application scope only**: prevents applications in a different scope than the business rule from calling this business rule.
- **All application scopes**: allows any application to call this business rule.

**Note**: Global business rules do not support domain separation.

### Scripts in scoped business rules

When you write a script in a business rule, you can access:

- Any script includes and global business rules in the same scope as the business rule.
- Script includes and global business rules that allow applications in a different scope to call them. To call functions from another scope, you must specify the scope of the function.
- For business rules in the global scope, you can access the system APIs (**GlideRecord**, **GlideSystem**, etc.) For more information on global APIs see the [legacy APIs on the developer portal](#).
- For business rules in a unique scope, you can access the scoped system APIs only (**ScopedGlideRecord**, **ScopedGlideSystem**, etc.) For more information on scoped APIs see the [scoped APIs on the developer portal](#).

For more information on scoped applications, see [scoped application scripting on the developer portal](#).

### Create a business rule

You can create any type of business rule from the Business Rule form.

1. Navigate to **System Definition > Business Rules**.
2. Click **New**.
3. Fill in the fields, as appropriate.

**Note**: You might need to configure the form to see all fields.

#### Table 1358: Business Rule Form Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the business rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table that the business rule runs on.</td>
</tr>
</tbody>
</table>

**Note**: The list shows only tables and database views that meet the scope protections for business rules starting with the Fuji release. Business rules defined for a database view can run only on **Query**. A business rule for a database view cannot run on insert, update, or delete.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application that contains this business rule.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Scope protection for a global business rule.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is visible only when the Table field is set to Global. It does not apply to rules that run on specific tables.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to enable the business rule.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to see the advanced version of the form.</td>
</tr>
<tr>
<td>When to run</td>
<td></td>
</tr>
<tr>
<td>When</td>
<td>[Advanced] Select when this business rule should execute: display, before, async, or after the database operation is complete.</td>
</tr>
<tr>
<td>Note:</td>
<td>Consider setting the Priority for async business rules as the system uses this value when creating the associated scheduled job.</td>
</tr>
<tr>
<td>Order</td>
<td>[Advanced] Enter a number indicating the sequence in which this business rule should run. If there are multiple rules on a particular activity, the rules run in the order specified here, from lowest to highest.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select this check box to execute the business rule when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select this check box to execute the business rule when a record is update.</td>
</tr>
<tr>
<td>Delete</td>
<td>[Advanced] Select this check box to execute the business rule when a record is deleted from the database.</td>
</tr>
<tr>
<td>Query</td>
<td>[Advanced] Select this check box to execute the business rule when a table is queried.</td>
</tr>
<tr>
<td>Filter Conditions</td>
<td>Use the condition builder to determine when the business rule should run based on the field values in the selected Table. You can also use the Condition field to build a condition with a script.</td>
</tr>
<tr>
<td>Role Conditions</td>
<td>Select the roles that users who are modifying records in the table must have for this business rule to run.</td>
</tr>
<tr>
<td>Actions</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Set field values | Set values for fields in the selected Table using the choice lists:  
  • The field  
  • The assignment operator:  
    • To: An exact value  
    • Same as: The value of another field  
    • To (dynamic): A value relative to the user configuring the business rule or a user with a specific role  
  • The value                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Add message   | Select this check box and enter a message that appears when this business rule is run                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Abort action  | Select this check box to abort the current database transaction. For example, on a before insert business rule, if the conditions are met, do not insert the record into the database.  
  If you select this option, you cannot perform additional actions on the record, such as setting field values and running scripts.  
  You can still display a message to users by selecting the Add message check box and composing the message.                                                                                                                                                                                                                                                                                                                                                   |
| Advanced      | [Advanced] Create a JavaScript conditional statement to specify when the business rule should run. By adding the condition statement to this field, you tell the system to evaluate the condition separately and run the business rule only if the condition is true.  
  If you decide to include the condition statement in the Script field or if you use the condition builder, leave this field blank.  
  To have the instance reevaluate the condition statement a second time before running an async business rule, add the system property glide.businessrule.async_condition_check and set the value to true.                                                                                                                                                                                                                          |
### Field Description

**Script**

[Advanced] Create a script that runs when the defined condition is true. The system automatically populates this field with a function name that matches the **When** value.

- onAfter
- onAsync
- onBefore
- onDisplay

**Note:** The function name must match the **When** value.

For more information and examples, see Scripting in Business Rules.

<table>
<thead>
<tr>
<th>Related list: Versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Versions</td>
</tr>
</tbody>
</table>

Shows all versions of the business rule. Use this list to compare versions or to revert to a previous version.

4. Click **Submit**.

## Global variables in business rules

Predefined global variables are available for use in business rules. Use the following predefined global variables to reference the system in a business rule script.

<table>
<thead>
<tr>
<th>Global variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>The current state of the record being referenced. <em>Check for null</em> before using this variable.</td>
</tr>
<tr>
<td>previous</td>
<td>The state of the referenced record prior to any updates made during the execution context, where the execution context begins with the first update or delete operation and ends after the script and any referenced business rules are executed. If multiple updates are made to the record within one execution context, <strong>previous</strong> will continue to hold the state of the record before the first update or delete operation. Available on update and delete operations only. Not available on async operations. <em>Check for null</em> before using this variable.</td>
</tr>
<tr>
<td>g_scratchpad</td>
<td>The scratchpad object is available on display rules, and is used to pass information to the client to be accessed from client scripts.</td>
</tr>
<tr>
<td>system (or gs)</td>
<td>References to <em>GlideSystem</em> functions.</td>
</tr>
</tbody>
</table>
The variables current, previous, and g_scratchpad are global across all business rules that run for a transaction.

**Prevent null pointer exceptions**

In some cases, there may not be a current or previous state for the record when a business rule runs, which means that the variables will be null. To check for null before using a variable, add the following code to your business rule:

```java
if (current == null) // to prevent null pointer exceptions.
    return;
```

**Define variables**

User-defined variables are globally scoped by default. If a new variable is declared in an order 100 business rule, the business rule that runs next at order 200 also has access to the variable. This may introduce unexpected behavior.

To prevent such unexpected behavior, always wrap your code in a function. This protects your variables from conflicting with system variables or global variables in other business rules that are not wrapped in a function. Additionally, variables such as current must be available when a function is invoked in order to be used.

The following script is vulnerable to conflicts with other code. If the variable gr is used in other rules, the value of the variable may unexpectedly change.

```java
var gr = new GlideRecord('incident');
gr.query();
while(gr.next()) {
   //do something
}
```

When this script is wrapped in a function, the variable is available only within the function and does not conflict with other functions using a variable named gr.

```java
myFunction();
function myFunction() {
   var gr = new GlideRecord('incident');
gr.query();
while(gr.next()) {
   //do something
}

```

**Compare date fields in a business rule**

It is possible to compare two date fields or two date and time fields in a business rule.

It is possible to compare two date fields or two date and time fields in a business rule, and abort a record insert or update if they are not correct. For example, you may want a start date to be before an end date.

The following is an example script:

```java
if ((!current.u_date1.nil()) && (!current.u_date2.nil())) {
   var start = current.u_date1.getGlideObject().getNumericValue();
   var end = current.u_date2.getGlideObject().getNumericValue();
```
if (start > end) {
    gs.addInfoMessage('start must be before end');
    current.u_date1.setError('start must be before end');
    current.setAbortAction(true);
}

As a good practice, make the business rule a before rule for insert and update actions. In the example above:

- u_date1 and u_date2 are the names of the two date fields. Replace these with your own field names.
- The first line checks that both fields actually have a value.
- The next two lines create variables that have the dates' numerical values.
- The next two lines create different alert messages for the end user: one at the top of the form and one by the u_date1 field in the form.
- The last line aborts the insert or update if the date fields are not correct.

Here is a more complex example of the above comparison. If you have more than one pair of start and end dates, you can use arrays as shown. Additionally, this script requires the input dates to be within a certain range, in this case, no fewer than 30 days in the past and no more than 365 days in the future.

```javascript
// Enter all start and end date fields you wish to check, as well as the previous values
// Make sure that you keep the placement in the sequence the same for all pairs
var startDate = new Array(current.start_date,current.work_start);
var prevStartDate = new Array(previous.start_date,previous.work_start);
var endDate = new Array(current.end_date,current.work_end);
var prevEndDate = new Array(previous.end_date,previous.work_end);

// The text string below is added to the front of 'start must be before end'
var userAlert = new Array('Planned','Work');

// Set the number of Previous Days you want to check
var pd = 30;
// Set the number of Future Days you want to check
var fd = 365;

// You shouldn't have to modify anything below this line
var nowdt = new GlideDateTime();
nowdt.setDisplayValue(gs.nowDateTime());
var nowMs = nowdt.getNumericValue();
var pdms = nowMs;
// Subtract the product of previous days to get value in milliseconds
pdms -= pd * 24 * 60 * 60 * 1000;
var fdms = nowMs;
// Add the product of future days to get value in milliseconds
fdms += fd * 24 * 60 * 60 * 1000;
var badDate = false;

// Iterate through all start and end date / time fields
for (x = 0; x < startDate.length; x ++) {
    if (!startDate[x].nil() && !endDate[x].nil()) {
        var start = startDate[x].getGlideObject().getNumericValue();
        var end = endDate[x].getGlideObject().getNumericValue();
        if (start > end) {
            gs.addInfoMessage(userAlert[x] + ' ' + 'start must be before end');
            startDate[x].setError(userAlert[x] + ' ' + 'start must be before end');
        }
    }
}
```
badDate = true; } 
else if ((prevStartDate[x]) != (startDate[x])) { 
    if (start < pdms) { 
        gs.addInfoMessage(userAlert[x] + ' start must be fewer than ' + pd + ' days ago');
        startDate[x].setError(userAlert[x] + ' start must be fewer than ' + pd + ' days ago');
        badDate = true; } } 
else if ((prevEndDate[x]) != (endDate[x])) { 
    if (end > fdms) { 
        gs.addInfoMessage(userAlert[x] + ' end must be fewer than ' + fd + ' days ahead');
        endDate[x].setError(userAlert[x] + ' end must be fewer than ' + fd + ' days ahead');
        badDate = true; } } 
} if (badDate == true ) { 
current.setAbortAction ( true ); }

Parse XML payloads

Fields in XML format can be parsed with the system's getXMLText function.

Fields that get inserted into the database in XML format, such as the payload of an ecc_event row, can be parsed with the system's getXMLText function. The getXMLText function takes a string and an XPATH expression. For example:

```javascript
var name = gs.getXMLText("<name>joe</name>", "//name");
```

returns the string 'joe'.

Assuming that the field "payload" contains XML, the function call might look like:

```javascript
var name = gs.getXMLText(current.payload, "//name");
```

For information on XPATH, visit w3schools.

Abort a database action in a before business-rule

In a before business rule script, you can cancel or abort the current database action.

In a before business-rule script, you can cancel or abort the current database action using the current.setAbortAction(true) method. For example, if the before business rule is executed during an insert action, and you have a condition in the script that calls current.setAbortAction(true), the new record stored in current is not created in the database.

Determine the operation that triggered the business rule

You can write a script for a business rule that is triggered on more than one database action.

If you want the business rule script to dynamically branch depending on the action that triggered the event, you can use the operation() function. For example:

```javascript
if(current.operation() == "update") { 
current.updates ++; } 
if(current.operation() == "insert") { 
current.updates = 0; }
```

Display business-rules

Display rules are processed when a user requests a record form.
The data is read from the database, display rules are executed, and the form is presented to the user. The current object is available and represents the record retrieved from the database. Any field changes are temporary since they are not yet submitted to the database. To the client, the form values appear to be the values from the database; there is no indication that the values were modified from a display rule. This is a similar concept to calculated fields.

The primary objective of display rules is to use a shared scratchpad object, `g_scratchpad`, which is also sent to the client as part of the form. This can be useful when you need to build client scripts that require server data that is not typically part of the record being displayed. In most cases, this would require a client script making a call back to the server. If the data can be determined prior to the form being displayed, it is more efficient to provide the data to the client on the initial load. The form scratchpad object is an empty object by default, and used only to store name:value pairs of data.

To populate the form scratchpad with data from a display rule:

```javascript
// From display business rule
g_scratchpad.someName = "someValue";
g_scratchpad.anotherName = "anotherValue";

// If you want the client to have access to record fields not being displayed on the form
g_scratchpad.created_by = current.sys_created_by;

// These are simple examples, in most cases you'll probably perform some other queries
// to test or get data
```

To access the form scratchpad data from a client script:

```javascript
// From client script
if(g_scratchpad.someName == "someValue") {
  //do something special
}
```

Use an OR condition in a business rule

An OR condition can be added to any query part within a business rule.

An OR condition can be added to any query part within a business rule with the `addOrCondition()` method. The example below shows a query for finding all the incidents that have either a 1 or a 2 priority. The first `addQuery()` condition is defined as a variable and is used in the OR condition.

```javascript
var inc = new GlideRecord('incident');
var qc = inc.addQuery('priority','1');
qc.addOrCondition('priority','2');
inc.query();
while(inc.next()) {
  // processing for the incident goes here
}
```

The following script is a more complex example, using two query condition variables doing the equivalent of `(priority = 1 OR priority = 2) AND (impact = 2 OR impact = 3)`. The results of the OR condition are run with two variables, `qc1` and `qc2`. This allows you to manipulate the query condition object later in the script, such as inside an IF condition or WHILE loop.

```javascript
var inc = new GlideRecord('incident');
var qc1 = inc.addQuery('priority','1');
qc1.addOrCondition('priority','2');
var qc2 = inc.addQuery('impact','2');
qc2.addOrCondition('impact','3');
```
Reference a Glide list from a business rule

A field defined as a glide list is an array of values stored in a single field.

Here are some examples of how to process a glide_list field when writing business rules. Generally a glide_list field contains a list of reference values to other tables.

Examples

For example, the Watch list field within tasks is a glide_list containing references to user records.

The code below shows how to reference the field.

```javascript
// list will contain a series of reference (sys_id) values separated by a comma
// array will be a javascript array of reference values
var list = current.watch_list.toString();
var array = list.split(",");
for (var i=0; i < array.length; i++) {
    gs.print("Reference value is: " + array[i]);
}
```

You can also get the display values associated with the reference values by using the getDisplayValue() method as shown below.

```javascript
// list will contain a series of display values separated by a comma
// array will be a javascript array of display values
var list = current.watch_list.getDisplayValue();
var array = list.split(",");
for (var i=0; i < array.length; i++) {
    gs.print("Display value is: " + array[i]);
}
```

Use indexOf("searchString") to find a string in a Glide list

Use `indexOf("searchString")` to return the location of the string passed into the method if the glide list field, such as a Watch list, has at least one value in it.

If the field is empty, it returns `undefined`. To avoid returning an undefined value, do any of the following:

- Force the field to a string, such as: `watch_list.toString().indexOf("searchString")`
- Check for an empty Glide list field with a condition before using `indexOf()`, such as: `if (watch_list.nil() || watch_list.indexOf("searchString") == -1)`

Task active state management business rule

A business rule that determines if the active field needs to change based on state changes.

The Task Active State Management business rule is executed for any task state change. It's execution order is 50, designed to run before most other task rules. If the current task table has the close_states attribute defined on it's table or it is inherited from a higher-level table then the rule will determine if the active field needs to change. This is done by comparing the previous and current state values. If the state changes from an active state to an inactive state, the active field will be set to false. If the
state changes from an inactive state to an active state, the active field will be set to true, effectively re-activating/re-opening the task. It is recommended that you leverage this action in your business rules (current.active.changesTo([true/false]) as opposed to creating rules on each task table that marks tasks as inactive or active.

Example script: Locking user accounts

An example script to lock user accounts if the user is not active in the LDAP directory or the user does not have self-service, itil, or admin access to the instance.

The following business rule script locks user accounts if the user is not active in the LDAP directory or the user does not have self-service, itil, or admin access to the instance:

```javascript
// Lock accounts if bcNetIDStatus != 'active' in LDAP and user does not have self-service, itil or admin role
var rls = current.accumulated_roles.toString();
if(current.u_bcnetidstatus == 'active' && (rls.indexOf(',itil,') > 0 || rls.indexOf(',admin,') > 0 || rls.indexOf(',ess,') > 0 )) {
    current.locked_out = false; }
else {
    current.locked_out = true; }

var gr = new GlideRecord("sys_user");
gr.query();
while(gr.next()) {
    gr.update();
    gs.print("updating " + gr.getDisplayValue());
}
```

Example script: default before-query business rule

You can use a query business rule that executes before a database query is made.

You can use a query business rule that executes before a database query is made to prevent users from accessing certain records. Consider the following example from a default business rule that limits access to incident records.

• Name: incident query
• Table: Incident
• When: before, query
• Script:

```javascript
if(!gs.hasRole("itil") && gs.isInteractive()) {
    var u = gs.getUserID();
    var qc =
        current.addQuery("caller_id",u).addOrCondition("opened_by",u).addOrCondition("watch_list","CONTAINS",u);
    gs.print("query restricted to user: " + u);
}
```

This example prevents users from accessing incident records unless they have the itil role are listed in the Caller or Opened by field. So, for example, when self-service users open a list of incidents, they can only see the incidents they submitted.

**Note:** You can also use access controls to restrict the records that users can see.

Script includes

Script includes are used to store JavaScript that runs on the server.
Create script includes to store JavaScript functions and classes for use by server scripts. Each script include defines either an object class or a function.

Consider using script includes instead of global business rules because script includes are only loaded on request.

**Script include form**

Script includes have a name, description and script. They also specify whether they are active or not, and whether they can be called from a client script.

To access script includes, navigate to System Definitions > Script Includes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the script include. If you are defining a class, this must match the name of the class, prototype, and type. If you are using a classless (on-demand) script include, the name must match the function name.</td>
</tr>
<tr>
<td>Client callable</td>
<td>Makes the script include available to client scripts, list/report filters, reference qualifiers, or if specified as part of the URL.</td>
</tr>
<tr>
<td>Application</td>
<td>The application where this script include resides.</td>
</tr>
<tr>
<td>Accessible from</td>

</tr>
</tbody>
</table>
type. When you create a new script include and give it a name, the system provides you a code snippet with the class and prototype set up properly.

```javascript
var NewInclude = Class.create();
NewInclude.prototype = {
    initialize: function() {},
    myFunction: function() {//Put function code here},
    type: 'NewInclude'};
```

You could then use the 'myFunction' line like this:

```javascript
var foo = new NewInclude();
foo.myFunction();
```

**Note:** Try not to modify a ServiceNow supplied script include. If you want a script include that does something similar to an existing one, copy it and make changes to the copy or consider extending the object. This is a common practice when using GlideAjax.

### Privacy settings

The privacy setting for a client-callable script-include can be public or private.

The private privacy-setting means that guests who access public pages cannot access the client-callable script-include. A private script cannot be executed by a non-logged-in user.

A public privacy-setting means that the client script can be executed by non-logged-in users that create an appropriate HTTP request. This can create a security problem if the client script provides confidential information.

The following script includes remain public by default because public pages need to access them:

- GlideSystemAjax
- SysMessageAjax
- KnowledgeMessagingAjax
- KnowledgeAjax
- PasswordResetAjax

### Change privacy on all client-callable script includes

How to change the privacy on all client-callable script includes.

To provide further control over all client-callable script includes, administrators can add the property glide.script.ccsi.ispublic. This property changes the visibility of client-callable script includes by making them all public or private. Configure the property as follows:

<table>
<thead>
<tr>
<th>Title</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.script.ccsi.ispublic</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>false</td>
</tr>
</tbody>
</table>
Change privacy on a single client callable script include

Change the privacy setting for a single client-callable script-include by adding the isPublic() function. The isPublic() setting takes precedence over the glide.script.ccsi.ispublic property. For example, if the property is set to false making all client-callable script-includes private, and a script sets isPublic() to true, the script is public.

To change the privacy for a single client-callable script include, add the following method to the script include:

```javascript
isPublic:function(){return[true/false];},
```

Use either true or false for the script include.

Script actions

You can use script actions to create server-side scripts that perform a variety of tasks, such as modifying a configuration item (CI), or managing failed login attempts. Script actions are triggered by events only.
### Configuration

To create a new script action, navigate to **System Policy > Events > Script Actions** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for your script action.</td>
</tr>
<tr>
<td>Event Name</td>
<td>Select the event to use for this script. If you do not find an event for your script action that suits your purpose, you can create a new one.</td>
</tr>
<tr>
<td>Application</td>
<td>The application that contains this script.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the script will be executed.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box (true) to enable this script action.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Create a statement for a condition under which this script should execute. The system only parses the <strong>Script</strong> field if the condition evaluates to true. If you decide to include the condition statement in the script, leave this field blank.</td>
</tr>
<tr>
<td>Script</td>
<td>Create a script that runs when the condition you define evaluates to true. Two additional objects are available in this script:</td>
</tr>
<tr>
<td></td>
<td>- <strong>event</strong>: a GlideRecord - the sysevent that caused this to be invoked. If you wanted so get this first parameter on the event, you would use event.parm1 or event.parm2 for the second parameter. For the date/time of the event, use event.sys_created_on. To get the user ID that created the event (if there was a user associated), use event.user_id.</td>
</tr>
<tr>
<td></td>
<td>- <strong>current</strong>: a GlideRecord - the event scheduled on behalf of (incident for example).</td>
</tr>
</tbody>
</table>

This is a sample of a script action that creates an email notification for Workflow activity:
```javascript
/*
  * Handle a workflow.notification event by creating an email notification that can be sent
  * parem1 - sys_id of workflow activity, sys_id of workflow context
  * parem2 - comma-separated list of recipients
  */

sendWorkflowNotification();

function sendWorkflowNotification() {

  var activity = new GlideRecord('wf_activity');
  if (!activity.get(parem1))
    return 0;

  var context = new GlideRecord('wf_context');
  if (parem2.length == 2)
    context.put(parem2);

  GlideController.putGlobal('context', context);
  GlideController.putGlobal('workflow', workflow);

  var subject = workflow(activity.vars,subject);
  var message = workflow(activity.vars,mail);
  var emailAction = new GlideEmailAction();

  var email = new GlideRecord('sysevent_email_action');
```
UI pages

UI pages can be used to create and display forms, dialogs, lists and other UI components.

Use UI pages as widgets on homepages. To find the UI pages, navigate to System UI > UI Pages.

This functionality requires a knowledge of HTML or Jelly.
Figure 937: UI page form

Client script:

```javascript
var t = gc("engines");
var tbody = t.firstChild;
initEngines();

function initEngines()
{
    var tables = [];
    for (var i = 0; i < t.engines.length; i++)
    {
        var table = tables.split(",");
        for (var i = 0; i < table.length; i++)
        {
            var table = tableList[i];
            var key = "glide.approval_engine." + table;
            var nvalue = gs.getParameter('engine_' + table) + ";
            if (nvalue != "nvalue")
            {
                gs.print("Set approval engine property " + key + " to " + nvalue + ");
            }
        }
    }
}
```

Processing script:

```javascript
var tableList = tables.split(",");
for (var i = 0; i < tableList.length; i++)
{
    var table = tableList[i];
    var key = "glide.approval_engine." + table;
    var nvalue = gs.getProperty(key) + ";
    var nvalue = request.getParameter('engine_' + table) + ";
    if (nvalue != "nvalue")
    {
        gs.print("Set approval engine property " + key + " to " + nvalue + ");
    }
}
```

Update Try It Delete

Compare this version of the UI Page with previous versions.

The UI page form provides the following fields:

### Table 1361: UI page

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name used to invoke the page via a URL (must not contain spaces).</td>
</tr>
<tr>
<td><strong>HTML</strong></td>
<td>Main component of the page, and it defines what will be rendered when the page is shown. It can contain either static XHTML or dynamically generated content defined as Jelly, and it can call script includes and UI Macros.</td>
</tr>
<tr>
<td><strong>Client Script</strong></td>
<td>Client-side JavaScript that runs in the browser (e.g. functions called by buttons, etc.). It is intended to handle any client-side processing needed, for example setting focus to a field, or other interactive DHTML features after a page is loaded. Ultimately, a UI page's Client Scripts are deployed to the browser within a <code>&lt;script/&gt;</code> tag, so it could be defined within the page's HTML field to achieve the same effect. Using the Client Script field instead to define these scripts makes things much more tidy and readable though, and it keeps the Jelly and HTML from becoming unmanageable.</td>
</tr>
<tr>
<td><strong>Processing Script</strong></td>
<td>Script that runs on the server when the page is submitted. This is useful if your page has a form (defined with the <code>&lt;g:ui_form/&gt;</code> or <code>&lt;g:form/&gt;</code> tags).</td>
</tr>
</tbody>
</table>

**Related lists on the form view:**

- **Versions**
  - Shows all versions of the UI page.

A UI page can be secured by creating an ACL with the following parameters:

- **Type**: `ui_page`
- **Operation**: `read`
- **Name**: name of the UI page to be protected

For details on creating an ACL rule, see [Create an ACL rule](#).

### UI page access

Each UI page has a URL computed from the application scope, page name, and the `.do` file extension.

For example, to display the page called `glidewindow_example` on the demo system, you would navigate to `https://<instance name>.service-now.com/glidewindow_example.do`. If the page was part of a custom application called `example_app`, you would instead navigate to `https://<instance name>.service-now.com/x_example_app_glidewindow_example.do`. 
You can also add additional parameters to a URL that can be accessed within a page's HTML section as jelly variables. That is, appending arguments to the URL as follows: `/my_test_page.do?sysparm_verbose=true` creates jelly variables called `verbose` that can be accessed as follows:

```plaintext
<j2:if test="(!$[!empty(sysparm_verbose)])"> <span>show extra stuff </span> </j2:if>
```

A common practical example of this might be retrieving a database record for display. To build a list of a user's roles, pass in a parameter with the user's `sys_id`. Invoke the following UI page to display a list of roles for that user with Jelly code:

```plaintext
role_select.do?sysparm_user=5137153cc611227c000b7bd81bd82d07
```

```plaintext
<j:set var="jvar_user_id" value="${sysparm_user}" />

<g:evaluate> var userRoles = new GlideRecord('sys_user_has_role');
userRoles.addQuery('user','${jvar_user_id}');
userRoles.query();
</g:evaluate>

<select id='select_role'>
<j:while test="${userRoles.next()}">
  <option value="${userRoles.sys_id}">${userRoles.role.name} </option>
</j:while>
</select>
```

An exception to be careful of, though, is the reserved variable name `sys_id`. This variable always contains the ID of the UI page itself, regardless of what is specified in the URL. A common substitute variable name is `sysparm_id`.

### UI page process scripts

If your UI page contains a form (uses the `<g:form>` tag), you can submit the form and have the process script run.

The processing script can naturally access fields on the form. For example, if your form contained the `application_sys_id` field:

```plaintext
<g:ui_form><p>Click OK to run the processing script.</p>
<g:dialog_buttons_ok_cancel ok = "return true"/> <input type = "hidden"
name = "application_sys_id" value = "499836460a0a0b1700003e7ad950b5da"/></g:ui_form>
```

You could then access it using just `application_sys_id`:

```
var application = new GlideRecord('hr_application');
application.get(application_sys_id);
application.status = "Rejected";
application.update();
var urlOnStack = GlideSession.get().getStack().bottom();
response.sendRedirect(urlOnStack);
```

**Note:**
- `GlideSession` replaces `Packages.com.glide.sys.GlideSession`
If you are using the UI page for a dialog, you can also reference the most recent URL on the stack using the code above and then send the response to that location. This is useful if you want to have the dialog’s processing script update something and then redisplay the screen that brought up the dialog.

**UI Macros**

UI macros define modular, reusable components in the ServiceNow platform. For example, UI Macros are used to apply formatters to various forms within ServiceNow that provide additional information about the form without using a field. This functionality requires the knowledge of Jelly script.

To administer UI macros, navigate to **System UI > UI Macros** and define the following information:

- **Name**: A unique and descriptive name for this macro.
- **Active**: Select the check box to render the element as defined. Clear the check box to disable the element without deleting the code. For example, the `email_reply` macro is inactive by default.
- **Description**: Describe the purpose of the macro and parameters passed to it.
- **XML**: Jelly script that defines the macro.

**Examples**

UI Macros can invoke other UI Macros. In this example, the UI Macro invokes the `ui_update_set_picker` and `ui_timezone_changer` macros:

```xml
<?xml version= "1.0" encoding="utf-8"?>
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
  <g:ui_update_set_picker />
  <g:ui_timezone_changer />
</j:jelly>
```

UI Macros can be invoked from UI Pages:

```xml
<g:macro_invoke macro="decorate_welcome_header_stripe_left" />
```

**Processors**

Processors are analogous to Java servlets. Processors provide a customizable URL endpoint that can execute arbitrary server-side JavaScript code and produce output such as TEXT, JSON, or HTML.

Typically, you create custom processors when you want a URL query to:

- Produce data in non-standard formats.
- Perform non-standard record operations.
- Act on multiple tables.

There are two types of processors.

- **Single-purpose**: processors that have a single purpose and single endpoint.
- **Multi-table**: processors that apply to all tables on the instance.

By default, processors are public and can execute without requiring authorization. This means that any logged-in user can execute the processor without needing a particular role. To prevent leakage of secure data, protect your processors by requiring a CSRF token or requiring users have an authorized role to run the processor.
Processor form
The processor form has the following fields.

### Table 1362: Processor Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the processor.</td>
</tr>
<tr>
<td>Type</td>
<td>Programming language of the processor script. Options include:</td>
</tr>
<tr>
<td></td>
<td>- java: do not select this option</td>
</tr>
<tr>
<td></td>
<td>- script</td>
</tr>
<tr>
<td>Application</td>
<td>Application containing this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Flag to enable or disable the record.</td>
</tr>
<tr>
<td>CSRF protect</td>
<td>Option to protect the processor from running unless the instance uses a CSRF token.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the processor's function or purpose.</td>
</tr>
<tr>
<td>Parameters</td>
<td>List of available input parameters. Specify parameter values in the URL as:&lt;parameter name&gt;=&lt;parameter value&gt;.</td>
</tr>
<tr>
<td>Path</td>
<td>URI path used to call this processor. Call a processor from the URL as:</td>
</tr>
<tr>
<td></td>
<td>https://&lt;instance name&gt;.service-now.com/&lt;Path&gt;.do</td>
</tr>
<tr>
<td>Script</td>
<td>Immediately Invoked Function Expression to run when the system calls this processor.</td>
</tr>
<tr>
<td></td>
<td>The function automatically provides input parameters for the following API objects.</td>
</tr>
<tr>
<td></td>
<td>- g_request</td>
</tr>
<tr>
<td></td>
<td>- g_response</td>
</tr>
<tr>
<td></td>
<td>- g_processor</td>
</tr>
<tr>
<td>Protection policy</td>
<td>Policy to use to protect this record's script. Options include:</td>
</tr>
<tr>
<td></td>
<td>- None</td>
</tr>
<tr>
<td></td>
<td>- Read-only</td>
</tr>
<tr>
<td></td>
<td>- Protected</td>
</tr>
</tbody>
</table>
Processor API components

Processors have access to dedicated API classes, objects, and methods.

