Now Platform Capabilities

The ServiceNow Platform is a powerful cloud application platform that enables you to link real-time data with activities, tasks, and processes to achieve better work outcomes.

Configuration Management Database (CMDB)

With the ServiceNow® Configuration Management Database (CMDB) application, build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the configuration management database (CMDB) which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Use core features such as CMDB Health, and CMDB Identification and Reconciliation, to monitor and detect health issues, and to reconcile data integrity issues.

Note: CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager, or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, baseline CMDB, and proposed changes.
These logical service configurations are mapped with the physical configuration / inventory data of the supporting infrastructure and application elements in the respective domains. They track the physical and logical state of IT service elements and associate incidents to the state of service elements, which helps in analyzing trends and reducing problems and incidents.

The configurations are stored in a configuration management database (ServiceNow® CMDB) which consists of entities, called Configuration Items (CI), that are part of your environment. A CI may be:

- A physical entity, such as a computer or router
- A logical entity, such as an instance of a database
- Conceptual, such as a Requisition Service

In each case, there are attributes about the CI that you want to maintain, and there is control you want to have over the CI. There are changes that may need to be made and tracked against the CI. Also, a CI does not exist on its own. CI’s have dependencies and relationship with other CI’s. For example, the loss of a bank of disk drives may take a database instance down, which affects the requisition service that the HR department uses to order equipment for new employees.

It is this relationship data that makes the CMDB a powerful decision support tool. Understanding the dependencies and other relationships among your CIs can tell you, for example, exactly who and what is affected by the loss of that bank of disk drives. When you find out that a router has failed, you will be able to assess the effect of that outage. When you decide to upgrade the processor in a server, you can tell who or what will be affected during the outage.

Configuration items are a personal issue, because each customer has a unique environment. Details about the exact physical attributes of a computer may be needed by one customer, but may represent meaningless data to another. The ServiceNow platform provides a mechanism to easily define new classes of configuration items and new relationships that may exist between CI’s. New classes can be defined that extend other classes. For example, a laptop class exists that extends the computer class. The computer class itself extends the base CI class. Customer class extensions are automatically part of the ServiceNow environment and blend seamlessly into the integration points for other ITIL processes.

Relationships between CI’s can be displayed in a hierarchical fashion, and adding or removing relationship instances is done with a simple double-click of your mouse.

Roles required

For viewing CMDB-related records in the user interface, the itil role is usually sufficient. For updating records and for other manipulation of records, roles with higher credentials are usually required, as noted.

ITIL Configuration Management integration

The CMDB has relationships with IT service management processes in the following areas: ITIL incident management, ITIL problem management, ITIL change management, ITIL service catalog management, and financial management.

ITIL Incident Management

Configuration management assists incident management by providing the Service Desk with immediate information on the CIs affected, and more timely resolution of faults by understanding what CIs have been affected and changed.
ITIL Problem Management

Configuration management assists problem management by linking the CIs affected by problems to the incident / problem / change management processes, and ensuring the CI status is properly maintained.

ITIL Change Management

Configuration management assists change management by recording which CIs have been changed and controlling the status of CIs throughout the entire CI lifecycle. Configuration management ensures any changes made to CIs are recorded and kept accurate.

ITIL Service Catalog Management

With Service Portfolio Management, business services in the CMDB can also be managed by the Service Catalog team, and exposed to end users who can then request items from them.

Financial Management

With Cost Management, costs can be associated with configuration items, so that the cost associated with configuration management can be tracked and bundled into expense lines, budgets, or cost centers.

ITIL

The IT Infrastructure Library (ITIL) is an integrated, process-based framework for managing IT services.

It provides guidance for creating and operating a Service Desk that provides efficient communication between the user community and the IT provider. Originally initiated to improve IT service management for the UK central government, it has become a standard for many organizations; public or private sector, large or small, centralized or distributed.

ITIL provides processes for three service concepts: design, transition, and operation.

Service design
This guide provides a general overview of ITIL service design concepts.

Service level management
The service level management process is designed to ensure customer satisfaction within IT service processes. Service level agreements are made between the IT staff and the customers, and the IT desk must monitor their performance as compared to the agreements. In addition, underpinning contracts with external vendors and operational level agreements with internal vendors ensures that these service level agreements are feasible.

Availability management
The availability management process ensures that availability within a system is kept as close to 100% as possible. By both reacting to past service failures, and planning to avoid future service failures, availability management can greatly increase end-user satisfaction with services.

Capacity management
The capacity management process is designed to ensure that business services are not made unavailable by over-capacity. By analyzing past failures and planning for growth of demand of services, capacity management can increase end-user satisfaction with services.

Supplier management
Supplier management is a process that defines and monitors agreements between an IT department and an external supplier.

Service catalog management
The service catalog provides a front end for customers to request items and services. Service catalog management ensures that this service catalog provides accurate and useful information on the items and services.

Service transition
This guide provides a general overview of ITIL service transition concepts and how the ServiceNow platform can enable these processes.

Change management
The change management process ensures that standardized methods and procedures are used for efficient and prompt handling of all changes to minimize the impact of change related incidents on service quality. Consequently, change management aims to improve the day-to-day operation
of the organization. IT-related changes that may affect one or many customers are tracked with change management. Adding memory to one machine, getting a new server, and installing the latest Windows OS on all PCs are all examples. To find out how the ServiceNow platform implements change management, see Change Management.

Knowledge management

The knowledge management process ensures that important information flows freely throughout the IT organization. Knowledge management keeps the CMDB and knowledge base of an organization up-to-date, and uses a knowledge-centered support approach to reduce repeat incidents and problems. For more information on how the ServiceNow platform implements knowledge management, see Knowledge Management.

Asset management

Asset management enables a process of monitoring processes, organizations, people, information, applications, infrastructure, and financial capital within an organization. This allows the organization to collect accurate records of these business components, making them available for both internal and external auditing processes. To find out how the ServiceNow platform implements asset management, see Asset Management.

Configuration management

Configuration management provides a logical model of the infrastructure or a service by identifying, controlling, maintaining and verifying the Configuration Items in existence. To find out how the ServiceNow platform implements configuration management, see Configuration Management Database (CMDB).

Release management

This discipline of IT service management is the management of all software configuration items within the organization. It is responsible for the management of software development, installation and support of an organization’s software products. Software Control & Distribution procedures include the management of the software Configuration Items and their distribution and implementation into a production environment. This involves the definition of a release program suitable for the organization, the definition of how version control is implemented, and the procedures surrounding how software is built, released and audited. To find out how the ServiceNow platform implements release management, visit Release Management.

Options to populate the CMDB

You can populate the CMDB by using Discovery, by importing information from another source, or by integrating with an existing external CMDB.

When you populate the CMDB with information, you create a record for each configuration item in the cmdb_ci table or on one of the tables that extend that table.

ITIL configuration management auto-discovery

The key to any configuration management business practice is the initial and on-going inventory or discovery of what you own. The ServiceNow platform provides three options for auto-discovery:
• The separate and highly robust *Discovery* product.
• A lightweight native discovery tool, called *Help the Help Desk*, as part of the overall CMDB. Help the Help Desk enables organizations to proactively scan their network to discover all Windows-based PCs and the software packages installed on those PCs. This WMI-based discovery is included in the core ServiceNow functionality, in the Self Service application, at no additional cost.
• For organizations that want to leverage the discovery technologies they already have deployed (SMS, Tally NetCensus, LanDesk, etc.), the ServiceNow platform supports integrations to those technologies via web services. Scanned data can be mapped directly into the CMDB.

For further information on designing, constructing, and maintaining the CMDB, see white papers *CMDB Design & Configuration* and *CMDB Design*.

Populate the CMDB with Discovery

The Discovery product automatically populates the CMDB. Discovery runs probes and sensors to collect information on hardware on the network, software running on that hardware, and the relationships between all of the items found. This information is sent back to the ServiceNow instance, and is used to populate the CMDB.

![Figure 1: Discovery overview](image)

Populate the CMDB by importing information from another source

Information can be imported to the CMDB using import sets. Import sets find files of information (in formats such as XML, Excel, or CSV), import them, and transform them onto the required table. This process can be scheduled or performed on demand.

To import relationships between CIs, use import sets to populate the table \( \text{cmdb\_rel\_ci} \) with information on the parent, the child, and the nature of the relationship. The \( \text{cmdb\_rel\_ci} \) table displays a list of all CI relationships and is useful when importing CI data.
Populate the CMDB by integrating with an existing external CMDB

If the data required for the CMDB is already being collected by another CMDB, it is possible to collect the information from that CMDB in an automated process.
Baseline CMDB

CMDB baselines provides capabilities that help you to understand and control the changes that have been made to your configuration items.

- You can create a baseline, which is a snapshot of your configuration items. You can review the changes that have been made to that configuration item since a previous baseline. Multiple baselines may be created and the system tracks the changes that have been made per baseline.

  Creating a baseline captures the attributes of the CI as well as all first level relationships for the CI. Any changes to the base CI or to any related CIs are captured and displayed. Newly created CIs are not automatically added to a baseline.

- You can associate a configuration item with a task, generally a change or change task, and to propose changes that are to be made to the CI after the change is complete. You can record changes, and these changes are not applied to the CI immediately but are delayed until the change is complete.

  When the change is complete, you can choose to apply the proposed changes which makes all changes previously proposed and associates the changes with the task.
You need the ecmdb_admin role to create and access baselines.

Create a CMDB baseline

You can create a baseline for a CI to track updates to the CI over time.

Role required: ecmdb_admin

1. Navigate to Configuration Baselines Baselines.
   If the Baselines module is not visible in the Configuration application, the module may be inactive. In that case append /sys_app_module.do?sys_id=f4463879a9fe3dba01b30bc100cbf404 to the instance URL, and in the Module - Baselines form, ensure that the module is Active.
2. Click New.
3. Enter a Name for the baseline.
   By default, the cmdb_ci table is selected so that the record creates the baseline for all configuration items in the system.
4. To limit the baseline to specific CIs, select a different Table or choose Conditions that a CI must meet for it to have a baseline entry.
   For example, you might create a baseline for the Database table with the condition [Location] (is) [{configured location}].
5. Click Submit.
   The creation of a baseline is time consuming and occurs in the background. A message at the top of the record list notifies you that your baseline has been scheduled and that you will receive an email when the process is complete.

Display baseline differences

You can see the changes that have been made to a CI or any first level related CIs by configuring the CI form layout to display the CMDB Baseline diff field. This field is labeled Baseline differences on the form.

1. Open a CI record.
2. Select the baseline you want to see for this CI from the choice list.
   The field displays the details of any changes that were made to the current record for the selected baseline, or indicates that no changes were made.

3. To add a relationship to the CI, click the green plus icon in the Related Items toolbar.
   The new relationship appears below the toolbar. For more information about the Related Items toolbar and how to control the display, see CI relations formatter.
4. Update a related CI and see the changes displayed as Basic attribute changes in the current CI record.
Proposed changes

The proposed changes feature allows you to pre-configure changes to configuration items and their associated relationships. These pre-configured changes are prepared to be implemented, but do not actually happen until they are applied at a later time.

When you view a CI, the proposed changes can be displayed so that you can see what is planned.

This feature is useful when you want to make modifications while a change process is in the approval stage, and only implement the changes after the approvals are complete. If the change is never approved, no changes to records have to be reversed. If the change is approved, a quick command applies all the proposed changes.

You can make the following proposed changes to a CI:

- Modify any field on the CI form.
- Add or delete a relationship to that CI.

To modify a relationship, you must delete the current relationship and add a new relationship. You cannot delete a proposed change.

View the proposed changes of a CI

You can view the proposed changes so that you can see what is planned for the CI.

Role required: personalize_form

To view any proposed changes, configure the CI form layout to display the CMDB Scheduled Changes field. Proposed changes are not displayed in a CI form by default.

1. Navigate to Change Open and open a change request.
2. In the Affected CIs related list, open the Configuration Item.
   You may also navigate directly to the CI form.
3. Right-click the form header bar.
4. Select Configure Form Layout.
5. Move the CMDB Scheduled Changes field to the Selected pane.
6. Click Save.
   The CI form now shows the details of any proposed changes in the Scheduled changes area.

Add a proposed change to a CI

Proposed changes to a CI can be made while viewing a change request or any task-related record.
Role required: itil

1. In the Change Request form, go to the Affected CIs related list. If there are no CIs in the Affected CIs list, click Edit to add CIs that are affected by this change request.
2. Right-click the CI that you want to configure for a proposed change, and select Proposed Change.
3. Complete the form to make the proposed changes, and click Save Proposed Change. Click Update to apply the changes immediately. Click Delete to delete the CI.
4. To propose an addition or a removal of a CI relationship:
   a) Click the plus icon in the Related Items section.
   b) In the Relationships section, add or delete a relationship. For information about using the relationship editor, see Create or edit a CI relationship.
   c) Click Save Propose Change.
   d) Confirm saving the proposed change.
   
   Click Update or Delete to commit the changes immediately.

   Note: Use only with CI relationships. Proposing additions or removal of relationships is not valid for user relationships and group relationships.

After the proposed changes are saved, the Apply Proposed Changes button appears on the Change Request form. This button lets the user commit the proposed changes to the CI. Your business processes determine the appropriate time to commit the changes. The CI retains the existing data until the proposed changes are committed. However, users can see that changes have been proposed.

Apply a proposed change to a CI

When you apply the proposed changes, all the proposed changes for that change request are applied to the configuration item. You can apply proposed changes without verification, or if verification tests of the proposed changes have failed.

Role required: itil

After you apply the proposed changes, the Scheduled changes part of the form displays No scheduled changes found. You can configure proposed change verification rules which you can use to verify proposed changes before applying the changes.

1. Navigate to the Change Request form.
2. Click the Apply Proposed Changes button.

You may have to right-click the form header and select the Reload Form option to see the changes.

Create or edit a proposed change verification rule

To ensure that proposed changes meet business requirements and do not introduce invalid data to the CMDB, create a rule that includes a script to verify the proposed changes.

Role required: asset or itil

When you configure proposed change verification rules for a CI, you have an option to verify that the proposed changes pass the verification test script in the rule. The verification test results are logged as passed or failed, and you can view the results. Running the verification test is not mandatory, and a failed verification test does not prevent you from applying proposed changes.

1. Navigate to Configuration Change Verification Proposed Change Verification Rules.
2. Click New or select an existing rule to edit.
3. Fill in the fields, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule name</td>
<td>The name of this rule.</td>
</tr>
<tr>
<td>Table name</td>
<td>The table to which the rule applies.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Conditions to apply this rule to specific CIs.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this rule.</td>
</tr>
<tr>
<td>Rule script</td>
<td>A verification Java script that needs to return true or false. For example:</td>
</tr>
<tr>
<td></td>
<td>```javascript</td>
</tr>
<tr>
<td></td>
<td>validateRule()</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>var os = current.getValue(&quot;os&quot;);</td>
</tr>
<tr>
<td></td>
<td>var cpu = current.getValue(&quot;cpu_count&quot;);</td>
</tr>
<tr>
<td></td>
<td>//Use current.getValue(fieldName) to get the proposed change value, eg.</td>
</tr>
<tr>
<td></td>
<td>var os = current.getValue(&quot;os&quot;);</td>
</tr>
<tr>
<td></td>
<td>//Your verification code</td>
</tr>
<tr>
<td></td>
<td>if (os != &quot;SunOS&quot;</td>
</tr>
<tr>
<td></td>
<td>//Return true to pass the verification and false if the verification</td>
</tr>
<tr>
<td></td>
<td>failed return true;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

4. Click Submit or Update.

On the Change Request form, you can click Verify Proposed Changes to verify proposed changes for the affected CIs.

Verify proposed changes

Before applying proposed changes to affected CIs, use proposed change verification rules to verify that the changes meet business requirements and do not add invalid data to the CMDB.

Create or edit the rules used to verify proposed changes. For details, see [Create or edit a proposed change verification rule](#).

Role required: none

You can apply proposed changes even if they are unverified or fail a verification test.

1. Open the Change Request form that affects the CI.
2. Click Verify Proposed Changes.
   The proposed changes are verified against any proposed change verification rules in which the CI meets the Filter condition criteria.
3. Review the message that appears at the top of the form after the verification process is finished.
   The message states whether the verification tests passed or failed.
To view the details of any verification tests that were performed for the change request in the past two days, click the Proposed Change Verification Log related link.

Create or edit a planned change validation script

Create a custom script that checks if a change to a class was valid according to business requirements, and whether the change was planned or not. A planned change validation script is used whenever a CI change is viewed in the CI timeline or change history.

Role required: admin or itil

The system attempts to validate each CI change as follows:

• If a custom script exists for the CI or one of the CI parents, then the script is executed and the results are used to flag the change as valid or invalid. Parent CIs are examined in the hierarchical order.
• If a custom script does not exist for the CI or any of its parents, then a predefined validation script is used. The change is determined as a planned change if the change occurred between the Work start and Work end dates of the change request associated with the changed CI.

However, this check is not always reliable because a user might have manually modified the CI within the work dates, which flags the change as valid even if it is invalid.

The script needs to return a boolean, true or false, which depends on meeting the test criteria in the script. You can define a separate script for each CI class, and you can define multiple planned change validation scripts for a single class. For example, to maintain different versions of the script. Only one script can be active for a CI class at any given time.

These are the parameters that uniquely characterize a change:

• The fields that were changed
• The data source that performed the change
• The time stamp of the change

To correctly determine the validity of a change, examine all of these parameters and apply business logic to evaluate if the validation tests are met. A planned change validation script can test any of these characteristics and determine if a change meets pre-established criteria. For example, the custom script can check if the mode of the CI is operational or maintenance, or who initiated the change.

1. Navigate to Configuration Change Verification Planned Change Validation Script.
2. Click New or select a validation script to edit.
3. Complete the form.

Table 2: Planned change validation script form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box to activate this script for validating changes.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Class that this script applies to.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to run to validate a change. If the script does not return a boolean value, then it is configured to false.</td>
</tr>
</tbody>
</table>

The script has a template which displays the input variables of the script.
Table 3: Template script input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>Current record that is being processed.</td>
</tr>
<tr>
<td>updatedOn</td>
<td>GlideDateTime</td>
<td>Time stamp of the change.</td>
</tr>
<tr>
<td>updatedBy</td>
<td>String</td>
<td>Entity responsible for the change.</td>
</tr>
<tr>
<td>fieldsChanged</td>
<td>String</td>
<td>Comma-separated list of the names of all fields that were changed.</td>
</tr>
</tbody>
</table>

This sample script checks who initiated the record update. It returns true if admin initiated the record update. Otherwise, the script returns false.

```javascript
isValidChange();

function isValidChange(/*GlideRecord current, GlideDateTime updatedOn, String updatedBy, String changedFields*/)
{
  //Return true if the user that updated the record has an admin role
  return isUserAdmin(updatedBy);
}

function isUserAdmin(userName)
{
  var grUser = new GlideRecord("sys_user");
  grUser.addQuery('name', userName);
  grUser.query();
  if(grUser.next())
  {
    var roles = new GlideRecord("sys_user_has_role");
    roles.addActiveQuery();
    roles.addQuery('user', grUser.sys_id);
    roles.query();
    while(roles.next())
    {
      if(roles.role.name == 'admin')
        return true;
    }
  }
  return false;
}
```

4. Click Submit.

CI relationships in the CMDB

The CMDB, in contrast to a static asset list, helps you track not only the configuration items (CIs) within your system, but also the relationships between those items.

A relationship in the CMDB consists of two CIs and a relationship type:

- Parent CI
- Child CI
- Type of the relationship that links both CIs
For example, in the \(\{\text{Server1}\} \{\text{Managed by}\} \{\text{Server2}\}\) relationship:

- Server1 is the child CI
- Server2 is the parent CI
- \(\{\text{Managed by}\}\) is the relationship type

For example, a web application might read data from a particular instance of Oracle, which in turn might depend on a piece of underlying hardware. Most CIs in a CMDB have multiple relationships to other CIs, users, and groups.

The relationships between CIs can be automatically discovered. If you use Discovery, many relationships can be automatically loaded into the system through the discovery process. If you import your data from another system, you may get some form of relationships.

You can add to automatically discovered relationships, create new relationships, or edit relationships for a CI by launching the CI relationship editor from the CI form.

**Suggested CI relationships**

The system keeps a table of relationship types that are appropriate for a CI type, based on its class. You can view these relationships by navigating to Configuration Suggested Relationships. You can also create additional suggested relationships.

**Suggestion model**

The relationship editor has a concept of a base CI, which designates the CI that a user was on before launching the editor, as the base CI in the new relationship. If you launched the relationship editor from the Linux100 CI, then Linux100 becomes the base CI. Also, every CI in the system has a type (class). For example, bond Linux100 is of the Linux server type.

Many CI types are children of other types in the hierarchy. For example, the class hierarchy for a Linux server is:

\[
\text{cmdb\_ci} \rightarrow \text{cmdb\_ci\_computer} \rightarrow \text{cmdb\_ci\_server} \rightarrow \text{cmdb\_ci\_linux\_server}
\]

When looking at a Linux server, the suggestion model works by analyzing the suggested relationship table for all relationships whose base class is the user’s current base class or any one of its parent classes. For example, when looking at a Linux server, the suggestion model would retrieve any relationships whose base class was:

- cmdb\_ci\_linux\_server
- cmdb\_ci\_server
- cmdb\_ci\_computer
- cmdb\_ci

**Suggested CI relationships in the relationship editor**

The CI relationship editor uses the suggestion model to help users select reasonable relationships for configuration items.

For example, consider these relationship types in the system:

- Provides Power for :: Receives Power From
- Runs on :: Hosts

A user may reasonably want to define the following relationship between two items as follows:

- a database runs on a server
- a rack provides power for a server
But neither of the following definitions would be appropriate:

• a rack runs on a server
• a server runs on a database

Add a suggested CI relationship

You can define suggested relationships that can be selected when new CI relationships are created.

Role required: admin

1. Navigate to Configuration Relationships Suggested Relationship s.
2. Click New.
3. Complete the form.

Table 4: Suggested Relationship fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base class</td>
<td>Parent CI in the relationship.</td>
</tr>
<tr>
<td>Relationship</td>
<td>Relationship type.</td>
</tr>
<tr>
<td>Dependent class</td>
<td>Child CI class in the relationship.</td>
</tr>
</tbody>
</table>

For example you can add suggested relationships such as the following

<table>
<thead>
<tr>
<th>Base Class</th>
<th>Relationship</th>
<th>Dependent Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Linux Server</td>
</tr>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Solaris Server</td>
</tr>
</tbody>
</table>

Note: The same parent class and relationship can appear more than once.

You may need to delete a suggested relationship, for example, to limit the choice of available relationships in the CI relationship editor. Removing a suggested relationship does not have any affect on relationships that are created or updated by Discovery.

CI relations formatter

The default CI form includes a CI relations formatter from which you can examine a CI and its relationships in various views. From the CI relations formatter, you can also launch the CI relationship editor for the CI. If the domain separation plugin is activated, then only relationships in which the logged on user is authorized to view both CIs, are displayed.

The CI relations formatter contains a list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. You can configure the controls in this formatter to modify varying aspects of the view. For more information about formatters, see Create a formatter and add it to the form.

Note:

• On instances that do not meet the internet browser requirements for the CI relations formatter, the default CI form includes the legacy CI relations formatter instead. For more information, see Legacy CI relations formatter.
- CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.

Table 5: Controls for viewing related CIs

<table>
<thead>
<tr>
<th>Control</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add CI relationship</td>
<td>Starts the relationship editor to manually create CI relationships. For more information, see Create or edit a CI relationship.</td>
</tr>
<tr>
<td>Show dependency views</td>
<td>Launches a Dependency Views map in another window or tab. The form’s CI is the central node in the map, with a configurable number of levels above and below that node in the hierarchy. Map indicators next to the nodes indicate the number of tasks, incidents, problems, changes, or outages related to that node. Right-click to expand collapsed nodes or display a list of related tasks or problems. For more information, see Dependency Views map.</td>
</tr>
<tr>
<td>Search for CI</td>
<td>Filters the CIs included in the display.</td>
</tr>
</tbody>
</table>

Click the Settings icon to configure additional view settings that filter the data displayed. Settings are preserved through logging out and logging back in.

Table 6: Related Items settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Relations in Flat/Tree Layout</td>
<td>To view a flat list of related CIs that are grouped by relationship type in alphabetical order, click Flat. To view groups of related CIs in a hierarchical tree, click Tree. If you select the tree view, you cannot configure any other settings for viewing related CIs. A single list of upstream and downstream relationships is displayed.</td>
</tr>
<tr>
<td>Show Relations in Split/Merge Layout</td>
<td>To view separate lists for upstream and downstream relationships, click Split. To view a single list that includes both upstream and downstream relationships, click Merge. Relationships are grouped by relationship type.</td>
</tr>
<tr>
<td>Filter Relations by Max Level</td>
<td>Select the number of levels in the hierarchy to include when displaying CIs in a flat view.</td>
</tr>
<tr>
<td>Filter Relations by Relationship Type</td>
<td>Select the types of relationships to view.</td>
</tr>
<tr>
<td>Filter Relations by CMDB View</td>
<td>Filter by tables specified in CMDB views, if any relationship filters exist.</td>
</tr>
</tbody>
</table>
The relations formatter uses the following icons to provide additional information about changes, problems, and outages related to CIs in the relationship:

Table 7: Icons related to CIs

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![recently_closed_changes]</td>
<td>Recently closed changes</td>
</tr>
<tr>
<td>![planned_changes]</td>
<td>Planned changes</td>
</tr>
<tr>
<td>![currently_open_changes]</td>
<td>Currently open changes</td>
</tr>
<tr>
<td>![recently_closed_outages]</td>
<td>Recently closed outages</td>
</tr>
<tr>
<td>![problems]</td>
<td>Problems</td>
</tr>
<tr>
<td>![incidents]</td>
<td>Incidents</td>
</tr>
<tr>
<td>![planned_outages]</td>
<td>Planned outages</td>
</tr>
<tr>
<td>![currently_open_outages]</td>
<td>Currently open outages</td>
</tr>
</tbody>
</table>

In large networks, a list of related CIs might be excessively long, which can slow performance when a CI form is rendered. You can configure these properties to control the amount of data that is displayed. To find a property, enter `sys_properties.list` in the left navigation filter and search for the property.

Table 8: Properties related to performance

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.ecmdb.find_relationship_issues</code></td>
<td>Hides or displays an icon in the CI relations formatter that links to open issues for the CI. This property defaults to true (displays the icon).</td>
</tr>
<tr>
<td><code>glide.ui.max_relation_levels</code></td>
<td>Specifies the maximum level for displaying CIs in flat view before reaching the maximum relations limit. The default value is 5.</td>
</tr>
<tr>
<td><code>glide.ui.max_relations</code></td>
<td>Specifies the maximum number of related CIs to display. When exceeded, a notification is displayed indicating that the limit has been reached, and that not all relations are displayed. The default value is 1000.</td>
</tr>
</tbody>
</table>

Create or edit a relationship filter

Create a custom relationship filter to display CI relationships from selected tables in the CI relations formatter.

Role required: ecmdb_admin
The CI relations formatter displays related CIs for the base CI, and the relationships between the CIs. You can use relationship filters on the CI relations formatter to customize CI relationship views.

1. Navigate to Configuration Relationships Relationship Filters.
2. Click New or select a filter to edit.
3. Enter or edit the relationship filter name.
4. Right-click the form header and click Save.
5. In the Configuration Types section, click Edit.
6. On the Edit Members form, select the tables of the CIs that you want to show with the filter and then move the tables to the Configuration Types list.
7. Click Save.

On a CI form, in the relations formatter settings, you can select the newly defined relationship filter from the Filter Relations by CMDB View list.

In the legacy CI relations formatter, you can click View and select the newly defined relationship filter. After you select a filter, the relations formatter displays only CIs from the tables specified in the filter or from descending tables.

Legacy CI relations formatter

On instances that do not meet the internet browser requirements for the latest CI relations formatter, the default CI form includes the legacy CI relations formatter instead.

This element contains the list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs.

![Related Items: + - Drilldown Show Levels](image)

**Figure 6: Related items field**

**Note:** The legacy BSM map provides a more complete view of CI relationships.

Configure the controls in this formatter with two properties that restrict varying aspects of the view.

**Flat layout**

Click the flat layout icon (…. ) to group the related CIs by relationship.
Tree layout

Click the tree layout icon ( ) to group the related CIs in a hierarchical tree.

CI relationship editor

Use the CI relationship editor to create CI relationships.

When you use the relationship editor, the CI from which the editor was launched is designated as the base CI. You can then select one or more CIs as a second CI for the relationship. Depending on the selected relationship type, the base CI can become the parent CI or the child CI in the new relationship.

The relationship editor operates differently, depending on whether or not you select the Use suggested relationship check box.
• With suggested relationships, the relationship editor lists all available relationship types for the base CI. To define a new relationship, select a relationship type, and then select a second CI for the relationship.

  Suggested relationships are highlighted for you. These relationships are displayed in blue with a prefix of (Suggested).

• Without suggested relationships, you define a new relationship by first selecting a second CI for the relationship and then selecting a parent or a child relationship type.

Suggested relationships

If you select the Use suggested relationship check box in the editor, the Suggested relationship list appears. It displays all available CI, user and group relationship types for the base CI. Relationship types have a suffix of (Parent) or (Child) to note the relationship descriptor, and suggested relationship types are displayed in blue and have a ** prefix.

When you select a relationship, you are also designating the base CI as being the parent or the child CI in the new relationship. For example, if you select the ‘Feeds’ relationship type, the base CI becomes the designated parent CI, and the second CI that you select becomes the child CI in this relationship.

Downstream relationships

If you do not select the Use suggested relationship check box in the editor, the Downstream relationships list appears. It displays all relationships in which the base CI is the parent CI. The child CI of the relationship is displayed in the Child column.

Upstream relationships

If you do not select the Use suggested relationship check box in the editor, the Upstream relationships list appears. It displays all relationships in which the base CI is the child CI. The parent CI in each relationship is displayed in the Parent column.

Supported browsers for the relationship editor

You must use supported browser versions in order to use the latest CI relationship editor. If you do not use a supported browser version, the instance provides the legacy CI relationship builder.

• Firefox version 20 and up
• Chrome version 25 and up
• Safari version 6 and up
• Internet Explorer version 9 and up

Create or edit a CI relationship

Use the relationship editor to view, create or modify CI relationships. You can open the relationship editor from the CI Relations formatter.

Role required: asset, itil, or admin

The relationship editor operates differently, depending on whether you check the Use suggested relationship option or not.

1. Launch the relationship editor:
   a) Open a CI form.
   b) Locate the Related Items section near the center of the form.
c) Click the plus (+) icon on the Related items section.

2. If you want to use suggested relationships then you need to first select a relationship type, and then select one or more CIs to be the child CIs in the relationship:
   a) Check Use suggested relationship.
   b) From the Suggested relationship type list, select a relationship type.
      You can filter the list of suggested relationships by using the filter check boxes.

<table>
<thead>
<tr>
<th>Filter option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide CI relationship</td>
<td>Hides any relationships between the base CI and another CI (such as “Receives data from”). Default filter is stored in the ci_manage_relationships_filter_hint.cmdb_ci user preference.</td>
</tr>
<tr>
<td>Hide user relationship</td>
<td>Hides any relationships between the base CI and a user (such as “Logs reviewed by”). The default filter is stored in the ci_manage_relationships_filter_hint.sys_user preference.</td>
</tr>
<tr>
<td>Hide group relationship</td>
<td>Hides any relationships between the base CI and a group (such as “Backups done by”). Default filter is stored in the ci_manage_relationships_filter_hint.sys_user_group user preference.</td>
</tr>
</tbody>
</table>

The Configurations Items list displays all the CIs that are appropriate for the base CI and the selected relationship type. The Relationships list at the bottom of the editor, displays all existing relationships of the selected relationship type, in which the base CI is a parent CI or a child CI.

   c) From the Configuration Items list, select one or more CIs as a second CI for the relationship.
      You can filter the list of Configurations Items by adding conditions in the Filter section and clicking Run filter.
      If you selected a parent relationship type, these CIs becomes the child CI in the relationship, and if you selected a child relationship type, then the selected CIs become the parent CI in the relationship.
      d) In the Relationships section, click the plus icon (+) to add the new relationships.
         Alternatively, you can drag the selected CIs to the Relationships list. Each new relationship will consist of the base CI, the selected relationship type, and a selected second CI.

3. If you do not want to use suggested relationships, then you need to first select one or more CIs to be the child CIs in the relationship, and then select the relationship type.
   a) Uncheck Use suggested relationship.
   b) In the Configuration Items list, select one or more CIs as a second CI for the relationship. You can filter the list of Configurations Items by adding conditions in the Filter area and clicking Run filter.
      Depending on the relationship type that you will select, the selected CIs might become a parent or a child CI in the relationship.
   c) With at least one CI selected in the Configuration Items list, click the ‘+’ sign in the Downstream Relationships section or the Upstream Relationships section to create the relationship.
• Add the relationship to Downstream Relationships to create a relationship in which the base CI is the parent CI and the selected CI is the child CI.
• Add the relationship to Upstream Relationships to create a relationship in which the base CI is the child CI and the selected CI is the parent CI.

d) For each newly created relationship in either the Downstream Relationships or the Upstream Relationships lists, click Please select a relationship and select a relationship type.
• The list of available relationship types in the Downstream Relationships list contains parent relationships only, in which the base CI is the parent CI.
• The list of available relationship types in the Upstream Relationships list contains child relationships only, in which the base CI is the child CI.

e) Click Save or Save and Exit.
Only after you enter all the information that is necessary for creating the relationship, these buttons light up indicating that there are pending updates that require saving.

Legacy CI relationship builder

In the legacy CI relations formatter, click the CI relationship builder icon (🔍) to display the legacy Define Relationships page.

Used to define CI relationships manually, this page is a sophisticated version of the standard slushbucket.

Select a CI relationship type
The top half of the legacy relationship editor contains a large option box that allows you to select which type of relationship you want to manipulate.
• Click the particular type of relationship you are interested in working with.

If we want to say that Bond Trading is backed up by Fred Luddy, select [Bond Trading] Backup done by

Filter the list of CI relationships
In the legacy relationship editor, the checkboxes along the right hand edge of the select box provide a quick way to filter down the list of available relationships.

By default, the system displays a list of all suggested relationships for the type of CI you selected. For example, if you selected a Database instance, a relationship of “Runs on” makes sense, but a relationship of “Provides HVAC for” does not. The default filter is stored in the user preferences ci_manage_relationships_filter_hint.cmdb_cici_manage_relationships_filter_hint.sys_user, and ci_manage_relationships_filter_hint.sys_user_group.

• Hide CI relationship -- Hides any relationships between this CI and another CI (e.g. “Receives data from”).
• Hide user relationships -- Hides any relationships between this CI and a user (e.g. "Logs reviewed by").
• Hide group relationships -- Hides any relationships between this CI and a group (e.g. "Backups done by").
• Show all relationships -- If you have the appropriate role (out of box this is itil_admin) you will have an additional checkbox labeled “Show all relationships.” If you click that checkbox, the system will let you choose any relationship defined in the system, regardless of where it is on the “suggested” list for this type of CI.
Select CI relationship targets
In the legacy relationship editor, users can link or unlink CIs for a relationship type.

As soon as you pick a relationship type, the system will fill in the two select boxes at the bottom of the screen with CI’s that are appropriate for the relationship you suggested. The left hand select box will contain a list of CI’s that might reasonably be linked via this relationship, while the right hand box contains a list of those CI’s which are already linked.

1. Link or unlink items.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link new items</td>
<td>Move that CI from the left hand box to the right hand box.</td>
</tr>
<tr>
<td>Unlink existing items</td>
<td>Move them from the right hand box to the left.</td>
</tr>
</tbody>
</table>

When you make either type of change, a message appears indicating that you have pending changes.

2. Apply or cancel your changes.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the Save button.</td>
<td>This will save your set of changes, and go back to the previous screen (either a CI or the BSM map depending on how you got here).</td>
</tr>
<tr>
<td>Click the Cancel button.</td>
<td>This causes you to exit without saving your changes.</td>
</tr>
</tbody>
</table>

Relation qualifier
A relation qualifier, which is a CI of the Qualifier (cmdb_ci_qualifier) type, stores important information about the CI relationships. In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain, however there can be only a single qualifier chain for a specific relationship type between two CIs.

For example, for a relationship between a parent CI and a child CI, you can add a relation qualifier to note that the relationship was discovered based on traffic (such as cmdb_ci_qualifier_trafficbased). This results in having two records in the CI Relationship (cmdb_rel_ci) table for the relationship.

- A record that links the parent CI and the new qualifier
- A record that links the new qualifier and the child CI

For this relationship, there is a parent CI and a child CI, and a relation qualifier of type cmdb_ci_qualifier_trafficbased.

For information about usage of relation qualifiers in the identification process, see Identification rules.

CI relationship security
When applying security to CI relationships, it is important to apply the access controls both to the cmdb_rel_ci table (which stores the relationships) as well as creating an operation editCIRelations to the * table as well.

If the current instance has defined security for editCIRelations, it will be applied to edit_ci_relations automatically in the process of upgrading, and the out-of-date security will be removed.
Create a CI relation rollup

A CI relation rollup allows you to sum, count, max, min, or mean a relationship type. You can create CI relation rollups.

Role required: ecmdb_admin

CI relation rollup can be useful for tracking and for receiving notifications. For example:

- In a sum rollup, add up fields from multiple CIs and display the result on another CI to which they are related. So, if you have four configuration items in a rack that are all consuming power, create a CI relation rollup to add all the power usage together and display the result in one field on the rack CI form.
- If a certain level of power consumption in a rack is exceeded, send a notification.
- With a rack that has 10 slots, send a notification when 9 slots are filled.

CI relation rollups use the cmdb synch event business rule on the \{cmdb_ci\} table. Although this business rule is active by default, you must modify the rule slightly before it will run.

1. Navigate to Configuration Relationships CI Relation Rollups.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Table 9: CI Relationship Rollup fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>CI Relationship Type</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Parent field</td>
</tr>
<tr>
<td>Child field</td>
</tr>
<tr>
<td>Rollup class</td>
</tr>
</tbody>
</table>

4. To run the cmdb synch event business rule, navigate to Business Rules.
5. Use the search box to find the \{cmdb synch event\} table.
6. Click the cmdb synch event business rule to go to the Business Rule page.
7. Select the Update, Delete, and Query check boxes.

Additionally, if you wish CI relation rollups to recalculate when there is a change to a relationship, use a similar procedure to select the Active check box on the cmdb_rel_ci synch event business rule.

CMDB classifications

CMDB classifications are groups of configuration items (CIs) that share the same attributes and are stored in their own table. Classifications allow administrators to define the hierarchy of CIs within the CMDB. A CI class refers to the actual table name in the instance database. In that context, CI Type is a friendly name that a CI is known by, such as computer, router, or printer.
As good practice, keep CI classifications as simple as possible.

Configuration Management Database

The Configuration Management Database (CMDB) is a series of tables that contain all the assets and business services controlled by a company and its configurations.

This includes computers and devices on the network, software contracts and licenses, business services, and more. The IT desk can use the CMDB to understand better their network users’ equipment, and the relationships between them. The CMDB can also be referenced by other processes within the system.

The CMDB can be populated using the Discovery product. Discovery searches the network for all attached computers and devices, then populates the CMDB with information on each computer/device’s configuration, provisioning, and current status. Discovery also reports on any software which is running, and the TCP connections between computer systems, thereby establishing their relationships.

The Asset Portfolio, Asset Contracts, and Configuration applications contain modules which display different tables within the CMDB. Each application is designed with a specific purpose in mind.

The two asset applications have an asset management focus, providing a business perspective on the CMDB. The Asset Portfolio application links to CMDB of all assets, hardware, software, assets in stock, as well as records for manufacturers and vendors. The Asset Contracts application contains information about contracts, including leases, service contracts, purchase orders, warranties, and software licenses. The Configuration application has a focus on operation.

CMDB tables

The configuration management database (CMDB) employs the following tables.

- The Base Configuration Item (cmdb) table, which is the core CMDB table for non IT CIs (descending classes are non IT CIs).
- The core Configuration Item (cmdb_ci) table, which stores the basic attributes of all the CIs. The admin, itil, or asset user role is required to access this table (descending classes are IT CIs).
- The CI Relationship (cmdb_rel_ci) table, which defines all relationships between CIs.

The Configuration Item table is extended to other tables, such as Database (cmdb_ci_database) and Computer (cmdb_ci_computer). The Computer table is extended to the Server (cmdb_ci_server) table, which is extended to the UNIX Server (cmdb_ci_unix_server) table, and so on.

You can use the schema map to view more details of tables and their relationships:

1. Navigate to System Definition Tables & Columns.
2. Select a table and click Schema Map.
Note: CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.

CI attributes

Attributes apply to all of the CIs in a classification. To change attributes for a CI, you must extend the table and create a new classification for that CI.

The position of a CI in the classification hierarchy is determined by the attributes it shares with the CIs below it. Each time a CI has a single different attribute from its parent, the classification hierarchy branches.
For example, servers have different attributes from computers, which includes workstations and laptops. Linux servers and UNIX servers have different attributes from the parent server classification and from each other, so they occupy separate branches in the hierarchy.

CMDB record types

The CMDB contains the following major record types.

Table 10: CMDB record types

<table>
<thead>
<tr>
<th>Record types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item (CI)</td>
<td>Any computer, device, or service in the CMDB. A CI’s record includes all of the relevant data, such as manufacturer, vendor, location, etc. Configuration items can be created or maintained either using tables, lists, and forms within the platform, or using the Discovery application.</td>
</tr>
<tr>
<td>Relation Type</td>
<td>A defined relationship between a CI and either another CI, a user, or a group. Relation types are defined twice, once from the perspective of the child CI and once from the parent CI’s perspective. For example, a parent CI that powers a child CI uses relation type Powers::Is Powered By. Example relation types include In Rack::Rack contains, Log Reviewed by::Reviews logs for, or Backup done by::Does backups for. CMDB relationships can be established using Discovery or using the tables, lists, and forms within the platform. The CMDB form has a specific Related Items toolbar optimized for modifying relationships.</td>
</tr>
</tbody>
</table>

Related Lists of CI components

Related Lists in CI records display additional components contained by that CI, such as disk drives on a server and the rules that control the behavior of a network router.

When Discovery runs, the Related List is populated with the components that Discovery finds running on the CI. The CI record might show different lists from scan to scan, depending on whether or not Discovery found the component.

By default, the Related Lists only display those components that are associated with that CI in the CMDB that have been discovered by the last scan. CI components that are discovered but cannot be matched to the CI in the CMDB are added to the CMDB and appear in the Related List. Components that are recorded in the CMDB but are not discovered in a scan, are deemed absent and do not appear in the list.

There are two types of components that appear in the Related List: those that are CIs themselves (such as hard disks), and those that are not (serial numbers and rules). The default filter condition in the breadcrumbs for components that are CIs is \( \text{[Status]} \neq \text{[Absent]} \). The filter condition for components that are not CIs is \( \text{[Absent]} = \text{false} \).

In the following example, the snc-tc01 router has several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.
Create CI class

Use the CI Definition form view to create a new CI class (table) that is an extension of an existing CI class.

Role required: itil_admin (on top of itil), or admin. Or personalize_dictionary if using the CI Class Manager.

The CI Definition view serves as a centralized location from which you can create a new table that is derived from the CMDB table, and configure additional CMDB-related configurations for the CI.

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) In the Class Hierarchy, right-click the class that the new class will be extended from. Click Extend.

      Extends table is populated with the selected class.

2. Fill out the Table form. The table that you specify in Extends table can for example, be an extension of the CMDB table.
   See Create a table for details about the Table form.

3. On the context menu, click Save.

4. Scroll to the bottom of the Table view to use any of the CI Definition form view specific controls, such as CI Identifiers, Reconciliation Definition, or Icon.

Reclassify a CI

You can upgrade, downgrade, or switch the class of a CI by modifying its Class attribute.

Role required: itil_admin (on top of itil), or admin
Each class is defined with a unique set of attributes. This set consists of attributes that were derived from the parent class, and additional attributes specifically defined for the class.

When you reclassify a class, the following occurs.

1. The set of attributes is adjusted to match the set of attributes of the newly assigned class. Attributes are added or removed as needed.
2. If any attributes are unique to the current class and are not defined in the newly reclassified class, they are lost.
3. A new record with the CI’s sys_id is inserted to the table of the new class, with the appropriate set of attributes for the class.

More specifically, depending on the reclassification, the following occurs.

**Downgrade**

The CI class is updated to a class that is lower in class hierarchy, and the newly assigned class is a parent of the current class and has less attributes than the current class. For example, reclassifying a CI from the cmdb_ci_server class to the cmdb_ci_computer class.

For example, the cmdb_ci_server class has attributes that the cmdb_ci_computer class does not have. During the downgrade, these attributes and their respective values are not included in the new CI record that is inserted into the cmdb_ci_computer class.

**Upgrade**

The CI class is updated to a class that is higher in class hierarchy, and the newly assigned class is a derived child of the current class and has additional attributes. For example, reclassifying a CI from the cmdb_ci_computer class to the cmdb_ci_server.

**Switch**

The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. For example, reclassifying a CI from the cmdb_ci_linux_server class to the cmdb_ci_win_server class.

A switch is a combination of a downgrade and an upgrade. For example if the CI is downgraded to the cmdb_ci_server, and then upgraded to the cmdb_ci_win_server class. Therefore, attributes are lost in the same manner as in a downgrade operation.

**Note:** Avoid the CI class downgrade and CI class switch operations as those can lead to data loss. When automatic CI reclassification is enabled (which is by default), the identification process can result in some automatic reclassifications which lead to data loss.

For more information about system properties that control system-wide behavior of automatic CI reclassification, see CI reclassification.

1. Locate the CI that you want to reclassify and display it in a list view.
You can use the application navigator. Or for example, if the CI is a server, then in the navigation search box, type cmdb_ci_server.list to display the CI in the Servers view.

2. Ensure that the Class field is displayed in the list.
   If you do not see this attribute, personalize the list to add the Class field.

3. Double-click the Class value for the CI, and select a new class.

4. Click the green check box to confirm your selection.

View table definitions

Use the CI Class Manager as a central location to explore tables and CI definitions, and to search through the CI class hierarchy. View the details of each table such as the table’s label and field definitions, and all related definitions and scorecards.

For each table, you can directly access additional CMDB health metrics and scorecards such as datasource precedence rules, orphan scorecard and certificate template defined for the table class.

1. Navigate to Configuration CI Class Manager.

2. Select a class from the Class Hierarchy list to display its table columns and other details.
   See control descriptions in Create a table.

3. Check Advanced at the top of the right sidebar and ensure that Fields is selected.

CMDB Identification and Reconciliation

The Identification and Reconciliation module provides a centralized framework for identifying and reconciling data from different data sources. It helps maintain the integrity of the CMDB when multiple data sources such as Discovery, import sets, and manual entries are used to create and update CI records.

The use of multiple sources increases the risk of introducing inconsistencies through duplicate records. To maintain the integrity of the database, it is important to correctly identify CIs and services so that new records are created only for CIs that are truly new to the CMDB. Identification and Reconciliation helps you prevent duplication of CI records, reconcile CI attributes, reclassify CIs, and allow only authoritative data sources to update the CMDB.

Domain Separation

The identification process is domain aware. If the domain separation plugin has been activated, then identification processes only those CIs in which the domain ID is identical to the domain of the currently logged on user. If duplicate CIs exists across domains (including parent and child domains), then those CIs will not be considered duplicate CIs because their domain IDs do not match.

Identification and reconciliation components and process

The CMDB identification and reconciliation functionality is supported by identification rules, reconciliation rules, de-duplication tasks, and reclassification tasks.

Components of Identification and Reconciliation

Identification

Identification is the process of uniquely identifying CIs, to determine if the CI already exists in the CMDB or if it is a newly discovered CI that must
Reconciliation

Reconciliation is the process of reconciling CIs and CI attributes by allowing only designated authoritative data sources to write to the CMDB at the CI table and attribute level. The CMDB is updated in real time as records are being processed. There is no staging area to verify the reconciliation activities before they are committed. The process relies on reconciliation rules.

De-duplication tasks

If the instance encounters duplicate CIs during the identification and reconciliation process, it groups each set of duplicate CIs into a de-duplication task. Review the information in these tasks to see how it was determined that these CIs are duplicates.

Reclassification tasks

During the CI identification process, a matched CI might need to be upgraded, downgraded, or switched to another CI class. If automatic reclassification is disabled, then the system generates a reclassification task. Review the information in these tasks, and decide whether a manual reclassification of the CI is appropriate.

API

The Identification and Reconciliation API is a centralized API that can be used with different sources of data such as Discovery, Monitoring, or Import Sets. You can use it to enforce identification and reconciliation before data is stored in the CMDB. Data sources do not directly write to the CMDB. Instead, they call the API first to ensure that the data being written does not introduce inconsistencies.

- `createOrUpdateCI()`: A scriptable API that creates or updates a CI based on identification and reconciliation rules.
- `CMDBTransformUtil`: An API to be used exclusively with Import Sets to apply identification and reconciliation processes to data imported by Import Sets.
- `CMDBTransformUtil`: An API to be used exclusively with Import Sets to apply identification and reconciliation processes to data imported by Import Sets.

Predefined identification and reconciliation rules are included for tables that are in the base instance. You can customize these rules for your organization. When a new table is created in the CMDB, it derives identification and reconciliation rules from its parent table if these rules exist. To apply identification and reconciliation rules to a new table, create the rules either at the child level or at its parent level.
Process flow of Identification and Reconciliation

Apply CI Identification and Reconciliation to Import Sets

You can apply CMDB Identification and Reconciliation processes when Import Sets are used to import CIs into the CMDB. CI identification can prevent duplicate CIs in the CMDB, which Import Sets might otherwise cause.

Populating CMDB tables using Import Sets can inadvertently result in duplicate CIs when multiple imported records are identical to an existing CI. To minimize this duplication, you can apply CMDB Identification and Reconciliation processes to Import Sets when importing new records into CMDB tables.

In the onBefore transform map script for an import set, add a call to the `CMDBTransformUtil` API, similar to the following code sample:

```javascript
(function runTransformScript(source, map, log, target) {
  // Call CMDB API to do Identification and Reconciliation of current row
  var cmdbUtil = new CMDBTransformUtil();
  cmdbUtil.identifyAndReconcile(source, map, log);
  ignore = true;
}
```
The CMDBTransformUtil API pre-processes the source data. Then passes the input values to the identification engine with import set being the data source by default. The ignore = true code phrase prevents Import Sets from creating the same record again after it is processed by the identification engine.

The identification engine performs identification of each source record before it is inserted into the CMDB. The identification engine determines if the record is a duplicate of an existing CI, and then:

- If not duplicate: Inserts the record to the target table.
- If duplicate: Updates the existing CI in the CMDB, with data from the source record.

Note:
- An import set should be associated with a single transform map. While adding a call to the CMDBTransformUtil API, ensure that still a single transform map exists for the import set.
- CI Identification and Reconciliation cannot be applied to Import Sets for dependent CIs (CIs with dependent identification rules).

Identification rules

The CMDB identification process relies on identification rules. Each identification rule consists of one or more identification entries.

Identification rules apply to a CI class and comprises of one or more identifier entries, each with a different priority. Each identifier entry defines a unique attribute set with a specific priority and each related entry defines rules for identifying related items. Create strong identification rules that give the highest priority to the strongest identifier entries.

The identification process and identification rules use the CIs attributes for identification:

Unique attributes
- Designated sets of criterion attribute values of a CI, that can be used to uniquely identify the CI. Unique attributes can be from the same table or from derived tables.

Required attributes
- Designated attributes of a CI that cannot be empty.

Identification rule types

The steps for identifying dependent CIs can be different from the steps for identifying independent CIs. This difference is reflected in the differences between dependent identification rules and independent identification rules.

Independent identification rule
- A rule that identifies a CI based on the CI’s own attributes, independently of other CIs or relationship.

Dependent identification rule
- A rule in which identifying a CI requires identifying a dependent CI first. A CI can have dependency on one or more CIs, and a dependent CI can have only a single parent CI with dependency. The relationship types between the CI and its dependent CIs are also included in the identification process. To assist in the identification process of
dependent CIs, add *Service rules metadata* that define the dependency structure of CI types and the relationship types.

The payload used for identification of a dependent CI, can include a relationship with a qualifier chain. For such relationship, if there is a matching parent/child pair, the system compares the qualifier chain in the payload, with the qualifier chain of the CIs in the database. If there is a difference, the qualifier chain in the database is updated to match the qualifier chain in the payload for that relationship.

Identifiers entries

You can configure an identifier entry to match a CI not only based on the CI’s own attributes (field based identification) but also based on the CI’s related list (lookup based identification) such as Serial Numbers or Network Adapters. The lookup based table that is used for identification, needs to have a reference field that points to `cmdb_ci`.

There are two types of identifier entries:

- **Regular identifier entry**: Based on CI’s attributes that uniquely identify the CI.
- **Lookup identifier entry**: Uses a related table (lookup table) which can be any table that has a reference to the CI that is being identified. After you select a related table in the lookup identifier entry, the list in Referenced field is populated with fields from the related table that reference either the cmdb_ci table itself, or one of its descendants.

Guidelines for lookup tables

Follow these guidelines when specifying a lookup table in an identifier entry.

1. Ensure that lookup tables reference the `cmdb_ci` table.
2. It is preferable to enforce exact count match (check box Enforce exact count match (Lookup)) for a stronger identification rule. During lookup identification, this option enforces matching only on exact lookup records count match.
3. Do not create conflicting identification rules especially for lookup based rule.

    Example: In a CI Identifier for the Hardware class you specify a lookup based rule for the Network Adapter class, and you also define a CI Identifier for the Network Adapter class. Duplicates might potentially be created in the Network Adapter table, because there are contradicting rules to identify a unique CI in that table:
    - One rule that looks only at criterion attributes (CI identifier rule)
    - Another rule that looks at criterion attributes and referenced sys_id (lookup rule).

Example: CI with related items that needs to be inserted - sysId is available.

```javascript
var payload = {
    items: [
```
Create or edit a CI identification rule

Identification rules are used to uniquely identify CIs in the CMDB, as part of the identification and reconciliation process. Each table in the CMDB can be associated with a single identification rule.

Role required: admin, or itil_admin (on top of itil)

Note: Users with the itil role have read access to the CI identification rules.

In a CI identification rule, specify identifier entries and related entries that uniquely identify the CI. Review the following before creating identification rules:

- Identification rules
- Effective usage of CMDB Identification

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class in the Class Hierarchy.
   c) In the sidebar on the right, select CI Identifiers.

2. Or, navigate to Configuration Identification/Reconciliation CI Identifiers.

3. Click New or open an existing rule.

4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of CI identifier.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Class that this CI identifier applies to.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the CI identifier.</td>
</tr>
<tr>
<td>Independent</td>
<td>Check box indicating that the CI identifier can identify the CI independently of other CIs. See Identification rules and Effective usage of CMDB Identification for more information.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.

6. In the Identifier Entries related list, click New or open an existing entry to specify criteria for matching the CI.

7. Fill in the fields, as appropriate.
### Table 12: Identifier Entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that specifies the identifier entry is active.</td>
</tr>
<tr>
<td>Criterion attributes</td>
<td>The set of attributes to uniquely identify the CI. Attributes can belong to the current class, or to a parent class. Click the lock icon to view, add, or remove attributes from the identification rule. It is not possible to add reference fields as a criterion attribute. Reference fields store sys_ids that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table.</td>
</tr>
<tr>
<td>Optional condition</td>
<td>Use the Add Filter Condition and the Add “OR” Clause buttons to construct a filter to narrow the set of records that will be searched for a matching CI. Optional condition is applied only to lookup based identification.</td>
</tr>
<tr>
<td>Identifier</td>
<td>The CI identifier to which this identifier entry belongs to. By default it is set to the identifier you previously selected.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the identifier entry. Identifier entries are applied based on priority. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly. It is recommended that you keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
<tr>
<td>Search on table</td>
<td>The table to search during the identification process. The table list consists of tables that either derive from the Configuration Item (cmdb_ci) table, or other tables that reference the CI and can be used as a lookup table for identification. The lookup table used should have a reference field to cmdb_ci, otherwise the identifier entry is considered invalid.</td>
</tr>
<tr>
<td>Allow fallback to parent’s rules</td>
<td>Check box to specify that the identification rules of the CI’s parent are used if a match is not found for this identification rule. Applies only for dependent identification rules.</td>
</tr>
<tr>
<td>Enforce exact count match (Lookup)</td>
<td>Check box to specify that for lookup identification, match only on exact lookup records count match.</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>Check box to allow null values for criterion and unique attributes.</td>
</tr>
</tbody>
</table>
Note: If criterion attributes have only two attributes and sys_class_name is one of them (for example (name, sys_class_name), (ip_address, sys_class_name)), then the other attribute cannot be NULL, even if Allow null attribute is enabled. This restriction is due to sys_class_name being considered a special system matching attribute.

8. Click Submit.

For example, the pre-defined Hardware Rule applies to the Hardware (cmdb_ci_hardware) table. It has an identifier entry with the criterion attribute Serial Number, Serial Number Type and its Search on table field is set to Serial Number.

The following payload snippet adds a CI to the cmdb_ci_linux_server class, that is a child of the Hardware class:

```json
{
    "items": [
        {
            "className": "cmdb_ci_linux_server",
            "lookup": [
                {
                    "className": "cmdb_serial_number",
                    "values": {
                        "serial_number": "VMware-42 21 e3 da 44 14 5a a6-56 48 2b 0a 28 53 42 4c",
                        "serial_number_type": "system",
                        "valid": "true"
                    }
                },
                {
                    "className": "cmdb_serial_number",
                    "values": {
                        "serial_number": "4221E3DA-4414-5AA6-5648-2B0A2853424C",
                        "serial_number_type": "uuid",
                        "valid": "true"
                    }
                }
            ],
            "values": {
                "name": "xpolog2.lab3",
                "os_name": "Linux",
                "output": "Linux xpolog2.lab3 2.6.32-431.el6.x86_64 #1 SMP Fri Nov 22 03:15:09 UTC 2013 x86_64 x86_64 GNU/Linux",
                "serial_number": "VMware-42 21 e3 da 44 14 5a a6-56 48 2b 0a 28 53 42 4c",
                "sys_class_name": "cmdb_ci_linux_server"
            }
        }
    ]
}
```

When the Hardware Rule is applied, the Serial Number (cmdb_serial_number) table is searched for a match with the values specified within the lookup key. Unless Enforce exact count match (Lookup) is checked, it is not necessary for every lookup key to return a match, as long as there is at least one match. If all matches reference the same CI, then that CI is considered to be the existing CI record. If no match is found,
then the identification search continues to the next rule entry. If after all the rules are
exhausted without finding a match, a new CI record is created in the database.

Reconciliation rules
Reconciliation rules specify which data sources can update a table or a set of table attributes, and they
can be defined at the parent and the child table level. Ensure that there is a reconciliation rule for each
data source that is authorized to update an attribute - multiple reconciliation rules can exist for the same
set of attributes.

As you create reconciliation rules, keep the following principles and guidelines in mind. These principles
are designed for flexibility and the refinement of rules at the attributes level.

Example reconciliation rules

For example, you might have the following reconciliation rules. The rules are created for the
cmdb_ci_computer table and one of its child tables, the cmdb_ci_linux_server table. The rules specify the
following:

1. Discovery is exclusively authorized to update the name attribute in the cmdb_ci_computer table.
   Because reconciliation rules are derived by child tables from parent tables, this rule also authorizes
   Discovery to update the name attribute in any child tables for the cmdb_ci_computer table.

2. ServiceWatch is exclusively authorized to update the name attribute in the cmdb_ci_linux_server
   table.

3. ServiceWatch is exclusively authorized to update all attributes in the cmdb_ci_linux_server table, as
   configured by leaving the Attributes field empty in the rule.

Authorization for all attributes in a table

If you want to authorize a data source to update all attributes in a table, leave the attribute list empty
in the reconciliation rule for the data source. However, this authorization can be overridden for some of
the attributes by rules for child tables in which specific attributes are listed.

For example, if only example rules #1 and #3 are created, then Discovery is authorized to update
the name attribute in the cmdb_ci_linux_server table. ServiceWatch is authorized to update all other
attributes in the table except for the name attribute.

To override the authorization of Discovery to update the name attribute, example rule #2 is added to
specifically authorize ServiceWatch to update the attribute.

Authorization to only specific attributes in a table

If you want to authorize a data source to update specific attributes in a table, list these attributes in the
reconciliation rule for the data source. A rule that grants access to specific attributes in a table overrides
other rules with an empty attribute list that grants access to the entire table.

Example rule #1 grants Discovery with exclusive authority to update the name attribute of the
cmdb_ci_computer table. All other data sources are prevented from updating the name attribute of any
CI in the cmdb_ci_computer table.
Child table rules overrides parent table rules

Any reconciliation rules defined for a child table override the rules defined for its parent table.

For example, rule #1 lets Discovery update the name attribute in the cmdb_ci_computer table and all of its child tables. However, rule #2 for the cmdb_ci_linux_server child table, which overrides rule #1 for the parent table, explicitly authorizes ServiceWatch to update this attribute in the child table.

As a result:

- Discovery cannot update the name attribute of the child cmdb_ci_linux_server table. Only ServiceWatch is authorized to update this attribute.
- Discovery is authorized to update the name attribute of CI records in all other child tables of the cmdb_ci_computer table.

Overlapping rules

Rules that authorize different data sources for the same attributes of the same table can coexist and do not exclude each other.

For example, assume the following rule is added. It is similar to example rule #1 but authorizes a different data source:

- ServiceWatch is authorized to update the name attribute in the cmdb_ci_computer table.

Like example rule #1, this new rule applies to the name attribute in the cmdb_ci_computer table so both Discovery and ServiceWatch can update the attribute. Any applicable data source precedence rules are enforced to prevent the data sources from overwriting each other’s updates.

Domain separation

If Domain Separation is enabled, then you can scope reconciliation rules to specific domains. Rules of the parent domain, if not overridden, apply to CIs of child domain. All rules that are visible to a domain are applied, and a rule overriding the parent domain displays the child domain version.

Create or edit a CI reconciliation rule

A reconciliation rule specifies the attributes that a data source is authorized to update for a given table and prevents unauthorized data sources from overwriting the attributes’ values. If an attribute does not have any reconciliation rules created for it, data sources are allowed to overwritten each other’s updates to the attribute’s value.

Role required: admin, or itil_admin (on top of itil)

Note: Users with the itil role have read access to the CI identification rules.

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Reconciliation Definitions from the Correctness group.

2. Or, navigate to Configuration Identification/Reconciliation Reconciliations Definitions.

3. Click New, and fill in the fields as appropriate.
### Table 13: Data Source Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>The data source that you are configuring this rule for.</td>
</tr>
<tr>
<td>Applies to</td>
<td>The table that the selected data source can update.</td>
</tr>
</tbody>
</table>
| Filter condition       | Conditions that the CI must meet, if you want to apply this rule to only specific CIs. For example, to apply this rule only to CIs that are associated with the Finance department, select this condition: 
                          (Department) [is] (Finance)                                                                                                                  |
| Attributes             | Attributes that the data source is authorized to update. You can select attributes from the current class, or a parent class.                 |
|                        | To authorize the data source to update all table attributes, leave this field empty.                                                        |
| Update with null       | Attributes that the data source can update with a null value. By default, authorized data sources cannot overwrite a non-null value with a null values. Attributes in this list, which are not in the Attributes list, are not included with the attributes that the data source can update with a null value. |
| Domain                 | Domain that the reconciliation rule is enforced in, if the Domain Support domain separation plugin is enabled.                               |
| Active                 | Check box to activate this reconciliation rule.                                                                                             |

4. Click Submit.

**Define or edit data source precedence**

If multiple data sources are authorized to update the same table or the same table attributes in the CMDB, assign a priority to each of these data sources to prevent them from overwriting each other’s updates. Without data source precedence rules, data sources can overwrite each other’s modifications.

**Role required:** admin, or itil_admin (on top of itil)

After an attribute is updated by an authorized data source, any subsequent updates are accepted only from the same data source or from a data source with a higher priority. Updates from a data source with a lower priority are rejected, unless the CI attribute was previously updated by a higher priority data source and it became stale based on staleness rules for the CI class.

Information about the last data source that updates each attribute is stored in the Data Source History (cmdb_datasource_last_update) table.

Data source precedence rules affect reconciliation of stale CI attributes. During reconciliation, the information in the Data Source History table is considered along with the staleness rules for the CI’s class to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the same data source that was the last to update the CI, within the Effective Duration defined in the staleness rule for the class for that specific data source. In this case, if another authorized data source, with a lower priority attempts to update the stale CI attribute, the update is allowed.
1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Datasource Precedence from the Correctness group.

2. Or, navigate to Configuration Identification/Reconciliation Datasource Precedences.
3. Click New or open an existing data precedence definition.
4. Complete the form.

Table 14: Data Source Precedence form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Check box to activate this precedence rule.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Resolve de-duplication tasks

When the instance encounters duplicate CIs during identification and reconciliation, it groups each set of duplicate CIs into a de-duplication task for review. Use de-duplication tasks to track the duplicate CIs until they can be resolved. A large number of duplicate CIs might be due to weak identification rules.

De-duplication tasks provide details about the duplication, including a list of all the duplicate CIs and the internal payload used during the identification process. Review the details of each duplicate CI in the task and the data that was used to determine that the CI is a duplicate.

If the duplicate CI is a dependent CI, then you can view the details of the dependent relationship, the Depend on CI, and any relation qualifier chain. If the dependent CI has a lookup table, then you can see the details of the respective lookup table.

Skip duplication

Processing of sets of duplicate CIs depends on the system properties glide.identification_engine.skip_duplicates (set to true by default) and glide.identification_engine.skip_duplicates.threshold (set to 5 by default), and on the number of duplicate CIs in a set.

- If glide.identification_engine.skip_duplicates is true, and the number of duplicate CIs
is less than the threshold specified by glide.identification_engine.skip_duplicates.threshold, then the oldest of the duplicate CIs is picked as a match and gets updated. The rest of the duplicate CIs are tagged as duplicates by setting the cmdb_ci’s discovery_source field as 'Duplicate'.

- If glide.identification_engine.skip_duplicates is false, then matching of duplicate CIs fails with an error, and none of the duplicate CIs is updated.

Note: In either case, de-duplication tasks are always created.

To modify these properties, you need to first add them to the System Properties (sys_properties) table. For more information, see Properties installed with Identification and Reconciliation.

Role required: admin or itil

1. Navigate to Configuration Identification/Reconciliation De-duplication Tasks.
2. Select a task.

Table 15: De-duplication Task fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>A unique task number.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>A person that is responsible for resolving the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description for the task.</td>
</tr>
<tr>
<td>Internal payload</td>
<td>Payload that was used in the identification process, during which the de-duplication task was generated.</td>
</tr>
<tr>
<td>Description</td>
<td>Full description for the task.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Notes to keep track of the decisions and steps of resolving the task.</td>
</tr>
<tr>
<td>Priority</td>
<td>Task priority.</td>
</tr>
<tr>
<td>State</td>
<td>State of the de-duplication task as it progresses through resolution.</td>
</tr>
<tr>
<td>Suggestion</td>
<td>Link to a list of suggestions for next steps in resolving the task.</td>
</tr>
<tr>
<td>Search Knowledge</td>
<td>Link to a list of related knowledge articles.</td>
</tr>
</tbody>
</table>

3. In the Duplicate Audit Results section, click a duplicate CI to view the details about how it was identified as a duplicate.
Based on your analysis of de-duplication tasks, you can determine which CI should remain active and which of the duplicate CIs in the Duplicate Audit Results records are stale or incorrect. Determine if it is appropriate to delete or inactivate any of these CIs.

**CI reclassification**

During the CI identification process, a CI might need to be reclassified to a different sys_class_name type. By default, CIs are reclassified automatically. If automatic reclassification is disabled, then the CI is not reclassified and the system generates a reclassification task for your review.

A CI can be upgraded to a higher class, downgraded to a lower class, or switched to a different branch in the class hierarchy. For more details about reclassification operations, see [Reclassify a CI](#). You can configure CI reclassification behavior at a system-wide level or individually per CI.

**Enabling and disabling automatic CI reclassification**

You can use the glide.class.upgrade.enabled, glide.class.downgrade.enabled, and glide.class.switch.enabled properties to configure system-wide behavior for CI reclassification. These properties are set to true by default, enabling automatic re-classification. To disable automatic CI re-classification, set the respective properties to false.

Alternatively, in the input payload of the createOrUpdateCI() API you can temporarily override a false value of the glide.class.upgrade.enabled property for individual CIs. In the payload, set these properties to true to enable automatic reclassification.

- classUpgrade
- classDowngrade
- classSwitch

The following sample JSON payload enables automatic reclassification for the specified CI:
View a reclassification task

When automatic CI reclassification is disabled, reclassification tasks are created for CIs that could not be automatically reclassified during the identification process. Review these tasks to locate the CIs and decide if to reclassify them.

Role required: admin or itil

1. Navigate to Configuration Identification/Reconciliation Reclassification Tasks.
2. Select a reclassification task.
3. Examine the details on the Reclassification Task form.

Table 17: Reclassification Task form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>The CI that must be reclassified.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description noting that CI reclassification was not allowed.</td>
</tr>
<tr>
<td>Description</td>
<td>Description noting the current class of the CI and the class that the CI must be changed to.</td>
</tr>
<tr>
<td>Internal payload</td>
<td>Payload used in the identification process.</td>
</tr>
</tbody>
</table>

After examining the task details, you can locate the CI that is noted in the task Description and manually reclassify it. For details, see Reclassify a CI.

Service rules metadata

Service definitions consist of CI types and relationship types. Service rules metadata define the dependency structure of the CI types and the relationship types in these service definitions, assisting in CI identification and in the construction of business service maps. The Metadata Rules Editor is used to configure and manage service rules metadata.

The dependencies that are defined by service rules metadata are used when identifying dependent CIs to prioritize the order of CI identification, and to match CIs and respective dependent CIs in a payload. Service rules metadata are also used by Service Mapping and can be defined for custom CI types. After defining a new CI type, you can define metadata rules that specify how the new CI type is related to existing types in the CMDB.

Service rules metadata consist of hosting rules and containment rules, each type modeling the data from a different perspective of the CI. Containment rules represent CIs’ configuration hierarchy, describing which CI contains which other CIs. Hosting rules represent CIs’ placement in a business definition, describing what CIs run on.

Both hosting and containment rules describe a relationship type between two CI types and the same relationship type can be used in a hosting rule and in a containment rule. It is the context in which the relationship is used that distinguishes between a containment and hosting rule.

The plugins that have been activated on an instance determine which hosting and containment rules exist out-of-box.
Hosting rules

Hosting rules represent all the possible valid combinations of pairs of hosting and hosted CIs in the service definition. Hosting rules are a flat set of rules that can be only one level deep, and which always involve resources, typically physical or virtual hardware. Each hosting rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can host, or by which valid CI type another CI type can be hosted. A hosting rule consists of a parent CI type, a relationship type (such as Hosted On::Hosts) and a child CI type. For example, you can have a hosting rule that specifies that the CI type ‘Application’ ‘Runs On::Runs’, the CI type ‘Hardware’.

A CI can be hosted on multiple resources (such as Windows and Linux). This will be represented by a hosting rule for the CI with each resource that the CI can be hosted on. During CI identification, the pair of CIs that are being examined, need to satisfy at least one hosting rule.

Hosting rules are stored in the CMDB Metadata Hosting Rules [cmdb_metadata_hosting] table.

Containment rules

Containment rules represent the containment hierarchy for a CI type, describing valid objects that a CI type can contain in the service definition, and valid objects that can be contained by the CI type. Containment rules are chained to each other in a containment rules group, with a CI type that is the top-level (root) parent of the group. The collection of containment rules construct a hierarchy-like map of containment relationships. Containment rules are logical concepts, and used to represent logical CIs for example to describe software that runs on a server. A containment rule consists of a parent CI type, a relationship type (such as ‘Contained By::Contains’) and a child CI type. For example, you might have a containment rule specifying that the CI type ‘Tomcat’ ‘Contains::Contains By’ CI type ‘WAR File’.

Endpoints are special containment rules that specify incoming or outgoing connections in the model, designating the CI types that data of some specified type flows in to or out from the service definition. After adding an endpoint to a containment rule you cannot add any child rules to the endpoint rule.

Containment rules are stored in the CMDB Metadata Containment Rules [cmdb_metadata_containment] table.

Rules requirements

The rules that you create are bound by the following requirements which narrow the relationships and ensure that only valid options are available in the drop down lists in the Metadata Rules Editor.

• Given a CI type that is as a child in a containment rule: It cannot be a top-level (root) parent of any other containment rule, and it cannot be in any hosting rule, either as a parent or as a child.
• Given a CI type that is a top-level (root) parent of a containment rule: It cannot be a child in a hosting rule (for example, you can’t be hosted on Tomcat, if Tomcat has any containment rules)
• Given a CI type that is a child in a hosting rule: It cannot be in any containment rule, either as a parent or a child.
• Given a CI type that is a parent in a hosting rule: It cannot be a child in any containment rule.
• Hosting rules can not create loops such as Tomcat –runs_on- VMWare –runs_on- Tomcat.
Hosting and containment rules model

Hosting rules that model the diagram:
- Tomcat ‘Runs on’ Hardware

Containment rules that model the diagram:
- Tomcat ‘Contains’ Configuration File
- Tomcat ‘Contains’ WAR
- WAR has two endpoints for JDBC with MySQL:
  - Inbound
  - Outbound

Valid set of rules

Tomcat Hosted Linux
Linux Hosted Computer

The second metadata entry triggers the 3rd. requirement, which is satisfied (it’s a hosting rule, not a containment rule).

Create or edit containment service rule metadata

Create containment service rule metadata for CIs to assist in correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies business metadata rules.

Role required: admin

A containment rule is a relationship definition between two CIs, structured as: CIType1 RelationshipType CIType2. The first CI type that you add becomes the top level CI of a containment
rules group which is a chain of containment rules. The entire set of containment rules is organized as
groups according to top-level CIs.

To create a containment rules group for a new CI type, you need to first add the CI type as CI Type1
of the relationship. To add a child containment rule for a CI type that exists, you need to select that CI
type, and define the second portion of the relationship rule which is the relationship type and CI Type2.

To each rule within a containment rules group you can add inbound or outbound endpoints, which are
noted by blue up and down arrows. After adding an endpoint, you cannot add a containment rule in
that branch of the containment rules hierarchy.

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Metadata Rules Editor in the Correctness
group.

2. Or, navigate to Configuration Identification/Reconciliation Metadata Rules Editor.

3. Click Add New Rule at the top of the Containment Rules list.

4. In the Add Top-Level Containment Rule dialog box, select the Configuration Item Type for which
   you want to create the top-level rule.

5. Complete the following steps to select a top-level containment rule and add a child rule.
   a) Click the green ‘+’ icon.
   b) Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The CI for the rule.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>A check box to use the reverse relationship in the rule.</td>
</tr>
</tbody>
</table>

   c) Click Create.

6. Complete the following steps to select a child rule and add an endpoint
   a) Click the blue “+” icon.
   b) Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Type</td>
<td>The type of endpoint.</td>
</tr>
<tr>
<td>Inbound or Outbound</td>
<td>The direction of the endpoint.</td>
</tr>
</tbody>
</table>

   c) Click Create.

Create or edit a hosting service rule metadata

Create hosting service rules metadata for CIs to assist in correctly identifying dependent CIs during
the business discovery process and service mapping. Discovery calls the identification API that applies
business metadata rules.

A hosting rule is a relationship definition between two CIs, structured as: CI Type1 relationship type CI
Type2. To create a hosting rule, you need to add a CI type as CI Type1 in the relationship rule, and
then define the second portion of the relationship rule which is the relationship type and CI Type2. The entire set of hosting rules is organized as groups according to the top-level hosted CIs.

Role required: admin

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Metadata Rules Editor in the Correctness group.

2. Or, navigate to Configuration Identification/Reconciliation Metadata Rules Editor.
3. Click Add New Rule at the top of the Hosting Rules list.
4. In the Add Top-Level Hosting Rule dialog box, select the Configuration Item Type for which you want to create the rule.
5. Complete the following steps to select the top-level hosting rule and add a child rule:
   a) Click the green ‘+’ icon.
   b) Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The CI for the rule.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>A check box to use the reverse relationship in the rule.</td>
</tr>
</tbody>
</table>

   c) click Create.

Effective usage of CMDB Identification

Use CMDB Identification effectively for optimal accuracy and performance.

Identification rules

An independent identification rule identifies a CI based on the CI’s attributes, independently of other CIs. A dependent identification rule identifies a CI by its dependent CIs and the relationships of the identified CI with those dependent CIs. Identification with a dependent identification rule is based on the dependent CIs and the relationships and qualifiers between the identified CI and its dependent CIs. Identification then requires more time than with an independent identification rule and is prone to some identification errors. Usage of dependent rules should therefore be minimized.

CI modeling determines which type of identification rules are required for proper CI identification.

Create identification rules using the following order of importance:

1. Independent identification rules — It is always preferable to create independent identification rules rather than dependent identification rules. When you model a CI, define the CI with a complete set of attributes that lend themselves to independent identification, eliminating the need to use additional CIs for identification.