### Table 1363: Processor API components

<table>
<thead>
<tr>
<th>Class, object, or method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_response</td>
<td>An object of type HttpServletResponse. See Interface HttpServletResponse.</td>
</tr>
<tr>
<td><code>setContentType('text/html; charset=UTF-8')</code></td>
<td>A HttpServletResponse method to set the content type of the response being sent to the client. See Interface HttpServletResponse.</td>
</tr>
<tr>
<td>g_request</td>
<td>An object of type HttpServletRequest. See Interface HttpServletRequest.</td>
</tr>
<tr>
<td><code>getParameter()</code></td>
<td>A glide method to get the value of a URL parameter.</td>
</tr>
<tr>
<td>canRead()</td>
<td>A GlideRecord method to determine if the user can read data from a table. See Scoped GlideRecord API Reference.</td>
</tr>
<tr>
<td>g_processor</td>
<td>A simplified servlet for processors.</td>
</tr>
<tr>
<td><code>writeOutput()</code></td>
<td>A processor method to display information on the client.</td>
</tr>
<tr>
<td>g_target</td>
<td>An object containing the target table name of a processor URL. For example, a processor containing the URI <code>incident.do</code> applies to the Incident table.</td>
</tr>
</tbody>
</table>

### Secure a processor

You can protect your processor against unauthorized use by using role restrictions.

You can re-use a table's user role restrictions to protect it from access by your processor. This protection method assumes the processor will access table data.

1. Create or select a user role that has access to the table the processor script calls.
2. Navigate to System Definition > Processors.
3. In Script, add the following code block.

   ```javascript
   var gr = new GlideRecord('your_table_name');
   // canRead() compares the table’s ACL to the user making this request,
   // and returns true if the logged-in user has read access to this table
   if(gr.canRead())
   {
     // Perform table query here
     g_processor.writeOutput('Success!');
   }
   else {
     g_processor.writeOutput('You do not have permission to read table your_table_name');
   }
   ```

4. Update the code block to use other access restrictions as needed.

Available access functions include:
Create a simple processor

In this exercise, you will create a simple processor to execute a script from a URL query.

The following steps assume that you have your own demonstration instance.

1. Navigate to System Definition > Processors.
2. Click New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Hello</td>
</tr>
<tr>
<td>Type</td>
<td>Script</td>
</tr>
<tr>
<td>Path</td>
<td>Hello</td>
</tr>
<tr>
<td>Script</td>
<td>var name= g_request.getParameter(&quot;name&quot;); g_processor.writeOutput(&quot;text/plain&quot;,&quot;Hello &quot;+name);</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. Enter a URL query to the instance with the following format: https://instance.service-now.com/processor_name.do?parameter=value. For example: https://<instancename>.service-now.com/Hello.do?name=world.

Create a multi-table processor

In this exercise, you will create a multi-table processor that reports the number of rows in any table on your instance.

The multi-table processor protects itself from performance and security violations by confirming that the user is authorized to read the table. It does not report on certain tables that are too large to query safely.

1. Navigate to System Definition > Processors.
2. Click New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>TableSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Choose Javascript</td>
</tr>
<tr>
<td>Description</td>
<td>Return number of records in a table</td>
</tr>
<tr>
<td>Parameters</td>
<td>SIZE</td>
</tr>
<tr>
<td>Path</td>
<td>&lt;leave empty&gt;</td>
</tr>
</tbody>
</table>
Script

```javascript
var name = g_request.getParameter("name");
g_processor.writeOutput("text/plain", "Hello " + name);
```

Create a custom processor

You can create a custom processor to execute a script from a URL query.

When complete, you will be able to:

- Create a new processor
- Run a script from a URL query

The following example steps assume you have your own demonstration instance.

1. Navigate to **System Definition > Processors**.
2. Click **New**.
3. For **Name**, enter **Hello**.
4. For **Type**, select **script**.
5. For **Path**, enter **Hello**.
6. For **Script**, enter the following code.

```
var name = g_request.getParameter("name");
g_processor.writeOutput("text/plain", "Hello " + name);
```
7. Click **Submit**.
8. Logout of the instance and open a new browser window.
9. Enter a URL query to the instance with the following format: `https://instance.service-now.com/processor_name.do?parameter=value`. For example: `https://<instancename>.service-now.com/Hello.do?name=world`.
10. When prompted, enter credentials for valid user.

Installation settings

Installation Settings permit the programmatic determination of a setting.

Installation settings are global business rules with calculated names. Installation settings are calculated just before a record is displayed and therefore facilitate very dynamic determination of access and roles. Installation settings controlling access to fields and records are:

- CanRead()
- CanWrite()
- CanCreate()
- CanDelete()

Functions can return true if access is permitted, false if not. No return value uses the permission calculated using roles. The function has access to the current record through the variable current code.

The name of the function checking the permission on a record is formed by prefixing the setting name with the record name:

record_nameCanRead()

Similarly, the permission on a field in a record are formed by prefixing the function name with the record name, underbar (_) and field name:

record_name_field_nameCanRead()

Naming Examples:

function incidentCanWrite() {} // can user write to this record?
function incident_numberCanWrite() {}  // can user write to the number field?

This sample business rule restricts the writing of the name field in the sys_dictionary file when the entry already exists:

// the element name cannot be written unless this is a new record (not yet in database)
function sys_dictionary_nameCanWrite() {
    if (current.isNewRecord())
        return;
    return false;
}

Using DurationCalculator to calculate a due date

Using the DurationCalculator script include, you can calculate the due date, using either a simple duration or relative duration.

The following script demonstrates how to use DurationCalculator to calculate a due date. The first part of the script illustrates how to set a start datetime using the setStartDateTime() method and then use the calcDuration() method to determine a due date that is "x" amount of continuous time (seconds) from the specified start datetime. The second half of the script illustrates how to use DurationCalculator to calculate a due date based on a schedule. Schedules enable you to apply a “filter” on future time, such as only including the days in a work week within the calculation. For example, if you apply a schedule
"weekdays" (which only includes Monday through Friday) to your duration calculation, and the start
datetime is Friday at 5:00 pm, when you add a duration of two days, your due date would be Tuesday
at 5:00 pm. If you did not use a schedule, your due date would be Sunday at 5:00 pm. For additional
information on schedules, see Schedules on page 1040.

This script can be cut and pasted into the Scripts Background page and run as is. It can also serve as an
example for authoring business rules, UI actions, or used any other place that server-side script can be
authored.

```javascript
/**
 * Demonstrate the use of DurationCalculator to compute a due date.
 *
 * You must have a start date and a duration. Then you can compute a
 * due date using the constraints of a schedule.
 */

gs.include('DurationCalculator');
executeSample();

/**
 * Function to house the sample script.
 */
function executeSample(){

    // First we need a DurationCalculator object.
    var dc = new DurationCalculator();

    // -------------- No schedule examples --------------

    // Simple computation of a due date without using a schedule. Seconds
    // are added to the start date continuously to get to a due date.
    var gdt = new GlideDateTime("2012-05-01 00:00:00");
    dc.setStartDateTime(gdt);
    if(!dc.calcDuration(2*24*3600)){ // 2 days
        gs.log("*** Error calculating duration");
        return;
    }
    gs.log("calcDuration no schedule: "+ dc.getEndDateTime()); // "2012-05-03 00:00:00" two days later

    // Start in the middle of the night (2:00 am) and compute a due date 1
    // hour in the future.
    // Without a schedule this yields 3:00 am.
    var gdt = new GlideDateTime("2012-05-03 02:00:00");
    dc.setStartDateTime(gdt);
    if(!dc.calcDuration(3600)){
        gs.log("*** Error calculating duration");
        return;
    }
    gs.log("Middle of night + 1 hour (no schedule): "+
    dc.getEndDateTime()); // No scheduled start date, just add 1 hour

    // -------------- Add a schedule to the date calculator

    addSchedule(dc);

    // Start in the middle of the night and compute a due date 1 hour in the
    future.
    // Since we start at 2:00 am the computation adds the 1 hour from the
    start
    // of the day, 8:00am to get to 9:00am
    var gdt = new GlideDateTime("2012-05-03 02:00:00");
```

© 2017 ServiceNow. All rights reserved. 3879
dc.setStartDateTime(gdt);
if(!dc.calcDuration(3600)) {
    gs.log("*** Error calculating duration");
    return;
}
gs.log("Middle of night + 1 hour (with 8-5 schedule): " +
dc.getEndDateTime()); // 9:00 am

// Start in the afternoon and add hours beyond quitting time. Our
// schedule says the work day
// ends at 5:00pm, if the duration extends beyond that, we roll over to
the next work day.
// In this example we are adding 4 hours to 3:00pm which gives us 10:00
am the next day.
var gdt = new GlideDateTime("2012-05-03 15:00:00");
dc.setStartDateTime(gdt);
if(!dc.calcDuration(4*3600)) {
    gs.log("*** Error calculating duration");
    return;
} gs.log("Afternoon + 4 hour (with 8-5 schedule): " +
dc.getEndDateTime()); // 10:00 am.

// This is a demo of adding 2 hours repeatedly and examine the result.
This
// is a good way to visualize the result of a due date calculation.
var gdt = new GlideDateTime("2012-05-03 15:00:00");
dc.setStartDateTime(gdt);
for(var i=2; i<24; i+=1) {
    if(!dc.calcDuration(i*3600)) {
        gs.log("*** Error calculating duration");
        return;
    }
gs.log("add " + i +" hours gives due date: " + dc.getEndDateTime());
}

// Setting the timezone causes the schedule to be interpreted in the
specified timezone.
// Run the same code as above with different timezone. Note that the 8
to 5 workday is
// offset by the two hours as specified in our timezone.
dc.setTimeZone("GMT-2");
var gdt = new GlideDateTime("2012-05-03 15:00:00");
dc.setStartDateTime(gdt);
for(var i=2; i<24; i+=1) {
    if(!dc.calcDuration(i*3600)) {
        gs.log("*** Error calculating duration");
        return;
    }
gs.log("add " + i +" hours gives due date (GMT-2): " +
dc.getEndDateTime());
}

/**
 * Add a specific schedule to the DurationCalculator object.
 * @param durationCalculator An instance of DurationCalculator
 */
function addSchedule(durationCalculator) {
    // Load the "8-5 weekdays excluding holidays" schedule into our duration
calculator.
    var scheduleName = "8-5 weekdays excluding holidays";
    var grSched = new GlideRecord('cmn_schedule');
Using DurationCalculator to compute a simple duration

A simple duration is the number of seconds between two date times.

If no schedule is used then this is a simple time date subtraction. If a schedule is used, then the schedule is consulted to remove non-work hours from the computation. Suppose schedule "8-5 weekdays excluding holidays" is used. In this case, the number of work hours from noon Monday to noon Tuesday is nine hours. To compute a simple duration, initialize DurationCalculator and call the `calcScheduleDuration()` method.

This script demonstrates how to use DurationCalculator to compute a simple duration.

```java
/**
 * Sample script demonstrating use of DurationCalculator to compute simple durations
 */
gs.include('DurationCalculator');
executeSample();

/**
 * Function to house the sample script.
 */
function executeSample(){
    // First we need a DurationCalculator object.
    var dc = new DurationCalculator();

    // Compute a simple duration without any schedule. The arguments 
    // can also be of type GlideDateTime, such as fields from a GlideRecord.
    var dur = dc.calcScheduleDuration("2012-05-01", "2012-05-02");
    gs.log("calcScheduleDuration no schedule: " + dur); // 86400 seconds (24 hours)

    // The above sample is useful in limited cases. We almost always want to
    // use some schedule in a duration computation, let's load a schedule.
    addSchedule(dc);

    // Compute a duration using the schedule. The schedule 
    // specifies a nine hour work day. The output of this is 32400 seconds, 
    // or 
    // a nine hour span.
    dur = dc.calcScheduleDuration("2012-05-23 12:00:00","2012-05-24 
    12:00:00");
    gs.log("calcScheduleDuration with schedule: " + dur); // 32400 seconds (9 hours)

    // Compute a duration that spans a weekend and holiday. Even though this
    // spans three days, it only spans 9 work hours based on the schedule.
}
```

See the ServiceNow Developers site for API information.
dur = dc.calcScheduleDuration("2012-05-25 12:00:00", "2012-05-29 12:00:00");
gs.log("calcScheduleDuration with schedule spanning holiday: " + dur); // 32400 seconds (9 hours)

// Use the current date time in a calculation. The output of this is dependent on when you run it.
var now = new Date();
dur = dc.calcScheduleDuration("2012-05-15", new GlideDateTime());
gs.log("calcScheduleDuration with schedule to now: " + dur); // Different on every run.

/**
 * Add a specific schedule to the DurationCalculator object.
 *
 * @param durationCalculator An instance of DurationCalculator
 */
function addSchedule(durationCalculator){
   // Load the "8-5 weekdays excluding holidays" schedule into our duration calculator.
   var scheduleName = "8-5 weekdays excluding holidays";
   var grSched = new GlideRecord('cmn_schedule');
grSched.addQuery('name', scheduleName);
grSched.query();
if(!grSched.next()){
   gs.log('*** Could not find schedule "' + scheduleName + '"");
   return;
}
durationCalculator.setSchedule(grSched.getUniqueValue());
}

Using relative duration

Relative duration is very similar to simple duration except a piece of script is used to determine what parts of a day to remove from the difference calculation.

This script is stored in table cmn_relative_duration and can be examined by navigating to System Scheduler > Schedules > Relative Durations. There are some example relative duration scripts in the out-of-the-box instance.

A relative duration sys_id is passed to the method calcRelativeDuration() of the DurationCalculator class after initialization. When this method is called, the DurationCalculator object is passed to the relative duration script (stored in table cmn_relative_duration) as the variable calculator. So, the relative duration script you write and store in cmn_relative_duration has access to the executing DurationCalculator through the variable calculator.

The following script demonstrates how to use DurationCalculator to calculate a relative duration.

/**
 * Sample use of relative duration calculation.
 *
 */
gs.include('DurationCalculator');
executeSample();

/**
 * Function to house the sample script.
 */
function executeSample(){
   // First we need a DurationCalculator object. We will also use
```javascript
// the out-of-box relative duration "2 bus days by 4pm"
var dc = new DurationCalculator();
var relDur = "3bf802c20a0a0b52008e2859cd8abcf2"; // 2 bus days by 4pm if before 10am
addSchedule(dc);

// Since our start date is before 10:00am our result is two days from now at 4:00pm.
var gdt = new GlideDateTime("2012-05-01 09:00:00");
dc.setStartDateTime(gdt);
if(!dc.calcRelativeDuration(relDur)){
gs.log("*** calcRelativeDuration failed");
return;
}
gs.log("Two days later 4:00pm: "+ dc.getEndDateTime());

// Since our start date is after 10:00am our result is three days from now at 4:00pm.
var gdt = new GlideDateTime("2012-05-01 11:00:00");
dc.setStartDateTime(gdt);
if(!dc.calcRelativeDuration(relDur)){
gs.log("*** calcRelativeDuration failed");
return;
}
gs.log("Three days later 4:00pm: "+ dc.getEndDateTime());

/**
 * Add a specific schedule to the DurationCalculator object.
 * @param durationCalculator An instance of DurationCalculator
 */
function addSchedule(durationCalculator){
    // Load the "8-5 weekdays excluding holidays" schedule into our duration calculator.
    var scheduleName ="8-5 weekdays excluding holidays";
    var grSched =new GlideRecord('cmn_schedule');
grSched.addQuery('name', scheduleName);
grSched.query();
if(!grSched.next()){ gs.log("*** Could not find schedule "+ scheduleName +""");
return;
}
durationCalculator.setSchedule(grSched.getUniqueValue(),"GMT");
}
```}

**Using GlideRecord to query tables**

In order to query a table, first create an object for the table.

This object is called a GlideRecord. To create a GlideRecord, create the following in script:

```javascript
var target = new GlideRecord('incident');
```

This creates a variable called target which is a GlideRecord object for the incident table. The only parameter needed is the name of the table to be accessed.

To process all records from the incident table, add the following script:

```javascript
target.query(); // Issue the query to the database to get all records
while (target.next()) {
    // add code here to process the incident record
}
```
This issues the `query()` to the database. Each call to `next()` would load the next record which you would process and do whatever you want to do.

But that is not the common case. Most of the time you actually want to retrieve a specific record or a specific set of records, and you have some criteria (query conditions) that define the records you want to obtain. For example, say you want to obtain all the incident records that have a priority value of 1. Here is the code that would accomplish that.

```javascript
var target = new GlideRecord('incident');
target.addQuery('priority', 1);
target.query(); // Issue the query to the database to get relevant records
while (target.next()) {
    // add code here to process the incident record
}
```

Notice in the above code we added the line `target.addQuery('priority', 1);`. This is indicating that you only want the records where the priority field is equal to 1. We assume that the majority of queries that you will want to do will be equality queries, queries where you want to find records where a field is equal to a value. Therefore we provide this format of the query and do not make you specify that you want an equals operation, we just assume it. However, lets say you wanted to find all incidents where the priority field is GREATER THAN 1. In that case you have to provide us with the operator that you want to apply to priority and this is done by providing the operator in the `addQuery()` request as is shown below.

```javascript
var target = new GlideRecord('incident');
target.addQuery('priority', '>', 1);
target.query(); // Issue the query to the database to get relevant records
while (target.next()) {
    // add code here to process the incident record
}
```

### Available JavaScript operators

The table below contains the operators that can be supplied to the `addQuery()` request.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
<th>addQuery</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>=</code></td>
<td>Field must be equal to value supplied.</td>
<td><code>addQuery('priority', '=', 1);</code></td>
</tr>
<tr>
<td><code>&gt;</code></td>
<td>Field must be greater than value supplied.</td>
<td><code>addQuery('priority', '&gt;', 1);</code></td>
</tr>
<tr>
<td><code>&lt;</code></td>
<td>Field must be less than value supplied.</td>
<td><code>addQuery('priority', '&lt;', 3);</code></td>
</tr>
<tr>
<td><code>&gt;=</code></td>
<td>Field must be equal or greater than value supplied.</td>
<td><code>addQuery('priority', '&gt;=', 1);</code></td>
</tr>
<tr>
<td><code>&lt;=</code></td>
<td>Field must be equal or less than value supplied.</td>
<td><code>addQuery('priority', '&lt;=', 3);</code></td>
</tr>
<tr>
<td><code>!=</code></td>
<td>Field must not equal the value supplied.</td>
<td><code>addQuery('priority', '!=', 1);</code></td>
</tr>
<tr>
<td>Field</td>
<td>Definition</td>
<td>addQuery</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STARTSWITH</td>
<td>Field must start with the value supplied. The example shown on the right will get all records where the <em>short_description</em> field starts with the text Error.</td>
<td>addQuery('short_description', 'STARTSWITH', 'Error');</td>
</tr>
<tr>
<td>CONTAINS</td>
<td>Field must contain the value supplied somewhere in the text. The example shown on the right will get all records where the <em>short_description</em> field contains the text Error anywhere in the field.</td>
<td>addQuery('short_description', 'CONTAINS', 'Error');</td>
</tr>
<tr>
<td>IN</td>
<td>Takes a map of values that allows commas, and gathers a collection of records that meet some other requirement. Behaves as <code>Select * from &lt;table&gt; where short_description IN ('Error'), which is identical to </code>Select * from &lt;table&gt; where short_description='Error'. For example, to query all variable values that belong to a specific Activity, use the IN clause to query all Activities that are of that type, and store their sys_ids in a map, or comma-separated list. Then query the variable value table and supply this list of sys_ids.</td>
<td>addQuery('short_description', 'IN', 'Error,Success,Failure');</td>
</tr>
<tr>
<td>ENDSWITH</td>
<td>Field must terminate with the value supplied. The example shown on the right will get all records where the <em>short_description</em> field ends with text Error.</td>
<td>addQuery('short_description', 'ENDSWITH', 'Error');</td>
</tr>
<tr>
<td>DOES NOT CONTAIN</td>
<td>Selects records that do NOT match the pattern in the field. This operator does not retrieve empty fields. For empty values, use the operators &quot;is empty&quot; or &quot;is not empty&quot;. The example shown on the right will get all records where the <em>short_description</em> field does not have the word &quot;Error&quot;.</td>
<td>addQuery('short_description', 'DOES NOT CONTAIN', 'Error');</td>
</tr>
</tbody>
</table>
### Field: NOT IN

**Definition:**
Takes a map of values that allows commas, and gathers a collection of records that meet some other requirement. Behaves as: Select * from <table> where short_description NOT IN ('Error').

**addQuery**
```
addQuery('short_description', 'NOT IN', 'Error,Success,Failure');
```

**Description:**
Special operator that allows you to retrieve only records of a specified "class" for tables which are extended. For example when going after configuration items (cmdb_ci table) you many want to retrieve all configuration items that are have are classified as computers. The code to the right will do that.

**addQuery**
```
addQuery('sys_class_name', 'INSTANCEOF', 'cmdb_ci_computer');
```

---

There are also some special methods that can be used when you want to search for data that is NULL or NOT NULL. To search for all incidents where the `short_description` field has not been supplied (is null), use the following query:

```javascript
var target = new GlideRecord('incident');
target.addNullQuery('short_description');
target.query(); // Issue the query to the database to get all records
while (target.next()) {
    // add code here to process the incident record
}
```

To find all incidents in which a `short_description` has been supplied, use the following query:

```javascript
var target = new GlideRecord('incident');
target.addNotNullQuery('short_description');
target.query(); // Issue the query to the database to get all records
while (target.next()) {
    // add code here to process the incident record
}
```

For additional information see [GlideRecord()](#) on the ServiceNow Developer Site.

## GlideRecord query examples

These examples demonstrate how to perform various GlideRecord queries.

### query

```javascript
var rec = new GlideRecord('incident');
rec.query();
while(rec.next()) {
    gs.print(rec.number + ' exists');
}
```
### update

```javascript
var rec = new GlideRecord('incident');
rec.addQuery('active', true);
rec.query();
while (rec.next()) {
    rec.active = false;
    gs.print('Active incident ' + rec.number + ' closed');
    rec.update();
}
```

### insert

```javascript
var rec = new GlideRecord('incident');
rec.initialize();
rec.short_description = 'Network problem';
rec.caller_id.setDisplayValue('Joe Employee');
rec.insert();
```

### delete

```javascript
var rec = new GlideRecord('incident');
rec.addQuery('active', false);
rec.query();
while (rec.next()) {
    gs.print('Inactive incident ' + rec.number + ' deleted');
    rec.deleteRecord();
}
```

### Querying Service Catalog Tables

You cannot directly query the variables of the Service Catalog Request Item table [sc_req_item]. Instead, query the Variable Ownership table, [sc_item_option_mtom], by adding two queries, one for the variable name and another for the value. The query returns the many-to-many relationship, which you can dot-walk to the requested item. The following example finds the request items that have the variable `item_name` with a value of `item_value` and displays the request item numbers:

```javascript
var gr = new GlideRecord('sc_item_option_mtom');
gr.addQuery('sc_item_option.item_option_new.name', 'item_name');
gr.addQuery('sc_item_option.value', 'item_value');
gr.query();
while (gr.next()) {
    gs.addInfoMessage(gr.request_item.number);
}
```

For additional information see `GlideRecord()` on the ServiceNow Developer Site.

### Running order guides automatically

Service catalog order guides allow customers to make a single service catalog request that can generate several ordered items.
Administrators can configure order guides to run automatically, from a workflow or a script to generate a set of ordered items without manually submitting a service catalog request. For example, an onboarding workflow for a new employee can run an order guide to automatically order items for that employee.

**Running order guides from scripts**

Running order guides with a server-side script is more complex than using workflows, but it allows more flexibility and can be used in non-workflow situations.

For example, you can use order guide scripts with UI actions or server-side business rules.

**Note:** When order guides run automatically, order guide UI policies are not enforced. Also, options in the Choose Options screen cannot be selected, so make sure that order guide rules define sensible defaults for these options to avoid processing failures.

Use the `SNC.ScriptableOrderGuide` Java class to run order guides with a script.

Use the `SNC.ScriptableOrderGuide(String orderGuideId)` constructor to create a new `ScriptableOrderGuide` object.

**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>process(String json)</code></td>
<td>boolean</td>
<td>Runs the order guide using the JSON encoded string parameter as the input for the order guide. Returns true or false depending on whether processing was successful or not.</td>
</tr>
</tbody>
</table>

**Note:** Both opened_by and requested_for parameters must be passed to the order guide, and both must have valid user record sys_id values.

If processing is successful and a request is created by the order guide, you can retrieve the request GlideRecord using `getRequest`.

If the processing fails, you can retrieve the failure GlideRecord using `getFailure()`, then submit the script for reprocessing using `reprocess`. 
<table>
<thead>
<tr>
<th>Method</th>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reprocess(GlideRecord failure)</td>
<td>boolean</td>
<td>Runs the order guide again using the JSON encoded string parameter stored in the failure GlideRecord.</td>
</tr>
<tr>
<td>getMessage()</td>
<td>String</td>
<td>Retrieves the message populated after processing or reprocessing.</td>
</tr>
<tr>
<td>getRequest()</td>
<td>GlideRecord</td>
<td>Retrieves the request GlideRecord.</td>
</tr>
<tr>
<td>getFailure()</td>
<td>GlideRecord</td>
<td>Retrieves the failure GlideRecord from the Scriptable Order Guide Failures [sc_script_order_guide_failure] table.</td>
</tr>
</tbody>
</table>

### Script Example

This script processes an order guide called IT Onboarding SOG.

```javascript
// Creating the object to later be JSON encoded
var json = {
"opened_by": "62826bf03710200044e0bfc8bcbe5df1", "requested_for": "06826bf03710200044e0bfc8bcbe5d8a", "department": "221f3db5c6112284009f4becd3039cc9"};

var gr = new GlideRecord("sc_cat_item_guide");
if (gr.get("name","IT Onboarding SOG")) {
    var sog = new SNC.ScriptableOrderGuide(gr.getValue("sys_id"));
    var result = sog.process(new JSON().encode(json));
    if(!result)
        gs.log("Processing the scriptable order guide failed with message: " + sog.getMessage());
    else {
        var request = sog.getRequest();
        gs.log("Request created - " + request.sys_id); } }
```

### Running order guides from workflows

Running an order guide from a workflow is suitable if you include order guides as part of a broader workflow-based process.

For example, an activity within an onboarding workflow for a new employee can automatically run an order guide to order items for that employee.

**Note:** When order guides run automatically, order guide UI policies are not enforced. Also, options in the Choose Options screen cannot be selected, so make sure that order guide rules define sensible defaults for these options to avoid processing failures.

To run order guides from a workflow, use the Scriptable Order Guideworkflow activity.
Table 1366: Running Order Guides from Workflows

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order Guide</td>
<td>The name of the order guide that this activity processes. For example, Example Employee Onboarding IT.</td>
</tr>
<tr>
<td>Script</td>
<td>A script passing information to the order guide. This information is sent as a JSON encoded string parameter assigned to the answer variable.</td>
</tr>
</tbody>
</table>

The script must meet these requirements:
- The names of the variables in the script must match the names used within the order guide. For example, if the order guide uses a department variable in a rule condition, the script must also pass a department parameter.
- Both opened_by and requested_for parameters must be passed to the order guide, and both must have valid user record sys_id values.

Results

- Success: the activity successfully processed the order guide. This does not mean a request was created. If a request was created, the request sys_id is added to the workflow scratchpad under the sc_request variable.
- Failure: while processing the order guide a failure occurred, creating a failure record. If the processing fails, you can view and edit the failure record.

Workflow Example

The Example Employee Onboarding IT Workflow workflow uses this example to generate IT catalog items for a new employee as part of an onboarding process.

The activity uses this script to:
1. Take a JSON string generated previously from the HR change record.
2. Append the mandatory opened_by and requested_for parameters to that string.
3. Submit the new string for processing by the order guide.

```java
var parameters = new JSON().decode(current.payload);
// Need to amend the json object to include additional values.
parameters.opened_by = current.opened_by + "";
parameters.requested_for = current.opened_for + "";
answer = new JSON().encode(parameters);
```
Viewing order guide failures

Order guide processing may fail, for example if the order guide being run does not exist.

If a failure occurs, a failure record is created in the Scriptable Order Guide Failures table.

To view details of a failure, navigate to Service Catalog > Catalog Policy > Scriptable Order Guide Failures, then open a failure record.

Reprocessing Failures

If you have fixed the error that caused the initial failure, you can reprocess failed order guides.

2. Open the failure record.
3. Click the Reprocess related link.

To reprocess one or more failures:

2. Select the check box beside one or more records to reprocess.
3. Select Reprocess from the Actions choice list.

Scriptable assignment of execution plans

Each catalog item has an associated execution plan, used whenever an item of that type is ordered; if no plan is specified, the default plan is used. This default is effective for most organizations, but your execution plan may need to vary based on additional criteria.

For example, in the base system service catalog, a request for a new PC always uses the PC Delivery Plan. However, this plan may need to vary for unusual circumstances - such as when a requester is working from home, at a remote location.

To provide this flexibility, you can use a script to override the default execution plan on a specific catalog item.

Limitations during script execution

Execution plan scripts have limitations that need to be considered during their implementation.

While the execution plan script runs:

- You cannot interact with any catalog tasks as catalog tasks are only created after the execution plan is selected.
- Some fields such as total delivery time and due date are not yet calculated, although the request itself is available within the script via current.request().
- Approvals have not yet been generated.

Writing the scripts

Follow these guidelines when writing execution plan scripts.

Execution plan scripts can access the same global variables and other functions as in any other server side execution plan.

- current is the currently-requested catalog item, sc_req_item.
- current.delivery_plan() is the assigned execution plan for this catalog item.
The evaluated value from the script is used as the sys_id of the execution plan.

Simple example:

```javascript
current.delivery_plan.setDisplayValue('PC Delivery Plan')
```

If an invalid value is returned, such as undefined or not found, then the existing assigned value is used.

More complex example:

```javascript
getexecutionplan();
function getexecutionplan() {
  var location = current.request.requested_for.location.getDisplayValue();
  // if we're in Atlanta
  if (location == 'Atlanta') {
    // use the remote pc delivery plan instead of the normal one
    var remote_plan = new GlideRecord('sc_cat_item_delivery_plan');
    remote_plan.addQuery('name', 'Remote PC Delivery Plan');
    remote_plan.query();
    remote_plan.next();
    current.delivery_plan = remote_plan.sys_id;
    return remote_plan_sys_id;
  }
  return current_delivery_plan;
}
```

In this example, any time a request is for a user in Atlanta, ServiceNow uses the Remote PC Delivery Plan. Otherwise, the execution plan is not overridden and ServiceNow uses the catalog item's normal execution plan, the PC Delivery Plan.

### Add a script to a catalog item

You can add a script to a catalog item so that the script runs each time a user requests that item.

1. Navigate to **Service Catalog > Maintain Items**.
2. Select the relevant catalog item to which you wish to add the script.
3. Configure the catalog item form to add the execution plan script field, often named **Delivery Plan Script**.
4. Fill in the script details.
5. Update the item form with your changes.

The script runs each time that item is requested, selecting the execution plan to run with that item.
Scriptable service catalog variables

You can use scripting to reference any variables used by a request item from any table.

An example of a variable reference follows.

```javascript
current.variables.<variable_name>
```

Where `current` refers to the current record, and `<variable_name>` is the name of your variable.