2. Dependent identification rules — If it is necessary to create dependent identification rules, then define a single level of dependency. Two is the maximum number of dependency levels that is supported.
3. Avoid creating lookup identifier entries. The use of lookup identifier entry is highly discouraged for performance reasons. If unavoidable, ensure to first review class definitions and consider updates that allow usage of independent identification rules.

4. Limit the number of identifier entries within an identification rule, ideally to 1. A second identifier entry reduces performance, as will each additional identifier entry.

5. Create strong identification rules in which the strongest identifier entries are set with the highest priority.

6. Ensure that the identification rule is at the class level that it needs to be.

Payload

Create the payload using the following order of importance:

1. Payload size — Limit the number of CIs per payload to 500.
2. Avoid duplicate entries in the payload.
   
   Example: If an identification rule has a criterion attribute for the name field, then the following payload has duplicate items resulting in failure:

   ```javascript
   var payload = {
       items: [{
           className:'cmdb_ci_linux_server',
           values: {
               name:'Win Server 200',
               ram:'2048'
           },
           {
               className:'cmdb_ci_linux_server',
               values: {
                   name:'Win Server 200',
                   ram:'4096'
               }
           }
       ]
   };
   ```

3. Do not pass system data such as the following in the payload.

   ```javascript
   var payload = {
       items: [{
           className:'cmdb_ci_linux_server',
           values: {
               name:'Win Server 200',
               sys_domain:'global',
               sys_domain_path:'xyz',
               sys_updated_on:'2017-06-15 16:25:11',
               sys_mod_count:23,
           }
       }]
   };
   ```

4. Provide the minimum necessary set of criterion attributes for each payload item, according to what is specified in the corresponding identification rules.

5. When matching CIs, use CIs’ sysIds if available.
   
   • Example: Independent CI that needs to be updated — sysId is available.

   ```javascript
   var payload = {
       items: [{
           className:'cmdb_ci_linux_server',
           values: {
               sys_id:'194876usytrr65378098',
           }
       }]
   };
   ```
• Example: Dependent CI that needs to be inserted. Tomcat War CI depends on Tomcat CI, and Tomcat CI depends on Linux Server CI. SysIds for the Tomcat and the Linux CIs are available.

```javascript
var payload = {
    items: [{
        className: 'cmdb_ci_app_server_tomcat_war',
        values: {
            name: 'war1',
            short_description: 'my description'
        }
    }, {
        className: 'cmdb_ci_app_server_tomcat',
        values: {
            sys_id: '194876usytrr65378098'
        }
    }, {
        className: 'cmdb_ci_linux_server',
        values: {
            sys_id: '09876tysueyt6345laku'
        }
    }],
    relations: [{
        parent: 1,
        child: 0,
        type: 'Contains::Contained by'}, {
        parent: 1,
        child: 2,
        type: 'Runs on::Runs'}
    ]
}
```

• Example: Dependent CI that needs to be updated — sysId is available.

```javascript
var payload = {
    items: [{
        className: 'cmdb_ci_app_server_tomcat_war',
        values: {
            sys_id: '039387euey637465sytet',
            short_description: 'my description new'
        }
    }]
}
```

6. When inserting many CIs, all of which depend on the same CI, you should serialize your API calls. Otherwise, attempting to concurrently process many CIs can clog the system, significantly degrading overall system performance.

### Installed with Identification and Reconciliation

**CMDB Identification and Reconciliation** adds tables, properties, and script includes.

**Tables installed with Identification and Reconciliation**

Identification and Reconciliation uses the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb_identifier</td>
<td>Identification rule sets defined for different classes of CIs.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reconciliation Definition (cmdb_reconciliation_definition)</td>
<td>Reconciliation rules defined for different classes of CIs at the table and field level.</td>
</tr>
<tr>
<td>Identifier Entry (cmdb_identifier_entry)</td>
<td>Rule entries with different priorities assigned to each identifier.</td>
</tr>
<tr>
<td>Data Source Precedence (cmdb_datasource_precedence)</td>
<td>Priorities of data sources that are authorized to update the same CI types or CI type with same sets of attributes.</td>
</tr>
<tr>
<td>Duplicate Audit Result (duplicate_audit_result)</td>
<td>Duplicate audit results corresponding to a specific duplicate task. These results are generated automatically during the identification process and should not be added manually.</td>
</tr>
<tr>
<td>Reconcile Duplicate Task (reconcile_duplicate_task)</td>
<td>Task to address duplication that is detected during the identification process. Records are generated automatically, and users should not add records manually.</td>
</tr>
<tr>
<td>Reclassification Task (reclassification_task)</td>
<td>Reclassification tasks that were generated during the identification process.</td>
</tr>
<tr>
<td>Data Source History (cmdb_datasource_last_update)</td>
<td>Information about the last data source that updated each attribute. Used to determine if a data source can update a stale CI.</td>
</tr>
<tr>
<td>Data Source Staleness Definition (cmdb_datasource_staleness)</td>
<td>Effective duration per data source. When effective duration is exceeded, then CMDB Health determines that the information provided by that data source is stale.</td>
</tr>
</tbody>
</table>

Properties installed with Identification and Reconciliation

Identification and Reconciliation uses the following properties. Updating these properties requires users to have the admin role.

Note: To open the System Property (sys_properties) table, enter sys_properties.list in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.required.attribute.enabled | Flag for enforcing required attributes during identification and reconciliation so that attributes cannot be null.  
  • Type: true | false  
  • Default value: true  
  • Location: System Properties (sys_properties) table. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.class.upgrade.enabled</td>
<td>Flag for allowing class upgrade during identification and reconciliation.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.class.downgrade.enabled</td>
<td>Flag for allowing class downgrades during identification and reconciliation.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.class.switch.enabled</td>
<td>Flag for allowing class switching during identification and reconciliation.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.reconciliation.override.null</td>
<td>Flag for allowing the update of an empty field by a lower priority data source.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>glide.identification_engine.skip_duplicates</td>
<td>Controls how identification processes a small set of duplicate CIs.</td>
</tr>
<tr>
<td></td>
<td>• When true: If the number of duplicate CIs is less than the threshold specified by glide.identification_engine.skip_duplicates.threshold, then the oldest of the duplicate CIs is picked as a match and gets updated. For the rest of the duplicate CIs, the CMDB.CIs’ discovery_source field is set to ‘Duplicate’.</td>
</tr>
<tr>
<td></td>
<td>• When false: Matching a CI fails, and an error is logged.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties (sys_properties) table.</td>
</tr>
</tbody>
</table>
### Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.identification_engine.skip_duplicates.threshold | The maximum number of CIs that can be in a set of duplicate CIs to allow identification to process the duplicate CIs according to the setting of glide.identification_engine.skip_duplicates. If the number of duplicate CIs exceeds the threshold, then identification processes the duplicate CIs as if glide.identification_engine.skip_duplicates is set to false.  
  • Type: Integer  
  • Default value: 5  
  • Location: Add to the System Properties (sys_properties) table. |
| glide.cache.size.service_cache | The max cache size (in MB) that is used by the identification engine for inbound and outbound relations. When the limit is reached, the least recently used cached data is discarded, releasing space for new data.  
  Note: You cannot disable the service cache.  
  • Type: Integer  
  • Default value: 20  
  • Location: Add to the System Properties (sys_properties) table. |

### Script includes installed with Identification and Reconciliation

Identification and Reconciliation uses this script include.

<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDBTransformUtil</td>
<td>Performs identification and reconciliation.</td>
</tr>
</tbody>
</table>

### CMDB Health

Monitoring and maintaining the health of the CMDB is essential to an effective and continuous use of the product. Health indicators such as duplicate CIs, required CI fields, and audits contribute to the calculation of health scorecards at the CI, class, and CMDB level. CMDB Health does not support domain separation.

The video at the following link shows how to access the CMDB Health dashboard and how to set it up:

The health of the CMDB data is monitored and reported in four major metrics, each further consisting of sub-metrics:

- Completeness: CIs are tested for required and recommended fields that are not populated.
- Correctness: CIs are tested against pre-defined data integrity rules such as identification rules, orphan CI rules, and stale CI rules.
- Compliance: The CMDB data is audited for adherence to pre-defined certificates.
- Relationships: The health of CI relationships is tested for indicators such as orphan and duplicate relationships.
After CIs are tested for various health indicators, the results are aggregated at the class level, and eventually at the overall CMDB level. You can configure how health is calculated and the weight of each metric at every level of the aggregation. For most health tests, you can configure the health tests themselves.

The following dashboards display CMDB health reports and let you configure the CMDB health metrics that CIs are evaluated for.

<table>
<thead>
<tr>
<th>Dashboard</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CMDB Dashboard</strong></td>
<td>Main CMDB health dashboard:</td>
</tr>
<tr>
<td>Configuration CMDB Dashboard</td>
<td>• Overall CMDB and class level aggregated CI health. Aggregation is displayed from the sub-metric level up to the overall CMDB level.</td>
</tr>
<tr>
<td></td>
<td>• Aggregated health for CI relationships, and sub-metrics.</td>
</tr>
<tr>
<td></td>
<td>• Displays the tasks that were generated for CIs that failed a health test.</td>
</tr>
<tr>
<td></td>
<td>• Drill down for each major metric to a detailed report of associated sub-metrics, broken by class.</td>
</tr>
<tr>

</tbody>
</table>
CMDB remediation

CMDB Health provides a framework for configuring CI remediation. This allows you to proactively apply corrective actions to unhealthy CIs in a managed and standardized fashion.

CMDB health metrics

The overall CMDB health score consists of three major metrics which are correctness, compliance and completeness, each further consisting of sub-metrics. Each metric is associated with a scorecard that determines the contribution of the metric to the aggregated health at the overall CMDB level, class, and CI level.

You can configure which metrics and sub-metrics are included in the aggregated calculation, and set their weight in the aggregation. In the base system, all of the major metrics and sub-metrics are included in the aggregated health report.

Overall

An aggregation of the major metrics correctness, completeness and compliance, according to their overall scorecard weight settings.

Correctness

An aggregation of the following sub-metrics, according to the correctness scorecard weight settings.

Orphan

Measures the percentage of orphan CIs in the CMDB. A CI can become orphan if it was unintentionally left in the CMDB when it is no longer needed. A CI is determined to be orphan if:

- The CI matches the criteria in an orphan rule.
- The CI doesn’t have any relationship in the relationship table.
- Data is missing for the CI in its respective table, or in one of its parents’ table.

Staleness

Measures the percentage of stale CIs in the CMDB. CI staleness is determined using reconciliation and staleness rules for the CI’s class if exist, and the glide.cmdb.health.staleness property. A CI is determined to be stale if it was not updated by the data source that was the last to update the CI, within a certain length of time. The length of time is determined either by the Effective Duration field in the staleness rule, or by the CMDB health system property glide.cmdb.health.staleness as follows:

- If a staleness rule is not defined for the CI’s class, then the glide.cmdb.health.staleness is used for testing the CI.
- If a staleness rule is defined for the CI’s class, then it is used for testing:
• If the CI fails that test, then the CI is determined to be stale.
• If the CI passes the test, then it is further tested using the glide.cmdb.health.staleness property.

For more information about how CI staleness and data source precedence rules affect each other, see Define or edit data source precedence.

In addition, a relationship in which a stale CI is a parent or a child, is determined to be a stale relationship.

Duplicate
Measures the percentage of duplicate CIs in the CMDB using identification rules. Only independent CIs are evaluated for duplication. In a set of duplicate CIs, the count of duplicate CIs is the total number of CIs in the set, minus one. The detailed graphs for a duplicate set of CIs display all the CIs in the set.

Completeness
An aggregation of the following sub-metrics, according to the completeness scorecard weight settings.

Required
Measures the percentage of CIs in which fields that are defined as mandatory, are not populated. Missing fields are tagged as incomplete noting that for this CI some information is missing. Required fields are equivalent to the fields that are specified as mandatory in the system dictionary.

Recommended
Measures the percentage of CIs in which fields defined as recommended, are not populated. Out-of-box, no recommended fields are specified.

Compliance
Based on an audit of the CMDB.

Audit
Compares actual values of specified fields, against expected values defined in template audits (scripted audits are not supported). For more information see Create an audit. Create a compliance-type audit, for which the results are calculated into the compliance CMDB health metric.
Relationships

Measures the health of CI relationships, consisting of the following sub-metrics which are not-configurable:

**Duplicate relationships**
Relationships that have identical parent and child CIs, identical relationship type, and an identical port. Duplicate relationships are displayed per relationship type. In a set of duplicate relationships, the duplicate relationship count is the total number of duplicate relationships in the set, minus one. The detailed graphs for a duplicate set of relationships display all the relationships in the set.

**Orphan relationships**
A relationship that is missing either a parent CI, a child CI, or both.

**Stale relationships**
A relationship in which the parent CI or the child CI is a stale CI.

A single relationship can fail more than one health test. For example, a duplicate relationship can also be stale.

Setup and configuration and initial configuration

The data collection system is highly configurable, however, the base system is minimally configured for aggregating CMDB health data. Most importantly, the CMDB Health Dashboard jobs are disabled and data is not collected. To display valuable and meaningful data, you should review and adjust settings.

1. For each metric and sub-metric that you want reported, define rules and fulfil other needed requirements. For example, create rules for evaluating orphan records and recommended fields, if you are interested in these metrics - see CMDB health metrics
2. Review and adjust the threshold ranges for best, at risk, and critical states for the CMDB health metrics scorecards - see Configure CMDB health scorecard thresholds
3. Set metric aggregation preferences, deactivate metrics that you are not interested in reporting, and adjust weighted averages of aggregation - see Configure CMDB Health metrics aggregation preferences.
4. Enable the Health Dashboard jobs for the metrics that you want reported - see Enable and configure a CMDB Health Dashboard job
5. Customize the CMDB dashboard
6. Customize the CI dashboard

Monitor CMDB health in the CMDB dashboard

The CMDB dashboard serves as a central location to view aggregated health reports for your CMDB at a glance which helps you understand the CMDB health status. Also, it lets you drill down to take actions to address health issues, and to improve CMDB health.

The CMDB dashboard requires some configuration before it can display meaningful data. Once configured, the dashboard displays data that is automatically collected and calculated on a recurring schedule. The CMDB dashboard is not domain aware and is not supported on Microsoft Edge browser.

Role required: asset or itil
Access the CMDB dashboard by navigating to Configuration CMDB Dashboard.

The CMDB dashboard has two viewing modes. Click CI Class or Relationship in the upper right corner of the dashboard to toggle between them.

CI Class View

The CI Class view is the default view for the CMDB dashboard. It contains scorecards detailing the overall health of your CMDB, and also per health metric. Additionally it contains useful reports showing a breakdown of any duplicate, orphan or stale CIs by class, and lists the top 10 incident, alert, and change generating CIs in the CMDB.

All of the default widgets in the CI Class view can be filtered using the CMDB class hierarchy tree. Initially, the class hierarchy filter is set to the root class, Configuration Item (All). Click CMDB Dashboard - All to select a different class, filtering all widgets on the dashboard to display data only for the selected class and its child classes.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the metric. Health results of sub-metrics are displayed underneath, each contributing according to the configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the CI Class view:

• In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that metric.
• In a charts widget: Click on a bar to display a list of all the records that the bar represents.
• In lists: Click the 'i' icon to view a list of all the tasks or alerts related to the CI.

Relationship View

The Relationship view displays various scorecards for health indicators of CI relationships in your CMDB. It contains charts detailing any duplicate, orphan or stale relationships, broken down by relationship type. You can drill down these charts for further details.

Changing the CI Class selection while in the Relationship view has no effect on the data displayed in this view.

Color codes

Both, the CI class view and the relationship view, use color codes when displaying aggregated health status. The status definitions are based on each scorecard’s threshold limits that are defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note: The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the sub-metric are halted for this cycle, and all associated aggregated summaries display 0%. Review the scorecard rules which might be ineffective, or the CMDB might be in an unstable state.

Configure metric rules and behavior

Configure CMDB Health related system properties, scheduled jobs, and health metric rules to customize how aggregated data is calculated, and other CMDB Health behavior.

See the following video on YouTube: [CMDB Health Dashboard for Helsinki | Overview](#) for information about configuring and using the CMDB dashboard.

CMDB health system properties

Configure the following system properties to customize how CMDB health is monitored and evaluated.

Role required: itil_admin

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.cmdb.health.metricProcessor.maxRunningTime | Max time in minutes for which individual metric processor will run in each scheduled cycle. If processing of a sub metric exceeds the specified time, CMDB health processing halts until the next CMDB health job is scheduled to run.  
  - Type: Numeric  
  - Default value: 120  
  - Location: Navigate to Configuration Health Properties. In the right hand-side navigator, click System Properties.  
    For performance reasons, it is recommended not to set this property to a value greater than 120. |

Note: If you enter an invalid value, the default value is used.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.cmdb.health.staleness | The length of time that is used for testing CI staleness. Used for CIs:  
  • For which a staleness rule is not defined for the CI’s class.  
  • For which a staleness rule for the CI’s class exist, and the CI passed that test. In this case, the CI is further tested for staleness using the value of the glide.cmdb.health.staleness property.  
  • Type: Numeric  
  • Default value: 60  
  • Location: Navigate to Configuration Health Properties. In the right hand-side navigator, click System Properties.  
  Note: If you enter an invalid value, the default value is used. |
| glide.cmdb.logger.use_syslog.CMDBHealth | A comma separated list that controls the level of logging of CMDB health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This helps debugging in case of failure. For example, to log error and info messages, set the value to ‘error,info’.  
  • Type: String  
  • Default value: error  
  • Other possible values: Comma separated list with any of the following values:  
    • info  
    • error  
    • warn  
  Or ‘*’ which is equivalent to including all possible values.  
  • Location: System Property (sys_properties) table. |

Enable and configure a CMDB Health Dashboard job

Enable the jobs that process CMDB health tests, to start calculating CMDB health metrics that will be aggregated into the overall CMDB health report.

Role required: admin

In the base system, CMDB Health Dashboard jobs are disabled by default. Enable the respective job for the CMDB health metric that you want data collected and aggregated for. You can schedule a job to run on a recurring schedule, or execute it once at any time.

1. Navigate to CMDB Dashboard and click Manage Jobs.  
2. Select a job that you want to enable or configure.
3. Review the default configuration, and update as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Job name. It is recommended that you do not modify the job’s name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the job.</td>
</tr>
<tr>
<td>Run</td>
<td>Configure recurring schedule of job execution, or select On Demand.</td>
</tr>
<tr>
<td>Time</td>
<td>If Active is selected, set the time (hour, minute, and second) to run the job.</td>
</tr>
<tr>
<td>Conditional</td>
<td>If selected, the scripted condition must evaluate to true before the job can run.</td>
</tr>
<tr>
<td>Run this script</td>
<td>The job’s script. Modifications to the script are not recommended.</td>
</tr>
</tbody>
</table>

4. Click Execute Now to run the job once immediately.

After you enable a CMDB Health Dashboard job, the corresponding health metric results are aggregated and displayed in the CMDB dashboard and CI dashboard, at the CMDB, class, and CI levels.

Configure CMDB health scorecard thresholds

Configure the thresholds for best, at risk and critical state definitions for the CMDB health metrics scorecards. You can configure these settings globally for the entire CMDB, or individually per class.

Role required: admin

Adjust scorecard thresholds to reflect the range of failures that should be used for each health state.

1. Navigate to Configuration CI Class Manager.
2. In the CI Class Manager expand the Class Hierarchy:
   • To configure thresholds for the completeness, correctness and compliance major metrics, select the top-level Configuration Item class. When you select the top-level Configuration Item class, threshold settings to any scorecard apply to the entire class hierarchy.
   • To configure thresholds for a specific class, select that class from the list.
3. Check Advanced on the right-hand side bar. Click Correctness and all other strip headers to display all scorecards.
4. Select a scorecard such as Required Fields Scorecard or CMDB Correctness Scorecard.
5. Double-click the metric for the cmdb_ci class, or click New to create scorecard thresholds only for the selected class.
If you select the global metric for the cmdb_ci class, the threshold setting will apply to the entire class hierarchy.

6. Slide the threshold sliders, or enter specific numbers to increase or to decrease the threshold bars to fit your definitions for best, at risk, and critical levels for the scorecard.

7. Click Save.

Configure CMDB Health metrics aggregation preferences

Sub-metrics health scorecards are aggregated into their respective major metric, which in return are aggregated into the overall CMDB Health report. Set metric aggregation preferences for the major metrics, and for each of their sub-metrics, deactivate metrics that you are not interested in reporting, and adjust weighted averages of aggregation.

To start collecting and reporting CMDB health metrics, you must first enable and configure the CMDB health dashboard jobs.

Role required: itil_admin (on top of itil)

The completeness metric for example, consists of the sub-metrics required fields and recommended fields, each contributing a different weight to the sum. You can configure the proportional weight of required fields and recommended fields within completeness to be 25 and 75 respectively. You can also configure the proportional weight of completeness, compliance and correctness within the aggregated sum of the overall CMDB health.

Note: Non-active metrics are displayed on the CMDB dashboard in faded coloring, displaying the most recent aggregations that were calculated when the metric was active.

In the ServiceNow base system, the weights of the main metrics have default settings, and each sub-metric is globally set.

1. Navigate to Configuration Health Properties.
2. Select Health Metrics on the right-hand side navigator.
3. Expand Select Metric and select one of the main metrics such as Completeness, or a sub-metric.

For Completeness, Compliance and Correctness:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the metric to include it in the aggregated CMDB health report.</td>
</tr>
<tr>
<td>Weighted Averages</td>
<td>Specify the weight of each sub-metric in the aggregated health report for the metric. The sum of weighted averages for all sub-metrics should be 100.</td>
</tr>
</tbody>
</table>

For a sub-metric:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the metric so it is included in the aggregated health report for the respective metric.</td>
</tr>
<tr>
<td>Create Task</td>
<td>If a record fails the metric test, create a task with details about the failure. You can then view the task on the CI dashboard, and configure remediation for the task.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Failure Threshold</td>
<td>When the threshold number of CIs that fail the health metric test is reached, health processing stops for the metric for this cycle.</td>
</tr>
<tr>
<td>Task Assignee Group</td>
<td>An assignment group for the task.</td>
</tr>
</tbody>
</table>

4. Click Save.

Set a CI field to be mandatory

Configure a CI field as mandatory so it is included in the CMDB Health tests for the required metric if enabled. Required is a sub-metric of the CMDB Health completeness metric.

When a field is configured as mandatory, the CMDB health tests check whether the field is populated or not. The CI dashboard then displays the number of required fields that are left empty. The CMDB dashboard displays the aggregated report of the percentage of CIs for which one or more required fields is empty.

1. Navigate to Configuration CI Class Manager.
2. Select a class from the Class Hierarchy.
3. Select Fields on the right-side bar.
4. Select a table column.
5. In the Dictionary form, select the Mandatory check box.
6. Click Update.

The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.

Note: Mandatory fields are global. The field is marked as mandatory everywhere it appears in a form.

Set a CI field to be recommended

You can define a list of CI fields as recommended, noting that it is desirable that they are populated by a data source such as Discovery. You can then configure the CMDB completeness health metric to include recommended fields in its aggregated health reports.

Use this for fields which should not be mandatory, but that might have useful information that the CI should have. For example, a field with information that might at some point help with diagnosis.

All classes derive the recommended fields that are defined at the parent level. You can remove any of these derived recommended fields for a CI, without affecting the parent CI or sibling CIs.

1. Navigate to Configuration CI Class Manager.
2. Select a class from the Class Hierarchy.
3. Check Advanced on the right-hand side bar, and select Recommended Fields from the Completeness group.
4. In the slushbucket move the fields that you want to designate as recommended, from the Available list to the Selected list.
5. Click Save.

Create or edit a CMDB health orphan rule

Create an orphan rule to determine the percentage of orphan CIs in the CMDB. This sum is then aggregated into the correctness CMDB Health metric, and weighed into the overall CMDB health report. Orphan rules are defined per class, and only a single orphan rule can be defined per class.
Role required: admin

An orphan rule can for example define that if a CI doesn’t have an owner or an asset, then it is considered an orphan CI.

1. Navigate to Configuration CI Class Manager.
2. Select a class from the Class Hierarchy.
3. On the right-hand side navigation pane, check Advanced, expand the Correctness strip, and click Orphan Rule.
   If an orphan rule exists for the class, then double-click it to edit.
4. Complete or edit the CMDB Health Orphan Rule form.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>The class for which the orphan rule applies.</td>
</tr>
<tr>
<td>Condition</td>
<td>The filter that determine which CIs are considered orphans. For example, the filter conditions in which both the Assigned to and the Owned by fields are empty, will identify the matching CIs as orphans.</td>
</tr>
<tr>
<td>No Relationship</td>
<td>Select to add the requirement that the CI should have no relationships to be considered an orphan CI.</td>
</tr>
</tbody>
</table>

5. Click Submit or Update to save the rule.

Create or edit a CMDB Health staleness rule

If the CMDB Health sub-metric staleness is in effect, then staleness rules are used to determine the percentage of stale CIs in the CMDB. This sum is then aggregated into the correctness metric, and weighs into the overall CMDB health calculation. Staleness rules are defined per class per data source.

Role required: admin

A staleness rule that is defined for a specific class is used in conjunction with a reconciliation rule for the same class to determine the staleness status of CIs from that class.

If the fields specified in the reconciliation rule for the CI’s class were not updated by the specified data source within a certain time period - the CI is determined to be stale. The time period is determined by the glide.cmdb.health.staleness property or by the Effective Duration field in the staleness rule. If a staleness rule exist for a CI’s class, then if a CI passes the rule’s test, the CI is further tested using the glide.cmdb.health.staleness property value. A CI then, might initially pass the staleness test and then fail the subsequent staleness test that uses the glide.cmdb.health.staleness property.

1. Navigate to Configuration CI Class Manager.
2. Select a class from the Class Hierarchy.
3. On the right-hand side navigation pane, check Advanced, expand the Correctness strip, and click Staleness Rule.
   If a staleness rule exists for the class, then double-click it to edit.
4. Complete or edit the Data Source Staleness Rule form.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>The class for which the rule applies.</td>
</tr>
</tbody>
</table>
## ServiceNow Helsinki Now Platform Capabilities

### Control Table

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>The data source for which the rule applies. Data source correlates to the Discovery source field on a CI. These two must match for the staleness rule to be applied to a CI. Ensure that the Discovery source field is properly populated either by Identification and Reconciliation processes, or manually.</td>
</tr>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the initial CI staleness test. If you enter a value with a prefix that is valid and a suffix that is not, such as 15 x - the valid portion of the value is used (’15’). If the entire value is invalid - the default value of 0 is used.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the rule.</td>
</tr>
</tbody>
</table>

5. Click Submit or Update to save the rule.

### Customize the CMDB dashboard

The CMDB dashboard displays aggregated CMDB health reports for all major metrics, and sub-metrics. The data is displayed in a tile format, each tile being a widget that you can customize to display the information in a way that is useful for you.

Role required: itil admin

Navigate to Configuration CMDB Dashboard and customize the CMDB dashboard as follows:

- Click the title area of a tile and drag it to a different location to rearrange the layout of tiles on the dashboard.
- Click the X in the upper right side of a widget to hide the widget.
- Click the + sign in the upper left corner of the dashboard to add content. In the Add content dialog box select the content to add and the location to place it.
- Click the gear icon in a widget tile to edit widget settings such as title and height.
- Click Reset to Default to revert to the base system settings.

**Note:** Customizations to the CMDB dashboard will not be preserved in future upgrades of ServiceNow.

### View CI health

The CI dashboard is a central location displaying health report for an individual CI, history of changes to the CI in a timeline view, and the relation formatter. The CI dashboard also displays incidents, changes, and other tasks affecting the CI, and business services affected by the CI. You can access the CI dashboard from a CI form, or from the CMDB dashboard.

Role required: asset or itil

The health scores are based on settings of CMDB health metrics and scorecards. The report is calculated in real-time from data stored in health-related tables which the CMDB Dashboard jobs update on a recurring schedule. The completeness and correctness metrics are always up to date, but for other metrics, it is possible that updates to the CMDB are not reflected because one of the dashboard jobs hasn’t run yet, as follows:
• Compliance: Depends on audit cycles and on the 'CMDB Health Dashboard - Compliance Score Calculation' job.
• Relationships: Depends on the 'CMDB Health Dashboard - Correctness Score Calculation' job.

To ensure that the latest updates to these metrics are reflected on the CI dashboard, navigate to the respective dashboard job, and click Execute Now.

1. On a CI form click Dashboard.
2. Or, navigate to CMDB Dashboard and click CMDB Dashboard - All to display the class hierarchy. Enter a search string and then select a CI from the Configuration Items group.

The search results are grouped by Classes and Configuration Items that match the search string.

Various widgets in the report display CI’s health with the following color codes:
• Green: The CI passed the metric test (for example, it is not a duplicate).
• Red: The CI failed the test (for example, it is a duplicate)
• Grey: The CI was not tested for this metric, because the threshold was not set for the CI (class) in the CI module.

The report displays the change history for the CI in a timeline format, that you can zoom in or out to select a time period for which to display details for. Use the related lists tabs Change, Incident, Task, Business Services, and Alerts to further drill into additional details.

Note:
Missing rules or other class definitions can prevent some health scores from being evaluated for a CI. The results in the CI dashboard in these situations, are described below:

Duplicate
• If no identification rules ([cmdb_identifier]) are defined for the CI's class or its ancestors: Not applicable notification appears.
• If only dependent identification rules are defined: Not applicable notification appears.

Orphan
If no orphan rules ([cmdb_health_orphan_rule]) are defined for the CI’s class or its ancestors: Not applicable notification appears.

Audit
If no desired state audits ([cert_audit]) are defined for the CI: Not applicable notification appears.

Customize the CI dashboard
You can add, remove or re-arrange content on the CI dashboard to display the CI health statistics that are important to you.

Role required: itil_admin

On a CI form click Dashboard and customize the CI dashboard as follows:
• Drag a tile near its upper edge and drag it to a different location on the dashboard to rearrange the current layout.
• Click the X in the upper right side of a widget to hide the widget.
• Click the + sign in the upper left corner of the dashboard to add content. In the Add content dialog box select the content to add and the location to place it.
• Click the gear icon in a widget tile to edit widget settings such as title and height.
• Click Reset to Default to revert to the base system settings.

View CI relationships health

View aggregated orphan, stale, and duplicate CI relationships in the CMDB dashboard. You can configure the relationship scorecards, but you cannot configure the underlying relationship metric health tests.

Role required: itil or asset

CMDB Health measures CI relationship health in its own metric and sub-metrics.

<table>
<thead>
<tr>
<th>Orphan relationship</th>
<th>A relationship that is missing a parent or missing a child.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duplicate relationship</td>
<td>Relationships that have identical parent, child and relationship type.</td>
</tr>
<tr>
<td>Stale relationship</td>
<td>A relationship in which one of the CIs is stale. For a stale CI – its associated relationships are also stale.</td>
</tr>
</tbody>
</table>

1. Navigate to Configuration CMDB Dashboard.
2. Select the Relationship tab.

Explore and modify CI class

The CI Class Manager displays the entire CMDB class hierarchy in a tree-view format, consolidating class definitions into a central location. It lets you define metadata for a class, such as reconciliation rules, required and recommended fields, and audit templates. You can also select a specific class to view, to modify, or to extend its definition to create a new CI class.

In the CI Class Manager, you can review and manage the health rules and settings for all CMDB Health metrics, at the class level. You can configure scorecard settings for calculating overall health for a class, and overall health for the entire CMDB.

1. Navigate to Configuration CI Class Manager.
2. Check Advanced and expand all strips that are closed.
3. Select any scorecard to review and update its setting for the class.
4. Expand the Class Hierarchy to explore the class hierarchy and to select a class to modify.
5. Modify any class detail as needed, and click Update.

Delete all records for a CMDB class

You can delete all the records for a CMDB class in the CI Class Manager.

Role required for the Configuration Item [cmdb_ci] table: itil or asset

1. Navigate to Configuration CI Class Manager.
2. Expand the Class Hierarchy and select the class for which you want to delete all records.
3. On the Table form, click Delete All Records.
Create CMDB remediation rule

A CMDB remediation rule is associated with a task that was created for a failed CMDB health test. A CMDB remediation rule is applied automatically or manually to execute a remediation workflow that can, for example, delete stale CIs.

You need to first create and publish a remediation workflow that addresses the CI issue. The workflow can be a regular workflow, or an Orchestration workflow, and the table in the workflow needs to match the task type in the remediation rule. Do not configure the workflow with any filter conditions so that the filters of the CMDB remediation rule will apply.

Role required: itil_admin (on top of itil)

1. Navigate to Configuration CMDB Remediations.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Remediation name.</td>
</tr>
<tr>
<td>Task type</td>
<td>Type of CMDB health-related tasks to apply the remediation to.</td>
</tr>
<tr>
<td>Task filter</td>
<td>Filters tasks to apply remediation to. Also applies dot-walking on CI fields so that remediation is applied to tasks associated with matching CIs.</td>
</tr>
</tbody>
</table>
| Execution              | • Manual: Remediation is applied manually.  
                          • Automatic: The workflow is applied once, upon the creation of a task that matches the Task type and Task filter. |
| Orchestration workflow | The CMDB remediation workflow (regular or Orchestration) that will execute automatically or manually, depending on the Execution setting. You can click the Lookup using list icon, and then click New to create a new workflow. |

3. Click Submit.

If Execution is set to Automatic, then the business rule ‘Run remediations for CMDBHealth task’ applies the remediation workflow to CIs that match the Task filter. If Execution is set to Manual, then you can manually apply the remediation workflow defined in the rule.

Apply CMDB remediation

Manually initiate a workflow to remediate a CI that failed a CMDB health test. For example, you can remediate CIs that are orphan or stale.

To manually apply a CMDB remediation, a CMDB remediation rule must exist, in which Execution is set to Manual.

Role required: itil_admin

1. Navigate to Configuration CMDB Dashboard.
2. Click on the metric tile that is associated with the remediation that you want to apply. For example, to remediate an orphan CI, click the Completeness tile.
3. In the detailed report, scroll to the CMDB Health Results list. In the Task column, select the task that is associated with the CI that you want to remediate.
4. On the task form, click Remediate.
5. In the Run Remediations dialog box, select the remediation rule that you want to apply. The list of remediation rules is based on the type of health metric (such as orphan, stale), and on the filter defined in the rule.
6. Click Execute.

Tables installed with CMDB Health

CMDB Health tracks and reports various metrics that monitor the health of the CMDB. CMDB Health adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Metric</td>
<td>Details such as if a metric is enabled, maximum failure threshold, and other settings for all CMDB Health metrics and sub-metrics.</td>
</tr>
<tr>
<td>CMDB Health Result</td>
<td>Results from the most recent CMDB Health processing cycle.</td>
</tr>
<tr>
<td>CMDB Health Scorecard</td>
<td>Current and historic health scores. Status of historic score records is ‘Historic’, and of latest score records is ‘Complete’.</td>
</tr>
<tr>
<td>CMDB Health Orphan Rule</td>
<td>Rules for calculating orphan records per class.</td>
</tr>
<tr>
<td>CMDB Recommended Fields</td>
<td>Recommended fields per class.</td>
</tr>
<tr>
<td>CMDB Health Metric Status</td>
<td>Internal table that tracks the status of each metric that is being processed. Includes metric status, processing time, and processing start date. A metric state changes from ‘In Progress’ to either of: • Complete • MaxFailures • Daily Processing Time Out Processing of a timed out metric continues on the following day.</td>
</tr>
<tr>
<td>CMDB Health Processor Status</td>
<td>Internal table that tracks the processing progress of each metric. Contains a list of tables that are processed for each metric, and processing status. Classes are processed sequentially, changing status from Draft -› In Progress -› Complete.</td>
</tr>
</tbody>
</table>

CMDB Health troubleshooting

Use the following information to track and troubleshoot CMDB Health processes.

Logging

By default, only error messages are logged to the syslog table, with the source name CmdbHealth. To enable logging of ‘info’ and ‘warning’ messages (which are typically logged
at the start and end of each processing cycle), you need to update the system property glide.cmdb.logger.use.Syslog.CMDBHealth. For information about using this property, see CMDB health system properties.

Processing status

If scheduled jobs are enabled, but data is not displaying on the CMDB dashboard, you can check the processing status in the CMDB Health Metric Status (cmdb_health_metric_status) table. Depending on the status of the inactive metric, decide how to proceed.

Initially, the state of all metrics is ‘In Progress’.

Possible final states of a sub-metric:

- Complete: All classes are processed and the number of failures is under the maximum failures threshold.
- Max Failures: The number of failures for this metric reached the maximum failures threshold. Processing has been aborted and will start over in the next run.
- Daily Time Out Pause: The processor reached the processing time limit. Processing is paused and will resume in the next run.

At the end of a processing cycle, the final state of a major metric depends on the final state of its sub-metrics. Possible final state of a major metric:

- Complete: All sub-metrics are in Complete state and score calculation is complete.
- Incomplete: Score is not calculated because one of the sub-metrics reached its maximum failure thresholds.
- Daily Time Out Pause: Timed out because one of the sub-metrics has reached its processing time limit.

Processing time

If processing of a metric times out, you can find out which class takes too long to process. This will help you find out if any validation rules are weak.

The progress of each metric is tracked in the CMDB Health Processor Status table (cmdb_health_processor_status). Status for classes that have been processed for a metric is Complete, and for classes that are yet to be processed is Draft. By looking at the update time for each class you can calculate the length of processing time for each class.

Fixing orphan records due to broken hierarchy

Orphan rules might detect an orphan CI, which you will not be able to access and delete. Or, there might be a mismatch between the list view that displays the orphan records, and the total number of records. This is due to records being deleted in the database from only one table in the CMDB hierarchy.

These CI records are not accessible via GlideRecord and need to be deleted directly from the database. Therefore, in this case, in order to delete an orphan CI from the database you will need to get help from customer support.
Orphan test results provide the details of where exactly the hierarchy is broken. For example, the message “This cmdb_ci_linux_server CI (91054fc24f22520053d6e1d18110c713) is missing record in cmdb_ci_computer table” means that a record of that sys_id needs to be deleted from the cmdb, cmdb.ci, cmdb.ci.hardware, cmdb.ci.server, and the cmdb.ci_linux_server tables (the Computer class is between the Hardware and the Server classes in the hierarchy.)

CMDB Health troubleshooting: failure threshold reached

The CMDB dashboard displays the string ‘failure threshold reached’ when the number of CIs that are failing the tests of a sub-metric, reaches the failure threshold set for the metric.

CMDB Health stops processing for this metric in the current cycle, and therefore there is no aggregated health score for the metric. Processing will be attempted again in the next cycle. Also, status in the CMDB Health Metric Status [cmdb_health_metric_status] table is set to Max Failures for this metric.

When the health score of a sub-metric cannot be evaluated, then the processing status of the respective parent metric (for example, correctness) is set to Incomplete. The CMDB dashboard displays the string Incomplete score for the respective parent metric and for the CMDB Health overall score. Also, aggregated health scores for the metric are not available for any class in the CMDB hierarchy.

To troubleshoot, do any of the following:

• Review and refine the rules defined for the sub-metric which has reached max failures. If a rule associated with the metric is too generic, resulting in large number of failures, attempt to refine it. For Example:
  • Completeness – Review the recommended fields that are causing failures and remove the ones that are not critical for the health score. For more information see Set a CI field to be recommended.
  • Correctness – For the staleness metric, depending on the cause of the failures it might be helpful to increase the value of the glide.cmdb.health.staleness CMDB Health system property.

• Reduce the number of failures by fixing CI records: If after adjusting the metric test rules the max failures for some sub metrics is still reached, then address the failures by updating CI records with the relevant missing information.

• Increase the failure threshold for the metric that is failing and check if processing for this metric completes successfully in the next cycle. Increasing the failure threshold beyond 500K might reduce overall performance.

CMDB Health troubleshooting: incomplete score

The CMDB dashboard displays the string ‘incomplete score’ for a metric when it fails to calculate the score for the metric.

‘Incomplete score’ is displayed when:

• The number of CIs that are failing the tests of one of its sub-metric, reaches the failure threshold set for the metric. In this situation, the processing status for the respective parent metric (for example, correctness) is set to ‘incomplete’ in the CMDB Health Metric Status [cmdb_health_metric_status] table. Processing for the failing metric in the current cycle stops, and therefore there are no aggregated health scores for the sub-metric, the parent parent metric, or the overall CMDB Health.

To troubleshoot, resolve the underlying cause of CIs failing the sub-metric tests. See CMDB Health troubleshooting: failure threshold reached for more information about resolving the failures of the sub-metric.

• An error is encountered while processing the sub-metric.

To troubleshoot, examine the system logs system logs to determine the cause of the error. After fixing the cause of the problem, restart processing by manually executing the respective parent metric dashboard job.

Useful related lists in CI forms

By default, the forms that display manageable configuration items (CI) - computers, printers, network gear, uninterruptible power supplies (UPS), and power distribution units (PDU) - provide a number of related lists for the form.

The following related lists are common to all forms for manageable CIs.

- **Network Adapters** - Displays all the NICs installed on a CI.
- **CI IPs** - Displays all the IP addresses on this CI:
  - Computers (workstations, laptops using various Mac and Windows operating systems)
  - Windows servers
  - Linux servers
  - AIX servers
  - Solaris servers
  - Devices discovered through SNMP.
- **DNS Names for CIs** - Displays all the DNS names on a CI.

The IP version information appears in all IP address related lists and forms.

Note: Since all paths here click into the IP Address to DNS Names list that associates an IP address with a DNS name, this part of the common flow was not added to the tree structure.

Discovery source

A table called Source (sys_object_source) stores information identifying the source of a discovery (by ServiceNow Discovery or another product), the ID of that source, and the date/time of the last scan. To view this information, configure a CI form and add the Sources related list. This table is populated automatically when the Discovery plugin is enabled.

CMDB and Extended CMDB

The Configuration Management (CMDB) application provides core functionality for the configuration management database, including modules for hardware and configuration items. The separate Extended CMDB plugin includes a collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.

The Configuration Management (CMDB) plugin is automatically active for all instances. You must activate related plugins to access the modules for specialized configuration items.

- CMDB Mainframe (com.snc.cmdb.mainframe)
- CMDB Radio Category (com.snc.cmdb.radio.category)
- CMDB Telecom Category (com.snc.cmdb.telecom.category)
- CMDB Test Equipment (com.snc.cmdb.test.equipment)

Activating the Extended CMDB plugins

Role required: admin

1. Navigate to System Definition Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   - If the plugin depends on other plugins, these plugins and their activation status are listed.
3. (Optional) Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.

Help the Help Desk

Help the Help Desk is a tool that allows users to populate the CMDB automatically with information about their Windows computer.

Help the Help Desk is a small Web application that downloads and runs locally, using a WMI login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more. Users have the option of using two types of SOAP authentication for running the Help the Help Desk script.

- **Cookie-based authentication**
- **Basic access authentication**

User roles and user names

Users must have the soap_ecc role to use Help the Help Desk from within an instance.

For users without access to an instance, you can configure Help the Help Desk to allow users to run the script without login credentials. Users with access to an instance can also use Help the Help Desk configured in this way, but only if they have the soap_ecc role.

User name cannot contain these characters: \\n
Any user name that contains the \\ characters prevents the Assigned to field on a computer from being populated.

Help the Help Desk device identification

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found. These queries attempt to match devices using three criteria in a certain order.

Updates to an existing CI require only a single match as the list is evaluated. For example, if a device’s name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the [cmdb_ci_computer] table
- MAC address in the [cmdb_ci_network_adapter] table
- Computer name in the [cmdb_ci_computer] table

Note: Discovery Identifiers are incompatible with Help the Help Desk queries.
Script include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Discovery vs. Help the Help Desk

Help the Help Desk is a standard feature available through the self-service Help the Help Desk application.

It gathers information, much as Discovery does, about a single Windows computer by running a script on that computer. Discovery does many things that Help the Help Desk cannot do.

Table 18: Comparison of Discovery vs. Help the Help Desk

<table>
<thead>
<tr>
<th>Capability</th>
<th>Discovery</th>
<th>Help the Help Desk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic discovery by schedule</td>

<tr>
<td>Automatic discovery of relationships between processes running on servers</td>
<td>✓</td>
<td></td>
</tr>
</tbody>
</table>

*Returns information about Windows server machines when Discovery is installed.

Configure SOAP authentication

By default, the ServiceNow system requires SOAP authentication. This affects the way in which your browser is configured for Help the Help Desk.

Role required: admin

1. Navigate to System Properties Web Services.
2. Verify the system property for Require basic authorization for incoming SOAP requests glide.basicauth.required.soap is enabled.
3. Click Save.

Note:

If you receive the error, There was a problem retrieving the XML data(0): Unknown, an authentication issue is preventing the script from sending information to your ServiceNow instance. Verify the user meets the requirements for Cookie-based authentication or Basic access authentication.

Cookie-based authentication

Cookie-based authentication uses cookies generated by Windows Internet Explorer for SOAP authentication on the instance.

This type of authentication can be used to run the Help the Help Desk script at the time it is downloaded or after it has been saved to the local drive. When the script is downloaded, Internet Explorer generates a cookie using the user’s login credentials, and then shares this cookie with the script. When a user attempts to run the script, the instance checks first for this cookie. If the cookie has been created, the script can authenticate on the instance through SOAP.
The following setup requirements are imposed on .hta file downloads by Microsoft.

- You must use Internet Explorer and choose to run the script while you’re logged in to your instance. If you choose to use a different browser and download the script file to run at a later time, the script will not work properly unless you have an active session on your instance with Internet Explorer.
- Disable Protected Mode and User Account Control (UAC). Protected Mode is available in Internet Explorer 7 or later in Windows Vista. UAC is a feature of Windows Vista and Windows 7.
- This feature requires that your logged in user session be persisted to the Help the Help Desk script. For this to occur, the Remember me check box in the login screen must be enabled and selected (the...
default behavior). This option enables the system to write back an HTTP cookie to your browser to be persisted across sessions.

Basic access authentication

An alternative to cookie-based authentication for the Help the Help Desk script is basic access authentication, which employs two properties to configure the script with credentials.

When a user logs in with the proper credentials, that user accesses the instance in the soap_ecc role, which grants access to the ECC queue but limits the user’s access to other features. The administrator then configures the system properties with the user name and password for the soap_ecc user.

The values from these properties are automatically saved to the script file helpthehelpdesk.js. When this user runs the Help the Help Desk script, the instance checks for a cookie. If no cookie is found, the instance checks for the login credentials provided by the system properties, and authenticates the script automatically.

Set up basic access authentication for the Help the Help Desk script

You can set up basic access authentication for the Help the Help Desk script.

Role required: admin

1. Create a new user with the following values.

<table>
<thead>
<tr>
<th>User ID</th>
<th>Create an easily recognizable user name such as SOAPAUTH or SOAPONLY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>SOAP</td>
</tr>
<tr>
<td>Last name</td>
<td>Authentication</td>
</tr>
<tr>
<td>Password</td>
<td>Any password</td>
</tr>
</tbody>
</table>

2. Right-click the header bar and select Save. The record is saved, and the Related Lists appear.
3. In the Roles Related List, click Edit.
4. In the slushbucket, move the soap_ecc role from the Collection list to the Roles list, and then click Save.
5. Navigate to System Definition Help the Help Desk.
6. Add the user name and password you created to the appropriate properties, and then click Save. The password is encoded when saved.

The login credentials from these properties are saved to the helpthehelpdesk.js script. When the Help the Help Desk script is run by a user logged in with these credentials (in the soap_ecc role), the script is able to authenticate automatically on the instance.

Help the Help Desk login script

The Help the Help Desk script enables organizations to proactively scan their network to discover all Windows based hardware and the software packages installed on those devices.

This WMI-based script is included in the core ServiceNow platform functionality. This script also can be set up to run as a Windows login script and used to keep the CMDB up to date. The script is named helpthehelpdesk.js and can be downloaded from each customer’s local instance.

Install and use the login script

The login script is installed on the instance and can be downloaded directly from a module.
Role required: admin

The same script is used to perform the Help the Help Desk scan, which gathers information about a user’s Windows computer and updates the CMDB.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to System DefinitionHelp the Help Desk Login Script.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: %SystemRoot%\sysvol\sysvol\(<domain DNS name>)\scripts where %SystemRoot% is usually c:\winnt or c:\WINDOWS and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com. This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct. The name of the instance is added automatically. It should look something like this:

```javascript
var server = "https://abctech.service-now.com/";
```

7. Ensure that basic authorization for SOAP requests is enabled in your instance, and a SOAP user is defined.
   This allows the script to connect to your instance. The entry should look something like this:

```javascript
var httpUsername = "user_on_your_instance";
var httpPassword = "user_s_password";
```

8. Create a Logon.bat script to run helpthehelpdesk.js as follows.

```bash
@echo off
cscript %0\..\helpthehelpdesk.js
EXIT
```

9. Add Logon.bat to the Logon script field on the Profile tab of the user properties dialog in the Active Directory Users and Computers MMC corresponds to the scriptPath attribute of the user object. Logon scripts can also be configured in Group Policy. However, Group Policy only applies to clients with Windows 2000 or above. The setting in Group Policy is User Configuration, Windows Settings, Scripts (Logon/Logoff), Logon. Copy the file you want for the Logon script to the Windows clipboard.

10. Open the Logon setting in the Group Policy editor.
11. Click the Show Files button.
12. Paste the desired file in the dialog.
You can select the file and edit it in this dialog as well. This is easier than navigating in Windows Explorer to the folder where Group Policy Logon scripts are saved. However, if you do have to navigate to the folder, the path on the domain controller is:

%SystemRoot%\sysvol\sysvol\<domain DNS name>\<policy GUID>\user\scripts\logon

Again, %SystemRoot% is usually c:\winnt and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com.

<policy GUID> is a hexadecimal string representing the GUID (unique identifier) of the specific Group Policy Object (GPO). Group Policies are assigned to a domain, site, or organizational unit in Active Directory.

The logon script setting applies to all users in the domain, site, or organizational unit to which the GPO applies. You will notice that you assign a logon script to all users in the container at once, rather than having to assign the scriptPath attribute for each user. This makes it much easier to assign logon scripts to many users. However, since the same Group Policy applies to all users in the domain, site, or organizational unit, you must code the logon script to accommodate all users.

Encode the Help the Help Desk password

You can use the Help the Help Desk properties to encode the password with simple base64 encoding.

Role required: admin

Configure the user name and encode the password in the properties before downloading the script. This adds the encoded password directly to the script without any further configuration.

1. Navigate to System DefinitionHelp the Help Desk.
2. Enter a user name and password into the properties for SOAP authentication.
3. Click Save.

The password is encoded immediately.

4. Navigate to System DefinitionHelp the Help Desk Login Script
5. Download the script.
The script downloads with the encoded password in place. If you download the script before encoding the password in the properties form, you must add the variable and encoded password manually.

Run the Help the Help Desk script
You can run the Help the Help Desk script manually.
You also can configure Help the Help Desk to run automatically when users log into their computer. For more details, see Help the Help Desk login script.

1. On your instance, navigate to Self Service Help the Help Desk.
2. Click Start the Scan to Help the Help Desk.
   You are prompted to run or save the discovery.hta script.
3. Run or save the discovery.hta script.
   • If your browser is Windows Internet Explorer, run the script.
   • If you are using any other browser, click Save and save the script to the local machine. To execute the saved script, double-click the file.

   The script runs a series of WMI queries to gather information about the Windows machine. When it is finished, the data is sent back to your instance and is used to populate the configuration database (CMDB).

Access Help the Help Desk status
Help the Help Desk displays the status of all scans in daily records. Drill down into a record for details on how the CMDB was updated within the last 24 hours from scans performed on the instance.

Role required: admin

1. Navigate to System DefinitionHelp the Help Desk Status.
   A new status record is created each day and displays the number of scans completed (devices scanned). The Description field shows Help the help desk as the source of the scan.
2. To view the details of individual scans, open a scan record.

3. In the scan record, select the Devices tab to view all the devices scanned by Help the Help Desk that day.
   
   Each CI displays the device class and the activity completed: Created CI or Updated CI. By default, Help the Help Desk cannot discriminate class between servers and workstations and classifies each CI as a Computer. However, if Discovery is activated on the instance, Help the Help Desk can classify CIs as either Windows servers or computers.

4. Select the ECC Queue tab to examine the data payload returned from each scan.
If Discovery is active on the instance, the Help the Help Desk status appears in the Discovery Status record list. These scan records are described as Help the help desk in the list to differentiate them from regular discoveries run from a schedule or a UI action. Open the status record to access the forms described in this page.

<table>
<thead>
<tr>
<th>Number</th>

</tbody>
</table>

**Determine values for the Assigned to field**

This page explains how to set properties to determine which value appears in the Assigned to field when the script is run.

Role required: admin

Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

- Navigate to **System Definition Help the Help Desk**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.wmi.assigned_to_always_overwrite</td>
<td>If the Help the Help Desk script is run on the same computer by different users, the platform overwrites the user name in the Assigned to field each time the script is run. To prevent this, set the For Help the Help Desk script, if the property is “yes”, the “assigned_to” field of the CI is always overwritten; otherwise the field is not overwritten unless it is empty (glide.wmi.assigned_to_always_overwrite) property to false (clear the check box).</td>
</tr>
<tr>
<td>glide.discovery.assigned_user_match_field</td>
<td>Help the Help Desk attempts to match a Windows user name it finds with the the user_name field of the User (sys_user) table. However, this might not be desirable if the user_name field from the User (sys_user) table contains formatting that is different from that found in Windows. The For Discovery and Help the Help Desk, the following field in the sys_user table is used to associate a computer CI with a user (glide.discovery.assigned_user_match_field) property enables you to select an alternative field for matching. For example, you can create a field called u_username, and then populate it with a user ID that can be matched against the Windows user name. In this case, replace the default value in the property with u_username.</td>
</tr>
</tbody>
</table>

**View scan results**

You can view the results of Help the Help Desk scans on an instance.
Role required: admin

These records provide access to logs, CI records, and the **ECC queue** for all scans conducted each day. Help the Help Desk status reports are also accessible from the **Discovery status** list.

1. Navigate to System Definition Help the Help Desk Status.
2. Open the daily **status record**.

Run the script with browsers other than Internet Explorer

You can run the discovery.hta script with browsers other than Internet Explorer.

Browsers other than IE cannot handle files with the .hta extension. Browsers like Firefox, Safari, and Opera prompt users to download the script file, which you can then double-click to run.

However, in Windows XP (including Vista, Windows 2003 Server, and later), files downloaded from the Internet are marked with a security restriction that interferes with running the script. The typical error message introduced by this security restriction looks like this:

```plaintext
eccEvent(): Access Denied
```

To remove the security lock on the downloaded file, complete the following steps.

1. Right-click on the downloaded file and select Properties.
   The following message is displayed on the bottom of the form:
   ```plaintext
   This file came from another computer and may be blocked to protect this computer.
   ```
2. Click Unblock to remove the security restriction.
   The script will run if SOAP authentication is disabled.

Detect software on 64-bit systems

You can detect all system software successfully on a 64-bit machine.

A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

- To detect all system software, run the Help the Help Desk script from a 64-bit browser.

Allow users without a ServiceNow instance login to run the script

You can configure the Help the Help Desk script to run for users without prompting for a user name and password.

Role required: admin

This setup enables users who do not have access privileges to an instance to run the script on their Windows machines without having to provide a user name and password. The script can be configured to login in automatically as a SOAP user with the soap_ecc role.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to System Definition Help the Help Desk Login Script.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: `%SystemRoot%\sysvol\sysvol\<domain DNS name>\scripts` where `%SystemRoot%` is usually `c:\winnt` or `c:\WINDOWS` and `<domain DNS name>` is the DNS name of the domain, similar to MyDomain.com.
   This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct. The name of the instance is added automatically. It should look something like this: var server = "https://abctech.service-now.com/">

```javascript
/* ******************* Required Variables *******************
 * The following section should be modified if the information is not correct.
 *  *******************************************************

// The variable should point to your instance URL, such as http://demo.service-now.com
var server = "https://abctech.service-now.com";

// If SOAP authentication is turned on on the instance. The http authentication should be provided here
var httpUsername = "";
var httpPassword = "";

/* ******************* Optional Variables *******************
 * The following section can be modified for other purposes.
 *  *******************************************************
```

7. Ensure that basic authorization for SOAP requests is enabled in your instance and a SOAP user is defined. This allows the script to connect to your instance. The entry should look something like this:

```javascript
var httpUsername = "user_on_your_instance";
var httpPassword = "user\'s_password";
```

8. Make the script file available to all users.

Unable to parse SOAP document error

The error message Error: Unable to parse SOAP document means that the Help the Help Desk script was unable to connect to the instance to relay the information that was discovered.

Enterprise CMDB

The Enterprise Configuration Management Database (ECMDB) is targeted toward businesses that want to monitor, manage, measure, track, alert on change, and generally understand business systems that consist of a large number of components, business, and support personnel.

For example, a bond trading service may have multiple application, and web servers, several databases, Linux, UNIX, and Windows servers. There will be security products, network storage, disaster recovery procedures and hardware, etc. that are necessary for the service to operate properly.

The ECMDB makes it easy to either manually enter the relationships or have them populated automatically by discovery tools. In addition to the hardware, software, network, database, and storage areas, it is beneficial to know which individuals or groups are responsible for the service from both a business perspective as well as an IT perspective. Who are the line of business users and managers? Who starts and stops the application or its components? Who monitors the log files? Who is in charge of backup and restore, business continuity, and disaster recovery?

Enterprise CMDB is available with the Configuration Management (CMDB Enterprise Edition) (com.snc.cmdb.enterprise) plugin, which is active in the base system.
CMDB relationships

The ECMDB lets you easily track all relationships by relationship type.
The Enterprise CMDB extends the capabilities of the ServiceNow platform CMDB in the following areas.

Extended configuration item types

- Clusters
- Database Instances (Oracle, MySQL, MSFT SQL Server)
- File Systems (Direct and network attached)
- Linux Servers
- Solaris Servers
- AIX Servers

Extended relationships

Accurate description of relationships between items, and between items and people or groups, is important to understand the fabric of a business service. ECMDB provides many relationship types out of the box, but it is easy to extend the number of relationship types. Example relationship types include the following.

- Connects to
- Depends on / Provides Service to
- Powered by / Powers
- Protected by / Protects
- Disaster Recovery Provided by / Provides Disaster Recovery for

Visualization

The system can show relationships as a hierarchy using a standard treeview, flattened, or graphically, all in a simple web interface.

Auditing

Auditing of changes to configuration items is turned on by default.

Federation

Federation of third party discovery and configuration data is supported through standard synchronization offerings (SMS, LAN Desk, others) and through the CMDB Discovery [cmdb_discovery] table.

Configuration item modeling (product models)

Model driven configuration management allows the definition of CI models up front that can be associated to product maintenance lifecycles, cost centers, and support organizations, as well as provides a means for capacity and inventory planning. By defining models for CIs (which have a many to one relationship to the model), you can dynamically group actual discovered or imported CIs into
logical, operational, and financial models. This facilitates an organized approach to managing your assets (CIs) in their respective domains.

Enterprise Configuration Management Database (ECMDB) action icons

Any of the following icons may appear in the ECMDB lists of related items.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</table>

The system looks 5 calendar days in the past and 7 calendar days in the future when looking at recent outages and changes.

Business service tables

In the CMDB, the Business Service table (cmdb_ci_service) stores information about business services. A business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account. A business service management map graphically displays the
configuration items (CI) that support a business service and the relationships between the configuration items.

The Business Service table (cmdb_ci_service) stores the business services in the CMDB.

Table 19: The Business Service table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Business criticality | The importance of this service to the business. This field can be used to determine disaster recovery strategies for this service. Default options are:  
• 1 - most critical  
• 2 - somewhat critical  
• 3 - less critical  
• 4 - not critical |
| SLA                 | A reference to the Agreement (sla) table.  
| Service classification | Designates the type of the service.  
• Business Service (For more information, see Business services)  
• Technical Service (For more information, see Create a technical service)  
• Service Offering (For more information, see Service offerings)  
• Shared Service (For more information, see IT shared services)  
• Application Service (To represent a service that is classified as a business application)  
• Billable Service (To represents a service that is billed, or that is cost managed) |
| Used for            | Designates how this service is used. Default options are:  
• Production  
• Staging  
• QA  
• Test  
• Development  
• Demonstration  
• Training  
• Disaster Recovery |
| Users supported     | The users that this service supports.  
A reference to the Group (sys_users_group) table. |
| Version             | Use this field for your own versioning processes. |

The Service Configuration Item Association table

The Service Configuration Item Association table (svc_ci_assoc) binds a business service and a configuration item (CI) to track which CIs are part of each business service.
Table 20: The Service Configuration Item Association table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Id</td>
<td>A reference to the configuration item (cmdb_ci) table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the business service (cmdb_ci_service) table.</td>
</tr>
</tbody>
</table>

The Service Relationship Association table

The Service Relationship Association table (svc_rel_assoc) binds a business service and a relationship to track which relationships are part of a business service.

Table 21: The Service Relationship Association table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relation Id</td>
<td>A reference to the CI Relationship (cmdb_rel_ci) table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the Business Service (cmdb_ci_service) table.</td>
</tr>
</tbody>
</table>

Table form views

When you view a table definition form, you can open the context menu, and select a form view in which to display the table. The default view for a table is the Default view. For any class that is an extension of the CMDB table, you can select the CI Definition view which provides additional access to related tables and information.

The CI Definition form view is a centralized location from which you can configure and view a table. In addition to the information that the default view displays, the CI Definition form view provides the following controls,

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon tab</td>
<td>View and create new NG-BSM icons for CI types</td>
</tr>
<tr>
<td>CI Identifier tab</td>
<td>View and create new CI identifiers</td>
</tr>
<tr>
<td>Reconciliation Definitions tab</td>
<td>View and create new data source definitions</td>
</tr>
<tr>
<td>Inclusion related link</td>
<td>Links to the Service Rules Metadata Editor</td>
</tr>
</tbody>
</table>

To access these additional controls on the CI Definition form view, you need to first create a new table that is derived from the CMDB table, and then view it using the CI Definition form.

Dependency Views

Dependency Views graphically displays an infrastructure view for a configuration item and the business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to the CI’s related alerts, incidents, problems, changes, and business services.
What’s new

- Dependency Views release notes

Administer

- Create or modify Dependency Views map indicators
- Create or modify map icons
- Create a predefined filter
- Create or modify Map Related Items
- Create or modify Dependency Views menu actions
- Create or edit a dependency type

Use

- Dependency Views map
- Dependency Views map menus and controls
- Access Dependency Views maps
- Change the layout of Dependency Views map
- Filter the view of a Dependency Views map
- Perform actions on nodes in a Dependency Views map
- Supported browsers for Dependency Views

Develop

- Developer training
- Developer documentation
- Properties installed with Dependency Views
- Tables installed with Dependency Views

Troubleshoot and get help

- ServiceNow Community
- Search the HI knowledge base for known error articles
- Contact ServiceNow Support

Components installed with Dependency Views

Dependency Views plugin adds tables and system properties.

Tables installed with Dependency Views

Dependency Views adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>

Properties installed with Dependency Views

Dependency Views adds the following properties.

Note: To open the System Property (sys_properties) table, enter sys_properties.list in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.bsm.max_nodes    | Maximum number of CI’s to display on a map at once  
Maximum number of CI’s to display on a map at once. The maximum number of nodes to retrieve from the database for a CI. If more nodes exist in the database, they are not displayed in the map.  
• Type: Integer  
• Default value: 1000  
• Location: Dependency Views Map Properties |
| glide.bsm.too_many_children | Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping.  
Nodes are collapsed for the map to meet this limit.  
• Type: Integer, valid values 1 or greater  
• Default value: 10  
• Location: Dependency Views Map Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.bsm.show_virtual_node_children | Show children of virtual groups  
Display the continuation of the map underneath virtual group. Virtual links are used to connect virtual groups to their child nodes.  
- Type: Yes | No  
- Default value: No  
- Location: Dependency Views Map Properties |
| glide.bsm.max_levels | Maximum level depth from the root CI that is initially displayed in Dependency Views maps.  
Level depth is the graph distance between the root CI and a node.  
- Type: Integer, valid values 1-49  
- Default value: 3  
- Location: Dependency Views Map Properties |
| glide.ngbsm.filters_remove_filtered_items | Filtered out items should be removed from the graph along with any disjoint children  
Filtered out items should be removed from the graph along with any disjoint children.  
- Type: Yes | No  
- Default value: No  
- Location: Dependency Views Map Properties |
| glide.ngbsm.filters_run_layout_automatically | When filters are changed the graph will recalculate the layout using the currently selected layout algorithm  
When filters are changed the graph will recalculate the layout using the currently selected layout algorithm.

  - Location: Dependency Views Map Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.bsm.color.affect_neighbors | Color of an affected neighbor node’s label Used for backwards compatibility support.  
  • Type: Color  
  • Default value: #efeb2 (Beige)  
  • Other possible values:  
    - A valid HTML4 color name. The color names are case-insensitive.  
      The extended color set (X11 color keywords) typically work, as well.  
    - An RGB hex code, such as #003366  
    - An RGB decimal code, such as rgb(0,51,102)  
  • Location: Dependency Views Map Properties |
| glide.bsm.refresh_interval | This property has no effect on the map, and remains for backward compatibility purposes only. |
| glide.ngbsm.show_class_labels | When available, the map should display the class labels for each CI  
When available, the map should display the class labels for each CI  
  • Type: Yes | No  
  • Default value: Yes  
  • Other possible values:  
    - Value 1: No  
  • Location: Dependency Views Map Properties |

Dependency Views map

ServiceNow® Dependency Views maps graphically display configuration items that support business services and the relationships between the configuration items.

A ServiceNow business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the icon on a CI record or on a task record that identifies a CI, the map opens.
Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

Note: CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps.

The Dependency Views module is active in all instances, and includes demo data.

Figure 12: Dependency Views sample map

When you click the map icon

[ ]
on a CI record or on a task record that identify a CI, a map opens.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the Saved Filters module.

Dependency Views map menus and controls

Dependency Views maps contain the following menus and controls.

Map options

The following options are available across the top of the map.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Next to the menu icon is the name of the current root node (CI) of the map.

Enter the name of a CI or a business service to load into the map. Alternatively, you can start typing to have the auto-complete feature present a list of CIs and businesses service that match your partial value.

Display the map in vertical view.

Display the map in horizontal view.

Display the map in radial view.

Centers the elements around the parent CI, regardless of upstream or downstream relationships.

Groups the elements according to their CI type.

Displays related lists such as Problems, Changes and Related Business Services that are associated with the selected CI.

• Click on a business service, to highlight the CIs that are associated with that business service.
• Click Related Business Services, then double-click a business service to display the business service map in the Event Management dashboard.

If the Event Management plugin is active, then events and alerts are also displayed.

Set filters for the map.

Use the navigation tools to increase or decrease the view of the map, rearrange the icons on the map, and move the map on the page.

• Use the plus sign (+) to increase magnification of the map.
• Use the minus sign (-) to decrease magnification of the map.
• Click the center dot to center the map on the page.
• Use the direction arrows to move the page in that direction.
• Use the selection tool under the navigation tool to toggle between moving the entire map or moving one CI on the map.

Map menu

The following options are available if you right-click the map background.

Redraws the map with the current layout option.

Resizes the map to fit all the nodes in the map window.
<table>
<thead>
<tr>
<th>Node menu</th>
</tr>
</thead>
</table>
The following options are available if you right-click a node.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record’s Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a clustered node, or virtual groups (virtual nodes that appear when glide.bsm.too_many_children is reached). This option appears only if the node is a cluster node or a virtual group node. If Load More was previously used, then Expand reverts the results of the Load More operation. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
<tr>
<td>Collapse</td>
<td>Collapses all CIs and components within a cluster node back to a single node. Also, collapses a virtual group that has been expanded. This option only appears if the node has been expanded using the Expand menu item. If Load More was previously used, then Expand reverts the results of the Load More operation.</td>
</tr>
<tr>
<td>Run Layout From Here</td>
<td>This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.</td>
</tr>
</tbody>
</table>
Load More

Starting at the selected icon, loads the next level of the map, past the setting of Max Levels.
Virtual grouping is not applied at the newly loaded level even if the criteria for virtual grouping is met.
The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.

Relationship menu

The following options are available if you right-click a relationship link.

<table>
<thead>
<tr>
<th>View Relationship Form</th>
<th>Opens the CI Relationship form. You can modify the Parent, Type, and Child of the relationship from this form.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify Relationship</td>
<td>Searches for and selects a new relationship for this link.</td>
</tr>
<tr>
<td>Delete Relationship</td>
<td>Deletes a relationship. The relationship is deleted after prompting for confirmation.</td>
</tr>
</tbody>
</table>

Supported browsers for Dependency Views

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox with the latest ESR.
- Chrome version 25 or later (latest version recommended)
- Safari version 6 or later
- Microsoft Internet Explorer (IE), with these requirements and limitations:
  - Dependency Views requires IE version 9 or later.
  - Exporting images from a Dependency Views map using Internet Explorer as the browser is supported only for Internet Explorer version 11, and for Helsinki Patch 4 releases and later.
  - When you save a map view, Dependency Views will not make a thumbnail image. You may navigate to the saved map view using the version number.

Collapsed nodes in a Dependency Views map

Dependency Views can display clusters and child nodes alongside individual CI nodes.

Aspects of the map can differ when cluster nodes are on the map. For example the nodes can display in a collapsed format to avoid unnecessary clutter in large maps. By default, the Dependency Views collapses all node clusters in the view. Menu options for a clustered node include Collapse and Expand which allow you to control the density on the map.

A cluster is an organized set of computer CIs that work together as a single system. Each node in the cluster represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters. Clusters are CIs in the Cluster (cmdb_ci_cluster) table and can have tasks assigned to them.
A **collapsed node** collects all the children of a CI that are in the same class into a single node when the number of children in that class exceeds a configurable threshold. Collapsed nodes contain CIs but are not CIs themselves and cannot have tasks assigned to them.

**Annotation**

Icons for clusters and collapsed nodes are noted by the string “Cluster” and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.

**Virtual grouping of nodes in a Dependency Views map**

To reduce the density on a map, Dependency Views automatically groups CIs of a similar CI type from the same level.

A large number of nodes can cause a Dependency Views map to become too dense to be helpful. Therefore, if the number of nodes with a similar CI type from same level, exceeds the value of the Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping property, then those nodes are automatically grouped into a **virtual group**. A single node, the **virtual group node** is displayed to represent the virtual group, while all actual nodes in the virtual group (that are of a similar CI type), are hidden. Virtual group nodes represent CIs of a similar CI type but are not CIs by themselves and cannot have tasks assigned to them. The number of actual collapsed nodes in the virtual group is noted on the virtual group node.

By default, child nodes of a virtual group are not displayed. You can enable the Show children of virtual groups property to display child nodes underneath virtual groups.

Virtual grouping is not applied at the level underneath a virtual group even if the criteria for virtual grouping is met (the number of nodes with a similar CI type from that level exceeds the preconfigured property value). However, virtual grouping can happen at the following level if that criteria is met. This behaviour does not depend on any property settings, and you cannot change it.

Menu options for a virtual group include Expand and Collapse, which allow you to apply virtual grouping and display only the virtual group node, or to undo the virtual grouping and display all actual nodes.

**Virtual links**

A virtual node is connected to other nodes with a **virtual link**. A virtual link denotes that there such link between at least one CI in the virtual group, to another CI node on the map.

---

**Note:** Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have excluded. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Also, when using the node menu option Load More, virtual grouping is not applied at the newly loaded level even the criteria for virtual grouping is met.
Figure 13: An expanded virtual group
Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don’t want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

Access Dependency Views maps

When you access a Dependency Views map from one of the view options, the view is centered on the root CI, and displays the layout and number of levels defined in the map properties.

General role requirements:

• To access a Dependency Views map from either the navigation menu, a script API, or directly from a URL, the minimum role required is the dependency_views. Some operations that are related to icons, indicators, and menu actions require the ecmdb_admin role. Some operations that are related to properties and dependency types require the admin role.
• Dependency Views enforces ACL permissions on CIs, and visually hides them and their relationship from the map if the permission requirement is not met.

The maps that Service Mapping provides are for business services, including comprehensive maps from the perspective of business services. For more information, see Service Mapping.

The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

Navigate to Dependency Views and open one of these modules:

• View Map in New Tab: Opens the map in a new, full screen tab without the application navigator.
• View Map: Opens the map in the content pane of the current tab.
• Saved Views: Opens a view of a map that you previously saved.

Click a number in the Version column, and then click the icon.

Save or load a Dependency Views map

In the View Map module, use the menu icon to save and load Dependency Views maps.

1. Navigate to Dependency Views View Map.
2. Click the menu icon

(![](icon))

3. Select Save View, Load View, or Last View.
Delete a saved Dependency Views map view

Use the Saved Views module to delete a previously saved view.

1. Navigate to Dependency Views Saved Views.
2. Use the checkbox in the first column of the table to select the map view that you wish to delete.
3. Select Delete from the Actions on selected rows drop-down menu.

Change the layout of Dependency Views map

You can select from different layout options for your Dependency Views map.

1. Navigate to Dependency Views View Map.
2. Select one of the following layout options from the menu across the top of the view.
   - Vertical: Displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   - Horizontal: Displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   - Radial: Displays the elements in a radial pattern according to their upstream and downstream relationships.
   - Force: Centers the elements around the parent CI, regardless of upstream or downstream relationships.
   - Group: Groups the elements according to their CI type.
   - Details: Displays related alerts, incidents, problems, and business services. If Service Mapping is activated, then the list of related business services includes business services that were discovered by Service Mapping.

Click Related Business Services and then double-click a business service to display the business service map in the Event Management dashboard.

Filter the view of a Dependency Views map

You can filter a Dependency Views map to display specific types or categories of configuration items.

Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.

1. Navigate to Dependency Views View Map.
2. Click the Settings button in the map’s header bar. Click a filter strip to expand or collapse it, and to set filter items.

<table>
<thead>
<tr>
<th>Filter panel strips and options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create New Custom Settings</td>
<td>Configure desired custom settings, then enter a name and click Save.</td>
</tr>
<tr>
<td></td>
<td>Custom settings can be loaded by using the Load Saved Custom Settings option.</td>
</tr>
<tr>
<td></td>
<td>Navigate to Dependency Views Saved Settings to display all saved custom settings.</td>
</tr>
<tr>
<td>Load Saved Custom Settings</td>
<td>Apply previously saved custom settings to the current map.</td>
</tr>
<tr>
<td>Filter panel strips and options</td>

<tr>
<td>Remove Filtered Items</td>
<td>Off: Gray out filtered items on the map. On: Do not display filtered items on the map.</td>
</tr>
<tr>
<td>Run Layout Automatically</td>
<td>On: The configured layout to the map is reapplied whenever the filter is changed. Off: The map layout remains static when the filter is changed.</td>
</tr>
<tr>
<td>Fit to Screen Automatically</td>
<td>On: The map magnification will increase or decrease automatically to display all CIs on the map. Off: The map magnification remains unchanged when the map is reloaded.</td>
</tr>
</tbody>
</table>

Perform actions on nodes in a Dependency Views map

You can view various related items for the nodes in a Dependency Views map.

If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

1. Navigate to Dependency Views View Map.
2. Click the ▼ icon next to a node or right-click a node on the map, to access the following menu items:
Table 22: Node Menu

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>

</tbody>
</table>

Export a Dependency Views map

You can export a Dependency Views map to an image in PNG format.

1. Navigate to Dependency Views View Map.
2. Configure the map view as you want the image to appear. The exported image displays the current view of the map.
3. Click the menu icon.
4. Click Export Image.
5. Right-click the image and select Save Image As, Print, or any other menu option.

Note: You can not export images from a Dependency Views map using Internet Explorer as your browser.

6. Click the “X” button to close the Export Image window.

View collapsed nodes in a Dependency Views map

Cluster and virtually grouped nodes can appear in a collapsed mode to avoid unnecessary clutter in large maps.
1. To expand a collapsed node, right-click the CI and select Expand from the context menu.
2. To collapse an expanded cluster node with children, right-click the CI and select Collapse from the context menu.

Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.

Create or modify Dependency Views map indicators

Dependency Views maps uses icons to display additional information for a CI by displaying its related records such as alerts, outages, incidents and problems. These icons are called map indicator.

The default configuration includes map indicators for the following record types:
• Open incident.
• Open alert.
• Unplanned current outage.
• Planned current outage, or an open problem.
• Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the Settings menu. Also, you can create a map indicator to define additional record types, such as trouble sources for business service CIs. You can also modify an existing map indicator, for example to use a different color scheme or to alter the priority of a task.

The Affected CI’s map indicator appears for CIs in two related but not identical situations. It appears for CIs for which tasks such as change request, incident, or problem were directly created for, and for any CIs that were added in those tasks (parent tasks) as Affected CIs (The CI for which a task is directly created for, is automatically added as an affected CI in that task). The state of affected CI’s depends on the status of the respective parent task. For as long as the parent task is active, the associated affected CIs continue to be impacted by the task issue. In a Dependency Views map, the Affected CI’s indicator displays for all affected CIs for as long as the parent task is active. On a Dependency Views map, the Affected CI tooltip displays the details of the task records in which the CI was added as an affected CI. However, the Details pane does not contain an Affected CI’s tab, and no further details
about affected CIs, or the associated tasks are displayed. After the parent task is closed, the Affected CI’s indicator no longer displays for any of the tasks’ affected CIs. For information about affected CIs in Change Management, see Associate CIs to a change request.

Note: Details about affected CIs are derived from the task and the cmdb_ci tables and their extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, it affects the details that are displayed for affected CIs.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see Collapsed nodes in a Dependency Views map.

1. Navigate to Dependency Views Map Indicators.
2. Click New to create a new map indicator, or click the name of an indicator from the Table column to modify an existing map indicator.
3. Fill in the fields on the form, as appropriate.

Table 23: Map Indicator form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table represented by this map indicator.</td>
</tr>
<tr>

</tr>
<tr>
<td>Tooltip Label</td>
<td>The prefix portion of the tooltip (Tooltip Label : Tooltip info).</td>
</tr>
<tr>
<td>Tooltip Info</td>
<td>The suffix portion of the tooltip (Tooltip Label : Tooltip info).</td>
</tr>
</tbody>
</table>

4. Click Submit to enter a new map indicator. Click Update to modify an existing map indicator.

Create or modify map icons

You can upload new icons or modify existing icons to customize the icon displayed for a CI in maps in Dependency Views, Service Mapping, and Event Management.

The icons used in Dependency Views maps are listed in the Map Icons module. Records in the Map Icons list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/app.ngbsm/\image name.svg. For information about uploading images to the database, see Storing images in the database.

Role required: admin or ecmdb_admin roles are required to access the records in this table (ngbsm_icon) to upload new icons.

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class in the Class Hierarchy.
   c) In the sidebar on the right, select Icon.

2. Or, navigate to Dependency Views Map Icons, and click New to create a new map icon or click the name of an existing icon from the Label column to modify an existing icon.

3. Fill in the fields on the form, as appropriate.

   Table 24: Map Icons form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Label or the informal name of the CI table that this icon represents in the view.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name of the icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Path to the icon image using the following format: /image name.svg Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>
4. Click Submit to enter a new icon. Click Update to modify an existing icon.

You can modify a Dependency Views map indicator to use the new icon.

Create a predefined filter

Create filters to narrow down the CIs that are displayed on a Dependency Views map. You can create filters that are based on CIs’ class, CIs’ attributes, or CIs’ relationships.

Role required: ecmdb_admin

Create a predefined filter that you can then select to determine the scope of the CIs that are displayed in a Dependency Views map. Configuration type filters filter by CI class, CI filters filter by CI attributes, and relationship filters filter by relationships. Only CIs that match at least one of the configuration type filters (if any exists), and at least one of the CI filters (if any exists), and at least one of the relationship type filters (if any exists) - are displayed on the map.

Note: Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have not included. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

1. Navigate to Dependency Views Predefined Filters.
2. On the Predefined Filters page, click New.
3. Type in a Name for the filter. Click Roles, and in the Roles dialog box, select the roles that this filter will be available for.
4. Right-click on the page header, and click Save.
5. To create a configuration type filter:
   a) Click Configuration Types, and then click Edit.
   b) In the Collection slushbucket, select the classes that CIs must belong to in order to be displayed on the map, and move them to the Configuration Types List.
   c) Click Save.
6. To create a CI filter:
   a) Click CI Filters, and then click New.
   b) In the CI Filters page enter conditions to filter CIs by specific attribute values.
   c) Click Submit.
7. To create a relationship type filter:
   a) Click Relationship Type, and then click New.
   b) In the Collection slushbucket, select the relationships that CIs must have in order to be displayed on the map, and move them to the Relationship Types List.
   c) Click Save.

After creating a predefined filter, you can apply it to a map:
1. Click Settings in the map’s header bar to open Map Settings.
2. Select a filter from the Predefined Filters list.
3. Click Apply.
Set a predefined filter as default

You can set a custom predefined filter as the default predefined filter for viewing maps.

1. Create the custom predefined filter to be used as the default predefined filter.
2. On the predefined filter form, click the context menu and select Copy sys_id.
3. Navigate to User Administration User Preferences.
4. Click New and create a new user preference record using these values:
   - Name: ecmdb.ciview
   - Type: string
   - Value: paste the sys_id of the custom predefined filter
   - User: leave blank to create a system-wide setting
   - Description: description of the predefined filter
   - System: selected

5. Click Submit.

In Settings, when you select the Default option for Predefined Filters, the custom predefined filter that was set, will be applied.

Create or modify Map Related Items

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

The base system configuration includes the following tables and relates them to items in the Computer (cmdb_ci_computer) and Server (cmdb_ci_server) tables.

- Disk (cmdb_ci_disk)
- Network Adapter (cmdb_ci_network_adapter)
- Database (cmdb_ci_database)

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the Configuration Item field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.
The Dependency Views map for the *JEMPLOYEE-IBM computer shows the network adapter attached to the computer.

You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

1. Navigate to Dependency Views Map Related Items.
2. Click New to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. Fill in the fields on the form, as appropriate.
   See the Related Items form table.
4. Click Submit to enter a new map related item. Click Update to modify an existing map related item.
Table 25: Related Items form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer (cmdb_ci_computer), which includes all types of workstations and servers.</td>
</tr>
<tr>
<td>Related item</td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td>Related field</td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
</tbody>
</table>

Create or modify Dependency Views menu actions

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy.

This ensures that your instance can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

1. To create a new menu option, navigate to Dependency Views Map Menu Actions and click New. Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to Dependency Views Map Menu Actions.
3. Open the menu action you want to edit.
4. Right-click in the header and click Insert and Stay. This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the Active check box.

Table 26: Menu Action form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
</tbody>
</table>
### Condition and script parameters for menu actions

#### Condition parameters

The Condition field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Node or reference link’s data on which you performed the right-click action.</td>
</tr>
<tr>
<td>item.label</td>
<td>Label of the node.</td>
</tr>
<tr>
<td>item.ci_type</td>
<td>CI’s type (table), such as cmdb_ci_service.</td>
</tr>
<tr>
<td>Text</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>item.name</td>
<td>Name of CIs. CI’s type name or the table label, such as Business Service.</td>
</tr>
<tr>
<td>item.location</td>
<td>Location of the CI, such as New York.</td>
</tr>
<tr>
<td>item.manufacturer_name</td>
<td>Name of the CI’s manufacturer, such as Dell Inc.</td>
</tr>
<tr>
<td>item.id</td>
<td>The sys_id of the CI.</td>
</tr>
<tr>
<td>item.is_selected</td>
<td>The item that is selected in the map.</td>
</tr>
<tr>
<td>item.level</td>
<td>The current default level.</td>
</tr>
<tr>
<td>item.locationId</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
<tr>
<td>item.locationName</td>
<td>The full address of the location.</td>
</tr>
<tr>
<td>item.manufacturerId</td>
<td>The sys_id of the CI’s manufacturer.</td>
</tr>
</tbody>
</table>

Table 28: Valid Conditions for Condition Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.is_collapsed</td>
<td>The node is a collapsed node.</td>
</tr>
<tr>
<td>item.is_cluster</td>
<td>The node is a cluster node.</td>
</tr>
</tbody>
</table>

Script parameters

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators. These are some additional, useful expressions for scripts:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.id</td>
<td>The sys_id of the CI node or relationship link.</td>
</tr>
<tr>
<td>item.source</td>
<td>The sys_id of the relationship’s parent or child.</td>
</tr>
<tr>
<td>item.target</td>
<td>The sys_id of the relationship’s parent or child.</td>
</tr>
<tr>
<td>item.label</td>
<td>The name of the CI node, such as IronMail-SD-02.</td>
</tr>
<tr>
<td>item.location</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
<tr>
<td>item.location_name</td>
<td>The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.</td>
</tr>
<tr>
<td>item.manufacturer_id</td>
<td>The sys_id of the CI’s manufacturer.</td>
</tr>
</tbody>
</table>

Create or edit a dependency type

Use one of the dependency types provided, or create a custom dependency type with a script that will execute in real time to generate a custom view of a Dependency Views map for a specific CI.

Create a JavaScript to customize the map. The script must comply with JavaScript syntax guidelines and the directions in the default script template, and it can call platform APIs. Use a dependency type, for example:

- To narrow down and simplify a map, leaving out CIs that are not important for a specific task.
• To include only specific CIs that are hidden by default, such as qualifiers, end-points, and entry points.
• To display virtual relationships that are calculated, and that otherwise do not exist in the CMDB.
• As a tool to plan a new topology deployment that is based on existing resources.

The following dependency types are included in the base system:

<table>
<thead>
<tr>
<th>Dependency Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application to Network Devices</td>
<td>Returns the network devices in the network paths leading to/from the given CI.</td>
</tr>
<tr>
<td>Network Device to Applications</td>
<td>Returns the applicative CIs which are target or source of network paths containing the given network device. In addition, returns the hosts of those applicative CIs, and for an applicative CI that is an inclusion, its parent CI is returned too.</td>
</tr>
<tr>
<td>Physical Network Connections</td>
<td>Returns hosts/network devices that are physically connected to the given host or network device.</td>
</tr>
</tbody>
</table>

1. Navigate to Dependency Views Dependency Types.
2. In the Load Filter Scripts list view, select an existing dependency type, or click New.
3. Enter or modify a script, adhering to the guidelines and requirements in the script template that is provided.
4. Click Submit.

In a Dependency Views map, you can click Use Dependency Type to apply a custom script defined in a dependency type.

Compliance

Compliance is a tool set that enables administrators to certify ServiceNow data for correctness and fix any discrepancies found in the data.

Compliance offers these certification options to suit your organization’s size and requirements:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Desired State</td>
<td>Automatically compares the actual attributes and relationships of specific ServiceNow records against the desired states for those records. For example, an audit can detect a Linux database server with insufficient RAM or whose Depends on relationships with another CI is incorrect. The system then publishes any discrepancies found and automatically assigns follow-on tasks to qualified users to bring that server into compliance.</td>
</tr>
<tr>
<td>Architecture Compliance</td>
<td>Automatically compares the actual attributes of specific CIs, such as CPU count, RAM, or disk size against the expected attributes for those CIs. The system publishes any discrepancies found and automatically assigns remediation tasks to qualified users.</td>
</tr>
</tbody>
</table>
Compliance Activation

Compliance functionality is provided by the Certification Core plugin.

The Certification Core plugin which contains shared functionality required for certification audits. It consists of the following plugins, and is activated by default.

- Desired State (activated by default)
- Architecture Compliance (activate)
- Data Certification (activate)

Installed with Compliance

These components are installed with the Certification Core plugin.

Demo data is included with the Desired State and Architecture Compliance plugins.

The Certification Core plugin adds or modifies these tables.

Table 30: Compliance Certification Core tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit [cert_audit]</td>
<td>Contains all the data required to run an audit, including the users assigned to follow-on tasks and the run schedule.</td>
</tr>
<tr>
<td>Audit Result [cert_audit_result]</td>
<td>Contains the results of specific, certification audits.</td>
</tr>
<tr>
<td>Follow On Task [cert_follow_on_task]</td>
<td>Contains the tasks that were generated from an audit discrepancy.</td>
</tr>
<tr>
<td>Certification Template [cert_template]</td>
<td>Contains the definition of the desired state of the record. The template includes a filter that identifies the records to evaluate and the expected attributes and relationship values. Contains the records to certify, the expected attributes, and the expected relationship values.</td>
</tr>
<tr>
<td>Certification Condition [cert_cond]</td>
<td>Base table that defines the desired attribute or relationship conditions used in templates.</td>
</tr>
<tr>
<td>Certification Attribute Condition [cert_attr_cond]</td>
<td>Contains the conditions that define the desired CI attribute values. This table extends the Certification Condition [cert_cond] base table.</td>

<tr>
<td>Certification CI Relationship Condition [cert_ci_rel_cond]</td>
<td>Contains the CI to CI relationship conditions. This table extends the Certification Condition [cert_cond] base table.</td>
</tr>
<tr>
<td>Certification User Relationship Condition [cert_user_rel_cond]</td>
<td>Contains the CI to user relationship conditions. This table extends the Certification Condition [cert_cond] base table.</td>
</tr>
<tr>
<td>Certification Group Relationship Condition [cert_group_rel_cond]</td>
<td>Contains the CI to group relationship conditions. This table extends the Certification Condition [cert_cond] base table.</td>
</tr>
<tr>
<td>Certification Related List Condition [cert_related_list_cond]</td>
<td>Contains the related list conditions. This table extends the Certification Condition [cert_cond] base table.</td>
</tr>
</tbody>
</table>
User roles

The certification role is automatically assigned to all users with the itil role when the Certification Core plugin is activated or when compliance applications are upgraded. Certification core installs two business rules, both called Add Certification Role To Manager, that perform similar tasks on different tables. One rule checks for a manager specified on the User (sys_user) table, and the other checks for the certification role on the User Role (sys_user_has_role) table. When both a manager and the certification role are specified for a user, the system automatically grants the certification role to the manager. This functionality ensures that a certification task can be escalated successfully to the next level. The system grants this automatic role to the user’s immediate manager only and not to others up the management chain.

Note: When a manager has only the certification role and no other role, the manager is considered a Requester and is not counted as a subscribed user (Fulfiller).

Table 31: Compliance Certification Core user roles

<td>Certification Template (cert_template)</td>
<td>Creates a new version when the template changes in any meaningful way.</td>
</tr>
</tbody>
</table>
Compliance Templates and Audits

The Templates and Audits modules on the top level of the Compliance menu enable a certification_admin user to create, edit, and delete all template and audit types.

You can use Compliance Templates and Audits to evaluate records for any table in the ServiceNow system, not just those extending the Configuration Item (cmdb_ci) table. Compliance audits certify record attributes only. Compliance templates can be used in Control Test Definitions in Governance Risk and Compliance.

Compliance Overview module

The Compliance Overview module is a type of homepage.

The Compliance Overview module summarizes the following:

- Current audit states
- Outstanding certification tasks
- Compliance discrepancies
- Upcoming audits
- General state of compliance audits for Data Certification, Desired State, Architectural Compliance, and Scripted audits

To use the Compliance Overview:

1. Navigate to ComplianceOverview.
2. Click elements within the reports to obtain more information.
   For example, click the Disk space (GB) bar in the Compliance Discrepancies chart to open a list of audit results that are filtered by disk space attributes.
Compliance Overview module roles

Only users with certain roles can access the Overview module.

The different levels of access are:

Table 36: Access levels per role

<table>
<thead>
<tr>

Architecture Compliance

Architecture Compliance performs scheduled or on-demand audits of configuration management database (CMDB) data to determine which configuration items (CI) match the expected attributes.

The compliance process checks servers to ensure that their resources, such as CPU speed or memory, comply with standards set by your organization. Audit reports show any discrepancies in the attributes of the target CIs, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

Activate Architecture Compliance

Administrators can activate the Architecture Compliance plugin to access the application.

Activating this plugin automatically activates these additional plugins.

- Certification Core plugin contains shared functionality required for certification audits.
- Version Management plugin manages certification filter and template versions.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.
Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Architecture Compliance

Architecture Compliance manages scheduled or on-demand reviews of CMDB data to determine which configuration items (CI) match expected attributes. The compliance audits check servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards.

The administrator responsible for compliance checking creates template definitions of expected attributes and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those that fail. ServiceNow automatically generates and assigns follow-on tasks to track the process of getting the CIs back into compliance. Architecture Compliance can be activated by users with the admin role.

Architecture Compliance Process

Perform these tasks in this order to certify configuration items with Architecture Compliance.

1. Create a filter.

   Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for compliance checking. Architecture compliance only supports filters on the Configuration Item (cmdb_ci) table and all tables that extend it.

2. Create a template.

   Create template conditions using values from reference fields in a related list or conditions that define the expected physical attributes of each CI in an audit. The template uses a filter to determine which configuration items the system should examine based on these conditions.

3. Create and run an audit.

   Create and schedule an audit or run an audit on demand. The audit generates a set of results based on the conditions in the template you specify.

4. View audit results.

   View the audit results which display any discrepancies between the expected state, as expressed by the template conditions, and the actual state of the target configuration items.

5. Correct discrepancies.

   Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

Architecture Compliance Overview module

The Architecture Compliance Overview module displays various architecture compliance reports. The Overview module is a type of homepage.

Only compliance users with certain roles can access the Overview module. The different levels of access are:
Table 37: Access levels per role

</tbody>
</table>
Architecture Compliance roles

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base ServiceNow system, certification_admin users have limited system rights and might not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator might need roles that grant access to these tables:

- Company (core_company)
- Cost Center (cmn_cost_center)
- Schedule (cmn_schedule)

Desired State

Desired State performs scheduled or on-demand audits of CMDB data to determine which records match the expected attributes, CI relationships, and relationships to other records in the system.

For example, desired state can determine if a computer has a license for a particular software program. The compliance process checks configuration items (CI) to ensure that their attributes and relationships comply with standards set by your organization. Audit results show any discrepancies in a record’s desired state, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

Desired State process

The Desired State application conducts scheduled or on-demand audits of CMDB data to determine which configuration items (CI) match a desired state. The desired state certification process can mean checking servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards, or ensuring that all critical business services have a manager, support group, and approval group assigned.

The administrator responsible for certification creates definitions of desired states and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those that fail. The ServiceNow system automatically generates follow-on tasks to track the process of adjusting the CIs to the desired state.

Desired state differs substantially from data certification. Data certification is a manual process to ensure that your data matches reality. Desired state examines the same data and determines if the configuration of each item is in the desired and approved state.

1. Create a certification filter: Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for certification. You can create filters on the Configuration Item (cmdb_ci) table and all tables that extend it.

2. Create a template: Create a template with conditions that define the desired state of the physical attributes, related records, and relationships for a CI. The certification filter you select for the template determines which configuration items the system should examine.

3. Create and run an audit: Create an audit using the template. Set the audit to run on a schedule or on demand. The audit generates a set of results based on the conditions from the template you specify. Determine usage of follow-on tasks:
   - Determine if the audit will create follow-on tasks and whom they should be assigned to.
• Determine if the same follow-on task should be used for the same audit failure across multiple runs. The system attribute glide.allow.new.cert_follow_on_task is set to true by default, allowing for new follow-on tasks to be created for the same failure, at each audit run.

4. View audit results: View the audit results which display any discrepancies between the desired state, as specified by the template, and the actual state of the target configuration items.

5. Correct discrepancies: Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

Desired State roles

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base ServiceNow ITSA Suite, certification_admin users have limited system rights and might not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator might need roles that grant access to these tables:

- Company (core_company)
- Cost Center (cmn_cost_center)
- Schedule (cmn_schedule)

Desired State Overview module

The Desired State Overview module displays various desired state reports. The Overview module is a type of homepage.

The Desired State Overview module is a type of homepage.

Use the Desired State Overview module

The Desired State Overview module displays various desired state reports.

1. Navigate to Compliance Desired State Overview.
2. Move or add reports where needed.
3. Click elements within the reports to obtain more information.

The Desired State Overview Module in the base system contains these reports:

- Upcoming Desired State Audits: All scheduled audits.
- Outstanding Desired State Tasks: All follow-on tasks in the Pending, Open, or Work in Progress state.
- Hierarchical Task Roll Up: All follow-on tasks grouped by Assigned to user.
- Desired State Discrepancies: All audit discrepancies for attributes and relationships.
- 30/60/90 Day Task Aging: All outstanding follow-on tasks grouped by age in 30 day increments.
Desired State Overview module roles

Only compliance users with certain roles can access the Overview module.

The different levels of access are:

Table 39: Access levels per role

<table>
<thead>
<tr>
<th>Role</th>

|                  | • Edit (can edit reports)                    |

Access levels

The different levels of access are:

- View: can view the overview page and refresh reports.
- Customize: can refresh, add, delete, and rearrange reports.
- Edit: can edit reports.

Desired State reporting

The Desired State application includes reports to assess your audit results.

These reports are available to all users whose role gives them access to the Reporting application. Users with the admin role can share these reports with specific users of groups or change the display options.

Navigate to Reports View / Run. In the Reports search field, enter all or part of the report name. You may also scroll to the designated category and select one of the reports.

In addition to these reports, you can also generate other reports.
Figure 18: Desired State threshold report

    (cert_follow_on_task)                                                                                                          | Follow On Task  |
Certification audits

A certification audit compares the actual attributes of certain ServiceNow records, selected by a filter, against the expected attributes, relationships, and related record values defined by template conditions or a script.

You can configure the audit to create and assign follow-on tasks to remediate any discrepancies the audit finds. Audit records use a standard ServiceNow scheduler to determine when to run. After an audit runs, the results and follow-on tasks appear in related lists in the audit record.

Users with the certification_admin role can create, update, delete, and run audits. Users with the certification role can view audits, audit results, and follow-on tasks.

Create an audit

Compliance offers two types of audits: one uses templates to define conditions and the other uses a script.

1. Ensure that an appropriate template record was created for this audit.
   
   **Note:** Conditions in the template define the values to audit.

2. Use the CI Class Manager:
   
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Audit in the Compliance group.

3. Or, navigate to one of these modules:
   
   - Compliance Audits
   - Compliance Architecture Compliance Audits
   - Compliance Desired State Audits
   - Compliance Scripted Audits Audits

4. Click New.
   
   The system opens a new record for the audit type associated with the navigation path you selected. The Audit type field is read-only.

5. Complete the form using the fields described in the table.

6. Right-click the header bar and select Save.
   
   The Audit Results and Follow On Tasks related lists appear on the form.

7. To run the audit immediately, click Run Audit.
   
   When an audit runs, ServiceNow updates the date and time in the Last run date field and populates the related lists.
8. View the records that passed and the discrepancies found by the audit in the Audit Results related list.

You can open template records and any follow-on tasks directly from this related list. Notice that the value in the Task description field now appears as the Short description in the follow-on tasks.

Note: You cannot delete audit records that have audit results or audit results that have follow-on tasks. ServiceNow disables the Delete option in records and lists where these dependent records exist.

Table 41: Creating Audits

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for this audit.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter to use when the audit type is Scripted. This field is required for scripted audits, but is hidden for all other audit types.</td>
</tr>
<tr>
<td>Template</td>
<td>(Required) Template to use when this audit runs. The list of available templates is filtered by audit type, and only the active versions of templates are available for selection. For example, when you create an audit from Desired State, only templates of the Desired State audit type are available for selection. For the Desired State and Architecture Compliance audit types, only templates for tables that extend the Configuration Item (cmdb_ci) table are available. This field is hidden when the audit type is Scripted.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) Table for the template.</td>
</tr>
<tr>
<td>Create tasks</td>
<td>Option to create follow-on tasks for correcting discrepancies (selected). In a scripted audit, you can create the logic for either task state by using true if tasks should be created or false if tasks should not be created. By default, this check box is cleared (false) in a new audit record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Assignment type  | Method for assigning follow-on tasks. This field is visible only when the Create task check box is selected. Choices are:  

- User Field: Select a user reference field on the table being audited. For example, you choose the user identified in the Managed by field on the failed record to perform the tasks. This selection displays the Assigned to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.  

- Specific User: Select a specific user to perform the tasks. This selection displays the User field.  

- Group Field: Select a group reference field on the table being audited. For example, you choose the group identified in the Support group field on the failed record to perform the tasks. Tasks are assigned to all members of the group. This selection displays the Assign to group and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.  

- Specific Group: Select a specific group to perform the tasks. This selection displays the Group field. All members of the selected group are assigned to the tasks.                                                                                                                                 |
| User             | The specific user this audit assigns to follow-on tasks. This user must have the certification role. This field is available under these conditions:  

- Assignment type is set to Specific User.  

- Assign to empty is set to Create Assigned Task, and Assignment type is set to User Field.                                                                                                                                                                                                                     |
<p>| Assign to group  | The group field that defines which group this audit assigns to the follow-on task. This field is available only when the Assignment type is Group Field.                                                                                                                                                                                                 |
| Group            | The specific group this audit assigns to follow-on tasks. This field is available only when the Assignment type is Specific Group.                                                                                                                                                                                                             |
| Assign to        | The user field that defines which user this audit assigns to the follow-on task. This field is available only when the Assignment type is User Field.                                                                                                                                                                                                 |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Assign to empty       | The behavior to use if the field selected in Assign to or Assign to group is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the Assign to empty setting determines what will happen. This field appears only when the Assignment type is User Field or Group Field. Choices are:  
  • Do Not Create Task: No follow-on task is created when the Assign to or Assign to group field is empty.  
  • Create Unassigned Task: Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later.  
  • Create Assigned Task: Create a follow-on task and assign it to the user or group specified. If the assignment type is User Field, the User field becomes available. If the assignment type is Group Field, the Group field becomes available.  
  The audit automatically creates follow-on tasks for all records that have Assign to populated, regardless of the Assign to empty setting. |
| Short description     | Brief description of this audit’s purpose.                                                                                                                                                                    |
| Task description      | General description of the work required for this audit’s follow-on tasks. All follow-on tasks created by this audit inherit this description.                                                                     |
| Active                | Activation control for this audit record. Clear this check box to prevent this audit from running and creating follow-on tasks.                                                                              |
| Run                   | How often to run the schedule that generates the audit.  
  • Daily  
  • Weekly  
  • Monthly  
  • Periodically  
  • Once  
  • On Demand |
| Day                   |  
  • If Run is Weekly, the day of the week when the audit should run.  
  • If Run is Monthly, the day of the month when the audit should run. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month. |

</tbody>
</table>

Audit Scheduling

The system performs audits automatically from the schedule you configure.

Users with the certification_admin or admin role can generate on-demand audits directly from the Audit form by clicking Run Audit. When an audit runs, ServiceNow populates the Audit Results related list in the form and shows follow-on tasks, if any, in the Follow On Tasks related list. Click Preview Audit Results to generate an audit preview that tests your template conditions without generating any audit results.
Certification audit results

Audit results show the records that have passed or failed an audit and itemize any discrepancies detected.

A discrepancy is considered any departure from the expected conditions defined in the template or script used for the audit. Audit results provide links to the source records and to the follow-on tasks for bringing failed records into compliance. Records that pass an audit have a single entry in the results table with a state of Certified. Records that fail an audit show all discrepancies, each with a state of Failed.

ServiceNow displays results from a certification audit in these locations:

- Audit Results list
- A related list in the Audit record

Figure 19: Audit Running
• A related list in the compliance view of a CI record

View an audit result

To generate certification results, you must first create and run an audit.

1. Navigate to one of the following locations:
   • Compliance Desired State Audit Results
   • Compliance Architecture Compliance Audit Results
   • Compliance Scripted Audits Audit Results
   • Data Certification Schedules Audit results

2. From any audit results list, you can edit the filter to show the results for any audit type.

![Audit Type filter](image)

The results are filtered by audit type and grouped by audit number. Within the groups, results are listed by date, from oldest to newest.

3. You can open the audit record, the CI record, or the follow-on tasks from this list.

Note: The Audit type field was set automatically when the audit result was created and cannot be changed. For scripted audits, the audit type is set when you create the audit record.
Figure 21: Desired State Audit Results

Audit results show this information:

Table 42: Audit Results

<table>

</tr>
<tr>
<td></td>
<td>• Unstable</td>
</tr>
</tbody>
</table>
Delete an audit result

While audit results can be deleted, you cannot delete an audit result that has a follow-on task associated with it.

1. Navigate to one of these modules:
   - Compliance Desired State Audit Results
   - Compliance Architecture Compliance Audit Results
   - Compliance Scripted Audits Audit Results

   The list is grouped by audit name.

2. Select the checkbox for a result in the list, and then select Delete from the Actions on selected rows menu at the bottom of the list.

   Note: If the result record has a follow-on task, the Delete option is not available. If you select multiple records, some with and some without tasks, the system only deletes those records that do not have tasks.

3. Click a date/time link to see the results for a specific CI.

   Note: The Delete button only appears on the form if the audit result does not have a follow-on task.

4. Click Delete.
View an audit result in the Compliance view

After an audit has run, you can view the results and follow-on tasks from the Compliance view in the records of every CI audited.

This view is available only for systems that use the default CI classes provided with the base ServiceNow system, such as Hardware, Software, and Computer. For information about creating views, see View Management.

1. Navigate to Configuration and open the record of a CI that was included in a compliance audit.
2. Select the view to configure by performing the appropriate action for your list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List V2</td>
<td>Open the context menu and select View Compliance</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the context menu and select Change View, and then click Compliance.</td>
</tr>
</tbody>
</table>
Figure 24: List v2: select View Compliance

The Audit Results Compliance View appears.
Table 43: Audit Results Compliance View List Descriptions

<table>
<thead>
<tr>
<th>Lists</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passed Audit Results</td>
<td>Lists audits for this CI that passed without discrepancies. The information includes the versions of the template and filter used. Records are grouped first by audit, and then by creation date and time.</td>
</tr>
<tr>
<td>Failed Audit Results</td>
<td>Lists all failed audits for this CI. The information includes the discrepancy data, the follow-on task, and the versions of the template and filter used. Records are grouped first by audit, and then by creation date and time.</td>
</tr>
<tr>
<td>Follow On Tasks</td>
<td>Lists all follow-on tasks generated from audit discrepancies for this CI.</td>
</tr>
</tbody>
</table>

3. Right-click the header bar and select View Compliance from the context menu.

Results preview

You can preview an audit to view potential results without saving audit results or generating follow-on tasks. For example, you might use this feature to test template conditions for correctness without creating thousands of result records.
In an audit record, click Preview Audit Results under Related Links.

![Audit Preview](image)

Figure 26: Arch Comp Audit Preview

A summary of the potential audit results appears at the top of the audit record. Previewing does not change the Last run date field.

![Audit Preview](image)

Figure 27: Arch Comp Audit Preview Message

**Health windows**

A health window is a trailing time frame in which the ServiceNow system evaluates audit results from CIs that have desired state fields defined.

Each window is defined by the Health window and Health unit fields, and ends when an audit runs. For example, an audit that runs on the 15th of the month with a 7 day window, evaluates a desired state field’s threshold values from the 8th to the 15th. When the same audit runs the next day, the system evaluates the threshold from the 9th to the 16th, and so on, counting backward 7 days from the current day. ServiceNow evaluates a CI’s threshold values for each health window, without considering
the results from the previous window. As a result, a CI’s health can fail for one audit and then pass in a subsequent audit that runs in a new window.

ServiceNow evaluates stability by recording the number of times a CI’s desired state threshold value switches between Failed and Certified within the health window. In the example shown here, a 5 minute health window was set for the desired state field on a UPS unit that measures the remaining battery time. The threshold was set at 2, which allows the field to fail two audits in the same health window.

![Figure 28: Desired State Health Window](image)

In the initial audit, the system evaluated the threshold value for the Seconds on battery field within a 5 minute window running from 13:52:51 to the time of the audit at 13:57:51. The desired state field showed In Limit for that audit and the second audit conducted less than a minute later. The next two audits were conducted within 5 minutes of the first audit and both showed that the threshold (set at 2) was Exceeded. A subsequent audit was conducted 5 minutes after the audit in which the desired state field threshold was first exceeded. Since the health window had moved forward enough units, the Seconds on battery field was within limits again with only one failure in the 5 minute window being evaluated.
**Copy an audit**

New audits can be created from an existing audit.

1. Open the audit record you want to copy.
2. Change the name or short description to distinguish this audit from the original.
3. Make any other changes you need.
4. Right-click in the header bar and select either Insert or Insert and Stay from the context menu.
The system clears the Last run date field and inserts the record into the database.

Certification filters

A certification filter creates a subset of ServiceNow records to audit, typically from configuration items (CI) of a certain type, such as all UNIX servers in a specific datacenter.

However, you can define a filter for any ServiceNow table by using any set of system-supported conditions. Records identified by a filter are then audited by the system for expected attributes or relationships, depending on the audit type.

You can create multiple versions of a filter, reactivate inactive versions, and select the version you want to use in a template or a certification schedule. Only the active versions of a filter are available for selection in template records. You can use a single filter for multiple certification templates or schedules.

Table 44: Certification filters

<table>
<thead>
<tr>
<th>Filter</th>

</tr>
</thead>
<tbody>
<tr>
<td>Data Certification</td>
<td>Validates CMDB data.</td>
</tr>
</tbody>
</table>
### Filter

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Architecture Compliance</td>
<td>Manages reviews of CMDB data in architecture compliance audits to determine which configuration items (CIs) match expected attributes.</td>
</tr>
<tr>
<td>Desired State</td>
<td>Manages reviews of CMDB data to determine which CIs match a desired state for both attributes and relationships.</td>
</tr>
<tr>
<td>Compliance</td>
<td>Manages reviews of records from any ServiceNow table to determine which records match an expected set of attributes and related record conditions.</td>
</tr>
<tr>
<td>IT Governance Risk and Compliance</td>
<td>Generates audits and tests to ensure that controls are being followed and creates tasks to track corrective actions.</td>
</tr>
</tbody>
</table>

### Compliance filter

The compliance filter for license bases uses the following fields to define entitled users or CIs. These field values can be used independently or together to calculate compliance.

**Table 45: Compliance Filter**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entitled company</td>
<td>All users or configuration items (CI) at all locations of this company, in all departments are entitled to use this software package. Compliance at this level is calculated by how many licenses are purchased for the company at large and how many are being consumed by entitled users or CIs.</td>
</tr>
<tr>
<td>Entitled location</td>
<td>CIs and users who are assigned to this company location in any department are entitled to use this software package. Compliance at this level is calculated by how many licenses are purchased for this company location and how many are being consumed by users and CIs there.</td>
</tr>
<tr>
<td>Entitled department</td>
<td>Only the users or CIs in this department at this company location are entitled to use this software package. Compliance is calculated for a single department only.</td>
</tr>
</tbody>
</table>

The license form can display information about all CIs or named users who are using this software package. The form indicates when license reconciliation is necessary and displays all compliant users or CIs.

### Possible compliance levels are:

**Table 46: Compliance**

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non applicable</td>
<td>Compliance levels for all infrastructure licenses related to cluster licenses are set to Non applicable automatically. Compliance levels are calculated in the cluster license only, and not in the related infrastructure licenses.</td>
</tr>
<tr>
<td>Level</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Out of compliance</td>
<td>More licenses are being consumed than were purchased. There are more users or CIs using this license than the license allows, and some users or CIs might not be entitled to use this software package.</td>
</tr>
<tr>
<td>Unused</td>
<td>The licenses for this software package are currently unused.</td>
</tr>
<tr>
<td>Reconciliation required</td>
<td>CIs or users who are not entitled to use this software are consuming licenses. Licenses that require reconciliation are considered out of compliance. Reconciliation requires action to ensure that unentitled users are not using the software. This might involve uninstalling software or increasing license counts to match actual user counts.</td>
</tr>
<tr>
<td>Nearly out of compliance</td>
<td>For a software package to be at this compliance level, more than 95% of the licenses for this software package must be in use by entitled users or CIs. License bases at this level are considered to be In compliance.</td>
</tr>
<tr>
<td>In compliance</td>
<td>This software package has unused licenses. All users or CIs using a license are entitled to use this software package.</td>
</tr>
</tbody>
</table>

Copy a filter

New filters can be created from an existing filter.

1. Open the filter record you want to copy.
2. Make sure to change the filter name or description to distinguish the new filter from the original.
3. Make any other necessary changes.
4. Right-click in the header bar and select either Insert or Insert and Stay from the context menu.
The system increments the record number and sets the version to 1 for the new record. Both the original filter and the copy are Active and appear in the record list. Showing all copies of a filter allows you to see the entire history of the filter.
Additional Roles

In the base ServiceNow system, users with the certification_admin role have limited system rights and might not have access to the tables required for creating a filter.

When assigning compliance resources, make sure certification_admin users have any additional roles they might need. For example, a user might need roles that grant access to the Company (core_company) table.

Filter versions

Versions can be displayed in a list.

The default list of filters displays only the active version of each filter. To see all filter versions in the list view, select All in the breadcrumbs.

Create a filter

You can create as many versions of a filter as necessary and designate which versions are active and available for selection in Compliance template records, Governance Risk and Compliance control test definitions, or Data Certification schedule definitions.

1. Use the CI Class Manager:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Certification Filter in the Compliance group.

2. Or, navigate to one of these modules:
   - Compliance Filters
   - IT GRC Administration Filters
   - Data Certification Schedules Certification Filters

3. Click New.
4. Fill in the fields (see table).
5. Click Submit.
   This action saves the filter as version 1.
6. To create another version of this filter, open the record and modify the name, table, or conditions.

Note:
You can change a filter Description without creating a new version.

7. Click Update.

The system saves a new version of the current filter and makes it the Active version. The previous version is marked inactive. The system displays only active filter versions for selection when you create templates or schedules.

Table 47: Creating Filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>(Read-only) Displays the automatically assigned filter identification number. All versions of a filter have the same number.</td>
</tr>
<tr>
<td>Name</td>
<td>(Required) Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Describes this filter. You can change the description of a filter without creating a new version.</td>
</tr>
<tr>
<td>Table</td>
<td>Specifies the table containing the records to select. The template or schedule that uses this filter works on this table. For example, you might select the ESXi Server (cmdb_ci_esx_server) table to select VMware ESX servers.</td>
</tr>
<tr>
<td>Active</td>
<td>Makes this filter available for use from the Filter field on the Certification Template or Schedule Definition form. Multiple versions of a filter can be active. You can activate or deactivate a filter without creating a new version.</td>
</tr>
<tr>
<td>Version</td>
<td>(Read-only) Indicates the version of this filter. Any changes to this filter, except to the description or the Active check box, makes it inactive. The system creates a new version of the updated filter and marks it as active. The system saves all versions of the filter and makes them available for reactivation.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Specifies the fields, operators, and values that create the filter. The available fields are based on the table selected. The condition builder shows the number of records that match the conditions. Click the refresh icon to recalculate the number of matching records when you edit the conditions.</td>
</tr>
</tbody>
</table>
Delete a filter

Only users with the certification, admin or admin role can delete filter versions; but you cannot delete a filter that is being used in a template or a scripted audit.

1. To delete a single filter version, open that version record and click Delete.
   The system hides the Delete button for filters that are in use. If you delete the latest version of a filter that is active, the previous version of that filter is reset to Active.

2. To delete all unused and inactive versions of a filter, open any version of that filter and click Delete inactive versions under Related Links.

3. When prompted, click OK to proceed.
   The system deletes unused filter versions. A message in the header bar identifies filter versions that cannot be deleted because they are used in a template or scripted audit.
Manage a filter version in a form

You can view and manage all versions of a filter from the Certification Filter form.

1. Open any version of a filter.
   The Other Versions related list displays all other versions of this filter, both active and inactive. The system prevents you from editing either the filter version or the record number in the list view.
2. Click any version in the related list to display the record for that version.
3. To make an inactive filter the current version, open the filter, edit it if desired, and then click Revert.

   This action:
   • Deactivates the previous active version of the filter.
   • Copies the inactive filter.
   • Makes this new copy current and active.
Certification follow-on tasks

The ServiceNow system can automatically generate and assign follow-on tasks to correct discrepancies detected during compliance audits.

The system attribute glide.allow.new.cert_follow_on_task is set to true by default, allowing for new follow-on tasks to be created for the same failure, at each audit run. You can set this property to false, to configure audit to use the same follow-on task for the same audit failure across multiple runs.

You configure and assign follow-on tasks as needed to qualified users or groups in the audit record. Any follow-on task can be reassigned by a user with the certification_admin role. The Audit Results related list in the Follow On Task form contains links to the records that failed.

Access follow-on tasks

Users with the certification role can only access follow-on tasks assigned to them but can reassign these tasks to other users.

1. Navigate to Compliance My Follow On Tasks.
   - The list contains all active follow-on tasks assigned to the logged in user.

2. Open a task.
   - The record shows the specifics of the task, the task activity, and the failed audit results.
Figure 39: Follow-on Task
3. Open records from the Audit Results related list to see each discrepancy.

![Audit Result Detail](image)

Figure 40: Audit Result Detail

4. Go to the CI named in the record and perform the work needed to bring it into compliance.

5. Update the State field in the follow-on task record and add work notes as you correct each discrepancy.

When you change the state, the system updates the task activity appropriately.

![Follow-on Task Activity](image)

Figure 41: Follow-on Task Activity

When the task is Closed Complete it no longer appears on the My Work list.
Manage follow-on tasks

Users with the certification, admin or admin role can see all follow-on tasks.

Tasks are pre-assigned to a user or group as specified in the audit record but can be reassigned by users with the certification, admin role.

1. Navigate to the appropriate application:
   - Compliance Architecture Compliance Follow On Tasks
   - Compliance Desired State Follow On Tasks
   - Compliance Scripted Audits Follow On Tasks

   The list of follow-on tasks appears, filtered by audit type.

   ![Figure 42: Arch Comp Task Audit Type](image)

2. Open a task.
   - The Audit and Configuration item fields are read-only for all users.
3. Edit the Assignment group or the Assigned to field if necessary.
4. Edit the Short description field if necessary.
   - The short description is inherited from the Task description field in the Audit form.
5. Use the links in the Audit Results related list to open the individual records that failed the audit.
6. If you update the follow-on task record, be sure to add work notes.

Certification templates

Certification templates can define attributes, relationships, and reference field values that indicate what a record is expected to contain.

These values are used to perform audits on ServiceNow records. The certification filter selected in the template identifies the table and records to audit, and the template conditions set the expected state for those records. The type of audit you create determines which tables and template conditions are available.

Users with the certification_admin role can create, update, and delete templates. Users with the certification role can view template versions.
Certification template audit types

When you create a template, ServiceNow assigns an Audit type that determines which tables and conditions are available in the certification template. This value is based on the application from which the template is created. Each application lists only the templates with the associated type.

Available Condition Builders

These are the available condition builders for each audit type:

- **Compliance**: Runs audits on any set of ServiceNow records, not only configuration items (CI). This audit type provides the following types of conditions for any ServiceNow table:
  - **Attribute**: Sets conditions for the attributes of the records.
  - **Related List**: Runs audits on records in tables that reference the table defined in the template.

- **Architecture Compliance**: Defines the following types of conditions for tables that extend the Configuration Item (cmdb_ci) table.
  - **Attribute**: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - **Related List**: Runs audits on records in tables that reference the table defined in the template.

- **Desired State**: Defines the following types of conditions for tables that extend the Configuration Item (cmdb_ci) table.
  - **Attribute**: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - **CI relationship**: Defines the relationships these CIs have with other CIs. An example of a relationship is a business service, such as Outlook Web Access, that depends on a server.
  - **User relationship**: Defines the user who reviewed the log records. This is the only operator available with this condition builder.
  - **Group relationship**: Defines user groups who backed up this CI. This is the only operator available with this condition builder.
  - **Related List**: Runs audits on records in tables that point toward the table defined in the template.

Create or edit a certification template

This topic explains how to create a certification template.

You must activate the Certification Core plugin to enable the Compliance functionality. See [Compliance Activation](#) for details.

1. Ensure that you have an appropriate filter that defines the records the template should evaluate.
   - The template applies its conditions to these records.
2. Use the CI Class Manager to navigate to the Certification Template form:
   a) Navigate to Configuration CI Class Manager.
   b) Select a class from the Class Hierarchy.
   c) In the sidebar on the right, check Advanced. Click Certification Template in the Compliance group.
3. Or, navigate using one of these paths:
   - Compliance Architecture Compliance Templates
   - Compliance Desired State Templates
   - Compliance Templates
4. Click New or select a certification template to edit.

The following fields are completed automatically:

- **Number:** Each new template has a unique number. All versions of the same template use the same number.
- **Active:** All new templates are set to Active.
- **Version:** The version of a new template is set to 1.
- **Audit type:** The system sets the default type to Architecture Compliance, Desired State, or Compliance, depending on the application in which the template was created. You can select a different type when you create the template, but the field becomes read-only when you submit the record. The system uses audit types to filter record lists for appropriate data and determine which conditions are visible on the template form.

5. Complete the following mandatory fields:

- **Name:** Enter a descriptive name for this template. The name should help identify the template’s purpose.
- **Filter:** Select the filter that identifies the records to be certified. You can select either active or inactive filter versions. By default, the system presents only active versions for selection. If you start typing the name of a filter, the auto-complete feature displays all versions for selection. For architecture compliance and desired state templates, only filters that use a table extended from Configuration Item (cmdb_ci) appear on the choice list. All filters appear on the choice list for a compliance template. After you select a filter, the template condition builders appears. The template operates on the table specified in the filter.

6. Enter a Description for this template

7. Define certification conditions using the condition builders. All conditions are AND conditions.

   The audit type of the template determines which conditions are available.

   - **Certification Attribute Conditions:** [All audit types] Select configuration item attributes or specifications to certify, such as CPU count, memory, or disk space. Available fields in the attribute condition builder depend on the table from the filter. Typical ServiceNow conditions for attributes are available, including the between operator for setting numerical conditions with high and low boundary values. This operator was added specifically for desired state conditions.

   The Show Related Fields item supports dot-walking, allowing you to include referenced fields in a certification attribute condition. Click Show Related Fields or Remove Related Fields to add or remove referenced fields (in the form of ⟨field⟩ = ⟨field⟩). Select a referenced field to drill down to the next level of referenced fields.

   See *Dot-walking*. 
• Certification CI Relationship Conditions: (Desired State audit types) Define the CI relationships to certify, such as Runs on or Depends on.
• Certification User Relationship Conditions: (Desired State audit types) Select the desired user relationship for this configuration item. The relationship provided in the base system is Log reviewed by.
• Certification Group Relationship Conditions: (Desired State audit types) Select the desired group relationship for this configuration item. The relationship provided in the base system is Backed up by.
• Certification Related List Conditions: (All audit types) Select field values from tables that reference the template table, or user defined related lists which are created via custom relationships in the sys_relationship table. For example, you might want to create a condition that evaluates all servers in the Server (cmdb_ci_server) table for the presence of Microsoft Word 2007, as referenced in the Software Installation (cmdb_sam_sw_install) table. The resulting condition is (Software Installation->Installed on) (Display name) (is) (Microsoft Word 2007).

Check All to include all records in the condition requirements of the related list. If there are no records in the related list, then:

• If All is checked, the condition requirement is met.
• If All is unchecked, the requirement is not met.

Note: By default, the condition builders for relationships display only suggested relationships. To see all possible relationships, select the Show all relationships check box on the right side of the form.

Figure 45: Clear Check

a) Click Insert a new row to insert a condition. You cannot insert an empty condition.
b) Click the green check mark icon to save a condition. Make sure to save the condition before performing any other operation. Updating the form does not save the condition.

c) To delete a condition, click the red X beside the condition. The system marks the condition as inactive.

The system marks the condition as inactive.

<table>
<thead>
<tr>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;RAM (MB)&quot; greater than &quot;114,000&quot;</td>
</tr>
<tr>
<td>&quot;Disk space (GB)&quot; greater than &quot;5,000&quot;</td>
</tr>
<tr>
<td>&quot;CPU count&quot; greater than or equal to &quot;2&quot;</td>
</tr>
<tr>
<td>&quot;CPU count&quot; less than &quot;4&quot;</td>
</tr>
</tbody>
</table>

Figure 46: Condition Marked as Inactive

d) To reactivate a condition, click the gray X. If another condition for the same field exists, the system prevents reactivation and warns you of the conflict.

8. Click Submit.
ServiceNow saves the template as version 1.

9. To create another version of this template, change the name, edit the conditions, or select a different filter. Updating the template Description does not create a new version.

Note: If you select a filter whose table is incompatible with the existing template conditions, the system displays a warning that the conditions cannot be applied.

Some template conditions are incompatible with the selected filter. Incompatible conditions will not be used for auditing.

10. Click Update.
The system saves a new version of the current template and makes it the Active version. The previous version is marked inactive.

Certification Template Record List

The default Templates list displays only the active version of each template, but users can update the breadcrumbs to display all template versions.

Default Templates List

The default Templates list displays only the active version of each template, filtered by Audit type.
Figure 47: Default Template

All Template Versions

To view all template versions for an audit type, click the arrow before Active=true to remove that condition from the breadcrumbs.
### Figure 48: All Template Versions

**Manage Certification template versions**

You can view and manage all versions of a template from the Template form.

1. Open any version of a template.
   - The Other Versions related list displays all other versions of this template, both active and inactive.
2. Click any version in the related list to display the record for that version.
3. Update the template to create a new version. The system creates a new version of the template when you edit any field except Description and Active. You can manage the template versions without returning to the list view.

---

![Revert Template](image-url)

Figure 50: Revert Template
This action does the following:

- Deactivates the previously active version of the template.
- Copies the inactive template.
- Makes the new copy the current, active version.

5. Select the Audits related list to view all audits configured to use this template.

6. Click New to create a new audit record with the template selection and table pre-populated.

Clone a Certification template

New templates can be cloned from an existing template.

1. Open the template record to be copied.
2. Make any necessary changes.
3. Change the template name or description to distinguish it from the original.
4. Click Clone.
   
   ServiceNow increments the record number above the highest template number and sets the version of the new record to 1. A message appears under the header bar naming the source record for the clone.
Both templates are Active and appear in the record list. This allows you to see the entire history of the template.
Delete a Certification template

Certification templates can be deleted.

Only users with the certification_admin or admin role can delete template versions. You cannot delete a template version that is being used for an audit.

1. To delete a single template version, open that version record and click Delete.

   The system hides the Delete button for templates that are in use. If you delete the latest, active version of a template, the previous version of that template is reset to Active.

2. To delete all unused and inactive versions of a template, open any version of that template and click Delete inactive versions under Related Links. This control appears on all versions, whether or not they are used in a audit.
Figure 54: Template Delete

Delete unused and inactive versions of this template

<tr>
<td>TEM001005</td>
<td>Attributes for all ESX servers in the UK...</td>
<td>ESX Servers - UK - 1</td>
<td>3</td>
</tr>
</tbody>
</table>

Delete inactive versions
3. When prompted, click OK to proceed. The system deletes only template versions that are not used in an audit. All protected versions are named in a message that appears in the header bar.

![Figure 55: Used Template Delete](image)

Controls and tests management

After you identify the risks, define controls with accompanying control tests to prevent issues from occurring.

This diagram illustrates the entire IT GRC control process.
Define a control

You must define a control before you can define a control test.

1. Navigate to IT GRC Controls All.
2. Click New.
3. Fill in the form, as appropriate (see table).
4. Click Submit.

![Figure 57: ITGRC Control](image)

**Table 48: Defining A Control**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control ID</td>
<td>A unique identifier generated dynamically by the system.</td>
</tr>
<tr>

<td>The basis for determining when the control is implemented.</td>
</tr>
<tr>
<td>State</td>
<td>A workflow field that determines where in the authoring process the control is currently.</td>
</tr>
<tr>
<td>Key control</td>
<td>Indicator that the control is considered key to preventing material risk, if selected.</td>
</tr>
<tr>
<td>Owning group</td>
<td>A reference to the group with ownership over the control.</td>
</tr>
<tr>
<td>Owner</td>
<td>A reference to the user with ownership over the control.</td>
</tr>
<tr>
<td>Owner delegate</td>
<td>A reference to the user who has ownership over the control when the specified owner is unavailable.</td>
</tr>
<tr>
<td>Description</td>
<td>A long-form description of the control.</td>
</tr>
</tbody>
</table>

Define a control test

After you define a control, create control tests that run periodically and provide documented evidence of whether the associated control is operating correctly.

1. Navigate to IT GRC Administration Control Test Definitions.
2. Click New.
3. Fill in the form, as appropriate (see table).
4. Click Submit.
Figure 58: IT GRC Control Test Def

<td>- Advanced: Uses condition collections to apply conditions to the table and to related tables.</td>
</tr>
<tr>
<td></td>
<td>- Template: Uses certification templates to apply conditions to the specified table. Select the template to use from the Template field.</td>
</tr>
<tr>
<td>Sample size</td>
<td>An integer number of rows for a random sample if Include supporting data is selected. A sample size of zero returns all matching records. This field is available only if Condition type is set to Basic and Data purpose is set to Support test execution.</td>
</tr>
<tr>
<td>Control test conditions</td>
<td>A condition builder that limits the sample data if Include supporting data is selected. This field is available only if Condition type is set to Basic.</td>
</tr>
<tr>
<td>In scope definition</td>
<td>A reference to a condition collection if Include supporting data is selected and Condition type is set to Advanced.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Configuration to retrieve | Method for using the Configuration reference field if Include supporting data is selected and Condition type is set to Advanced or Template.  
- None: Returns all records in scope.  
- Matching: Returns all matching records in scope.  
- Non-matching: Returns all non-matching records in scope.  
For more information, see Defining Advanced Conditions.

Template | (Required) Certification template that defines conditions for this test definition. Only templates with an audit type of Compliance are available for selection. This field is available and mandatory when the value in the Condition type field is Template.

Configuration | Condition collection to use. This field is available only if Include supporting data is selected, Condition type is set to Advanced, and Configuration to retrieve is set to anything except None.

---

**Advanced conditions**

Set the Condition type to Advanced on control tests to define more flexible conditions using condition collections.

Condition collections have one primary condition, which is applied to the selected table, and one or more supplemental conditions.

When a control test is performed, advanced conditions evaluate in this order:

1. The system processes the condition collection in the In scope definition reference in this order:
   a. The primary condition is processed on the fields specified in Table and Fields on the control test definition, returning an array of elements.
   b. For each element in the array returned by the primary condition, supplemental conditions are processed, filtering the array of elements further.
   c. The In Scope field is updated with the number of elements in the array.

2. The condition collection in the Configuration reference is processed on the array of elements returned from the In scope definition. The choices for Configuration to retrieve are:
   - None: These conditions are skipped. Supporting Data is all of the elements that are in scope.
   - Matching: The control test checks the array of elements, returning any elements that match the Configuration.
   - Non-matching: The control test checks the array of elements, returning any elements where at least one condition did not match the Configuration.

3. The final array of elements is recorded as Supporting Data records.

Both the In Scope and Configuration fields refer to the Condition Collection (grc_condition_collection) table.
To define condition collections:
1. Navigate to IT GRC Administration Condition Collections.
2. Click New.
3. Populate these fields:
   - Name: Name of the condition collection.
   - Description: Description of the condition collection.
   - Type: Which Control Test Definition field references the condition collection. Choices are:
     - In Scope Definition
     - Configuration Definition

4. After the condition collection is defined, use the Add Condition related link to add these conditions:
   - Condition: Predefined condition definition from the Condition [grc_condition] table.
   - Condition type: Choices are determined by the condition collection Type:
     - In Scope Definition
       - Primary
       - Supplemental
     - Configuration Definition
     - Not Applicable

To define new condition records:
1. Navigate to IT GRC Administration Conditions.
2. Click New.
3. Populate these fields:
   - Name: Name of the condition collection.
   - Description: Description of the condition collection.
   - Table: Table on which the condition should be applied.
   - Reference Field: For supplemental conditions, the reference field for the table on which the primary condition is running.
   - Condition: Condition builder for defining the condition.

Control test processing
When performing a control test, processing dependencies are evaluated.
- If a control test definition is active, the system generates the control test instances dynamically, according to definition. To generate a control test manually:
  1. Navigate to IT GRC Administration Control Test Definitions.
  2. Open a control test definition record.
  3. Click Execute Now.

ServiceNow generates a control test instance, marks it Pending, and assigns it to the group or individual responsible for the test according to the control test definition.
• If sample data was requested in the definition, any sample data that matches the conditions is found in the Supporting Data section. The Test Complete Data Values related list holds references to the records returned by the sample data query.

• If a control test has a condition type of Basic, the value in the Sample size field limits the number of failures that are stored as support data. If the result is passed or compliant, all the matching data is stored.

• If a control test has advanced conditions, the system evaluates them as follows:
  1. The condition collection in the In scope definition reference is processed.
     a. The primary condition is processed on the fields specified in Table and Fields on the control test definition and returns an array of elements.
     b. For each element in the array returned by the primary condition, supplemental conditions are processed, filtering the array of elements further.
     c. The In Scope field is updated with the number of elements in the array.
  2. The condition collection in the Configuration reference is processed on the array of elements returned from the In scope definition. The choices for Configuration to retrieve are:
     • None: These conditions are skipped. Supporting Data includes all of the elements that were in scope.
     • Matching: The control test checks the array of elements, returning any elements that match the Configuration.
     • Non-matching: The control test checks the array of elements, returning any elements where at least one condition did not match the Configuration.
  3. The final array of elements is recorded as Supporting Data records.

Remediation Tasks

If the control test reveals problems in the process, create a task from the Remediation Task related list. You can relate remediation tasks to any task in the system with the related items tool from the Many to Many Task Relations plugin.

Scripted audits

A scripted audit enables users with the certification_admin role to conduct an audit from a script rather than using restrictive template conditions.

A scripted audit uses a certification filter to select the records to audit, and then creates standard follow-on tasks for remediation of any discrepancies. Use this type of audit to query for any values or states that a script can define. A scripted audit is a specific audit type that is activated together with the Desired State plugin. ServiceNow provides a sample audit script with configuration instructions.

Create a scripted audit

A scripted audit is an audit whose conditions are defined by a script.

1. Navigate to Compliance Scripted Audits Audits.
   The list is filtered by an audit type of Scripted.
2. Click New.
3. Complete the form (see table).
4. Create the audit script.

The Run this script field includes a sample script with instructions for performing the audit and generating the follow-on tasks. This field appears only when you access audits from the Scripted Audits module.

5. Click Submit.

Sample script:

```javascript
/*
///////////////////////////////////////
/// This script works with Data Center Zones filter //
///////////////////////////////////////

var desiredFloorSpaceUsage = 30; // Value to audit against
var assignToUser = '46d44a23a9fe19810012d100ccca80666'; // Beth Anglin
var assignToGroup = '8a5055c9c61122780043563ef53438e3'; // Hardware group
var taskMsg = 'See the audit results below for the discrepancies that must be addressed';

// API call to retrieve records based on the filter
var gr = new SNC.CertificationProcessing().getFilterRecords(current.filter);

// Loop over all records defined by the filter
while(gr.next()) {
    var sysId = gr.getValue('sys_id'); // Sys ID of audited record
    var floorSpaceInUse = gr.getValue('floor_space_in_use'); // Value to audit

    // Determine if certification condition passes or fails
    if (floorSpaceInUse < desiredFloorSpaceUsage) {
        var columnNameSpace = gr.floor_space_in_use.getLabel(); // String value of column audited against

        // Call create Follow on Task API and save the returned sys_id for use in logging audit result fail
        // Params:
        // auditId - Sys id of the audit record executed
        // ciId Sys - id of the configuration item. Empty string if not a cmdb ci
        // assignedTo - Sys id of user to assign task to. Can be empty
        // assignmentGroup - Sys id of group to assign task to. Can be empty
        // shortDescr - Short description for the Follow On Task. Can be empty
        // Return value: Sys id of the created follow on task
        var followOnTask = new SNC.CertificationProcessing().createFollowOnTask(current.sys_id, sysId, assignToUser, '', taskMsg);

        // Call log failed result API
        // Params:
        // auditId - Sys id of audit record executed
        // auditedRecordId - Sys id of the record audited
        // followOnTask - Sys id of the follow on task associated with the audited record(see auditedRecordId). Can be empty
        // columnDisplayName - Label of the column audited(ex. Disk space (GB)). Can be empty
        // operatorLabel - Label of the operator used to audit the column(ex. is not empty, greater than). Can be empty
        // discrepancyValue - Discrepancy value. Can be empty
        // isCI - True, if audited record is a CI. False, otherwise.
        // domainToUse - Sys domain of the "cert_audit" record. Can be empty
    }
}
```

<tr>
<td><strong>Choice</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>User Field</td>
<td>Select a user reference field on the table being audited. As an example, you might select the user named in the Managed by field on the failed record to perform the tasks. This selection displays the Assigned to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td>Specific User</td>
<td>Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>
<tr>
<td>Group Field</td>
<td>Select a group reference field on the table being audited. As an example, you might select the Support group from the failed record to perform the tasks. This selection displays the Assign to group and Assign to empty fields. All members of the group from the reference field on the failed record are assigned to the tasks. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td>Specific Group</td>
<td>Select a specific group to perform the tasks. This selection displays the Group field. All members of the selected group are assigned to the tasks.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User</td>
<td>The specific user this audit assigns to follow-on tasks. This field is available under these conditions:</td>
</tr>
<tr>
<td></td>
<td>• Assignment type is set to Specific User.</td>
</tr>
<tr>
<td></td>
<td>• Assign to empty is set to Create Assigned Task, and Assignment type is set to User Field.</td>
</tr>
<tr>
<td></td>
<td>Note: Ensure that the specified user has the <a href="http://example.com">certification role</a>.</td>
</tr>
<tr>
<td>Assign to group</td>
<td>The group field that defines which group this audit assigns to the follow-on task. This field is available only when the Assignment type is Group Field.</td>
</tr>
<tr>
<td>Group</td>
<td>The specific group this audit assigns to follow-on tasks. This field is available only when the Assignment type is Specific Group and you have selected Group Field as the assignment type.</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user field that defines which user this audit assigns to the follow-on task. This field is available only when the Assignment type is User Field.</td>

<tr>
<td>Assign to empty</td>
<td>The behavior to use if the field selected in Assign to or Assign to group is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the value in this field determines what will happen. This field appears only when the Assignment type is User Field or Group Field. The possible selections are:</td>
</tr>
<tr>
<td></td>
<td>Table 52: Field selection</td>
</tr>
<tr>
<td>Selection</td>
<td>Description</td>
</tr>
<tr>
<td>Do Not Create Task</td>
<td>No follow-on task is created when the Assign to or Assign to group field is empty.</td>
</tr>
<tr>
<td>Create Unassigned Task</td>
<td>Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later.</td>
</tr>
<tr>
<td>Create Assigned Task</td>
<td>Create a follow-on task and assign it to the user or group specified. If you selected an assignment type of User Field, the User field becomes available. If you selected the Group Field type, the Group field becomes available.</td>
</tr>
<tr>
<td></td>
<td>The audit automatically creates follow-on tasks for all records that have Assign to populated, regardless of which selection you make for Assign to empty.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this audit’s purpose.</td>
</tr>
<tr>
<td>Task description</td>
<td>General description of the work required for the follow-on tasks created by this audit. All follow-on tasks created by this audit inherit this description.</td>
</tr>
<tr>
<td>Active</td>
<td>Activates this audit schedule and generates follow-on tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except Last run date) and not generate follow-on tasks.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Run                   | How often to run the schedule that generates the audit.  
  - Daily  
  - Weekly  
  - Monthly  
  - Periodically  
  - Once  
  - On demand                                                                                                                                  |
| Day                   | • If Run is Weekly, the day of the week when the audit should run.  
  • If Run is Monthly, the day of the month when the audit should run. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month.                                                                 |
| Repeat Interval       | If Run is Periodically, the frequency that the audit should run, entered in time, days, or both. For example, set Days to 10 and Hours to 14:00:00 to run the audit every 10 days at 2:00pm.                                                                                                     |
| Starting              | If Run is Periodically or Once, the date and time when the audit should run.                                                                                                                                                                                                 |
| Time                  | If Run is Daily, Weekly, Monthly, or Once, the time of day, on a 24-hour clock, when the audit should run.                                                                                                                                                                   |
| Last run date         | *(Read-only)* The last date and time the audit ran, either on its regular schedule or manually. Audit previews do not update this field.                                                                                                                                   |
| Next scheduled run    | *(Read-only)* The next date and time on which the audit should run. The system recalculates this field when you change the schedule.                                                                                                                                          |
| Audit type            | *(Read-only)* The type assigned to this audit.  
  The system selects the audit type based on the application from which the audit was created.  
  This can be:  
  - Desired State  
  - Architecture Compliance  
  - Compliance  
  - Scripted                                                                                                                                      |
| Run this script       | Audit script to run. This field is available only when the audit type is Scripted. The Audit form includes a sample script with instructions for performing the audit and generating the follow-on tasks. See Script Methods for a list of the methods provided and the accepted parameters. |
Script methods

ServiceNow provides four methods for creating the audit script.

Table 53: Script methods

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>getFilterRecords</td>
<td>public GlideRecord getFilterRecords(String filterId)</td>
<td>filterId: The sys_id of the filter to use.</td>
</tr>
<tr>
<td>logAuditResultPass</td>
<td>public void logAuditResultPass(String auditId, String auditedRecordId, boolean isCI, String domainToUse)</td>
<td>auditId: Sys_id of audit record executed. auditedRecordId: Sys_id of the record audited. isCI: True, if the audited record is a CI, false if otherwise. domainToUse: Sys_domain of the cert_audit record.</td>
</tr>
<tr>
<td>logAuditResultFail</td>
<td>public void logAuditResultFail(String auditId, String auditedRecordId, String followOnTask, String columnDisplayName, String operatorLabel, String desiredValue, String discrepancyValue, boolean isCI, String domainToUse)</td>
<td>auditId: Sys_id of audit record executed. auditedRecordId: Sys_id of the record audited. followOnTask: Sys_id of the follow-on task associated with the audited record. This can be an empty string. columnDisplayName: Label of the column audited. For example, Disk space (GB). operatorLabel: Label of the operator used to audit the column. For example, is not empty or greater than. desiredValue: Desired value of the column. discrepancyValue: Discrepancy value. isCI: True, if the audited record is a CI, false if otherwise. domainToUse: Sys_domain of the cert_audit record.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Parameters</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>createFollowOnTask()</td>
<td>public String createFollowOnTask(String auditId, String cld, String assignedTo, String assignmentGroup, String shortDescr)</td>
<td>auditId: Sys_id of the audit record executed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>cld: Sys_id of the configuration item. This is an empty string if the table is not extended from the cmdb_ci table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>assignedTo: Sys_id of the task’s assigned user. This can be an empty string.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>assignmentGroup: Sys_id of the group the task is assigned to. This can be an empty string.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>shortDescr: The text to use for the short description of the follow-on task.</td>
</tr>
</tbody>
</table>

**Data Certification**

Data Certification manages scheduled and on-demand validations of the configuration management database (CMDB) data.

Information is added to the CMDB by Discovery, by importing from third-party tools, or manually. For regulatory or procedural reasons, information in the CMDB needs to be checked for accuracy and certified. The person or team responsible for certification can define what information should be verified and the verification schedule. The schedule then generates a checklist for verifying the data. Individuals assigned to certification tasks answer a series of questions to verify the data.

Data certification can be performed against specific fields on specific tables. Based on the certification schedule, certification tasks are automatically created and assigned. For example, you can set up a certification to validate key information fields, such as Operating System and CPU count, on all Windows servers located in Chicago and assign the tasks to the appropriate team member automatically.

Domain separated systems can use the Data Certification application.

**Activate Data Certification**

You must activate the Data Certification plugin to access the application. Activating this plugin also activates the Version Management plugin, which manages certification filter versions.

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.
Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Installed With Data Certification
Activating the Data Certification plugin installs the following components.

Demo data is available with Data Certification. The demo data provides information including filters, schedules, instances, and tasks.

Tables

Data Certification adds the following tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Audit Definition</td>
<td>Stores collections of certification schedules that can be run as a single entity.</td>
</tr>
<tr>
<td>Certification Audit Definition Elements</td>
<td>Lists the certification schedules in each certification audit definition.</td>
</tr>
<tr>
<td>Certification Audit Instance</td>
<td>Stores the certification instances associated with a specific audit definition.</td>
</tr>
<tr>
<td>Certification Element</td>
<td>Stores the data elements that are grouped into certification tasks.</td>
</tr>
<tr>
<td>Certification Filter</td>
<td>Stores the data that needs to be certified using a filtering condition for the certification.</td>
</tr>
<tr>
<td>Certification Instance</td>
<td>Stores a collection of certification tasks representing a single instance of a scheduled certification. This table extends the Audit (cert_audit) table.</td>
</tr>
<tr>
<td>Certification Schedule</td>
<td>Stores certification for a specific set of information on a specific table, what user or group the tasks should be assigned to, and how often this certification should be done.</td>
</tr>
<tr>
<td>Certification Task</td>
<td>Stores individual certification tasks. Certification Task extends the Task table.</td>
</tr>
</tbody>
</table>

Script Includes

Data Certification adds the following script includes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CertificationAjax</td>
<td>Provides utilities that enable individual certification elements to be certified, rejected, or reverted.</td>
</tr>
<tr>
<td>CertificationTaskCreate</td>
<td>Custom code that extends the standard code for certification tasks.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CertTaskEscalationTimerPercentage</td>
<td>Updates time and percentage complete information for a certification.</td>
</tr>
<tr>
<td>CertificationUtilities</td>
<td>Provides utility functions for certification.</td>
</tr>
</tbody>
</table>

**Client Scripts**

Data Certification adds the following client scripts:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert If Boxes Checked</td>
<td>Certification Task (cert_task)</td>
<td>Provides a warning if the certifier attempts to leave a record without certifying the checked elements</td>
</tr>
<tr>
<td>Check Table Name</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Updates the table name when a different filter is selected.</td>
</tr>
</tbody>
</table>

**UI Policies**

Data Certification adds the following UI policies:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide next scheduled run</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Hides the Next Scheduled Run field when the schedule is set to run once or on demand only.</td>
</tr>
<tr>
<td>• Hide “run” associated fields when active is set to false</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Hides the Run field when Active is set to False.</td>
</tr>
<tr>
<td>• Hide Run When Not Active</td>
<td>Certification Schedule (cert_schedule)</td>
<td></td>
</tr>
<tr>
<td>Make table name read only</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Makes the Table field read-only.</td>
</tr>
<tr>
<td>Hide Table field</td>
<td>Certification Element (cert_element)</td>
<td>Hides the Table field on the certification task form.</td>
</tr>
<tr>
<td>Make percent complete field read only</td>
<td>Certification Instance (cert_instance)</td>
<td>Makes the Percent complete field read only when the State is Work in Progress, Closed Complete, Closed Incomplete, or Cancelled.</td>
</tr>
<tr>
<td>Show Assign to fields</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Shows the Assign To field when the assignment type is User and hides the Assign To field for all other assignment types.</td>
</tr>
<tr>
<td>Show Group field</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Shows the Assignment Group field when the assignment type is Group and hides the Assignment Group field for all other assignment types.</td>
</tr>
<tr>
<td>Show User field</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Shows the User field when the assignment type is User.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki Now Platform Capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Assignment Fields</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Shows the Assign To Empty option if the assignment type is User Field or Group Field.</td>
</tr>
</tbody>
</table>

#### Business Rules

Data Certification adds the following business rules:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjust dates for cert tasks</td>
<td>Certification Instance (cert_instance)</td>
<td>Adjusts dates for tasks belonging to the certification instance when the dates are changed for an active certification.</td>
</tr>
<tr>
<td>Cancel Instance</td>
<td>Certification Instance (cert_instance)</td>
<td>Cancels all open certification tasks when an active certification is canceled.</td>
</tr>
<tr>
<td>certification audit instance events</td>
<td>Certification Audit Instance (cert_audit_instance)</td>
<td>Sends an inserted event when an active certification audit instance is created. Sends a completed event when an active certification audit instance is marked as complete or incomplete.</td>
</tr>
<tr>
<td>certification element events</td>
<td>Certification Element (cert_element)</td>
<td>Sends a failed event when an element of a certification is marked as failed.</td>
</tr>
<tr>
<td>certification instance events</td>
<td>Certification Instance (cert_instance)</td>
<td>Sends an inserted event when an instance of a certification is created. Sends a completed event when an instance of a certification is completed.</td>
</tr>
<tr>
<td>Certification Instance Rollup</td>
<td>Certification Task (cert_task)</td>
<td>Updates the Percent complete field on the certification instance record.</td>
</tr>
<tr>
<td>certification task events</td>
<td>Certification Task (cert_task)</td>
<td>Sends an inserted event when a task is inserted. Sends a completed event when a task is deactivated. Sends a canceled event when a task is canceled.</td>
</tr>
<tr>
<td>Certification Task Values</td>
<td>Certification Element (cert_element)</td>
<td>Updates the percent complete of the parent task when a certification element is updated.</td>
</tr>
<tr>
<td>Check Certification Audit Progress</td>
<td>Certification Instance (cert_instance)</td>
<td>Updates the completion status of the audit instance as a whole when a certification that is part of an audit is complete.</td>
</tr>
<tr>
<td>Clean Certification Views</td>
<td>Certification Instance (cert_instance)</td>
<td>Cleans all related records when a certification instance is deleted.</td>
</tr>
<tr>
<td>Copy certification schedule fields</td>
<td>Certification Instance (cert_instance)</td>
<td>Copies changes to the certification schedule to the certification instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Merge Certification Tasks</td>
<td>Certification Task (cert_task)</td>
<td>Merges two tasks together when a task is reassigned and there is another task for the same instance with the new user.</td>
</tr>
<tr>
<td>Prevent delete of Filter with Schedule</td>
<td>Certification Filter (cert_filter)</td>
<td>Prevents the deletion of a filter that is used in a schedule.</td>
</tr>
<tr>
<td>Reassign Notification</td>
<td>Certification Task (cert_task)</td>
<td>Sends out a notification to the new and previous assignees when a task is reassigned.</td>
</tr>
<tr>
<td>Rollup State</td>
<td>Certification Task (cert_task)</td>
<td>Updates all necessary parent items when task state is changed.</td>
</tr>
<tr>
<td>Update audit reference</td>
<td>Certification Task (cert_task)</td>
<td>Makes Data Certification records compatible with Desired State records. This rule makes sure that the Audit field is correctly completed when a record is inserted using Insert and Stay.</td>
</tr>
<tr>
<td>Update audit result</td>
<td>Certification Element (cert_element)</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule puts certified values in the Desired value column when an audit is Certified and puts actual values in the Discrepancy value column when an audit is Failed.</td>
</tr>
<tr>
<td>Update follow_on_task &amp; audit references</td>
<td>Certification Element (cert_element)</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule makes certification tasks compatible with follow-on tasks and displays all tasks, regardless of origin.</td>
</tr>
<tr>
<td>Update next run time</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Updates the Next scheduled run field when a schedule runs Daily, Weekly, Monthly, or Periodically.</td>
</tr>
<tr>
<td>Verify Fields</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Verifies that no field is used in both Display and Certification fields when a certification schedule’s fields are changed.</td>
</tr>
</tbody>
</table>

Formatter

Data Certification adds the following formatter:
Table 54: Formatter

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Task Elements</td>
<td>Enables custom user interface formatting of elements on a certification task. For example, displays the green check mark and red exclamation point to use when certifying an element.</td>
</tr>
</tbody>
</table>

Properties

Table 55: Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.cert_task_activity.fields</td>
<td>System Properties (sys_properties)</td>
<td>Defines which journal field is the task activity field. Default: work_notes</td>
</tr>
</tbody>
</table>

User Roles

Data Certification adds the following user roles:

Table 56: User Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification_admin</td>
<td>certification</td>
<td>Can create certifications, configure certifications, override provided answers, perform certification tasks for certification task owners, send certification task notifications to users and owners at any time, and cancel or delete certifications in any state.</td>
</tr>
<tr>
<td>certification_filter_admin</td>
<td>certification</td>
<td>Can create and manage all data certification filters.</td>
</tr>
<tr>
<td>certification</td>
<td>none</td>
<td>Can update active or incomplete tasks assigned to them or to groups of which they are a member. Can also update configuration items owned by them or by groups of which they are a member. Receives email notifications when assigned certification tasks.</td>
</tr>
</tbody>
</table>

Events

Data Certification adds the following events. The ServiceNow system uses these events to send email notifications to task owners and managers about changes in certification records.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert_audit_instance.completed</td>
<td>A certification audit instance has been completed.</td>
</tr>
<tr>
<td>cert_audit_instance.inserted</td>
<td>A certification audit instance has been inserted.</td>
</tr>
<tr>
<td>cert_element.failed</td>
<td>A certification element has failed certification.</td>
</tr>
<tr>
<td>cert_instance.completed</td>
<td>A certification instance has been completed.</td>
</tr>
<tr>
<td>cert_instance.inserted</td>
<td>A certification instance has been inserted.</td>
</tr>
<tr>
<td>cert_task.cancelled</td>
<td>A certification task has been canceled.</td>
</tr>
<tr>
<td>cert_task.completed</td>
<td>A certification task has been completed.</td>
</tr>
<tr>
<td>cert_task.escalate</td>
<td>A certification task record has been escalated.</td>
</tr>
<tr>
<td>cert_task.inserted</td>
<td>A new certification task has been created.</td>
</tr>
<tr>
<td>cert_task.notifications</td>
<td>A certification task notification has been resent to a user.</td>
</tr>
<tr>
<td>cert_task.overdue</td>
<td>A certification task is past its specified completion date.</td>
</tr>
<tr>
<td>cert_task.reassign</td>
<td>A certification task has been reassigned.</td>
</tr>
<tr>
<td>cert_task.warning</td>
<td>A new task escalation point has been reached.</td>
</tr>
</tbody>
</table>

**Email Templates**

Data Certification adds the following email templates:

<table>
<thead>
<tr>
<th>Name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification.task.cancelled</td>
<td>A certification task assigned to you/your group as part of the data certification and management process has been canceled.</td>
</tr>
<tr>
<td>certification.task.reminder.inserted</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.outstanding</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.overdue</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process is overdue.</td>
</tr>
</tbody>
</table>

**Certification schedules**

A certification schedule defines the information that needs to be certified and how frequently the certification should be performed.