**Note:** In order to reference a variable from JavaScript, it must have a name.

---

**Print a variable**

```javascript
var original = current.variables.original_number;
gs.print(original);
```

**Set a variable**

```javascript
current.variables.name = "Auto-Generated:" + current.variables.asset_tag;
```

**Create an inventory item with fields set from variables**

```javascript
doCreation();

function doCreation ( ) {
    var create = current.variables.create_item;
    if (create == 'true') { // we want to create an asset
        var computer = new GlideRecord('cmdb_ci_computer');
        computer.initialize();
        computer.asset_tag = current.variables.asset_tag;
        computer.serial_number = current.variables.serial_number;
        computer.name = current.variables.name;
        computer.manufacturer = current.variables.company;
        computer.insert();
    } }
```

---

**Notes and limitations**

1. You can only *set* a variable in a *before* business rule. Variables set in an *after* rule are not written to the database.

2. There is nothing in place to prevent namespace collision with variables. Creating two variables named `computer_speed` would result in only one of them showing up; the second one would overwrite the first one.

3. Date/time variables use the same time zone formatting and storage rules as all other dates in the system. They are stored internally in GMT, but translated into the user's local time zone and format for display.
Scripting currency and price fields

Administrators can use currency and price fields in scripts.

You can obtain currency values using:

- getReference methods: apply to the system's base currency, when the item was created for the service catalog.
- getCurrency methods: apply to the currency used by the customer who ordered the item.
- getSession methods: apply to the currency of the currently logged-in user viewing the item, for example, a member of a fulfillment group processing the order.

Working with values

Altering values

You cannot simply add an integer to the return values, as they are returned as string values.

For example, with a current.price of 708.32, current.price + 100 returns a value of 708.32100.

You can use a parseFloat function in your script to provide the correct result. For example, parseFloat(current.price) + 100 will return 808.32.

Returning predictable values

Adding values to prices with scripts can be unpredictable. For example, consider a script which adds 100 to the price of our item.

```javascript
var newPrice = parseFloat(current.price) + 100;
```

Running that script in the UK returns a value of var newPrice = parseFloat(708.32) + 100 = 808.32.

However, if you run it in the US, this returns a value of var newPrice = parseFloat(1000) + 100 = 1100.

To get the predictable values back into our item, regardless of the session under which the script runs, you can write your scripts to run in the system's base currency.

For example:

```javascript
var newPrice = parseFloat(current.price.getReferenceValue()) + 100;
current.price = current.price.getReferenceCurrencyCode() + ',' + newPrice;
```

**Note:** This example still relies upon knowing what the base currency is, for the 100 to be meaningful.

Obtaining currency values

The following methods allow you to obtain currency values.

The Example value returned column shows details for an item:

- Created with an item price of $600 in a system base currency of USD (US dollars)
- Ordered by a British user in the GBP (British pounds) currency
- Viewed and fulfilled by a Spanish user in the EUR (Euro) currency

<thead>
<tr>
<th>Method Name</th>
<th>Description</th>
<th>Example value returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.price.getReferenceCurrencyCode()</td>
<td>The currency ISO code, in the base system currency.</td>
<td>USD</td>
</tr>
<tr>
<td>current.price.getReferenceDisplayValue()</td>
<td>The price, including the currency symbol, in the base system currency.</td>
<td>$600.00</td>
</tr>
<tr>
<td>current.price.getReferenceValue()</td>
<td>A string representation of the field's value, in the system's basis currency.</td>
<td>600</td>
</tr>
<tr>
<td>current.price.getSessionCurrencyCode()</td>
<td>The currency ISO code, in the current user's currency.</td>
<td>EUR</td>
</tr>
<tr>
<td>current.price.getSessionDisplayValue()</td>
<td>A string representation of the field's value, including the currency symbol, in the current user's currency.</td>
<td>€449,75</td>
</tr>
<tr>
<td>current.price.getSessionValue()</td>
<td>A string representation of the field's value, in the current user's currency.</td>
<td>449,75</td>
</tr>
<tr>
<td>current.price.getCurrencyCode()</td>
<td>The currency ISO code, in the currency used when the item was ordered.</td>
<td>GBP</td>
</tr>
<tr>
<td>current.price.getCurrencyDisplayValue()</td>
<td>A string representation of the field's value, including the currency symbol, in the currency used when the item was ordered.</td>
<td>£373.83</td>
</tr>
<tr>
<td>current.price.getCurrencyString()</td>
<td>A string including the ISO code as well as the price, in the currency used when the item was ordered.</td>
<td>GBP;373.83</td>
</tr>
<tr>
<td>current.price.getCurrencyValue()</td>
<td>The price, in the currency used when the item was ordered.</td>
<td>373.83</td>
</tr>
</tbody>
</table>

**Note:** Currency symbols are displayed on the left or the right of the currency as appropriate.

**Examples**

```
current.price=1000
```
This sets the current price = 1,000 of whatever the current session currency is. For example, for a Japanese user, the price is JPY (Japanese Yen) 1,000.

```
current.price='USD;1000'
```

Sets the current price = 1,000 USD.

**Service catalog script API**

A scriptable API for the service catalog makes it easier to order from the catalog when using business rules.

The `Cart()` API allows you to order any quantity of catalog items, using the `sys_id` of the Catalog Item `[sc_cat_item]` you want. You can then set catalog variables to values as required, assuming the variables have names.

**Note:** If the script runs as a result of a scheduled import, the script runs as system or as the user specified by that import in the **Run as** field. The script uses the specified user’s cart. Each instantiation of a new `Cart()` object empties the cart of the calling user, but does not use or empty any other carts.

**Examples**

Ordering a single BlackBerry:

```
var cartId = GlideGuid.generate(null);
var cart = new Cart(cartId);
var item = cart.addItem('e2132865c0a8016500108d9cee411699');
var rc = cart.placeOrder();
gs.addInfoMessage(rc.number);
```

Ordering twelve BlackBerries:

```
var cartId = GlideGuid.generate(null);
var cart = new Cart(cartId);
var item = cart.addItem('e2132865c0a8016500108d9cee411699',12);
var rc = cart.placeOrder();
gs.addInfoMessage(rc.number);
```

Ordering an executive desktop and setting its OS:

```
var cartId = GlideGuid.generate(null);
var cart = new Cart(cartId);
var item = cart.addItem('e46305bdc0a8010a00645e608031eb0f');
cart.setVariable(item,'os','Linux Red Hat');
var rc = cart.placeOrder();
gs.addInfoMessage(rc.number);
```

**Setting a GlideRecord variable to null**

GlideRecord variables (including current) are initially null in the database. Setting these back to an empty string, a space, or the JavaScript null value will not result in a return to this initial state.

**Note:** This functionality requires a knowledge of JavaScript.
Note: Functionality described here requires the Admin role.

To set it back to the initial state, simply set the value to "NULL". Note that the update() function does not run on the current object but rather on the record. The object displays the initial value until it is called again from the record.

Example 1

```javascript
var gr1 = new GlideRecord('incident');
gr1.query();
while(gr1.next()) {
  gr1.priority = "NULL";
  gr1.update();
}
```

Example 2 (Business Rule)

```javascript
current.u_affected_value = 'NULL';
current.update();
```

Use a script to approve an execution plan

You can use an approval rule script to approve an execution plan.

1. Retrieve an approval execution plan task.
2. View the Approval Script field.
3. Fill in an approval script using the same syntax and rules you would use on an approval rule.

For example, in the script below, the requestor's manager is the approver.

```
var request = current.request_item.request;
var rc = request.requested_for.manager;
rc;
```
Wizard scripts

You can create scripts to implement advanced custom functionality using wizards.

Use wizard scripts in record generator panels, transitions, and UI policies.

**Note:** The System Wizards application is not active by default.

To reference a wizard variable in a script, use the format `wizard.<name>`, where `<name>` is the value in the Name field of the variable definition.

Wizard script examples

These examples demonstrate scripts that use wizard variables.

**Example 1**

```javascript
//Find a user in the sys_user table with the wizard variable 'EmpName'
function getUser() {
    var gu = new GlideRecord('sys_user');
    gu.addQuery('sys_id', wizard.EmpName);
    gu.query();
    if (gu.next()) {
        gs.addInfoMessage('Found user ' + gu.name);
    }
}
```

**Example 2**

```javascript
//Loop through items in a wizard list collector with variable name astList
function removeAssets() {
    var items = wizard.astList.toString();
    items = items.split(',');
    for (var i = 0; i < items.length; i++) {
        // got the asset id
        var sys_id = items[i];
    }
}
```

**Example 3**

```javascript
//Set the url on wizard completion - user will be redirected to this location
var uri = ('sys_user_list.do?sysparm_query=sys_id=' + wizard.EmpName);
wizard.redirect = uri;
```

Wizard scripts on record generators

Use wizard scripts in record generator panels to create records in any table, including on more than one table.

1. In the **Table** field, select **Global**.
2. Enter a script in the **Script** field. Configure the form to add the field, if necessary.
Client scripts

Client scripts run on the client (web browser). You can use client scripts to define custom behaviors that run when events occur such as when a form is loaded or submitted, or a cell changes value.

Proper client-side processing depends on the form loading completely first. Making record updates prior to form load can produce unexpected results that bypass client-side processing.

Client-side Glide APIs (Application Programming Interfaces) provide classes and methods that you can use in scripts to perform client-side tasks.

Client script basics

Review the basics of ServiceNow platform client scripting.
Client script types on page 3901
Client script access to variable fields on task records on page 3902

- Introducing Jelly Scripting - Part 2 (Video)
- Introducing Jelly Scripting - Part 3 (Video)

Client script types

Client scripts are shipped to the client (the browser) and run there instead of on the server.

Users who know JavaScript can define scripts to run in the client browser. Several types of scripts are supported:

- **onLoad()**: Runs when a form is loaded.
- **onChange()**: Runs when a particular widget changes value.
- **onSubmit()**: Runs when a form is submitted.
- **onCellEdit()**: Runs when a cell on a list changes value.

**Note:** Best practice for performance reasons is to limit the amount of code sent to the client. You should always be aware of the impact on the client when adding client scripts.

**Warning:**

- Warning:
  - With the exception of onCellEdit client scripts, UI policies and client scripts apply to forms only. If you create UI policies or client scripts for fields on a form, you must use another method to ensure that data in those fields is similarly controlled in a list. You can:
    - Disable list editing for the table.
• Create appropriate business rules or access controls for list editing.
• Create data policies.
• Create a separate onCellEdit client script.

Client script access to variable fields on task records

Variable fields may be accessed via client script on records that are based on the task record.

The most obvious use for this is making Service Catalog variables conditionally display and function in the same way as they did when initially creating an order when they subsequently appear on Request [sc_request], Requested Item [sc_req_item], and Catalog Task [sc_task] records.

The following API is supported via g_form:

- g_form.setDisplay(name, display)
- g_form.setVisible(name, visibility)
- g_form.setMandatory(name, mandatory)
- g_form.setValue(name, value, display_value)
- g_form.getValue(name)
- g_form.setReadOnly(fieldName, boolean)

To specify that a variable is to be the object of the API call, the name must be prefixed with "variables.". This is necessary as another field that is not a variable but has the same name may already be present on the form.

For example, if we ordered an Executive Desktop using the out-of-box Service Catalog, we could add a client script to the Request Item [sc_req_item] to disable the display of the "cpu_speed" variable one would create a client script containing:

```
g_form.setDisplay("variables.cpu_speed", false);
```

Hiding mandatory variables

To hide a mandatory variable using a script, the script must first set the mandatory property of the variable to false.

Client script FAQ

Frequently asked questions and answers regarding client scripting.

Why do I have to name scripts like that?

The client code needs to know which function to attach to the document. Hence, it requires that you follow our naming convention with functions. Note that you can have more than one function on a client side script and have your onSubmit() function, for example, call other functions. The requirement is that the primary function follow our naming convention.

Can I have more than one function listening to the same thing?

You can, but there is no guarantee of sequencing. You cannot predict what order your event handlers will run.

How do I reference a field on the form?

To reference the actual HTML element of the priority field on the incident form:

```
var priority_field = g_form.getControl('priority');
```
The easiest way to reference a field's value is to use the built-in `g_form()` helper variable:

```javascript
var value_of_priority = g_form.getValue('priority');
```

**How do I cancel a form submission?**

Have your `onSubmit()` function return `false`. For example the following snippet of code disallows all form submission.

```javascript
function onSubmit() { return false; }
```

**How do I confirm a field value with the user?**

```javascript
function onSubmit() { //This allows you to access fields from the referenced record
    var assignedTo = g_form.getReference('assigned_to');
    var answer = confirm("The Assigned to is " + assignedTo.user_name + ". Is this correct?");
    if(answer == true) { return false; }
}
```

**How do I force a Save and Stay?**

```javascript
// onChange event on Incident table using Field name "Caller"
function onChange(control, oldValue, newValue, isLoading) {
    // Setting the control value prevents against an infinite loop
    // Change caller_id to the field the change event reacts to
    if(control.caller_id != newValue && control.caller_id != null) {
        //do any comparisons you want
        // . . . //
        //does an update and stay
        gsftSubmit(document.getElementById('sysverb_update_and_stay')); }

    // Change caller_id to the field the change event reacts to
    control.caller_id = newValue; }
```

**How do I call a business rule from a client script?**

To call a business rule from a client script, use `GlideAjax()`.

**Client script form**

Field descriptions for the client script form.

To open the client script form, navigate to **System Definition > Client Scripts**.

You can add client scripts only on tables that are in the same scope as the client script (starting with the Fuji release).
Figure 938: Client script form

The client script form provides the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique, descriptive name for this script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this client script (starting with the Fuji release).</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the script is active.</td>
</tr>
<tr>
<td>Global</td>
<td>Indicator of whether the script applies to all views. When <strong>Global</strong> is selected, the script runs regardless of what view is being displayed. When <strong>Global</strong> is not selected, this script runs only if the current view matches the script's view.</td>
</tr>
<tr>
<td>View</td>
<td>View to which the script applies. This option is available only if <strong>Global</strong> is not selected.</td>
</tr>
</tbody>
</table>
| Type         | Indicator of when the script runs. Select one of the following types:  
  • **onLoad()**: when a form is first loaded.  
  • **onSubmit()**: when a form is submitted. This type allows you to cancel the submission, if necessary.  
  • **onChange()**: when a specified field on the form changes value.  
  • **onCellEdit()**: when a user interacts with a specified field in a list.                                                                 |
| Table        | Table or database view to which this script applies, such as incident or change_request.                                                                                                                |
| Inherited    | Indicator of whether this script applies to any extended tables. For example, if the script is active on the task table, selecting **Inherited** runs this script on the incident, change_request, and problem tables, as well. |
| Field name   | Field to which the script applies. This option is available only if **Type** is set to **onChange()**.                                                                                                         |
| Description  | Detailed description of the client script.                                                                                                                                                                |

**Note:** The list shows only tables and database views that are in the same scope as the client script (starting with the Fuji release).
Create a catalog client script

Follow this procedure to create a catalog client script.

1. Navigate to Service Catalog > Catalog Policy > Catalog Client Scripts. A list of current custom catalog client scripts appears.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the catalog client script.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the item type this client script applies to:</td>
</tr>
<tr>
<td></td>
<td>• A Catalog Item: enables the Catalog item field.</td>
</tr>
<tr>
<td></td>
<td>• A Variable Set: enables the Variable set field.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the client script. Clear the check box to</td>
</tr>
<tr>
<td></td>
<td>disable the script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UI Type</td>
<td>Whether to apply this to desktop, mobile, or both.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the client script that should run on the service catalog item.</td>
</tr>
<tr>
<td>Type</td>
<td>Select when the script should run, such as <strong>onLoad</strong> or <strong>onSubmit</strong>.</td>
</tr>
<tr>
<td>Catalog item or Variable set</td>
<td>Select a catalog item or variable set from the list. The field name and options available depend on the selection in the <strong>Applies to</strong> field.</td>
</tr>
<tr>
<td>Applies on a Catalog Item view</td>
<td>Select the check box to apply the catalog client script to catalog items displayed within the order screen on the service catalog.</td>
</tr>
<tr>
<td>Applies on Requested Items</td>
<td>Select the check box to apply the catalog client script on a Requested Item form, after the item is requested.</td>
</tr>
<tr>
<td>Applies on Catalog Tasks</td>
<td>Select the check box to apply the catalog client script when a Catalog Task form for the item is being displayed.</td>
</tr>
</tbody>
</table>

**Catalog client script creation**

Client-side scripts can add dynamic effects and validation to forms. Scripts can apply to service catalog items or variable sets, allowing administrators to use the same functionality that is available on other forms.

You can use client side scripts to:

- Get or set variable values.
- Hide or display variables.
- Make variables mandatory or not.
- Validate form submission.
- Add something to the cart.
- Order something immediately.

**Catalog client script considerations**

When you create catalog client scripts, be aware of the following considerations.

- Catalog client scripts run when a user orders an item from the service catalog. Catalog client scripts can also run when variables or variable sets for a catalog item are displayed when a user requests that item.
- For a variable to be accessible using a catalog client script, it must have a variable name. Variables without names do not appear in the list of available variables.
- When using standard client scripts on a Requested Item or Catalog Task form, make a note of fields with the same name as variables. If a table field and a variable of the same name are both present on a form, the table field is matched when it is accessed using a script. If this happens, specifically address the variable by naming it `variables.variable name`. For example:
  ```javascript
  g_form.setValue('variables.replacement', 'false');
  ```
- If you are using record producers to pass variables from the service catalog to other types of records, these variables are made visible in those records with a variable editor, such as the Change Variable Editor UI formatter on Change request forms. You can manipulate these variables using standard client script methods, such as `setDisplay`, `setMandatory`, `setValue`, and `getValue`.
- Catalog client scripts can be used for catalog items included in a wizard.
Catalog client script differences
Catalog client scripts are very similar to standard client scripts, with a few important differences.

<table>
<thead>
<tr>
<th>Instead of selecting a table such as Incident for the script, select a catalog item or variable set. As your system may have a large number of catalog items, you should select a catalog item or variable set using a reference field instead of the choice list that the standard Client Script form uses.</th>
</tr>
</thead>
<tbody>
<tr>
<td>When using an onChange() catalog client script, it is linked to a particular variable instead of a field. The system automatically populates the variable name selection list with any named variables from the catalog item or variable set selected.</td>
</tr>
</tbody>
</table>

Catalog client script examples
Examples of client scripts to perform common actions.

**Get the value of a variable**
Use the following syntax to obtain the value of a catalog variable. Note that the variable must have a name. Replace `variable_name` with the name of the variable.

```javascript
g_form.getValue('variable_name');
```

**Restrict the number of characters a user can type in a variable**
This is an example of a script that runs when the variable is displayed, rather than when the item is ordered.

```javascript
function onLoad() {
  var sd = g_form.getControl('short_description');
  sd.maxLength=80;
}
```

Displaying a custom dialog
Using `GlideDialogWindow()`, you can write a script to open a custom dialog.

A GlideDialogWindow can be displayed anywhere you use client scripts, UI macros, or UI actions. These are most commonly called from a UI action with the `Client` check box selected.

For reference information on the available `GlideDialogWindow()` methods, see *GlideDialogWindow()* API reference.

**GlideDialogWindow basics**

Your script should accomplish the following tasks to display a dialog window:

- Initialize the window by calling `GlideDialogWindow(id)`.
- Specify the table to display in the dialog with `setPreference(name, value)`.
- Display the dialog using `render()`.

You can call `setTitle(title)` and `setSize(w,h)` to specify the window title and size. If you do not call `setTitle(title)`, the dialog is created without a title displayed in the title bar. You can also define a UI page to display in the dialog window and pass the result back to the calling window.
Displaying a list of records

This example opens a list of incidents in a dialog window. When the user selects an item in the dialog window, that item is opened in the calling window or, if the user clicks the close box, the window closes.

To trigger the dialog window, define a UI action or UI macro with a script that initializes the dialog, references the UI page, and renders the dialog window. In this example, a UI action to define and trigger the dialog window was created with the following attributes and script:

- **Name**: Popup Display List
- **Table**: Incident
- **Action name**: popup_display_list
- **Form button**: True
- **Client**: True
- **Onclick**: popupDispList()

```javascript
function popupDispList() {
    // Initialize the GlideDialogWindow
    var gdw = new GlideDialogWindow('display_incident_list');
    gdw.setTitle('Incidents');
    gdw.setPreference('table', 'incident_list');
    gdw.setPreference('sysparm_view', 'default');

    // Set the table to display
    var num = g_form.getValue('number');
    var query = 'active=true^priority=1^number!=' + num;
    gdw.setPreference('sysparm_query', query);

    // Open the dialog window
    gdw.render();
}
```

Opening a custom UI page in a dialog window

This is an example of how to use GlideDialogWindow() to open a custom UI page in a dialog window and pass the results back to the calling window.

To accomplish this, you will need to create the following:

- A trigger to open the dialog window and reference the UI page.
- A UI page with HTML and client script definitions.
- A script include to escape reserved characters in XML.

Defining the trigger

To trigger the dialog window, define a UI action or UI macro with a script that initializes the dialog, references the UI page, and renders the dialog window.

In this example, the following UI action triggers the dialog window:

- **Name**: Comments Dialog
- **Table**: Incident
- **Action name**: comments_dialog
function commentsDialog() {
    // Get the values to pass into the dialog
    var comments_text = g_form.getValue("comments");
    var short_text = g_form.getValue("short_description");

    // Initialize and open the dialog
    var dialog = new GlideDialogWindow("add_comments_dialog"); // Instantiate the dialog containing the UI page 'add_comments_dialog'
    dialog.setTitle("Add Task Comments"); // Set the dialog title
    dialog.setPreference("comments_text", comments_text); // Pass the comments into the dialog
    dialog.setPreference("short_text", short_text); // Pass in a short description for use in the dialog
    dialog.render(); // Open the dialog
}

The script obtains the values to pass to the dialog, calls the JSUtil script include to escape any content, initializes the dialog attributes, and displays the dialog.

**Defining the UI page**

In addition to the trigger that opens the dialog window, you will need to define the UI page to display in the dialog window. The UI page name must match the GlideDialogWindow that is instantiated in the trigger script. The example triggering script in the previous section creates a dialog window "add_comments_dialog" so the UI page is named "add_comments_dialog".

The following example UI page is displayed in the dialog window to add comments to an incident. See [Extensions to Jelly Syntax](#) for information on the ServiceNow extensions to Jelly. To obtain the window properties from the triggering script defined by the setPreference() method into the UI page, use RP.getWindowProperties() in the HTML script.

**Note:** For scoped applications, the RP.getWindowProperties.get() method is not available. Instead use the syntax RP.getWindowProperties.<property>, where <property> is the dialog box property that you want to obtain. For example, RP.getWindowProperties().get('title') would be RP.getWindowProperties().title.

**HTML script**

```html
<g:ui_form>
    <!-- Get the values from dialog preferences -->
    <g:evaluate var="jvar_short_text"
        expression="RP.getWindowProperties().get('short_text')" />
    <g:evaluate var="jvar_comments_text"
        expression="RP.getWindowProperties().get('comments_text')" />
    <!-- Set up form fields and labels -->
    <table width="100%"
        <tr id="description_row" valign="top">
            <td colspan="2">
                <!-- Short description value used as a label -->
            </td>
        </tr>
```

© 2017 ServiceNow. All rights reserved. 3910
Client script

The following is an example of a client script that is called when the OK button is clicked in the dialog window. The script checks if there is data in the dialog and, if so, closes the dialog window and pass the comments entered in the dialog window into the Comments field of the original form.

```javascript
function validateComments() {
  // This script is called when the user clicks "OK" in the dialog window
  // Make sure there are comments to submit
  var comments = gel("dialog_comments").value;
  var ga = new GlideAjax('validateComments'); // Call script include to escape text
  ga.addParam('sysparm_name', 'validateComments');
  ga.addParam('sysparm_comments', comments);
  ga/XMLWait();
  comments = ga.getAnswer(); // Set comments to escaped text
  comments = trim(comments);
  if (comments == "") {
    // If comments are empty, alert the user and stop submission
    alert("Please enter your comments before submitting.");
    return false;
  }
  // If there are comments, close the dialog window and submit them
  GlideDialogWindow.get().destroy(); // Close the dialog window
  g_form.setValue("comments", comments); // Set the "Comments" field with comments in the dialog
}
```
Script Include

To escape out XML-reserved characters from the content users enter into the custom dialog, create this script include.

- **Name**: validateComments
- **Client callable**: True
- **Script**:

```javascript
var validateComments = Class.create();
validateComments.prototype = Object.extendObject(AbstractAjaxProcessor, { 
    validateComments: function() { 
        var comments = this.getParameter('sysparm_comments');
        var ampRegex = new SNC.Regex('/&/');
        var ltRegex = new SNC.Regex('/</');
        var gtRegex = new SNC.Regex('/>/');

        var result = ampRegex.replaceAll('' + comments, '&' + 'amp;');
        result = ltRegex.replaceAll(result, '&' + 'lt;');
        return gtRegex.replaceAll(result, '&' + 'gt;');
    },
    type: 'validateComments'
});
```

Session client data

Session client data is a set of named strings sent from the server to the client when a form loads. Client scripts can store this data gathered from the server during form load, which is faster than an AJAX call to the server when the data is needed.

**Note**: To use session client data, the form must be configured to add the Synchronous field, which requires special setup by a TSE to enable the necessary synchronous event processing.

Using session client data

A script can use session client data to determine a user’s groups and group roles while the session is established. Session client data provides this information to the client script without requiring an AJAX call, thereby speeding up form load time.

When a session is established, a `session.established` event is added to the event queue. A script action that responds to this event can be written to set up any necessary client data for the session, as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Suggested Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Set session client values</td>
</tr>
<tr>
<td>Event name</td>
<td><code>session.established</code></td>
</tr>
<tr>
<td>Active</td>
<td>Checked</td>
</tr>
</tbody>
</table>
The GlideSession API includes:

```javascript
putClientData(name, value);
getClientData(name);
clearClientData(name);
```

When a form is created on the server, the Session Client Values are read and added to the `g_user` object that is created on the client. From any client script, you can use this JavaScript to get the client session data:

```javascript
var v = g_user.getClientData('test1');
```

In this case, the variable `v` has a value of `value1`.

For examples from a ServiceNow product principal on how you can reduce client-side lookups, see the Two ways to Reduce Client Side lookups blog post in the ServiceNow Community.

UI scripts

UI scripts provide a way to package client-side JavaScript into a reusable form, similar to how script includes store server-side JavaScript. Administrators can create UI scripts and run them from client scripts and other client-side script objects and from HTML code.

Create a UI script

Create a UI script to define reusable client-side JavaScript code.

To create UI scripts, navigate to System UI > UI Scripts and create or edit a record (see table for field descriptions).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script Name</td>
<td>Name of the UI script. Ensure the name is unique on your system.</td>
</tr>
<tr>
<td>API Name</td>
<td>The API name of the UI script, including the scope and script name (for example, x_custom_app.HelloWorld).</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains the UI script.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the UI script is active. Only active UI scripts can run.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Global</td>
<td>Indicator of whether the script loads on every page in the system.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Use caution when creating global UI scripts because they can impact performance. You cannot create a global UI script in a scoped application.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary of the purpose of the script.</td>
</tr>
<tr>
<td>Script</td>
<td>Client-side script to run when called from other scripts.</td>
</tr>
</tbody>
</table>

**Run UI scripts**
Follow these guidelines when running UI scripts.

To run a UI script on a form, create a formatter. In the associated UI macro, include a `g:requires` tag and specify the `name=` parameter as the name of the UI script followed by the `.jsdbx` extension. Add the formatter on the form view.

This code ensures that the definitions and results of the UI script are immediately available in the browser.

```xml
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null">
    <g2:evaluate var="jvar_stamp">
        var gr = new GlideRecord('sys_ui_script');
        gr.orderByDesc('sys_updated_on');
        gr.query();
        gr.next();
        gr.getValue('sys_updated_on');
    </g2:evaluate>
    <g:requires name="<UI SCRIPT NAME>.jsdbx" params="cache="$[jvar_stamp]" / >
</j:jelly>
```

To run a UI script from HTML code, use the `<script>` tag and specify the `src=` argument as the name of the UI script followed by the `.jsdbx` extension. For example, include the UI script named CoolClock with this code:

```html
<script language="javascript" src="CoolClock.jsdbx" /></script>
```

**Global UI scripts**
You can create a UI script and designate it as global, which makes the script available on any form in the system. You cannot create a global UI script in a scoped application.

You can mark a UI script as Global to make it available on any form in the system. You cannot create a global UI script in a scoped application. For example, you can create a UI script that has a function `helloWorld()`, and has the Global field checked:

```javascript
function helloWorld() {
    alert('Hi');
}
```
After you create this global UI script, you can call the `helloWorld()` function from any client script or UI policy you write.

**Wizard UI policy and client scripts**

Administrators and users with appropriate access rights can create dynamic effects for wizards using UI policies and client scripts, including:

- Get or set variable values
- Hide or display variables
- Make variables mandatory
- Validate form submission

UI policies apply effects based on conditions constructed with a condition builder. Client scripts accomplish more advanced functionality. Because UI policies do not require scripting, they are less likely to need maintenance after system updates.

**Note:** The System Wizards application is not active by default.

**Wizard UI policy**

UI policies can be applied to wizards.

1. Navigate to System Wizards > Wizard Policy > Wizard UI Policy.
2. Click New or select the policy to edit.
3. Enter the UI policy details and save the record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wizard</td>
<td>Select the wizard to which the UI Policy applies</td>
</tr>
<tr>
<td>Reverse if false</td>
<td>Select the check box to reverse the UI policy if the wizard condition statement evaluates to false.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the sequence in which this condition is evaluated if more than one matching condition exists. The order is evaluated from the lowest value to the highest value.</td>
</tr>
<tr>
<td>Global</td>
<td>This field is not used for wizards.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a brief description.</td>
</tr>
<tr>
<td>Wizard Conditions</td>
<td>Create conditions for the UI policy using wizard variables. The policy is applied if the conditions evaluate to true.</td>
</tr>
<tr>
<td>On load</td>
<td>Select the check box to apply the UI policy when the form is loaded. Clear the check box to apply the policy only when the form is changed.</td>
</tr>
</tbody>
</table>
Field | Input Value
--- | ---
Run scripts | Select the check box to use the Execute if true and Execute if false scripting fields. Scripts are necessary to apply a UI policy other than Read Only, Mandatory, or Visible. For example, you must create a script to apply a UI policy for a specific role.
Active | Select the check box to enable the UI policy. Clear the check box to disable it.
Inherit | Select the check box for other tables to inherit the UI policy. This option only applies to custom tables that extend the expert_ui_policy table.

**Wizard client scripts**
Wizard client scripts can create advanced dynamic effects.

The following table summarizes differences between standard and wizard client scripts.

<table>
<thead>
<tr>
<th>Standard client scripts</th>
<th>Wizard client scripts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply to specific table</td>
<td>Apply to specific wizard and panel</td>
</tr>
<tr>
<td>Apply to specific field in the table</td>
<td>Apply to specific variable in the wizard</td>
</tr>
</tbody>
</table>

**Note:** Variables must have a name to be accessible in client scripts.

1. Navigate to **System Wizards > Wizard Policy > Wizard Client Scripts**.
2. Click **New** or select the client script to edit.
3. Enter the client script details and save the record.

![Wizard client script](image)

**Figure 939: Wizard client script**
Examples

To get the value of a variable:

```javascript
g_form.getValue('variable_name');
```

To restrict the number of characters a user can enter in a variable:

```javascript
function onLoad() {
    var sd = g_form.getControl('variable_name');
    sd.maxLength = 80; }
```

**Note:** Because wizard panels are different from forms, not all `g_form()` methods function properly in wizard client scripts. Test all methods to determine whether they function properly before using them.