At each time interval specified, or on-demand, the certification schedule generates a set of certification tasks based on set conditions. Use the Preview Certification Tasks related link to preview the certification tasks generated from a certification schedule.
The minimum requirements for Unix Servers are:

- CPU Speed: 3ghz
- Ram: 16gb
- CPU Core Count: 4
Certification tasks

A certification task represents the work of verifying the data associated with a particular record. Task owners are responsible for performing the certification tasks. Tasks have an associated workflow that sends reminders to the task owner and, if necessary, the owner’s manager at regular intervals.

Figure 61: Certification Task
Certification elements

Each element of each record being certified is tracked in its own certification element record. Also tracked are the date and time when the element was certified, comments, and the original and certified values of the field. You can view elements on individual certification tasks.

![Certification Elements](image)

Figure 62: Certification Elements

Certification instances

A certification instance is the collection of certification tasks for one execution of a certification schedule.
Certification audit instances

A certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.
Certification audit definition

A certification audit definition is a collection of certification schedules that can be run at once.
Figure 65: Certification Audit Definition

Data Certification Overview module

The Data Certification Overview module displays various data certification-related reports on the Data Certification Console homepage.

The Overview module is a type of homepage.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>Role</td>
<td>Access</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------</td>
</tr>
</tbody>
</table>
| certification_admin | • View (view overview page and refresh reports)  
|                  | • Customize (refresh, add, delete, and rearrange reports)  
|                  | View, customize                             |
| admin            | • View (view overview page and refresh reports)  
|                  | • Customize (refresh, add, delete, and rearrange reports)  
|                  | • Edit (can edit reports)                    |

Data Certification Overview Module

The Overview module includes the following reports:

Table 58: Data Certification Overview Module Description

<table>
<thead>
<tr>
<th>report</th>
<th>Description</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>30/60/90 Day Aging</td>
<td>Groups tasks by the number of days (30, 60, 90, and 90 and over) since the task was opened.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Certification Instances</td>
<td>Lists all certification instances.</td>
<td>Certification Instance</td>
</tr>
<tr>
<td>Certification Progress Report</td>
<td>Groups tasks by task owner, indicating task progress as a percentage.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Certification Task Completed</td>
<td>Groups tasks by task owner, indicating tasks that are complete.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Exceptions To Date</td>
<td>Lists all task elements that have comments added and a state of Failed or In Progress.</td>
<td>Certification Element</td>
</tr>
<tr>
<td>Functional Roll Up</td>
<td>Lists the managers that have groups with assigned certification tasks. The report is a horizontal bar chart, grouped by status, with each bar representing a manager of an assignment group.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Hierarchical Roll Up</td>
<td>Shows the managers that have employees with assigned certification tasks (task owners). The report is a horizontal bar chart, grouped by status, with each bar representing a manager of a task owner (identified in the Assigned to field).</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Upcoming Schedules</td>
<td>Lists all schedules that are scheduled to run within the next 30 days.</td>
<td>Certification Schedule</td>
</tr>
</tbody>
</table>
Use the Data Certification Overview module

1. Navigate to Data Certification Overview.
2. Click elements within the reports to obtain more information.
   For example, click any of the colored bars in the Functional Roll Up bar chart and detailed information replaces the Data Certification Console screen.
3. Update some fields directly on the overview page.
   For example, in the red box on the image shown, a certification schedule is being updated in the certification instances report.

Data Certification planning

Initial planning can make the certification process more successful.

By defining certification schedules and certification audit definitions, users with the certification_admin role establish when certifications are performed, who performs it, and what data must be certified.

Required Roles

Users with the certification_admin role can view filter versions. These users can create, update, and delete filters, if they have the proper access to necessary tables. In the base ServiceNow system, certification_admin users have limited system rights and might not have access to all the tables required for creating a filter. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, this user might need roles that grant access to these tables:

- Company (core_company)
- Cost Center (cmn_cost_center)
- Schedule (cmn_schedule)

Planning Data Certification

Planning the data certification process requires defining the following:

- The certification schedule defines certification for a particular set of information on a particular table. It also generates certification tasks to perform that certification. One certification task is generated per task owner and the tasks are grouped together by a certification instance record.
- The optional certification audit definition groups a number of certification schedules to be performed together and generates certification audit instances to perform them.

The following questions should be answered for each certification schedule:

- What information needs to be certified?
- When is the due date by which the information needs to be certified?
- Who must perform the certification?

Create a certification filter

A filter is a subset of configuration items from any ServiceNow table that is created with a standard condition builder.

An example is a filter that selects all UNIX servers in the Australian data center.

With filters, you can:

- Create multiple versions of a filter and then select the version you want to use.
- Use one filter on multiple certification schedules.
- View the number of records that match your filter as you create the conditions.

Note: Be sure to create certification filters before creating certification schedules.

1. Navigate to Data Certification Certification Filters.
2. Click New.
3. Fill in the form (see table).
4. Click Submit.
   This action saves the filter as version 1.

Figure 67: Certification Filter V1

5. To create another filter version, modify the filter conditions and click Update.
   The system saves the new filter and increments the version number.

Figure 68: Certification Filter V2

By default, the Certification Filters list shows only the current version of each filter. To see all filter versions, click All in the breadcrumbs.
6. To make an inactive filter the current version, open the inactive filter and click Revert.

This action creates a new, active version of the filter and makes all previous versions inactive.

7. To delete a single filter version, open that version record and click Delete.

8. To delete all versions of a filter, click Delete all versions under Related Links in that filter record.

You cannot delete a filter that is used in a schedule definition. The system displays a warning and the filter is not deleted.
Table 59: Creating Certification Filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Brief description of the filter.</td>
</tr>
<tr>
<td>Number</td>
<td>(Read-only) Automatically assigned filter identification number.</td>
</tr>
<tr>
<td>Table</td>
<td>Table containing the records to be filtered. Use of the Database View (\text{sys_db_view}) table is limited by version.</td>
</tr>
<tr>
<td>Active</td>
<td>Control to make the filter available for use from the Filter field on the Certification Schedule form.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of this filter. Any significant changes to the filter make the current version inactive. The system copies the updated filter, marks it as active, and increments the version number. The system saves all versions of the filter and makes them available to users. More than one version of a filter can be marked active.</td>
</tr>
</tbody>
</table>
Define a certification schedule

A certification schedule specifies the fields to display, the fields that require certification, to whom certification tasks should be assigned, how much time the task owners have to complete their work, how often the schedule should run, and any detailed instructions for task owners.

Use the preview option to see what tasks will be created before saving the schedule. If the tasks are not what you want, edit the schedule and preview the tasks again. The system creates certification tasks automatically when it executes a schedule.

To schedule a certification:
1. Navigate to Data Certification Schedule Definitions.
2. Click New.
3. Fill in the fields (see table).
4. Click Submit.

Table 60: Defining A Certification Schedule

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A schedule name.</td>
</tr>
<tr>
<td>Filter</td>
<td>A certification filter for this schedule.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) The table holding the records to be certified. To change the table name, select a different Filter or create a new Filter.</td>
</tr>
<tr>
<td>Display fields</td>
<td>The fields displayed in the Certification Task list to provide context. These do not require certification themselves. For example, although users might not be required to certify the Name field of a record, it should be displayed so that users know what record they are certifying.</td>
</tr>
<tr>
<td>Certification fields</td>
<td>The fields to certify on this certification schedule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assignment type</td>
<td>A choice list to select how the certification schedule assigns the certification tasks.</td>
</tr>
<tr>
<td></td>
<td>• User Field: Select a user reference field on the table being certified. As an example, you might select the user named in the Managed by field to identify the user who should perform the task. This selection displays the Assign to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• Specific User: Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>
<tr>
<td></td>
<td>• Group Field: Select a group reference field on the table being certified. As an example, you might select the Support group field to identify the user who should perform the task. This selection displays the Assign to group and Assign to empty fields. All members of the group from the reference field on the record are assigned to the tasks. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• Specific Group: Select a specific group to perform the tasks. This selection displays the Group field. All members of the named group are assigned to the tasks.</td>
</tr>
<tr>
<td>User</td>
<td>This field appears when:</td>
</tr>
<tr>
<td></td>
<td>• Assignment type is Specific User. This system assigns this user to all certification tasks for this schedule.</td>
</tr>
<tr>
<td></td>
<td>• The Assign to empty field is set to Create Assigned Task, and you have selected User Field as the assignment type. The system assigns this user to certification tasks containing unassigned records.</td>
</tr>
<tr>
<td></td>
<td>You can only select users with the certification role.</td>
</tr>
<tr>
<td>Assign to group</td>
<td>The group field that defines the group assigned to the certification tasks. This field is available only when the Assignment type is Group Field.</td>
</tr>
<tr>
<td>Group</td>
<td>The specific group to which certification tasks are assigned for this schedule. This field is available only when the Assignment type is Specific Group.</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user field that defines which user is assigned to the certification task. This field is available only when the Assignment type is User Field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Assign to empty | The behavior to use if the field selected in Assign to or Assign to group is blank on the record being certified. For example, if a task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the Assignment type is User Field or Group Field. The possible selections are:  
  • Do Not Create Task: No task is created when the Assign to or Assign to group field is empty.  
  • Create Unassigned Task: Create a task, but do not assign it to any user or group. The task can be manually assigned later.  
  • Create Assigned Task: Create a task and assign it to the user or group specified. If you selected an assignment type of User Field, the User field is available. If you selected the Group Field type, the Group field is available.  
  The schedule automatically creates certification tasks for all records that do have “Assign to” populated, regardless of which selection you make for “Assign to empty.” |
| Days to complete | (Required) The number of days that task owners have to complete the certification tasks. If this certification schedule is part of a certification audit definition, the audit definition’s Days to Complete value overrides the value set for the certification schedule.                                                                                           |
| Active          | Check box to activate this certification schedule, generating certification tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except Last run date) and not generate certification tasks.                                                                                           |
| Run             | How often to run the schedule that generates certification tasks:  
  • Daily  
  • Weekly  
  • Monthly  
  • Periodically  
  • Once  
  • On Demand                                                                                                                                                                                                                                                                   |
| Day             | If Run is Weekly, the day of the week when the schedule should run and generate certification tasks.  
  If Run is Monthly, the day of the month when the schedule should run and generate certification tasks. If the day is 29, 30 or 31, the certification runs on the last day of the month for shorter months.                                                                                               |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat Interval</td>
<td>If Run is Periodically, the frequency that the schedule should run to generate certification tasks, entered in time, days, or both. For example, set Days to 10 and Hours to 14:00:00 to run the schedule and generate certification tasks every 10 days at 2:00 pm.</td>
</tr>
<tr>
<td>Starting</td>
<td>If Run is Periodically or Once, the date and time when the schedule should run and generate certification tasks.</td>
</tr>
<tr>
<td>Time</td>
<td>If Run is Daily, Weekly, Monthly, or Once, the time of day, on a 24-hour clock, when the schedule should run and generate certification tasks.</td>
</tr>
<tr>
<td>Last run date</td>
<td>(Read-only) The date and time that the schedule ran last, either on its regular schedule or manually, and generated certification tasks.</td>
</tr>
<tr>
<td>Next scheduled run</td>
<td>(Read-only) The next date and time on which the schedule should run and generate certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>A description to add to the Short Description field of the certification task.</td>
</tr>
<tr>
<td>Instructions</td>
<td>An HTML field for providing instructions to the user or group performing the certification.</td>
</tr>
</tbody>
</table>

### Preview a certification task

Previewing certification tasks saves any changes to the Certification Schedule form and displays the tasks that will be created when you execute the certification schedule.

Previewing tasks is especially useful if you want to test different combinations of options in the Assignment type, Assign to, and Assign to empty fields.

1. Navigate to Data Certification Schedules Schedule Definitions.
2. Click a certification schedule Name.
3. In Related Links, click Preview Certification Tasks.

The tasks to be created appear at the top of the screen.

![Figure 73: Certification Info Message](image)
Use a certification schedule notification

After you define a certification schedule, the system automatically sends notifications to specific users based on the information in the schedule.

The following notifications are sent automatically:

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email template name</th>
<th>Notification message is sent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>0% (when task is created)</td>
<td>certification.task.reminder.inserted</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>50%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>75%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and task owner’s manager, if specified</td>
</tr>
<tr>
<td>95%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and task owner’s manager, if specified</td>
</tr>
<tr>
<td>100%</td>
<td>certification.task.reminder.overdue</td>
<td>Task owner, assignment group, if specified, and task owner’s manager, if specified</td>
</tr>
</tbody>
</table>

The email templates used in the notifications can be edited, for example, to change the email message text.

Executing a Certification Schedule

Executing a certification schedule generates certification tasks based on the schedule.

1. Navigate to Data Certification Schedules Schedule Definitions.
2. Click a certification schedule Name.
3. Click Execute Now.

The related lists Certification Instances and Certification Tasks display the instances or tasks generated by the schedule. The amount of time it takes to generate all certification tasks depends on the size of the table selected and how many fields need to be certified.
Define and create a certification audit

A certification audit is a collection of certification schedules that can be run as a single entity. Certification audits can be useful when multiple certification schedules need to be coordinated. After creating a certification audit definition, you can generate a certification audit instance. The certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

1. Navigate to Data Certification Audits Audit Definitions.
2. Click New.
3. Fill in the fields (see table).
4. Right-click the header bar and select Save.
5. In the Certification Schedules related list, click Edit.
6. In the Collection list on the left, select one or more schedules and click Add.
7. Click Save.
8. In Related Links, click Create Certification Audit Instance.

The system generates an audit instance based on the certification schedules selected. All audit instances based on this audit definition are listed in the Certification Audit Instances related list.

Table 62: Defining and Creating a Certification Audit

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the audit definition.</td>
</tr>
<tr>
<td>Days to Complete</td>
<td>The number of days that task owners have to complete the certification tasks created by this audit definition. Overrides the identical field on the certification schedule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the intended audit.</td>
</tr>
</tbody>
</table>

**Track a certification audit instance**

You can view a list of all certification audit instances at any time.

1. Navigate to Data Certification Audits Audit Instances.
2. View the Certification Instances related list.
   
   The list contains each of the associated instances generated as part of the audit.

**Data certification performance**

After the certification process has been planned, certification tasks can be performed according to defined schedules.

After the certification process has been planned, certification tasks can be performed according to defined schedules. Users with the certification role can perform certification tasks. The certification tasks can be tracked as part of certification instances.

**Fulfill certification tasks**

After you execute a certification schedule manually or at a scheduled time, the ServiceNow system performs certain actions.

After you execute a certification schedule manually or at a scheduled time, ServiceNow performs the following actions:

- Creates tasks for any records that meet the filter requirements in the specified table, such as those from the Configuration Item (cmdb_ci) table.
- Assigns the new tasks to the user or group identified in one of these certification schedule fields:
  - Assign to
  - User
  - Assign to group
  - Group
- Places the new tasks in the Work in Progress state.
- Adds the certification schedule Short description and Assigned to values to the corresponding fields on the certification task record.
- Adds the certification schedule Days to complete and Complete by date fields to the certification task record, based on when the task is created.

Note: If the certification filter does not match any CIs, the system sets the State to Closed Complete and the Percent complete to 100.

To view tasks assigned to you, navigate to Data Certification Tasks My Tasks.

The following information is tracked on the certification task record:
Table 63: Certification task record

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identification number for the certification task.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The user responsible for certifying the data.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>The group responsible for certifying the data.</td>

<td>the text from the associated certification schedule’s Task description</td>
</tr>
<tr>
<td></td>
<td>field.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Information about work performed on the certification.</td>
</tr>
</tbody>
</table>

Export the certification list

Users with the certification_admin role can export the certifications list and save the list in Excel, CSV, XML, or PDF format. This may be useful if you have a long list of certification elements or if many different users are assigned to certify elements on a single certification schedule.

For general information and common export steps, see Export list data.

1. Navigate to Data Certification Tasks All Tasks
2. Open a task.
3. Open any column context menu in the certification data list and complete the export.

Certify an element

The Certification Task form contains a list of all elements to be certified.

Note: After you certify all the elements in a task, no elements can be reverted.

1. Navigate to Data Certification Tasks My Tasks.
2. Open a certification task with a State of Work in Progress.
3. In the upper right corner of the list, select whether to show only records that still need to be certified for this task or all records that are part of this certification task.

![Figure 75: Certification list 3](image)

4. Select the check box beside a certification element.
5. In Optional comment for checked elements, above the list, enter information that would be useful to others.

![Figure 76: Certification list](image)

6. Do one of the following:
   - Click the green check mark to certify the element.
   - Click the red exclamation point to fail the element.

7. To see the certified or failed element, set the view to Show All Records.
   A green check mark or red exclamation mark appears beside the element.
8. Point to an icon to see any certification comments.
9. Ensure that all elements have the correct certification, either accepted or rejected.

After you certify all elements, no elements can be reverted. When all elements of a certification task are certified or rejected, the task State changes to Closed Complete.

View an audit result

View audit results after you certify the elements.

1. Navigate to Data Certification Schedules Audit Results.

   The list of data certification audit results appears, grouped by certification instances. Certified configuration items show the Original value only. Failed CIs contain the Certified value and the Original value.

2. Click the links in the list to open any of the related records.
Reset certifications

You cannot reset any element after all elements are certified.

- To reset individual certifications, right-click the element in the certification list and select Revert Certification.
- To reset the entire task to its starting point, click the Reset all Certifications to Pending related link.

Track a task with a certification instance

The Certification Tasks related list on the certification instance record provides information about associated tasks.

The State field on the certification instance record is read-only and is based on the cumulative states of the certification tasks associated with the instance. The Percent complete column allows users with the certification_admin role to track task progress quickly. For more information, see Track Certification Tasks.

To track a certification instance:

1. Navigate to Data Certification Schedules Instances.
2. Click a certification instance Number.
3. View and edit the following fields as necessary.
Table 64: Certification instance

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>(Read-only) Automatically generated identification number for the instance.</td>
</tr>
<tr>
<td>Certification Schedule</td>
<td>The &lt;code&gt;certification schedule&lt;/code&gt; used to create the certification instance.</td>
</tr>
<tr>
<td>State</td>
<td>(Read-only) Current state of the certification instance: Work in Progress, Complete, Closed Incomplete, or Cancelled. For more information, see &lt;code&gt;Track Certification Tasks&lt;/code&gt;.</td>
</tr>
<tr>
<td>Created</td>
<td>(Read-only) Date and time on which the certification instance was created. Date is filled in automatically when the Execute Now button is clicked on the associated certification schedule.</td>
</tr>
<tr>
<td>Complete by</td>
<td>(Required) Date and time when the certification instance must be completed. The system updates this field when it executes the schedule, using the deadline specified on the instance. All certification tasks associated with the certification instance must be marked Complete, Closed Incomplete, or Cancelled before the instance is complete.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>Percentage of the instance that has reached the Closed Complete state. This field is automatically filled in based on the Percent Complete fields on the associated certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>Information about the certification instance. This field is automatically filled in with the text from the associated certification schedule’s Task description field.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Field for providing instructions to the user or group performing the certification. This field is automatically filled in with information from the Instructions field on the associated certification schedule.</td>
</tr>
</tbody>
</table>

Cancel a certification instance

Users with the certification_admin role can cancel a certification instance.

The instance must have a State of Work in Progress. Canceling a certification instance:

- Changes the certification instance State to Cancelled.
- Changes all associated Work in Progress certification tasks to Cancelled.

To cancel a certification instance:

1. Navigate to Data Certification Schedules Instances.
2. Click a certification instance Number.
3. Click Cancel.

Track a certification task

Use the certification task state to track the progress of a task.

The available task states are Work in Progress, Closed Complete, Closed Incomplete, and Cancelled.

When the state of a certification task changes, the certification instance state also changes in the following cases:

- If any certification task is in Work in Progress state, the certification instance is placed in Work in Progress state.
- If all certification tasks are in Cancelled state, the certification instance is placed in Cancelled state.
- If all certification tasks are in Cancelled or Closed Complete state, the instance is placed in a Closed Complete state. For example, if three certification tasks are Cancelled, and one task is Closed Complete, the instance state is changed to Closed Complete.
- If at least one certification task is in Closed Incomplete state and the remainder of the tasks are in Cancelled or Closed Complete state, the instance is placed in Closed Incomplete state.

To view the state of certification tasks:

1. Navigate to Data Certification Tasks and select My Tasks or All Tasks.
2. View the State column for each task.

Escalate a certification task

Users with the certification admin role can escalate a task in the Work in Progress state. To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

You may need to personalize the User form to see the Manager field.

Escalating a task:

- Sends an email message to the task owner and the task owner’s manager stating that the task has been escalated.
- Sets the manager as the new task owner.

The event that triggers the escalation is named cert_task.escalate and the email notification is named Escalation Notification. To edit the text of the email message that is sent, edit the Escalation Notification email notification directly.

For more information, see Email notifications.

To escalate a certification task from the Certification Task form:

1. Navigate to Data Certification Tasks All Tasks.
2. Click a certification task Number.
3. Click Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager.

Escalate a certification task from the certification task list

1. Navigate to Data Certification Tasks All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager. If you select multiple tasks from the list, and some are not eligible for escalation, the menu option indicates how many the system can escalate, such as Escalate (4 of 6).

Reassign a certification task

Users with the certification_admin role can reassign any certification task in the Work in Progress state. Tasks in Closed Complete, Closed Incomplete, or Cancelled state cannot be reassigned. When a task is reassigned, ServiceNow sends a message to the current task owner and the new task owner.

The event associated with the reassignment is named cert_task.reassign and the email notification is named Certification Task Reassignment. To edit the text of the email message that is sent, edit the Certification Task Reassignment email notification directly.

For more information, see Email notifications.

To reassign a certification task:
1. Navigate to Data Certification Tasks All Tasks.
2. Click a certification task Number.
3. Enter a new name in the Assigned to field.

Send certification task reminders

The Certification Task Escalations workflow sends automatic email reminders.

The Certification Task Escalations workflow sends automatic email reminders to the:

- Certification task owner.
- Assignment group, if the assignment group was specified on the Certification Task form.
- Certification task owner’s manager, if necessary and if a manager was specified on the task owner’s User form.

The reminders are based on the Complete by field on the certification task record. If the Complete by date is changed, the reminder schedule automatically adjusts to reflect the new date.

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email reminder is sent to</th>
<th>Escalate field on task record reads</th>
</tr>
</thead>
<tbody>
<tr>
<td>50%</td>
<td>task owner and assignment group (if specified)</td>
<td>Moderate</td>
</tr>
<tr>
<td>75%</td>
<td>task owner, assignment group, and task owner’s manager</td>
<td>High</td>
</tr>
<tr>
<td>95%</td>
<td>task owner, assignment group, and task owner’s manager</td>
<td>High</td>
</tr>
<tr>
<td>100%</td>
<td>task owner, assignment group, and task owner’s manager</td>
<td>High</td>
</tr>
</tbody>
</table>
To set reminders for different or more intervals, edit the workflow Certification Task Escalations. In addition to the email reminders sent automatically, users with the certification_admin role can send email reminders manually at any time.

Send an email reminder from the certification task form

How to manually send email reminders from the Certification Task form.
1. Navigate to Data Certification Tasks All Tasks.
2. Click a certification task Number.
3. Right-click the header bar and select Resend email notifications.

Send an email reminder from the certification task list

How to manually send email reminders from the Certification Task list.
1. Navigate to Data Certification Tasks All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Resend email notifications. If you select multiple tasks from the list, and some reminders have already been resent, the menu option indicates how many the system will resend, such as Resend email notifications (15 of 18).

Mark a certification task as closed incomplete

Mark a task as closed incomplete if, for example, only some of the elements can be certified.

The following users can mark a task as closed incomplete:
- Users with the certification_admin role.
- User identified in the Assigned to field on the certification task record.

To mark a task as closed incomplete:
1. Navigate to Data Certification Tasks and select All Tasks, or My Tasks.
2. Click a certification task Number.
3. In Work Notes, enter information about why the task could not be completed.
4. Click Close Incomplete.

If at least one task on a certification instance is marked Closed Incomplete, the Completed date and Percent complete fields on the certification instance record are not updated. A user with the certification_admin role can do one of the following:
- Complete the incomplete task or tasks.
- Cancel the incomplete task or tasks.

After all tasks on the certification instance are marked as Closed Complete or Cancelled, the system sets the Completed date field on the certification instance record to the current date and time, and changes the Percent complete field on the certification instance record to 100 percent.

Certification tasks cancellation

Users with the certification_admin role can cancel a certification task in the Work in Progress or Closed Incomplete state.
When a certification task is cancelled, a notification email is sent to the task owner or assignment group assigned to the task. The task owner or assignment group manager is not notified.

Cancel an individual task

1. Navigate to Data Certification Tasks All Tasks.
2. Find a task with a State of Work in Progress.
3. Click the task Number.
4. Click Cancel.

Cancel all tasks in an instance

1. Navigate to Data Certification Schedules Instances.
2. Find an instance with a State of Work in Progress.
3. Click the instance Number.
4. Click Cancel.

All tasks in the instance with a state of Work in Progress are cancelled. The task owner or assignment group is notified.

The email template used for the notification is named certification.task.cancelled. The email templates can be edited to change the email message text, for example.

Connect

ServiceNow Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, Human Resources, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

• Connect Chat: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.
• Connect Support: Enables support agents to provide real time assistance to end users, using queues. Requires the Connect Support plugin.

UI16 or UI15 is required to use Connect.

Note:
• Connect does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

Supported browsers for Connect

The system supports Connect Chat and Connect Support on most modern browsers.

• The latest public release of Firefox or Firefox ESR
• The latest public release of Chrome
• Safari version 6.1 and later
• Internet Explorer version 10 and later
  • Edge mode is supported.
  • Compatibility mode is not supported.
  • Setting Security Mode to High (via the Internet Options Security tab) is not supported.
  • Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

Activate Connect

Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Role required: admin

If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Installed with Connect

Several types of components are installed with Connect.

Tables installed with Connect

Connect adds the following tables.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collaborator</td>
<td>Stores a record for each conversation, for each conversation member.</td>
</tr>
</tbody>
</table>

Note: The Collaborator table is left over from the Collaborator plugin in Fuji. It is not used in Connect or Live Feed.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Action</td>
<td>Stores a record for each Connect action. This table is also used in Connect Support.</td>
</tr>
<tr>
<td>(connect_action)</td>
<td></td>
</tr>
</tbody>
</table>

**Properties installed with Connect**

Connect adds the following system properties.

**Note:** To open the System Property (sys_properties) table, enter sys_properties.list in the navigation filter.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collaboration.email_interval</td>
<td>Sets the number of minutes the system waits before sending a Connect notification email to an inactive user.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 3</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Administration Properties</td>
</tr>
<tr>
<td></td>
<td>• Learn more: Configure the email notification interval</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>collaboration.frameset</th>
<th>Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Administration Properties</td>
</tr>
<tr>
<td></td>
<td>• Learn more: Disable the Connect overlay</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>collaboration.polling_interval</th>
<th>Sets the number of seconds the system waits between polling for new Connect messages. This property also impacts Connect Support.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 10</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property (sys_properties) table</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>connect.notification.audio_alert</th>
<th>Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property’s value must point to the Name field of a record in the Audio File (db_audio) table. This property also impacts Connect Support.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: connect_alert.mp3</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Administration Properties</td>
</tr>
<tr>
<td></td>
<td>• Learn more: Customize the Connect audio notification sound</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| `connect.retrieve_external_link_content` | Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support.  
  • Type: true | false  
  • Default value: true  
  • Location: Collaborate Administration Properties |
| `connect.roles`                           | Determines which user roles are required to access Connect. When the value is blank, no role is required. This property also impacts Connect Support.  
  • Note: If you choose to restrict Connect access to specific roles, consider updating the role requirements for Connect modules and other access points.  
  • Type: string  
  • Default value: <empty>  
  • Location: Collaborate Administration Properties |
| `glide.connect.enabled`                   | Hides the Create or Join Chat Room related link, which appears on the Incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified.  
  • Type: true | false  
  • Default value: true  
  • Location: Collaborate Administration Properties |
| `glide.live_feed.task_header_button`     | Determines whether the show live feed icon and Follow button are available in the form header of tables that have the live_feed=true dictionary attribute.  
  • Type: choice list  
  • Default value: collaboration  
  • Other possible values:  
    • both: enables both the show live feed icon and the Follow button.  
    • live_feed: enables the show live feed icon.  
    • none: disables both the show live feed icon and the Follow button.  
  • Location: Collaborate Administration Properties  
  • Learn more: Configure record conversations |

Business rules installed with Connect

Connect adds the following business rules.
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add message to conversations</td>
<td>Visual Task Board Card (vtb_card)</td>
<td>Generates system messages for conversations created from Visual Task Boards. The messages provide updates when cards are added to the board or moved between lanes.</td>
</tr>
<tr>
<td>Broadcast Chat APNS</td>
<td>Live Feed Message (live_message)</td>
<td>Generates push notifications when new messages are received in a conversation.</td>
</tr>
<tr>
<td>Broadcast Chat APNS</td>
<td>Live Mention (live_mention)</td>
<td>Generates push notifications when a user is mentioned in a conversation.</td>
</tr>
<tr>
<td>Connect: Notify Record Conversations</td>
<td>Attachment (sys_attachment)</td>
<td>Enables record conversations to display attachments added to the underlying record, in real time.</td>
</tr>
<tr>
<td>Send Notification</td>
<td>Notification (live_notification)</td>
<td>Generates the appropriate notifications when a user is mentioned in an activity stream.</td>
</tr>
<tr>
<td>Sync Board Members With Group Members</td>
<td>Live Group Member (live_group_member)</td>
<td>Adds Visual Task Board members as conversation members when you create a conversation from the board.</td>
</tr>
</tbody>
</table>

Notifications installed with Connect

Connect adds the following notifications.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collaboration Offline Group Message(s)</td>
<td>Sends an email notification to offline users when there are new messages in group chats they are members of. Contains a link to open the conversation and a summary of the messages.</td>
</tr>
<tr>
<td>Collaboration Offline Message Bundle</td>
<td>Sends an email notification to offline users when there are new messages in direct chats. Contains a link to open the conversation and a summary of the messages.</td>
</tr>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Sends push notifications to users according to their notification preferences. This notification also impacts Connect Support.</td>
</tr>
</tbody>
</table>

Activate Connect Support

You can activate the Connect Support plugin (com.glide.connect.support) if you have the admin role. This plugin includes demo data. If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support cannot be used concurrently. Starting with Helsinki Patch 2, when you activate Connect Support, the system automatically sets the state of all Chat Queue Entry (chat_queue_entry) records to Closed Complete. This ends any open help desk chats.

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.
   
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

### Installed with Connect Support

Several types of components are installed with Connect Support.

Note: Connect Support also utilizes many of the components installed with Connect.

### Tables installed with Connect Support

Connect Support adds the following tables for system use.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue Entry Transfer</td>
<td>Stores a record each time an agent transfers a support conversation to another agent.</td>
</tr>
<tr>
<td>[chat_queue_entry_transfer]</td>
<td></td>
</tr>
</tbody>
</table>

### Properties installed with Connect Support

Connect Support adds the following system properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect.support.conversation_limit</td>
<td>Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: -1</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>connect.support.idle.delay</td>
<td>Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 120</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>connect.support.idle.count_down</td>
<td>Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 60</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>connect.support.show_agent_avatar</td>
<td>Determines whether an agent’s avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent’s name only.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>connect.support.user.closed.conversation_limit</td>
<td>Determines how many closed conversations appear in a user’s support conversation history. When the value is set to 0, all previous conversations appear in the history.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 0</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>glide.connect.support.enabled</td>
<td>Disables or enables Connect Support. When the property is enabled, all help desk conversations are opened in Connect Support, rather than legacy chat. Additionally, the support tab appears in the Connect sidebar. This property is for system use only and should not be modified.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties (sys_properties) table</td>
</tr>
</tbody>
</table>

Business rules installed with Connect Support

Connect Support adds the following business rules.
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Populates the Average wait time field on the Chat Queue table with a calculated value when a support conversation is accepted. The calculation is based on the last 20 support conversations for the queue.</td>
</tr>
<tr>
<td>SNC - Chat Queue Entry Duration</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Populates the Duration field on the Chat Queue Entry table with a calculated value, based on the amount of time the support conversation was open.</td>
</tr>
<tr>
<td>SNC - Reflect Support Record in Q.Entry</td>
<td>Live Group Profile (live_group_profile)</td>
<td>Populates the Document table and Document ID fields on the Chat Queue Entry table when an agent creates an incident from a support conversation.</td>
</tr>
</tbody>
</table>

### Additional plugins for Connect Support

Additional plugins are available for Connect Support. These plugins integrate Connect Support with other features and provide capabilities to track performance metrics.

You must have the admin role to activate these additional plugins. For details, see [Activate a plugin](#).

#### Table 66: Additional plugins for Connect Support

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager’s Dashboard (com.glide.connect.managers_dashboard)</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view. Note: The Connect Support Manager’s Dashboard plugin does not activate Connect Support automatically. You must activate Connect Support to collect data for the homepage.</td>
</tr>
</tbody>
</table>
| Human Resources Application: HR Connect (com.snc.hr.hr_connect) | Sets up a human resources (HR) chat queue and makes it available on the HR Service Portal. The Human Resources Application: HR Connect plugin activates these related plugins if they are not already active:  
  - Human Resources Application: Core (com.snc.hr.core): Provides basic HR features. |
### Performance Analytics - Content Pack - Service Desk Chat

**Plugin:**
com.snc.pa.chat

**Description:**
Provides the Service Desk Chat Monitor dashboard, which analyzes key Connect Support metrics and indicators.

The Performance Analytics - Content Pack - Service Desk Chat plugin activates these related plugins if they are not already active:

- Connect Support Manager’s Dashboard
com.glide.connect.managers_dashboard: See description in this table.

**Note:** You can activate Performance Analytics content packs on instances that do not have Performance Analytics Premium to evaluate the functionality. However, to collect scores for content pack indicators you must license Performance Analytics Premium.

### Performance Analytics - Context Sensitive Analytics for Chat

**Plugin:**
com.snc.pa.chat.context_sensitive_analytics

**Description:**
Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry chat_queue_entry form, and also as the Context Sensitive Analytics - Chat dashboard.

The Performance Analytics - Context Sensitive Analytics for Chat plugin activates these related plugins if they are not already active:

- Performance Analytics - Content Pack - Service Desk Chat com.snc.pa.chat: See description in this table.

---

**Connect interface**

Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

**Connect overlay**

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar and any Connect mini windows that are open.
Note: An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

Connect sidebar

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create new conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon ( ) in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

Connect Chat

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create new conversations.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the x icon to remove the conversation from the sidebar.

Connect Support

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays Queues to which you belong. It also displays your open support conversations under Cases.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

Figure 81: Support view of the Connect sidebar

Connect mini windows

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field. Several icons appear in the mini window header and by the message field.

Note: The icons you see for each conversation depend on the conversation type and other conditions.

Table 67: Chat mini window icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>Add user</td>
<td>Add a user to the conversation. This icon is visible for group and record conversations only.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>![folder]</td>
<td>View document</td>
<td>View the record associated with the conversation. This icon is visible for record and support conversations only.</td>
</tr>
<tr>
<td>![new_window]</td>
<td>New window</td>
<td>Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.</td>
</tr>
<tr>
<td>![minimize]</td>
<td>Collapse/Expand conversation</td>
<td>Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.</td>
</tr>
<tr>
<td>![close]</td>
<td>Close window</td>
<td>Close the mini window. The conversation remains in the Connect sidebar and the history is preserved when you reopen the conversation. You can also close a mini window by pressing the Escape key.</td>
</tr>
<tr>
<td>![menu]</td>
<td>Connect actions</td>
<td>Open the Connect actions menu, which contains options like Transfer and Create Incident. This icon is visible only when Connect actions are available for the conversation. By default, this icon is visible for support conversations only. Administrators can add options to this menu by creating new Connect actions.</td>
</tr>
<tr>
<td>![message]</td>
<td>Message type</td>
<td>Choose whether messages are added to the associated record as comments or work notes. This icon is visible only for record and support conversations.</td>
</tr>
<tr>
<td>![attach]</td>
<td>Attach file</td>
<td>Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.</td>
</tr>
</tbody>
</table>

**Connect workspace**

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It provides additional tools to help keep track of important information in conversations.

To open the Connect workspace, navigate to Collaborate Connect Chat or click the new window icon ( ![new_window] ) in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.

The Connect workspace is composed of the following elements.
### Table 68: Connect workspace elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sidebar</td>
<td>Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see <a href="#">Connect sidebar</a>.</td>
</tr>
<tr>
<td>Conversation pane</td>
<td>Displays the currently selected conversation.</td>
</tr>
<tr>
<td>Conversation tools</td>
<td>Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.</td>
</tr>
</tbody>
</table>
Figure 82: Connect workspace
Conversation pane

The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.

The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

Connect conversation tools

The conversation tools area in the Connect workspace contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

### Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, email, or audio notifications for all your Connect Chat and Connect Support conversations.

Role required: none

By default, Connect mobile, email, and audio notifications are enabled globally. You must enable desktop notifications.

An administrator can [customize the sound](#) used for audio notifications.

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. In the banner frame, click the gear icon (⚙️) to open the system settings.
2. In the system settings window, click the Notifications tab.
3. Enable or disable Connect mobile, desktop, email, or audio notifications.

Edit which notifications you receive [for a specific conversation](#).

### Connect notification browser support

The following browsers support Connect chat notifications.

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

<table>
<thead>
<tr>
<th>Browser</th>
<th>Enable notification steps</th>
</tr>
</thead>
</table>
| Chrome                           | 1. From a Chrome window, click the Chrome menu in the upper right corner.  
                                     2. Go to Settings Show advanced settings... Privacy Content settings .  
                                     3. In the Content settings window, from the notifications section, select your notification settings.                                                  |
| Mozilla Firefox (starting with version 44) | Manage browser notification settings using the information icon next to the URL.                                                                            |
| Safari (starting with OS X Mavericks) | 1. From a Safari window, open Preferences.  
                                     2. Select the notifications tab.  
                                     3. Select Allow or Deny to control which websites have access to notifications.                                                                    |
| Microsoft Edge                   | Notifications are enabled by default on Windows 10 PCs and tablets starting with EdgeHTML 14. For more information, see https://blogs.windows.com/msedgedev/2016/05/16/web-notifications-microsoft-edge/#pVkwubg7uvROayyI.97. |

Note: Internet Explorer does not support Connect notifications out of box.

Edit which notifications you receive for a conversation

You can control which types of Connect notifications you receive for each conversation and when you receive them.

Role required: none

Connect can send mobile, desktop, email, and audio notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile, desktop, and email notifications for all activity, and audio notifications only when someone mentions you. You might also want to disable a certain type of notification entirely for a conversation.

By default, you receive mobile, email, and audio notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see Connect notification browser support.

An administrator can customize the sound used for audio notifications.

Note: You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab ( ).
3. Edit the following settings according to your preferences.

Note: If a notification type is *disabled globally*, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.

| System Message Notifications | Enable or disable system message notifications, which are automatically generated by events like conversation membership changes and Visual Task Board updates. This option is not available for direct conversations. |

### Upload a profile picture

You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.
Role required: none

Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

1. Navigate to Collaborate Live Feed.
2. Click the tile with your picture or initials and title.

3. Use one of the following actions to add your photo.
   - Locate the photo file you want to use and drag it over the existing photo.
   - Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.

Drag and drop a file in a Connect conversation

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

Role required: none

You can drag and drop several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

   Drag and drop an item in a Connect mini window.

   To drag and drop a record from a list, drag the reference icon (ï¸œ), the record number, or a reference column value.
Connect accepts the same file extensions as the platform. For more information, see Add an attachment.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

2. Drag and drop a task board to a Connect mini window.
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Note that only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Mention a user in a Connect conversation

You can get someone’s attention in a group conversation by mentioning them.

Role required: none

Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.
1. Open a Connect group conversation.
2. In the message field, type the @ character.
   A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

Connect administration

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

Note: There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration and Connect Support administration.

Properties for Connect

The Connect Properties page provides several configuration options for Connect.

These properties are available for Connect.

Users with the admin role can access these properties by navigating to Collaborate Administration Properties.
Note: Many of the properties also impact Connect Support.

Table 71: Properties for Connect

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Disable Presence | Turns off user presence globally when enabled. Note that enabling this property turns off user presence throughout the platform, not just in Connect.  
- Type: true | false  
- Default value: false  
- Location: Collaborate Administration Properties  
- Learn more: [User presence](#) |
| Enable Connect in the frameset | Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.  
- Type: true | false  
- Default value: true  
- Location: Collaborate Administration Properties  
- Learn more: [Disable the Connect overlay](#) |
| Enable Connect to retrieve external link metadata in order to render richer content in messages with links to Youtube, news articles, images, etc. | Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support.  
- Type: true | false  
- Default value: true  
- Location: Collaborate Administration Properties |
| Number of minutes to wait before collecting unread messages and sending an email to offline users. | Sets the number of minutes the system waits before sending a Connect notification email to an inactive user.

- Learn more: [Configure the email notification interval](#) |
| Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect. This property’s value should point to the ‘name’ field of an audio file in the `db_audio` table. | Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property’s value must point to the Name field of a record in the Audio File (`db_audio`) table. This property also impacts Connect Support.  
- Type: string  
- Default value: `connect_alert.mp3`  
- Location: Collaborate Administration Properties  
- Learn more: [Customize the Connect audio notification sound](#) |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Comma separated whitelist of roles able access Connect. Empty allows all roles. connect.roles | Determines which user roles are required to access Connect. When the value is blank, no role is required. This property also impacts Connect Support.  
Note: If you choose to restrict Connect access to specific roles, consider updating the role requirements for Connect modules and other access points.  
- Type: string  
- Default value: <empty>  
- Location: Collaborate Administration Properties |
| Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task. Note: The Collaboration button will only be enabled if the frameset view is also enabled with collaboration.frameset = true glide.live_feed.task_header_button | Determines whether the show live feed icon and Follow button are available in the form header of tables that have the live_feed=true dictionary attribute.  
- Type: choice list  
- Default value: collaboration  
- Other possible values:  
  - both: enables both the show live feed icon and the Follow button.  
  - live_feed: enables the show live feed icon.  
  - none: disables both the show live feed icon and the Follow button.  
- Location: Collaborate Administration Properties  
- Learn more: Configure record conversations |
| Disable the legacy chat “Create or Join Chat Room” link on the Incident form (Must have Chat plugin enabled to see link) glide.connect.enabled | Hides the Create or Join Chat Room related link, which appears on the Incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified.  
- Type: true | false  
- Default value: true  
- Location: Collaborate Administration Properties |

**Configure the polling interval**

The polling interval determines how frequently the system polls for new Connect messages.

Role required: admin

The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.

Note: This setting impacts Connect Chat and Connect Support.

1. Navigate to sys.properties.list.
2. Locate the collaboration.polling_interval property.
3. Set the Value to a different number of seconds.
   Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

Disable the Connect overlay
The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.
Role required: admin
To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the collaboration.frameset property to false.
1. Navigate to Collaborate Administration Properties.
2. Locate the property called Enable Connect in the frameset (collaboration.frameset) and clear the check box.
3. Click Save.

Customize the Connect audio notification sound
You can replace the default Connect audio notification sound with an audio file of your choice.
Upload the audio file you want to use as the notification sound.
Role required: admin
The audio notification sound is used for all Connect conversation types, including Connect Support conversations.
1. Navigate to System UI Audio Files.
2. Locate the audio file you want to use as the notification sound and copy the Name value.
3. Navigate to Collaborate Administration Properties.
4. Locate the property called Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect (connect.notification.audio_alert) and replace the default value with the name of the audio file.
5. Click Save.

End users receive audio notifications when sending and receiving support chats. Support agents only receive audio notifications for inbound chats when the chat window is not in focus.

Administer Connect actions
You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.
If you want to customize the icon for a Connect action, navigate to Collaborate Administration Action Icons to view the available icons and their class names. Note the class name of the icon you want to use.
Role required: admin
The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.
1. Navigate to Collaborate Administration Actions.
2. Click New or open an existing Connect action.
3. Complete the Connect Action form, as appropriate.

</tr>
</tbody>
</table>
|                      | `response.newRecord("incident", {  
|                      |   short_description: conversation.document.short_description || "",  
|                      |   caller_id: conversation.document.opened_by });`                                                                                         |
|                      | For information about the response object, see the API reference documentation.                                                             |
|                      | **Note:** You can only create a Connect action based on a task table.                                                                       |
| Shortcut             | Text that triggers the action when entered after the "/" character in a conversation.                                                        |
| Title                | Text that appears in the Connect action menu. The title for each Connect action should be unique.                                             |
Connect Chat

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:

- Direct conversations between two users.
- Group conversations between three or more users.
- Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
- Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Chat.

This video demonstrates how to use Connect Chat.
This video demonstrates how to use Connect Support.

**Note:**
- Connect Chat does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

---

**Connect Chat use**

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

**Start a direct or group conversation**

You can start a conversation with one or more users in Connect Chat.

**Role required:** none

A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

1. In the chat view of the Connect sidebar, click the plus icon (+) by the filter.
   A Connect mini window appears.
2. In the To field, enter the name of the user you want to chat with.
   Suggestions appear as you type.
3. Enter additional names to create a group conversation.
   You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.
4. Press the Enter key to shift focus to the message field.
5. Send a message to create the conversation.
   The conversation is added to the Connect sidebar for quick access.

**Follow a record in Connect**

You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

**Role required:** whichever role is required to access the record you want to follow in Connect

Any record conversation you create in Connect becomes a record feed in live feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

**Note:** By default, record conversations are enabled for all tables that extend Task (task).
Administrators can enable record conversations for additional tables or disable them if desired.

1. Navigate to a task record.
2. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the record</td>
<td>1. In the form header, click Follow.</td>
</tr>
<tr>
<td></td>
<td>The system adds you as a member of the record conversation, but does not open the conversation. You can open the conversation from the Connect sidebar.</td>
</tr>
</tbody>
</table>
| Follow the record and open a chat mini window | 1. In the form header, click the down arrow in the Follow button.  
2. Select Open Connect Mini.                                                                 |
|                                            | The system adds you as a member of the record conversation and opens it in a Connect mini window.                                          |
| Follow the record and open the Connect workspace | 1. In the form header, click the down arrow in the Follow button.  
2. Select Open Connect Full.                                                                 |
|                                            | The system adds you as a member of the record conversation and opens it in the Connect workspace, the full-screen view.                      |

The Follow button is relabeled Following.

3. Add comments or work notes to the record directly from Connect.
   Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.
   a) In the record conversation, by the text entry field, click the message type icon (💬).
   b) Select Comment or Work Note.
   c) Enter a message.

By default, record conversation messages are added as comments.

Note: If you add an attachment to a record conversation, it is attached to the underlying record as well.

*Edit your notification settings* for the record conversation.

Edit basic conversation details

In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.

Role required: none

These details are not editable for direct conversations.

Note: The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

1. Open the a group or record conversation in the Connect workspace.
2. Click anywhere in the conversation header to the left of the icons. A pop-up appears to edit conversation details.
3. Edit the conversation image, name, and description as needed.
4. Click Save.

Add or remove conversation members

In Connect Chat, any member of a group or record conversation can add or remove other conversation members. In a direct conversation with only two people, you cannot add members to the conversation after you create it.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab.
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>2. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>2. Click the minus icon (-).</td>
</tr>
</tbody>
</table>

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

2. Open a task board.
3. In the board header, click the connect with board members icon. The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.

Note: There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.
Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Role required: admin

The default interval is 3 minutes. You can change this value.

1. Navigate to Collaborate Administration Properties.
2. Locate the property called Number of minutes to wait before collecting unread messages and sending an email to offline users. (collaboration.email_interval) and set the value to a different number of minutes.
3. Click Save.

Enable record conversations for a table

Record conversations are enabled for all tables that extend Task (task) by default. You can configure record conversations for additional tables that extend Task.

Role required: admin

To create record conversations, users must have access to the Follow button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

• The live_feed dictionary attribute must be set to true for the table.
  • By default, live_feed=true for all tables that extend Task (task).

• The glide.live_feed.task_header_button property must be set to both or collaboration.
  • By default, glide.live_feed.task_header_button is set to collaboration.

1. Navigate to the list view of a table for which you want to enable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v3</td>
<td>1. Click the list title menu and select Configure.</td>
</tr>
<tr>
<td></td>
<td>2. In the Configure window, click Dictionary.</td>
</tr>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.

The Dictionary Entry form appears.

4. In the Attributes related list, click New.

The Dictionary Attribute form appears.

5. In the Attribute field, enter Live feed.

6. In the Value field, enter true.

7. Click Submit.

8. Navigate to Collaborate Administration Properties.

9. Locate the property called Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task (glide.live_feed.task_header_button).

10. Ensure the property is set to both or collaboration.
The `glide.live_feed.task_header_button` property also controls whether the show live feed icon 📢 appears. If the property is set to collaboration, the show live feed icon does not appear on form headers.

Prevent users from following records in Connect for all tables

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for all tables.

Role required: admin

To disable record conversations for all tables, prevent the Follow button from appearing in all form headers by editing the `glide.live_feed.task_header_button` property.

1. Navigate to `sys_properties.list`.
2. Locate the `glide.live_feed.task_header_button` property.
3. Set the Value to `live_feed`.

Prevent users from following records in Connect for a specific table

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for a specific table.

Role required: admin

To disable record conversations for a specific table, prevent the Follow button from appearing in form headers for the table. To do so, set the `live_feed` dictionary attribute to false for the table.

1. Navigate to the list view of a table for which you want to disable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure Dictionary.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select Configure, and then select Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has `Type` set to `Collection`.

The Dictionary Entry form appears.

4. In the Attributes related list, locate the `Live feed` dictionary attribute.
5. Set the Value to `false`.

Note that setting the dictionary attribute to false also removes the show live feed icon 📢 for the table.

Connect Support

Connect Support is a real-time messaging tool that enables support agents to easily keep track of their support cases, quickly find solutions, and resolve problems quickly.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect. When Connect Support is enabled, users designated as support agents have access to the support tab of the Connect sidebar.
Features include:

- Administrators can create chat queues and enable users to access live support.
- Support agents can monitor the queues to provide instant support.
- Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Support.

Note:
- Connect Support does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

Monitor incoming Connect Support conversations

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.

Role required: none

Note: The support tab is visible only if you are an agent for one or more queues.

1. Navigate to Collaborate Connect Support.
   The Connect workspace opens in a new tab.

2. Click the support tab of the Connect sidebar, indicated by a headset icon (🥝).
   The support tab displays Queues to which you belong. It also displays your open support conversations under Cases. When a user starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue has the option to accept the conversation. An agent can also request to transfer a conversation directly to you.
3. Accept a conversation in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept a conversation from a queue</td>
<td>Under Queues, click Accept by the queue. The conversation opens in the conversation pane and an entry appears in the Cases section of the sidebar.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accept a transfer request</td>
<td>Under Cases, click Accept by a transfer request.</td>
</tr>
</tbody>
</table>

The conversation opens in the conversation pane. The agent who transferred the conversation may or may not stay in the conversation.

4. Respond to the user and help resolve the issue.

By default, your messages are added to the conversation record as comments and are visible to the user.

Share knowledge in a Connect Support conversation

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

Role required: none

Use the knowledge tool to research user questions and provide solutions quickly and easily.

1. Open a support conversation in the Connect workspace.
   The knowledge tool is not available in Connect mini windows.

2. In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.

   The knowledge homepage appears in the conversation tools pane.
3. Search for articles related to the user’s issue.
   For more information about finding knowledge, see `Knowledge search`.
4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.

**Transfer a Connect Support conversation to a different agent or queue**

You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Role required: none
1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.

3. In the Connect actions menu, select Transfer.
   A transfer dialog box opens.

4. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Transfer the conversation to an agent      | 1. To start the transfer request, click Transfer by an agent’s name.  
Be sure to choose an agent who is online, which is indicated by a green dot on their avatar.  
You can cancel the transfer any time before it is accepted.  
  
2. When the transfer is accepted, select one of the following options in the dialog box that appears.  
   • Stay: Remain in the conversation. This is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent.  
   • Leave: Exit the conversation. This is also known as a cold transfer. |
| Transfer the conversation to a queue       | Click Transfer by a queue.  
The system automatically removes you from the conversation and the conversation enters the queue you selected. |

Add a user to a Connect Support conversation

You can add additional users to a Connect Support conversation.

Role required: none, however you must be the assigned support agent to add users to the support conversation.

You must be on Helsinki patch 5 and an administrator must enable the support users property (glide.connect.support.add_members).

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab.
3. Do one of the following actions.

© 2019 ServiceNow, Inc. All rights reserved.  
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>2. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>2. Click the minus icon (−).</td>
</tr>
</tbody>
</table>

Only the assigned support agent can create an incident from the Connect Support conversation.

Escalate a Connect Support conversation

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

Define an escalation path for the queue, using the Escalate to field on the Chat Queue (chat_queue) table. For more information, see \( \text{t_AdministerConnectSupportQueues.dita#t_AdministerConnectSupportQueues} \).

Role required: none

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select Escalate. A confirmation dialog box appears.
4. In the dialog box, click Escalate. The system automatically removes you from the conversation and the conversation enters the escalated queue.

Create an incident from a Connect Support conversation

You can use a shortcut to create an incident on behalf of a user, directly from a Connect Support conversation.

Role required: none

You might want to create an incident if you cannot resolve the user’s issue over chat or if you want to create a record of the conversation to share with the user. When you create an incident from a support conversation, the system copies the conversation history to the incident activity stream as comments and work notes. Future messages are tracked in the incident as well.

Note: Administrators can customize the behavior of the Create Incident Connect action. For more information, see \( \text{Administer Connect actions} \).

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select Create Incident. In the conversation tools area to the right of the conversation, a new incident form opens in a record tab. The system automatically sets the Caller field to the user who opened the support conversation.
4. Complete the form as necessary and click Submit.
Any comments or work notes in the record conversation appear as comments on the incident form. Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.

a) In the record conversation, by the text entry field, click the message type icon.

b) Select Comment or Work Note.

c) Enter a message.

By default, record conversation messages are added as comments.

Note: If you add an attachment to a record conversation, it is attached to the underlying record as well.

The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry (chat_queue_entry) table. Any new journal fields added to the record do not appear in the chat.

Connect Support administration

Administrators can configure various performance settings and features of Connect Support.

Note: There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Legacy chat to Connect Support transition

Use these basic steps to transition from legacy chat to Connect Support.

Context

Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Connect Support should not be used concurrently with legacy chat.

Before you activate Connect Support

Inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is built into the Connect Support plugin in Helsinki patch 2 that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats your metrics and chat queue won’t work accurately.

Activate the Connect Support plugin

When you activate the Connect Support plugin, the glide.connect.support.enabled property redirects the legacy chat URL to Connect Support.

For more information, see Activate Connect Support.
Hide the Social IT application

Activating Connect Support doesn’t completely eliminate the legacy chat module. To prevent users from using it, hide the Social IT application menu. For more information, see Enable or disable an application menu or module.

Properties for Connect Support

The Connect Support Properties page provides several configuration options specifically for Connect Support. These properties are available for Connect Support.

Users with the admin role can access these properties by navigating to Collaborate Support Administration Properties.

Note: The Connect Properties page contains many general Connect properties that impact Connect Support.

Table 73: Properties for Connect Support

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Should Connect be used for handling chat queue entries</td>
<td>Disables or enables Connect Support. When the property is enabled, all help desk conversations are opened in Connect Support, rather than legacy chat. Additionally, the support tab appears in the Connect sidebar. This property is for system use only and should not be modified.</td>
</tr>
<tr>
<td>glide.connect.support.enabled</td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties [sys_properties] table</td>
</tr>
<tr>
<td></td>
<td>This property is removed from the Connect Support properties page starting with Helsinki Patch 2, but may still appear for upgraded instances.</td>
</tr>
<tr>
<td>Number of support conversations an individual agent can have at one time (-1 is unlimited)</td>
<td>Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.</td>
</tr>
<tr>
<td>connect.support.conversation_limit</td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: -1</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>Show agent avatar in Connect Support conversations.</td>
<td>Determines whether an agent’s avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent’s name only.</td>
</tr>
<tr>
<td>connect.support.show_agent_avatar</td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Number of seconds to wait (without user</td>
<td>Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears.</td>
</tr>
<tr>
<td>interaction), before presenting end-users</td>
<td>• Type: integer</td>
</tr>
<tr>
<td>with an idle countdown timer</td>
<td>• Default value: 120</td>
</tr>
<tr>
<td>connect.support.idle.delay</td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>Number of seconds to count down from before</td>
<td>Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session.</td>
</tr>
<tr>
<td>marking end-user as having left their</td>
<td>• Type: integer</td>
</tr>
<tr>
<td>support session</td>
<td>• Default value: 60</td>
</tr>
<tr>
<td>connect.support.idle.count_down</td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td>Limits the number of closed conversations</td>
<td>Determines how many closed conversations appear in a user’s support conversation history. When the value is set to 0, all previous conversations appear in the history.</td>
</tr>
<tr>
<td>that the support user can see. (0 =</td>
<td>• Type: integer</td>
</tr>
<tr>
<td>unlimited)</td>
<td>• Default value: 0</td>
</tr>
<tr>
<td>connect.support.user.closed.conversation</td>
<td>• Location: Collaborate Support Administration Properties</td>
</tr>
<tr>
<td><em>limit</em></td>
<td></td>
</tr>
</tbody>
</table>

Administer Connect Support queues

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

Role required: admin

---

Note: Both Connect Support queues and legacy chat queues are stored on the Chat Queue (chat_queue) table. Connect and legacy chat should not be used concurrently.

1. Navigate to Collaborate Support Administration Queues.
2. Click New or open an existing queue from the list.
3. Complete the Chat Queue form, as appropriate.

Table 74: Chat Queue form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated and should not be edited manually.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there might be a queue for high priority support chats. When a queue is defined in this field, agents can access the Escalate option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, Thank you for contacting support. We are looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the queue’s defined Schedule. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, How can I help you?</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>

4. To review conversations associated with the queue, add the Chat Queue Entries related list and review the records for the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How long the user waited and the result</td>
<td>Review information in the State and Wait time columns.</td>
</tr>
<tr>
<td>Who is actively helping employees in the queue</td>
<td>Review the names of agents in the Assigned to column.</td>
</tr>
</tbody>
</table>

**Make a Connect Support queue accessible to end users**

To make a Connect Support queue accessible to end users, use the accepted URL format.

Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.

Role required: admin

For example, you might create a module or add a link to a portal. The accepted URL format is `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.

1. Navigate to Collaborate Administration Queues.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select Copy sys.id. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
4. Preview the support queue by navigating to `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.
5. Create a module or other link to the queue using the URL.
Configure the add support users property

Administrators need to configure the property for support agents to add users to a Connect Support conversation. You must be on Helsinki patch 5 for this property to work.

Role required: admin

1. Enter sys_properties.list in the application navigator. For more information, see Add a system property.
2. Click New.
3. Complete the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.connect.support.add_members</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

Support agents can add users to a support conversation. Any added user can also add other users. Only the assigned agent can create an incident from the chat. When non-support agents are added to a chat, the chat appears in their chat tab.

Connect Support metrics

Optional plugins provide a homepage and Performance Analytics dashboards, which contain helpful Connect Support metrics.

The reporting homepage is ideal for support managers who want a simple solution to track the support organization’s recent performance. The Performance Analytics dashboards provide a more full-featured solution for support managers who want to analyze trends over time.

Users with the admin role can activate the following plugins to use these features.

Table 75: Connect Support homepage and dashboard plugins

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager’s Dashboard</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
<tr>
<td>(com.glide.connect.managers_dashboard)</td>
<td></td>
</tr>
<tr>
<td>Performance Analytics - Content Pack - Service Desk Chat</td>
<td>Provides the Service Desk Chat Monitor dashboard, which analyzes key Connect Support metrics and indicators. Note: You can activate Performance Analytics content packs on instances that do not have Performance Analytics Premium to evaluate the functionality. However, to collect scores for content pack indicators you must license Performance Analytics Premium.</td>
</tr>
<tr>
<td>(com.snc.pa.chat)</td>
<td></td>
</tr>
<tr>
<td>Plugin</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Performance Analytics - Context Sensitive Analytics for Chat</td>
<td>Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry form, and also as the Context Sensitive Analytics - Chat dashboard.</td>
</tr>
</tbody>
</table>

**Note:** For more information about these plugins, including which other plugins they activate, see [Additional plugins for Connect Support](#).

*Use the Connect Support homepage*

Use the Connect Support homepage to view key indicators and metrics related to support conversations, queues, and agents.

Activate the Connect Support Manager’s Dashboard plugin (com.glide.connect.managers_dashboard) to view this homepage.

Role required: chat_admin

The homepage is called Service Desk - Chat.

1. Navigate to Collaborate Support Administration Reporting Dashboard.

   **Note:** Though the module name contains the term dashboard, the module does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.

   The Connect Support homepage, which is called Service Desk - Chat, opens.

2. Click a widget to drill down into its data.

*Use the Connect Support Performance Analytics dashboards*

Use the Connect Support dashboards in Performance Analytics to understand trends in your support organization’s performance over time.

Activate one or both of the following plugins, according to your analytics needs:

- Performance Analytics - Content Pack - Service Desk Chat (com.snc.pa.chat)
- Performance Analytics - Context Sensitive Analytics for Chat (com.snc.pa.chat.context_sensitive_analytics)

Role required: both chat_admin and pa_viewer

The Performance Analytics - Content Pack - Service Desk Chat plugin includes the Service Desk Chat Monitor dashboard, which contains the following tabs:

- Chat Monitor By State: Contains metrics related to closed support conversations.
- Overview: Contains several metrics related to support conversations, queues, and agents.
- KPI Process: Contains metrics that are key performance indicators (KPIs) of the Connect Support process, including the average queue response time, the average duration of support conversations, and the number of new support conversations per day.

The Performance Analytics - Context Sensitive Analytics for Chat plugin includes the Context Sensitive Analytics - Chat dashboard. The dashboard contains additional metrics related to support queues, including the number of support conversations closed.
1. Navigate to Performance Analytics Dashboards.
   The last dashboard you viewed opens.
2. In the dashboard picker, under the Connect Chat group, select the dashboard you want to view.
3. View the indicators.

Connect Support and Service Portal

Use Connect Support in your portal to allow your users to ask questions or submit requests to support agents. You configure the instance options to control the appearance of your widget and how it functions.

The Connect Support and Service Portal integration creates a Connect Support widget that you can add to a page in the Service Portal.

Activate Connect Support for Service Portal

Activate the Connect Support and Service Portal integration plugin so you can add the Connect Support widget to a portal page.

Role required: admin

Activating the Connect Support and Service Portal integration plugin automatically activates the Connect Support plugin.

1. Navigate to System Definition Plugins.
2. Search for and activate the Connect Support and Service Portal integration plugin (com.glide.connect.support.service-portal).

After activating the plugin, the Connect Support widget appears in the list of widgets under Service Portal Widgets. Use Connect Support in a portal by adding the widget to any page within the portal. For more information on adding a widget to a page, see Customize a page.

Figure 85: Connect Support widget

Configure Connect Support widget instance options

You can control the appearance of your widget and how it functions by configuring the instance options.
Role required: admin

1. Navigate to Service Portal Service Portal Configuration and open the Service Portal Designer.
2. From the Service Portal Designer, select the page you added the Connect Support widget to. If you have not yet added the widget to a page, see Customize a page for more information.
3. Click the edit icon in the corner of the widget to open the instance options menu.
4. Complete the fields using the following table. Depending on the functionality you want to add, you may not need to add all these fields. For example, if you include the Queue ID, you do not also need to include the Queue Name or the Queue URL.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Select a color for your widget from a list of common bootstrap colors. Themes control the overall color of a widget, but if you want your widget to be a specific color, you can select it from the list.</td>
</tr>
<tr>
<td>Queue URL</td>
<td>The URL for the Connect Support chat queue that you want questions to be directed to. For example, http://&lt;instancename.service-now.com/$chat_support.do?queueID=&lt;sys_id&gt;</td>
</tr>
<tr>
<td>Queue Name</td>
<td>The name of the queue you want the questions to be directed to. You can find a list of queue names in Collaborate Connect Support Queues.</td>
</tr>
<tr>
<td>Queue ID</td>
<td>The sys_id of the queue you want questions to be directed to. You can find this ID by going to the support queue and either copying the queue ID from the support link, or by selecting Copy sys_id from the context menu.</td>
</tr>
<tr>
<td>Message</td>
<td>The text for the button in the Connect Support widget</td>
</tr>
<tr>
<td>Window</td>
<td>Use this option to open the chat in another tab rather than in a new window.</td>
</tr>
<tr>
<td>Title</td>
<td>The name in the widget header</td>
</tr>
</tbody>
</table>

Content Management System

The Content Management System (CMS) is a ServiceNow application that primarily enables users to create a custom interface for the ServiceNow platform and ServiceNow applications.

The CMS application is powerful and flexible. Customers use it for a wide variety of projects, from creating entire websites to integrating with other products. The Content Management application is active by default.

This video provides an overview of the CMS application.

A CMS typically requires a systems administrator or a web developer to set up and add features. Non-technical users can use the CMS application as a tool for website maintenance. You also want to consider the timing of the addition of content management, and the maturity level of ServiceNow data. For more information, see CMS Planning.

Following are several CMS project ideas:
• Design a company-wide service catalog that offers a collection of services.
• Present a customized UI for a knowledge base.
• Create customized login pages, search pages, views of lists, tables, charts, or graphs.
• Design a complete website.
• Integrate ServiceNow with other company applications.
• Build a tailored self-service portal for end users that is in compliance with a corporate style guide.

Example CMS sites

There are two common interface approaches within the ServiceNow community:
• An image and text-based interface similar to Amazon.com
• A search-based interface similar to Google

Both approaches have been used successfully. The approach you select depends on the needs of the people using the data and how easy it is to train them. While the two design philosophies are different, both approaches share the common goal of UI simplicity.

Content Management design

Before building a website in the CMS, it is important to have a good understanding of what to build and who the audience is.

A high volume of content can heavily influence the look and feel of the site and the site hierarchy. When deciding the content, design for ease of maintenance for the people who take care of the system. This level of planning can be time-consuming, but is important.

Review website design prerequisites to help you set expectations, scope deliverables, and define reasonable time lines. Consider both the planning and execution of site design, to understand how sites are built, and to provide a working overview of the CMS.

Timing is important when considering the addition of content management. Successful deployments of the content management system usually take place after phase 1 processes (for example, Incident, Problem, Change, Catalog, and Knowledge) are in place. This is especially true if the team has limited website design experience. Waiting until phase 2 of deployment gives administrators time to work in ServiceNow and to understand how the organization uses the system and what business needs it meets.

Also consider the maturity level of data in the ServiceNow system. Depending on the ITIL processes used, content management is only useful and effective once the data within ServiceNow is established. Ensure that hierarchies, tasks, and workflows are well-defined. For example, before creating a catalog interface, confirm that the service catalog has been in place for some time, has been used, and contains data. The same is true for a knowledge management interface, particularly when high ratings or view counts define article placement on the page.

Content organization

Before you begin to build the CMS website, list all the content that you want to include and take the time to organize it.

A site created in CMS relies on two different types of content.
• CMS site information, such as site pages, images, and menus
• System information, such as knowledge base articles and catalog items
CMS content

Begin by listing all the content you want to host on the CMS pages. Examples include help pages, My Requests, My Approvals, and specific catalog items. Think about current solutions that you can implement immediately, and note ideas for future implementation phases.

Within CMS, you group pages to define the top-down menu structure. You establish a home or starting page, and other pages in the site reference the home page in the Parent Page reference field.

There are several ways to group, such as by audience or the purpose of the website. After listing the content to host, group it logically and identify a common name for each group, as shown in the following examples.

Table 77: IT environment groups

<table>
<thead>
<tr>
<th>Content built for</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>End user</td>
<td>End User Page</td>
</tr>
<tr>
<td>IT professional</td>
<td>IT Professional Page</td>
</tr>
</tbody>
</table>

Table 78: General groups

<table>
<thead>
<tr>
<th>Purpose of site</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reports</td>
<td>Reporting Page</td>
</tr>
<tr>
<td>Help and knowledge</td>
<td>Knowledge page</td>
</tr>
</tbody>
</table>

System content

Organize the content so the interface is easy to navigate and understandable to the user. Determine the organization based on the data that you are leveraging, both in the CMS (using sites, parent pages, pages, and navigational menus) and throughout the rest of the system. For example, within the catalog you have “category,” and in the knowledge base you have “category” and “subcategory.” You can use these hierarchies with filtered lists for good search results.

Organizing CMS content logically is important for long-term maintenance of the site, however, the data typically comes from other ServiceNow applications. Communicate with the administrators for these applications, such as the knowledge base, service catalog, and business service portfolio. Work with them to offer the application data appropriately through the CMS pages you create. For example, the team that created the ServiceNow corporate website in CMS began by evaluating the naming conventions used in the corporate knowledge base.

Branding elements

Branding refers to the logo, name, colors, and symbols that identify an organization. It imposes consistency in design and use of terms. Your marketing department defines branding elements and can provide them to you as you plan your CMS pages. Consider how to incorporate the following branding elements.

- Logos
- Color palette
- Tag line
- Trademarked elements
• Graphics

Site design

During planning, consider providing a core set of features with a standard appearance throughout the site. The following web design elements are often used to create a consistent look.

• Page templates
• Navigation schemes
• Header
• Breadcrumbs
• Footer
• Forms

ServiceNow features

Analyze and organize the following ServiceNow features in your instance if you plan on using any of them with CMS pages.

• Account settings
• Email
• Workflow approvals
• Filters

Team member identification

Identify the team members who assist you with website design, branding, and development.

Engage team members for each listed function before you begin to build pages for the CMS website. Each function can be performed by the same or different people.

• Gather corporate style design guidelines.
• Define the written terminology and content for the site.
• Gather and define the site flow.
• Manage the CMS project as the webmaster. The CMS webmaster is responsible for executing the design and making the site work. The following skills are required:
  • Basic ServiceNow administration skills
  • HTML
  • CSS
  • Graphic design
  • Web design

After you identify the project team members, establish who is responsible to complete the tasks involved in building the CMS website.

• Determine who owns each page.
• Set a page update schedule so owners do not overwrite each other.
• Formalize content management processes, including content review and page updates.
Data preparation

It is important that there is enough data in the ServiceNow instance before you begin to build the CMS website.

Ensure that the necessary data and content are available in the instance by taking the following actions.

- Review the ITIL processes that you intend to implement in the CMS. Ensure that the data in the instance is a mature representation of the applications being used, for example, service catalog, knowledge management, and incident management.
- Review the defined hierarchies, such as the categories and subcategories for the knowledge base or service catalog. You use these categories to design the entry page into the application.

Corporate style guide

When you build a CMS website, you design the look and feel based on guidelines in the corporate style guide.

A corporate style guide provides detailed information for designing any corporate interface, including corporate websites.

Corporate design team

Many organizations have a web development team that designed the corporate website. Contact this team and involve the designers early in the planning, as they provide help and give their approval to the interface you design. Without approval, there is the risk of having to redesign the entire site because it does not adhere to the organizational guidelines.

Corporate style guide

A corporate style guide takes the guesswork out of designing the CMS website. The example style guide shown is defined down to the pixel. Creating a site with the style guide makes it easy to create clean CSS and HTML. Without the style guide, building the site can take a great deal of time.

Design considerations

Some modifications to the base design for forms may be necessary. The content area of any CMS design should be no smaller than 860px, or service catalog forms are clipped. The sample style guide entry specifies the content area to be 576px, which clips service catalog forms.
Columns and topics:

1. Navigation (levels 2–4)
2. Main content
3. Info snippets
Prototypes and rapid web design

Many user interface designers use prototypes and rapid web design techniques to visualize the final product before it is developed.

Design revisions are the most time consuming and expensive phase of site design. When the team analyzes and then uses prototypes to create pages, revisions to the published pages are minimal.

Develop the prototype and print it. Review the design with the appropriate team members and annotate the prototype, and annotate what to update on each page.

Define the following elements within the prototype.

- The site map for the entire site.
- A detailed prototype of every intended page, including elements such as links, link destinations, content, page names, and page descriptions.

Content Management navigation

After you design the hierarchical structure of the site, begin planning site navigation.

Consider the following as you plan site navigation.

- Placing navigation elements on every page.
- Locating navigation elements in the same place on every page.
- Using either text or images for navigation.
- Providing visitors with an easy way to understand where they are in the site, for example, with breadcrumbs or a specific color scheme.
- Adding a site map, which is a one-page, hyperlinked, hierarchical outline of the site.
- Providing a link to the home page from every site page, as visitors often enter the site on a page other than the home page.
- Designing navigation to help visitors find information quickly with as few clicks as possible.

In the CMS, navigation menus define your site navigation. Build menus as navigational blocks to create navigation paths. The menu chosen for the task depends on the size and complexity of your site. Available menu options include the following items.

- List menus
- Two types of tab menus
- Vertical, clickable list, usually placed on the left side
- Horizontal blocks
- Vertical blocks
- Super menu (a menu of menus)

System content management

Most of the content in a CMS site is managed in different locations throughout the system.

For example, if you are building a knowledge website, the pages and blocks exist in CMS, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

Links to content are typically static, however, take time to look at the document tree and review how field values are formatted for use within the CMS. To understand the information provided below, right-click within forms in the platform and select Show XML to view the document tree for the referenced
table. To see the table values for each field, right-click the form label and choose Show - (field name) or Configure Dictionary for reference.

Look at several internet news sites for ideas on how to format dynamic list data and also the full article detail. Research blog sites, shopping sites, and any other site you find easy to use, as layout and usability design can be time-consuming. If you find a site that inspires you, emulate it in your design.

- This New York Times example has two separate list formats.
- The CNN example has several list formats on the page.
- Several different list formats are used on the ServiceNow website.

**Knowledge articles - kb_knowledge table**

When you right-click and select Show XML on any form within the system, the document tree for the referenced database table becomes reference-able. Review the following selected subset of the document tree so you can acquaint yourself with the content readily available to your site design.

```xml
<kbservice_now> <active>true </active> <author display_value= "First Last Name" >Use this field value if author name is important </author> <short_description>Use this field value as the link to the full article detail </short_description> <description>Provide this field value as a 1-2 sentence summary of the article </description> <number>Unique ID can be leveraged in a number of different ways </number> <published>Published time stamp of the article </published> <rating>This field value provides a 1 to 5 star rating similar to iTunes </rating> <sys_view_count>Add to supplement article published timestamp </sys_view_count>8 <sys_updated_on>Add to supplement article published timestamp </sys_updated_on> <topic>Useful field value in creating hierarchical breadcrumbs </topic> </kb_knowledge>
```

<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
<%view_list content="knowledge" page_size= "20" max="100" />
</%view_list>
</j:jelly>

Activate the Content Management System

The Content Management System (CMS) application and the Service Management Portal application, which is implemented within Content Management, are automatically installed on new instances. If they are not active on your instance, administrators can activate them.

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status. If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Installed with Content Management

Several types of components are installed with the Content Management application.

Demo data is available for this feature.

Tables installed with Content Management

Content Management adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Page (content_page)</td>
<td>Provides an inventory list of pages within the system</td>
</tr>
<tr>
<td>Content Css (content_css)</td>
<td>Stores internal or external CSS for the page</td>
</tr>
<tr>
<td>Content Theme (content_theme)</td>
<td>Made up of a collection of CSS files</td>
</tr>
<tr>
<td>Content Link (content_link)</td>
<td></td>
</tr>
<tr>
<td>Content Page Rule (content_page_rule)</td>
<td></td>
</tr>
<tr>
<td>Content Block Programmatic (content_block_programmatic)</td>
<td></td>
</tr>
</tbody>
</table>
### Roles installed with Content Management

Content Management adds the following roles.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content administrator (content_admin)</td>
<td>Can read, write, and configure all elements of the Content Management Application</td>
<td>none</td>
</tr>
</tbody>
</table>

### Script includes installed with Content Management

Content Management adds the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMSCopyAjax</td>
<td>Support for copying CMS pages</td>
</tr>
<tr>
<td>CMSEntryPage</td>
<td>Creates an entry page</td>
</tr>
<tr>
<td>ContentPageClone</td>
<td>Copy support for CMS pages</td>
</tr>
<tr>
<td><strong>Script include</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>ContentSiteClone</td>
<td>Copy support for CMS sites</td>
</tr>
<tr>
<td>CMSAjax</td>
<td>CMS Ajax utilities</td>
</tr>
</tbody>
</table>

Client Script installed with Content Management

Content Management adds the following client script.

<table>
<thead>
<tr>
<th><strong>Client script</strong></th>
<th><strong>Table</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Header Color Change</td>
<td>Content Block Header</td>
<td>Changes the background color of the control to what the user selected</td>
</tr>
<tr>
<td></td>
<td>(content_block_header)</td>
<td></td>
</tr>
</tbody>
</table>

Business Rules installed with Content Management

Content Management adds the following business rules.

<table>
<thead>
<tr>
<th><strong>Business rule</strong></th>
<th><strong>Table</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace Stub</td>
<td>Content Block</td>
<td>Replaces a placeholder widget with a content widget.</td>
</tr>
<tr>
<td></td>
<td>(content_block)</td>
<td></td>
</tr>
<tr>
<td>Unload Page</td>
<td>Page</td>
<td>Unloads content from the page.</td>
</tr>
<tr>
<td></td>
<td>(content_page)</td>
<td></td>
</tr>
<tr>
<td>Bump Parent if Content</td>
<td>Portal</td>
<td>Replace content in the current page.</td>
</tr>
<tr>
<td></td>
<td>(sys_portal)</td>
<td></td>
</tr>
<tr>
<td>Remove Block from Pages</td>
<td>Content Block</td>
<td>Removes a block from pages where it is placed.</td>
</tr>
<tr>
<td></td>
<td>(content_block)</td>
<td></td>
</tr>
<tr>
<td>Validate Suffix</td>
<td>Content Page</td>
<td>Validates a suffix so that a page name or a page suffix cannot match a table name.</td>
</tr>
<tr>
<td></td>
<td>(content_page)</td>
<td></td>
</tr>
</tbody>
</table>

Configure Content Management sites

Planning a CMS site involves obtaining resources, communicating with others about design, and gathering content.

Role required: content admin or admin

The following steps are a high-level overview of how to set up a site.

1. Plan and design your content.
2. Create a site.
   
   The site is the container that holds all the content. To simplify your process, you can copy an existing site and edit its components. For more information on creating a site, see Create a site. For more information on copying a site, see Copy a site.
3. Add pages to the site.
   
   Pages contain blocks of information for the site. For more information, see Create a content page.
4. Create content blocks to customize the layout, headers, menu navigation, lists, and static and dynamic content.
Content blocks are chunks of actual HTML that make up the content page. There are various content block types available to help with your customization. For more information, see Content blocks.

5. Add style to your site using themes, style sheets, and frames.
Neither content sites or content pages reference style sheets directly. Configure them using the Themes or Style Sheets options. For more information, see Style in Content Management.

6. Test the site.
After you create or modify a site, test the site to ensure that content displays properly and all links work correctly. For more information, see Test the site.

Content sites

A content site is a group of related content pages that have the same basic theme, layout, and URL suffix.

Content sites are made up of a series of basic building blocks. The Employee Self-Service site is an out-of-box sample site that is included in the CMS activation. It provides existing, working examples or each CMS component, which you can use like a template to build your own site.

![Site components diagram]

Figure 87: Site components
Create a site

Configure a site by either creating a new site with CMS or by editing a copy of either the ESS Portal or the Service Management Portal.

Role required: content_admin or admin

If you are creating a catalog site in CMS, follow the steps in Manage catalog sites in Service Catalog Management.

1. Navigate to Content Management Sites.
2. Click New.
3. Complete the form.

Since you have not yet created pages, you cannot select the Home, Search, Login, and Gauge target pages. Add them to the site record after you create them.

Table 79: Site fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the site. The URL suffix is case-sensitive,</td>
</tr>
<tr>
<td></td>
<td>the suffix you enter impacts the CMS site URL used to launch the site. It</td>
</tr>
<tr>
<td></td>
<td>is incorporated into the URL as follows:</td>
</tr>
<tr>
<td></td>
<td>http://&lt;instance name&gt;.service-now.com/url_suffix/page.do</td>
</tr>
<tr>
<td></td>
<td>Note: Do not use portal and cms in the URL suffix. They are reserved terms</td>
</tr>
<tr>
<td></td>
<td>and return a Page not found if you use them.</td>
</tr>
<tr>
<td>Home page</td>
<td>The page to display when the user does not specify a page name in their</td>
</tr>
<tr>
<td></td>
<td>URL: http://&lt;instance name&gt;.service-now.com/url_suffix/</td>
</tr>
<tr>
<td>Search page</td>
<td>The page that displays search results when a user searches from any page</td>
</tr>
<tr>
<td></td>
<td>within the site.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page to use for logging in to the site. If specified, users must log in</td>
</tr>
<tr>
<td></td>
<td>to access the pages on the site. If left blank, no login is required to</td>
</tr>
<tr>
<td></td>
<td>access the pages within the site.</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>The page that displays gauge content. When the user clicks a gauge on the</td>
</tr>
<tr>
<td></td>
<td>new site, the gauge target page opens to show the gauge content. The gauge</td>
</tr>
<tr>
<td></td>

<tr>
<td>Title</td>
<td>A title for the site. The title can be the same as or different from the</td>
</tr>
<tr>
<td></td>
<td>Name.</td>
</tr>
<tr>
<td>Description</td>
<td>A full description of the site.</td>
</tr>
<tr>
<td>Default layout</td>
<td>The layout for pages to use by default. Any page in the site that has a</td>
</tr>
<tr>
<td></td>
<td>blank Layout field uses the layout selected in this field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default theme</td>
<td>The theme for pages to use by default. Any page in the site that has a blank Theme field uses the theme selected in this field.</td>
</tr>
<tr>
<td>Simple catalog display</td>
<td>Selecting this option simplifies catalog pages in the site by hiding the search bar, breadcrumbs, and the results per page choice list. It also prevents you from adding attachments from record producers to your CMS site.</td>
</tr>
<tr>
<td>Use external cart</td>
<td>Option to omit the default cart when rendering catalog pages within a site that contains catalog pages. Provide a <a href="#">catalog cart block</a> somewhere on the site to allow users to make catalog requests. Note: If you use an external cart, the no cart check box on a service catalog item has no effect. The external cart appears for all items.</td>
</tr>
</tbody>
</table>

4. Click Submit.

The following is the site record for the ESS Portal:
Copy a site

To create a new site quickly, you can copy an existing site.

Role required: content_admin or admin

The site copy option creates a complete standalone copy of the site and all its resources. If you are copying a site to create a second site, use this option after the first site is complete, tested, and production ready. This consideration is important because the blocks, CSS, and pages are duplicated to support the new site. There are various reasons why site copying is useful, such as site versioning, branding, or creating a backup.
Images are not included when you use the Copy Site option. They are stored separately in the sys_attachments table.

To copy just a few pages without duplicating all the resources (CSS, blocks, menus), use the page copy option. Page copy duplicates the page but not the resources used in the page. For more information, see Copy a page.

1. Navigate to Content Management Sites (Site Name).
2. On the Site form, click Copy.
3. In the dialog box that opens, type a name for the new site.
   - This name is a prefix for all the site elements that are duplicated. Do not use Portal or CMS in the site name.
   - A progress bar shows the copy process. When the process is complete, the Site form shows information for the new site.

Content Management security

There are several methods for securing CMS sites and pages. Site security is set in the Login page field on the site record. You can control if a page is public or private through the URL.

Every content page has its own URL that users can access outside of the platform. Depending on how the Login page or roles are defined, the URL may or may not be public.

• If the content page has no defined Read role or there is no defined Login page, any internet user can navigate to the URL and view the content page.
• If there is a defined Read role, then anyone who goes to the URL is asked to log in before they can view the site.
• If there is a defined Login page on the site record, all pages in the site are private.

Content Management URLs

The format for Content Management URLs is as follows.

`<path to the instance>+/<site suffix>+/<page suffix>+.do`

The `<site suffix>` is defined by the URL Suffix field on the site form. The `<page suffix>` is defined by the URL Suffix field in the page form. The URL suffix is case-sensitive.

For example, the page Austere - Site Entry has a site URL Suffix of austere and a page URL Suffix of entry. The constructed URL looks like the following URL.

`<instance name>.service-now.com/austere/entry.do`

If the site URL Suffix field is left blank, the `<site suffix>` is cms, as shown in this example:

`instance.service-now.com/cms/page.do`

If the page URL Suffix is left blank, the name of the page is used as shown in this example:

`instance.service-now.com/austere/Page Name.do`

Special characters in the name of the page have to be escaped.

Login pages instead of login rules

You set a login page on the site record to allow users to log in or out directly through the content site.

Login rules were used in earlier versions to dictate what users saw after logging in, based on their roles or permissions. Login rules still work, but their use is deprecated.
Configure CMS sites to use single sign-on (SSO)

To configure CMS to use SSO, make the view_content page private.

Because public pages do not require login, and CMS sites are public by default, CMS pages do not use SSO. Use the following procedure to turn off public-facing content pages and enable SSO.

1. Navigate to Public Pages [sys_public.list].
2. For the view_content page, set Active to false.

Content pages

Content pages are the core of the Content Management System. A content page is a web page that displays blocks of content.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in predefined layouts. They can be used to present login pages, search pages, or ServiceNow content.

Create a content page

Pages are built from content blocks and organized into sites.

Role required: content_admin or admin

1. Navigate to Content Management Sites.
2. Open the site to add the page.
3. In the Pages related list, click New.
4. Complete the form.

Table 80: Page form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the page. Prefix each page name with the name of the site followed by a dash and the page function. For example, ESS - Catalog Detail and ESS - Search Results are page names within the ESS site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the page. It is incorporated into the URL as follows: <a href="http://instance">http://instance</a> name.service-now.com/site/url_suffix.do</td>
</tr>
<tr>
<td>Parent page</td>
<td>The existing page that is the parent of the current page. Parent pages keep sections sortable on the site list of pages and are used to create breadcrumbs dynamically. Use CSS to define menus that give the Parent page context within the user interface.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Layout</td>
<td>The <em>layout</em> to use for the page. Layouts define dropzones where content blocks can be added to the page. If this field is left blank, the page inherits the default layout of the site. If the site does not have a default layout, there is a single dropzone for the entire page.</td>
</tr>
<tr>
<td>Content theme</td>
<td>The theme to use for the page. Themes bundle CSS style sheets that are applied to all content within the page. If this field is left blank, the page inherits the default theme of the site. Use the default theme unless the page requires a different set of CSS style sheets from the other pages in the site.</td>
</tr>
<tr>
<td>Frame buster</td>
<td>Select the check box to remove any restrictions placed by frames that contain the page. This way you avoid frame-within-frame issues that sometimes occur with improper linking.</td>
</tr>
<tr>
<td>Content site</td>
<td>The site associated with the content page. If you created the page from the related list in the site, the value defaults. The content site provides the <code>&lt;site_suffix&gt;</code> in the page URL, as follows: http://&lt;instance name&gt;.service-now.com/site_suffix/page_suffix.do</td>
</tr>
<tr>
<td>Read roles</td>
<td>Users with the selected roles can view the page. Click the lock icon to select roles.</td>
</tr>
<tr>
<td>Model document</td>
<td>A document ID of a record to display by default.</td>
</tr>
<tr>
<td>Page status</td>
<td>The status for the page, such as Draft or Published.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created the page. If your role has higher privileges than your user name and you enter your user name, the field defaults to the role. For example, if you are logged in as an Admin and you type your name, which has lower privileges, this field displays Admin.</td>
</tr>
<tr>
<td>Title</td>
<td>The title for the page. The title displays on the browser tab when the page is accessed.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description of the page that displays for users when they access the page.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Add content to a page

After you define the page settings, set the content of the page by adding content blocks. Setting content blocks is similar to how you add content to homepages.

Role required: content_admin or admin
Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see *Embedding reports in Jelly.*

2. Click Add Content.
3. Select a content block from the picker.
4. Select the dropzone where the content goes.
   Create content blocks by adding one of the content blocks named *New \( \text{block type} \) to the page.
Copy a page

Copying pages is an efficient way to avoid duplicating the same work and to create pages quickly from a guiding master template.
Role required: content_admin or admin
1. Navigate to Content Management Sites and select the site.
2. Select the page to copy.
3. Click Copy.
4. Rename the page.
5. Edit the page fields.
6. Click Update.

Assign a page to a site
If you have created multiple sites, you can add pages from one site to another site.
Role required: content_admin or admin
1. Navigate to Content Management Sites.
2. Select a site.
3. In the Pages related list, click Edit.
4. Select other pages to include in the site.
5. Click Save.
6. Update the site.

Add a page to an application
Homepages and content pages are not added automatically to update sets and applications. They must be manually added.
Role required: content_admin or admin
1. Navigate to Content ManagementPages.
2. Right-click a content page record.
   The page is added to the current application and to the current update set.

Configure a private UI page for CMS links
With single sign-on (SSO) in place, you can generate email links that take users directly to tickets and applications through the CMS interface.
Role required: content_admin or admin
You accomplish this procedure by creating a private UI page to redirect CMS links. Because the page is not public, it requires authentication and redirects to SSO appropriately.
1. Check that your CMS site is private by completing the following steps.
   a) Navigate to Content Management Sites [Your Site]
   b) Verify that the Login page field has a page listed.
2. Create a new UI page by completing the following steps.
   a) Navigate to System UI UI Pages.
   b) Click New.
c) Enter a Name, for example, redirector.

d) Enter the following Adobe Jelly code into the HTML field.

```
<?xml version="1.0" encoding="utf-8"?><j:jelly trim="true"
xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null"><script type="script/javascript">
window.location.href="${sysparm_uri}";</script></j:jelly>
```

The CMS now supports email links with following format:

http://⟨path to instance⟩/⟨UI page⟩.do?uri=⟨CMS suffix⟩/⟨record type⟩.do
%26sys_id=⟨record ID⟩

For example:

http://⟨instance name⟩.service-now.com/redirector.do?sysparm_uri=/ess/incident.do
%26sys_id=46e3e949a9fe19810069b824ba2c761a

Note: If you are using SAML 2.0 update 1 for SSO, use the UI page
saml_redirector instead of creating a new UI page. For example, an email link
to a SAML 2.0 redirector page would use the URL format: http://⟨instance
name⟩.service-now.com/saml_redirector.do?sysparm_uri=/ess/incident.do
%26sys_id=46e3e949a9fe19810069b824ba2c761a.

## Content Management templates

Templates are content pages that are reused to provide a consistent look and feel.

Templates are useful when creating CMS sites for the following reasons.

<table>
<thead>
<tr>
<th>Create new pages rapidly without risk by copying pages</th>
<th>Using a template to create new pages saves time because you do not have to keep repeating the same steps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a restore point for pages within the system</td>
<td>Have a working template available if something goes wrong in one of the blocks or in the theme CSS. It is often easier to start over from the template instead of trying to undo complex changes.</td>
</tr>
<tr>
<td>Provide a functional reference for editors on the site project</td>
<td>Having the template as a reference ensures that pages continue to conform to the style guide.</td>
</tr>
</tbody>
</table>

## Page templates

Every page that is part of the site needs a template.

## Critical page reference fields

When you build a new site, there are four page reference fields on the site record that are critical. Understanding these pages and how they are used helps you define page templates and site defaults.

- **Home page**: landing page for the site. A home page is mandatory.
- **Search page**: page that displays search results when a user searches from any page within the site. A search page is mandatory for your site to have a Search Results block.
- **Login page**: a standalone login page, which is useful to force authentication for the entire CMS site.
- **Gauge target page**: page used to display the drill-through content from a gauge. When the user clicks a gauge, the gauge target page opens showing the drill-through content for that gauge.
Detail pages

Depending on the data or tables that you plan to use, you may need detail pages. These detail pages use one of the content types in the following list.

- Knowledge detail page: displays a full knowledge article detail (mandatory for a knowledge site).
- Incident page: detail page for an incident record.
- Catalog page: detail page for all items, content items, order guides, and record producers.

Templates for creating sections

There are two page templates you can use when creating sections:

- Parent page: keeps sections within large sites organized and sortable on the site list of pages. Parent pages are also used to create breadcrumbs dynamically.
- Detail page: differs from the parent page in that the content area displays a full article or detail instead of a selection of related content. Detail pages must have a Current Document block.

These pages are mandatory if you plan on accessing system data. For example, if you plan on showing the service catalog in your CMS, you need the following items.

- A service catalog content type that references the `sc_cat_item` table.
- A detail page that provides the full view of the item.
New templates

If the base system sample site pages are not suitable, you can create a template from scratch. Create a page and then use it as a template. For more information, see Create a Content Page.

When you save a new template, include the word “template” in the page name.

Configure a master template

An easy way to create a master template is to copy the existing ESS sample site and customize it to suit your own needs. You can also configure a master template from scratch.

Role required: content_admin or admin

Follow these steps to create a single master page and generate all important components within the site.

1. Design a layout.
   Regardless of the interface, a site can be distilled into a few simple layouts. For more information, see Layout concepts.
2. Create a theme.
   The theme defines the structure of the layouts in CSS and the base styles, such as fonts and colors. For more information, see Design themes.
3. Build the common blocks.
   Pages are composed of content blocks. Most content blocks are reused on multiple pages. For the master template, build basic blocks such as a header, side navigation, and some basic content for the main content area of the page. More detailed content can be added later, but define content for reuse on many of the site pages here. For more information, see Content blocks.
4. Build a site entry page.
   Use the common content blocks you just created to design the first page that users see when they enter the site. For more information, see Create a content page.
5. Build a detail page.
   Design the detail pages to determine how pages such as knowledge articles, catalog items, and search results are displayed. You can build a detail page by copying the site entry page and adding additional content blocks. For more information, see Copy a page.
6. Assign the pages created to the new site.
   Create the site and apply the layout and theme to the site defaults. Then, navigate to the All Pages list and specify the master template site in the Site column for each of the master template pages. For more information, see Create a site.

Customize a copy of a page template

One good source for templates is the base system sample site. It is easy to copy pages and restyle them into new page templates to meet different business requirements.

The Employee Self-Service portal is provided as a working example and design template in the following procedure.

1. Navigate to Content Management Sites Employee Self-Service.
2. Select a page.
   For example, to copy the ESS sample site homepage, select Portal.
3. Click Copy.
4. Rename the page.
5. Right-click in the header and select Save.
7. Point your cursor to the content block to change and click the edit icon that appears on the right. For example, change the menus, alter the layout, or add a different logo.
8. Click Update.
9. Use the page in other sites you created by assigning pages to a site.

Content types

Content types provide site-specific control of how system data defined by templates is rendered.

In the site, one page displays a list of knowledge articles, and another page displays catalog items or incidents or a combination of the two. Different themes can be used for types of content and each theme can provide different user interaction. Content types define the pages that display content from a table. Each content type corresponds to a table.

Every type of document that the CMS displays has an associated content type. Changing the content type requires knowledge of Apache Jelly scripting. However, the common content types (such as service catalog or knowledge base) come in the base system. Content types can be associated with particular sites. This association allows different sites to use different detail pages for the same content type.

Content types define three features of associated documents.

- What does a link to one of these documents look like? For example, if a list of these documents is displayed on a page, how does each entry appear?
- What does a detailed view of one of these documents look like?
- What detail page is used to display the document? This decision is important and is often an area of confusion for new CMS users.

The document content type determines the page that a list of documents points to, the list itself does not determine the page. The content from a link is displayed in a detail content block on a page. The content type determines in which detail block on a page the document content is displayed.

For example, the list block Catalog Top 5 displays the top five items in the Service Catalog table [sc_cat_item]. Because the table is [sc_cat_item], the content type sc_cat_item controls how the Catalog Top 5 list is displayed. Clicking any item in the list displays the Service Catalog Detail page with the item displayed on it according to the detail template script. These content types are applied:

- in search results to link to the correct page.
- in the Current Document block to display the current record.
- in links on lists and other places that link to record types.

Several content types are available by default for tables such as Catalog Item [sc_cat_item], Gauge [sys_gauge], and Page [content_page].

Content type defaults that are set for CMS can be overridden for individual sites. Use the Content Types related list on the site record to customize content types.

Configure a content type

Users with the content_admin role can create a content type.

Role required: content_admin or admin

1. Navigate to Content Management Content Types.
2. Click New.
3. Complete the Content Type form.
Table 81: Content Type form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the table whose content will be rendered in Content Management.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site that will use this content type.</td>
</tr>
<tr>
<td>Media type</td>
<td>Enter one of the following media types to use with this content type or leave the field blank to use the UI11 interface.</td>
</tr>
<tr>
<td></td>
<td>• doctype: UI15 desktop interface only</td>
</tr>
<tr>
<td></td>
<td>• m: Smartphone interface only (not for CMS use)</td>
</tr>
<tr>
<td></td>
<td>• tablet: [Tablet interface] only (not for CMS use)</td>
</tr>
<tr>
<td>Default detail page</td>
<td>Select which page loads after a user clicks a link.</td>
</tr>
<tr>
<td>Gauge page</td>
<td>Select which page is the drill-through target for any gauge. If you display a gauge on a CMS page, then clicking the links loads the page specified here.</td>
</tr>
<tr>
<td>Summary Template</td>
<td>Write an XML script that determines how the list is displayed in the list block, if the link is displayed in a list block.</td>
</tr>
<tr>
<td>Detail Template</td>
<td>Write an XML script that determines how to display the associated information after a user clicks the link.</td>
</tr>
</tbody>
</table>

CMS gauge support

Gauges are a graphical way to display information from an instance.

A gauge might, for example, show a bar chart breaking down all open incidents by category. Gauges are fully supported within the CMS system. This means:

1. [You can put a gauge on a CMS page](#)
2. [You can control what will happen when a user clicks on a cell within that gauge](#)

**Put a gauge on a CMS page**

You have control over the gauges on a CMS page.

1. Bring up the CMS page in edit mode.
2. Click Add Content.
3. Select the gauge you want to add.
4. Place the gauge on the page in the desired location.

**Control what happens on a click**

Since a CMS system uses multiple pages you have to tell the system which page to use to display drill through content.

In the normal (non CMS) system, when you click a bar in a bar chart or a wedge on a pie chart, you drill through and your current screen is replaced with a list of records meeting the chart’s criteria. For
example, if you have a gauge of Incidents by Category and you click the bar labelled Hardware you drill through to a list of all incidents with a category=hardware.

Within the CMS system, there is a similar drill through mechanism at work, but you must manually specify which page to display.

There are two different models of the drill through:

• use an in-place target frame which directs all content there
• specify an alternate page to use to display the drill-through content

Using an In-Place Target

An in-place target is a named iframe on the same CMS page as the gauge. When the gauge is clicked, the drill-through content appears within that iframe rather than changing out the CMS page. The gauge (and the rest of the page other than the target) remain in place and active.

Using a Gauge Target Page

A gauge target page is a separate CMS page that is used to display the drill-through content from a gauge. When a gauge is clicked, the current CMS page is replaced with the gauge target page and the drill-through content is rendered within that second page.

• Gauge Target Page
  To set a site default, select Gauge Target Page, on the site configuration page. This will be used as the drill-through target for any gauges in the system that do not have a more specific gauge page specified in their content type.

• Gauge Page
  To set a content-type specific page, you can specify a Gauge Page, on a content type page. Any gauges for this type of content then use that page for any drill through.

  Note: The gauge target on a particular content type overrides the default, site level, gauge target.

• Gauge Target block
  A gauge target page is a normal CMS page, with one special requirement. Somewhere on that page, there must be a Gauge Target block. This is a market block telling the system where to output the drill through data.

View content types

The following is an example of where you might use Content Types.
This example uses the out-of-box Employee Self-Service (ESS) site as an example.
Role required: content_admin or admin
Use any out-of-box instance of a CMS site.
   The Issue Status, or incident_status CMS page contains two content blocks: Common Answer and Current Issues. These content blocks both use Content Types to render results.
This block matches the Common Answers section of the Issue Status page. The Table field describes the Content Type associated with Common Answers.

4. Use the link to view existing Content Types.

5. Click the Content Type to view the XML that determines how the list and record are rendered in CMS.

The Default Detail Page field indicates a CMS page that displays a record selected from a List of Content block.

6. Click the Information icon next to the Default Detail Page, to go to that page.

7. From the Default Detail Page, under Related Links, click Edit Page.

The Detail Block contains a content type formatter. When editing or viewing the page, it is looking for a URL to be passed to determine the record to display, which is why it says "Detail record could not be located".

8. Click the pencil icon to edit and view the Detailed Content block.

The Type drop down list has “Show the page’s current document” selected, which indicates that the document_id must be passed to this block from the CMS pages, then it can display the record based on the content type listed in the document_id.

9. From the Common Answers block, on the Self Service page, select a record.

The page opens with a URL similar to: https://<instance name>.service-now.com/ess/knowledge.do?
sysparm_document_key=kb_knowledge,02255450d731310013ab49547e61038e

The table sysparm_document_key=kb_knowledge and sys_id 02255450d731310013ab49547e61038e determine the record. The associated content type, kb_knowledge, renders the content on the Default Detail Page, Portal - Knowledge Detail / url_suffix=knowledge.

Content blocks

A block is a defined piece of content within the system that can be reused.

A content page is constructed by arranging customized blocks of content on a page. Content blocks are an integral part of a CMS site. Existing content such as reports, gauges, and record lists are automatically available as content blocks and more can be created within the CMS.

After defining content blocks, use them on any content page by adding them to dropzones. For more information, see Add content to a page.

Create content blocks after sites and pages have been designed.

Configure a content block

To configure a content block, define it in the appropriate form.

Role required: content_admin or admin

1. Perform one of the following actions to create a content block.

   • Navigate to Content Management Blocks (Block type) New . The form for creating the selected block type opens.
   • Navigate to Content Management Blocks All and select the type of content to create from the list.
   • Edit a content page and add a stub block of the desired content block type. Click the link in the stub block.

2. Complete the content block form and save it.

3. Add the content block to any content page.
View CMS block tags

A CMS block tag is used for advanced block creation and site flexibility.

Role required: content_admin or admin

It is constructed as `<g:content_block>{{Jelly_Tags|Jelly}}` and can be used in either of the following ways.

- Blocks: to display a block inside a block.
- Layouts: to display a block inside a layout.

The tag appears in the format, `<g:content_block type="<type>" id="<sys_id>"/>`.

An example of the block tag is included in the ESS Portal sample site.

1. Navigate to Content Management Design Frames.
2. Click cms_admin_home_frame.
3. View the code.

```xml
<style>
  DIV.cms_administration_home {
    background: url(gray_${current_page.getURLSuffix()}.pngx) no-repeat right top;
  }
</style>

<div class="cms_administration_home">
  ${body}
  <br/>
  <!-- Would you like to pivot off of parent page instead? try this snippet
  <j:if test="${current_page.getParentPage().getURLSuffix()}=='administration'">
    <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
  </j:if>
  The defaults use the page URL suffix to define sub menus
  -->
  <j:if test="${current_page.getURLSuffix()}=='administration'">
    <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
  </j:if>
  <j:if test="${current_page.getURLSuffix()}=='community_inspired'">
    <g:requires name="ess.portal.globals.jsdbx"/>
    <g:content_block type="content_block_menu" id="ccd4b8c7efb70000914304167b22566e"/>
  </j:if>
  <br/>
</div>
```

4. To see what the page looks like, navigate to the ESS Portal administration page. For example, http://instance name.service-now.com/ess/administration.do.

Types of content blocks

Content blocks, which make up content pages, are reusable pieces of content defined within the system.

Each content block can be used for a different type of content.
Configure a header block

A header block is a visual element placed at the top of pages. It provides a place for branding and other important site-wide functionality.

Role required: content_admin or admin

Some of the options that are available in headers include, global search, text size toggle, menus for navigational purposes, and the user name with logout link.

1. Navigate to Content Management Blocks Headers.
2. Click New.
3. Complete the form.

Table 82: Header form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the header block.</td>
</tr>
<tr>
<td>Background</td>
<td>Select a background for the header logo and menus.</td>
</tr>
<tr>
<td></td>
<td>• None - No background is rendered.</td>
</tr>
<tr>
<td></td>
<td>• Gradient/Image - Specify an image or gradient image to serve as the background.</td>
</tr>
<tr>
<td></td>
<td>• Colored Bars - Specify colors for three different sections of the header, top, middle, and bottom.</td>
</tr>
<tr>
<td>Image</td>
<td>If Background is Gradient/Image, upload an image for the header block background. For gradients, upload a gradient image.</td>
</tr>
<tr>
<td>Top bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the top menu.</td>
</tr>
<tr>
<td>Middle bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the logo and text.</td>
</tr>
<tr>
<td>Bottom bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the bottom menu.</td>
</tr>
<tr>
<td>Logo</td>
<td>Select a logo image. The image is also a link to the main page.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Text</td>
<td>Type the text to display beside the logo.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and type any scripted conditions to apply in the Condition script field that appears.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the header block. The category also determines the detail page in which header block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Top Menu</td>
<td>Select a navigational menu block to use as a menu above the logo.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Bottom Menu</td>
<td>Select a navigational menu block to use as a menu below the logo.</td>
</tr>
<tr>
<td>Height</td>
<td>Specify the height for the header.</td>
</tr>
<tr>
<td>Search</td>
<td>Select this check box to add a search element in the header.</td>
</tr>
<tr>
<td>Font sizer</td>
<td>Select this check box to include text sizing controls in the header.</td>
</tr>
<tr>
<td>Login</td>
<td>Select this check box to include a login link in the header. If the user is logged in, this element displays the user name and a logout link. If you specify a login page on the site record, it is important to include a login link so users can enter their username and password.</td>
</tr>
<tr>
<td>Chat Queue</td>
<td>Select the chat queue that users access by clicking the Help Desk Chat button in the header. Clear the field to remove the button. This field appears only if the Chat plugin is active.</td>
</tr>
</tbody>
</table>

Create a navigation menu block

Navigation menu blocks enable you to create a menu of links to different content pages.

Role required: content admin or admin

The following three objects define navigation menus.

- Menu block: The menu block defines the entire menu block and how it displays.
- Menu section: The menu sections define groups of links displayed within the block.
- Menu item: The menu items define the links within each menu section.

1. Navigate to Content Management Navigation Menus.
2. Click New.
   A gallery of available navigation menu blocks displays.
Choose a Menu System from the Options Below

<table>
<thead>
<tr>
<th>Image 1</th>
<th>Image 2</th>
<th>Image 3</th>
<th>Image 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super Menu for Headers</td>
<td>Drop Down Menu for Headers</td>
<td>Tab Menu for Headers</td>
<td>Horizontal Blocks</td>
</tr>
<tr>
<td>The super menu is a hybrid between the drop down menu and the tab system which allows the user to create a menu out or any number existing menus.</td>
<td>The drop down menu displays a menu much like those found at the top of typical desktop applications. They are frequently found in the headers of pages.</td>
<td>This tab menu is specifically designed for the bottom menu of header blocks. It is a common alternate for drop down menus, which uses inline links that render directly underneath the text.</td>
<td>The horizontal blocks menu displays a series of blocks horizontally until the horizontal space is exhausted and then they will stack. They are most often seen in the main content area of pages.</td>
</tr>
<tr>
<td>Tab Content Menu</td>
<td>Vertical Blocks</td>
<td>Vertical List</td>
<td></td>
</tr>
<tr>
<td>This tab menu for use in the content area of the page. Clicking a tab replaces the main content of the block container with the tabs corresponding sub menus.</td>
<td>The vertical books menu block displays a menu as a series of blocks stack one on top of the other.</td>
<td>The vertical list menu block displays a menu, consisting of a vertical stack of choices. They are most often seen along the left or right side of pages.</td>
<td></td>
</tr>
</tbody>
</table>

Figure 89: CMS menu options

3. Select the desired menu block style.
4. Complete the Navigation Menu form to define the block.

Table 83: Navigation Menu form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of navigation menu, which determines how the links are displayed.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the navigation menu block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, the Condition and Logged On fields appear.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the navigation menu block only if the user is logged on. This field appears only if Conditional is selected.</td>
</tr>
</tbody>
</table>
Configure menu sections

Menu sections define groups of links displayed within the navigation menu block.

Role required: content admin or admin

1. Navigate to Content Management Blocks Navigation Menus and select a block.
2. In the Menu Sections related list, click New.
3. Complete the Menu Section form.

Table 84: Menu Section form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image DB</td>
<td>Select the image database where your site images are stored.</td>
</tr>
<tr>
<td>Right image DB</td>
<td></td>
</tr>
<tr>
<td>Left image</td>
<td>Select icons to appear on the left and on the right of the name.</td>
</tr>
<tr>
<td>Right image</td>
<td></td>
</tr>
<tr>
<td>Second level text</td>
<td>Enter a description to appear beside the menu section title.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu section available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this section appears on the menu relative to other menu sections.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu section only if the user is logged on.</td>
</tr>
</tbody>
</table>
Configure menu items

Menu items are the links that appear within each menu section.

Role required: content_admin or admin

Not all navigation menu sections require menu items. Use menu items to link users to other pages or additional information. These steps use the ESS sample portal site as an example.

1. Navigate to Content Management Blocks Navigation Menus and select a navigation menu. For example, select the Documentation Menu.
2. From the Menu Sections related list, select a menu section. For example, select Getting Started.
3. From the Menu Items related list, click New.
4. Complete the form.

Table 85: Menu Item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when the menu item name and icon are clicked.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to open when the menu item title and icon are clicked. This field is available only if Redirect To is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when the name or icon is clicked. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu item to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu item belongs.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Type the name of the iFrame where the link opens when a user clicks the menu item name and icon. Make sure that there is an iFrame on the page. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Menu types**

By changing the Type field on the navigation menu block, you can format the same menu in different ways.

**Table 86: Menu types**

<table>
<thead>
<tr>
<th>Type</th>
<th>Image</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super Menu for Headers</td>
<td><img src="image.png" alt="Image" /></td>
<td>The super menu is a hybrid between the drop-down menu and the tabbed system. The user can use a super menu to create a menu from any number of menus.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Drop-Down Menu for Headers</td>
<td><img src="image1.png" alt="Image" /></td>
<td>The drop-down menu renders the menu sections as drop-down list. Use the mouse to point to the menu name and view the menu items.</td>
</tr>
<tr>
<td>Tab Menu for Headers</td>
<td><img src="image2.png" alt="Image" /></td>
<td>The tab menu renders the menu sections as tabs. Use the mouse to click the tab and view the menu items.</td>
</tr>
<tr>
<td>Horizontal Blocks</td>
<td><img src="image3.png" alt="Image" /></td>
<td>The horizontal blocks menu renders the menu sections as block headings with menu items as links within the blocks. The blocks are arranged horizontally.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>

<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Tab Content Block</td>
<td><img src="image1.png" alt="Image" /></td>
<td>The tab content block (horizontal) menu renders the menu sections as tabs with menu items as links within the block.</td>
</tr>
<tr>
<td>Vertical List</td>
<td><img src="image2.png" alt="Image" /></td>
<td>The vertical list menu renders the menu sections as headings with menu items as links below them.</td>
</tr>
<tr>
<td>Vertical Blocks</td>
<td><img src="image3.png" alt="Image" /></td>
<td>The vertical blocks menu renders the menu sections as block headings with menu items as links within the block. The blocks are arranged vertically.</td>
</tr>
</tbody>
</table>

**Menu style customization**

You can customize menu styles in the style sheets your site uses.

Navigate to **Content Management Design Style Sheets** to customize style sheets.
Supplementary page navigation menu example code

In the following example, look at the CSS class selectors and rules. Also, review how the block containers (div.cms_menu_section_blocks) are defined based on the outer container (TD.layout_content_submenu_column). The outer container is actually a part of the site layout.

This concept is clearer if you compare the styles to the styles used in the super menu further down in the example. This example shows that there is no need to make a completely new menu system. You can use CSS to change the look and feel of existing menus.

```css
TD.layout_content_submenu_column DIV.cms_menu_section_blocks {
  width: 156px;
  height: auto;
  float: left;
  position: relative;
  border-style: solid;
  margin: 0px 0px 0px 0px;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIV.sub_menu_section {
  width: 156px;
  height: 20px;
  float: left;
  border-style: solid;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 0px 12px 0px 12px;
}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {
  color: #FFF;
}

TD.layout_content_submenu_column IMG.menu_bullet {
  display: none;
}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a, TD.cms_menu_tab_blocks_text h2 {
  margin:0;
  padding: 0px;
  font-size: 11px;
  text-transform: uppercase;
  color: #42C4DD;
  font-weight: normal;
  white-space: nowrap;
}

TD.layout_content_submenu_column a.cms_menu_block_item {
  margin:0;
  padding: 0px;
  font-size:11px;
}
```
Super menu sections example code

The following menu is a simple float grid. The defaults are written first. Then, below the “SUPER MENU VARIATIONS...” comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of cms_header_bottom_menu (refer to the TD.cms_header_bottom_menu CSS selector).

```html
TD.layout_content_submenu_column DIV.cms_menu_section_blocks {
  width: 156px;
  height: auto;
  float: left;
  position: relative;
  border-style: solid;
  margin: 0px 0px 0px 0px;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIV.sub_menu_section {
  width: 156px;
  height: 20px;
  float: left;
  border-style: solid;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 0px 12px 0px 12px;
}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {
  color: #FFF;
}

TD.layout_content_submenu_column IMG.menu_bullet{
  display: none;
}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a,
TD.cms_menu_tab_blocks_text h2 {
  margin:0;
  padding: 0px;
  font-size: 11px;
  text-transform: uppercase;
  color: #42C4DD;
  font-weight: normal;
  white-space: nowrap;
}
4.2 2. Super Menu Sections Example Code

This menu is essentially a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of "cms_header_bottom_menu" (note the TD.cms_header_bottom_menu CSS selector).

Section Blocks Menu (cms_menu_section_blocks UI Macro)

---

```
div.cms_menu_section_blocks {
    width: 260px;
    height: 260px;
    float: left;
    border-style: solid;
    margin: 0px 0px 12px 12px;
    border: 1px solid #e0e0e0;
    padding: 10px;
    background: url(blue/portal_horizontal_bkg.pngx) repeat-x center bottom;
}
```

---

```
p.cms_menu_separator {
    border-top:1px dotted #ccc;
    margin-top: 6px;
    margin-bottom: 6px;
}
```

---

```
td.cms_menu_section_blocks_title h2, td.cms_menu_section_blocks_title h2 a,
td.cms_menu_tab_blocks_text h2 {
    margin:0;
    padding: 0px;
    font-size: larger;
    font-weight: normal;
    color:#444;
}
```

---

```
a.cms_menu_block_item {
    margin:0;
    padding: 0px;
    color:#999;
    font-size: inherit;
}
```

---
SUPER MENU VARIATIONS FOR HORIZONTAL MENUS - Section Blocks Menu  
(cms_menu_section_blocks UI Macro)  
*****************************************************************************
TD.cms_header_bottom_menu .cms_menu_super_menu_bar { /*style the super menu  
drop down bar */  
z-index: 199;  
float: left;  
background: none;  
margin-left: 44px;
}

TD.cms_header_bottom_menu div.cms_menu_section_blocks {  
width: 200px;  
float: left;  
border: 0px;  
margin: 0px 0px 12px 0px;  
padding: 0px;  
background: none;
}

TD.cms_header_bottom_menu p.cms_menu_separator {  
border-top:0px dotted #ccc;  
margin-top: 0px;  
margin-bottom: 0px;
}

TD.cms_header_bottom_menu .cms_menu_super_menu_bar_item { /*style an item on  
the super menu drop down bar*/  
z-index: 200;  
float: left;

color: #000;  
border-left: 1px solid #FFF;  
border-top: 1px solid #FFF;
}

TD.cms_header_bottom_menu .cms_menu_super_menu_bar_item_selected { /*style a  
selected item on the super menu drop down bar*/  
z-index: 200;  
float: left;  
padding-left: 12px;  
padding-right: 12px;  
padding-bottom: 8px;  
padding-top: 4px;  
cursor: pointer;  
cursor: hand;  
background: #fff url(super_menu_bkg.gifx) no-repeat left top;  
font-weight: bold;  
border-right: 0px solid #CCC;  
border-bottom: 0px solid #CCC;  
border-left: 1px solid #DDD;  
border-top: 1px solid #EEE;
}

TD.cms_header_bottom_menu .cms_menu_super_menu_content { /* style super menu  
content block */  
position: absolute;
Example menu items and content links

The method for choosing a link target (current window, iFrame, or new window) and referencing the item linked (page, attachment, or URL) are similar. Review examples of how to link within these elements.

- A content page reference helps you select the desired page. For example, the value home.do links to the site homepage.
- An attachment reference allows you to reference a single file attached to the menu item or section record. If there is more than one attachment, only the first attachment is referenced. The link is then generated automatically and displays a Browser File Save prompt.
- The specified URL reference allows you to link to a full URL string in your instance or from another system. For example, com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=66c313e7c0a8016b008eb1a8e3d97f5&sysparm_nameofstack=b654d15bef921000914304 links to the Ask a Question record producer. Use this reference to link to a page in an existing intranet system.

Menu items can be seen as featured links from each section. There are many choices in URL definitions and link options. Links within the ESS Portal open content pages within the site. In turn, each page has an iFrame or set of blocks that houses the corresponding data. This method is useful for rapid prototyping, but consider where to create dynamic detail pages and use the available linking options.
Menu items are similar to content links except they are called by the list block, not as part of a navigation menu block. Menu items and content links function the same as far as how they are defined and the options available for linking to items. Content links are meant to be called through a list block that calls the Content Link (content_link) table. Content links do not have the Logged in field or the Roles option used to control the UI experience for various roles.
View menu and list examples

Menu sections define groups of links and how the links behave.

Role required: content_admin or admin

For example, link behavior determines which page opens when the link is clicked and how it opens, such as in a new page or a new frame. Use the following procedure to view a sample menu section.

2. Click Portal - Block Menu.
3. In Menu Sections related list, click Order Things.
4. Click the reference icon next to Detail Page to open the page.
5. In Related Links, click Edit Page.

By default, the link goes to the Order Things page with the Portal - Order Splash Menu (Vertical Block Menu) in the page content area.

In most default CMS menus, the menu section has the menu title with secondary text, a separation line, and the links you define as menu items. Although the design is versatile and flows well between pages, there could be questions about linking and scalability to large catalogs. This practice may only be useful for a small catalog with limited items.

6. To view an example of dynamic content, follow these steps to look at the request catalog list/grid view on the ESS Portal.
   a) Add /ess/manage.do to your instance URL.
      For example, https://<instance name>.service-now.com/ess/manage.do.
   b) In the Code Example Demos section, click Request Catalog List / Grid View.
   c) Browse the catalog items.
Configure dynamic blocks
Use dynamic blocks to use scripting or to pull information from the system. Dynamic blocks are where most of your content resides.

Role required: content_admin or admin

A good use of dynamic blocks is job postings. Store the postings in knowledge articles and display the postings with a dynamic block.

Several dynamic blocks are predefined, including the following items.

• New Content: Each of the new content blocks allows for creating blocks while editing content pages.
• Clean Login: The default login page requesting user name and password, which includes a “Remember Me” check box. After the user logs in, this block triggers login rules.
• Login: An area that allows a logged out user to log in and a logged in user to log out. This block is especially useful on publicly available content pages.
• Search: The global text search field. Currently, global text search is the only form of search that can be included in a content page.
• Search Results: An area for displaying global text search results.

For information about Apache Jelly, see Jelly tags.

1. Navigate to Content Management Dynamic.
2. Click New.
3. Complete the Dynamic Content form.

Table 87: Dynamic Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the dynamic content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the dynamic block. The category also determines the detail page in which dynamic block links open.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the dynamic block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field to the form.</td>
</tr>
<tr>
<td>Two phase</td>
<td>Select this check box to allow two phase Jelly tags.</td>
</tr>
<tr>
<td>Dynamic content</td>
<td>Enter the XML script field that determines the behavior of the dynamic block.</td>
</tr>
</tbody>
</table>

Catalog cart block

The catalog cart block is a dynamic block provided in the base system.

This block provides the same cart that is available within the service catalog. If the site definition has the Use external cart option selected, include this block in the site so users can interact with their catalog cart.
Catalog cart block is available when the glide.sc.use_cart_layouts property is set to false.

*Customize the list block*

List blocks are content blocks that dynamically generate a list of links to records within the instance. When a user clicks a link in a list block, the associated information is displayed in a detail page determined by its content type.

Role required: content_admin or admin

Make the list using a simple query on any table or by scripting a more advanced query. Lists are powerful and flexible. Here are some places that allow you to have complete control over the list display.

Table 88: List control

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames</td>
<td>Frames provide a method to create decorative containers for content blocks and other elements within the site. When frames are used with the Type field, the designer has complete control over list placement.</td>
</tr>
<tr>
<td>List Type</td>
<td>The List Definitions module defines the type of lists available for content pages. On the List Block form, select a list definition in the Type field.</td>
</tr>
<tr>
<td>List Filtering</td>
<td>Provides every field in the referenced table for more granular results.</td>
</tr>
<tr>
<td>Max Entries</td>
<td>Limits the results from a table to fit the design of the block.</td>
</tr>
<tr>
<td>Order and Order Direction</td>
<td>Allows sorting by any field in the referenced table, in either ascending or descending order.</td>
</tr>
</tbody>
</table>

You can also use list blocks to create a list of links to information outside your instance. Create the external links as records on the Content Link [content_link] table, and then follow the steps in this procedure.

1. Navigate to Content Management Lists.
2. Click New.
3. Complete form.

Table 89: List Block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the list content block. It is used to identify the record in the instance and is not displayed on the content page. Use the Title field for that purpose.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a list definition UI macro to format the list of links. For more information, see Configure list definitions.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the list block. For more information, see Create a frame UI macro.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to enable generating a list from a script, rather than from a simple filtered query.</td>
</tr>
<tr>
<td>Query</td>
<td>Filters the results using a condition builder.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the name to display at the top of the list block when it appears in a content page.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Set the maximum number of entries to display in this list block.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to query for the list items. The table determines which detail page displays when a user clicks a link in the list block. For more information, see Configure a content type. Note: The list shows only tables and database views that are in the same scope as the list block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, a Condition script field appears. Other fields that appear include the Logged On and Omit if empty check boxes.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Configure list definitions**

List definitions, similar to content management frames, are decorative containers that control the look and feel of lists.

Role required: content_admin or admin

Specifically, list definitions are UI macros that use Adobe Jelly script to define how a list is rendered inside a list block. Site design often requires multiple list styles within the layout. Lists are often the primary form of navigation within a site, so it is important to have control over their formatting.

Configuring list definitions requires a knowledge of Adobe Jelly.

1. Navigate to Content Management Configuration List Definitions.
2. Click New.
3. Complete the List Definition form.

**Configure a static HTML block**

Use static blocks for text that does not change. For example, use a static block for a site footer with only the company or organization name. A static HTML block allows any HTML code to be run within a page.

Role required: content_admin or admin

Anyone who edits their own HTML, Jelly, or Javascript may find the HTML editor in the static block limited. The HTML editor can also add tags or formats that advanced coders find unnecessary. For more advanced options, use dynamic blocks.

1. Navigate to Content Management Blocks Static HTML.
2. Click New.
3. Complete the Static Content form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the static HTML content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the static HTML block. The category also determines the detail page in which static HTML block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the static HTML block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field and Logged on check box to the form.</td>
</tr>
<tr>
<td>Static Content</td>
<td>Enter HTML code that determines the behavior of the static HTML block.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Format an image as a static HTML block

An easy way to add an image to a CMS page is to use a static HTML block. After the block is created, you can reuse it throughout the site.

Role required: content_admin or admin

1. Navigate to Content Management Design Images.
2. Click New.
3. Select a Category to help organize the images.
4. Type the file name of the image, including the extension (such as .png).
5. Upload the file by selecting Click to add and browsing for the image.
6. Click OK.
7. Click Update.
9. Paste the following code into the HTML block, substituting the image name as uploaded in the previous step.
   
   The “x” at the end of the filename is required for image caching.
   
   ```html
   <img src="<image_name>.gifx"/>
   ```

   Now the image is a static HTML block and you can add it to any content page. Use standard HTML code to alter the image in the content block.

Configure Flash movie blocks

Use a Flash movie block to embed any Flash movie (.swf file) as an attachment or by referencing a URL in a content page.

Role required: content_admin or admin
To add streaming video or Flash video (.flv), for example, to a knowledge article, see *Embed videos in HTML fields*.

1. Navigate to *Content Management Specialty Content Flash Movies*.
2. Click New.
3. Complete the Flash Movie form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Flash movie block.</td>
</tr>
<tr>
<td>Source</td>
<td>Specify where the Flash movie is found.</td>
</tr>
<tr>
<td></td>
<td>• Attachment: If this choice is selected, upload the Flash movie to this record.</td>
</tr>
<tr>
<td></td>
<td>• Link to External Object: If this choice is selected, a URL field appears. Specify the Flash movie URL and ensure that the Flash movie is publicly accessible.</td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height of the Flash movie in pixels.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the Flash movie in pixels.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Configure content links**

Content links are the predecessors to navigation menus. You can use content links to create navigational links to information outside of your instance.

Role required: content_admin or admin

After the content link is configured, it must be defined in a list block. List blocks use content links to reference information outside of your CMS.

1. Navigate to *Content Management Specialty Content Content Links*.
2. Click New.
3. Complete the Content Link form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the content link</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select the location of the external link</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the site URL to open when the link is clicked. This field is available only if Redirect to is set to <em>The specified URL</em>.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of the clicked link.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the page where the link opens when it is clicked. This field is available only if Redirect to is set to <em>A content page</em>.</td>
</tr>
</tbody>
</table>
4. Click Submit.
5. From Content Management Blocks Lists, create a list block that references the content links by selecting Content Link in the table field.
6. Create a query to determine which external links display on the page. For example, the query Category is Search displays any external links that have a category defined as Search.
7. Click Update.

**Configure iFrames**

An iFrame embeds a URL on a page within a frame. It can embed external pages or render ServiceNow content.

**Note:** Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see *Embedding reports in Jelly*.

**Note:** The ServiceNow login portlet is the only content supported within an iframe HTML element. To deliver ServiceNow content from a web page, see *Service Portal* instead.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iFrame</td>
<td>Enter the name of the iFrame where the link opens when it is clicked. Make sure that there is an iFrame on the page where the link opens. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the iFrame block.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a name for the frame on the page. When you use iFrames to present ServiceNow content such as forms or lists, the frame name must be gsft_main. This name allows links within the iFrame to open within the iFrame.</td>
</tr>
</tbody>
</table>
### Field | Input value
--- | ---
**URL** | Enter the URL to display in the iFrame. If you use the iFrame to display ServiceNow content, start with the page name and do not include the base instance part of the URL. For example, to show the list of requested items, the URL is: `sc_req_item_list.do`
queries can be applied to the URL. For instance, to display a list of open requested items, the URL is: `sc_req_item_list.do?sysparm_query=active=true`
For more information, see [URL schema](#).
*Sizing* | Select an option for iFrame block size.
--- | ---
**Note**: The Expand to fit content choice only works with ServiceNow content. If Fixed Size is selected, height and width fields are displayed for you to enter the size in pixels.

---

Note: Some browsers suppress iframes because they use an X-Frame-Options header value of SAMEORIGIN. The X-Frame-Options header was introduced in Internet Explorer 8 RC1, to help detect and prevent frame-based redressing. The SAMEORIGIN value causes the browser to render a blank page instead of the target page of the `<frame>` or `<iframe>` when the frame target is not on the same origin as the page itself. Support for this header has been implemented in Safari 4.0, Chrome 4.1.249.1042, and Firefox 3.6.9 and above.

---

### Integrate Live Feed with CMS

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

The ESS Portal template includes the Portal - Live page and Live Feed dynamic block (requires the Live Feed plugin). To provide access to Live Feed from CMS pages, add the Live Feed dynamic block to a CMS page or include the Portal - Live page in a site.

1. Navigate to Content Management Specialty Content iFrames.
2. Click New.
3. Complete the iFrame block form with the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Type a unique name: Live Frame</td>
</tr>
<tr>
<td><strong>Frame name</strong></td>
<td>Type a frame name: live_frame</td>
</tr>
<tr>
<td><strong>URL</strong></td>
<td>Enter <code>https://instance name/live_feed.do?sysparm_doctype=true</code>. Replace instance name with your instance URL, for example, <code>&lt;myinstance&gt;.service-now.com</code>.</td>
</tr>
</tbody>
</table>
4. Click Submit.
5. Complete the steps in Add the block to a page.

iFrame methods

The following examples show how system records are pulled into an iFrame that is placed on a content page.

For system lists or forms, use the frame name gsft_main so that links work properly.

• Order Hardware is an example of linking to a catalog category.
  • URL: com.glideapp.servicecatalog_category_view.do?
    sysparm_parent=d258b953c611227a0146101fb1be7c31&sysparm_view=
  • Frame name: gsft_main

• My Approvals List is an example of linking to a list with a view filter and a JavaScript that reference the authenticated user.
  • URL: sysapproval_approver_list.do?
    sysparm_query=approver=javascript:getMyApprovals()&sysparm_view=ess
  • Frame name: gsft_main

• Service Catalog Home Page (system) references the system catalog page within the Service Catalog application. If you are satisfied with the way the catalog looks, this method is an easy way to bring the page into a CMS design.
  • URL: catalog_home.do?sysparm_view=catalog_default
  • Frame name: gsft_main

• Problem Management Overview references a homepage. ../ makes the URL string relative to system homepages. Without it, the URL string resolves to the default CMS homepage reference in the site.
  • URL: ../home.do?sysparm_view=problem_overview
  • Frame name: gsft_main

Configure a detailed content block

A detailed content block displays the content of an existing document, such as an incident, knowledge article, or service management request. The document type determines the page that a list of documents points to.

Role required: content_admin or admin

The block works with content types in the Default detail page field. For more information, see Configure a content type.

If you plan to use a script to find a document, configure the form to add the Script field if it is not displayed.

1. Navigate to Content Management Configuration Page Detail Settings.
2. Click New.
3. Complete the Detailed Content form.
Table 95: Detailed Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Detailed Content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the detailed content block. If the block Type is Show the page’s current document, the category displays content from any link of the same type.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the detailed content block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Model Document</td>
<td>Select the document to display by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the behavior for the block.</td>
</tr>
<tr>
<td></td>
<td>• Show a Specific Document: Displays the Model Document.</td>
</tr>
<tr>
<td></td>
<td>• Show the page’s current document: Displays the currently selected document.</td>
</tr>
<tr>
<td></td>
<td>• Use a script to find a document: Uses the Script field to select a particular document.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and enter any scripted conditions to be applied. Selecting this check box adds a Condition script field and Logged on check box to the form.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter a script to find an appropriate document if the Type is set to Use a script to find a document. Set the Return to the GlideRecord of the desired document.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Content Management and the Apache Jelly engine

Apache Jelly is a Java-based and XML-based scripting and processing engine for turning XML into executable code.

The Apache Jelly engine closely resembles XML and should be comfortable for developers familiar with JavaScript, XML, XHTML, or HTML. In the ServiceNow instance, the Apache Jelly engine renders items such as forms, lists, and UI Pages. Apache Jelly code renders well within a dynamic content block, but can have issues when used in static blocks. You can use Jelly tags, calls, and statements, but HTML acts just like XHTML.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <j:if test = "${current_page.getName()}=='Solutions'" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" >${gs.getMessage('Solutions')}</a> </b> </h1>
    <p class = "page_description" >
      ${current_page.getDescription()}
    </p>
  </j:if>
</j:jelly>
```
Ensure that all tags are closed. If the tag is not a naturally closing tag, then place a forward slash before the end bracket. For example, a <BR/> or an <IMG src="cms.png"/>

If you are unfamiliar with Jelly scripting, review these topics:

- **Jelly tags**
- **Extensions to Jelly syntax**
- **Jelly escaping types**

Include the following tag with all Apache Jelly scripts.

<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">

The tag looks complex, but keep the following information in mind.

- Apache Jelly script uses multiple namespaces.
- There are two types of prefixes in tags: j and g. The j prefix is used for tags that are natively part of Apache Jelly. The g prefix is used for tags that the ServiceNow platform created and is using for platform purposes.

The j2 and g2 prefixes are just like j and g, except that they are processed in a second phase. The Apache Jelly script parser runs through each j and g tag respectively. For example:

<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <j:set var="jvar_phase1" value="Hello" />
  <j2:set var="jvar_phase2" value="World" />
  ${jvar_phase1} ${jvar_phase2}
</j:jelly>

In phase 1, the parser runs through all the j and g tags. It then caches the result. Before it runs the second phase, it takes the j and g namespaces and moves the namespaces to the second phase. It looks something like the following code.

<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="jelly:core" xmlns:g2="glide">
  <j2:set var="jvar_phase2" value="World" />
  Hello ${jvar_phase2}
</j:jelly>

For subsequent calls of this script, only phase 2 is parsed.

Note: If you plan to use phase 2 Jelly tags (g2 and j2) on the Content Type [content_type] or Dynamic Content [content_block_programmatic] tables, select the Two phase option on the content form.

Another example is to create a report of all open incidents assigned to each group. For this purpose, you could use a report and save time, but it is a good example for learning Jelly. Start with the Jelly tag:
First, you need a list of open incidents. Use a g2:evaluate tag. The evaluate tag runs the script. Anything inside the tag is parsed like a business rule, so, for example, you can call global business rules, script includes, and gliderecord.

This script is in phase 1 because frequent changes to incident assignment groups are not expected. Also notice the var attribute on the evaluate tag. This attribute specifies what variable is set from this block. At the end of the script, there is a gr on a line by itself. That last line is what sets the variable.

You can omit the jvar_groups variable, but then all the variables in the evaluate tag become Apache Jelly variables. The object=true specifies that the variable is not a primitive data type. If object=true is omitted, the script would break because jvar_groups would only be able to hold items like integers and strings.

After the evaluate tag, loop through these groups and find the incidents for each one.

You can include normal XML in the Apache Jelly script at any time. Since there is no namespace, the Apache Jelly script does not try to parse the XML tags. Notice the j:while loop. It is a normal while loop and can iterate through a GlideRecord object. Also notice that you output a value with ${HTML:jvar_groups.getValue('name')}. Here are the important elements:

- The outer brackets, ${}, specify the output of the variable and the phase in which the variable is output: ${} means first phase, ${} means second phase.
- HTML before the expression is for escaping the output. The expression jvar_groups.getValue('name') is being escaped for HTML. For other types of escaping, there are JS (Javascript), NS (No Script), and some other options.

To select only one record and not iterate through many records, the code looks like the following example:
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var gr = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
    <j:if test="${jvar_groups.next()}">
      We found ${HTML:jvar_groups.getValue('name')}.
    </j:if>
  </j:jelly>
</j:jelly>

Content management and Jelly code examples

Code examples

Header Example Code

This dynamic content block needs to be active and have the "Two Phase" option clicked. The $g:requires$ tag is including the UI script defined in the system whose name is "servicenow.website.globals". The file extension in the call is .jsdbx and is used only in the call to the UI script, not in the name of the script in the system. For JSDBX, the file being called is a JavaScript (.js) defined within the database (db) that needs to be cached (x).

<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <g:requires name = "servicenow.website.globals.jsdbx" />
</j:jelly>

Page Title and Description Example Code

This dynamic content block needs to be active. There are two actions within this code snippet. First is a forward-looking string container that allows site translation, the $gs.getMessage('Your Text')$ string call). The second action pulls in the page title and description, ${current_page.getName()} and ${current_page.getDescription()}.

<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
    <j:if test="${current_page.getName()=='Solutions'}" >
      <h1 class = "page_name" ><b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" >${gs.getMessage('Solutions')}</a> </b> </h1>
      <p class = "page_description" >
        ${current_page.getDescription()}
      </p>
    </j:if>
    <j:if test="${current_page.getName()=='IT 3.0'}" >
      <h1 class = "page_name" ><b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" >${gs.getMessage('Solutions')}</a> | ${current_page.getName()}</b> </h1>
      <p class = "page_description" >
        ${current_page.getDescription()}
      </p>
    </j:if>
  </j:jelly>
</j:jelly>

List Block Pulling From Knowledge Articles Example Code

This code example contains one of the best tricks in the CMS. Using the type field with draws from a number of defined list definitions to make slight, or very dramatic changes, to list display. Because the UI is open to configuration and innovation, this is a good opportunity to use design skills. Anyone who can use HTML and CSS knows that a basic list can be turned into a float grid or be made inline. The combinations are limited only by what the designer can dream up and code.

In the code example, there is a custom logo field (u_logo) added to the Knowledge form. The custom field displays customer logos, partner logos, and award images on the awards page. There are a number of different sections that use this list definition so efficient reuse is taking place.
Style in Content Management

Content pages can be styled with CSS, just like any HTML website.

Three elements control CSS styles:

- **Style Sheets** are records containing CSS declarations.
- **Themes** are groups of style sheets that can be invoked together.
- **Frames** are UI macros that define the outer border of individual content blocks as they appear on a content page. Frames work by calling on particular definitions in the style sheets.

### Style sheets

Styles sheets are standard Cascading Style Sheets (CSS) that define the look and feel of all elements within the interface.
Cascading Style Sheets (CSS) can either be internal (stored in the database) or external (hosted on the server), based on organizational needs. To define an internal style sheet, use standard CSS in the style field. Using external CSS allows the Content Management System to use the same CSS as a corporate website or other online resource.

Use an external style sheet by defining a URL that points to the .cssx file. If you upload a .cssx file to the platform, you can reference the .cssx file using a URL.

Content pages do not reference style sheets directly. To invoke a style sheet, you assign the style sheet to a Theme using the related list on the Theme form.

Design themes

Design themes are the convergence of structure and styling, making them a critical tool for creating a powerful user interface.

For a successful project, review the corporate style guide and communicate with the corporate website art team. If the organization has an art or design department that maintains branding, include them in this process.

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages. In most environments, many pages share a few themes. Use multiple themes within a site to create stylistic differentiators between site areas. You can also use a single theme to create one unified look and feel for the site.

Customize a design theme

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages.

Role required: content_admin or admin

Themes can be invoked in any of the following ways.

- Directly by content pages.
- As the default theme of a content site.
- On the configuration page as a global default.

1. Navigate to Content Management Design Themes.
2. Click New.
3. Type a name for the theme and mark it as Active.
4. Right-click the form header and click Save.
   The Style Sheet related list appears.
5. Use the Style Sheet related list to add style sheets to the theme.

Doctypes

The view_content html page template on which all CMS is based defaults to doctype=html.

The code looks like the following HTML source code.

```html
<!DOCTYPE HTML>
```

If your CMS site does not render properly, remove the doctype from the page by setting the following property:

- glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse

The following is the default for this property.

- glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse, view_content
Setting this doctype offers these benefits for building new sites:

- Incorporating common practice: Use a practice that is becoming widely adopted across the Internet and can prevent certain browsers from running in quirks mode.
- Cleaner CSS and markup: Write more standards-based CSS and markup to promote code sharing.
- A step towards browser compatibility: Find solutions that work across browsers and avoid browser-specific workarounds.

Format a frame

Frames provide a way to manage decorative containers for content blocks and any other elements within the site. For example, one frame can be a container, made of div or span tags, that is styled with rounded corners.

**Role required:** content_admin or admin

Individual content blocks use a frame UI macro to define the frames. When viewing a content block form, the Frame field offers a choice between the different frame UI macros. The frame UI macro does not, however, have the definition for the frame within its Jelly script. Instead, it references a particular frame as defined in a style sheet.

Configuring a new frame is a two-step process.
1. Define the frame in a style sheet.
2. Create the frame UI macro to invoke the frame definition.

**Define a frame in a style sheet**

Add style definitions for any custom frame UI macro you create.

**Role required:** content_admin or admin

Each frame has its own class name.

1. Navigate to Content Management Design Style Sheets.
2. Select a style sheet to contain the frame definition.
   - Base system themes use a separate Frames style sheet.
3. Add the following code, substituting the desired frame name and style:
   
   ```
   div.FRAME_NAME{border:STYLE;}
   ```
4. Click Update.

**Create a frame UI macro**

Copy an existing frame UI macro to display content in a custom frame.

**Role required:** content_admin or admin

Create a custom frame UI macro if you want to control the style of the frame with your own style sheet definitions.

1. Navigate to Content Management Design Frames and select one of the existing frame UI macros.
2. Change the name to match the FRAME_NAME you used in the style sheet.
3. Right-click the header bar and select Insert and Stay.
4. Update the frame name in the XML field as shown:
   
   ```
   <div class="FRAME_NAME">
   ```
5. Click Submit.

- In any content block form, select the UI macro.
- Define the frame in a style sheet.
Content Management meta tags

Meta tags are special tags in web pages that contain information about the page but are not rendered with the page. You can define custom meta tags for content pages.

Meta tags are not noticeable to a page visitor unless the visitor looks at the page source code. Web search engines read meta tags as they "crawl" the web, identifying and organizing content. Modern website designers often use meta tags to embed "hints" to search engines about how to index or otherwise crawl the site.

Structurally, a meta tag consists of a tag and a name/content pair and looks similar to the following code.

```html
<meta name="generator" content="MediaWiki 1.16wmf4" />
```

The Content Management System allows you to define both site level and page level tags.

Configure a page level meta tag

A page level tag is a meta tag defined on a specific page and included on only that page.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site, the page tag takes precedence.

1. Navigate to Content Management Pages.
2. Open the page.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
5. Type a Name and Content for the tag.
6. Click Submit.

Configure a site level meta tag

A site level tag is a meta tag is defined on a site and included on every page within that site.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site tag, the page tag takes precedence.

1. Navigate to Content Management Sites.
2. Open the site.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
5. Enter a Name and Content for the tag.
6. Click Submit.

Configure DIV-based layouts

After you create your site, you can change the site layout with DIV tags.

Role required: content_admin or admin

Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags help in the following ways:

- simplify code
- reduce the amount of code
• increase page load speed
• separate content from presentation
• help pages adapt to different device resolutions
• make pages easier for search engines to crawl
• make code more compliant with evolving web page design standards

A theme named Administration Theme - Charcoal is included as an example of CSS-driven, DIV-based layouts. To view the Administration Theme - Charcoal DIV-based layout, complete the following steps.

1. Navigate to Content Management Design Layouts.
2. Click Admin 1 Column
3. Review the code.

Content meta tag hierarchy

Page and site level meta tags are included in a content meta tag hierarchy.

Site and page level tags

CMS supports page level and site level tags. The system behavior is to show the sum of all page level and site level tags. For example, if you have two tags on the site and one tag on the page, all with different names, you see three tags on the page. Two are from the site and one is from the page. If both the site and the page have a tag of the same name, only the page tag is used.

Note: The Content Management System does not support some commonly used meta tags. For example, you cannot use the X-UA-Compatible meta tag, which allows you to specify which version of Internet Explorer a site should be rendered in.

Example: all tags have unique names

```
<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

Output
```

```
<table>
<thead>
<tr>
<th>Name</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>
```

Example: page level tag overrides site level tag

```
<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
</tr>
</thead>
</table>
```
### Content Management integration points

Integration points use content blocks in CMS to link different applications together using static and dynamic methods.

By using integration points, users can connect to different systems from a single page. The power of the CMS is that it can display any data within the ServiceNow platform. The ESS portal, for example, connects users to a service catalog, a knowledge base, and a help and incident reporting site. Each section contains a set of links to additional content. List blocks offer the easiest way to display data dynamically. Content types define how lists link to the detailed data they reference.

Generating lists from the ServiceNow platform is straightforward, especially if you use filtering. When the CMS was first introduced, lists were the only method available to create navigational systems for sites. Content types define system record links using specific templates to define the list and the details.

- **Summary template**: defines the list
- **Detail template**: defines the detail as it is rendered in a page.

The templates work together to pass data attributes or unique record identifiers (sysid) into a single detail page that manages the data. Any attribute variations use the URL sent to the page.

Understanding how content types work can mean the difference between a site with 20 pages versus a site with 200 pages. There is a time for both types of data calls. Depending on the task, there are appropriate times to use static content and times for dynamic methods.

### View links between system elements and URLs

You can view the links between your system elements and their URLs to render more specific content within your site.

**Role required**: content_admin or admin

See the [URL schema](#) page for an overview of URL syntax in the ServiceNow platform.

The Incidents list offers a quick example of viewing a form within its own tab. This viewing method illustrates how to append the URL string to render more specific content within your site.

1. Navigate to Incident All.
2. Right-click in a blank area within the content frame and select Open Frame in New Window or Open Frame in New Tab.
   
The URL returned looks similar to this example.

   `<instance_name>/incident_list.do?
sysparm_userpref_module=b55b4ab0c0a80009007a9c0f03fb4da9`

   The URL is comprised of the following elements.

   - `incident_list.do?` is the call to the list with no parameters passed into it. Explore context menu options and list filtering variations to see how the URL string is appended with each action.
   - `incident_list.do?sysparm_query=&sysparm_view=ess` is an example of how the view is passed in the URL string.
• incident_list.do?sysparm_query=GROUPBYactive&sysparm_view= is how the URL looks when the group by option is chosen from the context menu.
• incident_list.do?sysparm_query=category%3Dsoftware is the result of applying a category is software filter to the list.

Explore all the options available within the right-click menu. Click through to the Incident form itself (incident.do) to see what the URL string does when parameters are passed into it.

Element link examples

View examples that show how to create a site pointing to various system data in several different data tables.

The following examples illustrate setting up access to the following system data.
• Knowledge: building a versatile front end for a knowledge base, from overview page to variations on the list definitions used in the site.
• Catalog: ideas for a business-to-consumer shopping experience that pulls various items and forms from your service catalog.
• Service Portfolio: using the business service portfolio to contain all defined services offered by your organization.
• Featured reports: methods for linking to the most important reports.
Page source view

Use the tools available in your browser to view the frame source page and understand what URL address bars pass between system frame sets.

The Firefox browser, for example, has the developer tools option. This option provides an easy way to view records that render within the main content frame (gsft_main) of the ServiceNow platform. Also, Firefox quickly builds menus and links to records within the system.

This Firefox functionality is useful when stepping through the menu items section.
Static methods

Static methods in the CMS application were created for ease of use. Form-based menu management and WYSYWIG code editing can be useful to both advanced and entry-level users. The technical ability of subject matter experts (SMEs) managing the language of your site can vary considerably. Letting SMEs write the content and having a technical resource manage the linking expedites menu and link creation within the system.
Navigation Menu Links

Use base system templates to group similar links for placement on the page. Though the terminology is different (menu sections and menu items), this type of linking behaves the same way as content links. For more information on creating a navigation menu block, see Create a navigation menu block.

Static HTML Details

Content blocks that are useful for areas administered by developers unfamiliar with HTML or markup. Anyone familiar with markup can use dynamic blocks because they are extendable. For more information on static HTML, see Using Content Blocks.

Content Links

The predecessors to navigation menus from when the CMS was first introduced. Use content links to make navigational links by defining several content links under the same category. Then,
call the links as a list referencing the Content Link (content_link) table.

**iFrame Details**

Used both dynamically and statically throughout the system. Using them is an easy way to bring any form or list into your CMS pages. For more information on iFrame methods, see *Using Content Blocks*.

---

**Dynamic methods**

While static methods are a powerful navigational tool, you have more control over data rendering using the dynamic methods.

Reference common code in the system to make long-term maintenance of the site easier. Coding skills are useful when implementing dynamic methods.

---

**Figure 95: Static and dynamic methods**

---

**Dynamic Blocks**

These blocks are where the majority of your work resides. For more information, see *Configure dynamic blocks*. 
Frames
Frames are meant to be decorative wrappers around any block in the system. They are mentioned with dynamic blocks because frames are essentially UI macros with the category of Frame. Frames apply the ${body} variable to a block and define where the block is inserted when rendered on the page.

Lists
Lists generate links to records based on the filtering rules you define. Lists can be sorted for presentation by any field in the corresponding record. Lists help supplement navigation and pull data from outside the CMS. For more information, see Customize the list block.

Content Types
Content types provide site-specific control of how system data defined as templates is rendered. The rendering of lists is considered first (summary templates). The next consideration is the detail template, which allows control over the record rendering.

List Definitions
List definitions enable you to extend the summary template defaults defined on the site level. Used with frames, list definitions render the same data differently based on the placement on the page or site. For more information, see Configure list definitions.

Detailed Content
Detailed content in page detail settings) are blocks that display the content of an existing document as a block on a content page. For more information, see Configure a detailed content block.

Example integration points
Each element on the page links to a specific URL point.
Business Services links to a content page (CMS page referenced: Business Service Portfolio, URL: (business_service_category.do) that pulls the system service catalog homepage into a frame within the content area. Each link within this section uses the browse by category page, where you pass in the name of the category to return results.

- Target page iFrame URL: catalog_home.do?
sysparm_nameofstack=aabdae07ef221000914304167b22567d&sysparm_view=business&sysparm_clear_stack=yes
- Target page frame name: gsft_main
- Desktop Computing URL: category_browse.do?category=Desktop Computing
- Business Applications URL: category_browse.do?category=Business Applications
- Communications Services URL: category_browse.do?category=Communications Services
- Infrastructure Services URL: category_browse.do?category=Infrastructure Services
- Hosting Services URL: category_browse.do?category=Hosting Services

Featured Services links to a content page which pulls a small subset of services into an iFrame.

- iFrame URL: com.glideapp.servicecatalog_category_view.do?
sysparm_parent=d67c446ec0a8016500335aa37eafbc1&sysparm_view=
- Frame name: gsft_main
- Install Software URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=10d69689c611227600ffeba41c6e4824
- Email Account URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=d67a86b6c0a80165009386c752cd4a09
- Electronic Messaging URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=533798810a0a0b2600f1a03593e19058
• VPN RSA Token URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=d67b099ac0a80165019d0c276b772502
• Shared Storage (SAN) URL: catalog.do?uri=com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=cedd458a0a0b8300c3b1e32e7a3ac2

Reporting links to a content page that pulls the reports page into an iFrame. All links within this menu leverage homepages in the system, which creates an issue with the home.do URL. Notice in the following links that ../ is used to create a relative URL outside of the CMS site home.do definition. Without this path, the site homepage would render within the iFrame.
• iFrame URL: report_home.do
• Frame name: gsft_main
• Cost Management Overview URL: ../home.do?
sysparm_userpref_homepage=fa81ae91c0a805c64c0942ab2e4b852b
• Administration Overview URL: ../home.do?
sysparm_userpref_homepage=8b7b11f6c611228901ff3fcfbd3cc8f
• Portfolio Overview URL: catalog_home.do?sysparm_view=business
• Service Availability URL: ../home.do?
sysparm_userpref_homepage=8ee77200a0bad00c38eb7e68b93d0
• Service Level Agreements (SLA) URL: ../home.do?
sysparm_userpref_homepage=757e86a30a0006d4010a6851639498d1

Content Management testing

Test your site to ensure that all pages display correctly, links go to the specified address, and images are not broken. It is important to test the site as you build it. Do not wait until just before launch to begin testing.

Also, test templates as you create them so any issues are resolved before creating other content based on the templates. Recruit as many people as possible to help you test.

Here are some general site testing guidelines:
• Test on the browsers and platforms your site visitors use
• Test on various monitors (for example, LCD and CRT)
• View pages using different screen resolutions
• View pages using different color settings
• Test all navigation and links
• Test items that can be downloaded (for example, PDF files)
• Test the search functionality
• Test site security
• If necessary, test for accessibility (for guidelines, see the W3C Website Accessibility Initiative)

Global search in Content Management

When you add global search to a CMS site, two different search result blocks can display, depending on the user role: global or no global.

Roles are defined at System Properties Global Text Search.
• Search Results (Global): For users with permission to use the global search within the normal frame set. The normal frame set is defined as the default, non-CMS user interface with the set of frames.
- Search Results (No Global): For users without permission to use the global search. Searches only the knowledge base and the catalog.

The header search bar and the Search dynamic block in the base system both automatically handle the permissions and direct the user to the appropriate search results. In the base system, the search result blocks are deployed on the same Search Results content page.

In order for the global search to work properly, it is important to ensure that the DEFAULT directs users to a working content page. If not, the results from the global search link back to the frame set, not to pages within the CMS site.

Note: The global search is similar to the normal frame set user interface and ties to the same roles (set in \textit{Set global text search properties}).

Search Results (Global)

Before you use the Search Results (Global) dynamic block, define \textit{content types} to control the behavior a search result is clicked. If no content type is defined for a table, selecting a link on that table renders the results according to the DEFAULT content type. It is good practice to point the DEFAULT content type to a page with a normal "Current Document" detailed block. Set the content type detail (Detail Template field) to have just an iFrame.

The Search Results (No Global) dynamic block does not require any additional configuration.

CMS translation

You can translate CMS sites by activating internationalization plugins and manually translating custom interface strings.

Two tables support the translation of a CMS site into other languages.

- Translated Name / Field (sys\_translated): Stores strings that are shared or commonly used within a site. These include menu section names, menu item names, site breadcrumb names, link names, and footer menu links. Internationalization plugins typically provide translations for these strings. See \textit{Internationalization support}.
- Translated Text (sys\_translated\_text): Stores unique string translations which you create when you manually translate interface elements. See \textit{Translate the interface}.

View a translated CMS site

Activating an internationalization plugin provides a quick way to see translated strings for CMS menus, breadcrumbs, and links. For a full translation, you must translate the instance manually.

The following example explains how to view a translated site in Japanese.

1. Navigate to System Definition Plugins.
2. In the Go to filter, select Name, enter I18N, and then press the Enter key.
3. Activate both the I18N - Japanese Translations and the I18N: Knowledge Management Internationalization Plugin v2 plugins.
4. Refresh the browser.
6. Browse the site to see the translated language strings.
7. Navigate to the ESS Portal. The path is: http://Instance Name.service-now.com/ess/.
8. Browse the site to see the translated language strings in the ESS Portal.
Credentials

Credentials, such as user names and passwords, or certificates, are required to gain access to a computer or network device for ServiceNow Discovery or to perform work on a computer using Orchestration.

Introduction to credentials

Credentials are used by Discovery, Orchestration, and Service Mapping to access the external devices that they explore or manage.