What are some of the available helper functions?

Available helper functions.

**What are some of the available helper functions?**

There is a global object that ServiceNow automatically creates called `g_form` that references the currently active form. You can use the `g_form` object in your scripts to simplify certain common programming tasks.

A second global object, called `g_user`, references the currently active user. Just like `g_form`, you can use `g_user` in your scripts to react based on the current user (and that user's roles).

**Hide or show a field**

While you can use client scripting to hide or show a field, you can usually accomplish the same thing without scripting via UI policies.

```javascript
g_form.setVisible(<fieldname>, <value>);
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    var index = newValue.indexOf('Change');
    if(index == -1 ) { // hide it
        g_form.setVisible('field', false); }
    else { // unhide it
        g_form.setVisible('field', true); } }
```

**Make a field mandatory**

While you can use client scripting to make a field mandatory, you can usually accomplish the same thing without scripting via UI policies.

```javascript
g_form.setMandatory(<fieldname>, <value>);
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    if(oldValue == newValue) return;
    g_form.setMandatory('short_description', true); }
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    if(isLoading) return;
    if(newValue == "Critical")
        g_form.setMandatory('u_due_date', true);
    else
```
Make a field read-only

While you can use client scripting to make a field read-only, you can usually accomplish the same thing without scripting by using UI policies.

In order to make a field read-only, the field must be present on the form, though it may be hidden. The following example makes the `incident_state` field read-only on the Incident form upon load:

```javascript
function onLoad() {
    g_form.setReadonly('incident_state', true); }
```

To do the same thing for a derived field (e.g., the Caller's phone number field if it has been added to the Incident form), you can use the following:

```javascript
function onLoad() {
    g_form.setReadonly('caller_id.phone', true) }
```

Get a field value

```javascript
g_form.getValue(<fieldName>);
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    alert(g_form.getValue('short_description')));
}
```

Set a field value

```javascript
g_form.setValue(<fieldName>, <value>);
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    g_form.setValue('short_description', 'hello world'); }
```

Set a glide_list field value

You can pass one argument or two. For reference values, passing both the sys_id and the display value is more efficient because the client does not have to look up the display values for you. However, if you do not want to pass the display value, the client will do an AJAX call to find the value, which takes time.

Example: reset to no values.

```javascript
g_form.setValue("watch_list", "");
```

Example: Set to two references, passing the display values to avoid an AJAX call.

```javascript
var valueArray = new Array("46d44a23a9fe19810012d100cca80666", "46c6f9efa9fe198101dd5eed9aff6e7");
var labelArray = new Array("Beth Anglin", "Bud Richman");
g_form.setValue("watch_list", valueArray, labelArray);
```

Example: Set arbitrary email address (for a sys_user glide list).

```javascript
g_form.setValue("watch_list", ",", "you@you.com");
```

Example: Set references and emails, passing the display values to avoid an AJAX call.

```javascript
var valueArray = new Array("46d44a23a9fe19810012d100cca80666", ",", "46c6f9efa9fe198101dd5eed9aff6e7");
var labelArray = new Array("Beth Anglin", "me@me.com", "Bud Richman");
```
g_form.setValue("watch_list", valueArray, labelArray);

Example: Set references and emails, but use AJAX to obtain display values for references (this is a bit less efficient as the server must be contacted for the display values).

var valueArray = new Array("46d44a23a9fe19810012d100cca80666", "me@me.com", "46c6f9efa9fe198101ddf5eed9ad6e7");
g_form.setValue("watch_list", valueArray);

Example: Set references and emails using a comma separated string, but use AJAX to obtain display values for references (this is a bit less efficient as the server must be contacted for the display values).

g_form.setValue("watch_list", "46d44a23a9fe19810012d100cca80666,me@me.com," 46c6f9efa9fe198101ddf5eed9ad6e7");

Add an Option to the end of a choice list

`g_form.addOption(<fieldName>, <choiceValue>, <choiceLabel>);`

```javascript
function onChange(control, oldValue, newValue, isLoading) {
  g_form.addOption('priority', '6', '6 - Really Low'); }
```

Add an Option at a specific point on a choice list

`g_form.addOption(<fieldName>, <choiceValue>, <choiceLabel>, <targetIndex>);`

```javascript
function onChange(control, oldValue, newValue, isLoading) {
  g_form.addOption('priority', '2.5', '2.5 - Really Low', 3); }
```

Note that an insert happens at the location you specify on a zero based array. Existing options will all shift up one level. For example:

[A, B, C, D]
Insert E at 0
[E, A, B, C, D]
Insert E at 2
[A, B, E, C, D]

Remove an option from a choice list

```javascript
function onChange(control, oldValue, newValue, isLoading) {
  g_form.addOption('priority', '2.5', '2.5 - Really Low', 3); }
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
  g_form.removeOption('priority', '1'); }
```

Remove the Closed state option if the user is not an admin:

```javascript
function onLoad() {
  var isAdmin = g_user.hasRole('admin');
  var state = g_form.getValue('state');
  if(!isAdmin && (state != 7)) {
    alert('Current user is not an admin');
    g_form.removeOption('state', '7'); }
}
```

Remove ALL options from a choice list
The **Category** choice list, for example:

```javascript
var choiceValue = g_form.getValue(<fieldName>);
var choiceLabel = g_form.getOption(<fieldName>, choiceValue).text;
```

**Get the label for a choice list value**

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    var choiceValue = g_form.getValue('category');
    var choiceLabel = g_form.getOption('category', choiceValue).text;
}
```

Show or hide an action button depending on the form view

```javascript
function onLoad() {
    var objView = document.getElementById('sysparm_view');
    var strView = objView.getAttribute('value');
    if(strView == 'ess') {
        var objCloseButton = document.getElementById('close_incident');
        objCloseButton.style.display = 'none';
    }
}
```

**Look up the value of a reference field**

```javascript
var gr = g_form.getReference('fieldName');
```

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    var caller = g_form.getReference('caller_id');
    if(caller.vip == 'true')
        alert('Caller is a VIP!');
}
```

**Note:** When setting values, use the storage value instead of the display value.

**Get the current user name**

```javascript
var myVariable = g_user.userName;
```

```javascript
function onLoad() {
    var userName = g_user.userName;
    alert('Current user = ' + userName);
}
```

**Get the value of a parameter**

```javascript
var currentView = g_form.getParameter('view');
```

```javascript
function onLoad() {
    var view = g_form.getParameter('view');
    alert('Current view = ' + view);
}
```

**Test if the current user has a role**

```javascript
var myRole = g_user.hasRole(<role>);
```

```javascript
function onLoad() {
    var isAdmin = g_user.hasRole('admin');
    if(isAdmin)
        alert('Current user is an admin');
}
else
  alert('Current user is NOT an admin'); }

Determine what submit button was clicked

function onSubmit() {
  var action = g_form.getActionName();
  alert('You pressed ' + action); }

Determine if any fields on the form have changed

function onSubmit() {
  var field1 = g_form.getControl('caller_id');

  //See if the 'changed' attribute is true
  if(field1.changed) {
    return confirm("The Caller field has changed.\nDo you really want to
save this record?"); } }

Using GlideRecord query from client

There is a lightweight GlideRecord object on the client side that can be used to query the server from within client scripts. The following are some common methods that are available.

• addQuery()
• get()
• hasNext()
• next()
• orderBy()
• query()

For additional information, see GlideRecord() on the ServiceNow Developer Site.

One limitation is that the addOrCondition() method is not available. You can work around this by setting the GlideRecord encodedQuery property with an encoded query string.

Example:

var cat = g_form.getValue('category');
var subcat = g_form.getValue('subcategory');
var lookup = new GlideRecord('u_assignment_lookup');
strQuery = "u_type=Incident^ORu_type=All";
strQuery = strQuery + "^u_category=" + cat;
strQuery = strQuery + "^u_subcategory=" + subcat;
lookup.encodedQuery = strQuery;
lookup.query();

Check if order guide is loaded for the first time

It can be helpful for a catalog client script to know whether the user has just started an order guide or is going back to the guide using the Describe Needs button from the item page.

// onload catalog script
if(g_form.getParameter('cart_edit') != 'guide_serial') {
  // this stuff only runs if the guide is reloaded after initial submit
  // it will not run on initial load of the guide }
Mobile Client GlideForm (g form) scripting

Client scripting for mobile is identical to scripting for the web, with some exceptions. All new scripts must conform to certain guidelines.

For your existing scripts to run correctly on mobile devices, you must modify them to conform to the requirements described in Mobile platform migration impacts on page 3922.

For related information on developing for the mobile interface, see Mobile experience set up for admins on page 1201.

**Mobile platform migration impacts**
The following are affected on the mobile platform: client scripts, UI policies, navigator modules, and UI actions.

### Client scripts

For new or existing scripts to be valid for mobile, they must conform to the following requirements:

- Use the new mobile methods in place of `g_form.getControl()`.
- Do not use deprecated methods.
- Do not reference unsupported browser objects.
- Do not make synchronous JavaScript, GlideAjax, and GlideRecord calls.
- Do not call methods that are not available for mobile.
- Enable scripts to run on the mobile UI.

**Table 1372: Requirements**

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the new mobile methods</td>
<td>Several new methods are available for modifying form fields instead of directly manipulating the HTML. These methods replace previous usages of <code>g_form.getControl()</code>, which is deprecated for the mobile platform. In your existing scripts, ensure that the new methods are used in place of methods that are not valid on the mobile platform. For information on these new methods, refer to Mobile GlideForm(). See the ServiceNow Developers site for API information.</td>
</tr>
</tbody>
</table>
| Do not use deprecated methods | The following methods have been deprecated for the mobile platform because direct access to HTML elements is not allowed:

- `g_form.getControl()`
- `g_form.getFormElement()`
- `g_form.getElementById()`

To ensure that existing scripts are compatible, remove all calls to deprecated methods from your code. For new scripts, do not use deprecated methods if you want the script to be valid for mobile.

For `g_form.getControl()`, some of the functionality previously included with this method has been extracted to individual methods. Instead of `g_form.getControl()`, use the new methods described on the developer site.

See the [ServiceNow Developers site](https://developer.servicenow.com) for API information. |
| Do not reference unsupported browser objects | The following browser objects are not supported in mobile scripts:

- `Window`
- `jQuery` or `Prototype` ($, $j, or $$)
- `Document`

Make sure that new scripts do not use these objects, and remove any usage of these objects from your existing scripts. Use `GlideForm` (g_form) instead, which provides methods such as `setLabel()`, `addDecoration()`, and `hasField()` for accomplishing the same tasks. |
| Do not make synchronous JavaScript calls | The mobile platform does not allow synchronous JavaScript calls. The `g_form.getReference()` method must now have the callback parameter defined. For example:

```
g_form.getReference(fieldName, callback)
```

Be sure that all `g_form.getReference()` calls include the callback parameter. For example, the following script does not include a callback and is incompatible with the mobile platform:

```
var userName =
g_form.getReference('assigned_to').user_name,
g_form.setValue('u_assigned_user_name', userName);
```

The following script has been updated to include the callback and is compatible with the mobile platform:

```
g_form.getReference('assigned_to', function(gr) {
    g_form.setValue('u_assigned_user_name', gr.user_name);
});
```

<p>| Do not make synchronous Ajax calls | The mobile platform does not allow synchronous GlideAjax calls. Any use of <code>getXMLWait()</code> in a GlideAjax call will not work on the mobile platform. Be sure that all GlideAjax calls are asynchronous. For more on synchronous versus asynchronous GlideAjax calls and <code>getXMLWait()</code>, see <a href="#">GlideAjax</a>. For information on the available GlideAjax methods, refer to the <a href="#">development portal</a>. |</p>
<table>
<thead>
<tr>
<th>Do not make synchronous GlideRecord calls</th>
<th>The mobile platform does not allow synchronous GlideRecord calls. Make sure that any existing GlideRecord calls include a callback. For example, the following script does not include a callback and is incompatible with the mobile platform:</th>
</tr>
</thead>
</table>
| ```javascript
var gr = new GlideRecord('incident');
gr.addQuery('number',
g_form.getValue('related_incident'));
gr.query();
gr.next();
g_form.setValue('u_related_incident_description',
gr.short_description);
``` | The following script has been updated to include the callback, and is compatible with the mobile platform: |
| ```javascript
var gr = new GlideRecord('incident');
gr.addQuery('number',
g_form.getValue('related_incident'));
gr.query(function(gr) {
  gr.next();
  g_form.setValue('u_related_incident_description',
  gr.short_description);
});
``` | |
<table>
<thead>
<tr>
<th>Do not use methods unavailable on the mobile platform</th>
<th>Due to the limitations and reduced functionality that is imposed by the mobile platform, the following methods are not deprecated but are not available on the mobile platform. If these run on the mobile platform, no action occurs:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• showRelatedList ()</td>
<td>• showRelatedList ()</td>
</tr>
<tr>
<td>• hideRelatedList ()</td>
<td>• showRelatedLists ()</td>
</tr>
<tr>

<td>• getSections()</td>
<td>• getParameter()</td>
</tr>
<tr>
<td>• enableAttachments()</td>
<td></td>
</tr>
<tr>
<td>• disableAttachments()</td>
<td></td>
</tr>
<tr>
<td>• setReadOnly()</td>
<td></td>
</tr>
<tr>
<td>(Note that setReadOnly() is available)</td>
<td></td>
</tr>
</tbody>
</table>

| Enable scripts for mobile | Scripts must be enabled for the mobile platform. See Enable client scripts for the smartphone interface on page 1227. |
UI policies

A field is now available on the UI Policy form for scripts to run on a desktop or mobile platform, or both at the same time. Update existing policies so that they apply to either the mobile platform or both. For new scripts, also ensure that the mobile option or both is selected. For more on UI policies for mobile, see Enable UI policies for the smartphone interface on page 1225.

Navigator modules

For existing code, modules must be transferred to either the sys_ui_application or sys_ui_module tables to be available on the mobile platform. When developing new code, be sure that all modules are created in the sys_ui_application or sys_ui_module tables. For more information, see Define a new smartphone module on page 1204.

UI actions

UI actions must be transferred to the sys_ui_ng_action table to appear on the mobile platform. UI action scripts that do not use deprecated methods do not require changes to the script itself. For new UI actions, be sure that they are created in the sys_ui_ng_action table. For more information, see Smartphone interface UI actions on page 1229.

Set client script order

Control the order of execution for your client scripts using the Order field. To avoid having two or more client scripts run concurrently and then conflict, you can add an order for the scripts to run in.

Role required: admin

Adding an order to the client script creates a processing sequence, ordered from lowest to highest number. If two scripts conflict, the client script with the lower number executes first.

1. Navigate to System Definition > Client Script and open an existing client script or click New.
2. Configure the form to include the Order field.
3. Add a number to the order field based on what order you want it to run in relation to other client scripts. Choose a lower number for the script you want to execute first.

AJAX

AJAX (asynchronous JavaScript and XML) is a group of interrelated, client-side development techniques used to create asynchronous Web applications.

AJAX enables web applications to send and retrieve information to and from a server in the background, without impacting the user experience with the displayed web page.

GlideAjax

The GlideAjax class allows the execution of server-side code from the client. GlideAjax calls pass parameters to the script includes, and, using naming conventions, allows the use of these parameters.

Note: This functionality requires a knowledge of JavaScript.

Using GlideAjax:

- Initialize GlideAjax with the name of the script include that you want to use.
- When creating the script include, you must set the name field to be exactly the same as the class name.
- When creating the script include, you must select the **Client callable** check box.
- Specify the parameter `sysparm_name`. GlideAjax uses `sysparm_name` to find which function to use.
- Any extra parameters may be passed in, all of which must begin with `sysparm_`. Avoid using predefined parameter names:
  - `sysparm_name`
  - `sysparm_function`
  - `sysparm_value`
  - `sysparm_type`
- Code is then executed with the `getXML()` or `getXMLWait()` functions

For additional information on GlideAjax, refer to *GlideAjax* in the development portal.

**Examples of asynchronous GlideAjax**

There are two parts to the asynchronous GlideAjax script: client-side and server-side code.

### Hello World: Returning a value from the server

**Client side**

This code runs on the client (the web browser). Create a client script as normal. This sends the parameters to server, which then does the processing. So that the client does not wait for the result, a callback function is used to return the result, passed to the `getXML()` function. (In this case it is called `HelloWorldParse`.)

The `getXMLWait()` function does not need a separate callback function, but this will block the client. If the client-server communication takes a long time (for example on slow networks), the application will seem unresponsive and slow. An example of `getXMLWait()` is in the *Examples of synchronous GlideAjax* on page 3929.

```javascript
var ga = new GlideAjax('HelloWorld');
ga.addParam('sysparm_name', 'helloWorld');
ga.addParam('sysparm_user_name', "Bob");
ga.getXML(HelloWorldParse);

function HelloWorldParse(response) {
    var answer = response.responseXML.documentElement.getAttribute("answer");
    alert(answer); }
```

**Server side**

The server-side code for the above function. Do not create a business rule, but instead navigate to **System Definition > Script Include** and create a new script. Paste in the code below.

---

**Note:** You must set the name of the script include to `HelloWorld`.

- The `sys_script_include` code must extend the `AbstractAjaxProcessor` class and be client-callable.
- Function names starting with "_" are considered private and are not callable from the client.
• Avoid overriding methods of `AbstractAjaxProcessor`, including `initialize`. While it is possible to invoke methods of your superclass object which you have overridden, it is complicated and best avoided altogether.

```javascript
var HelloWorld = Class.create();
HelloWorld.prototype =
  Object.extendsObject(AbstractAjaxProcessor, {
  helloWorld:function() { return "Hello " +
    this.getParameter('sysparm_user_name') + "!"; } ,
  _privateFunction: function() { // this function is not client
callable
}
});
```

This results in an alert box that says 'Hello Bob!' when you visit the form.

**Returning multiple values**

Since the response is an XML document we are not limited to returning a single `answer` value. Here is a more complex example returning multiple XML nodes and attributes.

**AJAX processor script include**

```javascript
/*
* MyFavoritesAjax script include Description - sample AJAX
processor returning multiple value pairs
*/
var MyFavoritesAjax = Class.create();
MyFavoritesAjax.prototype =
  Object.extendsObject(AbstractAjaxProcessor, {

  /*
  * method available to client scripts call using:
  * var gajax = new GlideAjax("MyFavoritesAjax");
  * gajax.addParam("sysparm_name","getFavorites");
  */
  getFavorites: function() { // build new response xml element
    for result
      var result = this.newItem("result");
      result.setAttribute("message","returning all favorites");

    //add some favorite nodes with name and value attributes
    this._addFavorite("color","blue");
    this._addFavorite("beer","lager");
    this._addFavorite("pet","dog");
},

  // all items are returned to the client through the inherited
  methods of AbstractAjaxProcessor
  _addFavorite: function(name, value) {
    var favs = this.newItem("favorite");
    favs.setAttribute("name",name);
    favs.setAttribute("value",value); },

  type:"MyFavoritesAjax"
});
```
Client script

```javascript
// new GlideAjax object referencing name of AJAX script include
var ga = new GlideAjax("MyFavoritesAjax");
// add name parameter to define which function we want to call
// method name in script include will be getFavorites
ga.addParam("sysparm_name","getFavorites");

// submit request to server, call ajaxResponse function with server response
ga.getXML(ajaxResponse);

function ajaxResponse(serverResponse) {
    // get result element and attributes
    var result = serverResponse.responseXML.getElementsByTagName("result");
    var message = result[0].getAttribute("message");

    // check for message attribute and alert user
    if(message) alert(message);

    // build output to display on client for testing
    var output = "";

    // get favorite elements
    var favorites = serverResponse.responseXML.getElementsByTagName("favorite");
    for(var i = 0; i < favorites.length; i++) {
        var name = favorites[i].getAttribute("name");
        var value = favorites[i].getAttribute("value");
        output += name + " = " + value + "\n";
    }
    alert(output);
}
```

XML response

```xml
<xml sysparm_max= "15" sysparm_name="getFavorites"
    sysparm_processor="MyFavoritesAjax">
    <result message = "returning all favorites"></result>
    <favorite name = "color" value = "blue"></favorite>
    <favorite name = "beer" value = "lager"></favorite>
    <favorite name = "pet" value = "dog"></favorite>
</xml>
```

Examples of synchronous GlideAjax

Use synchronous when your script cannot continue without the GlideAjax response. This stops the session until the response is received.

If your use case demands that no further processing can occur until the GlideAjax response has been received, you can use `getXMLWait()`. However, because this will slow down your code and lock the user session until the response is received, it is generally recommended that you use `getXML()` with a callback function.

**Note:** Do not use `AJAXEvaluateSynchronously`.

**Note:** The `getXMLWait()` method is not available in scoped applications.

© 2017 ServiceNow. All rights reserved. 3929
This code results in a client-side alert that displays `The Server Says Hello Bob!`.

The client code.

```javascript
var ga = new GlideAjax('HelloWorld');
ga.addParam('sysparm_name','helloWorld');
ga.addParam('sysparm_user_name','Bob');
ga.getXMLWait();
alert(ga.getAnswer());
```

The server-side script include code.

```javascript
var HelloWorld = Class.create();
HelloWorld.prototype = Object.extendsObject(AbstractAjaxProcessor, {
  helloWorld: function() { return "The Server Says Hello " +
    this.getParameter('sysparm_user_name') + "!"; }
});
```

**AJAXClientHelper**

Provides helper functions for Ajax clients to generate Choice Lists and retrieve displayed values from a choice list.

**Where to Use**

Use this script include wherever you need to generate Choice Lists or retrieve a value from an Ajax client.

**Method Summary**

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>

<td>generateChoiceTable()</td>
<td>Generates the choice table.</td>
</tr>
<tr>
<td>getDisplay()</td>
<td>Gets the display value from the choice list.</td>
</tr>
</tbody>
</table>

**Method Detail**

**getValues()**

Gets the values from the Choice List.

**Input Fields**

Parameters:
- None

**Output Fields**

Returns: The choice list values.

**generateChoice()**

Generates the choices for a Choice List.

**Input Fields**
Parameters:
• None

Output Fields
Returns: The choice list.
generateChoiceTable()
Generates the choice table.

Input Fields
Parameters:
• None

Output Fields
Returns: The choice table.
getDisplay()
Gets the display value from the choice list.

Input Fields
Parameters:
• None

Output Fields
Returns: The display value.

AJAXClientTiming
Saves client timing values for a transaction.

Jelly tags
This is a list of Jelly tags and Glide tags.
Jelly Tags

if

- **Description:** The *if* tag is just what it looks like, an if tag. This is like an if statement in any programming language, but keep in mind that there is no elseif tag and no else tag. If you want to create that kind of structure, try the choose/when/otherwise syntax.
- **Parameters:** *test* - The condition to evaluate in order to determine if the block will execute.
- **Example:**

  ```
  <g:evaluate var="jvar_gr" object="true">
    var gr = new GlideRecord("incident");
    gr.addQuery("active", true);
    gr.query();
    gr;
  </g:evaluate>
  
  <j:if test="!${jvar_gr.hasNext()}">
    We did not find any active incidents.
  </j:if>
  <j:if test="${jvar_gr.next()}">
    We found ${jvar_gr.getRowCount()} active incidents.
  </j:if>
  ```

while

- **Description:** The *while* tag does a while loop.
- **Parameters:** *test* - The condition to evaluate in order to determine if the statement will loop through. This should be an expression enclosed in ${} or [] that evaluates to true or false.
- **Example:**

  ```
  <g:evaluate var="jvar_gr" object="true">
    var gr = new GlideRecord("incident");
    gr.addQuery("active", true);
    gr.query();
    gr;
  </g:evaluate>
  
  <j:while test="${jvar_gr.next()}">
    <a href="incident.do?sys_id=${jvar_gr.getValue('sys_id')}">${jvar_gr.getValue('number')}</a>
  </j:while>
  ```

set

- **Description:** The *set* tag sets a variable.
- **Parameters:**
- **var** - The variable to set. Often the system prefixes these variables with jvar_ for consistency.
- **value** - The value to set var to. This is often an expression enclosed in ${} or $[].
- **defaultValue** - If the value results to null or empty, this value is put into the var.

**Example:**

```<j:set var="jvar_incident_number" value="${jvar_gr.getValue('number')}"/>```

**set_if**

- **Description**: The set_if tag sets a variable based on a test. This tag is similar to the ternary operator in other programming languages (var = <test> ? <if_true> : <if_false>).
- **Parameters**:
  - **var** - The variable to set. Often the system prefixes these variables with jvar_ for consistency.
  - **test** - The condition to evaluate in order to determine if the statement will evaluate the true value or the false value. This should be an expression enclosed in ${} or $[] that evaluates to true or false.
  - **true** - The value to set the variable to if test evaluates to true. This parameter is optional, so if the field is blank, and if test evaluates to true, the variable will be left blank.
  - **false** - The value to set the variable to if test evaluates to false. This parameter is optional, so if the field is blank, and if test evaluates to false, the variable will be left blank.

**choose**

- **Description**: The choose tag starts a choose block of code. This is similar to the if-elseif-else kind of syntax in most programming languages. With a choose tag, you can use when and otherwise tags to specify other blocks of code.
- **Parameters**: None.
- **Example**:

```<j:choose>
  <j:when test="${jvar_gr.getRowCount() lt 1}">We found multiple records!</j:when>
  <j:when test="${jvar_gr.next()}">We```
When

- **Description**: The `when` tag is used within a choose block to indicate a condition. This tag is similar to an if or an elseif in that it specifies a condition, executes the inner content, and then implies a break at the end to leave the if-elseif construct.

- **Parameters**: `test` - The condition to evaluate in order to determine if the statement will loop through. This should be an expression enclosed in `{}` or `[]` that evaluates to true or false.

- **Example**:

```xml
<j:choose>
  <j:when
    test="${jvar_gr.getRowCount()} ${AMP}lt; 1">We found multiple records!</j:when>
  <j:when
    test="${jvar_gr.next()}">We found record
    ${jvar_gr.getValue('number')}\</j:when>
  <j:otherwise>Sorry, we could not find the record you specified.</j:otherwise>
</j:choose>
```

Otherwise

- **Description**: The `otherwise` tag is used within a choose/when/otherwise block, and is like the "else" or "default" case.

- **Parameters**: None.

- **Example**:

```xml
<j:choose>
  <j:when
    test="${jvar_gr.getRowCount()} ${AMP}lt; 1">We found multiple records!</j:when>
  <j:when
    test="${jvar_gr.next()}">We found record
    ${jvar_gr.getValue('number')}\</j:when>
  <j:otherwise>Sorry, we could not find the record you specified.</j:otherwise>
</j:choose>
```
Glide Tags

**evaluate**

- **Description:** The `evaluate` tag evaluates JavaScript code (server side), and makes variables visible to future code. Unlike other tags, the evaluate tag evaluates the content that is inside the tag as server side JavaScript.

  The context is the same as that of script includes in the system. Other script includes, global business rules, GlideRecord, GlideSystem, and Jelly variables (prefixed with jelly, if the parameter jelly="true" is set) are available.

- **Parameters:**
  - `var` - The name of the variable that will be set to the result of the script.
  - `object` - If set to true, the result of the expression will be treated as an object instead of a primitive variable (string or integer variable values).
  - `jelly` - If set to true, allows Jelly context variables to be referenced in the script.
  - `expression` - This is an expression to be executed for the value to put in `var`. The expression can be either of two places. First, it can be an attribute on the evaluate tag itself. Otherwise, the content between the beginning tag and ending tag is the expression. The last line of the expression is the actual value passed into `var`.

- **Example:**

  ```
  <g:evaluate var="jvar_gr" object="true">
    var gr = new GlideRecord("incident");
    gr.addQuery("active", "true");
    gr.query();
    gr; // this is the variable put into the variable jvar_gr
  </g:evaluate>
  ```

**messages**

- **Description:** The `messages` tag helps with translation. When `gs.getMessage()` is called anywhere on a page, there are two possible
places where the translation is found. First, the page checks a local cache of translations. Second, the page makes an AJAX call to the server to find the translation. What g:messages does is allow pages to cache certain messages.

- **Parameters**: None.
- **Example**:

```html
<g:messages>
  Yes
  No
  Cancel
</g:messages>
```

**breakpoint**

- **Description**: When the `breakpoint` tag is called, it prints a list of all the variables in Jelly at the current moment, with their respective values. If a variable is specified, it prints the requested variable and its value. The output is placed in the System Log.
- **Parameters**: `var` - (Optional) The variable to log the value for. If `var` is not specified, then all variables will be dumped into the log.
- **Example**:

```html
<g:breakpoint />
```

```html
<g:breakpoint var="sysparm_view"/>
```

**no_escape**

- **Description**: The system, by default, uses escaped output as a security measure. Output placed inside of `no_escape` tags is not escaped before output. Be careful when using these tags, because if user input is displayed here it can open a security vulnerability on the page.
- **Parameters**: None.
- **Example**:

```html
<g:no_escape>
${jvar_raw_html_data}
</g:no_escape>
```

**macro_invoke**

- **Description**: The `macro_invoke` tag calls a UI macro that you have specified in the database. You may also call a UI macro by specifying it in the tag name. For example, if you had a UI macro named `my_macro`, you could call that macro with the tag `<g:my_macro/>`.
- **Parameters**:
  - `macro` - The name of the UI macro to execute. If your tag name is `g:macro_invoke`, then the macro attribute specifies the name
of the macro. If the tag name includes the name of the macro, then there is no need to include a macro attribute.

- Other attributes - For each attribute you specify, a variable with that name will be available in the context of the UI macro, prefixed with "jvar_".

- Example:

```xml
<!-- Will invoke the contents of the UI macro named "sample_macro", which will have the variable jvar_message available within it-->
<g:macro_invoke
macro="sample_macro"
message="This is a sample macro variable." />

<!-- Will invoke the contents of the UI macro named "sample_macro", which will have the variable jvar_message available within it-->
<g:sample_macro message="This is a sample macro variable." />
```

Extensions to Jelly syntax

Apache's Jelly syntax is used to render forms, lists, UI pages, and many other things rendered in ServiceNow.

With Jelly, logic can be embedded within static content and computed values may be inserted into the static content.

**Attention:** This functionality requires a knowledge of Apache Jelly (a Java and XML based scripting and processing engine for turning XML into executable code).

This page from Apache has a summary of the standard Jelly tags: [http://commons.apache.org/jelly/tags.html](http://commons.apache.org/jelly/tags.html)

**Namespaces**

Jelly often includes multiple namespaces when invoking tags.

The "j" namespaces are standard Jelly whereas the "g" namespaces are unique to ServiceNow scripts. For example, the `<g:evaluate>` tag is supplied by ServiceNow to allow you to compute a value using JavaScript. The standard Jelly tag `<j:test>` is used to evaluate a condition.

**Phases**

Usually, there are two phases indicated by namespaces `<j>` versus `<j2>` and `<g>` versus `<g2>`.

The namespaces without the "2" happen in the first phase of processing and these are cached except when used in a UI page. Those with the "2" are never cached. Care must be taken when selecting whether to use phase 1 or phase 2 for efficiency and correct results.
In addition to the namespaces, the syntax used to insert values into static content differs depending on which phase is to supply the value. A dollar with braces surrounding a value inserts the value in phase 1. For example, ${jvar_ref} inserts the value jvar_ref during phase 1 of the jelly process. A dollar with brackets surrounding a value inserts the value in phase 2. For example, ${jvar_ref} inserts the value jvar_ref during phase 2. A value surrounded by quotes is treated as a string. For example, '\${jvar_ref}' inserts the value jvar_ref as a string during phase 2.