Credential types

The following credential types are provided:

<table>
<thead>
<tr>
<th>Credential type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative Credentials</td>
<td>The credentials to explore the applications on a device or computer. Patterns often need appllicative credentials.</td>
</tr>
<tr>
<td>AWS Credentials</td>
<td>The Amazon Web Services (AWS) master account, access key ID, and secret access key.</td>
</tr>
<tr>
<td>Azure Service Principal</td>
<td>The Azure service principals required for an Azure subscription.</td>
</tr>
<tr>
<td>Basic Authentication Credentials</td>
<td>A user name and password.</td>
</tr>
<tr>
<td>CIM Credentials</td>
<td>The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.</td>
</tr>
<tr>
<td>Cloud Management Credential</td>
<td>Credentials that Orchestration uses to access cloud resources.</td>
</tr>
<tr>
<td>JDBC Credentials</td>
<td>A user name and password to access a Java Database Connectivity (JDBC) connection.</td>
</tr>
<tr>
<td>Credential type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>JMS Credentials</strong></td>
<td>A user name and password to access to a Java Message Service (JMS).</td>
</tr>
<tr>
<td><strong>SNMP Community Credentials (Password Only)</strong></td>
<td>The community string to access devices via SNMP.</td>
</tr>
<tr>
<td><strong>SNMPv3 Credentials</strong></td>
<td>The user name and keys required to access devices on your SNMP v3 network.</td>
</tr>
<tr>
<td><strong>SSH Credentials</strong></td>
<td>The user name and password to access Linux and Unix devices.</td>
</tr>
<tr>
<td><strong>SSH Private Key Credentials</strong></td>
<td>The private key credentials to access Linux and Unix devices. SSH private key credentials are recommended over SSH password credentials for security reasons.</td>
</tr>
<tr>
<td><strong>VMware Credentials</strong></td>
<td>Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.</td>
</tr>
<tr>
<td><strong>Windows Credentials</strong></td>
<td>The user name and password required to access Windows computers. Several permission requirements must be met to use Windows credentials.</td>
</tr>
</tbody>
</table>

How MID Server uses credentials

Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. This login is configured when the MID Server is installed and must have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the ServiceNow instance in Discovery > Credentials.

MID Servers used by Orchestration must have access to the necessary credentials to execute commands on computers in the network as specified by the Workflow activities. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for PowerShell) and VMware.

Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials (discovery_credentials) table, and once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server’s public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server’s private key.
Note: The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the Credentials Form, which forces Discovery and Orchestration to try all the credentials at their disposal in a certain sequence. Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

Tagging

Credential tagging allows workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. Credential tagging also works with credential affinities.

Security considerations for the MID Server

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

Create credentials for Discovery and Orchestration

Orchestration or Discovery provide default Credential types to assign credentials and communicate with external systems.

1. Navigate to Orchestration > Credentials.
2. Click New.
3. On the Credentials page click a link for the credential type and complete the form.
4. Click Submit.
Test credentials for Discovery and Orchestration.

Applicative credentials

Applicative credentials access applications that reside on devices.
Patterns can use applicative credentials in addition to the SNMP or SSH credentials that are required to access the device.

These fields are available in the Credentials form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name required by the application.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password required by the application.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>CI type</td>
<td>Select the table for the CI you are trying to discover.</td>
</tr>
</tbody>
</table>

Amazon Web Services credentials for Discovery and Orchestration

The AWS credential type manages access to an Amazon Web Services (AWS) account.
The Credentials table can store existing Amazon Web Services (AWS) credentials. This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for AWS:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it Amazon Web Services.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>AWS Account</td>
<td>Name of the AWS account that uses this credential.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Enter the access key ID generated from the AWS Management Console, for example, APIAIOSFODNN7EXAMPLE.</td>
</tr>
</tbody>
</table>
Basic authentication credentials for Discovery and Orchestration

The Basic Auth credential type manages access to store basic authentication credentials. This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for basic authentication.

Table 97: Basic Auth credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secret Access Key</td>
<td>Enter the secret access key ID generated from the AWS Management Console for example, wPalrXUtnFEMI/K7MDENG/bPxFiCYEXAMPLEKEY.</td>
</tr>
</tbody>
</table>

CIM credentials

The CIM credential type manages access to a CIM server (also referred to as a CIMOM - Common Information Model Object Manager) for information about VMware ESXi servers. This credential type is available for Discovery.

These fields are available in the Credentials form for CIM.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin in activated. Note: Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
</tbody>
</table>
ServiceNow Helsinki Now Platform Capabilities

Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

Configure NetApp Storage Devices for CIM credentials

NetApp storage devices require additional configuration in order for Discovery to explore them.

Role required: admin

1. Install the SMI-S agent on the storage device host. See the Data ONTAP SMI-S Agent 5.2 Installation and Configuration Guide for instructions and requirements.

   Note:
   ServiceNow does not maintain the documentation on this site. Be aware that this document can change without notice.

2. Create a user account and password for the SMI-S agent.

3. Create a credential record for the SMI-S agent credentials. Set the credential type to CIM.

Cloud Management credentials form

The Cloud Management credential type manages access to a cloud-based application. This credential type is available for Orchestration.

These fields are available in the Credentials form for cloud management.

Table 98: Cloud Management credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it Cloud Atlanta.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Specify AWS.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the CIM user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the CIM password.</td>
</tr>
<tr>
<td>SSH Passphrase</td>
<td>Enter a memorable phrase for key generation. For example, you might enter Friday is a good day.</td>
</tr>
<tr>
<td>SSH private key</td>
<td>Enter the SSH private key.</td>
</tr>
<tr>
<td>Authentication protocol</td>
<td>Select the MD5 or SHA authentication protocol that was used to generate the Authentication Key.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authentication Key</td>
<td>Enter a SSH-generated authentication key.</td>
</tr>
<tr>
<td>Privacy protocol</td>
<td>Enter one of the following privacy protocols that describes encryption for</td>
</tr>
<tr>
<td></td>
<td>the Privacy Key:</td>
</tr>
<tr>
<td></td>
<td>• 3DES for Triple Data Encryption Standard (DES)</td>
</tr>
<tr>
<td></td>
<td>• AES128 for Advanced Encryption Standard (AES) with 128 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• AES192 for AES with 192 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• AES256 for AES with 256 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• DES for legacy DES encryption</td>
</tr>
<tr>
<td>Enter an additional</td>
<td></td>
</tr>
<tr>
<td>privacy key.</td>
<td></td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in</td>
</tr>
<tr>
<td></td>
<td>an Orchestration workflow or assign different credentials to each occurrence</td>
</tr>
<tr>
<td></td>
<td>of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential</td>
<td>Select this check box to use an external credential storage system. When</td>
</tr>
<tr>
<td>store</td>
<td>you select this option the User name and Password fields are replaced with</td>
</tr>
<tr>
<td></td>
<td>the Credential ID field. Currently, the only supported external storage</td>
</tr>
<tr>
<td></td>
<td>system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network</td>
</tr>
<tr>
<td></td>
<td>, or to one or more Specific MID servers. Specify the MID Servers that</td>
</tr>
<tr>
<td></td>
<td>should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>Classification</td>
<td>Enter the Application Classification for CI discovery.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it</td>
</tr>
<tr>
<td></td>
<td>attempts to log onto devices. The smaller the number, the higher in the</td>
</tr>
<tr>
<td></td>
<td>list this credential appears. Establish credential order when using large</td>
</tr>
<tr>
<td></td>
<td>numbers of credentials or when security locks out users after three failed</td>
</tr>
<tr>
<td></td>
<td>login attempts. If all the credentials have the same order number (or none),</td>
</tr>
<tr>
<td></td>
<td>Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**Custom credentials**

ServiceNow supports several credential types by default, such as SSH or SNMP.

Users with the admin role can create a custom credential type. After you create a Custom credential, the type is available for configuration in the same manner as other Credential types. The capability to create a custom credential type is available for Discovery and Orchestration.

**Create custom table for custom credentials**

You can create custom credentials, which must have a custom table to manage them.

Role required: admin

Create a custom table with the following requirements:

• The Table Name: must end with "_credentials". For example my_custom_credentials.
• The Extends Table value is Credentials (discovery_credentials).

Create a custom credential type with a MID server script

A custom credential type requires a MID Server script include to process the new credential type.

Role required: admin

1. Navigate to MID Server > Script Includes.
2. Click New.
3. Create a script that extends the AProbe class and specify a run function that meets this criteria:
   • Class: Probe
   • ECC queue type: JavascriptProbe
   • ECC queue name: A JavaScript class name, for example, CustomCredTypeTestProbe

For example, this script include creates the iterator credentials containing all credentials with a Value of customtype. This example does not show the JavaScript code to evaluate each credential.

```javascript
var CustomCredTypeTestProbe = Class.create();

CustomCredTypeTestProbe.prototype = Object.extendsObject(AProbe, {
    initialize : function(probe) {
        this.probe = probe;
    },
    run : function() {
        // Use the Value specified by the credential type choice for the string parameter of the getCredentials method.
        var credentials = this.getCredentials("customtype");

        while (credentials.hasNext()) {
            var credential = credentials.next(); // Iterate through each credential.
            try {
                ms.log('Attempting to log in with user: ' + credential.getUsername());
                // Try each credential.
                // This code varies based on your login requirements.
                credentials.worked(this.getParameter("probe"));
            } catch (ex) {
                throw ex;
            }
        }
    }

type: "CustomCredTypeTestProbe"
});
```

Add a custom credential type to the choice list

You can add a custom credential type to the choice list so it can appear on the Credentials form.
Role required: admin

Create a new Choice record with these values:
- Table: The new table that supports custom credentials.
- Element: The type name.
- Value: The parameter used by the script include getCredentials method.

### JDBC credentials

The JDBC credential type manages access to a Java Database Connectivity (JDBC) connection. This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for JDBC type credentials.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the <a href="#">External Credential Storage plugin</a> is activated. Note: Currently, the only supported external storage system is <a href="#">CyberArk</a>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
</tbody>
</table>
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

### JMS credentials

The JMS credentials type manages access to a Java Message Service (JMS). This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for JMS.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
</tbody>
</table>
### External credential store

Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the [External Credential Storage plugin](#) is activated.

**Note:** Currently, the only supported external storage system is [CyberArk](#).

### Applies to

Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.

### MID servers

Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.

### Order

Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.

---

**SAP credentials**

The SAP credential type manages access to SAP JCo systems. This credential type is available for Discovery and Orchestration.

These fields are available in the Credentials form for SAP type credentials.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated. Note: Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**SNMP credentials**

Discovery explores many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. Credentials for SNMP do not include a user name, just a password, called the community string.

The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string. Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3.

The default Orchestration activity SNMP Query returns the object identifier (OID) of a device and requires SNMP credentials.
SNMP community credentials

The SNMP Community credential type manages access to discover many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. This credential type is available for Discovery, Service Mapping, and Orchestration.

Credentials for SNMP do not include a user name, just a password (the community string). The default read-only community string for many SNMP devices is public, and the system will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

These fields are available in the Credentials form for SNMP community.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin in activated. Note: Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
</tbody>
</table>
### SNMPv3 credentials

The SNMP credentials type accepts a privacy protocol and an additional privacy key and is available for Discovery and Orchestration.

Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3. These fields are available in the Credentials form for SNMPv3.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Unique and descriptive name for this credential. For example, you might call it SNMP Community Atlanta.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td><strong>Applies to</strong></td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td><strong>MID servers</strong></td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
<tr>
<td><strong>User name</strong></td>
<td>Enter the SNMP user name. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td><strong>Authentication protocol</strong></td>
<td>Select the authentication type to use for this credential. The choices are MD5 and SHA.</td>
</tr>
<tr>
<td><strong>Authentication Key</strong></td>
<td>Enter the authentication key to use for this credential.</td>
</tr>
</tbody>
</table>
### Field | Input value
---|---
Privacy protocol | Select the encryption protocol for this credential. The choices are:
- 3DES
- AES128
- AES192
- AES256
- DES

Privacy key | Enter the key associated with the selected privacy protocol.

Credential ID | Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters.

This field is only visible when the External credential store check box is selected.

Tag | Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

External credential store | Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin in activated.

### SSH credentials

the SSH credential type manages access for Unix and Linux devices that use the Secure Shell (SSH).

Note: For increased security, ServiceNow recommends the use of SSH private key credentials rather than SSH password credentials.

These fields are available in the Credentials form for SSH.

### Field | Description
---|---
Name | Enter a unique and descriptive name for this credential.
Active | Enable or disable these credentials for use.
User name | Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.

The VMware credentials must have the read-only role in vCenter.

Password | Enter the password.

</tbody>
</table>
| SSH private key        | Enter a secure, private key that can be used instead of a password for SSH logins. This field is available only for SSH Private Key credentials. The private key must be entered in the proper format to ensure it is correctly encrypted. The private key must start with the string -----BEGIN. Here is an example of a correctly formatted private key:  

```
-----BEGIN RSA PRIVATE KEY-----
MIIEogIBAAKCAQEAsEK65scPssPSobpDFMpR+Btv3MS4Q7NP8ErAT2xSh3IWz+x... 
...7hrxV2dbSug60FahyupGWBGTnXm5PaE2X5WPLuUj94v
-----END RSA PRIVATE KEY-----
```

The ServiceNow platform supports private keys in the PEM format generated by the OpenSSH ssh-keygen utility. To convert PPK keys that were generated by PuTTY:

- Open your private key in PuTTYGen.
- Export it in OpenSSH format from the menu Conversions > Export OpenSSH key.
- Save the new OpenSSH key. |

**UNIX and Linux credentials**

Discovery and Orchestration explore UNIX and Linux devices by using commands executed over Secure Shell (SSH), so they need SSH credentials.

The user can be any user. Both applications must run commands on UNIX and Linux systems with root privileges. There are two general approaches to accomplishing this:

- Give root credentials. These are obviously the most powerful credentials, but may not be desirable from a security perspective. If Discovery or Orchestration have the root credentials to any UNIX or Linux system, no further configuration is required.
- Give other credentials for Discovery or Orchestration, but grant the user in those credentials the right to execute certain commands with root privileges, using `sudo`. This is a secure way to grant limited privileges. Discovery or Orchestration use `sudo` on any probe that has the must_sudoparameter set to true (it defaults to false). However, each system must be configured to allow `sudo` to work. This is done by editing the `/etc/sudoers` file using the `visudo` command.

**Access Requirements for Non-Root Credentials**

If you do not provide Discovery with root access credentials, you must provide credentials with the following access requirements.

<table>
<thead>
<tr>

### UNIX and Linux commands requiring root privileges for Discovery and Orchestration

These commands require root privileges in Discovery and Orchestration.

The examples here assume that the user name in the credentials is Disco. Substitute the actual user name and ensure that the paths for the commands match the path on the systems.

---

**Note:** Sudo commands do not work with private key credentials, because there is no password to supply to the sudo command. A solution is to add the NOPASSWD option to the sudo configuration. For example, you might enter: disco ALL=(root) NOPASSWD:/usr/sbin/dmidecode,/usr/sbin/lsof,/sbin/ifconfig.

---

**Table 101: UNIX and Linux commands requiring root privileges**

<table>
<thead>
<tr>
<th>Command</th>
<th>Platform</th>
<th>Purpose</th>
<th>/etc/sudoers line example</th>
<th>Used by</th>
</tr>
</thead>
<tbody>
<tr>
<td>dmidecode</td>
<td>All Linux</td>
<td>Gathers several pieces of information about the hardware, including the serial number embedded within the motherboard.</td>
<td>Disco ALL=(root) / sbin/dmidecode</td>
<td>Discovery</td>
</tr>
<tr>
<td>lsof</td>
<td>All UNIX versions</td>
<td>Determines the relationship between processes and the connections being made to the system.</td>
<td>Disco ALL=(root) / sbin/lsof</td>
<td>Discovery</td>
</tr>
<tr>
<td>adb</td>
<td>HP-UX</td>
<td>Gathers CPU speed and memory.</td>
<td>Disco ALL=(root) / usr/bin/adb</td>
<td>Discovery</td>
</tr>
<tr>
<td>chpasswd</td>
<td>All Linux and UNIX versions</td>
<td>Changes user passwords.</td>
<td>Disco ALL=(root) / etc/chpasswd</td>
<td>Orchestration</td>
</tr>
<tr>
<td>Command</td>
<td>Platform</td>
<td>Purpose</td>
<td>/etc/sudoers line example</td>
<td>Used by</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------</td>
<td>--------------------------------------------------------------------------</td>
<td>---------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>chage</td>
<td>All Linux and UNIX versions</td>
<td>Changes the number of days between password changes and the date of the last password change.</td>
<td>Disco ALL=(root) /usr/bin/chage</td>
<td>Orchestration</td>
</tr>
<tr>
<td>oratab</td>
<td>All Unix versions</td>
<td>Grants read access to the oratab file for locating the Oracle Home and pfile.</td>
<td>N/A</td>
<td>Discovery</td>
</tr>
<tr>
<td>/usr/bin/ps</td>
<td>Solaris</td>
<td>Lists running process. As an alternative to running with root access, add a proc_owner role.</td>
<td>Disco ALL=(root) /usr/bin/ps</td>
<td>Discovery</td>
</tr>
<tr>
<td>/usr/ucb/ps</td>
<td>Solaris</td>
<td>Lists running process. As an alternative to running with root access, add a proc_owner role.</td>
<td>Disco ALL=(root) /usr/ucb/ps</td>
<td>Discovery</td>
</tr>
</tbody>
</table>

Note:
The use of the /usr/ucb/ps command is deprecated as of Solaris 11. Because Discovery and Orchestration require the use of this command for all Solaris versions, you must install the ucb utility manually on Solaris 11 systems. For instructions, see [KB0564262](https://kb.dn).
Privileged commands for Discovery

To discover certain information on a host server, Discovery must run SSH commands with higher privilege.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use `sudo` commands, you must configure the hosts in your network to use one of the other privileged commands.

Note: You can have different privileged commands set up for different hosts. However, Discovery supports only one privileged command per host.

<table>

</table>

Table 102: SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| sudo    | • Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
<pre><code>     | • Credentials provided for Discovery must be able to run the command `sudo -S -p &lt;password&gt; &lt;commands&gt;`. Possible SSH commands are those listed in `UNIX and Linux commands requiring root privileges for Discovery and Orchestration`. |
</code></pre>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| pbrun   | • Host must support the pbrun -v command and return the correct version of PowerBroker.  
• Credentials provided for Discovery must be able to run pbrun <commands>. Possible SSH commands are those listed in [UNIX and Linux commands requiring root privileges for Discovery and Orchestration](https://www.service-now.com).  
• Discovery does not support any other pbrun - options, such as a password prompt.  
• The instance must be able to reach the target host via SSH. |
| pfexec  | • Host must support the pfexec id -a command and return the correct ID.  
• Credentials provided for Discovery must be able to run pfexec <commands>. Possible SSH commands are those listed in [UNIX and Linux commands requiring root privileges for Discovery and Orchestration](https://www.service-now.com).  
• Discovery does not support any other pfexec - options, such as a password prompt. |
| dzdo    | • Host must support the command dzdo command and return the path to dzdo in standard output.  
• Credentials provided for Discovery must be able to run dzdo <commands>. Possible SSH commands are those listed in [UNIX and Linux commands requiring root privileges for Discovery and Orchestration](https://www.service-now.com).  
• Discovery does not support any other dzdo - options, but Discovery supports password authentication for dzdo. |

**Configure Discovery for privileged commands**

Administrators can specify a list of privileged commands for Discovery to use.

**Role required:** discovery_admin, admin

Check the host servers to ensure that sudo or one of its alternative commands is configured. For details, see [Privileged commands for Discovery](https://www.service-now.com).

Use either of these procedures to configure the list of commands for a probe:

• In the **Probe Parameters** related list in the probe record, add a parameter called privileged_command. The value for this parameter is a comma separated list of privileged commands, such as sudo, pbrun, or pfexec.

• Create a new **MID Server parameter** called mid.ssh.privileged_commands. The value for this parameter is a comma separated list of privileged commands, such as sudo, pbrun, or pfexec.

Discovery goes through the list you configured and selects the first privileged command available.
Long running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the pbrun and pfexec privileged commands.

Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

• The !requiretty option is required.
• Allow individual commands to be run by the user in the provided credential with NOPASSWD configured.
• The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "sudo fdisk -l" or "${sudo:fdisk -l}" rather than "must_sudo" for the entire script.

Note: Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting must_sudo on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as /tmp/.run.aef13123fe124123, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as /sbin/fdisk -l.

VMware credentials

The VMware credentials type manages access to vCenter credentials.

This credential type is available for vCenter discovery.

For example, the VMware credential type allows Discovery to explore VMware’s vCenter running on a Windows machine to discover ESXi machines, virtual machines, and resource pools. Setting up VMWare discovery requires credentials and access rights for the VMWare CIM service. This is because during the Identification phase of Discovery, unique serial numbers are required to uniquely identify CI’s.
The VMWare discovery and automation API (vCenter API) provides the globally unique serial number
for computer CIs. CIM credentials are no longer needed to allow access to each VMWare host.

Note: In versions prior to Helsinki patch 4, you need to provide CIM credentials to determine
unique serial numbers for VMWare CI’s, a CIM Credential record must be provided that allows
access to each VMWare Host. Create a new VMWare user with the CIM Interaction role
on each VMWare Host, that can be used as the necessary CIM Credential. Ensure that the
credential Type selected is VMware.

Note: Do not use VMware Type credentials for Orchestration activities that perform work on
the individual virtual machines cloned by vCenter (for example, restarting a Linux VM). For these
activities, the credential Type depends on the operating system of the virtual machine (either
SSH or Windows).

These fields are available in the Credentials form for VMware.

<table>

</tr>
</tbody>
</table>

Permission requirements for Windows credentials

Provide the proper permissions for the Windows credentials.

To provide sufficient permissions, Windows credentials must be one of the following:

- A domain administrator.
- A domain user with local administrator access on the target Windows hosts.
- A user who meets the requirements of Windows probes and permissions (Discovery only).
- A user who meets the requirements of the Orchestration activity to be run (Orchestration only).

Domain requirements for Windows credentials

To enable Windows credentials to function across multiple domains, make sure to use the correct name formats and MID Server configuration.

Supported User Name Formats

Discovery and Orchestration support Windows domain credentials in both User Principal Name and Down-Level Logon Name user name formats. For example, Domain\UserName or UserName@example.domain.com. You can provide Windows workgroup credentials in the following format: WORKGROUP\UserName.

You can also provide a local account by using the .\user name.

For information about credential requirements, see Permission requirements for Windows credentials.
Windows Domain Requirements

Additional actions are required to enable credentials to function across multiple Windows domains.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Additional actions required</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server host on the same domain as the Windows target.</td>
<td>None</td>
</tr>
<tr>
<td>MID Server host on a different domain than the Windows target.</td>
<td>Ensure that Powershell 2.0 or higher is installed on the MID Server host.</td>
</tr>
<tr>
<td>MID Server host on a different domain than the Microsoft SQL Server target.</td>
<td>See Microsoft SQL Servers</td>
</tr>
</tbody>
</table>

Windows credential requirements for Discovery and Orchestration

Add Windows credentials to specific locations for Discovery and Orchestration.

Discovery and Orchestration have the following requirements for Windows credentials:

- Install a MID Server on a Windows host as a service.
- Add Windows credentials to one of these locations:
  - An entry in the Credentials [windows_credentials] table
  - A MID Server service account to run as a specific Windows user or domain account.

Configure MID Server credentials from the credentials table

Configure the MID Server to use Windows credentials from the Credentials [discovery_credentials] table.

To have the MID Server use credentials from the Credentials [discovery_credentials] table:

1. Add individual Windows credentials to the Credentials [windows_credentials] table.
   - Verify each credential meets the permission requirements.
   - Verify each username meets the name format requirements.
   - Verify each credential meets the Windows domain requirements.
2. [Optional] Configure the MID Server to use Powershell by setting the mid.use_powershell parameter to true. See MID Server Configuration.
3. [Optional] By default, Discovery automatically uses the MID Server service account credentials if all credentials in the Credentials table fail. If you do not want to use the MID Server service credentials as a fall back, set the mid.powershell.local_mid_service_credential_fallback parameter to false.

Configure MID Server credentials from the service account

Configure the MID Server to use the credentials of its own Windows service.

To have the MID Server use credentials from the MID Server service account:

1. Set the MID Server service account to a user who meets the permission requirements.
2. Verify the username meets the name format requirements.
3. Fill in the fields on the form, as appropriate.
4. Verify the credentials meet domain requirements.
Test credentials for Discovery and Orchestration

You can test your credentials directly from the Credentials record without launching a Discovery or an Orchestration workflow.

Role required: discovery_admin, admin

You can submit a credential record first and then test it later, or test the credential immediately before saving it. The exceptions are Amazon Web Services (AWS) credentials, which must be saved prior to testing.

Note: Credentials are encrypted at all times during the test.

Credential testing is supported for these credential types:

- SSH (including private keys)
- Windows
- SNMP (including v3)
- VMware
- JDBC
- JMS
- AWS

This procedure assumes you are testing the credential before submitting it.

1. Navigate to Discovery Credentials and click New.
2. Select the type of credentials to create.
3. Enter your credentials in the record fields.
4. Under Related Links, click Test credential.

   The test runs immediately for AWS credentials. There are no test fields to complete for these credentials, because they do not use a MID Server and are based on the account specified in the credentials record.

5. For all other credential types, complete the fields in the Test Credential dialog box.

Figure 97: Test credentials dialog box

<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. Using this Initial Context Factory, various JMS objects, such as JMS Connection, are created. For example, to connect to ActiveMQ V5.10, (JMS Provider), the value in this field would be org.apache.activemq.jndi.ActiveMQInitialContextFactory</td>
<td>JMS</td>
</tr>
</tbody>
</table>

6. Click OK to begin the test.

An indicator appears, showing that the system is attempting to contact the target using the credentials you have provided. When the instance connects to the target it displays a success message. If the instance encounters a problem with the test inputs you have provided, it displays the appropriate error message. The following are some common error messages.

- Incorrect target or port number:
• Incorrect user name or password:

Figure 99: Authentication failure

• Incorrect MID Server for Windows credentials:

Figure 100: MID Server error

7. Click Retry to open the test Credential dialog box and correct the input error.
8. When your credentials test is successful, click Submit to save the record.

Important: Testing credentials does not ensure that the credentials have the necessary privileges required for the intended Discovery or Orchestration workflow tasks.

Credential affinity for Discovery and Orchestration

It is not necessary to associate credentials with a device within Discovery.

When Discovery or Orchestration first attempts to access a device, they try all available credentials until they find the correct ones. After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity (dscy_credentials_affinity) table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.
Note: If Orchestration and Discovery are installed, and credential tagging is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Credential tagging for Orchestration activities

Credential tagging gives an administrator more control over the credentials used in Orchestration activities.

This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential tagging interacts with credential affinity to determine which credentials should be used for an Orchestration activity.

How credential tagging works

A business rule called Insert Discovery Affinity (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper credential_id (the sys_id of the record in the Credentials [discovery_credentials] table) to use in the generated probe. When the platform encounters an affinity with a credential tag value defined (credential_tag in the business rule), the business rule determines if the credential referenced by the affinity has the specified tag. If it does, the business rule selects the credential_id of the tagged credential and passes that value to the probe. If the credential does not have the specified tag, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials [discovery_credentials] table and select's the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.
IP service affinity for Discovery and Orchestration

IP Service affinity saves the IP service information that is used to successfully find a device and associates it with the IP address of the device.

Using this information, Discovery can target the device in subsequent runs with the accurate protocol. Discovery records the IP Service along with the IP address.
Discovery can store the successful IP service information in the IP Service Affinity table (ip_service_affinity).

A network device has both an SSH port and an SNMP port open. By its agentless design, Discovery tries SSH first. However, network devices should be discovered through SNMP. Discovery tries the SSH probe and it fails. This triggers the SNMP probe, which succeeds. With the association between the IP address and the IP service, subsequent discovery runs that target this IP address use SNMP first, because that is the probe that succeeded.

Check IP service affinity for Discovery and Orchestration

You can check the IP Services table for a list of IP addresses that are associated with a protocol.
Role required: admin

You can check the IP Services table for a list of IP addresses that are associated with a protocol.
1. Navigate to Discovery Discovery Definition IP Services.
2. Filter the list to find the appropriate IP service.
3. Click the name of the service to go to that IP service page.
4. Click the IP Service Affinities tab for the list of IP addresses associated with that service.

External credential storage for Discovery and Orchestration

A ServiceNow instance can store credentials used by Discovery, Orchestration, and Service Mapping in an external credential repository rather than directly in a ServiceNow credentials record.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier from the instance, and then uses a customer-provided JAR file to resolve the identifier from the repository into a usable credential. Currently, the ServiceNow® platform supports the use of the CyberArk vault for external credential storage.
Activate external credential storage for Discovery and Orchestration

The External Credential Storage plugin is available by request.

Role required: none

Request the plugin through the HI Service Portal.
1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Components installed with External Credential Storage

The following components are installed with the External Credential Storage plugin.

Business rule: External Credential Storage

The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:

- Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
- Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

Disable external credential storage after activation

A property called Enable External Credential Storage (com.snc.use_external_credentials) enables or disables the External Credential Storage plugin after it is activated. The property is located in Discovery Definition Properties and Orchestration MID Server Properties, and is enabled when you activate the plugin.
If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

External credential storage architecture

External credential storage requires a properly configured MID Server to retrieve the credentials from the external store.

Credential process flow

The MID Server retrieves credentials from an external store using this process:

1. MID Server downloads credential objects from the ServiceNow Credentials (discovery_credentials) table that contain the corresponding credential ID from the target vault.
2. MID Server checks to see if there are probes to execute from Discovery or Orchestration jobs.
3. MID Server determines if the relevant credentials, such as SSH, Windows or SNMP, are available for the specified probe target. If not, the MID Server uses the Credential Resolver JAR to make a call to the vault to get the actual user name and password. The details about the correct credential object to retrieve from the vault are determined by the Credential Resolver JAR file. Information such as credential ID, target IP address, or credential type are available to the JAR file. If a credential has been retrieved from a previous probe, the credential is cached and is not retrieved again, unless the MID Server is restarted or specifically directed to flush the credential cache.
4. MID Server executes the probe with the appropriate credential.

Note: Credential affinity still applies. The mechanism remains the same, since the only real difference from the MID Server’s perspective is that the real credential details (user name and password) come from the third party vault.
Architecture
Configure external credential storage for Discovery and Orchestration

Configure your instance to obtain credentials from a remote repository.

Role required: Admin

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

To configure External Credential Storage, complete these tasks in order.

Create a JAR file to resolve credentials

Create a JAR file to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

Make sure to include all the credential elements that the instance expects, such as the private key.

To create a JAR file to resolve credentials:

1. Use this sample Java file as a template:

```java
package com.snc.discovery;

import java.util.*;
import java.io.*;

/**
 * Basic implementation of a CredentialResolver that uses a properties file.
 */

public class CredentialResolver {

    private static String ENV_VAR = "CREDENTIAL_RESOLVER_FILE";
    private static String DEFAULT_PROP_FILE_PATH = "C:\dummycredentials.properties";

    // These are the permissible names of arguments passed INTO the resolve() method.
    public static final String ARG_ID = "id";
    public static final String ARG_IP = "ip";
    public static final String ARG_TYPE = "type";
    public static final String ARG_MID = "mid";

    // These are the permissible names of values returned FROM the resolve() method.
    public static final String ARG_USER = "user";

    // the string identifier as configured on the ServiceNow instance...
    public static final String ARG_ID = "id";

    // a dotted-form string IPv4 address (like "10.22.231.12") of the target
    public static final String ARG_IP = "ip";

    // the string type (ssh, snmp, etc.) of credential as configured on the instance...
    public static final String ARG_TYPE = "type";

    // the string MID server making the request, as configured on the instance...
    public static final String ARG_MID = "mid";

    // These are the permissible names of values returned FROM the resolve() method.
    public static final String ARG_USER = "user";

    // the string user name for the credential, if needed...
```

public static final String VAL_USER = "user";

// the string password for the credential, if needed...
public static final String VAL_PSWD = "pswd";

// the string pass phrase for the credential if needed:
public static final String VAL_PASSPHRASE = "passphrase";

// the string private key for the credential, if needed...
public static final String VAL_PKEY = "pkey";

// the string authentication protocol for the credential, if needed...
public static final String VAL_AUTHPROTO = "authprotocol";

// the string authentication key for the credential, if needed...
public static final String VAL_AUTHPROTO = "authkey";

// the string privacy protocol for the credential, if needed...
public static final String VAL_PRIVPROTO = "privprotocol";

// the string privacy key for the credential, if needed...
public static final String VAL_PRIVKEY = "privkey";

private Properties fProps;

public CredentialResolver() {
}

private void loadProps() {
    if (fProps == null)
        fProps = new Properties();

    try {
        String propFilePath = System.getenv(ENV_VAR);
        if (propFilePath == null) {
            System.err.println("Environment var "+ENV_VAR+" not found.
Using default file: "+DEFAULT_PROP_FILE_PATH);
            propFilePath = DEFAULT_PROP_FILE_PATH;
        }

        File propFile = new File(propFilePath);
        if (!propFile.exists() || !propFile.canRead()) {
            System.err.println("Can't open
"+propFile.getAbsolutePath());
        }
        else {
            InputStream propsIn = new FileInputStream(propFile);
            fProps.load(propsIn);
        }

        fProps.load(CredentialResolver.class.getClassLoader().getResourceAsStream("dummycredentials.properties"));
    } catch (IOException e) {
        System.err.println("Problem loading credentials file:");
        e.printStackTrace();
    }
}

/**
 * Resolve a credential.
 */
public Map resolve(Map args) {
    loadProps();
    String id = (String) args.get(ARG_ID);
String type = (String) args.get(ARG_TYPE);
String keyPrefix = id + "." + type + ".";

if (id.equalsIgnoreCase("misbehave"))
    throw new RuntimeException("I've been a baaaaaaaaaad CredentialResolver!");

    // the resolved credential is returned in a HashMap...
    Map result = new HashMap();
    result.put(VAL_USER, fProps.get(keyPrefix + VAL_USER));
    result.put(VAL_PSWD, fProps.get(keyPrefix + VAL_PSWD));
    result.put(VAL_PKEY, fProps.get(keyPrefix + VAL_PKEY));
    result.put(VAL_PASSPHRASE, fProps.get(keyPrefix + VAL_PASSPHRASE));
    result.put(VAL_AUTHPROTO, fProps.get(keyPrefix + VAL_AUTHPROTO));
    result.put(VAL_AUTHKEY, fProps.get(keyPrefix + VAL_AUTHKEY));
    result.put(VAL_PRIVPROTO, fProps.get(keyPrefix + VAL_PRIVPROTO));
    result.put(VAL_PRIVKEY, fProps.get(keyPrefix + VAL_PRIVKEY));

    System.err.println("Resolving credential id/type[" + id + "/" + type + "] -
" + result.get(VAL_USER) + "/" + result.get(VAL_PSWD) + "/" + result.get(VAL_PASSPHRASE) + "/" + result.get(VAL_PKEY) + "/" + result.get(VAL_AUTHPROTO) + "/" + result.get(VAL_AUTHKEY) + "/" + result.get(VAL_PRIVPROTO) + "/" + result.get(VAL_PRIVKEY) + 
"Return: " + result);

/**
 * Return the API version supported by this class.
 */
    public String getVersion() {
        return "1.0";
    }

    public static void main(String[] args) {
        CredentialResolver obj = new CredentialResolver();
        obj.loadProps();

        System.err.println("I spy the following credentials: ");
        for (Object key : obj.fProps.keySet()) {
            System.err.println("+" + key + ": " + obj.fProps.get(key));
        }
    }

2. Create a properties file to store the external credentials for the script. Use the sample below to add
the necessary credentials.

#dummycredentials.properties
#set the environment variable CREDENTIAL_RESOLVER_FILE to the fully
qualified path to this file (including file name)
#If the environment variable isn't set, it defaults to C:/Mid Servers/
Credentials/dummycredentials.properties
#CREDENTIAL_ID.TYPE.user=
#CREDENTIAL_ID.TYPE.pswd=
#CREDENTIAL_ID.TYPE.pkey=
#CREDENTIAL_ID.TYPE.passphrase=
#CREDENTIAL_ID.snmpv3.authprotocol=
#CREDENTIAL_ID.snmpv3.authkey=
#CREDENTIAL_ID.snmpv3.privprotocol=
#CREDENTIAL_ID.snmpv3.privkey=

#CREDENTIAL_ID is the value in the "Credential ID" field on the instance.
#TYPE is one of
#ssh_password
# ssh_private_key
# snmp
# snmpv3
# vmware
# windows
# mssql
# cim

PublicSnmp.snmp.pswd=public
TestingSnmp.snmp.pswd=Muffins

ExampleDomain.windows.user=EXAMPLEDOMAIN\administrator
ExampleDomain.windows.pswd=Password1

ExampleLinux.ssh_password.user=root
ExampleLinux.ssh_password.pswd=Rootpass123

#For VMWare on 10.0.103.14
ExampleVMWare.vmware.user=administrator
ExampleVMWare.vmware.pswd=vmpass123##$#@

#### Examples ####
# No Authorization with no Privileges

---

**Import a JAR file to resolve credentials**

Import a JAR file created to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

After you create the JAR file, import it into the instance, where it becomes accessible to the MID Server.

1. After creating the JAR and properties files, copy the properties file to the MID Server.
2. Navigate to MID Server JAR Files.
3. Click New.
4. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
</tbody>
</table>

---
5. Click the paper clip icon in the banner and attach the JAR file to the record.

![Figure 105: Attaching a JAR file](image)

6. Click Submit.
7. Restart the MID Server service.
   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Configure the credential identifier

Configure the credential identifier in the instance.
Role required: Admin
Verify the following items:
- The **External Credential Storage** plugin must be active.
- The **Enable External Credential Storage Discovery** property is enabled.

1. Navigate to **Discovery Credentials** or **Orchestration Credentials**.
2. Click New.
3. Select a credential type.
4. Complete the Credentials form using the fields from the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

5. Select the External credential store check box. The User name and Password fields disappear, and the Credential ID field appears.
6. In Credential ID, enter the unique key configured for these credentials in the external repository. This is the identifier defined in the JAR file. This is the ID passed to the Java class in the parameter map:

```java
public static final String ARG_ID = "id";
```

The MID Server uses this identifier to resolve the actual credentials on the repository.

Figure 106: Configuring external credential storage
7. Click Submit.

Disable external credential storage after activation

A system property installed with the External Credential Storage plugin allows this feature to be disabled after activation.

A property called Enable External Credential Storage (com.snc.use_external_credentials) enables or disables the External Credential Storage plugin after it is activated. The property is located in Discovery Definition Properties and Orchestration MID Server Properties, and is enabled when you activate the plugin.

If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

External credential storage log

The MID Server posts log messages about external credential storage.

If the repository encounters an error while attempting to resolve a credentials request, the MID Server posts log messages with the following prefix:

Problem with client’s CredentialResolver:

CyberArk credential storage integration

The MID Server integration with the CyberArk vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

CyberArk’s Application Identity Management (AIM) product uses the Privileged Account Security solution to eliminate the need to store application passwords embedded in applications, scripts or configuration files, and allows these highly-sensitive passwords to be centrally stored, logged and managed within the CyberArk vault. This approach enables organizations to comply with internal and regulatory requirements of periodic password replacement and to monitor activities associated with all types of privileged identities, whether on-premise or in the cloud.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier, credential type, and IP address from the instance, and then uses the CyberArk vault to resolve these elements into a usable credential.

The CyberArk integration requires the ServiceNow® External Credential Storage plugin, which is available by request.

The CyberArk integration supports these ServiceNow credential types:

- CIM
- JMS
- SNMP Community
- SSH
- SSH Private Key (with key only)
- VMware
- Windows

Orchestration activities that use these network protocols support the use of credentials stored on a CyberArk vault:

- SOAP (with basic authentication overrides)
• REST (with basic authentication overrides)
• JDBC
• SSH
• PowerShell
• JMS
• SFTP

Important: You cannot manage credentials stored on a CyberArk vault and a custom external credential storage system using the same MID Server. To use both types of external storage, install and configure a dedicated MID Server for each. The MID Server must be installed on the same machine as the CyberArk AIM API/client.
Installed with the CyberArk integration

The External Credential Storage plugin installs specific components used by the CyberArk integration.

Business rule

The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:

- Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
- Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

System property

A property called Enable External Credential Storage [com.snc.use_external_credentials] enables or disables the External Credential Storage plugin after it is activated. This property is located in Discovery Definition Properties and Orchestration MID Server Properties, and is enabled when you activate the plugin.

Note: If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

How the MID Server handles Windows accounts on CyberArk

The MID Server must determine if the Windows credential it receives from CyberArk is a local or domain account.

Credential lookup first attempts to match the specified credential ID to an existing value in the CyberArk vault Name field. If a match is found, that credential is returned. If no match is found, the credential lookup attempts to find a match using the IP address. If the IP address lookup matches more than one credential, such as Windows and Tomcat on the same server, the lookup fails. To avoid this issue, set the ext.cred.type_specifier parameter in the MID Server config.xml file to true to force CyberArk to return credentials that match both the credential type and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential type of Windows returns the Windows credential only.

CyberArk integration configuration

These procedures include both CyberArk and ServiceNow configuration tasks, including references to the appropriate CyberArk documentation.

The credential identifier configured in the ServiceNow instance must be mapped to the credential name in the CyberArk vault. When looking up a credential, the MID Server first tries to find the credential by name, which must be unique, and then by IP address. To identify the credential by IP address, the system looks at the credential type to ensure that there is only one credential of that type at that address. An example of this might be when a Windows server and vCenter are both running on the same IP address. To support strict credential requirements in an environment like this, a MID Server configuration parameter allows you to require that the credential type requested matches the type returned by CyberArk.

To configure your instance to obtain credentials from a CyberArk vault, complete these tasks in the order in which they appear below.
Configure the CyberArk vault and install the AIM API

Configure the CyberArk vault to allow MID Server access and install the CyberArk AIM API on the MID Server machine.

Role required: admin

Before starting this procedure, ensure that the External Credential Storage plugin is activated.

1. Configure the CyberArk vault with the application ID and authentication details that all MID Servers requesting credentials will use.
   For details, refer to the CyberArk Credential Provider and ASCP Implementation Guide.
   a) Ensure that CyberArk is configured to allow the MID Server to access the vault by creating an App-ID in CyberArk called ServiceNow_MID_Server.
   b) Make sure that every credential the MID Server needs is granted access to the ServiceNow_MID_Server App-ID.

   Note: You can override the default ServiceNow_MID_Server App-ID in the MID Server config.xml file using the ext.cred.app_id parameter. If you change the value in this parameter, make sure to configure a matching value in the vault.

2. Install the CyberArk Credential Provider, including the AIM API, on each machine that hosts a MID Server service that is used to access the credential store.

3. Provision CyberArk accounts and set permissions for application access.
   For details, refer to the CyberArk Privileged Account Security Implementation Guide.
   a) In the CyberArk Password Safe, create the privileged accounts required by Discovery, Orchestration, or Service Mapping to access different devices and ensure that these accounts are members of the safes in which the necessary credentials are stored.
   b) Add the Credential Provider and application users as members of the Password Safes where the application passwords are stored.

Import the CyberArk JAR file

Import the CyberArk JavaPasswordSDK.jar file into the instance to make it accessible to the MID Server.

Role required: agent_admin, admin

Before starting this procedure, ensure that CyberArk is configured to allow the MID Server access to credentials. Ensure that the CyberArk AIM API is installed on each server hosting a MID Server that is used to access the vault.

Use this process even if the JavaPasswordSDK.jar file already exists on the MID Server.

1. Navigate to MID Server JAR Files.
2. Click New.
3. Complete the form using the fields in the table.

Table 104: JAR File form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>Optional version number for the file, if one is available.</td>
</tr>
</tbody>
</table>
4. Attach the JAR file to this record.
   The AIM JavaPasswordSDK.jar file comes with the AIM SDK installation files and is typically located on the MID Server in the AIM installation directory at <install_dir>/CyberArk/ApplicationPasswordSdk.

5. Click Submit.

6. Restart the MID Server service.
   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

**Configure the MID Server for CyberArk**
Configure the config.xml file to grant the MID Server access to the CyberArk vault.

Role required: admin

Before starting this procedure, import the JavaPasswordSDK.jar file into the instance.

Manually configure the MID Server `config.xml` file with these parameters.

This configuration cannot be done from the instance.

<table>
<thead>
<tr>
<th>Table 105: Required configuration parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>

<tr>
<td>ext.cred.use_cyberark</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 106: Optional configuration parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>ext.cred.safe_timeout</td>
</tr>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------------------</td>
</tr>
</tbody>
</table>
| ext.cred.safe_name    | NameOfSafe                  | Default safe name used for all credential lookups. If parameters are in multiple safes, the credential ID may be specified in the format `<safeName>:<CredentialID>`. When configured like this, the NameOfSafe field is ignored. If all external credentials have their credential IDs specified in this format, then leave out the NameOfSafe field. Note: By default the separator character in this format is a colon. To assign any character you want as a separator, add this line to the CredMap.properties file:
  
  ```
  safe.cred.split.string=<string>.
  ``` |
| ext.cred.app_id       | ServiceNow_MID_Server       | Specifies the App-ID used to grant permission to the MID Server to access the CyberArk vault. The default value, ServiceNow_MID_Server, must be defined in the CyberArk vault. You can use this parameter to override the default and specify your own App-ID. If you edit the App-ID in this parameter, make sure to configure CyberArk to match. |
| ext.cred.type_specifier | true                        | Forces the lookup to return credentials that match both the CyberArk platform ID and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential with a platform ID starting with Win returns the Windows credential only. When this parameter is set to true, CyberArk looks for platform IDs that begin with:  
  - Win: Windows  
  - Unix: SSH  
  - VMWare: VMware |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.check_ssh_type</td>
<td>false</td>
<td>When set to true, requires that the type of credential returned from CyberArk matches the type of credential requested. For example, if a normal SSH username/password credential is requested and only SSH keys are available, the credential lookup fails.</td>
</tr>
</tbody>
</table>

**Configure CyberArk for SNMPv2 credentials**

If your system uses SNMPv2, you can create a special file to map the attribute in a credential to the community string.

Role required: admin

Before starting this procedure, configure the MID Server to have access to the CyberArk vault.

Note: If the community string appears in the password field of the CyberArk credential, it is not necessary to perform this procedure.

SNMPv2 is not natively supported in CyberArk. If your organization has created custom SNMPv2 credentials in which the community string does not appear in the password field of the credential, use this procedure to map the attribute in the credential to the community string.

1. In a text editor, create a file called CredMap.properties, containing this code:
   ```properties```
   SNMPv2.Community=attribute_name
   ```properties```
2. Save the file to the /agent directory of your MID Server installation.

   On credential lookup, the MID Server attempts to find this attribute for the credential. If the attribute is not found, the MID Server then looks in the password field. If the password field is empty, the credential lookup fails.

**Configure the CyberArk credential identifier**

Create the unique key that CyberArk can use to identify specific credentials in the external repository.

Role required: admin

Before starting this procedure, ensure that the External Credential Storage plugin is activated, and the Enable External Credential Storage system property is set to true.

1. Navigate to Discovery Credentials or Orchestration Credentials.
2. Click New.
3. From the list of credential types, select a type that supports CyberArk external storage.
4. Complete the form using the fields from your credential type.
5. Select the External credential storage check box.

   The User name and Password fields are replaced with the Credential ID field.

6. In the Credential ID field, enter an expression using one of these formats:
   - If all your credentials are in the same safe, configure this safe name in the MID Server config.xml file using the ext.cred.safe_name parameter, and then specify the credential ID by name only, as `<credential ID>`.
   - To name credentials for a given platform that reside is a specific safe, define the credential ID as `<safe>:<credential ID>:<platform ID>`.
   - If your credentials are in multiple safes, specify the credential ID in this format: `<safe>:<credential ID>`.
• If you want CyberArk to look up the credential by IP address, using an alternate safe, specify the credential ID in this format: \(<\text{safe}>::\).  
• If you want CyberArk to look up the credential for an alternate platform ID in the same safe, use this format: ::\(<\text{platform ID}>\)  
• If you want CyberArk to look up the credential in a configured safe by the IP address rather than the credential ID, leave this field blank. This is the best practice for handling installations in which each server has a unique credential. Without this type of lookup, you must create a credential ID record in your instance for every server in your environment.

Note: The credential ID must match the value in the Name field of the credential in the CyberArk vault. The Credential ID field has a limit of 40 characters.

7. Click Submit.

MID Server logging for CyberArk

The MID Server logs any failures with CyberArk stored credentials in the agent log. If the repository encounters an error while attempting to resolve a credentials request, the MID Server posts log messages with the following prefix:

Problem with client’s CredentialResolver:

ServiceNow Edge Encryption

With Edge Encryption, you control and possess all encryption keys for encrypted data.

Edge Encryption is a proxy application that resides in your network. It encrypts data before the data is sent over the Internet to your instance (encrypted while in flight). The data remains encrypted while stored in the instance (encrypted while at rest). The encrypted data is sent back to the proxy application when requested (encrypted in motion). Finally, the encrypted data is decrypted by the proxy before being sent to the client in your network.

Your security administrator specifies which fields are to be encrypted. AES 128 or AES 256 encryption algorithms can be used. Attachments can be encrypted on a table by table basis.

Depending on the encryption type chosen for a field, certain levels of UI filtering, sorting, or compare functionality can be preserved.
You own and manage the encryption keys. Encryption keys are never sent to the instance. ServiceNow never possesses the clear data and cannot see it. Three key storage mechanisms are supported: file store, Java KeyStore, and SafeNet. The Edge Encryption proxy obtains encryption keys from one of the key stores to encrypt and decrypt data.

This podcast offers additional information on Edge Encryption.

**Edge Encryption limitations**

Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

**Field type restrictions**

Restrictions on encrypting field types.

- Only string fields can be encrypted. Choice fields, virtual fields, journal fields, and any fields other than string fields cannot be encrypted. See [Field types](#) for more information.
- String fields that include more than five multi-byte characters cannot be encrypted.
- Fields in system tables, except for certain fields in sys_user, cannot be encrypted.
- System fields in tables cannot be encrypted.
- Fields named “number” and fields associated with an auto-numbering scheme cannot be encrypted.
- Encrypted fields are not available in Go to and header filter boxes.
- When encrypting fields used as an index, only order preserving and equality preserving encryption types can be used. Indexed fields cannot be encrypted using the standard encryption type.

**Configuration restrictions**

Restrictions and behavior of encryption configurations.
• After a field has been added to the Edge Encryption Configuration table, the configuration record cannot be deleted. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table, and schedule an encryption job to decrypt the data.

• If a field in a parent table is marked to be encrypted, the field in all inherited tables is also encrypted. For example, if the short description field in the Task table is encrypted, then the contents of the short description field in the Incident table are encrypted.

• If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if short description in the Incident table is marked to be encrypted, then short description in the Task table cannot be encrypted. In the example, you can encrypt the short description in the Problem table.

• When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server. Importing data to a field with an encryption configuration defined is not supported.

Instance restrictions

Impact of using Edge Encryption on the instance.

• Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

• Scripts run on the server cannot change encrypted data.

• Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be what the user expects.

• Encrypted data cannot be copied to a record where the field is not encrypted.

• Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.

• Other than file store, Java KeyStore, and SafeNet, no third-party software, or hardware encryption key management is supported.

• While multiple encryption proxies connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.

• System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.

• The Edge Encryption proxy server can only connect to a single instance

• If your instance uses an Oracle database and the string field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.

• If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.

• Encrypted values included in emails are encrypted.

• Encrypted data cannot be used in reports.

Integration restrictions

Restrictions on data integrations with Edge Encryption.

• Attachments uploaded via REST or SOAP cannot be uploaded to tables marked for attachment encryption.

• Importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined is not supported.
Getting started with Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation.

Answer the following questions in the planning stage.

• Which fields are to be encrypted?
• Which encryption types are to be used?
• How many Edge Encryption proxies are needed?
• If an order preserving encryption type or encryption patterns are to be used, where is the MySQL instance located?
• Which key management system is to be used?
• How are browsers to be set up to access an Edge Encryption proxy?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

• System administrators need the security-admin role. The system administrator needs to:
  • Download the Edge Encryption proxy application.
  • Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  • Configure encryption keys, and set the default keys.
  • Configure Edge Encryption on the instance.
  • Schedule encryption jobs.
  • Monitor Edge Encryption.
  • Create and edit encryption rules.

• Your network administrator needs to:
  • Install the Edge Encryption proxy application.
  • Know network addresses for proxy servers, and the proxy database server used for order-preserving encryption and encryption patterns.
  • Install the proxy database to be used for order-preserving encryption and encryption patterns.
  • Start and stop the proxy applications.
  • Perform encryption key management.
  • Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
  • Deal with the issues of using multiple encryption proxy applications.

• Your security administrator must determine the encryption types to be assigned to each field.

Edge Encryption application and proxy

Edge Encryption has these components: the Edge Encryption applications installed via a plugin and the Edge Encryption proxy that can be downloaded from one of the menu options from the Edge Encryption application.

Use the Edge Encryption application to specify which fields and attachments are encrypted, manage encryption rules, and schedule mass encryption jobs.

The Edge Encryption proxy uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go
through the Edge Encryption proxy. This includes any requests originating from a browser, as well as any SOAP and REST requests.

Encryption types

For each encryption type, Edge Encryption provides support for AES with 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, it also provides support for 256-bit encryption keys for each of the encryption types.

The following encryption types are listed in decreasing security quality.

Table 107: Encryption types

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
<tr>
<td>Order preserving AES 128</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>

When using standard encryption, the encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

When using equality preserving encryption, the encrypted value of a field is the same when the field value remains the same. When a field is encrypted using equality preserving encryption, it is possible to perform equality comparisons and group by operations on that field.

**Note:** When equality preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group together fields with the same value if one is encrypted and the other is not.

When a field is encrypted using order preserving encryption, in addition to supporting all the features supported by equality preserving, it also supports the ability to sort data in the field. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption Proxy.

**Note:** When using order preserving encryption and the proxy database is down, updates can be made to fields using order preserving encryption. However, the sort order cannot be correct when trying to sort data based on those fields. Groups also not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

Encrypted attachments

You can encrypt attachments for specific tables.
All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:
• On a record with attachment encryption activated:
  • The user can see that there are attachments and the attachment names.
  • The user cannot open or download the attachments.
  • The user cannot add new attachments.
• On a record without attachment encryption activated:
  • The user can open and download existing attachments.
  • The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

Encryption patterns
You can specify string patterns to be replaced by tokens before being sent to and stored in the instance.

You can pick patterns provided out of the box, or create your own patterns. You can create a basic pattern by specifying a sequence of characters. You create an advanced pattern by specifying a Java RegEx expression. The out of the box patterns are advanced patterns.

Encryption pattern limitations.
• A pattern of all alpha characters is not allowed.
• The minimum pattern size is 5 characters. This can be changed using a system property.
• The asterisk (*) and plus (+) characters are not allowed in patterns.

When the proxy matches a pattern in a request going to the instance, the proxy replaces the string with a token the same size as the string being replaced, and sends the token to the instance. The string matching the pattern is not sent to the instance. When the response is sent from the instance to the browser of HTTP client, the proxy replaces the token with the string so you see the clear text.

Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.

The string matching the pattern is not encrypted, it is replaced with a token. The clear text never leaves your network. If the same string is sent to the instance multiple times, it is replaced with the same token. This means that you can perform text searches for strings that have been replaced with a token. While the search happens on the instance with tokens, the query string is changed to a token when the query is sent to the instance, the search is performed on tokens, and when the search results are sent back to you, the tokens are replaced with the clear text. Searches are done on exact matches; features such as stemming do not work.

The encryption pattern feature uses the same MySQL database used for order-preserving encryption.

Note: Encrypted fields are not checked for encryption patterns.

Proxy database
The proxy database is used to support the order preserving encryption type and encryption patterns.
The proxy database is a MySQL database located in your network. All proxies use the same database. Proxies find the database by checking properties in the edgeencryption.properties file.

The proxy database contains these tables.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

**Key management**

You are responsible for providing and managing the encryption keys used by Edge Encryption.

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, you should consider the following:

- Whether to use AES 128 or AES 256. You must define a default AES 128 encryption key even if it is not used.
- Whether to use file store, Java KeyStore, or NAE.
- When to rotate encryption keys.
- When and if to use a mass encryption job to re-encrypt data using the new key.

Before removing a key from the proxy configuration files and the key store, decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

**Key store management**

Encryption keys must be stored in one or more encryption key stores.

Edge Encryption supports the following types of key storage mechanisms.

- File system: Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted so it is your responsibility to protect these files.
- Java KeyStore: Keys are stored in Java’s JCEKS keystore. A Java Keystore is protected by a password so it is more secure than storing keys in a file in the file system. A single Java Keystore can store multiple keys and the keys are identified by a key alias, making it easier to manage multiple keys.
- NAE (Network Attached Encryption) key store: Keys are stored and retrieved with SafeNet’s KeySecure key management.

The Edge Encryption proxy ships with the Java JCEKS Keystore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow certificate used to validate encryption rules that have been signed by ServiceNow.

**Note:** If using a keystore other than the base system JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

In addition to the encryption keys, the Java JCEKS Keystore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the...
digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

Encryption key rotation
You can perform encryption key rotation from the instance. You can add a new key, change the default key assignment, and then schedule a mass key rotation job.

Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before it can be assigned as the default key.

Note: Before removing a key from the proxy, ensure that no data on the instance uses the key. You can do this by setting up and running a mass key rotation job.

Request Edge Encryption
The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Edge Encryption proxy installation
Install one or more Edge Encryption proxy applications on your network.
Installing a Edge Encryption proxy includes these steps.

- Install the Edge Encryption proxy application on a server in your network.
- Generate the RSA key pair for digitally signing encryption configurations and encryption rules.
- Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.
- If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore key store.
- If order preserving encryption types or encryption patterns are to be used, set up a MySQL database instance on a machine in your network.
- Set up the edgeencryption.properties configuration file.
- Set up each user’s browser to point to an Edge Encryption proxy.

Accessing the proxy server

Once installation is complete, point each user’s browser to an Edge Encryption proxy using the URL format: (host):(port). Values are determined by the host and port properties in the edgeencryption.properties file. See Configure the proxy properties.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>hostname.mycompany.com</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>8081</td>
</tr>
</tbody>
</table>

A client will access the proxy server using the following address: http://hostname.mycompany.com:8081/.

Note: DNS settings and routing rules may be used. Host and port values are determined by your network administrator.

Edge Encryption system requirements

The Edge Encryption proxy application can run on servers or virtual machines running Windows or Linux.

The Edge Encryption proxy distribution comes with JRE 1.8. Out of the box, the Edge Encryption proxy uses the JRE bundled with the distribution. You can change this by modifying the wrapper.conf file in the <installation dir>/conf directory.

Proxy server minimum configuration

The minimum configuration includes:

- A minimum of 4 GB of available RAM per proxy server (6 GB is recommended for most deployments).

  Note: The host machine running the proxy server must have at least 1 more GB of RAM available for OS services than is needed to run the proxy server. Specifically, if a proxy server is set to use 4 GB of RAM, the VM or hardware must have at least 5 GB of RAM installed.
- 3+ GHz CPU, with a 4-core CPU preferred.
• Multiple proxy servers behind a load balancer. The number of proxy servers will depend on the number of application nodes, number of simultaneous users, and failover needs. See Sizing your Edge Encryption environment for considerations.
• Ability to ride-along with other services, depending on the server utilization and resource availability.
• Java 8 is required to run the installer.

Proxy server supported systems

The following systems are supported.

• Windows Server
  • All Windows Server 2012-R2 editions or later
  • Virtual machines or physical hardware
  • 32-bit and 64-bit systems

• Linux
  • Virtual machines or physical hardware
  • 32-bit and 64-bit systems

Note: Because the proxy server requires access to at least 4 GB of RAM, a 64-bit operating system and JVM is recommended.

On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: yum install glibc.i686

Note: Because the Edge Encryption proxy server resides in your network, its host IP and port may be subject to vulnerability scans by your network software. The Edge Encryption proxy server will forward such scan requests to your ServiceNow instance. To prevent IP scanner or similar requests from being forwarded to your ServiceNow instance, make sure to configure your network scanner to skip the Edge Encryption proxy server port or IP address. Alternatively, you can configure a firewall utility on the host machine to prevent the proxy server from forwarding requests from specific addresses to the instance.

Proxy database minimum configuration

Order-preserving encryption and encryption patterns require a MySQL database configured for the Edge Encryption proxy. Use a dedicated machine to run the proxy database. The minimum requirements include.

• Version: MySQL database versions 5.5 to 7.x
• OS: 64-bit systems
• CPU: 2+ GHz CPU, with a 4-core CPU preferred
• RAM: 16 GB
• Disk: SAN or local storage (RAID 10 recommended)
• Size: Determined by the number of potential records multiplied by record size. Calculate the proxy database size.
• Configuration: High Availability cluster. If you are unsure of how to configure your MySQL server, contact MySQL for configuration information.
Sizing your Edge Encryption environment

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

Redundancy

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

Size

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.

For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.

Load balancers

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the “least connections” method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

CPU utilization

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

Memory

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.
Calculate the proxy database size

If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.

**Note:** Use a dedicated machine to run the proxy database. Do not run the database on the same hardware as the proxy server.

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a) Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b) To allow for growth, multiply the result by three.

2. Multiply the result of step 1 by 1,536.
   1,536 is the average size of a record in bytes.

3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

The calculated value is the recommended size in bytes for your proxy database.

Encryption proxy connection requirements

The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network.

Make sure that the proxy server has these network privileges:

- **Firewall access:** Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.
- **Network access:** Configure each client to let the proxy server connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.
- **Network account:** Install the proxy server with the proper account, either local or domain administrator.

Additionally, for the proxy server to access your instance:

- Ensure network access to the instance. Make sure that the network used by the proxy server is configured to allow traffic over TCP port 443.

Download the Edge Encryption proxy application

Download the Edge Encryption proxy application from your instance, and then copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

Role required: security-admin

1. Navigate to Encryption Configuration Installation & Downloads Downloads.
2. Select the OS version for your proxy server.
3. Copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

Install the encryption proxy on Linux

You can install an Edge Encryption proxy on a 32-bit or 64-bit Linux computer.
Java 8 is required to run the installer.
1. Create the installation directory.
2. Copy the Edge Encryption archive file to the installation directory.
3. Change to the installation directory.
4. Run the following command:

   java -jar edgeencryption-dist-<version>-linux-x86-64.zip -m install -n <ProxyName> -h <host> -p <port> -proto https

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version number of the Edge Encryption release.</td>
</tr>
<tr>
<td>ProxyName</td>
<td>The name of the encryption proxy instance.</td>
</tr>
<tr>
<td>host</td>
<td>Your instance.</td>
</tr>
<tr>
<td>port</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments: java -jar edgeencryption-dist-<version>-linux-x86-64.zip

The ProxyName_port directory is created in the current directory. The edgeencryption.properties file is updated with the host, port, and protocol values from the command line.

Install the encryption proxy on Windows

You can install an Edge Encryption proxy on a 32-bit or 64-bit Windows computer.
Java 8 is required to run the installer.
1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Start the Windows cmd terminal program with administrator privileges.
4. Change to the installation directory.
5. Run the following command:

   java -jar edgeencryption-dist-<version>-windows-x86-64.zip -m install -n <ProxyName> -h <host> -p <port> -proto https

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version number of the Edge Encryption release.</td>
</tr>
<tr>
<td>ProxyName</td>
<td>The name of the encryption proxy instance.</td>
</tr>
<tr>
<td>host</td>
<td>Your instance.</td>
</tr>
</tbody>
</table>
If you want to see the help screen, execute this command without arguments: java -jar edgeencryption-dist-{version}-windows-x86-64.zip

6. Optionally change the name of the service.

Caution: You must perform this step before running the install command on Windows. See Start the Edge Encryption proxy.

If this step is not performed, the Edge Encryption proxy service installs under the name Wrapper.

a) Open the conf/wrapper.conf file on the new proxy and add the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

b) Save and close the file.

The ProxyName_port directory is created in the current directory. The edgeencryption.properties file is updated with the host, port, and protocol values from the command line.

Configure the target properties

In the edgeencryption.properties file, specify the instance with which the Edge Encryption proxy communicates. These values are initially set when the proxy application is installed.

1. Change to the <installation directory>/conf/ directory.
2. Open the edgeencryption.properties file.
3. Enter the following target properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.host</td>
<td>The host name for the instance. It must be the same for all encryption proxies. This property is set when the proxy is installed. For example instancename.service-now.com</td>
</tr>
<tr>
<td>edgeencryption.target.port</td>
<td>The instance port. It must be the same for all encryption proxies. This property is set when the proxy is installed.</td>
</tr>
<tr>
<td>edgeencryption.target.protocol</td>
<td>The instance protocol. It must be the same for all encryption proxies. This property is set when the proxy is installed.</td>
</tr>
</tbody>
</table>

4. Save and close the edgeencryption.properties file.
Set up an Edge Encryption user account

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the edge_encryption role to the user.
3. On each proxy, update the edgeencryption.properties file with the properties for the user account.
   a) Change to the \(\text{installation directory}/\text{conf/}\) directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the user account.

<p>| Table 111: User account properties |
|-----------------------------------|---------------------------------|</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.username</td>
<td>The user name that the proxy uses to log in to the instance. The user must have the edge_encryption role.</td>
</tr>
<tr>
<td>edgeencryption.target.password</td>
<td>The password that the proxy uses to log in to the instance.</td>
</tr>
</tbody>
</table>

4. Save and close the edgeencryption.properties file.

Configure the proxy properties

In the edgeencryption.properties file, you can specify how the Edge Encryption proxy communicates with your ServiceNow instance.

Note: If you are copying an edgeencryption.properties file from one proxy to another, verify that the name property is unique to each proxy.

1. Change to the \(\text{installation directory}/\text{conf/}\) directory.
2. Open the edgeencryption.properties file.
3. Enter the proxy properties.

<p>| Table 112: Proxy properties |
|-------------------------------|---------------------------------|</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Name of the proxy. It must be unique for each proxy.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
</tbody>
</table>
4. Save and close the `edgeencryption.properties` file.

Configure web proxy properties

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

If your network does not use a web proxy, leave these configuration parameters commented out.

The Edge Encryption proxy supports HTTP connection to and basic authentication with the web proxy.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Enter the proxy properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.webproxy.host</code></td>
<td>Can be the web-proxy’s name or its IP address.</td>
</tr>
<tr>
<td><code>edgeencryption.webproxy.port</code></td>
<td>Port on the web proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.webproxy.user</code></td>
<td>User name to be used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
<tr>
<td><code>edgeencryption.webproxy.password</code></td>
<td>Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
</tbody>
</table>

4. Save and close the `edgeencryption.properties` file.
5. If the web proxy requires a customer-specific client certificate, add the certificate to the Edge proxy Java truststore at `<installation directory>/java/jre/lib/security/cacerts`.
   To import a certificate to the truststore, execute the command: `keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>`

Install the Java Cryptography Extension (JCE)

If you want to use AES 256 encryption, you must install the Java Cryptography Extension (JCE) jurisdiction policy files and copy them into each Edge Encryption proxy.

Edge Encryption ships with the AES 128 policy files, which you must overwrite with the AES 256 policy files. It is only necessary to download the JCE once, but every Edge Encryption proxy must be updated.

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server, copy the `local_policy.jar` and `US_export_policy.jar` files into the `<proxy-dir>/java/jre/lib/security` folder.
Create and configure the RSA key pair for the digital signature

Create an RSA key pair that the proxy can use to create the digital signature for signing changes to the encryption properties and configuration.

To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. You generate an encryption key pair by using the keytool command.

If the proxy was installed on SElinux (e.g. CentOS), to use the keytool utility you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.

```
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.
   
   The default password is changeme.
   
   ```
   keytool -keystore keystore.jceks -storetype jceks -storepasswd -new <newpassword>
   ```
3. Create an encryption key pair.
   
   Note: Do not enter a password for the key when the keytool utility prompts for one.

   ```
   keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
   ```

4. Update the encryption proxy property file (`edgeencryption.properties`).
   a) Change to the `(installation directory)/conf/ directory.`
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the digital signature.

   These properties must be the same for all proxies.

   Table 114: Digital signature properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.signature.keystore.path</code></td>
<td>Path and Java KeyStore file name.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.signature.keystore.password</code></td>
<td>Password. The default password is <code>(changeme)</code>. Change the password after installing the Java KeyStore.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.signature.keystore.keyalias</code></td>
<td>The key alias given in as the <code>-alias</code> argument when the RSA key pair was generated.</td>
</tr>
</tbody>
</table>

5. Save and close the `edgeencryption.properties` file.
Import and configure the certificate for secure SSL connection

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

You must obtain the server certificate before you can add it to the Java KeyStore.

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java Keystore and generated the certificate from that key.</td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</td>
</tr>
<tr>
<td>If you have a PKCS12 file that contains the RSA key and the certificate.</td>
<td>keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srckeystore &lt;PKCS12 filename&gt; -srckeystore pkcs12</td>
</tr>
</tbody>
</table>

Make sure the private key password is the same as the Java Keystore password.

You can run this command to change the password.

keytool -keypasswd -keystore keystore.jceks -alias <key alias>

For testing, you can use this command to generate a self-signed certificate.

keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa

2. Update the edgeencryption.properties file.

   a) Change to the <installation directory>/conf/ directory.
   
   b) Open the edgeencryption.properties file.
   
   c) Enter the properties for the SSL certificate.

The certificate must be the same for all proxies.

Table 115: SSL certificate properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.https.cert.alias</td>
<td>Alias of the certificate.</td>
</tr>
</tbody>
</table>

3. Save and close the edgeencryption.properties file.

Set up a SafeNet KeySecure key store

If you are using a SafeNet key store, copy a set of libraries into the proxy distribution directory.

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

Note: On Linux, file paths use a forward slash.

1. Copy these files to <installation directory>/lib directory:
   
   • ingrian-nae-8.2.0.000.jar
   
   • ingrian-log4j-api-2.0-rc1.jar
   
   • ingrian-log4j-core-2.0-rc1.jar

2. Change to the <installation directory>/conf/ directory, and open the edgeencryption.properties file.

3. Enter the properties for the SafeNet key store.
Table 116: Properties for an NAE device

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.nae.retries</td>
<td>Number of retries to make.</td>
</tr>
<tr>
<td>edgeencryption.nae.enabled</td>
<td>If an NAE device is available.</td>
</tr>
<tr>
<td>edgeencryption.nae.server</td>
<td>Name of the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.port</td>
<td>Port used by the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.protocol</td>
<td>Protocol used by the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.keystore.path</td>
<td>Path to the key store on the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.keystore.password</td>
<td>NAE key store password.</td>
</tr>
<tr>
<td>edgeencryption.nae.username</td>
<td>User name to use to authenticate with the NAE device.</td>
</tr>
<tr>
<td>edgeencryption.nae.password</td>
<td>Password to use to authenticate with the NAE device.</td>
</tr>
</tbody>
</table>

An example for a SafeNet key store.

edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_truststore
edgeencryption.nae.keystore.password = password
edgeencryption.nae.user = safenet_user
edgeencryption.nae.password = safenet_password

4. Add or create a key in the SafeNet key store.
   You add the key name (alias) on the instance when you assign default keys.
5. Save and close the edgeencryption.properties file.

Set up a Java KeyStore key store

You can use a Java KeyStore key store to store encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in <proxy install dir>/java/jre/bin/keytool.

1. Set up the key store properties.
   a) Change to the <installation directory>/conf/ directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the key store.

Table 117: Properties for a Java KeyStore key store

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.keystore.path</td>
<td>Path and Java KeyStore file name.</td>
</tr>
<tr>
<td>edgeencryption.keystore.password</td>
<td>Password the proxy uses to connect to the KeyStore.</td>
</tr>
</tbody>
</table>
An example for a Java KeyStore key store.

```java
edgeencryption.keystore.path = keystore/keystore.jceks
edgeencryption.keystore.password = password
```

2. Save and close the edgeencryption.properties file.

Create encryption keys using the Java KeyStore keytool

You can use the keytool shipped with the encryption proxy distribution to create AES 128 and AES 256 encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

To find out more about the keytool utility, see the [Java SE Documentation](#).

Note: The Java KeyStore requires that the alias name (key name, key alias) use lowercase letters and numbers.

1. Change to the key store directory, `<installation directory>/keystore/`.
2. To create the encryption key, run one of the following commands.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks</td>
</tr>
<tr>
<td>AES 256</td>
<td>keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks</td>
</tr>
</tbody>
</table>

You add the alias on the instance when you assign default keys.

Set up a file store

After creating a file store, you must set up the encryption.properties.

1. Update the edgeencryption.properties file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the file store.

You have this set of properties for each encryption key stored in a file. A number is appended to each property to make the properties unique. For example, `edgeencryptionencrypter.type.1`. 
Table 118: Properties for a file-type key store

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.keyfile.directory</td>
<td>Specifies the directory where key files are stored.</td>
</tr>
</tbody>
</table>

An example for a file system key store.

edgeencryption.keyfile.directory=keys

2. Save and close the edgeencryption.properties file.

Create an encryption key stored in a file

You can use a file as a key store. Each file holds a single encryption key.

You must create the encryption key separately. The name of the key file must match the key alias specified in the encryption keys table in the instance.

Create a file store.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

Obfuscate passwords in the properties file

You can obfuscate passwords in the edgeencryption.properties file to share the properties file without revealing clear text passwords.

Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, Stop the Edge Encryption proxy.

Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.

1. Change to the 〈installation directory〉/conf/ directory.
2. In the conf directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the edgeencryption.properties file. This passphrase should be a random and complex phrase not related to the passwords themselves.
3. Open the edgeencryption.properties file.
4. Enter the password property.
Table 119: Password property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.encrypter.properties.password</td>
<td>Name of the file in the conf folder that contains a string used within a secure process to obfuscate passwords in the edgeencryption.properties file. If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.</td>
</tr>
</tbody>
</table>

Set the clear text and IV properties

Set the clear text and IV (initialization vector) properties during the initial installation. Make sure that these properties are the same for all proxies.

1. Change to the ⟨installation directory⟩/conf/ directory.
2. Open the edgeencryption.properties file.
3. Replace the default values for these proxy properties with values that are unique for your installation.

Table 120: General encryption properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.customer.assigned.known.cleartext</td>
<td>Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.encrypter.static.iv</td>
<td>The static IV (initialization vector) to be used in equality preserving and order preserving encryption. This property must be the same for all proxies, and it must be exactly 16 bytes (e.g. 16 ASCII characters.)</td>
</tr>
</tbody>
</table>

Lock the proxy configuration

If you want to prevent encryption configuration changes to the proxy in production, set the proxy locked property.

1. Change to the ⟨installation directory⟩/conf/ directory.
2. Open the edgeencryption.properties file.
3. Set the proxy locked property.
4. Save and close the edgeencryption.properties file.

Configure the proxy database properties

If you are using an order preserving encryption type or encryption patterns, you must set the Edge Encryption proxy properties for the proxy database.

1. Change to the <installation directory>/conf/ directory.
2. Open the edgeencryption.properties file.
3. Enter the properties for the proxy database.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.db.url</td>
<td>Location of the proxy database. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.db.user</td>
<td>User name for accessing the proxy database. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.db.password</td>
<td>The password for accessing the proxy database. The default is blank. Must be the same for all proxies.</td>
</tr>
</tbody>
</table>
| edgeencryption.db.name        | The name of the proxy database. Must be the same for all proxies.  
• Default value: edgeencryption |
| edgeencryption.db.bootstrap.file | The bootstrap file for the proxy database. The file is relative to the sql/ directory. Must be the same for all proxies. This parameter should not be changed under normal circumstances. |

4. Save and close the edgeencryption.properties file.

Set the proxy server initial and upper bound memory limits

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). The initial and upper bound memory limits determine how much memory the proxy server can consume.

1. In your proxy server directory, open <install dir>/conf/wrapper.conf.
2. Set the proxy server’s initial memory limit.
   a) Locate the line: #wrapper.java.initmemory=3.
   b) Replace it with: wrapper.java.initmemory=6144.
3. Optionally set the upper bound memory limit.
   Because an upper bound memory limit is not set in the base system, the proxy server may utilize all available memory. If other services are running on the server, you may want to set the upper bound memory limit.
   a) Locate the line: `wrapper.java.maxmemory=<max_memory_specified_in_MB>`.
   b) Set the max memory to the desired number.

4. Save and close the file.

Edge Encryption general properties

The proxy configuration file contains properties that should not be changed under normal circumstances.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `edgeencryption.config.poll.interval` | The poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.  

   *Note:* Do not change this property. |
| `edgeencryption.rules.dir` | Folder where the encryption rules are stored on the proxy.  
| `edgeencryption.encryption.order_preserving.cache.enable` | Whether caching is used to support order preserving encryption types.  
| `edgeencryption.encryption.order_preserving.cache.size` | Maximum cache size, in bytes.  
| `edgeencryption.jobs.concurrency` | Maximum number of mass encryption jobs that can run concurrently on this proxy.  
| `edgeencryption.jobs.requests_per_second` | Number of http job requests per second that can be sent to the instance by this proxy.  
| `edgeencryption.attachments.request.timeout.seconds` | Attachment upload request timeout in seconds.  
| `edgeencryption.request.buffer.size` | If an encryption request is larger than this size, the excess is saved to disk. You should not change this number.  
| `edgeencryption.register.retry.count` | Maximum number of times the proxy will ping the instance to try to register. The default is 0 (no limit). |

Deprecated encryption properties

Some encryption properties are no longer needed, and have been deprecated.
Table 124: Deprecated proxy encryption properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryptionencrypter.default.key128</td>
<td>Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryptionencrypter.default.key256</td>
<td>Specifies the name of the current AES 256 key. Must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryptionencrypter.key</td>
<td>Specifies the key name. This property is specified for each key. This name is used to specify the default keys. This is the key alias included as part of the metadata included with each encrypted item, which means that it is stored on the instance. The key name must use lowercase letters.</td>
</tr>
<tr>
<td>edgeencryptionencryptertype</td>
<td>Specifies the type of encryption key store system.</td>
</tr>
<tr>
<td>edgeencryptionencrypterfile</td>
<td>Specifies the path and file name of the key’s text file.</td>
</tr>
<tr>
<td>edgeencryptionencrypterpassword</td>
<td>Specifies the password for accessing the key store.</td>
</tr>
</tbody>
</table>

Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. However, you must either configure the environment to return responses to the load balancer instead of the proxy server and configure load balancer iRules, or run the proxy servers on the same port as the load balancer. Otherwise, users cannot view the responses to their requests.

Important: All production environments should include at least two Edge Encryption proxy servers for redundancy.

Edge request processing without a load balancer

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the Edge Encryption instance.
4. The instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user’s browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.

Edge request processing with a load balancer

However, if you are using a load balancer, the user’s browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.
Note: The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for the Virtual Server.
   - Host: edgencryption.proxy.host
   - HTTP port: edgencryption.proxy.http.port
   - HTTPS port: edgencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.
   - If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response on the same port identified in the response header.
   - If the load balancer and proxy servers are using different ports, the request fails because the user’s browser communicates only with the load balancer, but the response is on the proxy server.

Solutions

To return responses from the load balancer to the clients in your network, determine whether to use proxy servers on the same port as the load balancer, or to configure the load balancer environment instead.

Use proxy servers on the same port as the load balancer

Because the proxy servers and load balancer use the same port, the client browser receives the response on the same port identified in the response header. This solution requires less maintenance and is more performant than configuring the load balancer environment.

Verify that the host and port properties in the edgeencryption.properties file point to the port running both the load balancer and Edge proxies. The host must point to the load balancer.

Properties to configure include:
   - edgencryption.proxy.host: Set the value to the load balancer host machine.
   - edgencryption.proxy.http.port: Set the value to the port used by both the load balancer and the Edge proxies.
   - edgencryption.proxy.https.port: Set the value to the port used by both the load balancer and the Edge proxies.
Configure the load balancer to rewrite the response

For more information on Edge Encryption properties, see [Edge Encryption properties](#).

If the load balancer and proxy servers are using different ports, configure the load balancer to rewrite the response before forwarding it to the client browser. The load balancer must terminate the SSL connection with the Edge proxy, rewrite the response using an iRule, and recertify and forward the response to the browser. This solution enables you to configure proxy servers on different ports from the load balancer, but can cost more in maintenance and performance. In this configuration:

1. The instance sends a response to the Edge proxy, which forwards the response to the load balancer.
2. The load balancer terminates the SSL connection.
3. The load balancer uses an iRule to rewrite the response, changing the port in the response location header to the load balancer port.
4. The load balancer recertifies the response and forwards it to the client browser. To recertify the response, the load balancer must host the servicenow certificate and private key.

Configure the load balancer

If the load balancer and proxy servers are using different ports, configure the load balancer to rewrite the response before forwarding it to the client browser. The load balancer must terminate the SSL connection with the Edge proxy, rewrite the response using an iRule, and recertify and forward the response to the browser. This solution enables you to configure proxy servers on different ports from the load balancer, but can cost more in maintenance and performance.

Role required: admin

1. Add the servicenow certificate and private key to the load balancer. These files must be maintained and up-to-date.
2. Configure the load balancer to terminate the SSL connection, modify the response from the instance, and recertify and forward the response to the client browser.
   
   Create scripts or iRules on the load balancer to rewrite the response location header to use the load balancer port. This enables the client browser communicating with the load balancer to receive the response. To learn more about iRules, see [F5 load balancer documentation](#).

The load balancer intercepts each response from the proxy server and rewrites the response location header before forwarding it to the client.

Add an additional proxy on Linux

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on Linux.
Note: Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

1. Install the proxy using the command for Linux. See Install the encryption proxy on Linux.
2. Copy all the encryption keys and the edgeencryption.properties file from the first proxy to the new proxy.
   Encryption keys may be located in the proxy keystore, in the /keys directory, or in a SafeNet KeySecure keystore.
3. Open the edgeencryption.properties file on the new proxy.
4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td>edgeencryption.proxy.host</td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy. Do not change this property if installing the proxy server on the same machine the properties file was copied from.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. Save and close the file.
6. Launch the proxy using the appropriate command. See Start the Edge Encryption proxy.

Add an additional proxy on Windows

After the first Edge Encryption proxy is configured, you can set up additional proxies on Windows.

Note: Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database is set up as part of the installation, all proxies must use the same proxy database.

1. Install the proxy using the command for Windows. See Install the encryption proxy on Windows.
2. Copy the encryption keys and the edgeencryption.properties file from the first proxy to the new proxy.
   Encryption keys may be located in the proxy keystore, in the /keys directory, or in a SafeNet KeySecure keystore.
3. Open the edgeencryption.properties file on the new proxy and change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td>edgeencryption.proxy.host</td>
<td>The server name, IP address, or fully qualified domain name of the computer running the proxy. Do not change this property if installing the proxy server on the same machine the properties file was copied from.</td>
</tr>
</tbody>
</table>
4. Caution: You must perform this step before launching the proxy server.

Open the conf/wrapper.conf file on the new proxy and add the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication. Must be unique across processes on the machine.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. Save and close the file.

6. Launch the proxy using the appropriate command. See [Start the Edge Encryption proxy](#).

Set up multiple provider SSO with Edge Encryption

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

- Role required: admin
- Enable the Edge Encryption plugin (com.glide.edgeencryption) and ensure that one or more proxy servers are set up in your network.
- Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO. To determine the URL of an Edge Encryption proxy server, see [Edge Encryption proxy installation](#).

- If routing all users through the Edge Encryption proxy server, set up your identity provider record and define the proxy server URL in the ServiceNow Homepage, Entity ID / Issuer, and Audience URI fields.
- To route some users through the proxy server and some users to the instance, create two identity provider records. Both records use the same value in the Identity Provider URL field. However, one of the records routes through the proxy server, while the other routes to the instance.

1. Enable the duplication of identity provider URLs in identity provider records.

A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.

   a) Navigate to System Definition Dictionary.

   b) Open the definition record for the idp field of in the Identity Providers table (saml2_update1_properties).
c) Configure the form to add the Unique field.
d) Ensure that the value of the Unique field is set to false.

2. Navigate to **Multi-Provider SSO Identity Providers**.
3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL.
   To create an identity provider record, see **Create and update identity providers**.
   a) For the Edge Encryption proxy server URL, complete the form using these values.
      
      | Field              | Value                                                                 |
      |--------------------|----------------------------------------------------------------------|
      | Identity Provider URL | Imported from IdP metadata.                                          |
      | ServiceNow Homepage | The URL for your proxy server homepage. For example:                 |
      |                    | https://<proxy hostname>:<port>/navpage.do                             |
      | Entity ID / Issuer  | https://<proxy hostname>:<port>                                      |
      | Audience URI        | https://<proxy hostname>:<port>                                      |
      
   b) Click Submit.
   c) For the instance URL, complete the form using these values.
      
      | Field              | Value                                                                 |
      |--------------------|----------------------------------------------------------------------|
      | Identity Provider URL | Imported from IdP metadata.                                          |
      | ServiceNow Homepage | https://<instance>.service-now.com/navpage.do                         |
      | Entity ID / Issuer  | https://<instance>.service-now.com/navpage.do                         |
      | Audience URI        | https://<instance>.service-now.com/navpage.do                         |
      
   d) Click Submit.

4. If using more than one identity provider, modify the MultiSSO installation exit.
   a) Navigate to **System Definition Installation Exits**.
      The system displays the current list of installation exits.
   b) Open the MultiSSO installation exit.
   c) Locate the following statement in the Script field.
      ```javascript
      var samlResponseTxt = request.getParameter("SAMLResponse");
      if (!GlideSession.get().isLoggedin() &&
          GlideStringUtil.notNil(samlResponseTxt)) {
          var idpRecord = this.getIdPRecord(request);
          if (idpRecord) {
              SSO_Helper.debug("IdP found based on SAML response: " +
                  idpRecord.getUniqueValue());
              return new SSO_Helper(idpRecord.getUniqueValue(), false, null,
                  true);
          }
      }
      ```
   d) Replace the statement with the following code.
      ```javascript
      var samlResponseTxt = request.getParameter("SAMLResponse");
      if (!GlideSession.get().isLoggedin() &&
          GlideStringUtil.notNil(samlResponseTxt)) {
          /* // You have two profiles that use the same IdP entity id it cannot use */
          ```
// the IdP issuer / entity id from the response otherwise it may
result in the
// wrong IdP profile. IdP initiated login will not work
var idpRecord = this.getIdPRecord(request);
if (idpRecord) {
    SSO_Helper.debug("IdP found based on SAML response: " +
    idpRecord.getUniqueValue());
    return new SSO_Helper(idpRecord.getUniqueValue(), false, null,
    true);
}* /
return new SSO_Helper(null, true);

Note: IdP initiated login does not work in this configuration.

e) Click Update.

5. If using more than one company, Configure users for multi-provider SSO. Update the sys_id of the
identity provider record depending on the user.
    • To configure a user to log in through the Edge Encryption proxy server, use the sys_id of the
      identity provider record that uses the Edge Encryption proxy server URL.
    • To configure a user to log in to the instance, use the sys_id of the identity provider record that
      uses the instance URL.

Table 125: Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

Edge Encryption ODBC driver integration

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy
server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated
with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before
passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.
Import a self-signed certificate to the ODBC truststore

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
      
      ```
      keytool -list -keystore keystore.jceks -storetype jceks -v
      ```
   
   b) Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   
   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```
4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.
5. Import the certificate to your ODBC truststore.
   
   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

Set the ODBC driver properties

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to Start Programs ServiceNow ODBC Management Console.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the DataSourceIPProperties attribute.
4. Change the Value to the URL of your Edge Encryption proxy server, such as https://<IP address>:<port>
Figure 109: DataSourceIPProperties
5. Click OK.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

Edge Encryption MID Server integration

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server’s endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

Limitations when integrating with the MID Server

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

Point the MID Server to the Edge Encryption proxy server

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server’s endpoint.

1. Navigate to your local MID Server directory and open the config.xml file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, http://hostname.mycompany.com:8081.
   This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

Configure Edge Encryption on the instance

Configure Edge Encryption by defining encryption keys, assigning fields and attachments to be encrypted, and specifying encryption patterns.

To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a sub-production instance before making the changes to the production instance.

Define encryption keys

After setting up one or more proxies, you must configure the instance to use the encryption keys. This means entering the key alias (name), the key’s size (128 or 256), and key type (file, Keystore, or...
Assign fields and attachments to be encrypted

Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

- Determine what system features might be impacted.
- Examine all scripts for use of the field.
- Make any desired adjustments to the field’s size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to hold the extra space needed to store the encrypted data. The process of expanding the field size can take a long time depending on the number of records in the table.

Specify encryption patterns

The encryption patterns are string patterns to be replaced by tokens before being sent to and stored in the instance. You can define a string pattern or use one of the predefined patterns.

Configure encryption keys

Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Role required: security-admin

Before setting up new encryption keys on the instance, you must do the following.

1. Create the new encryption key.
2. Make the new key available to all encryption proxies. This could be copying the file or Java KeyStore file to each proxy, or ensuring that each proxy has access to the Java KeyStore or NAE device.

Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

1. Navigate to Edge Encryption Configuration Encryption Key Configuration Set Up Keys
   The Encryption Key Configuration - Created form is shown.
2. Add new keys
   Rows in the list with an X in the left column can be deleted. Keys that have been used as the default, or are in the Available state cannot be deleted.
   a) In the row that says Insert a new row... double-click.
      An edit box is shown.
   b) Enter a name for the key, then click the check mark.
      Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click Submit. Key aliases must be unique.
   c) In the same row, double-click in the Key size column.
      A select box is shown.
   d) Select a key size, either 128 bits or 256 bits, then click the check mark.
e) In the same row, double-click in the Type column. A select box is shown.
f) Select a key type, either File, Keystore, or SafeNet, then click the check mark.
g) When you are done adding keys, click Next Step.
   You must specify an alias, key size, and key type for each key before moving on.
   The form moves to the Key Status step.

3. When the key status becomes Available, click Next Step.
   When a key alias is available on all proxies, its state becomes Available. If, after a few minutes, the state does not change, check to ensure the key is available on all proxies. If the state remains Unavailable, one or more of the proxies does not have the key alias.

4. On the Change Default Keys tab, either type in the key alias, or click the spy glass icon and select an alias, and then click Next Step.
   The form moves to the Schedule Key Rotation step.

5. If desired, create and run a mass encryption job to encrypt existing data using the new encryption key.
   If you do not run a mass encryption job, existing data remains encrypted with the old key until the data is accessed again.

Configure field encryption
Select the fields to be encrypted and identify the encryption type.
Role required: security-admin
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table containing the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Column.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the Type is Column.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

3. Click Submit.

After the encryption record has been added, you can create an encryption job to encrypt existing data. If you do not run an encryption job, the existing data is encrypted the next time it is changed.

Configure attachment encryption
Select the tables whose attachments are to be encrypted and identify the encryption type.
Role required: security-admin
2. Fill in the fields on the form, as appropriate.
Table 127: Edge Encryption configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Attachment.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted.</td>
</tr>
<tr>
<td></td>
<td>This field appears when the Type is Column, and not when Type is Attachment.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click Submit.

After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.

Configure basic encryption patterns

You can build a pattern character by character.

In order to use encryption patterns, you must install and set up a proxy database in your network. This is the same database used for order-preserving encryption. In order to create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: security-admin

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used. To enter a series of character types use the basic input type. To enter a Java RegEx expression use the advanced input type. To use one of the preconfigured patterns, edit one of the patterns on the Advanced Patterns list.

1. Navigate to Edge Encryption Configuration Encryption Patterns Create New.
2. Enter the pattern name.
3. Create a pattern by clicking the Add button, and then selecting a character type.

   The Sample pattern shows what your pattern looks like as you add characters and specify the character type.

   You can use the New Block button to move the next character to the next line. This allows you to group characters in a long pattern.

   Click the X button to delete the last character in the pattern.
4. Click Submit.

Configure advanced encryption patterns

You can build a pattern using a Java RegEx expression.

In order to use encryption patterns, you must install and set up a proxy database in your network. This is the same database used for order-preserving encryption. In order to create or edit encryption patterns, you must be connected to the instance through the proxy.
Role required: security-admin

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used. To enter a series of character types use the basic input type. To enter a Java RegEx expression use the advanced input type. To use one of the preconfigured patterns, edit one of the patterns on the Advanced Patterns list.

1. Navigate to Edge Encryption Configuration Encryption Patterns Create New.
2. Enter the pattern name.
3. In the Edge pattern input type list, select Advanced.
4. When the Convert basic pattern to advanced dialog is shown, click OK.
5. In the Sample match edit box, enter a sample pattern.
   Use this sample pattern to test the RegEx expression you enter. You cannot save the pattern until the pattern matches the sample.
6. In the Pattern edit box, enter a Java RegEx expression.
7. Click the Validate button to verify that the expression matches the sample pattern.
8. Click Submit.

Configure predefined encryption patterns

Edge Encryption ships with a set of predefined encryption patterns. You can activate these patterns instead of creating your own patterns.

In order to use encryption patterns, you must install and set up a proxy database in your network. This is the same database used for order-preserving encryption. In order to create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: security-admin

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used. To enter a series of character types use the basic input type. To enter a Java RegEx expression use the advanced input type. To use one of the preconfigured patterns, edit one of the patterns on the Advanced Patterns list.

1. Navigate to Edge Encryption Configuration Encryption Patterns Advanced Patterns.
2. Click on the pattern you want to use.
   You can change the pattern to match your specific requirements.
   The Encryption Pattern form is shown.
3. Click Active, and then click Update.
   The Encryption Patterns list is shown.

Encryption key states

The instance tracks the status of every encryption key available to any proxy.

Table 128: Encryption key states

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>All online proxies have the key.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>This is a new key and the proxies have not yet loaded the key, or at least one proxy failed to load the key.</td>
</tr>
</tbody>
</table>
Deactivate an encryption configuration

After configuring a field or a table’s attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run a Decryption job for fields or an Attachment Decryption job for attachments to remove the encrypted data from the instance.

Role required: security-admin

⚠️ Warning: Deactivating an encryption configuration does not delete the encryption record and the encryption type cannot be changed.

1. Navigate to Edge Encryption Configuration Edge Encryption Configurations All.
   The Edge Encryption Configurations list is shown.
2. Click on the encryption configuration to be deactivated.
   The Edge Encryption Configuration form is shown.
3. Click on the Active box.
   The Active box is clear.
4. Click Update.
   The Edge Encryption Configurations list is shown.

You can run a Decryption or Attachment Decryption job to removed encrypted from the instance. If you do not run a job, the encrypted data is decrypted the next time it is changed.

Change a field or attachment’s encryption type

To change a field or attachment’s encryption type, you must deactivate the current encryption configuration, and then create an encryption configuration for the field or attachment.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Edge Encryption Configurations All.
   The Edge Encryption Configurations list is shown.
2. Click on the encryption configuration to be deactivated.
   The Edge Encryption Configuration form is shown.
3. Click on the Active box.
   The Active box is clear.
4. Click Update.
   The Edge Encryption Configurations list is shown.
5. If needed, run a Decryption job or an Attachment Decryption job.
   It is not necessary to run a decryption job. If you do not run a decryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.
7. Create a new encryption configuration for the field or attachment.
8. If needed, run an encryption or attachment encryption job.
   It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

Create an encryption rule

Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.
Role required: security-admin

To create or edit encryption rules, you must be connected to the instance through an encryption proxy. For information on writing conditions and rules see Encryption rules.

1. Navigate to Edge Encryption Configuration Rules Create New.
2. In the Name box, enter a name.
3. In the Request Type, select HTTP Post or HTTP Get.
4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.

Encrypt data from a record producer

Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.

Role required: security_admin

Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See Configure field encryption. To encrypt attachments from a record producer, see Configure attachment encryption.

1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to Service Catalog Catalog Definitions Record Producers.
3. Create a record producer record or open an existing record producer record.

Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.

<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>⟨RecordProducerName⟩</td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td>⟨RecordProducerName ⟩Json</td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.
   a) Navigate to Edge Encryption Configuration Rules All.
   b) Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.
      If using the record producer in the Service Catalog, activate the ⟨RecordProducerName⟩ encryption rule. If using the record producer in the Service Portal, activate the ⟨RecordProducerName ⟩ Json encryption rule.

6. If using the record producer in the Service Portal, add a sys_id URL parameter to the widget client script record producer function. Then, in the ⟨RecordProducerName ⟩ Json encryption rule condition, add a check for the correct record producer sys_id.
Checking for the record producer sys_id ensures that the correct record producer is associated with the rule.

a) Open the widget that uses the record producer in the widget editor. To edit a base system widget, you must first clone the widget.

b) Examine the client script and locate the record producer function. For example, if updating a clone of the SC Catalog Item widget, the postCatalogFormRequest() function calls the record producer.

c) Add a statement to the function to add a sys_id URL parameter to the record producer.

```javascript
var url = spUtil.getURL('sc_cat_item') + "&sys_id=" + $scope.data.sc_cat_item.sys_id;
```

d) Save the widget.

e) Open the <RecordProducerName>Json encryption rule.

f) In the condition, add a check for the record producer sys_id.

```javascript
function RecordProducerNameJsonCondition(request) {
  if(request.path.indexOf("angular.do") > -1 && request.urlParams.sys_id == '<record_producer_sys_id>' && request.urlParams.type == 'sc_cat_item') {
    return true;
  }
  return false;
}
```

The record producer sys_id is a unique identifier for the Edge Encryption rule condition. Adding this parameter guarantees that the correct Edge Encryption rule is executed, regardless of the underlying variable mappings.

7. Examine the encryption rule Action field and replace ‘FILL ME IN’ with the target field for any scripted variables.

If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through scripts on the platform, you may need to update the rules to map each variable to the correct field. The variable sys_id is provided to ensure that the correct variable is mapped to the target field.

The two encryption rules enable the record producer to insert values into fields marked for encryption from either the Service Catalog or Service Portal.

Start the Edge Encryption proxy

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The edgeencryption.properties file on this machine has been configured.
- If using an order preserving encryption type or encryption patterns, the proxy database is running.

Note: The first time you set up the edgeencryption.properties file or change properties, you may want not to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.
1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>1. cd to ServerName_port</td>
</tr>
<tr>
<td></td>
<td>2. Execute ./startup.sh</td>
</tr>
</tbody>
</table>

| On a Windows machine     | 1. cd to ServerName_port/bin                     |
|                          | 2. Execute edgeencryption.bat install            |
|                          | 3. Execute edgeencryption.bat start              |

2. Check the log on the proxy server to verify that the proxy is running.

Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

1. Stop the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute ./shutdown.sh</td>
</tr>
</tbody>
</table>

| On a Windows machine     | Execute edgeencryption.bat stop                  |

2. Check the log on the proxy server to verify the proxy has stopped.

Update an Edge Encryption proxy

You must manually update each Edge Encryption proxy.

When you update a proxy, a backup is made, new encryption properties are added to the bottom of the encryption.properties file, the proxy shuts down, and the proxy restarts. The proxy is offline for only a short time.

Mixed proxy-version environments

Edge Encryption supports environments running old versions of the proxy and up-to-date versions of the proxy.

You can run old versions of the proxy with new versions of the proxy on the same instance, however -

- If a proxy running the Geneva version of software is registered with the instance, you cannot use the instance to assign a default key.
- If you have assigned a default key using the instance, a Geneva version of the proxy cannot register with the instance.

Update a proxy running on Linux

Update a proxy running on Linux.

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:
   
   java -jar edgeencryption-dist-<version>-linux-x86-64.zip -m upgrade -d <proxy directory>
### Update a proxy running on Windows

Update a proxy running on Windows.

Role required: admin

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:

   ```
   java -jar edgeencryption-dist-<version>-windows-x86-64.zip -m upgrade -d <proxy directory>
   ```

If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-windows-x86-64.zip`

The old proxy is backed up, the proxy is updated, shutdown, and restarted.

5. Check the proxy log and the instance to verify that the proxy has been updated and is running.

### Rollback a proxy update

If a proxy update is unsuccessful, you can go back to the earlier version.

The old proxy is stored in a backup directory unmodified. The backup directory is in the proxy installation directory with a name in the form `<proxy name>_backup`.

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   - The backup directory has the form `<proxy name>_backup`.
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.
Uninstall the Edge Encryption proxy on Linux

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute the shutdown.sh shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

Uninstall the Edge Encryption proxy on Windows

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute edgeencryption.bat stop
3. Execute edgeencryption.bat remove
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

Scheduled encryption jobs

If you have the security-admin role, you can schedule several different types of jobs to be performed by the Edge Encryption proxy.

You can schedule jobs for the following:

- Encrypting, decrypting, or re-encrypting data in a table field or attachments for a table.
- Repairing order tokens.
- Recreating the proxy database.

Running any of these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.

Schedule an encryption job

You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, the records are encrypted as they are saved to the instance.
Role required: security-admin

1. Navigate to Edge Encryption Configuration Encryption Configurations All.
2. Click the field that you want to schedule an encryption job for.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for any previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule an attachment encryption job

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Encryption Configurations All.
2. Click the table you want to schedule an encryption job for.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule a decryption job

You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

Note: You must mark the encryption record for the field as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Encryption Configurations All.
2. Click the field that you want to decrypt.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule an attachment decryption job

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

Note: You must mark the encryption record for the table as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Encryption Configurations All.
2. Click the table with the attachments that you want to decrypt.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.
Schedule a mass key rotation job

You can schedule a job to find data encrypted with old keys and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Maintenance Schedule Mass Key Rotation.
2. Fill in the fields on the form, as appropriate.

Schedule a single key rotation job

You can schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

Role required: security-admin

Before scheduling this job, make sure you update the default key in Edge Encryption Configuration Encryption Key Configuration Set Default Keys.

1. Navigate to Edge Encryption Configuration Maintenance Schedule Single Key Rotation.
2. Fill in the fields on the form, as appropriate.
Schedule an attachment key rotation job

You can schedule a job to find attachments encrypted using a specified key alias and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Maintenance Schedule Attachment Key Rotation.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Key Rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.
5. To run the job immediately, click Execute Now.

Schedule an order token repair job

You can schedule a job to find and repair fields where the order token is missing.

Role required: security-admin
Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.

1. Navigate to Edge Encryption Configuration Maintenance Schedule Order Token Repair.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Order Token Repair.</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimated Record Count.

Schedule a proxy-database recovery job

Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.

Role required: security-admin

1. Navigate to Edge Encryption Configuration Maintenance Schedule Database Recovery.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Database Recovery.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.

Edge Encryption monitoring

You can monitor sessions that use Edge Encryption proxies.
The instance tracks all encryption proxies. Each encryption proxy registers when it starts up. The instance is notified when:

- A new encryption proxy starts up.
- An encryption proxy is intentionally shut down.

If an encryption proxy attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.

All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click History List in the menu. The Mass Encryption Job file is not audited.

You can also monitor the following lists and files for information about your proxies:

<table>
<thead>
<tr>
<th>Table Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Configuration Diagnostics And</td>
<td>List of attempts to save the following data to encrypted fields:</td>

</tbody>
</table>

Edge Encryption logging

Edge Encryption logs information on the instance and on each proxy server.

You can view a log file listing all cases of when an attempt was made to save unencrypted data to an encrypted field. Navigate to Edge Encryption Configuration Diagnostics And Troubleshooting Invalid Insert Attempts. An administrator can trace back to why data was not saved.

There are encryption log files on each proxy server.
Encryption rules

It may be necessary to write encryption rules when you want to encrypt data passed as part of GET and POST requests to processors or APIs on the instance. You can create rules for mapping elements of fields in requests to Glide table-field names.

Edge Encryption uses encryption rules executed on the proxy to map fields in an HTTP request to fields in a table. Each encryption rule is composed of a condition and an action. The condition identifies the type of request, and the action performs the mapping from fields in the request to fields in a table.

A set of encryption rules is installed as part of the Edge Encryption plugin. These rules handle the core platform use cases such as editing a field from the list edit form, and updating a record from the record form, direct web services, and REST API. Applications created using standard forms and lists should work without custom encryption rules.

If you develop scripted processors, scripted web services, scripted REST APIs, UlS, or Ajax scripts that contain data that must be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

You must have the security-admin role to create a rule. The script is checked for compliance with JavaScript syntax before the rule is saved.

Except for attachment requests, each HTTP request goes through the process of executing the encryption rule conditions until either all conditions return false, or one condition returns true. When a condition returns true, the action part of the rule is run, and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions must be as specific as possible to avoid inadvertently satisfying the condition. If a generic condition for a rule is unavoidable, the rule should be marked with a high order value so that more specific rules are evaluated first.

Encryption rules are written using a combination of JavaScript and the Edge Encryption API that lets you easily iterate through post parameters, and JSON and XML content in the request body. The API uses expressions similar to XPath to navigate through both JSON and XML content.

The API uses stream parsing to parse JSON and XML data, so operations on the data in the action part of an encryption rule should process the data in one pass. Trying to fetch and parse the content of the request body multiple times may lead to unexpected results.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as current. Because the rules are created for HTTP POST and HTTP GET objects, a global request variable is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

Encryption rule conditions

Encryption rule conditions determine if the rule should be executed.

An encryption rule condition should return true if the rule is to handle the HTTP request; otherwise, it should return false. The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request.

The condition has access to these fields via the request object.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET or POST.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

An example:

```javascript
function SampleCondition(request) {
  if (endsWith(request.path, "/sample_processor.do")) {
    return true;
  }
  return false;
}
```

An example accessing a URL query string parameter:

```javascript
//Check if the property 'myParam' exists in the urlParams object.
if (request.urlParams.myParam) {
  var myParam = request.urlParams.myParam;
}
```

Encryption rule actions

An encryption rule action is responsible for mapping fields in an HTTP request to fields in a table. In addition to the fields available in the condition part of a rule, the action part of a rule has access to the JSON or XML content in the request.

POST parameters

POST parameters are part of the postParams object.

To access POST parameters in any part of an encryption rule, you get the postParams property from the request object. Each POST parameter is a property of the postParams object.

An example of accessing the postParams object in a string context. The parameter evaluates to the string representation of the value.

```javascript
if (request.postParams.myparam == "hello") {
  var paramValue = request.postParams.myparam;
}
```

An example of accessing the postParams object in a for loop.

```javascript
for (var paramName in request.postParams) {
  var paramValue = request.postParams[paramName];
}
```

XML content

You can access XML data from either a post parameter or from the HTTP request content.

You access XML data in a post parameter by calling request.postParams.<parameter name>.getAsXmlContent().

You access XML data in the request content by calling request.getAsXmlContent().

Calling either of these two functions returns an object of type XMLContent that provides methods to iterate over the XML content.

An example using an XMLContent object with the following XML.
To iterate through the XML, you can do the following.

```javascript
var xmlContent = request.getAsXmlContent();
// This outer loop will iterate over all record elements
for (var xmlElementIter = xmlContent.getIterator(/records/record);
xmlElementIter.hasNext(); ) {
  var xmlElement = xmlElementIter.next();
  // This inner look will iterate over all elements within each record element
  for (var childIter = xmlElement.getIteratorOverAllChildren();
childIter.hasNext(); ) {
    var childElement = childIter.next();
    var fieldname = childElement.getName();
  }
}
```

By calling `xmlContent.getIterator(/records/record)` you can iterate over the record elements by calling `hasNext()` to determine if there is another element with the path specified in the expression argument in the call to `getIterator()`. The `next()` method gives you the next element found matching the expression. An object of type `XMLElement` is returned.

**JSON content**

You can access JSON data from either a post parameter or the HTTP request content.

You access JSON content from a post parameter by calling `request.postParms.<parameter name>.getAsJsonContent()`.

You access JSON content from the HTTP request by calling `request.getAsJsonContent()`.

Calling either of the methods returns an object of type `JsonNode`. With a `JsonNode` object, you can easily iterate over the properties by calling `getIterator()` with an XPath-like expression.

An example using a `JsonNode` object with the following value.

```json
{
  records: [
    {
      name: 'Test Record 1',
      description: 'Test Record 1 Description'
    },
    {
      name: 'Test Record 1',
      description: 'Test Record 1 Description'
    }
  ]
}
```

To iterate through the JSON, you can do the following.

```javascript
var jsonContent = request.getAsJsonContent();
//Get the table name from a URL parameter
var tableName = request.urlParams.tableName;

// This outer loop iterates over all elements in the records array
for (var jsonNodeIter = jsonContent.getIterator('/records');
jsonNodeIter.hasNext(); ) {
```
var jsonNode = jsonNodeIter.next();
// This inner loop iterates over all child elements in an object in the
// records array
for (var propertyIter = jsonNode.iterator(); propertyIter.hasNext(); ) {
  var property = propertyIter.next();
  var propertyName = property.getName();

  //The valueFor method replaces the value of the 'current' element with
  //an encrypted
  //value if the field in the table provided as arguments is marked as
  //encrypted. Otherwise,
  //it leaves the value as-is.
  property.valueFor(tableName, propertyName);
}

Error handling

When a rule throws an exception, the proxy disables the rule.

If an encryption rule condition or action throws an exception, the exception is caught and the encryption
rule is disabled. The proxy continues to evaluate the remaining rules in order as if the rule that threw the
exception is not present. The exception is logged in the localhost log with a stack trace identifying the
root cause of the problem.

request API

The request object is a global object available in Edge Encryption rule action scripts.

`request.getEncodedQueryFor(String tableName)`

Specifies that the value of the parameter is an encoded query for the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter represents an
encoded query for the specified table. The proxy parses the encoded query and encrypts the values for
fields in the encoded query that must be encrypted.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Table 130: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>tableName</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 131: Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

This example is from the List Request encryption rule.

```javascript
function ListRequestAction(request) {
  var path = request.path;
  var tableNameEndIndex = path.indexOf("_list.do");
  var tableName = path.substring(1, tableNameEndIndex);
  request.urlParams.sysparm_query.encodedQueryFor(tableName);
}
```

and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
request.valueFor(String tableName, String fieldName)

Identifies that the parameter maps to the specified field in the specified table.

Calling this function on a parameter value tells the proxy that the value for this parameter maps to the specified field in the specified table. The proxy then decides if the field must be encrypted.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Table 133: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the Form Post encryption rule.

```javascript
function FormPostAction(request) {
    var tableName = request.postParams.sys_target;
    for (var paramName in request.postParams) {
        var fieldName = paramName.replace("sys_display.original.", "");
        fieldName = fieldName.replace("sys_original.", "");
        fieldName = fieldName.replace("sys_display.", "");
        fieldName = fieldName.replace(tableName + ".", ";
        request.postParams[paramName].valueFor(tableName, fieldName);
    }
}
```

request.getAsJsonContent()

Returns the request as an object of type JsonNode.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 135: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request.</td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
    var urlArray = request.path.split('/');
    var tableName = urlArray[urlArray.length - 1];
```
```javascript
if (request.urlParams && request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
}

var jsonContent = request.getAsJsonContent();
for (var jsonElementItr = jsonContent.iterator();
     jsonElementItr.hasNext(); ) {
    var jsonElement = jsonElementItr.next();
    jsonElement.valueFor(tableName, jsonElement.getName());
}

request.getAsXmlContent()
Returns the request content as an object of type XMLContent.
This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
    var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter = xmlContent.getIterator('record_update');
         xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
             xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            for (var xmlFieldIter = xmlRecord.getIterator('field');
                 xmlFieldIter.hasNext(); ) {
                var xmlField = xmlFieldIter.next();
                var fieldName = xmlField.getAttributeValue('name');
                for (var childIter = xmlField.getIteratorOverAllChildren();
                     childIter.hasNext(); ) {
                    var childElement = childIter.next();
                    childElement.valueFor(tableName, fieldName);
                }
            }
        }
    }
}
```

JsonNode API
The JsonNode class is available in Edge Encryption rule action scripts.
You get a JsonNode object by calling the next() method of a JsonNodeIterator object.

```
JsonNode - getIterator(String xPath)
```

Returns a JsonNodeIterator object for the JSON content.

This method is available only in an Edge Encryption rule action script.

---

Note: This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the iterator() method.

---

### Table 138: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An XPath expression.</td>
</tr>
</tbody>
</table>

### Table 139: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

```
JsonNode - iterator()
```

Returns a JsonNodeIterator object that iterates over all child nodes of the current node.

This method is available only in an Edge Encryption rule action script.

---

### Table 140: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 141: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
    var urlArray = request.path.split('/');
    var tableName = urlArray[urlArray.length - 1];

    if (request.urlParams && request.urlParams.sysparm_query) {
        request.urlParams.sysparm_query.encodedQueryFor(tableName);
    }

    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.iterator();
        jsonElementItr.hasNext(); ) {
        var jsonElement = jsonElementItr.next();
```
jsonElement.valueFor(tableName, jsonElement.getName());
}
}

**JsonNode - getAsString(String propertyName)**

Returns the string value of the specified property.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value.</td>
</tr>
</tbody>
</table>

**JsonNode - getName()**

Returns the name of the current JSON node.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the JSON node.</td>
</tr>
</tbody>
</table>

**JsonNode - valueFor(String tableName, String fieldName)**

Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted.

This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------</td>
<td>--------------------------------------</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Table 147: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
  var urlArray = request.path.split('/');
  var tableName = urlArray[urlArray.length - 1];

  if (request.urlParams && request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
  }

  var jsonContent = request.getAsJsonContent();
  for (var jsonElementItr = jsonContent.iterator(); jsonElementItr.hasNext(); ) {
    var jsonElement = jsonElementItr.next();
    jsonElement.valueFor(tableName, jsonElement.getName());
  }
}
```

`JsonNode - encodedQueryFor(String tableName)`

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on a JSON node tells the proxy that the value is an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

Table 148: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>A table name.</td>
</tr>
</tbody>
</table>

Table 149: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
  var urlArray = request.path.split('/');
  var tableName = urlArray[urlArray.length - 1];

  if (request.urlParams && request.urlParams.sysparm_query) {
    request.urlParams.sysparm_query.encodedQueryFor(tableName);
  }
}
JsonNodeIterator API

The JsonNodeIterator class is available in Edge Encryption rule action scripts.

You get an JsonNodeIterator object by calling the getIterator() or iterator() methods of the JsonNode class.

**JsonNodeIterator - hasNext()**
Determines if there is another property available.
This method is available only in an Edge Encryption rule action script.

<table>
<thead>
<tr>
<th>Table 150: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 151: Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Boolean</td>
</tr>
</tbody>
</table>

This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
    var urlArray = request.path.split('/');
    var tableName = urlArray[urlArray.length - 1];

    if (request.urlParams && request.urlParams.sysparm_query) {
        request.urlParams.sysparm_query.encodedQueryFor(tableName);
    }

    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.iterator();
        jsonElementItr.hasNext(); ) {
        var jsonElement = jsonElementItr.next();
        jsonElement.valueFor(tableName, jsonElement.getName());
    }
}
```

**JsonNodeIterator - next()**
Returns the next property in the iterator.
This method is available only in an Edge Encryption rule action script.
This example is from the REST JSON encryption rule.

```javascript
function RESTJSONAction(request) {
    var urlArray = request.path.split('/');
    var tableName = urlArray[urlArray.length - 1];

    if (request.urlParams && request.urlParams.sysparm_query) {
        request.urlParams.sysparm_query.encodedQueryFor(tableName);
    }

    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.iterator();
         jsonElementItr.hasNext(); ) {
        var jsonElement = jsonElementItr.next();
        jsonElement.valueFor(tableName, jsonElement.getName());
    }
}
```

**XMLContent API**

The XMLContent class is a global object available in Edge Encryption rule action scripts.

*XMLContent - getIterator()*

Returns an XMLElementIterator object for the XML content.

This method is available only in an Edge Encryption rule action script.

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
    var xmlContent =
        request.postParams.sysparm_xml.getAsXmlContent();
```
for (var xmlElementIter = xmlContent.getIterator('record_update'); xmlElementIter.hasNext(); ) {
  var xmlElement = xmlElementIter.next();
  var tableName = xmlElement.getAttributeValue('table');
  for (var xmlRecordIter = xmlElement.getIterator('record'); xmlRecordIter.hasNext(); ) {
    var xmlRecord = xmlRecordIter.next();
    for (var xmlFieldIter = xmlRecord.getIterator('field'); xmlFieldIter.hasNext(); ) {
      var xmlField = xmlFieldIter.next();
      var fieldName = xmlField.getAttributeValue('name');
      for (var childIter = xmlField.getIteratorOverAllChildren(); childIter.hasNext(); ) {
        var childElement = childIter.next();
        childElement.valueFor(tableName, fieldName);
      }
    }
  }
}

XMLContent - getIterator(String xPath)
Returns an XMLElementIterator object for the XML content based on the specified parameter.
This method is available only in an Edge Encryption rule action script.

Table 156: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An XPath-like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>

Table 157: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update'); xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record'); xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
      for (var xmlFieldIter = xmlRecord.getIterator('field'); xmlFieldIter.hasNext(); ) {
        var xmlField = xmlFieldIter.next();
        var fieldName = xmlField.getAttributeValue('name');
        for (var childIter = xmlField.getIteratorOverAllChildren(); childIter.hasNext(); ) {
          var childElement = childIter.next();
          childElement.valueFor(tableName, fieldName);
        }
      }
    }
  }
}
for (var childIter = xmlField.getIteratorOverAllChildren();
    childIter.hasNext(); ) {
    var childElement = childIter.next();
    childElement.valueFor(tableName, fieldName);
}

XMLElementIterator API

The XMLElementIterator class is available in Edge Encryption rule action scripts.

You get an XMLElementIterator object by calling the getIterator() method of the XMLContent class.

XMLElementIterator - hasNext()

Determines if there is another element available.

This method is available only in an Edge Encryption rule action script.

Table 158: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 159: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

function ListEditAction(request) {
    var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter = xmlContent.getIterator('record_update');
        xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
            xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            for (var xmlFieldIter = xmlRecord.getIterator('field');
                xmlFieldIter.hasNext(); ) {
                var xmlField = xmlFieldIter.next();
                var fieldName = xmlField.getAttributeValue('name');
                for (var childIter = xmlField.getIteratorOverAllChildren();
                    childIter.hasNext(); ) {
                    var childElement = childIter.next();
                    childElement.valueFor(tableName, fieldName);
                }
            }
        }
    }
}
XMLElementIterator - next()

Returns the next element in the iterator.

This method is available only in an Edge Encryption rule action script.

Table 160: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 161: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
    var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter = xmlContent.getIterator('record_update');
        xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
            xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            for (var xmlFieldIter = xmlRecord.getIterator('field');
                xmlFieldIter.hasNext(); ) {
                var xmlField = xmlFieldIter.next();
                var fieldName = xmlField.getAttributeValue('name');
                for (var childIter = xmlField.getIteratorOverAllChildren();
                    childIter.hasNext(); ) {
                    var childElement = childIter.next();
                    childElement.valueFor(tableName, fieldName);
                }
            }
        }
    }
}
```

XMLElement API

The XMLElement class is available in Edge Encryption rule action scripts.

You get an XMLElement object by calling the next() method of an XMLElementIterator object.

XMLElement - getIterator(String xPath)

Returns an XMLElementIterator object for the XML element based on the specified parameter.

This method is available only in an Edge Encryption rule action script.
Table 162: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An XPath-like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>

Table 163: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update');
    xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
      xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
      for (var xmlFieldIter = xmlRecord.getIterator('field');
        xmlFieldIter.hasNext(); ) {
        var xmlField = xmlFieldIter.next();
        var fieldName = xmlField.getAttributeValue('name');
        for (var childIter = xmlField.getIteratorOverAllChildren();
          childIter.hasNext(); ) {
          var childElement = childIter.next();
          childElement.valueFor(tableName, fieldName);
        }
      }
    }
  }
}
```

`XMLElement - getIteratorOverAllChildren()`

Returns an XMLElementIterator object that includes all subelements for the XML element based on the specified parameter.

This method is available only in an Edge Encryption rule action script.

Table 164: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Table 165: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that will iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.

```javascript
function ListEditAction(request) {
  var xmlContent = request.postParams.sysparm_xml.getAsXmlContent();
  for (var xmlElementIter = xmlContent.getIterator('record_update');
    xmlElementIter.hasNext(); ) {
    var xmlElement = xmlElementIter.next();
    var tableName = xmlElement.getAttributeValue('table');
    for (var xmlRecordIter = xmlElement.getIterator('record');
      xmlRecordIter.hasNext(); ) {
      var xmlRecord = xmlRecordIter.next();
      for (var xmlFieldIter = xmlRecord.getIterator('field');
        xmlFieldIter.hasNext(); ) {
        var xmlField = xmlFieldIter.next();
        var fieldName = xmlField.getAttributeValue('name');
        for (var childIter = xmlField.getIteratorOverAllChildren();
          childIter.hasNext(); ) {
          var childElement = childIter.next();
          childElement.valueFor(tableName, fieldName);
        }
      }
    }
  }
}
```

**XMLElement - valueFor(String tableName, String fieldName)**

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then decides if the field must be encrypted.

This method is available only in an Edge Encryption rule action script.

### Table 166: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

### Table 167: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example is from the List Edit encryption rule.
function ListEditAction(request) {
    var xmlContent =
        request.postParams.sysparm_xml.getAsXmlContent();
    for (var xmlElementIter =
        xmlContent.getIterator('record_update');
        xmlElementIter.hasNext(); ) {
        var xmlElement = xmlElementIter.next();
        var tableName = xmlElement.getAttributeValue('table');
        for (var xmlRecordIter = xmlElement.getIterator('record');
            xmlRecordIter.hasNext(); ) {
            var xmlRecord = xmlRecordIter.next();
            for (var xmlFieldIter = xmlRecord.getIterator('field');
                xmlFieldIter.hasNext(); ) {
                var xmlField = xmlFieldIter.next();
                var fieldName = xmlField.getAttributeValue('name');
                for (var childIter = xmlField.getIteratorOverAllChildren();
                    childIter.hasNext(); ) {
                    var childElement = childIter.next();
                    childElement.valueFor(tableName, fieldName);
                }
            }
        }
    }
}

XMLElement.encodeQueryFor(String tableName)
Specifies that the value of the element is an encoded query for the specified table.
Calling this function on an element tells the proxy that the value of the element is an encoded query for

This method is available only in an Edge Encryption rule action script.

Table 168: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>A table name.</td>
</tr>
</tbody>
</table>

Table 169: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XMLElement.getName()
Returns the element name.
This method is available only in an Edge Encryption rule action script.

Table 170: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 171: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

**XMLElement** - `getAttributeValue(String attribute)`

Returns the value of the specified attribute.

This method is available only in an Edge Encryption rule action script.

Table 172: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

Table 173: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

**Global methods**

Several global methods can be used in encryption rules.

`print(String message)`

Prints a message to the wrapper log file: `<proxy server directory>/logs/wrapper_.<date>.log`.

This method is available only in an Edge Encryption rule action script.

Table 174: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Table 175: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

`endsWith(String toMatch)`

Determines if the string ends with the specified string.

This method is available only in an Edge Encryption rule action script.
Table 176: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>toMatch</td>
<td>String</td>
<td>The string to match.</td>
</tr>
</tbody>
</table>

Table 177: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the specified string matches the end of the target string.</td>
</tr>
</tbody>
</table>

This example is from the Vacation encryption rule condition.

```javascript
function VacationCondition(request) {
  if (endsWith(request.path, '/service_catalog.do') &&
      request.postParams.sysparm_action == 'execute_producer' &&
      request.postParams.sysparm_id ==
      'c322301653a33100c0eca5f4a11c084d')
    return true;
  return false;
}
```

`string.replace(String old, String new)`

Creates a new string by replacing an existing sub-string with a new sub-string.

This method is available only in an Edge Encryption rule action script.

Table 178: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old</td>
<td>String</td>
<td>The sub-string to be replaced.</td>
</tr>
<tr>
<td>new</td>
<td>String</td>
<td>The sub-string replacing the old sub-string.</td>
</tr>
</tbody>
</table>

Table 179: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The string with the new sub-string.</td>
</tr>
</tbody>
</table>

Prohibited keywords

The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

Table 180: Prohibited keywords

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
</tbody>
</table>
Dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields.

To set a Edge Encryption dictionary attribute to true, you must enter attribute=true in the Attributes field. To add a dictionary attribute to a record, see Dictionary attributes.

Table 181: Edge Encryption dictionary attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Target element</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>

<td>(sys_encryption_proxy_key)</td>
<td></td>
</tr>
</tbody>
</table>

Properties Installed with Edge Encryption

Properties

Edge Encryption adds the following properties.
Note: To open the System Properties (sys_properties) table, enter sys_properties.list in the navigation filter.

### Table 183: Properties for Edge Encryption

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.edge.pattern.disallowed.chars | A list of characters that are not allowed in patterns.  
  - Type: a string of a comma-separated list of values  
  - Location: System Properties (sys_properties) table |
| glide.edge.pattern.min.size | The minimum pattern size allowed. Allowing smaller patterns means finding more matches, which increases overhead.  
  - Type: number  
  - Default value: 5  
  - Location: System Properties (sys_properties) table |
| sn_edge_encryption.logging.destination | Where log messages are to go.  
  - Type: string  
  - Default value: file  
  - Location: System Properties (sys_properties) table |
| sn_edge_encryption.logging.verbosity | The logging level to use.  
  - Type: string  
  - Default value: info  
  - Location: System Properties (sys_properties) table |
| sn_edge_encryption.encryption.proxy.buildtag | The proxy version.  
  - Type: string  
  - Default value: 2.0.0  
  - Location: System Properties (sys_properties) table |
| sn_edge_encryption.cleartext.allowed | When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.  
  - Type: Boolean  
  - Default value: false  
  - Location: System Properties (sys_properties) table |
Roles installed with Edge Encryption

<tr>
<td>edge_encryption</td>
<td>Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.</td>
<td>None</td>
</tr>
</tbody>
</table>

Notifications

Notifications keep users informed of events that concern them. The system can notify users by email, SMS text message, or push notification.

What’s new

- Email and notifications release notes

Email

- Basic email setup
- Advanced email setup
- Create an email notification
- The email client
- System mailboxes
- Inbound email actions

Push Notifications

- Set up push notifications for the ServiceNow mobile app
- Set up push notifications for a custom push app
- Push notifications

Subscription-based notifications

- Set up a notification device
- Add personal subscriptions
- Modify notifications for a specific user device

Troubleshoot and get help

- Ask or answer questions in the Notifications community
- Search the HI knowledge base for known error articles
- Contact ServiceNow Support

Email notifications

Use email notifications to send selected users email about specific activities in the system, such as updates to incidents or change requests.

If you want to change how the instance processes incoming email, see Inbound email actions.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
• Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
• To prevent broken links, items like images and incidents, that are linked with URLs relative to a particular instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

Note: The rich HTML format is the default for all new email notifications.

See the Email logs for examples of what you might see if a notification or inbound email action is not processed.

Note: Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

Email setup

All email notifications use the email properties that you define and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

Email properties

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email service size restrictions

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

• Standard email configurations – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

• Alternate email configurations – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.
Email service availability

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post *Whitelisting emails sent from the ServiceNow infrastructure* by a ServiceNow Technical Support Engineer in the ServiceNow Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in *Email notifications*.

Instance-to-instance communication via email

Use *Web services* to communicate between two instances.

Basic email setup

All production instances can send and receive email using ServiceNow-provided resources.

Basic email offers the following services and features:

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.
- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

*Configure standard email using SMTP and POP3*

The standard email configuration uses the SMTP and POP3 services provided by ServiceNow.

Role required: admin

1. Navigate to System Properties Email.
2. Configure these email properties and click Save.

Table 185: Email Property Descriptions

<table>
<thead>
<tr>
<th>Property section</th>
<th>System property</th>
<th>Label</th>
<th>Setting required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Mail Server</td>
<td>glide.email.smtp.active</td>
<td>Mail sending enabled.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Network layout basic email

Basic email uses ServiceNow-provided mail servers and email accounts. The instance has an email address of instance@service-now.com.
Figure 110: Standard email configuration
Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both. Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

Configure standard email using your own address or domain

You can use the standard email infrastructure with your own internal email address.

Role required: admin

1. Navigate to System Properties Email.
2. Configure the following email properties and click Save.

<table>
<thead>
<tr>
<th>Property Section</th>
<th>System Property</th>
<th>Label</th>
<th>Setting Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Mail Server</td>
<td>glide.email.smtp.active</td>
<td>Mail sending enabled.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

3. Set up a forward on your internal email architecture. For example, forward mail sent to helpdesk@company.com to instance@service-now.com.

Configure alternate email using your own SMTP server

You can set up an alternate email configuration using your own SMTP server.

Role required: admin

1. Navigate to System Properties Email.
2. Configure these email properties and click Save.

<table>
<thead>
<tr>
<th>Property Section</th>
<th>System Property</th>
<th>Label</th>
<th>Setting Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Mail Server</td>
<td>glide.email.smtp.active</td>
<td>Email sending enabled.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Configure alternate email configuration using your own POP3 server

You can set up an alternate email configuration using your own POP3 server.

Role required: admin

1. Navigate to System Properties Email.
2. Configure these email properties and click Save.
3. Verify the Incoming Mail Server displays a Connection Successful message.

**Configure alternate email configuration using your own SMTP and POP3 servers**
You can set up an alternate email configuration using your own internal SMTP and POP3 servers.

Role required: admin
1. Navigate to System Properties Email.
2. Configure these email properties and click Save.

Table 189: Email property descriptions

<table>
<thead>
<tr>
<th>Property Section</th>
<th>System Property</th>
<th>Label</th>
<th>Setting Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Mail Server</td>
<td>glide.email.smtp.active</td>
<td>Email sending enabled.</td>
<td>Yes</td>
</tr>
<tr>
<td>Incoming Mail Server</td>
<td>glide.email.read.active</td>
<td>Email receiving enabled</td>
<td>Yes</td>
</tr>
</tbody>
</table>

3. Verify you receive a Connection Successful message for the Outgoing Mail Server.

**OAuth email authentication**

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

---

**Note:** Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See [Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API](#) for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see [OAuth 2.0](#) for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

Role required: admin
1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Enable OAuth 2.0 for email

   Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.

   • Role required: admin
   • Plugin required: Email - OAUTH support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   • client ID
   • client secret
   • authorization URL
   • token URL
   • redirect URL
   • token revocation URL
3. Navigate to System OAuth Application Registry.
4. Click New.
5. Click Connect to a third party OAuth Provider to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form. See Use a third-party OAuth provider for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
7. Click Submit.
8. Navigate to System Mailboxes Administration Email Accounts. The system displays the list of available email accounts.
9. If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change Active to false.

   The system can receive email from multiple POP3 email accounts.
10. Locate the records for ServiceNow SMTP and change Active to false.
11. Click New.
   The system displays a blank Email Account form.

12. Create an email account record for your OAuth 2.0 SMTP server where the Type is SMTP.

13. For Authentication, select OAuth 2.0.

14. For OAuth Profile, select the application registry record you created.

15. Click Authorize Email Account Access to obtain the access and refresh tokens.
   Another browser window opens asking you to authorize the account access on the third-party email account.

16. Authorize the access.
   After the authorization is successful and the tokens are saved to the instance, the Authorize Email Account Access button no longer appears on the Email Account form.

17. Click New.
   The system displays a blank Email Account form.

18. Create an email account record for your OAuth 2.0 IMAP server where the Type is IMAP.
   Use the same Authentication and OAuth profile settings as the OAuth SMTP email account.

**Network layout email forwarding**
You can use your own SMTP server to forward email sent to a custom email address to the actual instance email address.

Typically, organizations use a custom email address to change the reply-to address from the instance name to a custom email address within their domain. This configuration requires an SMTP server in your internal email architecture to forward email sent to your custom email address to the actual instance email address. Implement a spam filter on your custom email address to prevent unwanted mail from triggering actions on your instance.
**Network layout using your own SMTP server**

You can use your own SMTP server to send email to and from your instance.

This layout bypasses the ServiceNow-provided SMTP server normally used to send email from your instance.

Send
Email accounts

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

Note: The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the sys_email_account table. Create separate email accounts to send and receive email. Use email properties to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address instance@service-now.com. Likewise, the ServiceNow SMTP server sends email from the address instance@service-now.com. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.
Configure an email account

You can create email accounts in addition to the accounts provisioned for you.

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
- IMAP

1. Navigate to System Mailboxes Administration Email Accounts.
2. Click New.
3. Fill in the fields on the form (see table).
4. Click Submit.
5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

<table>
<thead>

Email properties

The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

- System Mailboxes Email Properties
- System Properties Email Properties
## Email Properties

Email accounts can be created or modified in the Email Accounts table. Email account connection status and diagnostics information can be found on the Email Diagnostics page.

### Outbound Email Configuration

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.smtp.default_retry  | Resend email when server returns unknown SMTP error codes. | Enables (true) or disables (false) resending email when an unknown SMTP error code is encountered. The instance only recognizes the SMTP error codes defined in the glide.smtp.defer_retry_ids property.  
  - Type: true | false  
  - Default value: true |
| glide.ui.activity.email_roles | Roles that can view email in the Activity formatter when including “Sent/Received Emails” | Specifies the comma-separated list of roles that can view email in the activity formatter.  
  - Type: string  
  - Default value: itil |
| glide.email.journal.lines | Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all). | Specifies the number of entries from a journal field, such as Additional comments or Work notes, included in email notifications. A value of -1 includes all journal entries.  
  - Type: integer  
  - Default value: 3  
  - Learn More: Restrict the Number of Entries Sent in a Notification |

**Inbound mail configuration**

The Inbound Mail Configuration section of the Email Properties page contains properties to control inbound email.
### Inbound Email Configuration

| Email receiving enabled | ![Yes | No] |
|-------------------------|---------|
| Identify email as a reply by these subject prefixes | `re;,aw;,r;,Accepted;,Tentative;,Declined:` |
| Identify email as a forward by these subject prefixes | `fw;,fwd:` |
| Discard everything below this text if found in a reply body (comma separated, case sensitive) | `\n\n----Original Message----,\n\n _____ \n\nFrom:` |
| Ignore email with these headers (comma separated name:value pairs) | `X-ServiceNow-Spam-Flag:YES,X-ServiceNow-Virus:INFECTED,Auto-Subn` |
| Ignore email when subject starts with text (comma separated, case insensitive) | `out of office autoreply, undeliverable:, delivery failure:, returned mail:, au` |
| Ignore email from these senders. Use the name before the @ sign. (comma-separated) | `mailer-daemon, postmaster` |
| Automatically create users for incoming emails from trusted domains | ![Yes | No] |
| Default password for users created from email sent from trusted domains. (must reset upon login) | `password` |
Table 191: Inbound email properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.read.active   | Email receiving enabled                         | Specifies whether to enable or disable the inbound mail server.  
  - Type: true | false  
  - Default value: true |                                                                                                                                                                                                       |
| glide.email.reply_subject_prefix | Identify email as a reply by these subject prefixes | Specifies the comma-separated list of prefixes in the subject line that identify an email reply.  
  - Type: string  
  - Default value: re:, aw:, r:, Accepted:, Tentative: Declined:  
  Note: The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on. |                                                                                                                                                                                                       |
| glide.email.forward_subject_prefix | Identify email as a forward by these subject prefixes | Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email.  
  - Type: string  
  - Default value: fw:, fwd: |                                                                                                                                                                                                       |
  Note: The case of the forward prefix in the email, for example fw:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Fwd: prefix and only fwd: is defined in the property, the email will not be recognized as a forward. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as FWD:, Fwd:, and so on. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.pop3.reply_separators | Discard everything below this text if found in a reply body (comma separated, case sensitive) | Specifies the comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case sensitive.  
  - Type: string  
  - Default value: 

    

    | Original Message | From: |
|---------------------|-------|
| | | |
| glide.pop3.ignore_headers | Ignore email with these headers (comma separated name : value pairs) | Specifies the comma-separated list of email headers that cause the instance to ignore an email message. Use the format name : value to specify email header types and values. You can use a wildcard (*) for the subtype. For example, Content-Type: multipart/*; report-type=delivery-status; ignores emails containing a type of multipart and a value of report-type=delivery-status. For syntax specifications, see http://www.w3.org/Protocols/rfc1341/4_Content-Type.html.  
  - Type: string  

Note: If the Email Filters plugin is activated, the Ignore header email filter overrides this property. The property does not appear on the Mail Properties page when email filters are enabled.
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.pop3.ignore_subjects | Ignore email when subject starts with text (comma separated, case insensitive) | Specifies the comma-separated list of strings that cause the instance to ignore an email message if the string is present at the start of a subject line. These values are not case sensitive.  
  - Type: string  
  - Default value: out of office autoreply, undeliverable:, delivery failure:, returned mail:, autoreply  
  
  Note: If the Email Filters plugin is activated, the Ignore subject email filter overrides this property. The property does not appear on the Mail Properties page when email filters are enabled |
| glide.pop3.ignore_senders | Ignore email from these senders. Use the name before the @ sign. (comma-separated) | Specifies the comma-separated list of senders that cause the instance to ignore an email message. Enter only the name before the at sign (@).  
  - Type: string  
  - Default value: mailer-daemon, postmaster  
  
  Note: If the Email Filters plugin is activated, the Ignore sender email filter overrides this property. The property does not appear on the Mail Properties page when email filters are enabled |
| glide.pop3readerjob.create_caller | Automatically create users for incoming emails from trusted domains | Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to true, the instance creates a new user record for the email address and places that new user in the Caller field of any tickets created. If the property is set to false, the instance places Guest in the Caller field of any tickets created.  
  - Type: true | false  
  - Default value: false  
  - Learn More: Enabling Automatic User Creation |

</tr>
</tbody>
</table>

**Additional email properties**

There are several advanced email properties that you can use to fine tune the way your instance sends or receives email.

You must add these properties to the System Property (sys_properties) table before they can be used to overwrite the defaults.

Table 192: Additional properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.email.max_body_bytes</td>
<td>Sets the maximum body size in bytes allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1048576</td>
</tr>
<tr>
<td>com.glide.email.max_read</td>
<td>Specifies the maximum number of emails a POP3 reader should process concurrently.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 20</td>
</tr>
<tr>

<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| glide.email.inbound.calendar_behavior | Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):  
  • Attach: Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.  
  • Ignore: Discard the calendar data.  
  • Inline: Store the calendar data as text in the email Body field.  
  • Type: string  
  • Default value: Attach |
| glide.email.inbound.convert_html_inline_attachment_references | Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.  
  • Type: true | false  
  • Default value: true |
| glide.email.inbound.max_attachment_count | Sets the maximum number of attachments allowed per inbound email. This property is available starting with the Eureka Patch 4 release.  
  • Type: integer  
  • Default value: 30  
  • Location: System Property (sys_properties) table |
| glide.email.inbound.max_total_attachment_size_bytes | Sets the maximum total attachment size in bytes allowed per inbound email. This property is available starting with the Eureka Patch 4 release.  
  • Type: integer  
  • Default value: 18874368  
  • Location: System Property (sys_properties) table |
| glide.email.mail_to | Specifies the email address for sending notifications that use the ${mailto:} variable.  
  • Type: string  
  • Default value: value of glide.email.user property |
| glide.email.name_split | Specifies the delimiter used between first and last names in an email address. For example, a delimiter of “.” (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.  
  • Type: string  
  • Default value: period (.) |
<table>

</table>
| glide.smtp.timeformat             | Specify the time format to use for outgoing email notifications.  
  - Type: string  
  - Default value: time format listed in email sender’s user record (sys_user.time_format) |
| glide.smtp.tls                    | Use the glide.smtp.encryption property in the Outgoing Mail Server section of the Mail Properties page to specify how to encrypt communications with the SMTP server.  
  - Type: true | false  
  - Default value: false |
| glide.ui.activity.email.use_display | Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.  
  - Type: true | false  
  - Default value: false |
| glide.ui.email_client.email_address.disambiguator | Sets the columns from the User (sys_user) table that the autocomplete list displays. Separate each column name with a semicolon character (;).  
  - Type: string  
  - Default value: name  
  - Learn more: Displaying Additional Information in the Email Client Autocomplete |
| glide.ui.incident_activity.max_addresses | Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).  
  - Type: string  
  - Default value: 5 |
| NotifyAffectedCI.max_rel_level    | Sets a value used by the Affected ci notifications business rule, which notifies subscribers when configuration items (CIs) are affected by tasks. The business rule generates notifications for parent CIs up to the level defined by this property. You might need to adjust the property value according to the complexity and depth of your CI relationships.  
  - Type: integer  
  - Default value: 5 |

**Deprecated mail server properties**

In previous releases, you could configure email accounts from the Email Properties page.
Starting with the Geneva release, you must configure email accounts from the System Mailboxes Email Accounts module. Properties related to email accounts are deprecated. The same functionality in these deprecated properties is configured on the Email Account form.

Properties deprecated in the Geneva release

- SMTP mail server (glide.email.server)
- SMTP account (glide.email.user)
- Outgoing mail display name (glide.email.username)
- SMTP account password (glide.email.user_password)
- POP3 mail server (glide.pop3.server)
- POP3 account (glide.pop3.user)
- POP3 account password (glide.pop3.password)
- POP3 server port (110) (glide.pop3.port)
- Connect to POP3 server using SSL encryption (glide.pop3.secure)
- SMTP server requires username and password authentication (glide.smtp.auth)
- SMTP server port (25) (glide.smtp.port)
- SMTP Encryption (glide.smtp.encryption)
- [Legacy] TLS security for SMTP (glide.smtp.tls)

Email logs

The email log records all email notifications sent from all instances within the system.

This is a verbose and unfiltered view of email. For a more detailed view, see the System Mailbox application.

This log provides the following information for all notifications.

Table 193: Email log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox to use for filtering the email notifications displayed.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the notification (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email notification (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **Type**                    | The status of the email notification. Choices are:  
|                             | • received: The server received this email.  
|                             | • received - ignored: The server received this  
|                             |   email, but it was ignored by the instance for  
|                             |   inbound email action purposes. Typically, these  
|                             |   emails are either spam or auto-replies. See the  
|                             |   Error String field for details.  
|                             | • send - failed: The server has attempted to send  
|                             |   the email and failed. See the Error String field  
|                             |   for details.  
|                             | • send - ignored: The server skipped sending this  
|                             |   email. Typically, this is for an email which was  
|                             |   generated but lacked a recipient email address or  
|                             |   is a duplicate email. See the Error String field  
|                             |   for details.  
|                             | • send - ready: The email is ready to be sent,  
|                             |   but has not been sent out by the mail server.  
|                             |   Typically, an email remains in this state for only  
|                             |   a short time.  
|                             | • sent: The email was sent by the instance without  
|                             |   any errors or issues. |
| **Target**                  | A Document ID reference to the record if the email  
|                             |   is generated by an insert, update, or delete of a  
|                             |   particular record. |
| **User**                    | The name of the user, from the user record, of the  
|                             |   instance from which the email notification was sent.  
|                             | Note: This is a string field. |
| **Notification Type**       | The type of notification. Choices are:  
|                             | • None  
|                             | • SMS  
|                             | • SMTP |
| **UID**                     | The unique ID for the server. |
| **Created**                 | The date and time of the email activity for the locale  
|                             |   of the machine running the instance. |
| **Deleted**                 | An indication of whether the email was deleted from  
|                             |   an instance mailbox. |
| **Weight**                  | The weight of the email, which determines the  
|                             |   sending priority relative to other notifications on the  
|                             |   same table. |
| **Importance**              | An indication that the email was sent with a changed  
|                             |   level of importance, such as Urgent. |
| **Originating Event and Notification** | An embedded list that stores the event and notification that initiated the email notification. For more information, see [Events](#). |
| **Subject**                 | A configured description of the action that generated  
|                             |   the email notification. You create the subject  
<p>|                             |   text for notifications in <a href="#">System Notification Email Notifications</a>. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email address of the recipient of each notification.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

Invalid email addresses that the instance strips out of outbound email messages are logged, starting with the Geneva release.

**Email size limits**

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

Administrators can modify the maximum values using properties.

**Note:** The system cannot send or receive emails that exceed the maximum email size, even if one or more properties are configured to allow bigger attachments.

**Message body size limit properties**

Several properties enforce the maximum email body size allowed for inbound and outbound emails.

**Properties**

In some situations, an email message may contain more information in the body than the system can process, especially when string searches and regular expressions are used. By default, the system can process only up to 16 MB worth of information in the email body and body_text fields (8 MB each). If the email body exceeds this limit, the system truncates the body text.

Users with the admin role can configure the following properties to control email body size limits. The properties can be added to the System Property (sys_properties) table. Neither property should exceed the system limit of 16 MB. Setting either of the following properties to an excessively large value may cause performance issues.

**Table 194: Message body size limit properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.email.max_body_bytes</td>
<td>Sets the maximum body size in bytes allowed per inbound email. Ensure that the sum of this property and the glide.email.inbound.max_total_attachment_size_bytes property is well below the maximum total email size.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1048576</td>
</tr>
</tbody>
</table>
### glide.email.outbound.max_body_bytes

Sets the maximum body size in bytes allowed per outbound email. Ensure that the sum of this property and the glide.email.outbound.max_total_attachment_size_bytes property is well below the maximum total email size.

- **Type:** integer
- **Default value:** 1048576

#### Note:
A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.

### Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the com.glide.email.max_body_bytes property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

  Email set to receive-ignored because its size exceeds the value set in com.glide.email.max_body_bytes. 1995 character(s) were truncated from the body field.

### Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the glide.email.outbound.max_body_bytes property. When the body size exceeds the configured value:

- The system does not send the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

  Email set to send-ignored because its size exceeds the value set in glide.email.outbound.max_body_bytes. 1337 character(s) were truncated from the body field.

### Attachment limit properties

Several properties control email attachment limits.

### Properties

All the properties are located in the System Property (sys_properties) table. Setting any of the following properties to an excessively large value may cause performance issues.
Table 195: Attachment limit properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.max_attachment_count</td>
<td>Sets the maximum number of attachments allowed per inbound email.</td>
</tr>

<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 18874368</td>
</tr>
<tr>
<td></td>
<td>• Learn more: Inbound Email Attachment Processing</td>
</tr>
<tr>
<td>glide.email.outbound.max_attachment_count</td>
<td>Sets the maximum number of attachments allowed per outbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 30</td>
</tr>
<tr>
<td></td>
<td>• Learn more: Outbound Email Attachment Processing</td>
</tr>
<tr>
<td>glide.email.outbound.max_total_attachment_size_bytes</td>
<td>Sets the maximum total attachment size in bytes allowed per outbound email. To send an email, the system must encode the contents of the email. This process may significantly increase the size of the email, including any attachments. It is best to set this property to a value well below the maximum email size.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 18874368</td>
</tr>
<tr>
<td></td>
<td>• Learn more: Outbound Email Attachment Processing</td>
</tr>
</tbody>
</table>

Note: A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.

Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the glide.email.inbound.max_attachment_count and glide.email.inbound.max_total_attachment_size_bytes properties. When the attachments for an inbound email exceed either value, the system logs a warning and discards the excess attachments. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.
Outbound email attachment processing

For outbound emails, the system enforces the maximum number and size of attachments as set by the glide.email.outbound.max_attachment_count and glide.email.outbound.max_total_attachment_size_bytes properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email [sys_email] table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this:

Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.

Emails for notifications, scheduled reports, and exported tables

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

Email diagnostics and troubleshooting inbound and outbound email

The Diagnostics and Connection page displays information about the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.

Email diagnostics

Email diagnostic information can help you identify problems with inbound or outbound email. For example, if your instance is not receiving inbound emails, use email diagnostics to review items that might affect inbound emails, such as the email connection status and email reader scheduled job.

Navigate to the Diagnostics and Connection page from either of these modules:

- System Mailboxes Email Diagnostics
- System Diagnostics Email Diagnostics
Figure 119: Email Diagnostics and Connection page

### Troubleshooting email problems

See the following resources on troubleshooting inbound and outbound email problems.

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance not receiving inbound email</td>
<td>See Inbound Email Troubleshooting, ServiceNow <a href="https://servicenow.com/kb0524472">KB0524472</a>. This KB article also provides links to a video series on troubleshooting inbound emails.</td>
</tr>
<tr>
<td>Error or symptom</td>
<td>Solution</td>
</tr>
<tr>
<td>------------------------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Instance not sending outbound email</td>
<td>See Troubleshooting Outbound Email, ServiceNow KB0521382. This KB article also provides links to a video series on troubleshooting outbound emails.</td>
</tr>
<tr>
<td>Email from Outlook produces an empty Incident record containing an attachment named winmail.dat.</td>
<td>Configure the local Outlook client or Exchange server to not send Rich Text formatted (RTF) data to the instance. To prevent Windows email from containing a winmail.dat file, see Microsoft KB 138053 for information on configuring Exchange.</td>
</tr>
</tbody>
</table>

Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.

- Test the email configuration by routing all email to a single user (set the glide.email.test.user property).
- Review the baseline email notifications and templates to determine if they meet your business needs.
- Review the baseline inbound email actions to determine if they meet your business needs.
- Determine if you want to use email filters to restrict the email the instance receives.
- Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
- Determine what kind of watermarks outbound email uses to associate records with email messages.
- Determine if you want to create users when the instance receives an email from an unrecognized user.
- Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the glide.smtp.precedence.bulk property).
- Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
- Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Create an email notification

Creating an email notification involves specifying when to send it, who receives it, and what it contains.

Role required: admin

Note: If you do not see all the fields on the form, switch to the Advanced view.

1. Configure email properties to enable your instance to send and receive email.
2. Navigate to System Notification Email Notifications.
3. Click New.
4. Fill in the fields at the top of the Email Notifications form, as appropriate (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the database table to link the notification to, for example Incident (incident).</td>
</tr>
<tr>
<td></td>
<td><strong>Attention:</strong> Do not select the Task (task) table. This table is for extending other tables. Notifications that run on the Task table directly are not supported.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only tables and database views that are in the same application scope appear in the list.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of notification you are creating: EMAIL or Meeting Invitation.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the email notification.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description for this notification.</td>
</tr>
</tbody>
</table>

5. Fill in the fields on the When to send tab (see table).
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Set a numerical value for the notification priority relative to other notifications with the same target table and recipients. The system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification. Note: The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select Priority (&gt;) greater than (&gt;) 3 - Moderate to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field is visible only when the Send when field has been set to Record inserted or updated.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field is visible only when the Send when field has been set to Record inserted or updated.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field is visible only when the Send when field has been set to Event is fired.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Advanced condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties.</td>
</tr>
<tr>
<td><strong>The advanced condition</strong> script must return true or set a global answer variable to true to send the notification.</td>
</tr>
<tr>
<td>The advanced condition script uses the following global variables:</td>
</tr>
<tr>
<td>• current: contains the current record from the table to which the notification is linked.</td>
</tr>
<tr>
<td>• event: contains the event that triggered the notification.</td>
</tr>
</tbody>
</table>

**Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

6. Fill in the fields on the Who will receive tab (see table).

**Tip:** Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property glide.email.smtp.max_recipients.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select users or groups from reference fields. For example, if a notification uses the Incident (incident) table, then you can select users or groups from incident fields like Opened by and Assignment group. This list of users or groups is variable and depends upon the values of the associated task record.</td>
</tr>
<tr>
<td></td>
<td>Note: You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users you selected.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want know why you may not be receiving certain email notifications, see the blog post Troubleshooting email notifications - Send to the Event Creator by a ServiceNow Technical Support Engineer in the ServiceNow Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more email recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more email recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Select this check box to allow all users to subscribe to this notification. See Subscription-based notifications for more information.</td>
</tr>
<tr>
<td></td>
<td>Note: Do not enable this option for notifications that contain sensitive or protected data or where you want to restrict who can see it.</td>
</tr>
</tbody>
</table>
Note: The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details. If the record contains sensitive or protected data, consider restricting the recipient list to just those users and groups who normally have access to it, and do not enable the Subscribable option.

7. Fill in the fields on the What it will contain tab (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email template</td>
<td>If you want to reuse existing content, select an email template to add content to the email notification.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter the subject line for the email message. The subject can include variables from the Select variables column.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message HTML</td>
<td>Enter the content of the email notification message. The message can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. The Message HTML field is visible only if you set the content type to HTML and plain text or HTML only. To prevent adding extra ( &lt;p&gt; ) and ( &lt;div&gt; ) elements to your email notifications, see the blog post <a href="https://community.servicenow.com/t5/ServiceNow-Posts/Extra-line-spacing-with-paragraph-tags-in-email-client/td-p/379780">Extra line spacing with paragraph tags in email client</a> by a ServiceNow employee in the ServiceNow Community.</td>
</tr>
<tr>
<td>SMS alternate</td>
<td>Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters.</td>
</tr>
<tr>
<td>Importance</td>
<td>Set the importance of the email message to low or high.</td>
</tr>
<tr>
<td>Content type</td>
<td>Select the content type for the email notification: • HTML and plain text • HTML only • Plain text only By default, HTML only is enabled.</td>
</tr>
<tr>
<td>Include attachments</td>
<td>Select this check box to send all attachments from the triggering record as email attachments.</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>Use this check box to apply or remove the watermark attached to each email. Do not remove the watermark as a reply to an email without a watermark creates an incident rather than updating the incident the original email referred to. For more information, and an alternative way to hide watermarks, see <a href="https://community.servicenow.com/t5/ServiceNow-Posts/Watermarks-on-notification-emails/td-p/379864">Watermarks on notification emails</a>.</td>
</tr>
<tr>
<td>Message Text</td>
<td>Enter the notification message to send in plain text. This field is visible only if you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>From</td>
<td>Enter the email address that you want the email notification to use in the From field. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reply to</td>
<td>Enter the email address you want people to use when replying to the email notification. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field.</td>
</tr>
<tr>
<td>Push message only</td>
<td>Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The Push Notification feature must be active.</td>
</tr>
</tbody>
</table>

8. Click Submit.

Images can be inserted into email notifications that were created in the Eureka release or that were converted to rich format using the HTML editor. The images can be stored in the image library in your instance, or they can be inserted as attachments.

**Convert legacy email notifications to rich HTML**

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to System Policy Email Notifications.
2. On the Email Notifications list screen, click the name of the email notification you want to convert.
3. Click the What it will contain tab.
4. Click Switch to Rich HTML Editor.

Any raw HTML in the Message field is rendered as WYSIWYG text. Additionally, any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
Note: The letter “P” at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an HTML `<p>` tag.