```javascript
if (confirm("$[gs.getMessage('home.delete.confirm')]"))
...
</script>
```

```html
<input type="hidden" id="${jvar_name}" name="${jvar_name}" value="${jvar_value}" class="${jvar_class}" />
```

**If tests**

Testing whether something is true or not can be done as follows:

```html
<j:if test="${jvar_something}">...do something...</j:if>
<j:if test="${!jvar_something}">...do something...</j:if>
```

The reason this works, is that, in Jelly, a term like jvar_something is "truthful" in an if tag if:
1. it is Boolean and true
2. it is a String and = "true", "yes", "on", or "1"

Testing whether something exists can be done as follows:

```html
<j:if test="${empty(jvar_something)}">...do something...</j:if>
```

The reason this works is that the jexl empty function returns true if its argument is:
1. null
2. an empty string
3. a zero length collection
4. a map with no keys
5. an empty array

**Set_IF**

Sets a variable to one of two different values depending on whether a test is true or false.

```html
<g2:set_if var="jvar_style" test="$[gs.getPreference('table.compact') != 'false']" 
  true="margin-top:0px; margin-bottom:0px;" 
  false="margin-top:2px; margin-bottom:2px;" />
```

**<g:insert> versus <g:inline> versus <g:call>**

This page provides a comparative explanation of three tags: <g:insert>, <g:inline>, and <g:call>. 

© 2017 ServiceNow. All rights reserved. 3938
<g:insert>
The <g:insert> tag inserts a Jelly file into your Jelly in a new context. This means you cannot access the variables previously established in your Jelly.

<g:insert template="get_target_form_function.xml" />

<g:inline>
The <g:inline> tag inserts a Jelly file into your Jelly in the same context. This means that the inserted Jelly can access the variables you previously established and it can change the values of those variables.

<g:inline template="element_default.xml" />

<g:call>
For better encapsulation, the <g:call> tag may be used. Your function will only have access to the values passed to it. The Jelly context will look the same after a call as before the call. This means you cannot set a global variable here and read it later. This also means you can't mistakenly set a global variable called "jvar_temp" and overwrite a variable that somebody else was relying on.

Passing values, if needed, is done explicitly by including the name of the parameter on the <g:call> line followed by the equal sign followed by the value in quotes:

<g:call function="collapsing_image.xml" id="${jvar_section_id}" image="${jvar_cimg}" first_section_id="${jvar_first_section_id}" image_alt="${jvar_cimg_alt}" />

If values are passed, and you want to have defaults or required parameters, your Jelly referenced in the function must then include a line to declare whether the parameters are required or have a default value:

<g:function id="REQUIRED" image="REQUIRED" image_prefix="" image_alt="REQUIRED"/>

The example above indicates that 3 of the parameter are required and one parameter is option with a blank default value. Note that if you are not passing values or if you do want to have default or required values, you do not need to include the <g:function> line at all. In general, however, you will want to include a <g:function> line.

The value can then be referenced in your template by prepending the "jvar_" prefix to the parameter's name:

<img id="img.${jvar_id}" src="images/${jvar_image}" alt="${jvar_image_alt}" onclick="toggleSectionDisplay('${jvar_id}','${jvar_image_prefix}','${jvar_first_section_id}');"/>

For <g:call>, parameters may also be pass implicitly as a list of named variables in an "arguments" parameter:

<g:call function="item_link_default.xml" arguments="sysparm_view,ref_parent,jvar_target_text"/>

© 2017 ServiceNow. All rights reserved.  3939
As an alternative to passing variables into the function via separate tag arguments, it is possible to pass a list of variables in a single 'arguments' argument. All variables identified by name (comma separated) in the argument parameter are re-introduced within the function under the exact same name (e.g. inside the function template, we'd have variables sysparm_view, ref_parent, and jvar_target_text available to us).

The function template may return a value to the calling template using the return attribute. Within the function the jvar_answer variable sets the return value.

```xml
<g:call function="item_body_cell_calc_style.xml" arguments="jvar_type" return="jvar_style"/>
```

The <g:evaluate> tag is used to evaluate an expression written in Rhino JavaScript and sometimes to set a variable to the value of the expression.

The last statement in the expression is the value the variable will contain.

```xml
<g2:evaluate var="jvar_page" jelly="true">
  var page = "";
  var pageTitle = "";
  var pageGR = new GlideRecord("cmn_schedule_page");
  pageGR.addQuery("type", jelly.jvar_type);
  pageGR.query();
  if (pageGR.next()) {
    page = pageGR.getValue("sys_id");
    pageTitle = pageGR.getDisplayValue();
  }
  page;
</g2:evaluate>
```

If you would like to have the evaluate return an object (for example an array), use the argument object="true".

```xml
<g2:evaluate object="true" var="jvar_items" expression="SncRelationships.getCMDBViews()" />
```

If you would like to access Jelly variables inside an evaluate, include jelly="true" in the evaluate and add "jelly." before the Jelly variable's name. For example, to access the GlideJellyContext:

```xml
<g2:evaluate var="jvar_row_no" jelly="true">
  var gf = jelly.context.getGlideForm();
  var row = gf.getRowNumber();
  row;
</g2:evaluate>
```

Another example of accessing a jvar using the jelly="true" parameter. The value of jvar_h was set previously and we can access it inside the evaluate:

```xml
[$[NLBR:jvar_h.getHTMLValue('newvalue')]
<g2:evaluate var="jvar_fix_escaping" jelly="true">
```

© 2017 ServiceNow. All rights reserved.  3940
var auditValue = jelly.jvar_h.getHTMLValue('newvalue');
gs.log("************ " + auditValue);
</g2:evaluate>

copyToPhase2="true"

If you have a need to take the results of an evaluation that occurs in phase 1 and propagate it to phase 2, use copyToPhase2="true". There is some protection for escaping in this use. For example:

```
<g:evaluate var="jvar_has_special_inc" copyToPhase2="true">
    var specialInc = gs.tableExists("special_incident");
    specialInc;
</g:evaluate>
[jvar_has_special_inc]
```

If you do not need to evaluate something, you can do this more directly. Beware of escaping issues here (double quotes in jvar_rows would cause a problem in the example):

```
<j2:set var="jvar_rows" value="${jvar_rows}"/>
```

This tag can be used to display the current Jelly variables and their values in the log.

Be sure to remove this tag before going to production.

```
<g:include_script/>
```

In pre-Fuji releases, this tag can be used to include UI scripts for client side access to reusable javascript.

For example, the jQuery library is included as a UI script. To view this library, navigate to System UI > UI Scripts > jquery.min. To include this library in a UI page or macro, add `<g:include_script src="jquery.min.jsdbx"/>` to the jelly script. This example uses the name of the UI script with the extension .jsdbx appended.

Starting with the Fuji release, you cannot use this include or you might break the existing jQuery code on the instance.

```
<g:ui_form/>
```

This tag defines a form on the UI page.

For example, if your form contained the application_sys_id field:

```
<g:ui_form>
    <p>Click OK to run the processing script.</p>
    <g:dialog_buttons_ok_cancel ok="return true" />
    <input type="hidden" name="application_sys_id" value="499836460a0a0b1700003e7ad950b5da"/>
</g:ui_form>
```

The g:ui_form may benefit greatly from a processing script.

```
<g:ui_input_field />
```

This tag adds a reference to a UI macro that creates an input field on a page that allows users to input information. The ui_input_field passes a label, name, value, and size into the UI macro.

Here is an example from a UI page:

```
<g:ui_input_field label="sys_id" name="sysid" value="9d385017c611228701d22104cc95c371" size="50"/>
```
This tag puts a user-editable check mark on a page. The name and value are passed into the UI macro.

Here is an example from a table on a UI page:

```
<table>
  <tr>
    <td nowrap="true">
      <label>Time Card Active:</label>
    </td>
    <td>
      <g:ui_checkbox name="timecard_active" value="${sysparm_timecard_active}"/>
    </td>
  </tr>
</table>
```

This tag puts buttons on the UI page that run a specified processing script if the tag returns true.

If your UI page contains a form (uses the `<g:form>` tag), you can submit the form and have the Processing Script run. The Processing Script can naturally access fields on the form. For example, if your form contained the `application_sys_id` field:

```
<g:ui_form>
  <p>Click OK to run the processing script.</p>
  <g:dialog_buttons_ok_cancel ok="return true" />
  <input type="hidden" name="application_sys_id" value="499836460a0a0b1700003e7ad950b5da"/>
</g:ui_form>
```

This tag adds a reference to a page that can be referenced by a Processing Script.

The following example creates a reference defined by name, id, and table parameters in the tag:

```
<g:ui_reference name="QUERY:active=true^roles=itil" id="assigned_to" table="sys_user" />
```

Then in the Processing Script, reference the name field like this:

```
newTask.assigned_to = request.getParameter("QUERY:active=true^roles=itil");
```

You can specify a reference qualifier, so that the "name" attribute can be unique. The following example creates a reference defined by name, id, and table parameters in the tag. Note: the "columns" attribute only applies to the auto-completer.

```
<g:ui_reference name="parent_id" id="parent_id" table="pm_project"
  query="active=true" completer="AJAXTableCompleter" columns="project_manager;short_description"/>
```

**Ampersand**

Ampersands in Jelly can cause you grief because Jelly is XML.

Use `${AMP}` to insert an ampersand in Jelly. If you are writing JavaScript that appears in the HTML part of say a UI page or UI macro that is actually going to run on the browser you are better off putting this code in the "client script" field and that way you can avoid escaping issues. However, if you really must put it in the "HTML" field, you will need to do something like this:

```
ta = ta[1].split('${AMP}');
```
And
Use ${AMP} to insert a JavaScript and in Jelly.

For example:

```javascript
if (d ${AND} e)
    var color = d.value;
```

Alternately, in a Jelly test you would use &amp;amp. For example:

```xml
<j:if test="${jvar_form_name == 'sys_form_template' && !RP.isDialog()}">

Less than
Similar to ampersands, less than ("<") signs can also cause problems due to Jelly being XML. This can be resolved by reversing your test such that it is not necessary or by using ${AMP}lt; in place of the less than sign.

```xml
<g2:evaluate var="jvar_text">
    var days = "";
    var selectedDays = '${${ref}}';
    for (var i = 1; i <= 7; i++) {
        if (selectedDays.indexOf(i.toString()) >= 0) {
            days += gs.getMessage("dow" + i);
            days += " ";
        }
    }
    days;
</g2:evaluate>
```

Many times you can avoid the "less than" operator altogether by just using "not equals" which doesn't have escaping issues. For example:

```javascript
for (var i=0; i != ta.length; i++) {
}
```

Whitespace
Normally, white space is removed by Jelly. To keep it, you must specify that it not be trimmed.

For example, the following keeps the space after the colon.

```xml
<j2:whitespace trim="false">${gs.getMessage('Did you mean')}: ${SP}</j2:whitespace>
```

Spaces
To encode a non-breaking space (&nbsp;), you can use ${SP}.

For example:

```html
<span id="gsft_domain" style="display: inline">
    ${gs.getMessage('Domain')} ${SP}
    <span id="domainDD" class="drop_down_element" style="text-decoration: none; color: white">
        ${gs.getMessage('Loading...')}
    </span>
</span>
```

Tracing Jelly
ServiceNow has a feature that allows the evaluation of Jelly to be traced.
The trace is sent to the log. This should only be turned on during debugging as this produces a lot of logging. To turn on the trace, set the property glide.ui.template.trace to true. For example, the following script can be executed to do this:

```java
GlideProperties.set ( 'glide.ui.template.trace', true );
```

If you want to see your log entries on your web browser at the bottom of each page, navigate to **System Diagnostics > Debug Log**.

**Jelly escaping types**

**Note:** This functionality requires a knowledge of JavaScript, HTML, and Apache Jelly (a Java and XML based scripting and processing engine for turning XML into executable code).

There are two different types of escaping that is required when generating output from Jelly:

- JavaScript
- HTML

The escaping for each of these consists of:

<table>
<thead>
<tr>
<th>Type</th>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>JavaScript</td>
<td>' (single quote)</td>
<td>&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot; (double quote)</td>
<td>&quot;</td>
</tr>
<tr>
<td></td>
<td>CR (carriage return)</td>
<td>(blank)</td>
</tr>
<tr>
<td></td>
<td>NL (newline)</td>
<td>\n (' followed by 'n')</td>
</tr>
<tr>
<td>HTML</td>
<td>&amp; (ampersand)</td>
<td>&amp;</td>
</tr>
<tr>
<td></td>
<td>&lt; (less than)</td>
<td>&lt;</td>
</tr>
<tr>
<td></td>
<td>&gt; (greater than)</td>
<td>&gt;</td>
</tr>
</tbody>
</table>

You can also escape HTML using the `getHTMLValue()` function which will enforce all line breaks and escape the characters mentioned above. It can be used as follows:

```java
${test.getHTMLValue()}
```

Add escaping to a Jelly replacement

You can handle character escaping in Jelly files. XML escaping behavior can be modified only by users with the security admin role.

**Note:** This functionality requires a knowledge of JavaScript, HTML, and Apache Jelly (a Java and XML based scripting and processing engine for turning XML into executable code).

Add a prefix to the `_${expression}_` or `_${expression}_` indicating the escaping to be performed.

```java
${JS:expression}
${HTML:expression}
```
The prefix tells the system to take the result of the expression and escape it before outputting. The escaping may be combined by specifying a comma-separated list of prefixes:

$$\{JS,HTML:expression\}$$

Client scripts good practices

Follow these practices to help ensure that client scripts work effectively and efficiently.

A client script is a piece of JavaScript code that runs on the client, rather than the server. With the exception of onCellEdit client scripts, client scripts apply to forms only.

Well-designed client scripts can reduce the amount of time it takes to complete a form. However, improperly implemented client scripts can significantly slow down form load times.

Restrict list editing

If you create UI policies or client scripts for fields on a form, you must use another method to ensure that data in those fields is similarly controlled in a list.

With the exception of onCellEdit client scripts, UI policies and client scripts apply to forms only. Use the following methods to restrict list editing when using client scripts:

- Disable list editing for the table.
- Create appropriate business rules or access controls for list editing.
- Create data policies.
- Create a separate onCellEdit client script.

Minimize server lookups

Use client data as much as possible to eliminate the need for time-consuming server lookups.

Client scripting uses either data available on the client or data retrieved from the server. The top ways to get information from the server are g_scratchpad and asynchronous GlideAjax lookup.

The primary difference between these methods is that g_scratchpad is sent once when a form is loaded (information is pushed from the server to the client), whereas GlideAjax is dynamically triggered when the client requests information from the server.

**Note:** GlideRecord and g_form.getReference() are also available for retrieving server information. However, these methods are no longer recommended due to their performance impact. Both methods retrieve all fields in the requested GlideRecord when most cases only require one field.

Example - retrieve server data using g_scratchpad

The g_scratchpad object passes information from the server to the client, such as when the client requires information not available on the form.

For example, if you have a client script that needs to access the field u_retrieve, and the field is not on the form, the data is not available to the client script. A typical solution to this situation is to place the field on the form and then always hide it with a client script or UI policy. While this solution may be faster to configure, it is slower to execute.

If you know what information the client needs from the server before the form is loaded, a display business rule can create g_scratchpad properties to hold this information. The g_scratchpad is sent to the client when the form is requested, making it available to all client-side scripting methods. This is a very efficient means of sending information from the server to the client. However, you can only load data this way when the form is loaded. The business rule cannot be triggered dynamically. In those cases, use an asynchronous GlideAjax call.
For example, assume you open an incident and need to pass this information to the client:

- The value of the system property css.base.color
- Whether or not the current record has attachments
- The name of the caller's manager

A display business rule sends this information to the client using the following script:

```javascript
// Get the value of the system property css.base.color
g_scratchpad.css = gs.getProperty('css.base.color');

// Check if the current record has attachments
if (g_scratchpad.hasAttachments)
  // do something interesting here
else
  alert('You need to attach a form signed by ' +
        g_scratchpad.managerName);
```

Example - retrieve server data using asynchronous GlideAjax

Asynchronous GlideAjax allows you to dynamically request information from the server.

This script compares the support group of the CI and the assignment group of the incident by name:

```javascript
// Check if the assignment group's name matches the support group
function onChange(control, oldValue, newValue, isLoading) {
  if (isLoading)
    return;

  var ga = new GlideAjax('ciCheck');

  ga.addParam('sysparm_name', 'getCiSupportGroup');
  ga.addParam('sysparm_ci', g_form.getValue('cmdb_ci'));
  ga.addParam('sysparm_ag', g_form.getValue('assignment_group'));

  ga.getXML(doAlert); // Always try to use asynchronous (getXML) calls rather than synchronous (getXMLWait)
}

// Callback function to process the response returned from the server
function doAlert(response) {
  var answer = response.responseXML.documentElement.getAttribute("answer");

  alert(answer);
}
```

This script relies on the accompanying script include:

```javascript
var ciCheck = Class.create();
```
Use the setValue() displayValue parameter for reference fields

When using setValue() on a reference field, include the displayValue parameter to avoid additional server calls.

When using setValue() on a reference field, be sure to include the reference field display value as the 3rd parameter. If you set the value without the displayValue, the instance does a synchronous call to retrieve the display value for the record you specified. This extra round trip to the server can impact performance.

This example demonstrates the incorrect way to call setValue:

```javascript
var id = '5137153cc611227c000bbd1bd8cd2005';
g_form.setValue('assigned_to', id); // Client needs to go back to the server to fetch the name that goes with this ID
```

Instead, include the display value as an optional parameter in setValue():

```javascript
var id = '5137153cc611227c000bbd1bd8cd2005';
var name = 'Fred Luddy';
g_form.setValue('assigned_to', id, name); // No server call required
```
Use UI policy instead of a client script

When possible, consider using a UI policy instead of a client script.

UI policies provide these benefits over client scripts:

- UI policies have an **Order** field to allow full control over the order in which client-side operations take place.
- UI policies do not require scripting to make a field mandatory, read-only, or visible.

**Note:** UI policies apply after client scripts.

Validate input using client scripts

An excellent use for client scripts is validating input from the user.

This validation improves the user experience because the user finds out if there are data issues before submitting the information.

An example of validation is to verify that the **Impact** field value is valid with the **Priority** field value. In this example, **Low** impact is not allowed with **High** priority.

```javascript
if (g_form.getValue('impact') == '3' &&
g_form.getValue('priority') == '1')
    g_form.showFieldMsg('impact', gs.getMessage('Low impact now allowed with High priority'), 'error');
```

Run only necessary scripts

To avoid running time-consuming scripts unnecessarily, make sure that client scripts perform only necessary tasks.

The following examples demonstrate improvements to the initial code sample. Each example demonstrates a particular enhancement to the script to improve performance and avoid unnecessary calls.

Remember that client scripts have no **Condition** field. This means that onData() and onChange() scripts run in their entirety every time the appropriate form is loaded. This example is an inefficient onChange() client script set to run when the **Configuration item** field changes.

```javascript
//Set Assignment Group to CI's support group if assignment group is empty
function onChange(control, oldValue, newValue, isLoading) {

    var ciSupportGroup =
        g_form.getReference('cmdb_ci').support_group;

    if (ciSupportGroup != '' &&
        g_form.getValue('assignment_group') != '')
        g_form.setValue('assignment_group',
            ciRec.support_group.sys_id);
}
```
This example improves upon the first by replacing the getReference() or GlideRecord lookup with an asynchronous GlideAjax call.

```
//Set Assignment Group to support group if assignment group is empty
function onChange(control, oldValue, newValue, isLoading) {
    var ga = new GlideAjax('ciCheck');
    ga.addParam('sysparm_name', 'getSupportGroup');
    ga.addParam('sysparm_ci', g_form.getValue('cmdb_ci'));
    ga.getXML(setAssignmentGroup);
}
function setAssignmentGroup(response) {
    var answer = response.responseXML.documentElement.getAttribute("answer");
    g_form.setValue('assignment_group', answer);
}
```

The isLoading flag is the simplest way to prevent unnecessary code from taking up browser time in onChange scripts. The isLoading flag should be used at the beginning of any script that is not required to run when the form is loading. There is no need to run this script on a form load because the logic would have already run when the field was last changed. Adding the isLoading check to the script prevents it from doing a cmdb_ci lookup on every form load.

The isTemplate flag indicates that a template is loading.

```
//Set Assignment Group to CI's support group if assignment group is empty
function onChange(control, oldValue, newValue, isLoading, isTemplate) {
    if (isLoading)
        return;
    var ga = new GlideAjax('ciCheck');
    ga.addParam('sysparm_name', 'getSupportGroup');
    ga.addParam('sysparm_ci', g_form.getValue('cmdb_ci'));
    ga.getXML(setAssignmentGroup);
}
function setAssignmentGroup(response) {
    var answer = response.responseXML.documentElement.getAttribute("answer");
    g_form.setValue('assignment_group', answer);
}
```

If the onChange script should run during loading, use the following convention:

```
function onChange(control, oldValue, newValue, isLoading, isTemplate) {
```

if (isLoading) {}; // run during loading
   // rest of script here
}

The newValue check tells this script to continue only if there is a valid value in the relevant field. This prevents the script from running when the field value is removed or blanked out. This also ensures that there will always be a valid value available when the rest of the script runs.

//Set Assignment Group to CI's support group if assignment group is empty
function onChange(control, oldValue, newValue, isLoading, isTemplate) {
    if (isLoading)
        return;

    if (newValue) {
        var ga = new GlideAjax('ciCheck');

        ga.addParam('sysparm_name', 'getSupportGroup');
        ga.addParam('sysparm_ci', g_form.getValue('cmdb_ci'));
        ga.getXML(setAssignmentGroup);
    }
}

function setAssignmentGroup(response) {
    var answer = response.responseXML.documentElement.getAttribute("answer");

    g_form.setValue('assignment_group', answer);
}

To have the script react to a value that changes after the form loads, use the newValue != oldValue check.

//Set Assignment Group to CI's support group if assignment group is empty
function onChange(control, oldValue, newValue, isLoading, isTemplate) {
    if (isLoading)
        return;

    if (newValue) {
        if (newValue != oldValue) {
            var ga = new GlideAjax('ciCheck');

            ga.addParam('sysparm_name', 'getSupportGroup');
            ga.addParam('sysparm_ci', g_form.getValue('cmdb_ci'));
            ga.getXML(setAssignmentGroup);
        }
    }
}
In this example, the GlideAjax call is buried one level deeper by rearranging the script to check as many things available to the client as possible before running the server calls. The script checks the assignment before executing the GlideAjax call. This prevents the server lookup when the assignment_group field is already set.

```javascript
function onChange(control, oldValue, newValue, isLoading, isTemplate) {
    if (isLoading)
        return;

    if (newValue) {
        if (newValue != oldValue) {
            if (g_form.getValue('assignment_group') == '') {
                var ga = new GlideAjax('ciCheck');
                ga.addParam('sysparm_name', 'getSupportGroup');
                ga.addParam('sysparm_ci', g_form.getValue('cmdb_ci'));
                g_form.getValue('cmdb_ci'));
                ga.getXML(setAssignmentGroup);
            }
        }
    }
}

function setAssignmentGroup(response) {
    var answer = response.responseXML.documentElement.getAttribute("answer");
    g_form.setValue('assignment_group', answer);
}
```

Server API reference

Server-side Glide APIs enable you to create scripts to run on the server. Script includes provide common functionality that you can include in your server-side scripts. This page provides links to reference information for the server-side APIs and script includes.
<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>

Glide class overview

The ServiceNow Glide classes expose JavaScript APIs that enable you to conveniently work with tables using scripts.

Using the Glide APIs, you can perform database operations without writing SQL queries, display UI pages, and define UI actions. The following tables provide brief descriptions of the Glide classes and links to detailed information.

Table 1378: Server-side Glide classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>Use this class for database operations instead of writing SQL queries. GlideRecord is a special Java class that can be used in JavaScript exactly as if it were a native JavaScript class. A GlideRecord is an object that contains records from a single table. See GlideRecord.</td>
</tr>
<tr>
<td>GlideElement</td>
<td>Use this class to operate on the fields of the current GlideRecord. See GlideElement.</td>
</tr>
<tr>
<td>GlideSystem</td>
<td>Use this class to get information about the system. See GlideSystem.</td>
</tr>
</tbody>
</table>
### Table 1379: Client-side Glide Classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideAggregate</td>
<td>Use this class to perform database aggregation queries, such as COUNT, SUM,</td>
</tr>
<tr>
<td></td>
<td>MIN, MAX, and AVG, for creating customized reports or calculations in</td>
</tr>
<tr>
<td></td>
<td>calculated fields. See <a href="#">GlideAggregate</a>.</td>
</tr>
<tr>
<td>GlideDateTime</td>
<td>Use this class to perform date-time operations, such as date-time</td>
</tr>
<tr>
<td></td>
<td>calculations, formatting a date-time, or converting between date-time</td>
</tr>
<tr>
<td></td>
<td>formats. See <a href="#">GlideDateTime</a>.</td>
</tr>
</tbody>
</table>

### Glide stack

Glide is an extensible Web 2.0 development platform written in Java that facilitates rapid development of forms-based workflow applications (work orders, trouble ticketing, and project management, for example).

### Table 1380: User interface stack technology map

<th>Attributes</th>
</tr>
</thead>
</table>
| GlideServlet    | The primary driver of Glide, and the only servlet in the system, is found in GlideServlet.java. The GlideServlet: | • Handles inbound action requests  
• Renders pages  
• Merges data with forms  
• Presents to user  
• Interfaces with script layer |
| Business Rules  |                                                                             | • ECMA / JavaScript implementation based on Mozilla Rhino  
• Interfaces with persistence layer using JDBC recordset interface  
• Merges persistence layer meta-data with data for easy correlation |
| Persistence     |                                                                             | • Persistence means any store  
• RDBMS  
• LDAP  
• File system  
• Uniform access regardless of store type  
• Provides QUID and meta-data capabilities  
• Interfaces presented to callers  
• RecordSet  
• TableDescriptor  
• ElementDescriptor |
Scripting alert, info, and error messages

You can send messages to customers as alerts, informative messages, or error messages.

Table 1382: Business rule and other general use scripts

<table>
<thead>
<tr>
<th>Script</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>current.field_name.setError(&quot;Hello World&quot;);</code></td>
<td>Will put &quot;Hello World&quot; below the specified field.</td>
</tr>
<tr>
<td><code>gs.addInfoMessage(&quot;Hello World&quot;);</code></td>
<td>Will put &quot;Hello World&quot; on the top of the screen.</td>
</tr>
<tr>
<td><code>gs.print(&quot;Hello World&quot;);</code></td>
<td>Will write to the text log on the file system but not to the sys_log table in the database.</td>
</tr>
<tr>
<td>Script</td>
<td>Result</td>
</tr>
<tr>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td><code>gs.log(&quot;Hello World&quot;);</code></td>
<td>Will write to the database and the log file.</td>
</tr>
</tbody>
</table>

**Note:** Too much of this can adversely affect performance.

**Important:** The methods in this table are only for use with client scripts.

Table 1383: Client side scripts

<table>
<thead>
<tr>
<th>Script</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>alert(&quot;Hello World&quot;);</code></td>
<td>Will pop up a window with &quot;Hello World&quot; and an 'OK' button.</td>
</tr>
<tr>
<td><code>confirm(&quot;Hello World&quot;);</code></td>
<td>Will pop up a window with &quot;Hello World?&quot; and a 'Ok' and 'Cancel' buttons.</td>
</tr>
<tr>
<td><code>g_form.showFieldMsg(&quot;field_name&quot;, &quot;Hello World&quot;, &quot;error&quot;);</code></td>
<td>Puts &quot;Hello World&quot; in an error message below the specified field.</td>
</tr>
<tr>
<td><code>g_form.hideFieldMsg(&quot;field_name&quot;);</code></td>
<td>Hides an error box that is visible under the specified field.</td>
</tr>
</tbody>
</table>

It is also possible to add other custom messages to your forms if necessary using client scripting.

The text size of info and error messages at the top of the screen is customizable. Two properties control this. If you configured your forms, you may need to add these properties.

Table 1384: Error and alert text size properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>css.outputmsg.info.text.font-size</code></td>
<td>Sets the size for info messages. Default is 11pt.</td>
</tr>
<tr>
<td><code>css.outputmsg.error.text.font-size</code></td>
<td>Sets the size for error messages. Default is 11pt.</td>
</tr>
</tbody>
</table>

**Cost management APIs**

ServiceNow provides APIs for cost management.

See the *ServiceNow Developers site* for API information.

**Glide Server APIs**

ServiceNow provides APIs for the Glide Server.

See the *ServiceNow Developers site* for API information.

**GlideAggregate**

The *GlideAggregate* class is an extension of *GlideRecord* and allows database aggregation (COUNT, SUM, MIN, MAX, AVG) queries to be done. This can be helpful in creating customized reports or in calculations for calculated fields.
For additional information on these APIs, see `GlideAggregate` and `GlideRecord` on the ServiceNow Developers site.

**Note:** This functionality requires a knowledge of JavaScript.

See the ServiceNow Developers site for API information.

**GlideAggregate examples**

GlideAggregate is an extension of GlideRecord and its use is probably best shown through a series of examples.

**Note:** This functionality requires a knowledge of JavaScript.

For additional information, refer to GlideAggregate on the ServiceNow Developers site.

Here is an example that simply gets a count of the number of records in a table:

```javascript
var count = new GlideAggregate('incident');
count.addAggregate('COUNT');
count.query();
var incidents = 0;
if (count.next())
    incidents = count.getAggregate('COUNT');
```

There is no query associated with the above example but if you wanted to get a count of the incidents that were open then you simply add a query just as is done with GlideRecord. Here is an example to get a count of the number of active incidents.

```javascript
var count = new GlideAggregate('incident');
count.addQuery('active', 'true');
count.addAggregate('COUNT');
count.query();
var incidents = 0;
if (count.next())
    incidents = count.getAggregate('COUNT');
```

To get a count of all of the open incidents by category the code is:

```javascript
var count = new GlideAggregate('incident');
count.addQuery('active', 'true');
count.addAggregate('COUNT', 'category');
count.query();
while (count.next()) {
    var category = count.category;
    var categoryCount = count.getAggregate('COUNT', 'category');
    gs.log("The are currently "+ categoryCount + " incidents with a category of "+ category);
}
```

The output is:

*** Script: The are currently 1.0 incidents with a category of Data
*** Script: The are currently 11.0 incidents with a category of Enhancement
*** Script: The are currently 1.0 incidents with a category of Implementation
*** Script: The are currently 197.0 incidents with a category of inquiry
*** Script: The are currently 13.0 incidents with a category of Issue
*** Script: The are currently 1.0 incidents with a category of request
*** Script: The are currently 47.0 incidents with a category of request

Below is an example that is meant to show that you can ask for multiple aggregations. We are asking to see how many times records have been modified and we want the MIN, MAX, and AVG values.

```javascript
var count = new GlideAggregate('incident');
count.addAggregate('MIN', 'sys_mod_count');
```
count.addAggregate('MAX','sys_mod_count');
count.addAggregate('AVG','sys_mod_count');
count.groupBy('category');
count.query();
while(count.next()){
    var min = count.getAggregate('MIN','sys_mod_count');
    var max = count.getAggregate('MAX','sys_mod_count');
    var avg = count.getAggregate('AVG','sys_mod_count');
    var category = count.category.getDisplayValue();
    gs.log(category +" Update counts: MIN = "+ min +" MAX = "+ max +" AVG = "+ avg);
}

The output is:

*** Script: Data Import Update counts: MIN = 4.0 MAX = 21.0 AVG = 9.3333
*** Script: Enhancement Update counts: MIN = 1.0 MAX = 44.0 AVG = 9.6711
*** Script: Implementation Update counts: MIN = 4.0 MAX = 8.0 AVG = 6.0
*** Script: inquiry Update counts: MIN = 0.0 MAX = 60.0 AVG = 5.9715
*** Script: Inquiry / Help Update counts: MIN = 1.0 MAX = 4.0 AVG = 2.0
*** Script: Issue Update counts: MIN = 0.0 MAX = 63.0 AVG = 14.9459
*** Script: Monitor Update counts: MIN = 0.0 MAX = 63.0 AVG = 3.6561
*** Script: request Update counts: MIN = 0.0 MAX = 53.0 AVG = 5.0987

Here is a somewhat more complex example that shows how to compare activity from one month to the next.

```javascript
var agg = new GlideAggregate('incident');
agg.addAggregate('count','category');
agg.orderByAggregate('count','category');
agg.orderBy('category');
agg.addQuery('opened_at','>=','javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at','<=','javascript:gs.monthsAgoEnd(2)');
agg.query();
while(agg.next()){
    var category = agg.category;
    var count = agg.getAggregate('count','category');
    var query = agg.getQuery();
    var agg2 = new GlideAggregate('incident');
    agg2.addAggregate('count','category');
    agg2.orderByAggregate('count','category');
    agg2.orderBy('category');
    agg2.addQuery('opened_at','>=','javascript:gs.monthsAgoStart(3)');
    agg2.addQuery('opened_at','<=','javascript:gs.monthsAgoEnd(3)');
    agg2.addEncodedQuery(query);
    agg2.query();
    var last = ";
    while(agg2.next()){last = agg2.getAggregate('count','category');}
    gs.log(category +": Last month:" + count +" Previous Month:" + last);
}
```

The output is:

*** Script: Monitor: Last month:6866.0 Previous Month:4468.0
*** Script: inquiry: Last month:142.0 Previous Month:177.0
*** Script: request: Last month:105.0 Previous Month:26.0
*** Script: Issue: Last month:8.0 Previous Month:7.0
*** Script: Enhancement: Last month:5.0 Previous Month:5.0
*** Script: Implementation: Last month:1.0 Previous Month:0

Here is an example to get distinct count of a field on a group query.

```javascript
var agg = new GlideAggregate('incident');
```
```javascript
agg.addAggregate('count');
agg.addAggregate('count(distinct','category');
agg.addQuery('opened_at', '>=', 'javascript:gs.monthsAgoStart(2)');
agg.addQuery('opened_at', '<=', 'javascript:gs.monthsAgoEnd(2)');
//
agg.groupBy('priority');
agg.query();
while (agg.next()) {
  // Expected count of incidents and count of categories within each priority
  value (group)
gs.info('Incidents in priority ' + agg.priority + ' = ' +
  agg.getAggregate('count') +
  '(' + agg.getAggregate('count(distinct','category') + ' categories');
}
```

The output is:

```text
*** Script: Incidents in priority 1 = 13 (3 categories)
*** Script: Incidents in priority 2 = 10 (5 categories)
*** Script: Incidents in priority 3 = 5 (3 categories)
*** Script: Incidents in priority 4 = 22 (6 categories)
```

**GlideRecord**

GlideRecord is a special Java class (GlideRecord.java) that can be used in JavaScript exactly as if it was a native JavaScript class.

GlideRecord:

- is used for database operations instead of writing SQL queries.
- is an object that contains zero or more records from one table. Another way to say this is that a GlideRecord is an ordered list.

A GlideRecord contains both records (rows) and fields (columns). The field names are the same as the underlying database column names.

For additional information, refer to GlideRecord on the ServiceNow Developers site.

See the ServiceNow Developers site for API information.

**Using GlideRecordSecure**

GlideRecordSecure is a class inherited from GlideRecord that performs the same functions as GlideRecord, and also enforces ACLs.

**Non-Writable Fields**

Be aware that, when using GlideRecordSecure, non-writable fields are set to NULL when trying to write to the database. By default, canCreate() on the column is replaced with canWrite() on the column. If that returns false, the column value is set to NULL.
Checking for NULL Values

If an element cannot be read because an ACL restricts access, a NULL value is created in memory for that record. With GlideRecord, you must explicitly check for any ACLs that might restrict read access to the record. To do so, an if statement such as the following is required to check if the record can be read:

```javascript
if ( !grs.canRead() ) continue;
```

With GlideRecordSecure, you do not need to explicitly check for read access using canRead(). Instead, you can use next() by itself to move to the next record. The following example provides a comparison between GlideRecord and GlideRecordSecure.

```javascript
var count  = 0;
var gr  = new GlideRecord('mytable');
gr. query();
while (gr. next()) {
  if (!gr. canRead()) continue;
  if (!gr. canWrite()) continue;
  if (!gr. val. canRead() || !gr. val. canWrite())
    gr. val = null;
  else
    gr. val = "val-" + gr. id;
  if (gr. update())
    count ++;
}
```

```javascript
var count  = 0;
var grs  = new GlideRecordSecure('mytable');
grs. query();
while (grs. next()) {
  grs. val = "val-" + grs. id;
  if (grs. update())
    count ++;
}
```

Examples

These are two simple examples using GlideRecordSecure.

```javascript
var att  = new GlideRecordSecure ('sys_attachment');
att. get('${sys_attachment.sys_id}');
var sm  = GlideSecurityManager.get();
var checkMe = 'record/sys_attachment/delete';
var canDelete = sm.hasRightsTo(checkMe,att);
gs. log('canDelete: ' + canDelete);
canDelete;
```

```javascript
var grs = new GlideRecordSecure('task_ci');
grs.addQuery();
grs.query();
var count = grs. getRowCount();
if (count > 0 ) {
  var allocation = parseInt(10000/count) / 100;
  while (grs.next()) {
    grs.u_allocation = allocation;
    grs.update();
  }
}
```
GlideSystem

The GlideSystem API provides methods for retrieving information.

The GlideSystem (referred to by the variable name 'gs' in business rules) provides a number of convenient methods to get information about the system, the current logged in user, etc. For example, the method addInfoMessage() permits communication with the user.

```javascript
gs.addInfoMessage('Email address added for notification');
```

Many of the GlideSystem methods facilitate the easy inclusion of dates in query ranges and are most often used in filters and reporting.

For additional information, see GlideSystem on the ServiceNow Developers site.

See the ServiceNow Developers site for API information.

GlideSession

The GlideSession API allows you to find information about the current session.

For additional information, see GlideSession in the ServiceNow Developers site.

See the ServiceNow Developers site for API information.

GlideDateTime

The GlideDateTime class provides methods for performing operations on GlideDateTime objects, such as instantiating GlideDateTime objects or working with glide_date_time fields.

In addition to the instantiation methods described below, a GlideDateTime object can be instantiated from a glide_date_time field using the getGlideObject() method (for example, var gdt = gr.my_datetime_field.getGlideObject();).

Some methods use the Java Virtual Machine time zone when retrieving or modifying a date and time value. Using these methods may result in unexpected behavior. Use equivalent local time and UTC methods whenever possible.

For additional information, refer to GlideDateTime on the ServiceNow Developers site.

See the ServiceNow Developers site for API information.

GlideDate and GlideDateTime examples

The GlideDate and GlideDateTime APIs are used to manipulate date and time values.

**Note:** This functionality requires a knowledge of JavaScript.

For additional information, refer to GlideDate and GlideDateTime on the ServiceNow Developers site.

You can create a GlideDateTime object from a GlideDate object by passing in the GlideDate object as a parameter to the GlideDateTime constructor.

```javascript
var gDate = new GlideDate();
gDate.setValue('2015-01-01');
gs.info(gDate);

var gDT = new GlideDateTime(gDate);
gs.info(gDT);
```

Output:

```
2015-01-01
```
JavaScript tools script includes reference

<table>
<thead>
<tr>
<th>Script Include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>Include class to pull in prototype server if referenced.</td>
</tr>
<tr>
<td>GenericException</td>
<td>Provides generic exception wrapping.</td>
</tr>
<tr>
<td>GSLog</td>
<td>Implements levels of log output to simplify logging and debugging from JavaScript.</td>
</tr>
<tr>
<td>IllegalArgumentException</td>
<td>Provides exception wrapping for a specified illegal argument. This class extends GenericException.</td>
</tr>
<tr>
<td>isJavaObject</td>
<td>Determines if a given value is an instance of a JavaScript object.</td>
</tr>
<tr>
<td>JSONParser</td>
<td>Parses JSON without using JavaScript.</td>
</tr>
<tr>
<td>JSValidator</td>
<td>Provides functions for validating JavaScript code.</td>
</tr>
</tbody>
</table>

GenericException

Provides generic exception wrapping.

Where to Use

Use these methods to define exception handling in your JavaScript code.

Method Summary

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initialize(errorMessage)</td>
<td>Method called by the Prototype JavaScript Framework during object creation.</td>
</tr>
<tr>
<td>getMessage()</td>
<td>Gets the error message.</td>
</tr>
<tr>
<td>toString()</td>
<td>Converts the error message to a string.</td>
</tr>
</tbody>
</table>

Method Detail

initialize(errorMessage)

Called by the Prototype JavaScript Framework during object creation to initialize a new instance of this class. Provide the parameter value but do not directly call this method.

Input Fields
Parameters:

• **errorMessage** - (string) The error message.

### Output Fields

Returns: void

### Example

```java
var jerr = new GenericException("This is an error");
jerr.getMessage();
```

Gets the error message.

### Input Fields

Parameters:

• None

### Output Fields

Returns: (string) The error message.

### Example

```java
var jerr = new GenericException("This is an error");
gs.print(jerr.getMessage());
```

### Output:

```text
*** Script: This is an error
```

### toString()

Converts the error message to a string.

### Input Fields

Parameters:

• None

### Output Fields

Returns: (string) The error message.

### Example

```java
var jerr = new GenericException("This is an error");
gs.print(jerr.toString());
```

### Output:

```text
*** Script: This is an error
```

### IsJavaObject

Determines if a value is an instance of a Java object rather than a JavaScript primitive, JavaScript object, null, or undefined.
Where to Use

Use in any JavaScript code if you need to test for a Java object instance.

Method Summary

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isJavaObject(val)</td>
<td>Determines if a given value is an instance of a Java object.</td>
</tr>
</tbody>
</table>

Method Detail

isJavaObject(val)
Determines if a given value is an instance of a Java object.

Input Fields

Parameters:
- val - The value to test.

Output Fields

Returns: (boolean) True if the given value is an instance Java object; false, if the value is a JavaScript primitive, JavaScript object, null, or undefined.

Example

```javascript
var jsn = new JSON();
var jsary = [{ name: 'test', value: 1 }, { key: 'test2', value: 2}];
gs.print(isJavaObject(jsn));
```

Output

```
*** Script: false
```

JSValidator

Provides a helper function for validating JavaScript code, by getting any script errors generated by the Glide System. This class extends AbstractAjaxProcessor.

Where to Use

Use this script include whenever you need to validate a script.

Method Summary

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validate()</td>
<td>Validates the JavaScript code.</td>
</tr>
</tbody>
</table>
Method Detail

validate()
Gets any script errors generated by the Glide System.

Input Fields
Parameters:
• None

Output Fields
Returns: Any script error messages resulting from the validation; if none have occurred, returns null.

Example

```javascript
var jsv = new JSValidator();
gs.print(jsv.validate());
```

Schedule Pages

A schedule page is a record that contains a collection of scripts that allow for custom generation of a calendar or timeline display.

Creation of timeline schedule pages requires understanding how the page/event flow works as well as the ability to write client and server side JavaScript.

Schedule pages form

To access schedule pages, navigate to System Scheduler > Schedules > Schedule Pages.

The form provides the following fields, depending upon the View Type selected:

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>General name that is used to identity the current schedule page.</td>
</tr>
<tr>
<td>Field</td>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Schedule type</td>
<td>String</td>
<td>The schedule type is a string that is used to uniquely identify the schedule page via the &quot;sysparm_page_schedule_type&quot; URI parameter. For example, a schedule page could be accessed as follows: /show_schedule_page.do?sysparm_page_schedule_type=gantt_chart&amp;sysparm_timeline_task_id=d530bf907f0000015ce594fd929cf6a4 Alternatively, the schedule page can also be accessed by setting the &quot;sysparm_page_sys_id&quot; URI parameter to that of the unique 32 character hexadecimal system identifier of the schedule page.</td>
</tr>
<tr>
<td>View Type</td>
<td>Choice</td>
<td>Each view type displays different field combinations. There are two options available: • Calendars • Timelines</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>General description that provides additional information about the current schedule page. This field is not necessary.</td>
</tr>
<tr>
<td>Init function name</td>
<td>String</td>
<td>Note: This functionality is only used by Calendar type schedule pages. The init function name specifies the name of the JavaScript function to call inside the Client script function for calendar type schedule pages.</td>
</tr>
</tbody>
</table>
### Field Types and Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTML</td>
<td>String</td>
<td><strong>Note:</strong> This functionality is only used by Calendar type schedule pages. The HTML field is a scriptable section that is parsed by Jelly and injected into the display page prior to the rest of the calendar. It can be used to pass in variables from the server and define extra fields are necessary.</td>
</tr>
<tr>
<td>Client script</td>
<td>String</td>
<td>The client script is a scriptable section that allows for configuring options of the schedule page display. The API is different depending on the schedule page view type and is discussed below.</td>
</tr>
<tr>
<td>Server AJAX processor</td>
<td>String</td>
<td><strong>Note:</strong> This functionality is only used by Calendar type schedule pages. The Server AJAX processor is specific to calendar type schedule pages that is used to return a set of schedule items and spans to be displayed.</td>
</tr>
</tbody>
</table>

### Timeline Schedule Pages

A Timeline Schedule Page is a specific record that contains configuration information for displaying time based points and spans in a "timeline" like fashion.

The timeline schedule page references a script include that extends from AbstractTimelineSchedulePage to perform dynamic modification to the timeline based on different events and conditions. Both the schedule page and the script include for timeline generation allow for extreme customization and their corresponding application programming interface (API) is documented below.

The following diagram shows the series of events that occur when a timeline schedule page is accessed. Once the timeline has been loaded, all subsequent events, such as events resulting from timeline interaction (e.g. moving a timeline span), follow the same logic flow shown in the gray event box.
Applications that use schedule pages to generate time lines

- Project Management
- Maintenance Schedules
- Group On-Call Rotation
- Field Service Management

Timeline schedule page example

This example demonstrates how to create a timeline schedule page with a script include.

For this example we are going to create an Incident Summary Timeline for a project support manager to visualize all of the new incidents. All new incidents should be displayed as single points where the
priority of the incident is distinguished by a different point icon. Additionally, all closed incidents should be displayed on the timeline in a separate group that shows the duration of the incident before it was closed. Since the Project Manager wants to be able to easily close new items that are resolved without using any form lists, we will handle the vertical move event allowing the new incidents to be dragged into the closed incident group or items within.

**Schedule Page**

Create a new schedule page with the following properties:

- **Name**: Hardware Incidents
- **Schedule type**: incident_timeline
- **View Type**: Timeline
- **Client Script**:

```javascript
// Set our page configuration
glideTimeline.setReadOnly(false);
glideTimeline.showLeftPane(true);
glideTimeline.showLeftPaneAsTree(true);
glideTimeline.showTimelineText(true);
glideTimeline.showDependencyLines(false);
glideTimeline.groupByParent(true);
glideTimeline.setDefaultPointIconClass('milestone');

// We will define what items to display and provide a custom event handler for moving new items to the closed state
glideTimeline.registerEvent('getItems','IncidentTimelineScriptInclude');
glideTimeline.registerEvent('elementMoveY','IncidentTimelineScriptInclude');
```

**Script Include**

Now that the schedule page has been created we need to generate a matching script include for the events that were registered. Create a new script include with the following properties:

- **Name**: IncidentTimelineScriptInclude
- **Active**: Checked
- **Client callable**: Checked
- **Script**:

```javascript
// Class Imports
var IncidentTimelineScriptInclude = Class.create();
IncidentTimelineScriptInclude.prototype =
Object.extendsObject(AbstractTimelineSchedulePage, {

// GET_ITEMS

getItems: function() {
  // Specify the page title
  this.setPageTitle('My Custom Incident Summary Timeline');

  var groupNew = new GlideTimelineItem('new');
groupNew.setLeftLabelText('New Incidents');
groupNew.setImage('../images/icons/all.gifx');
groupNew.setTextBold(true);
this.add(groupNew);
```

© 2017 ServiceNow. All rights reserved. 3970
var groupClosed = new GlideTimelineItem('closed');
groupClosed.setLeftLabelText('Closed Incidents');
groupClosed.setImage('../images/icons/all.gifx');
groupClosed.setTextBold(true);
groupClosed.setIsDroppable(true);

// This allows us to drag an open incident onto the closed group row.
this.add(groupClosed);

// Get all the incidents and let's add only the new/closed ones appropriately
var gr = new GlideRecord('incident');
gr.query();
while(gr.next()) {
    // Only loop through new/closed incidents
    if(gr.incident_state != '1' && gr.incident_state != '7') continue;

    // Ok, we have a new/closed incident. Create the item and the span first.
    var item = new GlideTimelineItem(gr.getTableName(), gr.sys_id);
    var span = item.createTimelineSpan(gr.getTableName(), gr.sys_id);

    // Specific properties for a new incident
    if(gr.incident_state == '1') { // New
        item.setParent(groupNew.getSysId());
        item.setImage('../images/icons/open.gifx');
        span.setTimeSpan(gr.getElement('opened_at').getGlideObject().getNumericValue(),
                         gr.getElement('opened_at').getGlideObject().getNumericValue());

        // We'll show different colors based upon the priorities only for new incidents
        switch(gr.getElement('priority').toString()) {
            case '1': span.setPointIconClass('red_circle'); break;
            case '2': span.setPointIconClass('red_square'); break;
            case '3': span.setPointIconClass('blue_circle'); break;
            case '4': span.setPointIconClass('blue_square'); break;
            case '5': span.setPointIconClass('sepia_circle'); break;
            default: // Otherwise, the default point icon class will be used (Milestone)
                }
    }

    // Specific properties for a closed incident
    else if(gr.incident_state == '7') {
        item.setParent(groupClosed.getSysId());
        item.setImage('../images/icons/closed.gifx');
        span.setTimeSpan(gr.getElement('opened_at').getGlideObject().getNumericValue(),
                         gr.getElement('closed_at').getGlideObject().getNumericValue());

        // Common item properties
        item.setLeftLabelText(gr.short_description);

        // Common span properties
        span.setSpanText(gr.short_description);
        span.setToolTipText('<strong>' + GlideStringUtil.escapeHTML(gr.short_description) + '</strong><br>' +
                             gr.number);
        span.setAllowXMove(false);
        span.setAllowYMove(gr.canWrite() ? true:false);
        span.setAllowYMovePredecessor(false);
        span.setAllowXDragLeft(false);
        span.setAllowXDragRight(false);
    }
}
span.setAllowXDragRight(false);

// Now we add the actual item
this.add(item);
}
},

///////////////////////////////////////////////////////////
ELEMENT_MOVE_Y
///////////////////////////////////////////////////////////

/**
* This is one of the AbstractTimelineSchedulePage event handler methods
* that corresponds to a vertical
* move. The arguments for this function are defined in the API section of
* the event handler methods.
*/
elementMoveY: function(spanId, itemId, newItemId) {

// Get information about the current incident
var gr = new GlideRecord('incident');
gr.addQuery('sys_id', spanId);
gr.query();
if(!gr.next())
    return this.setStatusError('Error', 'Unable to lookup the current
incident.);

// Only allow the new incidents to have their state adjusted.
if(gr.incident_state != '1')
    return this.setStatusError('Error', 'Only new incidents can have
their state adjusted.');

// Get information about the dropped GlideTimelineItem. If it was
dropped in an item on the "New Incidents"
// group let's do nothing. If it was dropped in the "Closed Incidents"
then let's adjust the state automatically.
var grDropped = new GlideRecord('incident');
grDropped.addQuery('sys_id', newItemId);
grDropped.query();
if(!grDropped.next() || grDropped.incident_state == '7') {
    // This means the dropped item was either the 'Closed Incidents'
group (which has no record or sys_id) or an
    // existing incident that is closed. The 'New Incidents' also has no
    sys_id; however, the default behavior for
    // items without a sysId is to be non-droppable. This is why we
    explicitly denoted the 'Closed Incidents' to
    // be marked as "droppable".
    // Return a dialog prompt
    this.setStatusPrompt('Confirm', 'Are you sure you want to close: ' +
    '<div style="margin:10px 0 10px 14px;padding:4px;background-color:#EBEBEB;">'+
    GlideStringUtil.escapeHTML(gr.short_description) +
    '</div></div>',
    'this._elementMoveYHandler_DoClose', // This function is for
    when the OK button is clicked.
    'this._elementMoveYHandler_DoNothing', // This function is
    for when the Cancel button is clicked.
    'this._elementMoveYHandler_DoNothing'); // This function is
    for when the Close button is clicked.
    } },

_elementMoveYHandler_DoClose: function(spanId, itemId, newItemId) {
// Notice that this function takes the same function arguments as the
// original function for which it
// is a custom event handler for.

// Update the database record from 'New' to 'Closed'.
var gr = new GlideRecord('incident');
gr.addQuery('sys_id', spanId);
gr.query();
gr.next();
gr.setValue('incident_state', '7');
gr.update();

// This will re-render the timeline showing the updated item in the
// closed group.
this.setDoReRenderTimeline(true);

// Let's show a success message
this.setStatusSuccess('Success', '<strong>' + gr.short_description + '</strong> was successfully closed.');

// Since the user clicked cancel or close we simply do nothing.
_elementMoveYHandler_DoNothing: function(spanId, itemId, newItemId) {
}};

**Screenshots / Results**

1. **Navigate to:**
   
   http://[YOURINSTANCE]:8080/show_schedule_page.do?
sysparm_page_schedule_type=incident_timeline

   Notice the bold text is the value of the schedule page **Schedule type** field.

2. **The page displays a timeline as specified by the schedule page and script include created.** A link to this page can be created and placed as a module or UI action as necessary.
3. Attempting to move a closed incident anywhere displays the expected error message.

![Error Message Example](image)

Figure 943: Timeline Example Error Moving

4. Moving the incident: I need more memory displays the following confirmation box.

![Confirmation Box Example](image)

Figure 944: Timeline Example Confirm Close

5. Clicking the Cancel button closes the overlay. Clicking the OK button actually updates the incident_state of the record and then displays the following success box.

![Success Message Example](image)

Figure 945: Timeline Example Close Success

6. After clicking OK, it is clear the incident is now listed in the Closed Incidents group.
Figure 946: Timeline Example Incident Updated
Using discovery script includes

Discovery script includes define JavaScript classes that you can use to accomplish Discovery tasks. See the ServiceNow Developers site for API information.

Using GlideRecordUtil to Work with GlideRecords

GlideRecordUtil is a utility class that provides methods that are useful for working with GlideRecords during Discovery.

Getting a GlideRecord Instance

To get a GlideRecord instance for a given configuration item, and of the correct class and table, use the getCIGR(sys_id) method. For example, the following code gets the GlideRecord of a CI with the sys_id of 2dfd7c8437201000deeabfc8bcbe5d56:

```javascript
var gr = new GlideRecordUtil().getCIGR("2dfd7c8437201000deeabfc8bcbe5d56");
```

To retrieve any hierarchical table without knowing its class type, use the getGR(base_table, sys_id) method. For instance, if you need to get a GlideRecord for a computer class CI, you may not know if it is a computer class or more specifically a Windows server class or Linux server class. Using this method guarantees that you have a GlideRecord with the correct class. This is important because different classes have different attributes—in this case, a Windows server has attributes different from those of a Linux server. You must get a GlideRecord in the correct class or attributes may be missing. The following is a typical example of how to do this:

```javascript
var gr = new GlideRecordUtil().getGR("cmdb_ci_computer", "2dfd7c8437201000deeabfc8bcbe5d56");
```

Getting All the Fields In a GlideRecord

The getFields(gr) method returns a JavaScript object, such as a hash map, of all the fields or attributes that exist in a given GlideRecord.

```javascript
var gr = new GlideRecordUtil().getGR("cmdb_ci_computer", "2dfd7c8437201000deeabfc8bcbe5d56");
var fields = new GlideRecordUtil().getFields(gr);
gs.log(fields.join(" ")); // List all the fields that are in a computer CI
```

Populating GlideRecord Object Fields

The populateFromGR(hashmap, gr, ignore) method allows you to take a GlideRecord object and populate its fields and values into a JavaScript object. The third argument (ignore) is an optional JavaScript object that allows you to exclude certain fields. For example, you may not care about sys_created_by or sys_updated_by fields in a GlideRecord.

```javascript
var objectToPopulate = { };
var gr = new GlideRecordUtil().getGR("cmdb_ci_computer", "2dfd7c8437201000deeabfc8bcbe5d56");
var ignore = {"sys_created_on": true, "sys_updated_by": true};
new GlideRecordUtil().populateFromGR(objectToPopulate, gr, ignore);
```
// Now the objectToPopulate contains field/value pairs from the computer GlideRecord

The `mergeToGR(hashmap, gr, ignore)` method allows you to populate a GlideRecord with a field/value-paired object. The ignore argument stops specified fields from being updated. The following code example updates a computer record’s name and os fields, but does not update the sys_created_by field:

```javascript
var gr = new GlideRecordUtil().getGR("cmdb_ci_computer", "2dfd7c8437201000deeabfc8bcbef5d56");
var obj = {"name": "xyz", "os": "windows 2000", "sys_created_by": "aleck.lin"};
var ignore = {"sys_created_by": true};
new GlideRecordUtil().mergeToGR(obj, gr, ignore);
gr.update();
```

**Getting Table Hierarchies**

The `getTables(table)` method returns a list of table hierarchies, as shown in the following example:

```javascript
var tables = new GlideRecordUtil().getTables("cmdb_ci_linux_server");
gs.log(tables.join(",");
// The result would be "cmdb_ci, cmdb_ci_computer, cmdb_ci_server, cmdb_ci_linux_server".
```

**Using DiscoveryException and AutomationException**

When writing Discovery sensors and sensor-related scripts, you may want to use DiscoveryException or AutomationException to indicate that an exception has come from Discovery.

The `DiscoveryException` script include extends `AutomationException`, which extends the `GenericException` class. The following example uses `DiscoveryException` to throw an exception:

```javascript
function foo() {
    if(//condition matches) throw new DiscoveryException("The message", "The cause");
}
```

The first argument takes the message of the exception and the second argument (optional) takes the cause of the exception. You may also want to catch the exception and log it as shown in the example below:

```javascript
try {
    foo();
}
catch(e) {
    if(e instanceof DiscoveryException)
        gs.log("A DiscoveryException occurred. It is " + e.getMessage() + " caused by " + e.getCause());
}
```

The above example also applies for `AutomationException`. `DiscoveryException` is typically used to provide exception processing specifically for Discovery, while `AutomationException` is used for exception processing that applies to both Orchestration and Discovery.

**vCenter API User Privileges**

To determine the user privileges required by the VMware activity that logs into vCenter:
Determining Privileges

1. Navigate to the VMware API documentation.
2. In the vCenter API page, select **All Types** in the left navigation menu.

3. Click **U-Z** in the API index that appears.

4. Select **VirtualMachine** in the index.
   
   Information appears about a VirtualMachine object in the API.

5. Select **Local Methods** from the navigation menu at the top of the page.
6. Click the following methods to see the required vCenter login privileges:
   - CloneVM_Task: No privileges are required.

Methods

Methods inherited from ManagedEntity

Destroy_Task, Reload, Rename_Task

Methods inherited from ExtensibleManagedObject

setCustomValue
XMLDocument script object

A JavaScript object wrapper for parsing and extracting XML data from an XML document (String).

Use this Javascript class to instantiate an object from an XML string, usually a return value from a Web Service invocation, or the XML payload of ECC Queue. Using the XMLDocument object in a Javascript business rule lets you query values from the XML elements and attributes directly.

Programming Interface

Constructor

The constructor of a script object creates a new instance of the object to be used.

```javascript
var xmlString = "<test>
  <one>
    <two att="xxx">abcd1234</two>
    <three boo="yah" att="yyy">1234abcd</three>
    <two>another</two>
  </one>
  <number>1234</number>
</test>";
var xmldoc = new XMLDocument(xmlString);
```

To perform XML parsing of an XML string that is name space qualified, specify "true" for the second argument for the XMLDocument constructor. The following is an example of parsing and XML string that contains name space qualification of its elements.

```javascript
var xmlString = "<bk:book xmlns:bk='urn:loc.gov:books'
  <bk:title>Cheaper by the Dozen</bk:title>
  <isbn:number>1568491379</isbn:number>
</bk:book>";
var xmldoc = new XMLDocument(xmlString, true); // XML document is name space aware
```

Locating Nodes and Elements

Now that we have the XMLDocument object, we can call the following APIs to locate nodes and elements of the XML document, as well as extract text from it directly. The query syntax for locating nodes and attributes is based on XPath.

**Note:** XML parsing with this object is not namespace aware, this means that if you are locating a node name with namespace in it eg. "<names:myelement> ...", the XPath search string would be "/names/myelement"

The following are examples of locating a node by its XPath and getting the text value out of the resulting node.

```javascript
var str = xmldoc.getNodeText("//two"); // returns the first occurence of the node
// str == "abcd1234"
```
The following examples locates the node by XPath and uses the API on node and element to get attributes and value.

```javascript
var node = xmldoc.getNode("/test/one/two");
// node.getNodeName() == "two"
// node.getNodeType() == "1" // 1 == ELEMENT_NODE
// node.getLastChild().getType() == "3" // 3 == TEXT_NODE
// node.getLastChild().getNodeValue() == "abcd1234"
```

Or you can use the following convenience functions to get the node name and type

```javascript
str = xmldoc.getNodeName("//three");
// str == "three"

str = xmldoc.getNodeType("//three");
// str == "1"
```

You can also get a list of nodes that you can iterate or access directly by position

```javascript
var nodelist = xmldoc.getNodes("//one/*"); // two, three, and two
// nodelist.getLength() == "3"
// nodelist.item(0).getNodeName() == "two"
// nodelist.item(1).getNodeName() == "three"
```

The following is an example of parsing an XML string that is qualified with name spaces.

```javascript
var xmlString = "<bk:book xmlns:bk='urn:loc.gov:books'
xmlns:isbn='urn:ISBN:0-395-36341-6'>" +
"<bk:title>Cheaper by the Dozen</bk:title>" +
"<isbn:number>1568491379</isbn:number>" +
"</bk:book>";

var xmldoc = new XMLDocument(xmlString, true);
var str = xmldoc.getNodeText("//bk:title"); // returns the first occurrence of the node
gs.log(str);

str = xmldoc.getNodeText("//bk:book/*");
gs.log(str);

str = xmldoc.getNodeInt("//isbn:number");
gs.log(str);
```

**Getting attribute values**

An attribute is just an extension of a node and so it has all the same APIs.

The following example shows how to query for a node to get its attribute by position

```javascript
node = xmldoc.getNode("//two");
```
XPath also has a query syntax for locating the attribute node directly, for example

```
str = xmldoc.getAttribute("//two", "att");
// str == "xxx"
```

```
str = xmldoc.getNodeText("//*[@att="yyy"]");
// str == "1234abcd"
```

```
str = xmldoc.getNode("//@boo").getNodeValue();
// str == "yah"
```

Creating new elements

An XML element can be created at any level of the XML document once it has been created. Use the `setCurrent` function to position where the new element will be created as a child element, and use the `createElement` function to create the element.

```
var xmlString = "<test>"
  "  <one>
    "<two att="xxx">abcd1234</two>
    "<three boo="yah" att="yyy">1234abcd</three>
    "<two>another</two>
  "</one>
  "<number>1234</number>"
"</test>";
```

```
var xmldoc = new XMLDocument(xmlString);
xmldoc.createElement("new", "test"); // creates the new element at the document element level if setCurrent is never called
xmldoc.createElement("new2"); // calling without a value will create a new element by itself
```

```
var el = xmldoc.createElement("new3");
xmldoc.setCurrent(el); // this is now the parent of any new elements created subsequently using createElement()
xmldoc.createElement("newChild", "test");
```

The resulting XML document looks like this

```
<test>
  <one>
    <two att="xxx">abcd1234</two>
    <three boo="yah" att="yyy">1234abcd</three>
    <two>another</two>
  </one>
  <number>1234</number>
  <new test="new" new2/> <new3>
    <newChild>test</newChild>
  </new3>
</test>
```

XMLHelper

The XML helper script include makes it extremely easy to parse XML in ServiceNow JavaScript. The script include will convert your XML document into a JavaScript object.
The following changes were made to the XML helper script include:

- The `toObject()` method now returns an object whose properties are all JavaScript objects. This method now works properly whether the supplied parameter is an XML document or an XML string.
- The methods `toXMLDoc()` and `toXMLStr()` are now available. These methods are the inverse of the existing `toObject()` method.
- The `toObject()` method has been extended to take an optional parameter of the XML input to convert as an alternative to the (still present) mechanism of specifying the XML input in the constructor.

**Example**

The following example takes an example XML document and then converts it into a JavaScript object. It then takes the outputted JavaScript object and uses a recursive function to output all members of the object. The recursive function is useful and reusable if you have any questions about how a particular XML document will be structured after being converted to a JavaScript object.

**Script**

```javascript
var xmlString = "<company>
  <employee>
    <id>10</id>
    <firstname>Tom</firstname>
    <lastname>Cruise</lastname>
    <test>test1</test>
    <test>test3</test>
  </employee>
  <employee>
    <id>20</id>
    <firstname>Paul</firstname>
    <lastname>Enderson</lastname>
    <test>test6</test>
    <test>test5</test>
  </employee>
  <employee>
    <id>30</id>
    <firstname>Paul</firstname>
    <lastname>Bush</lastname>
    <test>test2</test>
    <test>test4</test>
  </employee>
</company>";

var helper = new XMLHelper(xmlString);
var obj = helper.toObject();

logObj(obj, "**")
function logObj(obj, sep){
  for(x in obj){
    if(typeof obj[x]!="function"){
      gs.log(sep + x +": " + obj[x]);
      logObj(obj[x], sep +"*");}
  }
}
```

**Output**

```
*** Script: *employee:: [object Object], [object Object], [object Object]
*** Script: **2:: [object Object]
*** Script: ***id:: 30
*** Script: ****test:: test2, test4
*** Script: *****0:: test2
*** Script: ****1:: test4
*** Script: ***firstname:: Paul
*** Script: ****lastname:: Bush
*** Script: **0:: [object Object]
*** Script: ***id:: 10
*** Script: ****test:: test1, test3
*** Script: *****0:: test1
*** Script: ****1:: test3
*** Script: ***firstname:: Tom
*** Script: ****lastname:: Cruise
*** Script: **1:: [object Object]
*** Script: ***id:: 20
```
Useful scripts

Scripts that provide useful functionality not included in the core system.

Get a user object

In a business rule or other server script, the `gs.getUser()` method returns a user object. The user object is an internal representation of the currently logged in user and provides information about the user and various utility functions.

See the ServiceNow Developers site for API information.

For a list and description of the available scoped methods for the user object, see `GlideUser()` on the ServiceNow Developers site.

To get user information for a particular user:

1. Retrieve the current user.
   
   ```javascript
   var myUserObject = gs.getUser()
   ```

2. Use the `getUserByID` method to fetch a different user using the `user_name` field or `sys_id` on the target record.
   For example:

   ```javascript
   var ourUser = gs.getUser();
   gs.print(ourUser.getFirstName()); //print the first name of the user you are currently logged in as
   ourUser = ourUser.getUserByID('-abel.tuter'); //fetch a different user, using the user_name field or sys_id on the target user record.
   gs.print(ourUser.getFirstName()); //first name of the user you fetched above
   gs.print(ourUser.isMemberOf('-Capacity Mgmt'));
   ```

Accessing the workflow scratchpad from business rules

A catalog item has been requested, the attached workflow contains a run script activity that populates a value in the scratchpad. From a business rule running on the requested item, we want to retrieve or set scratchpad values.

Prerequisites

Role required: admin

Name: Access Workflow Scratchpad from Business Rules

Type: Business Rule

Table: sc_req_item (Requested Item)
**Description:** A catalog item has been requested, the attached workflow contains a run script activity that populates a value in the scratchpad. From a business rule running on the requested item, we want to retrieve or set scratchpad values.

**Parameters:** n/a

**Script:**

```javascript
//the run script activity sets a value in the scratchpad
workflow.scratchpad.important_msg = "scratch me";

//get the workflow script include helper
var workflow = new Workflow();

//get the requested items workflow context
//this will get all contexts so you'll need to get the proper one if you have multiple workflows for a record
var context = workflow.getContexts(current);
//make sure we have a valid context
if (context.next()) {
  //get a value from the scratchpad
  var msg = context.scratchpad.important_msg;
  //msg now equals "scratch me", that was set in the run script activity

  //add or modify a scratchpad value
  context.scratchpad.status = "completed";
  //we need to save the context record to save the scratchpad
  context.update();
}
```

Add a field to the service catalog checkout

This is an example of adding a **Company** field to the checkout below the **Requested for** field.

![Requested for field](image)

**Figure 947: Requested for field**

This field will then passing the value of that field to the **Company** field of the Service Catalog Request.

This example makes the following assumptions.

- This example is for an instance using two-step checkout. If two-step checkout is not enabled, enable it before beginning.
- This example populates the **Company** field on the Service Catalog Request form. If the field does not appear on the form, configure the form before beginning.

To add a field to the Service Catalog Checkout:

1. Go to **System UI > UI Macros** and select **servicecatalog_cart_template**.
2. Find where there are hidden variables declared and add the following line:

```html
<input type="HIDDEN" name="cart_id" id="cart_id" value="${sc_cart.sys_id}" />
```

3. Find the following code, which generates the **Requested For** code:

```html
<tr class="header">
    <td width="30%">
        ${gs.getMessage('Requested for')}:
    </td>
    <td width="70%">
        <label for="requestor_location">${gs.getMessage('Deliver to')}:</label>
    </td>
</tr>
<tr><td>$[SP]</td></tr>
<tr><td valign="top">
    <j2:if test="$[jvar_can_delta_rf == false]">
        $[sc_cart.requested_for.getDisplayValue()]
    </j2:if>
    <j2:if test="$[jvar_can_delta_rf != false]">
        <g2:catalog_requested_for />
    </j2:if>
</td>
<td>
    <textarea id="requestor_location" style="width:100%" rows="4"
        name="requestor_location" wrap="soft"
        onChange="catDeliveryAddress('${sc_cart.sys_id}',
            'requestor_location');">
        $[sc_cart.delivery_address]
    </textarea>
</td>
<tr><td>$[SP]</td></tr>
</tr>
<tr><td colspan="2">Company</td></tr>
<tr><td>$[SP]</td></tr>
<tr><td colspan="2">
    <g2:ui_reference name="core_company" table="core_company"
        onchange="setCartValue()"/>
</td></tr>
<tr><td>$[SP]</td></tr>
</tr>
```

4. Add the following code afterwards:

```html
<tr class="header">
    <td colspan="2">Company</td>
</tr>
<tr><td>$[SP]</td></tr>
<tr><td colspan="2">
    <g2:ui_reference name="core_company" table="core_company"
        onchange="setCartValue()"/>
</td></tr>
<tr><td>$[SP]</td></tr>
</tr>
```

- Note that 'ui_reference' is another macro that defines a reference field. There are several macros for different field types. You can see examples of these field types under **System UI -> UI Macros**. These macros start with 'ui_'. For this example, the reference field created is named **core_company**.
5. Now navigate to System UI > UI Pages and select the servicecatalog_checkout_one UI Page. Add this script to the Client script field:

```javascript
function setCartValue() {
  var newField = gel('core_company');
  var myCart = gel('cart_id');
  var cart_item = new GlideRecord('sc_cart_item');
  cart_item.addQuery('cart', myCart.value);
  cart_item.query();
  if(cart_item.next()) {
    cart_item.hints = "<hints><entry key='sysparm_processing_hint' value='setfield:request.company=' + newField.value + "/'></hints>>";
    cart_item.update();
  }
}
```

For this example, the reference field was called core_company, and the field being populated on the request is company. If different fields are used:

- Find this line: var company = gel('core_company'); and replace core_company with the name of the field in the checkout.
- In the line that starts with 'cart_item.hints' replace 'request.company' with the name of the field to be populated on the request ticket where 'request' is the request being generated and 'company' is the name of the field.

Now, when an item is ordered, the company field appears on the Catalog form:
Add role to every user

Adds a role to every user.

Prerequisites

**Note:** This functionality requires a knowledge of JavaScript.

Role required: admin

In this sample, the role being added is Self Service. To add a different role, simply substitute the desired role for self_service.

**Name:** Add Role to Every User  
**Type:** Client Script, Background Script  
**Table:** sys_user  
**Description:** Adds a role to every user. In this sample, the role being added is **Self Service**. To add a different role, simply substitute the desired role for **self_service**.
Assign a catalog item to a group based on a delivery plan task

This assignment rule assigns a service catalog item to the database group if it uses a delivery plan that has a catalog task assigned to the desktop group.

**Prerequisites**

Role required: admin

---

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Name:** Assign Catalog Item to Group Based on Delivery Plan Task

**Type:** Assignment Rule

**Table:**

**Description:** This assignment rule assigns a service catalog item to the database group if it uses a delivery plan that has a catalog task assigned to the desktop group.

**Parameters:**

**Script:**

```javascript
//Return catalog items that have no group but do have a delivery plan assigned
var ri = new GlideRecord("sc_cat_item");
ri.addQuery("group", ",\nnull);
ri.addQuery("delivery_plan", ",\n!=", null);
ri.query();
while(ri.next()) {
    gs.log("Found an item");
    //Return tasks that point to the same delivery plan as the above item
    var dptask = new GlideRecord("sc_cat_item_delivery_task");
dptask.addQuery("delivery_plan", ",\n!=", ri.delivery_plan);
dptask.query();
    while(dptask.next()) {
        gs.log("Found a task");
        var gp = dptask.group.getDisplayValue();
gs.log(gp);
        //If the task is assigned to desktop, assign the item's group to desktop
        if (dptask.group.getDisplayValue() == "Desktop") {
            ri.group.setDisplayValue("Desktop");
gs.log("updating " + ri.getDisplayValue());
            ri.update();
        }
    }
}
```
Change form color on state change

Changes color of a form field of the form on state change. The script can easily be changed to adjust any property of any object on the page accessible via the HTML DOM.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Name: Change Form Color on State Change
Type: Client Script
Table:
Description: Changes color of a form field of the form on state change. The script can easily be changed to adjust any property of any object on the page accessible via the HTML DOM.
Parameters:
Script:

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    var elementID = gel("incident.priority");
    switch (newValue) {
        case "1":
            elementID.style.backgroundColor = "red";
            break;
        case "2":
            elementID.style.backgroundColor = "tomato";
            break;
        case "3":
            elementID.style.backgroundColor = "orange";
            break;
        case "4":
            elementID.style.backgroundColor = "yellow";
            break;
        case "5":
            elementID.style.backgroundColor = "green";
            break;
        default:
            elementID.style.backgroundColor = "white";
            break;
    }
}
```

Create a UI routing action

This solution enables you to create a record with the service desk without knowing whether it is an incident or request item; the service desk can then route the record to the appropriate table.

**Note:** Functionality described here requires the Admin role.

To create a UI routing action:

1. Create a new table that extends the task table (for example, New Call).
2. Create a module to create a new New Call record.
3. Create any fields that you want on the New Call table.

   The only fields you need are those fields necessary to determine whether the new call should route to an Incident or a Request Item. Ensure that the form contains any fields that you want to pass to the Incident or Request Item. In this example, the following are created on the form:
   - Requested for (reference)
   - Location (reference)
   - Call type (choice with two values--Incident and Request)
   - Request Item (reference to the sc_cat_item Item table)

4. Add some UI policies to set a couple of fields to mandatory and hide the Request item field based on the Call type selection.
5. Remove unnecessary buttons and functionality from the form.

6. Create a new UI Action button. This button redirects the user to either an incident or a request. It also creates the incident record and copies values to the incident and the Request Item form.

```javascript
var reqItem = current.u_item;
var requestedFor = current.u_requested_for;
var location = current.location;

if(current.u_incident_request == 'Incident'){
    //Create a new incident record and redirect to the new incident
    var rec = new GlideRecord('incident');
    rec.initialize();
    rec.caller_id = requestedFor;
    rec.location = location;
    rec.insert();
    action.setRedirectURL(rec);
}

if(current.u_incident_request == 'Request'){
    //Build the url and route the user to the request item
    var url = '';
    if(current.u_item.sys_class_name == 'sc_cat_item_guide'){
        url = 'com.glideapp.servicecatalog_cat_item_guide_view.do?' +
              'sysparm_initial=true&sysparm_guide=' +
              reqItem + '&sysparm_user=' + requestedFor + '&sysparm_location=' +
              location;
    } else{
        url = 'com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=' +
              reqItem + '&sysparm_user=' +
              requestedFor + '&sysparm_location=' + location;
    }
    action.setRedirectURL(url);
}
```

7. The Route button in the preceding example passes the Requested for and Location values in the URL to the Request Item form. Ensure that you have variables called requested_for and location on your item, record producer, or order guide that map these values using the following client script. There is a limit as to how much information you can pass, as the URL has a restricted length. It is generally not a best practice to send information from long text fields using this method.

```javascript
function onLoad() {
    var url = document.location.toString();
    var userKey = 'sysparm_user=';
    var locKey = 'sysparm_location=';
    var userPosition = url.indexOf(userKey);
    var locPosition = url.indexOf(locKey);
    if (userPosition != -1) {
        var user = url.substr(userPosition+userKey.length, 32);
        g_form.setValue('requested_for',user);
    }
    if (locPosition != -1) {
        var loc = url.substr(locPosition+locKey.length, 32);
        g_form.setValue('location',loc);
    }
}
```

Custom approval UI macro

This section describes how to create a custom approval UI macro.
**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Script Name:** Custom Approval UI Macro  
**Type:** UI Macro  
**Description:** Here is an option to get more detail out of the My Approvals view of an Execution Plan. This can be done by creating a new UI macro. Navigate to System UI and click UI Macros. First, you will need to rename the existing approval_summarizer_sc_task to something like approval_summarizer_sc_task_old and deactivate it. Then you will need to create a new one using the same name (approval_summarizer_sc_task). The name should basically tell you what the macro does and what it applies to. In this case, we’re replacing an existing one so we decided to re-use the existing name.

Then you should copy the xml script at the bottom of this article into the xml code window in the new UI macro. This is great way to give some detail to an approver when you are doing line item approvals via approval tasks within the Service Catalog Execution Plans.
The old way

This is the view you see in My Approvals when using an approval task via the old method.

Figure 949: My Approvals (old way)

Notice there is not much detail telling the approver what they are actually approving. You can see the short description of the task but not much around what the item is.

The new way

This is the view you will see if you use the xml script below in place of the OOB (out-of-box) UI macro.
Using this method you can see details much like the request approval. You have a link into the item ordered, a short description (which contains the ability to expand the variables from the item), price, quantity and the total price. This helps the approver in that it shows more detail. They can now see what they are actually approving.

Script:

```xml
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="true" xmlns:j="jelly:core" xmlns:g="glide"
xmlns:j2="null" xmlns:g2="null">
<tr>
  <td class="label_left" width="100%">
    <label style="margin-left: 10px">
      ${gs.getMessage('Summary of Item being approved')}:<input style="visibility: hidden" NAME="make_spacing_ok"></input>
    </label>
  </td>
</tr>
<g:evaluate var="jvar_ni" expression="
  var sc_task = ${ref}.sysapproval;
  var sc_req_labels = new GlideRecord('sc_req_item');
  sc_req_labels.initialize();
  var sc_req_item = new GlideRecord('sc_req_item');
  sc_req_item.addQuery('request_item', sc_task.request_item.sys_id);
  sc_req_item.query();
" />
<tr>
  <td width="100%">
    <table width="100%">
      <tr>
        <td class="label_left" width="150px">
          <label style="margin-left: 10px">

Display field messages

Rather than use JavaScript alert(), for a cleaner look, you can display an error on the form itself. The methods `showFieldMsg()` and `hideFieldMsg()` can be used to display a message just below the field itself.

`showFieldMsg` and `hideFieldMsg` are methods that can be used with the `g_form` object.

These methods are used to make changes to the form view of records (Incident, Problem, and Change forms). These methods may also be available in other client scripts, but must be tested to determine whether they will work as expected.

When a field message is displayed on a form on load, the form will scroll to ensure that the field message is visible, ensuring that users will not miss a field message because it was off the screen.

A global property (glide.ui.scroll_to_message_field) is now available that controls automatic message scrolling when the form field is offscreen (scrolls the form to the control or field).
### Table 1386: Method Detail

<table>
<thead>
<tr>
<th>Method Detail</th>
<th>Parameters</th>
<th>Example</th>
</tr>
</thead>
</table>
| `showFieldMsg(input, message, type, [scrollform])` | - input - name of the field or control  
- message - message you would like to display  
- type - either 'info' or 'error', defaults to info if not supplied  
- scroll form - (optional) Set scrollForm to false to prevent scrolling to the field message offscreen. | **Error Message**  
g_form.showFieldMsg('impact','Low impact not allowed with High priority','error');  
| **Informational Message**  
g_form.showFieldMsg('impact','Low impact response time can be one week','info');  
//or this defaults to info type  
//g_form.showFieldMsg('impact','Low impact response time can be one week'); |
| `hideFieldMsg(input)` | - input - name of the field or control  
- clearAll - (optional) boolean parameter indicating whether to clear all messages. If true, all messages for the field will be cleared; if false or empty, only the last message will be removed | **Removing a Message**  
//this will clear the last message printed to the field  
g_form.hideFieldMsg('impact'); |

### Legacy support

The `showErrorBox()` and `hideErrorBox()` are still available but simply call the new methods with type of error. It is recommended that you use the new methods.

### GSLog

GSLog is a script include which makes logging and debugging from script easier by implementing levels of log output, selectable by per-caller identified sys_properties values.
Log level

Logs can be at the level of Debug, Info, Notice, Warning, Err, or Crit (after BSD syslog.h and followers). The default logging level would normally be Notice, so levels should be chosen accordingly.

Where to use

Use for any server-side script where you want to implement event logging.

Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Input Fields</th>
<th>Output Fields</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>initialize(traceProperty, caller)</td>
<td>Called by the Prototype JavaScript Framework during object creation to initialize a new instance of this class. Provide the input parameters, but do not call this method directly.</td>
<td>Parameters: - traceProperty - A system property that contains a value indicating the level at or above which messages will be written to the log. - caller - The name of the script calling the logger.</td>
<td>Returns: void</td>
<td>var gl = new GSLog(&quot;com.snc.sla.tasksla.log&quot;, &quot;TaskSLA&quot;);</td>
</tr>
</tbody>
</table>
| logDebug(msg)  | Logs debug events.            | Parameters: msg - The message to write to the log.                          | Returns: void | var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
<p>|                |                              |                                                                              |               | gl.logDebug(&quot;This is a debug message&quot;);                               | Output: *** Script [TaskSLA]: This is a debug message |
| logInfo(msg)   | Logs information events.      | Parameters: msg - The message to write to the log.                          | Returns: void | var gl = new GSLog(&quot;com.snc.sla.tasksla.log&quot;, &quot;TaskSLA&quot;);             |</p>
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Input Fields</th>
<th>Output Fields</th>
<th>Example</th>
</tr>
</thead>
</table>
| logNotice(msg) | Logs notice events.    | Parameters: msg  
- The message to write to the log. | Returns: void | var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");  
gl.logNotice("This is a notice");  

Output:  
*** Script [TaskSLA]:  
This is a notice |
| logWarning(msg) | Logs warning events. | Parameters: msg  
- The message to write to the log. | Returns: void | var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");  
gl.logWarning("This is a warning message");  

Output:  
*** Script [TaskSLA]:  
This is a warning message |
| logErr(msg)    | Logs error events.    | Parameters: msg  
- The message to write to the log. | Returns: void | var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");  
gl.logErr("This is an error message");  

Output:  
*** Script [TaskSLA]:  
This is an error message |
| logCrit(msg)  | Logs critical events. | Parameters: msg  
- The message to write to the log. | Returns: void | var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");  
gl.logCrit("This is a critical message");  

Output:  
*** Script [TaskSLA]:  
This is a critical message |
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Input Fields</th>
<th>Output Fields</th>

**Modify a GlideDateTime field value**

This example demonstrates how to modify a GlideDateTime field value using a script.

**Name:** Modify a GlideDateTime Field Value

**Type:** A server side script that accesses a GlideDateTime field.

**Table:** N/A

**Description:** Given a GlideDateTime field or script object, show a variety of ways to easily modify value. The same concept also applies to the GlideDate object.

**Parameters:** N/A

**Script:**

```java
//You first need a GlideDateTime object
//this can be from instantiating a new object "var gdt = new GlideDateTime()"
//or getting the object from a GlideDateTime field
//getting the field value (for example: var gdt = current.start_date) only returns the string value, not the object
//to get the object use var gdt = current.start_date.getGlideObject();
//now gdt is a GlideDateTime object
var gdt = current.start_date.getGlideObject();

//All methods can use negative values to subtract intervals

//add 1 hour (60 mins * 60 secs)
gdt.addSeconds(3600);

//add 1 day
gdt.addDaysLocalTime(1);
```

<table>

//subtract 1 day
gdt.addDaysLocalTime(-1);

//add 3 weeks

gdt.addWeeksLocalTime(3);

//subtract 6 months.
gdt.addMonthsLocalTime(-6);

//add 1 year, representing the date and time using the UTC timezone instead of the local user's timezone.
gdt.addYearsUTC(1);

Reprocess received emails

It is possible to reprocess emails that were received by your instance.

A similar “Reprocess received emails” UI action gives a list choice option at the bottom of the email list, which can be used to reprocess multiple emails at once.

A UI action named “Reprocess Email” puts a button on the email form:

![Figure 951: Reprocess Email UI action](image)

The script and condition are duplicated below for easy cutting and pasting. This UI action gives you a button when you open an email (in System Logs --> Email) that has a type of "received" or "received-ignored". It will create an event that will reprocess that incoming email through the Inbound Email Actions.

**Condition**

```javascript
current.type == 'received' || current.type == 'received-ignored'
```

**Script**

```javascript
var evt = new GlideRecord('sysevent');
evt.initialize();
evt.process_on = gs.nowDateTime();
```
Sample ASP.NET with C Sharp redirect with cookies

This sample ASP.NET code creates a simple authentication portal and passes an unencrypted HTTP header as a cookie.

**Note:** Functionality described here requires the **Admin** role.

**Note:** Cookies are domain specific and cannot be used across different network domains. The only domain that can read a cookie is the domain that sets it. It does not matter what domain name you set. If you do not have an option of your SSO portal being in the same network domain as your ServiceNow instance (for example, in an on-premises deployment, an alternative is to pass the SSO token using URL GET or POST parameters.

This sample assumes:

- The web server supports ASP.NET and C#
- The target ServiceNow instance is `https://<instance name>.service-now.com/`
- SiteMinder or another single sign-on application has pre-authenticated the user
- The target ServiceNow instance expects an HTTP header of SM_USER

Change the ASP code to redirect users to the proper ServiceNow instance.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head runat="server">
    <title>Portal Page Login</title>
    <%--    <meta http-equiv="REFRESH" content="0;url=https://<instance name>.service-now.com/">--%>
</head>
<body>
<form id="form1" runat="server">
<h2><b>Portal Page Login</b></h2>
<hr style="position: static" />
<br />
<asp:Label ID="Label2" runat="server" Font-Size="Larger" Height="21px" Style="position: static" Text="Instance URL:" Width="113px"></asp:Label>
<asp:TextBox ID="urlBox" runat="server" Font-Size="Large" Style="position: static"></asp:TextBox><br />
<br />
<asp:Label ID="Label1" runat="server" Font-Size="Larger" Height="17px" Style="position: static," Text="User Id:" Width="113px"></asp:Label>
<asp:TextBox ID="userNameBox" runat="server" Font-Size="Large" Style="position: static;">"</asp:TextBox><br />
<br />
<asp:Button ID="Button1" runat="server" Height="39px" Style="position: static;" Text="Ok" Width="88px" OnClick="Button1_click" />
</form>
</body>
</html>
```
Figure 952: ASP Portal Redirect

The following C# code handles the OnClick button event for the form. The code:

- Creates the cookie "SM_USER"
- Performs a redirect to the URL specified on the ASP form.

Change the C# code to create the proper cookie name.

```csharp
using System;
using System.Data;
using System.Configuration;
using System.Web;

public partial class _Default : System.Web.UI.Page
{
    protected void Page_Load(object sender, EventArgs e)
    {
    }

    protected void Button1_click(object sender, EventArgs e)
    {
        try
        {
            HttpCookie myCookie = new HttpCookie("SM_USER");
            myCookie.Value = userNameBox.Text;
            Response.Cookies.Add(myCookie);
            Response.Redirect(urlBox.Text);
        }
        catch {}
    }
}
```
Useful approval assignment scripts

This is a searchable version of the useful approval and assignment scripts.

Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

For an easy-to-navigate version, visit the Useful Scripts portal.

Assign a group for ESS requests
Type: Assignment Rule
Description: This script automatically assigns a group for all ESS Requests.
Script example:

```java
if(current.opened_by.roles==""){
    current.assignment_group.setDisplayValue('Network');
    current.update();
}
```

Assign Catalog Item to Group Based on Delivery Plan Task
Type: Assignment Rule
Description: This assignment rule assigns a service catalog item to the database group if it uses a delivery plan that has a catalog task assigned to the desktop group.

```java
//Return catalog items that have no group but do have a delivery plan assigned
var ri = new GlideRecord("sc_cat_item");
ri.addQuery("group","=",null);
ri.addQuery("delivery_plan","!=",null);
ri.query();
while(ri.next()){    
    gs.log("Found an item");
    //Return tasks that point to the same delivery plan as the above item
    var dptask = new GlideRecord("sc_cat_item_delivery_task");
    dptask.addQuery("delivery_plan","=",ri.delivery_plan);
    dptask.query();
    while(dptask.next()){    
        gs.log("Found a task");
        var gp = dptask.group.getDisplayValue();
        gs.log(gp);
        //If the task is assigned to desktop, assign the item's group to desktop
        if(dptask.group.getDisplayValue()=="Desktop"){
            ri.group.setDisplayValue("Desktop");
            gs.log("updating "+ ri.getDisplayValue());
            ri.update();
            break;
        }
    }
}
```

Assign items with one task
Type: Assignment Rule
Description: Automatically assigns any catalog items with only one task associated to a particular group.

```java
//Get the catalog item for the current requested item
var scCatItem = new GlideRecord("sc_cat_item");
if(scCatItem.get('sys_id', current.cat_item)){
```
Assignment based on workload
Type: Business Rule

Description: Populate the assigned to based on the assignment group member who has the least amount of active incidents.

Parameters:
- order: >1000 if you want to execute after assignment rules
- condition: current.assigned_to == " & current.assignment_group != "
- when: before, insert/update

```javascript
var assignTo = getLowestUser();
gs.addInfoMessage("assigning to is " + assignTo);
current.assigned_to= assignTo;

function getLowestUser(){
    var userList = new Array();
    var cg = new GlideRecord('sys_user_grmember');
    cg.addQuery('group', current.assignment_group);
    cg.query();
    while(cg.next()){var tech = cg.user.toString();
        var cnt = countTickets(tech);
        gs.addInfoMessage("Tech counts " + cg.user.name+ ' '+ cnt +" " + tech);
        userList.push({ sys_id: tech, name: cg.user.name, count: cnt });}
    for(var i=0; i < userList.length; i++){
        gs.addInfoMessage(userList[i].sys_id+" + userList[i].name+" + userList[i].count);
    }
    userList.sort(function(a, b){
        gs.addInfoMessage("Sorting: " + a.sys_id"(" + a.count");
        "+ b.sys_id"(" + b.count")");
        return a.count- b.count;});
    if(userList.length<=0)return"; return userList[0].sys_id;}

function countTickets(tech){
    var ct = new GlideRecord('incident');
    ct.addQuery('assigned_to',tech);
    ct.addQuery('active',true);
    ct.query();
    return ct.getRowCount();}
```

Run assignment rules when category is changed
Type: Client script
Table: Incident
Description: This example is an onChange client script on the category field within Incident. Note: this script used to use synchronous AJAX (asynchronous behavior is specified by the third parameter of the ajaxRequest call). The implementation below uses asynchronous AJAX. The drawback of using the synchronous version is that a network response problem could cause the browser to hang.

```javascript
// Make an AJAX request to the server to get who this incident would be
// assigned to given the current values in the record. This runs the
// rules that have been defined in System Policy and returns the assigned_to
// and
// the assignment_group

function onChange(control, oldValue, newValue, isLoading){
    if(isLoading){return;
    // No change, do not do anything
}

    // Construct the URL to ask the server for the assignment
    var url = "xmlhttp.do?sysparm_processor=AJAXAssignment&sys_target=incident";
    var uv = gel('sys_uniqueValue');
    if(uv){
        url +="&sys_uniqueValue="+ uv.value;
    // Make the AJAX request to the server and get the response
    var serial = g_form.serialize();
    // get all values currently assigned to the incident
    var response = ajaxRequest(url, serial, true, responseFunc);

    // This callback function handles the AJAX response.
    function responseFunc(response){
        var item = response.responseXML.getElementsByTagName("item") [0];
        // Process the item returned by the server
        if(item){
            // Get the assigned_to ID and its display value and put them on the form
            var name = item.getAttribute("name");
            var name_label = item.getAttribute("name_label");
            if(name_label && name){
                g_form.setValue('assigned_to', name, name_label);
            }else{
                g_form.setValue('assigned_to', '', '');
            }
            // Get the assignment_group ID and its display value and put then on the
            form
            var group = item.getAttribute("group");
            var group_label = item.getAttribute("group_label");
            if(group_label && group){
                g_form.setValue('assignment_group', group, group_label);
            }else{
                g_form.setValue('assignment_group', '', '');
            }
        }
    }
}
```

**Custom approval UI macro**

**Type:** UI macro

The following option illustrates how to obtain more detail from the **My Approvals** view of an Execution Plan by creating a new UI Macro.

- Navigate to **System UI** and click **UI Macros**.
- Rename the existing "approval_summarizer_sc_task" to something like "approval_summarizer_sc_task_old" and deactivate it.
- Create a new one using the same name ("approval_summarizer_sc_task"). The name should basically tell you what the macro does and to what it applies. In this case, we're replacing an existing one so we decided to re-use the existing name.
Then copy the xml script at the bottom of this article into the xml code window in the new UI Macro. This is a great way to give some detail to an approver when you are doing line item approvals using approval tasks within the Service Catalog Execution Plans.

### Different ways

#### Old way

This is the view you see in **My Approvals** when using an approval task using the old method.
Notice there is not much detail telling the approver what they are actually approving. You can see the short description of the task but not much information about the item.

**New way**

This is the view you will see if you use the xml script below in place of the OOB (out-of-box) UI Macro.

Using this method you can see details much like the request approval. You have a link into the item ordered, a short description (which contains the ability to expand the variables from the item), price, quantity and the total price. This helps the approver in that it shows more detail. They can now see what they are actually approving.

**Useful field scripts**

This is a searchable version of the useful field customization scripts.
**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

For an easy-to-navigate version, visit the Useful Scripts portal.

**AKA Incident Template, Auto Assignments, Quick Calls, Call Script, Auto Populate**

Let's say you want to auto-fill your **Short Description** based on the selected **Subcategory**. First, create a lookup table, then populate the key field, in this case the **Subcategory** and the auto-filled field, **Short Description**. So let's say your table had a record with **Subcategory** = Password and **Short Description** = Password Reset. When the user selects the **Subcategory** of Password on the Incident form, a client script looks up the matching record and sets **Short Description** equal to Password Reset.

**Client script settings...** Type = onChange, Table name = incident, Field name = Subcategory

```javascript
function onChange(control, oldValue, newValue, isLoading){
  if(isLoading){return;}
  var newrec = gel('sys_row');
  //Check if new record
  if (newrec.value==-1) {
    var lookup = new GlideRecord('u_short_desc_lookup');
    lookup.addQuery('u_subcategory', g_form.getValue('subcategory'));
    lookup.query();
    var temp; //temp var - reusable
    if(lookup.next()){
      temp = lookup.u_short_description;
      if(null!= temp) {
        //Set the form value from lookup if there is a lookup value
        g_form.setValue('short_description', temp);
      } else {
        g_form.setValue('short_description','""');
      }
    } else {
      //If a lookup record does not exist based on lookup.addQuery
      //Then set to UNDEFINED or NULL depending on type
      g_form.setValue('short_description','""');
    }
  }
}
```

You could populate multiple fields or even pull Call Script questions into the **Comments** field so call center personnel gather good information to pass on to a technician. There are already Assignment Rules, Templates, and Wizards built in that perform similar functions.

**Disable HTML tags in descriptions**

Description: This code disables HTML tags in descriptions and short descriptions by substituting the tags with harmless versions that won’t execute.

```javascript
function doit(){
  var desc = current.description.toString();
  var shdesc = current.short_description.toString();
  if(desc.indexOf('script>')>-1|| shdesc.indexOf('script>')>-1){
    desc = desc.replace(/<script>/g,"(script)"));
    current.description = desc.replace(/</script>/g,"(\</script")
    shdesc = shdesc.replace(/<script>/g,"(script)"));
    current.short_description = shdesc.replace(/</script>/g,"(\</script")
  }
}
```
Eliminate leading and trailing spaces in fields

Table: sys_user

Description: This example of the script trims trailing and leading spaces in the FirstName and LastName fields of sys_user.

doit();

function doit(){
    var gr =new GlideRecord('sys_user');
    gr.query();
    while(gr.next()){
        if((gr.first_name.toString().length!=
            gr.first_name.toString().trim().length)||(gr.last_name.toString().length!=
            gr.last_name.toString().trim().length)){
            gr.first_name= gr.first_name.toString().trim();
            gr.last_name= gr.last_name.toString().trim();
            gr.autoSysFields(false);
            gr.update();}
    }
}

Make a field label flash

Type: Client script

Description: The following example is for the number field on incident. The label will flash for two seconds:

    g_form.flash("incident.number","#FFFACD",0);

The arguments for the flash method are as follows:

1. tablename.fieldname
2. RGB color or acceptable CSS color like "blue" or "tomato"
3. integer that determines how long the label will flash:
   - Use 2 for a 1-second flash
   - Use 0 for a 2-second flash
   - Use -2 for a 3-second flash
   - Use -4 for a 4-second flash

Do not specify this argument if you want the field label simply colored the specified color.

Make field label bold

Type: Client script

Description: This script makes the label of a particular field (in this case, Short Description on the Incident Table) bold.

    functiononLoad(){
        var l = g_form.getLabel('incident.short_description');
        l.style.fontWeight='bold';
    }

Make fields read-only

Type: Client script

Table: Incident

Description: This onLoad client script makes fields read-only. For this example, the script makes the following fields on the Incident table read-only: Incident state, Impact, Urgency, Priority, Configuration
item, and Assigned to. It also removes the magnifying glass for the read-only Reference Fields (Configuration item and Assigned to).

```javascript
function onLoad(){
  var incidentState = g_form.getValue('incident_state');
  if( incidentState == '6' || incidentState == '7'){
    g_form.setReadonly('incident_state',true);
    g_form.setReadonly('impact',true);
    g_form.setReadonly('urgency',true);
    g_form.setReadonly('priority',true);
    g_form.setReadonly('cmdb_ci',true);
    g_form.setReadonly('assigned_to',true);}}
```

Set current date/time in field

Type: Client script

Description: You can use the following two lines to set the current date and time in a date/time field. This bypasses the problem of getting the value into the proper format and proper timezone.

```javascript
var ajax = new GlideAjax('MyDateTimeAjax');
ajax.addParam('sysparm_name','nowDateTime');
ajax.getXML(function(){
  g_form.setValue('put your field name here', ajax.getAnswer());});
```

System script include

```javascript
// Be sure the "Client callable" checkbox is checked

var MyDateTimeAjax = Class.create();
MyDateTimeAjax.prototype = Object.extendObject(AbstractAjaxProcessor, {
  nowDateTime: function()
  {
    return gs.nowDateTime();
  }});
```

Toggle timer field by field name

Type: Client script

Description: Toggles the timer field based on a particular field name.

```javascript
function toggleTimerByFieldName(fieldName){
  //Step 1: Find the timer object
  //timeObjectName: the timer objects name as it would normally be referenced
  //timeObjectHidden: the hidden input node in the field td
  //timeObjectParent: the parent td node containing the field and it's constituent nodes
  //timeObjectFields: anchor tag with onclick to stop timer

  var timeObjectName = fieldName;
  var timeObjectHidden = gel(timeObjectName);

  //Step 2: simulate click stop button
  var timeObjectParent;
  var timeObjectFields;

  //verify that we got the correct object
  if(timeObjectHidden.type=="hidden"){
    //Get Parent td node
    timeObjectParent = timeObjectHidden.parentNode;
```
//Get input fields
var timeObjectFields = timeObjectParent.getElementsByTagName("input");

//simulate click of stop button
var timerTestString = "paused";
var timerImg;

//loop through input objects looking for the pause timer object
for(var elIt=0; elIt < timeObjectFields.length; elIt++){
  if(timeObjectFields[elIt].id.match(timerTestString)){
    if(timeObjectFields[elIt].value=="false"){
      timeObjectFields[elIt].value="true";
      timerImg = timeObjectParent.getElementsByTagName("img")[0];
      timerImg.src="images/timer_start.gifx";
    }
    else if(timeObjectFields[elIt].value=="true"){
      timeObjectFields[elIt].value="false";
      timerImg = timeObjectParent.getElementsByTagName("img")[0];
      timerImg.src="images/timer_stop.gifx";
    }
  }
}

Modify GlideDateTime field value

Type: A server side script that accesses a GlideDateTime field.

Description: Given a GlideDateTime field or script object, show a variety of ways to easily modify value. The same concept also applies to the GlideDate object.

//You first need a GlideDateTime object
//this can be from instantiating a new object "var gdt = new GlideDateTime()"
//or getting the object from a GlideDateTime field
//getting the field value (for example: var gdt = current.start_date)
//only returns the string value, not the object
//to get the object use var gdt = current.start_date.getGlideObject();
//now gdt is a GlideDateTime object
var gdt = current.start_date.getGlideObject();

//All methods can use negative values to subtract intervals

//add 1 hour (60 mins * 60 secs)
gdt.addSecondsLocalTime(3600);

//add 1 day
gdt.addDaysLocalTime(1);

//subtract 1 day
gdt.addDaysLocalTime(-1);

//add 3 weeks
gdt.addWeeksLocalTime(3);

//subtract 6 months.
gdt.addMonthsLocalTime(-6);

//add 1 year, representing the date and time using the UTC timezone instead of the local user's timezone.
gdt.addYearsUTC(1);

Useful scheduling scripts

A business rule script specifies the actions that the business rule takes. Scripts commonly include predefined global variables to reference items in your system, such as the current record. Global variables are available to all business rules.
Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Calculate duration given a schedule
Type: Before update/insert business rule
Table: Incident
Description: A Business Duration calculates the Open to Close duration on an incident based on the particular Schedules on page 1040. If there is no schedule specified, the script will simply use the first schedule returned by the query.

Script example:
The example below sets the resolved duration when the incident state moves to resolved.

```javascript
if(current.incident_state==6){
  var dur = calcDurationSchedule(current.opened_at,current.sys_updated_on);
  current.u_resolved_duration= dur;
}

function calcDurationSchedule(start, end){
  // Get the user
  var usr =new GlideRecord('sys_user');
  usr.get(gs.getUserID());
  // Create schedule - pass in the sys_id of your standard work day schedule and pass in the users timezone
  var sched =new GlideSchedule('08fcd0830a0a0b2600079f56b1adb9ae',usr.time_zone);
  // Get duration based on schedule/timezone
  return(sched.duration(start.getGlideObject(), end.getGlideObject()));}
```

Check upcoming termination dates
Type: Scheduled script
Description: This script checks nightly for termination dates on contracts coming up in 90, 50, or 10 days (depending on the contract duration field).

Script example:

```javascript
function contractNoticeDue(){
  var gr =new GlideRecord("contract");
  gr.addQuery("u_contract_status","Active");
  gr.query();
  while(gr.next()){ 
    if((gr.u_termination_date<= gs.daysAgo(-90))&&(gr.u_contract_duration=="Long")){
      gr.u_contract_status="In review";
    }else if((gr.u_termination_date<= gs.daysAgo(-50))&&(gr.u_contract_duration=="Medium")){
      gr.u_contract_status="In review";
    }else if((gr.u_termination_date<= gs.daysAgo(-10))&&(gr.u_contract_duration=="Short")){
      gr.u_contract_status="In review";
    }
    gr.update();
  }
}
```

Use scripts in business rules to accomplish common tasks such as:
- Comparing two date fields.
• Parsing XML payloads.
• Aborting a database action in a business rule.

With scripts, you can also:
• Specify the operation that triggers the business rule.
• Use the scratchpad with display business rules to change form values just before a user loads the form.
• Use the OR condition like you would in a condition builder.

You can also utilize the system's scripting functionality available for server-side scripts.

You can use options on the Business Rules form to build conditions, set field values, and display alert messages without needing to write a script.

Abort a database action in a business rule

During a before business rule script, you can cancel or abort the current database action using the current.setAbortAction(true) method.

For example, if the before business rule is executed during an insert action, and you have a condition in the script that calls current.setAbortAction(true), the new record stored in current is not created in the database.

Add autofill functionality

Add autofill functionality is also called incident template, auto assignments, quick calls, call script, or auto populate.

Let's say you want to auto-fill your Short Description based on the Subcategory selected. First, create a lookup table, then populate the key field, in this case Subcategory and the auto-filled field, Short Description. So let's say your table had a record with Subcategory = Password and Short Description = Password Reset. When the user selects the subcategory of Password on the Incident form a client script looks up the matching record and sets short description equal to Password Reset. Client script settings...

Type = onChange, Table name = incident, Field name = Subcategory.

```javascript
function onChange(control, oldValue, newValue, isLoading) {
    if (isLoading) { return; }
    var newrec = gel('sys_row');
    // Check if new record
    if (newrec.value == -1) {
        var lookup = new GlideRecord('u_short_desc_lookup');
        lookup.addQuery('u_subcategory', g_form.getValue('subcategory'));
        lookup.query();
        var temp; //temp var - reusable
        if (lookup.next()) {
            temp = lookup.u_short_description;
            if (null != temp) { // Set the form value from lookup if there is a lookup value
                g_form.setValue('short_description', temp);
            } else {
                g_form.setValue('short_description', "" );
            }
        } else {
            // If a lookup record does not exist based on lookup.addQuery
            // Then set to UNDEFINED or NULL depending on type
            g_form.setValue('short_description', "" );
        }
    }
}
```

You could populate many fields or even pull in call script questions into the Comments field so call center personnel gather good information to pass on to a technician. There are already Assignment Rule, Templates and Wizards built in that perform similar functions.
Example script: A default before-query business rule

You can use a query business rule that executes before the database query is made to prevent users from accessing certain records.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Consider the following example from a default business rule that limits access to incident records.

**Table 1387: Default business rule limits access to incident records**

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>When</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident query</td>
<td>Incident</td>
<td>before, query</td>
</tr>
</tbody>
</table>

**Example script**

This example prevents users from accessing incident records unless they have the itil role are listed in the Caller or Opened by field. So, for example, when self-service users open a list of incidents, they can only see the incidents they submitted.

```javascript
if(!gs.hasRole("itil")&& gs.isInteractive()){
    var u = gs.getUserID();
    var qc = current.addQuery("caller_id", u).addOrCondition("opened_by", u).addOrCondition("watch_list","CONTAINS", u);
    gs.print("query restricted to user: "+ u);}
```

**Note:** You can also use access controls to restrict the records that users can see.

**Schedule script for weekdays**

Type: Business Rules/Client Scripts

This script schedules the script for weekdays. Insert any script where it says "Your Script Here."

```javascript
var go = 'false';
var now = new Date();

// Correct time zone, which is by default GMT -7
now.setHours(now.getHours()+8);
var day = now.getDay();

// No go on Saturday or Sunday
if(day !=0&& day !=6){
    // (your script here)
}
```

**Set date field according to current date**

This script sets a date field depending on the current day of the week. In this example, if the day is Monday through Wednesday, it sets the date to this coming Monday; otherwise it sets the date field to next Monday.

```javascript
function setCabDate(){
```

© 2017 ServiceNow. All rights reserved.
var today = new Date();
var thisDay = today.getDay();
// returns 0 for Sunday, 1 for Monday, etc. thru 6 for Saturday.
var thisMon = new GlideDateTime();
thisMon.setDisplayValue(gs.beginningOfThisWeek());
var nextMon = thisMon.getNumericValue();
nextMon += (1000 * 60 * 60 * 24 * 7);

if((thisDay < 4) && (thisDay > 0))
    // if today is Mon thru Wed (thisDay = 1, 2, or 3), set cab to this coming Monday.
    current.u_req_cab_rev_date.setDateNumericValue(thisMon.getNumericValue());
elseif((thisDay >= 4) || (thisDay == 0))
    // if today is Thurs thru Sun (thisDay = 4, 5, 6, or 0), set cab to next Monday.
    current.u_req_cab_rev_date.setDateNumericValue(nextMon);

To validate the input of all date/time fields, you can use the following in a validation script (System Definition > Validation Scripts). Because the date/time format is hard coded in this script, it must match your instance’s date/time format. If your instance’s date/time format changes, you must update your validation script.

Set the validation script's type to Date/Time. Then, with this validation script, if a user enters an incorrect format in a date/time field, they will receive an error message.

function validate(value){
    // empty fields are still valid dates
    if(!value)return true;

    // We "should" have the global date format defined always defined. but there's always that edge case...
    if(typeof g_user_date_time_format !== 'undefined') return isDate(value, g_user_date_time_format);

    // if we don't have that defined, we can always try guessing
    return parseDate(value) !== null;
Sample ASP Script for unencrypted single sign-on

This sample ASP .NET code creates a simple authentication portal and passes an unencrypted HTTP header as a URL parameter.

This sample assumes:

- The web server supports ASP .NET
- The target instance is https://<instance name>.service-now.com/
- SiteMinder or another single sign-on application has pre-authenticated the user
- The target instance expects an HTTP header of SM_USER

Change the ASP code to redirect users to the proper instance and create the proper HTTP header.

```html
<html xmlns = "http://www.w3.org/1999/xhtml" >
<head runat = "server" >
<title >Portal Page Login </ title > <%--    <meta http-equiv = "REFRESH" content = "0;url=https://<instance name>.service-now.com/">--%>
<script runat = "server" >
    public void go_to(object sender, EventArgs e)
    {
        //Send URL parameters
        String URL = urlBox.Text + "?SM_USER=" + userNameBox.Text;
        Response.Redirect(URL);
    }
</script>
</head >
<body >
<form id = "form1" runat = "server" >
<h2 >Portal Page Login </ h2 >&lt; / h2 &gt;&lt; hr style = "position: static" / &gt;&lt; br / &gt;
```

Figure 953: Date/time validation
Validate date and time

To validate the input of all date/time fields, you can use the following in a validation script (System Definition > Validation Scripts).

Because the date/time format is hardcoded in this script, it must match your instance’s date/time format. If your instance’s date/time format changes, you must update your validation script.

Set the validation script’s type to "glide_date_time". Then, with this validation script, if a user enters an incorrect format in a date/time field, they will receive an error message.

```javascript
function validate (value ) { if ( !value ) { return true ; } return (getDateFromFormat (value , 'yyyy-MM-dd HH:mm:ss' ) != 0 ) ; }
```
Figure 955: Date/time validation

Workflow use case

Often you may need to provide users with a way to specify when a task or process is due. Using the DurationCalculator script include, you can calculate the due date, using either a simple duration or relative duration.

For information on schedules, which you can use as inputs to DurationCalculator methods, see Schedules on page 1040.

See the ServiceNow Developers site for API information.

This script demonstrates how to use DurationCalculator to compute a due date.

```javascript
/**
 * Demonstrate the use of DurationCalculator to compute a due date.
 *
 * You must have a start date and a duration. Then you can compute a
 * due date using the constraints of a schedule.
 */

gs.include('DurationCalculator');
executeSample();

/**
 * Function to house the sample script.
 */function executeSample(){

    // First we need a DurationCalculator object.var dc =new
    DurationCalculator();

    // --------------- No schedule examples ------------------
```
// Simple computation of a due date without using a schedule. Seconds are added to the start date continuously to get to a due date.
// Start in the middle of the night (2:00 am) and compute a due date 1 hour in the future. Without a schedule this yields 3:00 am.
dc.setStartDateTime("5/3/2012 02:00:00");if(!dc.calcDuration(3600)){
    gs.log("*** Error calculating duration");return;
}gs.log("Middle of night + 1 hour (no schedule): "+
dc.getEndDateTime());// "2012-05-03 03:00:00" three hours later

// Start in the middle of the night (2:00 am) and compute a due date 1 hour in the future. Since we start at 2:00 am the computation adds the 1 hour from the start of the day, 8:00am to get to 9:00am
// Setting the timezone causes the schedule to be interpreted in the specified timezone. Run the same code as above with different timezone.
dc.setTimeZone("GMT-2");
dc.setStartDateTime("5/3/2012 15:00:00");for(var i=2; i<24; i+=1){if(!dc.calcDuration(i*3600)){
    gs.log("*** Error calculating duration");return;
}gs.log("add " + i + " hours gives due date (GMT-2): "+
dc.getEndDateTime());}

// Setting the timezone causes the schedule to be interpreted in the specified timezone. Run the same code as above with different timezone. Note that the 8 to 5 workday is offset by the two hours as specified in our timezone.
dc.setTimeZone("US/Eastern");
dc.setStartDateTime("5/3/2012 15:00:00");for(var i=2; i<24; i+=1){if(!dc.calcDuration(i*3600)){
    gs.log("*** Error calculating duration");return;
}gs.log("add " + i + " hours gives due date (US/Eastern): "+
dc.getEndDateTime());}

/**
 * Add a specific schedule to the DurationCalculator object.
 * @param durationCalculator An instance of DurationCalculator
 */
function addSchedule(durationCalculator){//  Load the "8-5 weekdays excluding holidays" schedule into our duration calculator.
var scheduleName ="8-5 weekdays excluding holidays";
var grSched =new GlideRecord('cmn_schedule');
}}
Calculating a relative duration

An example of a relative duration calculation script.

This script calculates the relative duration for "Next day at 4pm if after 10am":

```javascript
// Next day at 4pm if before 10am
var days = 1;
if (calculator.isAfter(calculator.startDateTime, "10:00:00"))
    days++;

calculator.calcRelativeDueDate(calculator.startDateTime, days, "16:00:00");
```

This script demonstrates how to use DurationCalculator to calculate a relative duration.

```javascript
/**
 * Sample use of relative duration calculation.
 *
 */
gs.include('DurationCalculator');
executeSample();

/**
 * Function to house the sample script.
 */
function executeSample(){
    // First we need a DurationCalculator object. We will also use//
    the out-of-box relative duration "2 bus days by 4pm"var dc = new
    DurationCalculator();var relDur = "3bf802c20a0a0b52008e2859cd8abcf2";// 2
    bus days by 4pm if before 10am
    addSchedule(dc);

    // Since our start date is before 10:00am our result is two days from//
    now at 4:00pm.
    dc.setStartDateTime("5/1/2012 09:00:00");
    if (!
        dc.calcRelativeDuration(relDur)){
        gs.log("*** calcRelativeDuration failed");
        return;
    }
    gs.log("Two days later 4:00pm: " + dc.getEndDate());

    // Since our start date is after 10:00am our result is three days from//
    now at 4:00pm.
    dc.setStartDateTime("5/1/2012 11:00:00");
    if (!
        dc.calcRelativeDuration(relDur)){
        gs.log("*** calcRelativeDuration failed");
        return;
    }
    gs.log("Three days later 4:00pm: " + dc.getEndDate());

    // Add a specific schedule to the DurationCalculator object.
    //
    * @param durationCalculator An instance of DurationCalculator
    */
    function addSchedule(durationCalculator){
        // Load the "8-5 weekdays excluding holidays" schedule into our duration calculator.
        var scheduleName = "8-5 weekdays excluding holidays";
        var grSched = new GlideRecord('cmn_schedule');
        grSched.addQuery('name', scheduleName);
        grSched.query();
        if (!grSched.next()){
            gs.log('*** Could not find schedule "' + scheduleName + '"");
            return;
        } else {
            durationCalculator.setSchedule(grSched.getUniqueValue(), "GMT");
        }
    }
```
Calculating a simple duration

This business rule and script example demonstrate how to calculate a simple duration.

```javascript
var dur = new DurationCalculator();
dur.setSchedule(current.schedule);
dur.setStartDateTime('');

if(current.duration_type==''){
  dur.calcDuration(current.duration.getGlideObject().getNumericValue()/1000);}
else{
  dur.calcRelativeDuration(current.duration_type);
}

current.end_date_time= dur.getEndDateTime();
current.work_seconds= dur.getSeconds();
```

This script demonstrates how to use DurationCalculator to calculate a simple duration.

```javascript
/**
 * Sample script demonstrating use of DurationCalculator to compute simple durations
 *
 */
gs.include('DurationCalculator');
executeSample();

/**
 * Function to house the sample script.
 */
function executeSample(){

  // First we need a DurationCalculator object.
  var dc = new DurationCalculator();

  // Compute a simple duration without any schedule. The arguments can also be of type GlideDateTime, such as fields from a GlideRecord.
  var dur = dc.calcScheduleDuration("5/1/2012","5/2/2012");
  gs.log("calcScheduleDuration no schedule: "+ dur); // 86400 seconds (24 hours)

  // The above sample is useful in limited cases. We almost always want to use some schedule in a duration computation, let's load a schedule.
  addSchedule(dc);

  // Compute a duration using the schedule. The schedule specifies a nine hour work day. The output of this is 32400 seconds, or a nine hour span.
  dur = dc.calcScheduleDuration("5/23/2012 12:00","5/24/2012 12:00");
  gs.log("calcScheduleDuration with schedule: "+ dur); // 32400 seconds (9 hours)

  // Compute a duration that spans a weekend and holiday. Even though this spans three days, it only spans 9 work hours based on the schedule.
  dur = dc.calcScheduleDuration("5/25/2012 12:00","5/29/2012 12:00");
  gs.log("calcScheduleDuration with schedule spanning holiday: "+ dur); // 32400 seconds (9 hours)

  // Use the current date time in a calculation. The output of this is dependent on when you run it.
  var now = new Date();
  dur = dc.calcScheduleDuration("5/15/2012", new GlideDateTime());
```
gs.log("calcScheduleDuration with schedule to now: "+ dur);// Different on every run.}

/**
 * Add a specific schedule to the DurationCalculator object.
 * @param durationCalculator An instance of DurationCalculator
 */

function addSchedule(durationCalculator){// Load the "8-5 weekdays excluding holidays" schedule into our duration calculator.

var scheduleName = "8-5 weekdays excluding holidays";
var grSched = new GlideRecord('cmn_schedule');
grSched.addQuery('name', scheduleName);
grSched.query();

if(!grSched.next()){
    gs.log('*** Could not find schedule "+ scheduleName +"');
    return;
}

durationCalculator.setSchedule(grSched.getUniqueValue());

Elapsed time vs work time

Typically, setting a due date requires that you calculate the actual work time required for completion rather than the total time that elapses until the due date.

SLAs, Workflow tasks, and approvals are examples of situations that require the actual work rather than the total time that has elapsed. In this case, only the part of the day when work is performed is considered when determining when the work is to be complete. For example, if a task is due in 10 hours, but the actual time to perform the task is restricted to a business day schedule, the 10 hours of work can only be done at most 8 hours each day. If this work starts at 10am on Monday, it is expected to complete, or be due, on Tuesday at 12pm:

10am-5pm on Monday (6 hours) + 8am-12pm on Tuesday (4 hours)

How to implement a relative duration

The general steps for implementing a relative duration.

1. Create the cmn_relative_duration table.
2. Create the DurationCalculator script include.
3. Create a sample relative duration entry (for example, "Next business day by 4pm").
4. Add the needed fields to SLA tables to support relative durations.
5. Modify duration calculation for SLAs.
6. Modify SLA Percentage timer calculation for SLAs (this must use work_seconds).
7. Add schedule fields to the Workflow: Schedule and Timezone (selected based on the field from workflow table).
8. Add duration support fields to the Workflow Task activity.
9. Implement duration calculation script for the task activity.

Simple duration vs relative duration

How much work is required to complete a task can be expressed as a "relative duration".

Relative duration determines the expected due date and time relative to the starting time. Examples of relative durations include "Next business day by 4pm", or "2 business days by 10:30am".

To calculate a relative duration, the calendar and time zone must be considered to determine what "next business day" means since it is the calendar that defines which days are valid work days and the time zone will affect the result as well. As an example, consider "Next business day by 4pm":

- If it is Monday at 12pm: Next business day by 4pm => Tuesday at 4pm
• If it is Friday at 2pm: Next business day by 4pm => the following Monday at 4pm

**Note:** Next business day is often defined by a starting day and time. For example, "next business day at 4pm if before 2pm" indicates that if the current time is after 2pm on a business day, then "Next business day" really means 2 business days since today does not count.

### The relative duration table and the DurationCalculator methods

The cmn_relative_duration table supports the definition of a due date as either a duration of time or a relative duration.

This table consists of two fields: "name" and "script". The "script" field contains the relative duration calculation script. This script includes the "calculator" variable, which is used to calculate the due date.

The DurationCalculator script include can be used to perform the duration calculations. The following are methods that are available in this script include.

See the [ServiceNow Developers site](https://developer.servicenow.com) for API information.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setSchedule(String schedID, [String timezone])</td>
<td>Sets the schedule and time zone to be used for calculating the due date.</td>
</tr>
<tr>
<td>setStartDateTime(GlideDateTime start)</td>
<td>Sets the start time for the duration calculations. If 'start' is blank, uses current date/time.</td>
</tr>
<tr>
<td>calcDuration(int seconds)</td>
<td>Calculates the end date and time. Upon completion the this.endDateTime and this.seconds properties will be set to indicate the results of the calculation.</td>
</tr>
<tr>
<td>calcRelativeDuration(String relativeDurationID)</td>
<td>Calculates the duration using the specified relative duration script. Upon completion the this.endDateTime and this.seconds properties will be set to indicate the results of the calculation.</td>
</tr>
<tr>
<td>getEndDateTime()</td>
<td>Gets the this.endDateTime property that was set by calcDuration/calcRelativeDuration indicating the end date and time for the duration.</td>
</tr>
<tr>
<td>getSeconds()</td>
<td>Gets the this.seconds property that was set by calcDuration/calcRelativeDuration indicating the total number of seconds of work to be performed for the duration.</td>
</tr>
<tr>
<td>getTotalSeconds()</td>
<td>Gets the this.totalSeconds property that was set by calcDuration/calcRelativeDuration indicating the total number of seconds between the start and end times of the duration.</td>
</tr>
</tbody>
</table>

**Note:** This is the total work time, not the total time between start and end times and may be used to determine percentages of the work time.
The following functions are used in relative duration scripts:

Table 1389: Relative duration script functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean isAfter(GlideDateTime dt, String time)</td>
<td>Is 'time' of day after the time of day specified by 'dt'? dt, if blank, uses current date/time. time is in &quot;hh:mm:ss&quot; in 24-hour format.</td>
</tr>
<tr>
<td>calcRelativeDueDate(GlideDateTime start, int days, String endTime)</td>
<td>Calculates the due date starting at 'start' and adding 'days' using the schedule and time zone. When we find the day that the work is due on, set the time to 'endTime' of that day. Upon completion, this.endDateTime and this.seconds properties will be set to indicate the results of the calculation. If endTime is blank, use end of the ending work day.</td>
</tr>
</tbody>
</table>

Use A BSM Map
- access the map 2212
  - CI filters by group 2220
  - create a relationship 2224
  - delete a relationship 2226
  - direction and level 2219
  - edit a relationship 2225
  - export a map 2222
  - filter the map 2217
  - manage map relationships 2223
  - manage the map 2213
  - tasks by type and date 2220
  - view a change to a relationship 2225
  - view a relationship 2223
  - view map information glyphs 2221

Use Chat
- add a favorite room 2328
- add favorite user 2317
- change the display 2328
  - chat window 2324
  - create a chat room 2319, 2321
  - delete a chat room 2306
  - invite a user 2328
  - join chat room 2323, 2324, 2324
  - join one-to-one chat 2323
  - message 2326
  - remove a favorite room 2329
  - remove favorite user 2317
  - send emoticons 2326
  - send message 2325
  - set chat preferences 2329
  - start a one-to-one chat 2319
  - task 2321, 2324
  - task record 2324
  - update profile 2312
  - update status 2313
  - use favorites list 2315
  - view a room 2318
  - view online user 2317

Use Content Blocks
- CMS block tag 2073
  - create a content block 2072
  - detailed content block 2072
  - iframe 2098
use feeds in live feed
activity stream 2381