When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script `{sys_script_email}` table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Policy Email Notification Email Scripts. When the scripts are completed, add a `${mail_script:script name}` embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by `<mail_script>` `/mail_script` in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.
In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

The advanced condition script must set the answer variable to true to send the notification. For example, to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group, use this code:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else{
    answer = true;
}
```

You can add a script-based condition in the Advanced condition field by configuring the Email Notification form and adding the field. You can access the field in the Advanced view without configuring the form.

The advanced condition script uses the following business rule global variables:

- `current`: contains the current record from the table to which the notification is linked.
- `event`: contains the event that triggered the notification.

**Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the Condition and Advanced condition must evaluate to true in order to send the notification.

**Edit HTML content in an email notification**

For added control over the content of a converted email notification, you can edit the underlying HTML.

**Role required:** admin

1. With the converted email notification displayed in the Message text field, click the HTML button in the rich HTML editor.
2. Make the needed changes to the HTML.
3. Click Update.

**Document attachments on an email notification**

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the Include attachments field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding, which increases total attachment size by approximately 37%.

**Attaching documents with scripting**

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.
Linking to an attachment

You can add attachments to a notification by linking to the attachment record in the message of the notification. Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr.sys_id + '"></a>
  file_name + '</a>\n' );
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```
${report:X:Y}
```

where:

X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).

Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `_${report:reportID:<abc123>}_`
- `_${report:gaugeID:<abc123>}_`
- `_${report:dashboardID:<abc123>}_`
- `_${report:chartID:<abc123>}_`

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates.

To provide control over line breaks, a Newlines to HTML check box is available in the Email Script form.

![Newlines to HTML option](image)

Figure 120: Newlines to HTML option
Selecting the Newlines to HTML check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the Newlines to HTML check box is automatically selected.

For new mail scripts, add correct HTML line breaks to template.print() statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with <div> tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

HTML line breaks in new scripts

When writing new scripts, insert explicit HTML line breaks and clear the Newlines to HTML check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace template.print("\n") JavaScript function calls with template.print("<br />"). This replacement gives you better control over the HTML formatting of your email notifications.

Preview email notifications

You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

Note: If you are using Internet Explorer, you must have version 9 or later to use this feature.

You can preview both types of notifications as specified by the Send when field on the Notification form:

- Record inserted or updated: A change to record in the instance triggers the notification.
- Event is fired: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to System Notification Email Notifications.
2. Open the notification or create one. You must save the record before you can view the preview accurately.
3. Click the Preview Notification UI action on the top of the form. The Notification Preview window opens.
4. You can see the content of the notification, modify the preview records to see what changes take place in the notification content, and view who can receive the notification (see table for field descriptions).

Change Request CHG0000001 notification -- Rollback Oracle Version

**Body**

Short description: Rollback Oracle Version
Click here to view Change Request: CHG00000001

State: New
Category: Software
Configuration item: Sales Force Automation
Opened by: System Administrator
Assignment group:
Assigned to: ITIL User

Description:
Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend.

We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.
Comments and Work notes:
### Table 197: Notification preview

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event Creator</strong></td>
<td>The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked Preview Notification. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td><strong>Preview Record</strong></td>
<td>The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the table specified in the Table field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
</tbody>
</table>
| **Event type** | The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:  
  • Generated Event: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.  
  • Existing Event: Preview with an existing event record in the instance. If you select this option, select the event in the Event Record field. |
| **Event Record** | An existing event to preview an event-created notification. This option appears if you select Existing Event as the event type (for event-triggered notifications only). |
| **Users**    | The users who will receive the notification, as specified in the Who will receive section of the Email Notification form:  
  • All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.  
  • Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user’s notification settings are disabled. |
### Time zone for email notifications

A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property glide.email.append.timezone controls whether to append the time zone. If true, the system time zone of the instance is appended to any dates or date/times in outbound email messages (for example, 2010-07-02 04:01:14 PST).

### Specify alternative outbound email addresses for notifications

By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin

For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to System Notification Email Notifications.
2. Select an existing notification record for the desired event, such as Incident Closed.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the Advanced view related link.
5. In the What it will contain section, add an email address to the From field that is different from the default instance address.
6. Add a different email address than the From address to the Reply to field if you want replies to this notification to go to a different address.

   The system checks the From field for an address. If this field is empty, then the system uses the default address for the instance. If the Reply to field is empty, then all replies are sent to the address from which the notification was sent. If the Reply to field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

   For example, if the Company is a certain value, then the notification comes from a unique email address entered in the From field.

8. Click Update.

### Specify an outbound email address for a particular language

You can specify a different email address for each language your instance supports.

Role required: admin

1. Create or copy a notification record for the desired event.
2. In the What will it contain section, enter a new email address in the From field.
3. Create the Subject and Message content in the desired language.
4. In the When to send section, create a condition as follows:
   1. In the list of Condition fields, select Show Related Fields from the bottom of the choice list.
   2. From the choice list of Related Fields, select the field that identifies the recipient.
      For example, select Caller User fields to send the notification to the user who called in an incident, or Assigned to User fields to send the notification to the user to whom an incident is assigned.
   3. From the choice list of user fields, select Language.
   4. Select the is operator.
   5. Complete the condition by selecting the language of the desired user.
5. Click Update.
All notifications for that event originate from the specified email address and go out in the language of the recipient.

Scripting for email notifications
Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a ${mail_script:script name} embedded script tag to the body of the email notification or template, replacing script name with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by <mail_script> and </mail_script> in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag (${mail_script:script_name}).

JavaScript in emails
Create mail scripts in System Notifications Email Notification Email Script, and refer to them by using ${mail_script:script name} in the script field.

To print text into the body of the message, use the template.print(“a string”) function.
The event.parm1 and event.parm2 parameters that come from the originating event can also be used.

### Links to records in email notifications

Adding the `${URI}` parameter to an outbound email body or template creates a link to a specific record. When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

![Figure 122: Link displayed by `${URI}` parameter](image)

The `${URI}` parameter has an extension called the `${URI+}` format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```javascript
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
&sysparm_scriptlet_condition=current.assigned_to.nil()
&sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to incident_active.

Enable links to records
Adding the special ${URI} parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

Figure 123: URI email notification

The ${URI} parameter has an extension called the ${URI+} format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```plaintext
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()&sysparm_scriptlet_condition=current.assigned_to.nil()&sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to incident_active.

Change the link text
To show the display value of the record as the link text instead of the word LINK, use the ${URI_REF} parameter instead of the ${URI} parameter.

Figure 124: URI_REF email notification

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

Link to related records
A notification can link to a related record by specifying a reference field in front of the ${URI} or ${URI_REF} parameters.

Format the related record link as follows:
- `${<reference field that contains the related record you want to display>.URI}`
- `${<reference field that contains the related record you want to display>.URI_REF}`
For example:

Table 198: Related records

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval (sysapproval_approver) | Approval for (sysapproval) | • ${sysapproval.URI}
• ${sysapproval.URI_REF} |
| Related problem record in an incident notification | Incident | Problem (problem_id) | • ${problem_id.URI}
• ${problem_id.URI_REF} |

For example, the following notification template produces the email links in the picture below:

Click here to view Incident: ${URI_REF}
Click here to view Related Problem: ${problem_id.URI_REF}

Click here to view Incident: INC0010002
Click here to view Related Problem: PRB0040001

Figure 125: Related record link

Content page links in email notifications

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages.

The link takes the following format: ${CMS_URI+<site>/<page>}.  

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: ${CMS_URI+ess/incident_detail}

The resulting email URL has this format: https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

Link to content pages

You can create links to content management pages using the following format: ${CMS_URI+<site>/ <page>}.  

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: 

${CMS_URI+ess/incident_detail}

The resulting email URL has this format: 

https://<instance name>.service-now.com/ess/incident_detail.do?
sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

Example scripting for email notifications

Examples of scripting for email notifications.

Scripting examples for email notifications

A simple text string is the most basic example of the way a mail script works. This script prints out “Incident number - INC00001”.

    template.print("Incident number - "+ current.number);
More advanced scripts, like this one, can be found by browsing through the base system email templates.

```javascript
template.print("Summary of Requested items:<br />");
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
    template.print(gr.number + ":  " + gr.quantity + " X " +
gr.cat_item.getDisplayValue()
    + " at " + gr.cat_item.price.getDisplayValue() + " each
    <br />");
}
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```javascript
... email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
...
```

Using the `instance_name` property ensures that the notification still works when migrated between instances.

```javascript
dothis();

function dothis(){
    var gr = new GlideRecord('sys_attachment');
gr.addQuery('table_sys_id',current.sys_id);
gr.query();
while(gr.next()){
    template.print('Attachment: <a href="https://'+
gs.getProperty('instance_name')+'.'+service-now.com/sys_attachment.do?sys_id='+ gr.sys_id+'">'+
    gr.file_name+'</a>');
}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

```javascript
//email.addAddress(type, address, displayname);
email.addAddress("cc","john.copy@example.com","John Roberts");
email.addAddress("bcc","john.secret@example.com","John Roberts");
```

The following is an example script to add users from `watch_list` as copied recipients.

```javascript
if(!current.watch_list.nil()){ //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split("","");

    //get user records
    var user = new GlideRecord("sys_user");
    user.addQuery("sys_id", watcherIds);
    user.addQuery("notification",2);
    //email
    user.addQuery("email","!=","");
    user.query();

    while(user.next()){ //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());
    }
}
```

Mail script API

Certain variables are available when processing mail_script scripts.
Table 199: Mail script variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
</table>
| template     | Handles printing from the mail script to the email message.  
  template.print("message"); //outputs message to the email body.  
  template.space("number of spaces"); //outputs spaces to the email body. |
| email_action | GlideRecord object for the email notification (sysevent_email_action). |
| event        | GlideRecord object for the event that fired the notification (sysevent). |
| email        | EmailOutbound object  
  Available methods:  
  • addAddress(String type, String address, String displayname): type can be cc or bcc.  
  • setFrom(String address): override the sender address.  
  • setReplyTo(String address): override the reply to address.  
  • setSubject(String subject): override the subject of the message.  
  • setBody(String message): override the body of the message.  
  The email address that is passed by setFrom and setReplyTo needs to be in a valid form such as helpdesk@sn.com or Display Name <helpdesk@sn.com>. If the email address includes a 'Display Name', then that value overrides the instance's display name. |

Useful attachment scripts

This is a searchable version of the Useful Attachment Scripts.

Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow Customer Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.
## Table 200: Useful attachment scripts

    task.query();
    if (task.next()) {
        task.u_has_attachment = answer;
        task.autoSysFields(false); // Don't set the lastUpdatedTime or the Simultaneous Update Alert will likely get triggered
        task.setWorkflow(false); // Don't allow other business rules to run, otherwise multiple notifications will likely be sent
        task.update();
    }
}
### Attachment Logging

Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

### Notification examples

There are several examples that illustrate how to set up email and SMS notifications.

The two processes are identical, with the exception of the length and content of the message. SMS messages do not permit user response to links and are limited to 140 characters. Use the SMS alternate field in the Email Template and Email Notification forms to create a brief text message for SMS devices.

### Baseline email notifications

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

Notification example: simple reminder
In this notification example, set up a very simple reminder that sends a user an email at a specified time, based on information in an incident.

Role required: admin

We will create the following:
- A custom date/time field on the Incident form
- A business rule to define an event based on the new field
- An email notification to react to that event

1. Create a custom Date/Time field on the Incident form labeled Reminder, with a field name of u_reminder
2. Define an event that is triggered when the Reminder field gets a value. We create an event called incident.reminder that is triggered at a specific time. We use the gs.eventQueueScheduled() function, which is similar to the standard event creation function, but can pass a parameter to specify when the event is triggered. In this case, the event is triggered at the date and time specified in the new Reminder field.

Note: Be sure to register your new event. If you do not, the system will not know to look for it.

```java
gs.eventQueueScheduled ( "incident.reminder", current, gs.getUserID ( ) , gs.getUserName ( ) , current. u_reminder );
```

3. Create an email notification record that reacts to the new incident.reminder event. This brief notification message is suitable for SMS as well.
Create a concept topic to introduce the background needed to perform this process or task.

Notification example: assignment notification

In this notification example, enhance the To Do application to send an email notification when someone is assigned a task.

Role required: admin

The email notification is triggered by an event, which is triggered by a business rule. Events can be triggered by business rules and, in turn, reacted to elsewhere. This event is triggered by the business rule created in the next procedure and will, in turn, trigger the email notification.

1. Navigate to System Policy Events Registry.
2. Click the New to create an event registry record.
3. Select the To_Do table.
4. Type A To Do has been assigned in the Description field.
   Fired by is basically a comment to remind you where the events come from. We select Business Rule.

5. Click Submit.
7. Click New to create a business rule.
8. Fill in the fields as follows:
   - Name: To Do Assigned
   - Table: to_do
   - Run at: server
   - When: after
   - Insert: true
   - Update: true

9. Enter a condition to trigger the business rule whenever the Assigned to field is changed or initially populated:
   
   \[
   \text{current. u_assigned_to. changes ( )} \]

10. Enter a script to add a to_do.assigned event.

11. In addition to the event name and the current record, specify two additional parameters (user’s ID and Name).

   \[
   \text{gs. eventQueue ( "to_do.assigned" , current , gs. getUserID ( ) , gs. getUserName ( ) ) ;} \]
12. Click Submit.
13. Test that the business rule is creating the event as follows:
   1. Change the value in the Assigned to field of an existing To Do record or create a new record and specify an Assigned to.
   2. Navigate to System Policy Events Event log and look for an event with the name to_do.assigned.
   3. To make this easier, you can sort the event log in descending order by created.
14. Navigate to System Notification Email Notifications.
15. Click New to create an email notification.
16. Fill in the following fields:
   - Name: To Do Assigned
   - Event name: to_do.assigned
   - Table name: to_do

   The User field specifies to whom the email should be sent. In this case, send it to the Assigned to user.
17. In User field, enter u_assigned_to.

   Sometimes, you do not want notifications to be sent to the person who triggered the notification. In this case, clear the Send to event creator check box. Select this option to see all the notifications.
18. Enter the Subject of the email as To Do Assigned.
19. Under Select variables, click Due Date.
You will see text added to the message text box which causes the value of the due date to be inserted. You can change the label (Due Date in this case) which was provided automatically. Use the same method to add two more variables to the message text: Priority and Short Description.

20. Click Submit.

21. **Warning:** Do not use your own POP server for this exercise. You should have a test account set up on your mail server (see the administrator of your mail system). It may download the contents of your POP account. You may choose to skip configuring Glide to use an email server and just check the Glide email log instead of sending an actual email (see final step below).

Navigate to **System Properties Email**.

22. Under SMTP Server Settings, enter the outgoing mail server, outgoing mail address, the mail server password, and outgoing mail display name.

23. If you are using a POP server, enter the POP server, incoming POP mail account name (do not include the @ and server name here), and incoming POP mail account password.

At the bottom of the form is a space where a test email account can be provided to direct emails to it instead of the actual email addresses. Rather than test emails sent to the test users, place your own email address here.
24. Click Save.
25. Test the assignment notifications.
   1. Assign some To Do records.
   2. Navigate to System Logs Email to see that status of generated emails.
      You should receive email notifications in a few moments.

Notification example: approval request
In this notification example, a change request approval is requested, which results in an update to the Approval [sysapproval_approval] table.
Role required: admin
The approval events Business Rule is executed which creates the approval.inserted event. The Approval Request email event is configured to process the approval.inserted event, which uses the change.itil.approve.role email template. This is part of an automatic response that enables the recipient to click a link in the email to send a pre-formatted response back to the system to either approve or reject the change request automatically.
   1. Create an email notification that looks like this:
2. Create an email template like this:

The combination of the notification and template generates an email that looks something like the following:
Notice that the receiver of this email has the following links in the mail:

- A link to view the approval record
- A link to view all the details of the change request
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change

Notification example: priority 1 incident update
In this notification example, configure the instance to notify specific users by email whenever an incident with a priority of 1 - Critical is updated, regardless of the changes that have been made.

Role required: admin

We will create an email notification to alert all recipients when the default system event incident.update is triggered for a priority 1 incident. The notification will display information of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. Navigate to System Notification Email Notifications, and then click New.
2. Configure the email notification record as follows.

Table 202: Priority 1 incident update notification Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Give your notification record a unique name, such as Incident of Priority 1 Updated.</td>
</tr>
<tr>
<td>User</td>
<td>Click the magnifying glass icon and select a recipient from the list of users. You can select only one user in this field.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event to use for this notification. The incident.updated event is triggered by any change to an incident record and can be used to send our notification.</td>
</tr>
<tr>
<td>User field</td>
<td>Enter the field name from the Incident table that defines the recipient for this notification. For example, you might send notification of an update to the person who opened the incident by typing opened_by.</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Email template</td>
<td>Leave this field blank. We will cover the construction and use of templates in another exercise.</td>
</tr>
<tr>
<td>Group</td>
<td>Click the magnifying glass icon, and then select a group from the list of groups. You can select only one group in this field.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the appropriate database table, in this case Incident (incident).</td>
</tr>
<tr>
<td>Group field</td>
<td>Enter the field name from the Incident table that defines the group to notify. For example, you might send notification of the update to the designated assignment group by typing assignment_group.</td>
</tr>
<tr>
<td>Weight</td>
<td>Weight determines the sending priority of each notification when more than one qualifies. This is an arbitrary scale that you set.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also specified in the Users/groups in fields, Users, or Groups field. If the event creator is not specified in one of these fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td>Type</td>
<td>Select EMAIL.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box (true) to enable email notification.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Updated --&gt; is anything. This creates the condition under which the notification is sent. In the example, an update to any field in an incident record sends an email to all recipients.</td>
</tr>
<tr>
<td>Subject</td>
<td>Type an appropriate subject line for your email. Select variables for your content from fields in the Incident table. Put the cursor in the subject line where you want the variable to appear, and then click the field name in the Select variables column. For this exercise, type the following subject line and insert the variable for the Priority field: An Incident of Priority ${priority}$ has been updated. In this notification, the variable ${priority}$ returns the value 1 – Critical.</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Message   | Construct a message that includes all the information you think the recipients need to know about the updated incident. Select the appropriate variables for your message from the fields in the Incident table. Put the cursor in the message where you want the variable to appear, and then click the field name in the Select variables column. The special character, `<hr/>`, creates a manual break in the message that sets off the Comments section. For this example, create the following message:  
Short Description:  
${short_description}$  
Click here to view incident:  
${URI}$  
Incident number: ${number}$  
Category: ${category}$  
Assigned to: ${assigned_to}$  
Assignment group:  
${assignment_group}$  
<hr/>  
Comments:  
${comments}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| List      | Click the lock icon to open a list of recipients for the email notification. Click the magnifying glass icon and select names from the list of users. You can select as many users from the list as you want.                                                                                                                                                                                                                                                                                                                                                      |
| List field| Enter the field name from the Incident table that identifies a list that contains potential recipients. For example, to send the notification to users who are on the watch list for this issue, type watch_list.                                                                                                                                                                                                                                                                                                                                                 |
| SMS alternate | Enter an abbreviated version of the email message that eliminates such things as the ${URI} link that requires recipient interaction and the ${comments} field. SMS messages can only display 140 characters.                                                                                                                                                                                                                                                                                                           |

Your email notification record should look like this:
3. Note: After you have created the email notification record, set up a test in your environment to make sure the intended recipients get the proper notification.

Create users in your platform who have email addresses you can monitor, and then create a group that includes one of these users.

4. Open a Priority 1 – Critical incident, and assign it to one of the users you created. Then select the group you created as the assignment group.

5. Open your email notification record and specify the recipients.
   1. Select one of the users you created from the lookup list in the User field.
   2. Type assigned_to for the User field value.
   3. Type assignment_group for the Group field value.

6. Update your Priority 1 incident by adding comments, and then click Update.
7. Check the email accounts of the user to whom you assigned the incident and the user member of the assignment group.

The email that is sent should have the same structure as the following sample:

Email templates

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template

You can create an email template with rich HTML formatting, rather than plain text.

Role required: admin

1. Navigate to System Policy Email Templates.
2. Click New.
3. Fill in the form fields (see table).
Figure 126: The Email Template form with the HTML editor.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, change.update.risk.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, Change Request (change_request).</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the Select variables column. For example: \n\n${sys_class_name} ${number} with ${risk} risk has been assigned to you.</td>
</tr>
<tr>
<td>Message HTML</td>
<td>Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident’s short description or comments and work notes. Notes: \n\n- When a template is applied to a notification, the contents of this field are used if you selected HTML and plain text or HTML in the Content Type field in the Email Notification form. \n- You cannot use HTML code to control the appearance of the contents in the ${comments} variable. \n- If you want to include a link to the record that triggered the notification.</td>
</tr>
<tr>
<td>Message Text</td>
<td>Enter the notification message to send in plain text. Note: When a template is applied to a notification, the contents of this field are used if you selected HTML and plain text or Text in the Content Type field in the Email Notification form.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Create a different message to be delivered to the recipient’s SMS device. You might want a brief message, showing the most important information only. If this message field is blank, the contents of the Message Text field are used for the SMS message. Note: The message in this field is used when the message is sent to a device configured as SMS.</td>
</tr>
</tbody>
</table>

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to System Notification Email Notifications.
2. Open the email notification record that should use the template.
3. Navigate to the What it will contain section.
4. From the Email template field, select the appropriate template.
5. Click Update.

**Convert an email template to rich HTML**

If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to System Policy Email Templates.
2. Open the email template you want to convert.
Thank you for submitting $(number). We appreciate your willingness to help out the knowledge management team. Your article led us to generate the following new knowledge base articles:

$(mail_script:kb_submission_script_1)

The knowledge engineer had the following comments upon closure:

$(close_notes)
3. Click Switch to Rich HTML Editor.

When content is converted, these changes are made to the content:

- **HTML Editor:** Any raw HTML in the Message field is rendered as WYSIWYG text in the Message HTML field. The content can be edited in a feature-rich HTML editor.
- **Simplified Mail Scripts:** Any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
Thank you for submitting \$\text{number}. We appreciate your willingness to help out the knowledge management team. Your article led us to generate the following new knowledge base articles:
\$\text{mail_script:kb_submission_script_1}

The knowledge engineer had the following comments upon closure:
\$\text{close_notes}
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

Note: The letter “P” at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an `<HTML>` tag.

Note: Email templates that are already formatted with rich HTML do not show the Switch to Rich HTML Editor button.

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in System Notification Email Notification Email Scripts. When the scripts are completed, a `$$\{mail\_script:script\_name\}$$` embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (`sys_script_email`) table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the Show Notification Scripts related link.

Override a template value
You can customize an email notification to override a specific value without changing the basic information contained in the template.

Role required: admin
1. Navigate to System Policy Email Templates.
2. Open an email template.
3. Enter a new value for the field you want to override.
4. Click Update.

For example, you might change the subject line to read The risk level of $\{sys\_class\_name\}$ $\{number\}$ has been raised to $\{risk\}$. This would not change the basic information about the change request contained in the template, but would make the email notification appropriate for the change manager who needs to know when risk levels are escalated above a certain threshold.

Construct an email message with a template
Email templates provide a list of the fields from database tables that are available for constructing an email message.

There is also a template that allows a mailtoautomatic response link which allows the receiver of the email can to simply choose a link to send a pre-formatted response back to the instance. An example is the email template that is used for notification that an approval is required. The base email is shown below:
### Notification - Approval Request [Advanced view]*

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Approval Request</td>
</tr>
<tr>
<td>Table</td>
<td>Approval [sysapproval_approve]</td>
</tr>
<tr>
<td>Type</td>
<td>EMAIL</td>
</tr>
<tr>
<td>Active</td>
<td>enabled</td>
</tr>
</tbody>
</table>

#### What it will contain

- **Email template**: change.jti.approve.role

### Select variables:

*Note: The image includes a table showing the notification settings with the `change.jti.approve.role` as the selected email template.*
Notice the selection list on the right that shows the available fields from the sysapproval.approver table. All email templates get used based on an event that was created. Generally events are created based on Business Rules that execute when a database record is modified in some way. The database record being modified when the event is created is the record that is available for generating an email request.

In this case, a change request approval was being requested which results in an update to the sysapproval.approval table. The “approval events” Business Rule was executed which created the “approval.inserted” event. The “Approval Request” email event is defined to process the approval.inserted event and this email event is defined to use the change.itil.approve.role email template that is shown above. Notice that this template has two mailto: items specified. One for “mailto.approval” and one for “mailto.rejection.” These are email templates that are used to construct an automatic response so that the email receiver can simply click a link in the email to automatically either approve or reject the change request.

Here is what the change.itil.approve.role template looks like using the rich HTML editor:
### Email Template

**change.itil.approve.role**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>change.itil.approve.role</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>Approval (sysapproval.approve)</td>
</tr>
<tr>
<td><strong>Subject</strong></td>
<td>$(sysapproval.sys_class_name) $(sysapproval.Approval Request)</td>
</tr>
<tr>
<td><strong>Message HTML</strong></td>
<td></td>
</tr>
</tbody>
</table>

```html
B B / / Font Family Font Sizes  

Short Description: $(sysapproval.short_description)
Priority: $(sysapproval.priority)
Category: $(sysapproval.category)

$(mail:script:change_request.summary)
Comments:
$(sysapproval.description)

$(mailto:mailto.approve)

$(mailto:mailto.rejection)

Click here to view Approval Request: $(URL)
Click here to view $(sysapproval.sys_class_name): $(sysapproval.URL)

div
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
And the mailto.approval template:

![Email Template](image)

**Figure 129: The mailto approval template**
Note: If you put text on the lines following the Click here to approve \{sysapproval\} line, this forms the actual body of the email.

The above combination of templates would generate an email that looks something like the following:

```
Short Description: Upgrade to a new version of Windows Office
Click here to view Approval Request: LINK
Click here to view Change Request: LINK

Priority: 4 – Low
Category: Software
Comments:
All matches for the sales department must be updated to the latest version of Windows Office

Click here to approve CHG30003
Click here to reject CHG30003

- Service-now.sysapproval_approver.d67d8dc41437857db57db2c7d9a45b9a
```

Figure 130: Template generated email message

Notice that the receiver of this email has the following links in the mail:
• A link to view all the details of the change request
• A link to view the approval record
• A link that will generate an automatic email response to approve the change
• A link that will generate an automatic email response to reject the change

Add blank lines in an email template
You can easily add blank lines in an email template using HTML tags.
Judicious use of these HTML tags can make your email easier to read.
• You can use \(<br/>\) to insert a line break
• You can wrap paragraphs in \(<p>\) ... \</p> tags to format your email nicely.

**Calendar integration**
With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the Message Text field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${dtstart}</td>
<td>Start Date</td>
</tr>
<tr>
<td>${dtend}</td>
<td>End Date</td>
</tr>
<tr>
<td>${location}</td>
<td>Location</td>
</tr>
<tr>
<td>${alarm_time}</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>
The instance computes the value of iCalendar variables using import and export maps for the following tables:

- change_request
- reminder
- itil_appointment
- incident

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.

<table>
<thead>
<tr>
<th>External name</th>
<th>Associated variable name</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>$(dtstart)</td>
<td>change_request</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>dtend</td>
<td>$(dtend)</td>
<td>change_request</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables
You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the dtstart and dtend variables in the import export map for the iCalendar invitation.

Role required: admin
1. In the navigation filter, enter sys_impex_map.list.
2. Open the icalendar.change_request map or the map you want to edit.
3. In the Field Maps related list, click either the end_date or start_date mapped field to change the mapping for dtstart or dtend, as needed.
4. Change the Database field to the field you want to use to set the start date or end date.
5. Click Update.

Create iCalendar invitations for custom tables
To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin
1. Create the custom table and fields using the Date/Time field type for the fields that map to the ${dtstart} and ${dtend} variables.
2. In the navigation filter, enter sys_impex_map.list.
3. Click New.
4. Set the following fields:
   • Name: Use the following naming convention: icalendar.<table name>. For example, icalendar.u_my_custom_table.
   • Table: Select the custom table you created.
   • Type: Select icalendar.
5. Right-click the form header and select Save.
6. In the Field Maps related list, click New.
7. In the Mapping Entry Wizard, select Mapping to a Database Field.
8. Create field mappings for dtstart and dtend. These variables are required.
   For example, map the External Name dtstart to the u_meeting_start_time field in u_my_custom_table.
9. Click Submit.
10. Create field mappings for any other iCalendar fields as necessary.
11. Click Update.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, u_my_custom_table:

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>u_meeting_start_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>dtend</td>
<td>u_meeting_end_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>description</td>
<td>u_meeting_description</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   a) Set the Table field to the custom table you created.
   b) In the Message text field, use the following format to define the iCalendar invitation.
BEGIN:VCALENDAR
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
END:VCALENDAR

Note: Mail script is not allowed or processed in meeting invitation email templates.

Table 204: iCalendar invitation template details

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>VERSION:2.0</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>METHOD:REQUEST</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>BEGIN:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO: ${to}</td>
<td>Yes</td>
<td>You must use the import export map to map dtstart to a start time field on the custom table.</td>
</tr>
<tr>
<td>DTSTART:${dtstart}</td>
<td>Yes</td>
<td>You must use the import export map to map dtend to an end time field on the custom table.</td>
</tr>
<tr>
<td>DTEND:${dtend}</td>
<td>Yes</td>
<td>You must provide the name of a field that uniquely identifies the record, such as the sys_id or the record number field.</td>
</tr>
<tr>
<td>UID:${sys_id}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DTSTAMP:${dtstamp}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DESCRIPTION: ${description}</td>
<td>No</td>
<td>To include a multiple line description, you must use the import export map to map description to a text field on the custom table. The field mapping ensures that the system encodes line breaks correctly for the iCalendar file format.</td>
</tr>
</tbody>
</table>
### iCalendar template line

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUMMARY: ${u_meeting_summary}$</td>
<td>No</td>
<td>To include a summary from a text field on the custom table, provide the name of the field, such as <code>u_meeting_summary</code>. The summary field value must not contain line breaks. You do not need to create a field mapping.</td>
</tr>
<tr>
<td>END:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>END:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

- **Table:** Select the custom table.
- **Type:** Select Meeting Invitation.
- **Content type:** Select Plain text only.
- **Email template:** Select the template you created.

### Inbound email actions

Inbound email actions enable you to define the actions an instance takes when receiving email.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the inbound email action takes the action that you configure. The system can take two types of actions:

- **Record action:** setting a value for a field in the target table.
- **Email reply:** sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action’s script.

### Attachments

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.

### Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
- Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.
See the *Email logs* for examples of what you might see if a notification or inbound email action is not processed.

---

**Note:** Starting with the Helsinki release, the state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to Processed.

---

**Domain separation**

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the Caller field. If that user is not in the User `sys_user` table, the incident is in the global domain.

**Inbound action type criteria**

An instance uses a set of criteria to decide what action to take based on the type of message that is sent to the instance.
Figure 133: How an instance matches email to an inbound action type
### Table 205: Inbound action type criteria

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
</table>
| Forward                   | The email contains the following conditions:  
1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present).  
2. From <user email> appears anywhere in the email body.                                                                                                               | Create Incident (Forwarded)                                 | Create new record                        |
| Reply                     | The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  
1. A valid watermark that matches an existing record.  
2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  
3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record. | Update Incident (BP)                                       | Update existing record                    |
| New                       | The email does not meet the conditions for either a reply or forward type inbound email action                                                                                                                             | Create Incident                                           | Create new record                        |

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action’s table, the instance uses the Order field to determine the order in which the actions run.

**Recognized reply prefixes**  
Emails with certain prefixes trigger inbound email actions of the type reply.
When no watermark or is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the glide.email.reply_subject_prefix property as reply email. When this property is set, your email system uses non-standard reply prefixes.

Table 206: Specifying recognized reply prefixes

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: re:,aw:,r:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

Note: Prefixes are case insensitive.

Recognized forward prefixes

Emails with certain prefixes trigger inbound email actions of the type forward.

The instance recognizes any email whose subject line contains a prefix from the glide.email.reply_subject_prefix property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. When this property is set, your email system uses non-standard forward prefixes or you want forwards to behave like replies.

Table 207: Specifying recognized forward prefixes

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: fw:,fwd:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

Note: Prefixes are case insensitive.

Email forwards as replies

Properties are available to force inbound actions to process forwarded mail as replied mail.

These properties control the subject prefix that the inbound actions use.

Table 208: Properties that process forwards as replies

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>re:,Re:,RE:,aw:,r:,fw:,fwd:,Fwd:,FWD:</td>
</tr>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>(any text that is not a forward prefix)</td>
</tr>
</tbody>
</table>

This causes all forwarded and replied to mail to be processed by the Update Incident inbound action.
Note: The glide.email.forward_subject_prefix property must contain some text in order for the forwarded email to be processed as a Reply. It can be any text except a forward prefix (that is, fw:, fwd:, Fwd:, FWD:).

The matching of a sender email address to a user
The instance matches a sender’s email address to an active user in the User (sys_user) table using inbound actions.

Note: The Email Automatic User Creation plugin must be active.

When processing an email, the instance sets the current user to the user whose email address matches email.from. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the incident’s caller_id to the value returned by gs.getUserID().

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

Note: It is strongly recommended to have unique email addresses for each user record. Otherwise, the instance cannot reliably match the email to the correct user and unpredictable matches may occur.

If providing a unique email address to each user is not possible, only having one active user with the shared email address is recommended. This configuration guarantees that the instance always matches incoming email from this address to the active user.

The matching of incoming email to an inbound action type
The instance uses the following logic to match an email to a specific inbound action type.

Figure 134: Matching incoming email to an inbound action type
Incoming email matching
By default, the instance searches email for a watermark to match the incoming email to an existing record in the system.
The instance searches for watermarks in the email subject line first, then in the email body. If no watermark is present, the instance searches for an In-Reply-To email header that matches an existing record. If that is not found, the instances searches the subject line for a recognized reply prefix.

Note: Some versions of Microsoft Exchange Server require a hotfix to support the “In-Reply-To” header when replying to email that originates from outside the organization.
Examples of matching watermarks in the Subject line or Body
The following examples illustrate how the instance matches watermarks in an email’s subject line or body.

Table 209: Examples of matching watermarks in the Subject line or body

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref:MSG0000008</td>
<td>The instance recognizes this as a watermark and searches the Email Watermarks (sys_watermarks) table for a record with the number MSG0000008. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Ref:MSGWTR0000008</td>
<td>The instance recognizes this as a watermark and searches the Email Watermarks (sys_watermarks) table for a record with the number MSGWTR0000008. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Ref:WTR0000008</td>
<td>The instance recognizes this as a watermark and searches the Email Watermarks (sys_watermarks) table for a record with the number WTR0000008. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>MSG00000008</td>
<td>The instance does not recognize this as a watermark because it does not start with the Ref: prefix. It uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

Examples of matching record numbers in the Subject line
The following examples illustrate how the instance matches record numbers in an email’s subject line to an existing record when no watermark is present.

Table 210: Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Subject line contents</td>
<td>Matching results</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does recognize the “INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example *INC0005574</td>
<td>The instance recognizes this subject line as a reply but does recognize the “INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: &quot;Example INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it will not find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example INC0005574*</td>
<td>The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance will match first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: CHG0008593 and INC000576</td>
<td>The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance will match first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email. The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance will match first. For this reason, the instance does not recommend creating notifications that include more than one $number variable.</td>
</tr>
<tr>
<td>FW: Example INC0005574</td>
<td>The instance recognizes this subject line as a forward because of the FW: prefix and uses the inbound action for forwarded emails to create an incident, and associates the new incident with the email.</td>
</tr>
<tr>
<td>Example INC0005574</td>
<td>The instance recognizes this subject line as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident, and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

*Create an inbound email action*

You can create inbound email actions to define the actions that the system takes when an email is received.

Role required: admin

1. Navigate to System Policy Email Inbound Actions.
2. Click New.
3. Fill in the fields as described in the table.
Inbound Email Actions - Create Incident

Inbound email actions specify how ServiceNow creates or updates task records in a table when the instance receives an email. The inbound email action looks for a watermark in the email to associate it with a specific task. If the conditions specified in the inbound action are met, the script is run.

<table>
<thead>
<tr>
<th>Name</th>
<th>Create Incident</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Action type</td>
<td>Record Action</td>
</tr>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
</tbody>
</table>

**When to run**

Only emails of the selected Type will trigger this inbound action.

<table>
<thead>
<tr>
<th>Type</th>
<th>New</th>
</tr>
</thead>
</table>

Order determines when to run relative to other inbound actions. The inbound action with the lowest order runs first.

| Order | 100 |

All of the following conditions must be true, to trigger this inbound action.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Add Filter Condition</th>
<th>Add &quot;OR&quot; Clause</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- choose field --</td>
<td>-- oper --</td>
<td>-- value --</td>
</tr>
</tbody>
</table>
Table 211: Inbound Email Actions form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to run</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this email action.</td>
</tr>
<tr>
<td>Target table</td>
<td>Select the table where the action will add or update records.</td>
</tr>
<tr>
<td>Action type</td>
<td>Select the type of action the instance takes. Select Record Action to modify a record in the instance or select Reply Email to have the instance send an email back to the source of the inbound email.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to prevent the system from running additional inbound email actions after this one runs. Clear the check box to disable the action.</td>
</tr>
<tr>
<td>Stop processing</td>
<td>Select this option to stop processing after this inbound email action runs.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the message type required to run the action. The action runs only if the inbound email is of the selected type. Available types are:</td>
</tr>
<tr>
<td></td>
<td>• New: An email that is not recognized as a reply or forward.</td>
</tr>
<tr>
<td></td>
<td>• Reply: An email with a watermark with an In-Reply-To email header, or whose subject line begins with a recognized reply prefix.</td>
</tr>
<tr>
<td></td>
<td>• Forward: An email whose subject line begins with a recognized forward prefix, even if the email also contains a watermark or In-Reply-To header.</td>
</tr>
<tr>
<td></td>
<td>Note: By default, inbound emails of the Forward type always generate new incidents regardless of the presence of a watermark. If this behavior does not match your business logic, you can change the recognized reply and forward prefixes to treat forwards like replies.</td>
</tr>
<tr>
<td>Required roles</td>
<td>Specify required roles the sender must have to trigger the inbound action.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number that specifies when this inbound action runs relative to other inbound actions that use the same target table. The instance processes the action with the lowest order number first.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>From</td>
<td>Select the user required to run the action. If a user is selected, the action runs only when the email sender matches the user name. Leave this field blank to perform the action for all users.</td>
</tr>
</tbody>
</table>
| Condition    | Specify the condition that must evaluate to true to trigger the inbound action. Build a condition with the choice lists or enter a statement that determines when the inbound email action runs. For example:  
  `email.subject. startsWith ( "chg:" )` |
| Actions      | Specify how information in the email is inserted into the record.                                                                            |
| Field actions| For example, select (Created by) (From email) (Sender), so that when the request is inserted, you can see who it is for.  
  This field appears if the action type is Record Action.                                           |
<p>| Reply email  | Compose the email message to send to the source that triggered the inbound email action.                                                    |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Enter the script the action runs. Typically, this script uses the validators script include and email variables. A template is provided:</td>
</tr>
<tr>
<td></td>
<td><code>(function runAction(/ *GlideRecord*/ current, / *GlideRecord*/ event, / *EmailWrapper*/ email, / *ScopedEmailLogger*/ logger) { // Implement email action here })(current, event, email, logger);</code></td>
</tr>
<tr>
<td></td>
<td>These are the objects available:</td>
</tr>
<tr>
<td></td>
<td>• current: access the record referred to by the inbound email. For example, current.assigned_to accesses the person assigned to the task.</td>
</tr>
<tr>
<td></td>
<td>• event: access one of the parameters of the originating event. For example, event.parm1 accesses the first parameter of the event or event.parm2 for the second parameter. See Events for more information.</td>
</tr>
<tr>
<td></td>
<td>• email: access the inbound current email record. For example, email.subject accesses the content in the subject line of the email. See Accessing email objects with variables for more information.</td>
</tr>
<tr>
<td></td>
<td>• logger: add a message to the log file with the source set to email.&lt;Sys ID of incoming email&gt;. For example: logger.log (&quot;Some information&quot;)</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a detailed explanation of what this inbound email action does.</td>
</tr>
<tr>
<td>Other fields</td>
<td>Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. For more information. This field is not installed by the Ordered Email Processing plugin.</td>
</tr>
</tbody>
</table>

**Accessing email objects with variables**

An inbound email action script has access to various pieces of an inbound email through script variables.

Table 212: Accessing email objects with variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>email.to</td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td>Variable</td>
<td>Contents</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>email.direct</td>
<td>Contains a comma-separated list of email addresses in the To: box.</td>
</tr>
<tr>
<td>email.copied</td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td>email.body_text</td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td>email.body_html</td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
<tr>
<td>email.from</td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field matches an existing user’s Email address, this variable contains the user’s email address.</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field does not match an existing user’s Email address, this variable contains the address listed in the email Headers field.</td>
</tr>
<tr>
<td>email.from_sys_id</td>
<td>Contains the Sys ID of the user who sent the email to the instance.</td>
</tr>
<tr>
<td>email.origemail</td>
<td>Contains the address of the email sender as listed in the email Headers field.</td>
</tr>
<tr>
<td>email.subject</td>
<td>Contains the subject of the email as a plain text string.</td>
</tr>
<tr>
<td>email.recipients</td>
<td>Contains a comma-separated list of recipient addresses.</td>
</tr>
<tr>
<td>email.recipients_array</td>
<td>Contains the recipient addresses as an array.</td>
</tr>
<tr>
<td>email.content_type</td>
<td>Contains the MIME content type of the email (for example, text/plain; charset=&quot;us-ascii&quot; or text/html; charset=&quot;us-ascii&quot;).</td>
</tr>
<tr>
<td>email.headers</td>
<td>Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.</td>
</tr>
</tbody>
</table>

Note: The instance follows RFC 2822 (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the email.to, email.direct, and email.copied variables only if emails addressed to groups follow the expected RFC format.

Example assignment of tasks via email
Name:value pairs in an email template can set field values in a record.

For example, the change.itil.approve.role email template lists several fields in the outbound notification.
Figure 136: The Email Template form

Notice the line in the template that shows Priority: ${sysapproval.priority}. When replying to this email, the approver can change the value of the Priority field directly from the email. For example, the approver could set the priority to 4 - Low:

Priority: 4

**Locked out users triggering inbound email actions**

A property is available to have locked out users trigger inbound actions. The property glide.pop3.process_locked_out allows users who need to reset their password to send an email message to an instance asking for assistance.

⚠️ **Warning:** Enabling this property also enables users from untrusted domains to trigger inbound actions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.pop3.process_locked_out</td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>Type: true</td>
</tr>
<tr>
<td></td>
<td>Default value: false</td>
</tr>
<tr>
<td></td>
<td>Location: Add to the System Properties (sys_properties) table</td>
</tr>
</tbody>
</table>

**Email user matching**

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>Matching User ID</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>Value of email.from Variable</td>
<td>Matching User ID</td>
<td>Email Address</td>
<td>Name</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------</td>
<td>---------------</td>
<td>------</td>
</tr>
<tr>
<td>&quot;Michael Tossi&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi, Michael&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi&quot; <a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td>Tossi</td>
</tr>
</tbody>
</table>

Note: This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the gs.createUser() method. Use either the automatically-generated email variables or the gs.GetUserID() method instead.

User impersonations and inbound actions
When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

Note: If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions.

User creation from incoming email
An instance can automatically create users from incoming email.

When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID (sys_user.user_name) set to the sender’s full email address.

Table 215: Creating users from incoming email

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>

<tr>
<td>&quot;User, New&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot; <a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

Enabling automatic user creation
To enable the automatic creation of user records from email, you must set two email properties.

1. Navigate to System Properties Email.
2. Select the check box for Automatically create users for incoming email from trusted domains (glide.pop3readerjob.create_caller).
3. Enter the list of trusted domains in Trusted domains for creating users from incoming emails (glide.user.trusted_domain).

<table>
<thead>
<tr>
<th>Trusted domains for creating users from incoming emails. Comma separated (e.g., &quot;company.com,company.org,company.net&quot;). Use * for all. Incoming email from other domains is ignored unless from an existing user's address.</th>
</tr>
</thead>
<tbody>
<tr>
<td>* glide.user.trusted_domain</td>
</tr>
</tbody>
</table>

4. Click Save.

Note: When the property glide.pop3readerjob.create_caller is set to false, the instance runs inbound actions from users who do not match an existing user by impersonating the Guest user. When the property glide.pop3readerjob.create_caller is set to false, the instance runs inbound actions from users who do not match an existing user by impersonating Guest user. You may want to prevent untrusted users from triggering inbound actions by locking out the Guest user.

**User creation method**

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin makes the following changes:

- Sets the property glide.email.create_userid_from_email to true.
- Increases the width of the User ID (sys_user.user_name) column to accommodate email addresses.

After activating the plugin, enable automatic user creation from email.

**Warning:** Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and will randomly select one of the users with the matching email address.

**Prevent untrusted users from triggering inbound actions**

You can prevent users from untrusted domains from triggering inbound actions.

Role required: admin

For example, you can prevent email from users outside your company domain from creating incidents.

Note: Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

1. Enable automatic user creation and add a list of trusted domains. For example, add your company domain example.com.
2. Navigate to User Administration Users.
3. Select the user guest.
4. Select the Locked out field to disable the guest account. Locking out a user record prevents the user from processing inbound actions.

When a user from a trusted domain sends an email to the instance, the instance either matches the email to an existing user or creates a new user. Since the incoming email matches a user record (either an existing or new one), the email can trigger an inbound action.

When a user from an untrusted domain sends an email to the instance, the instance attempts to impersonate the guest user. Since the guest user is locked out, the impersonation fails and the incoming email cannot trigger an inbound action.

⚠️ Warning: Allowing locked out users to trigger inbound actions also allows untrusted users to trigger inbound actions.

**Inbound email recipient processing**

The recipients variables allow processing of inbound email based on the email recipients.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>email.recipients</td>
<td>Returns a comma-separated list of recipient addresses as a plain text string.</td>
</tr>
<tr>
<td>email.recipients_array</td>
<td>Returns the recipient addresses as an array.</td>
</tr>
</tbody>
</table>

For example, create a script to process email based on the array values:

```javascript
var rarray  = email.recipients_array; for ( var i  = 0 ; i  < rarray.length ; i ++ ) { var recipient  = rarray [i ] ; // do something with it }
```

**The sys_email variable**

You can use the global variable sys_email with inbound email actions.

This lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as uid, sys_id, content_type, and so on.

**Email redirection to the instance POP3 account**

You can have other mailboxes forward email to the instance’s POP3 account.

By default, the POP Reader schedules job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The POP Reader downloads any email waiting on the mail server and creates email.read events. After the instance processes the events, the inbound email actions run.

The POP Reader shows the number of emails processed during the reader’s last run. The message shows the number of emails the reader processed or 0 processed if no emails were available. The reader resets the status each time it runs.

While it is not possible to specify more than one POP3 account for the instance, you can have other mailboxes forward to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient and then set an assignment_group value.

```javascript
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities Management');
```

**Field values from the email body**

Values in an inbound email can set field values in a task record.
Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

To populate a reference field, use setDisplayValue() instead. See *Redirecting Emails* for an example of using setDisplayValue() in an inbound email action.

Note: The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

Foo:bar

The inbound email script creates the variable email.body.foo with the value of bar. You can use these variables to create conditions such as:

```javascript
if(email.body.foo!=undefined){
    current.[field]=email.body.foo;
}
```

In this example, the script sets the value of `{field}` to the value bar.

**Integrating inbound events**

This tutorial illustrates how to create a notification from an inbound JSON request.

Role required: admin

When complete, you will be able to:

- Send a JSON request to the imp_notification web service import set with the JSON processor
- Create a new import set in the imp_notification table in the instance using data from the JSON request

The following example steps assume you have your own demonstration instance.

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.
   ```json
   {"sysparm_action":"insert","message":"this is an event","uuid":"abc"}
   ```
5. Click Send.
7. Verify that the instance sends back a response with a sys_id.

8. Login to your development instance.
10. Verify that the import set table has an event matching your JSON request.
**Inbound email action examples**

Several examples of inbound email actions are available to help you build your own inbound email actions.

**Inbound email action example: handling email replies**

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

**Role required: admin**

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the Additional Comments text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

1. Navigate to **System Policy Inbound Actions** and click New.
2. Populate the form as follows:

   **Table 217: Inbound action field values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Update Incident</td>
</tr>
<tr>
<td>Type</td>
<td>Reply</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident (incident)</td>
</tr>
</tbody>
</table>

3. In Script, enter this code.

   ```javascript
   gs.include('validators');

   //Note: current.caller_id and current.opened_by are already set to the first UserID that matches the From: email address
   if (current.getTableName() == "incident") {
       current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;
       if (email.body.assign != undefined)
           current.assigned_to = email.body.assign;
       if (email.body.priority != undefined && isNumeric(email.body.priority))
           current.priority = email.body.priority;
       if (email.body.category != undefined)
           current.category = email.body.category;
   }
   ```
Inbound email action example: logging a problem
This example shows you how to set up inbound email actions to create a problem record.

Role required: admin

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Problem [problem]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Problem: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.description = email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description = email.subject.toString().substring(9);</td>
</tr>
<tr>
<td></td>
<td>current.assignment_group.setDisplayValue(&quot;Development&quot;);</td>
</tr>
<tr>
<td></td>
<td>if (email.body.assign != undefined)</td>
</tr>
<tr>
<td></td>
<td>current.assigned_to = email.body.assign;</td>
</tr>
<tr>
<td></td>
<td>current.insert();</td>
</tr>
</tbody>
</table>

Inbound email action example: requesting a change
This example shows you how to set up inbound email actions to create a change request record.

Role required: admin

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Field</td>
<td>Entry</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request [change_request]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Change Request: &quot;) == 0</td>
</tr>
</tbody>
</table>
| Script    | current.comments = email.body_text;  
            | current.short_description = email.subject;  
            | current.notify = 2;  
            | if (email.body_text.assign != undefined)  
            |    current.assigned_to = email.body_text.assign;  
            | if (email.body_text.priority != undefined)  
            |    current.priority = email.body_text.priority;  
            | if (email.body_text.category != undefined)  
            |    current.category = email.body_text.category;  
            | current.insert(); |

Inbound email action example: updating an incident

Inbound Email Actions allow users to log or update incidents on an instance via email. The Inbound Email Action parses the email and responds using a script.

Role required: admin

By default, an email received by the instance creates a new incident, sets the Contact type field to Email, and adds the body of the email to the Additional Comments field. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

The following Inbound Email Action applies to email replies. Normally, when a user responds to an email sent by the instance, the inbound email action will match the watermark to an existing incident, and update the incident rather than creating a new record. However, if the watermark is missing, this Inbound Email Action will attempt to match a reply to the original incident.

To define an inbound email action for replies:

1. Navigate to System Policy Email Inbound Actions and click New.
2. Populate the form (see table).
Values automatically set from incoming email
The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.caller_id</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
<tr>
<td>current.opened_by</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.

**Ordered email processing**
The Ordered Email Processing plugin enables you to configure a processing order for inbound email actions.

In addition to forcing email actions to run in a prescribed order, the administrator can add a command to the script for an action that halts processing after the script runs. The plugin simply adds the Order column to the Rules (sysrule) table, which the instance uses to determine when to process emails.

Configure the processing order
Configure the processing order for inbound email actions to force them to run in a prescribed order.

Role required: admin

1. Navigate to System PolicyEmailInbound Actions.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the Order field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the Order field might be named Execution Order.

   Note: Ensure each inbound action has a unique Order value to ensure the system stops processing as expected. If multiple inbound actions have the same Order value, the system might evaluate all of the inbound actions, even if one of them contains the event.state="stop_processing"; script or has the Stop processing option selected.

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:
   - Select the Stop processing check box.
   - Add the following line to the bottom of the Actions script:

     event.state="stop_processing";
Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

Role required: admin
In this example, you can create new problem records when prb: appears in the subject line and new change requests when chg: appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

1. Create an action with a condition of Subject › starts with › chg: and the event.state="stop_processing"; command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of Subject › starts with › prb: and the event.state="stop_processing"; command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

It is not necessary to add the stop_processing command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

If either a change request or a problem is created, the stop_processing command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Activate ordered email processing

The Ordered Email Processing plugin is enabled by default for all new instances and can be installed by a user with the admin role for upgraded instances.

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.

If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Email filters

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. Email filters are inactive by default.

Default email filters

After activation, these filters are available from the System Mailboxes Filters module:
## Table 219: Default email filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents <strong>inbound email actions</strong> from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the <code>glide.pop3.ignore_headers</code> property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the <code>glide.pop3.ignore_senders</code> property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the <code>glide.pop3.ignore_subjects</code> property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter changes an email’s x-headers to mark a message as spam. This filter does not include the software product of the same name. This filter is enhanced in the Geneva release to provide better spam filtering.</td>
</tr>
</tbody>
</table>

**Note:** Using the Move spam to junk folder filter requires configuring your own email servers as the ServiceNow email infrastructure does not support changing email headers. You can accomplish such filtering with any software capable of changing email headers.

### Email filter script include

Email filters use a script include called EmailUtils that contains a simple utility function to determine if vCalendar is in the body of the response email. The results of this query are used in a condition script in the Ignore VCAL email filter.

### Spam scoring and filtering

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin. This is only available for instances that use the ServiceNow email infrastructure. See [KB0549426](#) for an explanation of email scoring and filtering.

**Activate email filters**

Administrators can activate the Email Filters plugin (com.glide.email_filter).

Role required: admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
If the plugin depends on other plugins, these plugins are listed along with their activation status. If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Create an email filter
You can create email filters to apply a custom action script or filter actions when email matches your filter’s conditions.

Role required: admin

1. Navigate to System Mailboxes Administration Filters.
2. Click New.
3. Complete the fields (see the table).
4. Right-click in the header bar and select Save from the context menu.
   The Filter Actions related list appears.
5. Click New in the related list.
6. Select how the system should react when the conditions of this filter evaluate to true.
   The two choices in the base system are: Mark as Ignored and Move to Junk. You can use the Action script to perform additional email tasks.
Table 220: New filter table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Brief, descriptive name for this filter.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Define an order for this filter to determine when it is evaluated. By default, the Ignore VCAL filter has the lowest order number and is evaluated first.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box (true) to enable this filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Concise description of the function of this filter.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Add conditions for this filter with the condition builder or with a condition script. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Create a script that defines the conditions for this filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Use the action script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs Email).</td>
</tr>
</tbody>
</table>

**Note:** Before creating additional email actions with a script, see [Inbound Email Actions](#). Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

---

**Email retention**

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.

**Email archive and destruction plugins**

The email archiving and destruction feature uses the [Data Archiving](#) and [Email Retention](#) plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

**Note:** The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.
Archiving and destroying email records

Archiving means moving records from the Email (sys_email) table to the Archive Email (ar_sys_email) table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

Note: When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

Default archive and destroy rules

Email Retention provides these email archive rules:

- Emails - Ignored and over 90 days old: archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- Emails - Over a year old: archives email message records that were created more than 365 days prior to the current date.

Email Retention also provides this email destroy rule:

- Email Archive - Over a year old: destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

Note: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

Note: For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a Sent Email section with a link to the email message. If the system archives the email message, the activity formatter removes Sent Email section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.
Note: Set the archive time length long enough so your users can access sent emails though the activity formatter.

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the In-Reply-To field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

Activate the Email Retention plugin
The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

Required role: admin

The Email Retention plugin requires these plugins:

- Data Archiving
- System Mailboxes

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Archive email manually
You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Email Retention provides these email archive rules:

- Emails - Ignored and over 90 days old: archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- Emails - Over a year old: archives email message records that were created more than 365 days prior to the current date.

You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

Note: An archive record must be active for the instance to be able to process records with it.

1. Navigate to System Archiving Archive Rules.
2. Open the email archiving rule that you want to modify.
3. Click Recalculate Estimate to see how many records in the Email (sys_email) table are going to be archived. The estimate appears in the Record estimate field.
4. Click Run Archive Now.

Note: You can also archive related records. See Archive related records.

Watermarks on notification emails

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records.

The watermark always includes “Ref:” and a customizable prefix, followed by the auto-numbered identifier of the source record, such as incident, problem, or change request. The default prefix is MSG. For example, Ref:MSG3846157.

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

Inbound email actions might not work properly if watermarks are omitted from email notifications. Without a watermark, inbound email messages cannot be associated with the accumulated comments related to the original incident, and each subsequent notification that is sent is treated as a new incident.

Note: Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

Note: Email clients that use the plain text version of the email still show the watermark.

Create a custom watermark prefix for email notifications

By default, email notifications use the watermark prefix MSG, but you can create a custom watermark prefix.

Role required: admin

Any email notifications that are forwarded from one instance to another might be indistinguishable because they use the same watermark. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.

1. Navigate to System Definition Number Maintenance.
2. Open the sys_watermark record.
3. Make the Prefix unique for this instance.
4. Click Update.

_Omit an email notification watermark_
You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Role required: admin
When incoming email does not contain a watermark, the system searches the subject line and message body for an incident number. The system attempts to match any incident number that it finds to an existing incident. If there is a matching incident number, the system updates the incident with the values in the incoming email.

1. Navigate to System Notification Email Notifications.
2. Select the email notification to update.
3. Click the Advanced View related link.
4. In the What it will contain section, select the Omit watermark check box.
5. (Optional) If you want response email messages to generate new incidents, remove the record number ${number} variable from the Subject and Message HTML fields.

_Hide email watermarks globally_
Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Role required: admin

1. Navigate to sys_properties.list in the Application Navigator.
2. Create a new property named glide.email.watermark.visible and set it to false.

   This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.
System mailboxes

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box. Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email (sys_email) table.

System Mailboxes

- Inbound emails: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the **Received** state. If the email message matches the criteria in an inbound email action, the email is changed to **Processed**. If not, it is changed to **Ready**. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.
- Outbound emails: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to **Sent** (if sent) or **Skipped** (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

The email client

The email client enables you to send email directly from any record, such as an incident, change request, problem, or user record. The email client is available by default, and enabled by default on the incident table.

The email client can be useful in cases where you want to send an email:

- To engage more people in a piece of work
- That includes Cc and Bcc recipients
- That includes personalized comments
- To a third party who doesn’t have an account in your instance
- To someone about an incident where you don’t have an email notification set up to do exactly what you want

The email client always uses the multipart/mixed content type and supports HTML markup in the message body.

Note: Line breaks do not appear for multi-line fields such as ${description} and ${comments} in the email client template.

Email client interface

The instance’s email client interface looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

Users see an email icon based on the UI version.

- UI16: The email icon (📧) appears in the more options menu.
- UI15: The email icon (📧) appears in the form header.

Users click the email icon to launch the email client as a pop-up window.
Figure 138: The email client interface

Note: The Subject field on the email client allows a larger character count than the default setting for the Subject field on the Email table. If the subject text from the client is being truncated, increase the Max length value for the Subject field on the Email table.

Customize the email client
The email client has default properties and values that you can customize to suit your needs.
Table 221: Email client default properties and values

<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>How to Customize</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACL access</td>
<td>Defaults to allowing only users with the itil role to access the email client.</td>
<td>To control who can see the email client, see <a href="#">Control access to the email client</a>.</td>
</tr>
<tr>
<td>Email icon</td>
<td>Allows only users with write access to the current table to see the email icon.</td>
<td>To remove the email icon, see <a href="#">Email icon display</a>.</td>
</tr>
</tbody>
</table>
| Autocomplete | Defaults to only displaying a user’s first and last name. A system property controls what columns the email client auto-complete displays. If your organization has several users with the same name, consider adding company or email address columns to help distinguish between users. | • To change search behavior, see [Configure email client auto-complete search results](#).  
• To display additional information, see [Additional information in the email client auto-complete](#). |
| To          | Defaults to the email address of the caller.                                  | To edit the default value, create an email client template.                        |
| Cc           | Defaults to the email addresses of the user who opened the incident and all users in the watch list. | To edit the default value, create an email client template.                        |
| Subject      | Defaults to the incident number and short description.                       | To edit the default value, create an email client template.                        |

Configure email client auto-complete search results

You can control the email client’s auto-complete search results with an email client property.

The following properties on System Properties UI Properties control the autocomplete functionality for the email client.

Maximum number of autocomplete matches returned to the Email Client. Applies separately to users and groups.

| 10 |

Include groups in Email Client autocomplete results

[Yes] [No]

Figure 139: Email client autocomplete properties

Table 222: Email client properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.email_client.autocomplete.count</td>
<td>Set the maximum number of auto-complete matches.</td>
</tr>
<tr>
<td>glide.ui.email_client.autocomplete.group</td>
<td>Specify whether groups are included in auto-complete results.</td>
</tr>
</tbody>
</table>

Additional information in the email client auto-complete
A system property allows the email client to display additional columns from the User table in the auto-complete list.

Administrators can add this system property to help distinguish between individuals who have the same first and last names, and to ensure that users select the proper recipient for an email.

Table 223: Email client properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.email_client.email_address.disambiguator</td>
<td>Sets the columns from the User (sys_user) table that the autocomplete list displays. Separate each column name with a semicolon character (;). See the system dictionary for a list of available column names. For example, to add the sys_user.email and sys_user.company columns, set the property to: email;company.</td>
</tr>
<tr>
<td>• Type: string</td>
<td></td>
</tr>
<tr>
<td>• Default value: name</td>
<td></td>
</tr>
<tr>
<td>• Location: Add to the System Property (sys_properties) table</td>
<td></td>
</tr>
</tbody>
</table>

Figure 140: Auto-complete in the email client

Control access to the email client
You can control access to the email client by changing an ACL rule.

Only users with the itil role can access the email client. The following ACL rule controls this access:

Table 224: ACL rule

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailClientProcessor</td>
<td>processor</td>
<td>execute</td>
</tr>
</tbody>
</table>
Note: Because the visibility of the email icon is determined by whether the current user has write access to the table, it is possible that a user may be able to see the email icon and still not open the email client.

Create an email client template
You can create a different template for each table that uses the email client.
Role required: admin

The email client uses its own email templates to define default values for fields.

1. Navigate to System Policy Email Client Templates.
2. Click New.
3. Fill in the fields on the Email Client Template form.

Table 225: Email client template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique template name.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table that the template applies to. You must enable the email client for the same table.</td>
</tr>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses.</td>
</tr>
<tr>
<td>Cc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses.</td>
</tr>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses.</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a description of the email. The description can contain a comma-separated list of field names or specific values.</td>
</tr>
<tr>
<td>Body</td>
<td>Enter any text or mail script that you want to appear in the message body.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Note: If the Client Templates module is not visible, enable the module.

Here is a sample template for the Incident table.

```javascript
template.print("Incident number -" + current.number + ":n" );
```

Here is how the template populates an incident email.
Set the from address with an email client template

Use an email client template to set a default value for the From field if it should be different from the system default.

Role required: admin

For example, you can dynamically set the From field to the email address of the current user.

1. Navigate to System Policy Email Client Templates.
2. Select an existing template or create one. For example, select the Incident Template record.
3. Configure the form to add the From field.
4. Enter a script to add a default value to the From field.

   For example, the following script displays the current user name and the current user email address.

   `javascript:gs.getUserDisplayName() + " <" + gs.getUser().getEmail() + " >"`

Display an editable From field

By default, the email client does not display a From field on email messages, but you can add one and have it be editable.

Role required: admin

By default, the email client uses an email address taken from the email account. To display an editable From field in the email client:

1. Navigate to System Properties UI Properties.
2. Select the Yes check box for Override the email ‘From:’ address in the email client (glide.ui.email_client.from).

**Display the Reply To field**
By default, the email client does not display the Reply to field because users cannot change this address. But you can display this field using a UI property.

Role required: admin

The email client always uses the same Reply to address as that defined for email notifications. This ensures that the email has a valid watermark and can generate inbound email actions as normal. If you want to change the global reply-to address you must configure your instance to use your own SMTP server.

1. Navigate to System Properties UI Properties.
2. In the Override the email ‘Reply to:’ address in the email client (glide.ui.email_client.reply_to) field, select the Yes check box.

**SMS delivery with the email client**
A property is available that lets the user select an option to send a notification via SMS.

The Subscription Based Notifications plugin activates the following system property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email_client.show_sms_option</td>
<td>Specify whether a check box appears in the email client for sending the message to the user’s SMS device. If no SMS device exists, the email client sends the message to the primary email device.</td>
</tr>
</tbody>
</table>
Quick messages
Quick messages allow you to insert predefined text into the message body of the email client.

Role required: admin

Selecting a quick message fills the Message Text field with the body specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client. Use the following syntax: ${variable_name}.

Note: If you add attachments to the Quick Message templates, the attachments are not sent as part of the email distribution.

1. Navigate to System Policy Email Quick Messages.
2. Click New.
3. Fill in the Email Client Canned Messages form.

Table 227: Email client canned messages form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter a name to appear in the Quick Message selector.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the quick message available for selection. Clear this check box to remove the message from the Quick Message selector.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>User</td>
<td>Select the user who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Select the group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Body</td>
<td>Enter the text you want to insert into the Message Text field. By default, the field supports HTML format.</td>
</tr>
</tbody>
</table>

4. Click Submit.
Email icon display

You can use access control rules to hide or display the email icon on forms.

Users with write access to the current table can see the email icon. To remove the icon, remove the user’s write access to the table. Typically you do this in one of two ways:

- Make the user an Employee Self-Service (ESS) user. ESS users do not have a user role, and without a role they do not have write access to the Incident table. Making a user an ESS users, therefore, hides the email icon on the Incident form.
- Create a custom ACL rule and user role that does not have write access to the table. The default ACL rule for the email client checks to see if the user has the itil role. If you grant users a custom role other than itil, then any such users will not see the email icon.
Remove or display the email icon for a table by setting the email_only dictionary attribute to true or false on the table’s collection record. This will not display the email icon for users without write access to the table. For more detail see .

Push notifications

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices.

A push notification is a text message that appears on a user’s mobile device to alert them about something important or to ask them to perform an action. Starting with the Geneva release, your instance supports push notifications.

![An example push notification](image)

Figure 142: An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by taking action on related records. For example, you can have the instance send an approval request for a Change to a user, and let the user approve or deny the Change by clicking a response button on push notification. The user’s response can then update the status of the Change record.
You can set up push notifications in a similar manner to email and SMS notifications. Determine:

- who to send the notification to
- when it should be sent
- what it should contain

By default, the ServiceNow mobile application supports push notifications. But you can also develop your own push application and configure your instance to send push notifications to it.

Push notification setup

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- **Push notification setup with the ServiceNow mobile application**

  Note: Push notifications for on-premise instances are not supported.

- **Push notification setup with a custom push application**. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system works. For more information, see the APNs Overview in the *Local and Remote Notification Programming Guide* for Apple developers.

  Attention: Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the *Local and Remote Notification Programming Guide* for Apple developers.

The push notification system

Several elements are involved in the push notification system.

- **Customer instance**: your instance.
- **Push proxy**: An instance that collects all push notifications that go to the ServiceNow mobile application and forwards them to the ServiceNow iOS application. If you create a custom push application, you do not use the push proxy.
- **Push provider**: The provider of push messages, which by default is the Apple Push Notification Service (APNs) for the ServiceNow mobile application.
- **Feedback provider**: The provider of feedback messages, which tell the instance what devices are no longer valid. By default, the Apple feedback server handles feedback messages for the ServiceNow mobile application.
- **Feedback proxy**: The ServiceNow instance that handles feedback messages from the Apple feedback server.
- **Push application on a mobile device**: The application, such as the ServiceNow mobile application. You can also build and customize your own push application.

Push notification process

The push notification process is as follows:

1. Activity on the instance triggers a push notification.
2. The instance looks for who to send the notification to and checks the user’s preferences to find their push device settings.
3. The instance sends the push notification to the push notification service, such as the Apple Push Notification Service (APNs). Optionally the instance can send the notification through a push proxy instance, which then forwards the notification to the APNs.

4. The push notification service sends the notification to the user’s push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID so that a response to the notification can be sent back to the correct instance.

5. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

6. The instance identifies a script to run to handle the response.

7. The script takes action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

This diagram shows the elements of the push notification system. Within the ServiceNow infrastructure are your instance, the optional push proxy instance, and the ServiceNow feedback proxy. External to ServiceNow are the APNs, and the user’s mobile device, which includes the application that is registered to receive push notifications. See Push feedback for an explanation of the feedback servers.
Push notification responses

One of the benefits of push notifications is that users can take action on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

http://{instance_name}/api/now/v1/push/{application Name}/action/{action}

The application name is the push application the user is using. This must match the application name in the Push Application [sys_push_application] table. The action is the Sys ID of the action in the Push Notification Action Script [sys_push_notif_act_script] table.

Push feedback

Feedback refers to the information about failed message delivery and the push applications that can no longer receive push notifications.

The instance uses a scheduled job to pull feedback data every hour from the APNs. When the APNs determines that a device can no longer receive push messages, the corresponding device in the Push Installation [sys_push_installation] table is set to inactive, thereby making it unable to receive push notification messages. If the same device is again able to receive push notifications, the device receives the same token and a new record is inserted into the Push Notification Installation [sys_push_notif_app_install] table.

Push notification setup with the ServiceNow mobile application

If you are using the default ServiceNow mobile application, push notifications are set up similar to subscribable notifications.

Note: Push notifications with the ServiceNow mobile application are not supported in on-premise instances.

The process is as follows:

1. A user installs the ServiceNow mobile application and agrees to accept push notifications. The device then:
   • Obtains a token that identifies the device
   • Triggers the creation of a device in the user’s notifications preferences
   • Automatically subscribes the user to the push-specific notifications that are set up for the ServiceNow mobile app.

   When the instance receives the push notification acceptance message, it creates a record in the Push Notification Installation [sys_push_notif_app_install] table. This record is what the instance uses to idenfity the device + mobile application combination necessary to identify a push notification recipient.

2. The system administrator sets up push notifications, just like they set up an email notification. Push notifications contain two parts:
   • The push message
   • The notification, which includes the push message

3. Users or administrators can verify the user’s notification preferences to see if the user has a push device configured and that the user is subscribed to the relevant push notifications.
Push notification setup with a custom push application

If you are using your own mobile or push application, push notifications there are a number of steps to take in addition to setting up push notifications with the ServiceNow mobile application.

The process is as follows:

1. The push app developer creates a record in the Push Application (sys_push_application) table for the custom application. This record is what the instance uses to identify the device + push application combination necessary to identify a push notification recipient.
2. The push app developer creates push notification action scripts to tell the instance how to handle responses to push notifications.
3. The push app developer can also create a content payload in JSON for different types of push notifications. The content determines how a push notification appears on the push application, and whether or not the user can send a message in response to the push notification.
4. The system administrator sets up push notifications, and specifies the custom push app and, if desired, the content.
5. Users set up their push device on their user profile’s notification preferences, just as they can set up email addresses or devices for SMS messages. Administrators can also set up these preferences on behalf of users.

Activate push notifications

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.snc.service_management_m) plugin active, push notification plugins are automatically activated.

Role required: admin

You must have the following plugins active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.

This plugin is installed in the push notification infrastructure:

- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki Now Platform Capabilities

Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

<table>
<thead>
<tr>
<th>Reason/Comments</th>
<th>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</th>
</tr>
</thead>
</table>

3. Click Submit.

### Installed with push notifications

Several types of components are installed with the push notifications plugins.

### Tables installed with push notifications

These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Application (sys_push_application)</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Push Default Registration (sys_pushnotif_default_reg)</td>
<td>Contains all of the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
<tr>
<td>Push Feedback (sys_push_feedback)</td>
<td>Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or a central instance that uses a REST call to tell your instance which push applications to deactivate.</td>
</tr>
<tr>
<td>Push Message Attribute Definition (sys_pushnotif_msg_attr_def)</td>
<td>The attribute definitions used for push message content specification.</td>
</tr>
<tr>
<td>Push Message Attribute Value (sys_pushnotif_msg_attr_val)</td>
<td>The values associated with push messages.</td>
</tr>
<tr>
<td>Push Notification (sys_push_notification)</td>
<td>The push notifications that the instance attempted to send to users.</td>
</tr>
<tr>
<td>Push Notification Action Script (sys_pushnotif_act_script)</td>
<td>The scripts that the instance uses in response to an actionable push message.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki Now Platform Capabilities

#### Push Notification Installation
(sys_pushnotif_app_install)

The devices with push apps where users agreed to receive push notifications. The records in this table are listed by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app.

The Mobile Devices (sys_mobile_devices) table, which is installed with the Mobile UI plugin, contains all the user devices that logged into the instance with the ServiceNow mobile application.

#### Push Notification Message (sys_pushnotif_msg)

Messages customized for push notifications. These messages can be associated with a notification.

#### Push Notification Message Content (sys_pushnotif_msg_content)

The entire content, including JSON, for push messages.

#### Push Platform (sys_pushplatform)

The platforms that are supported for push notifications, and the maximum payload size.

#### Business rules installed with push notifications

These business rules are installed with push notifications.

<table>
<thead>
<tr>
<th>Business rule</th>

</table>

Set up push notifications for the ServiceNow mobile app

Administrators can set up push notifications by creating push-specific notifications and associating them with standard platform notifications.

The **Push notification plugin** must be active.

Role required: admin

Follow these steps to set up push notifications that send content to users.

Create a push message

Before you create a push notification, create a push message with the actual message content.
Role required: admin
2. Fill out the fields on the form (see table).
3. Click Submit.

Table 232: Push Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
<tr>
<td>Push app</td>
<td>Select a push app that this message can be sent to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Push Message Content</td>
<td>Select <a href="#">content layout for the message</a></td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Values</td>
<td>Select the attributes that apply to this notification. The attributes on this form override those <a href="#">associated with the content layout</a>.</td>
</tr>
</tbody>
</table>

Make sure that the relevant users have their push devices configured and that the users subscribe to the notification in the user’s notification preferences. See [Set up a mobile notification device for a user](#), [Select notifications](#), and [Add personal subscriptions](#).

Create a notification using a push message

Email administrators can create a notification that specifically sends a push notification.

Configure the [push message](#) and create a [push message content](#) before performing these steps.

**Role required:** admin

You can associate a push message with a standard notification.

1. Navigate to [System Notification Create Push Notification](#).
2. Fill out the notification form as necessary (see [Create an email notification](#) for descriptions of the form fields).
3. Click the What it will contain tab.
4. Next to Push Messages, click the lock icon and select a push message.
5. If you want this notification to be sent only as a push notification and not as any other type of notification, select Push Message Only.
6. Click Submit.

If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

Make sure that the relevant users have their push devices configured and that the users subscribe to the notification in the user’s notification preferences. See [Set up a mobile notification device for a user](#), [Select notifications](#), and [Add personal subscriptions](#).

Set up push notifications for a custom push app

Mobile application developers can set up a customized push app and configure components such as action scripts and notification layouts.

The [Push notification plugin](#) must be active.

**Role required:** admin or push_admin

Follow these steps to set up a push notification infrastructure using your own push application.

---

Caution: General system administrators do not need to configure these settings to use the ServiceNow mobile application with push messages. These instructions are intended for users who develop their own customized push application.

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Create a push application

You must register your customized mobile application with your instance so it can receive push notifications.

Role required: admin or push_admin

Push notifications are application specific: they are sent to one type of mobile application, regardless of how many users have this application installed. By default, the ServiceNow mobile application is automatically set up and ready to use starting with the Geneva release. If you develop your own mobile application, you must create a record for it in the Push Application table.

1. Navigate to System Notification Email Push Application.
2. Fill out the fields on the form (see table).
3. Click Submit.
A push application is a mobile app that can receive push notifications from a ServiceNow instance. Create a mobile application record for your customized mobile app and specify how to handle push messages and feedback.

Name: ServiceNowPushApp  Application: Global
Push: REST API  Feedback: None

Push Notification Message Contents

</tbody>
</table>

Create a push action

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the Approval field on the relevant Change Request record.
You can use global variables or, optionally, current variables and parameters passed through the JSON content.

Role required: admin or push_admin

2. Fill in the form fields (see table).
3. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the action.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the script.</td>
</tr>
</tbody>
</table>

See Push notification example for an example of a push action.

Create push message content

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

You must know how to use JSON with push messages.

Role required: admin or push_admin

The content layout defines the style of push notification that can be sent out. Push contents give you the opportunity to add content, such as a picture, as well as provide action buttons or icons. Use these in the script:

- current: the properties of the current record.
- message: the push message sent as the body of the entire push content.
- attributes: the object of the push message attributes that you define.

2. Fill out the fields on the form (see table).
3. Click Submit.
Push notification message content specifies additional JSON content in the push notification payload that is sent to the push provider. Use this record to create the JSON content and specify the provider-specific values, such as a sound or badge.

The following variables are available for use in the script:
- `current`: access properties of the record that triggered this push notification, such as the fields on an incident record.
- `message`: access contents of the message that will be sent as the body of the push notification.
- `attributes`: access attributes defined for this push notification.

### Table 235: Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the layout. See the example scripts below.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Definitions</td>
<td>Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create an attribute definition for information on creating attributes.</td>
</tr>
</tbody>
</table>

The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
  "table" : current.getTableName(),
  "sys_id" : current.sys_id,
  "template" : {
    "type": "2 button",
    "button1" : {
      "title" : "Approve",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "approve"
      }
    },
    "button2" : {
      "title" : "Decline",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "decline"
      }
    }
  }
};

json;
```

Create an attribute definition
Push message attribute definitions allow you to create reusable properties for push message content specification.

Role required: admin or push_admin

Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

These attributes can be overridden by any push message attribute values that you create.

2. Select a content layout record or script record.
3. In the Push Message Attribute Definition related list, click New.
4. Fill out the fields on the form (see table).
5. Click Submit.

Table 236: Push Message Attribute Definition form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Attribute Type</td>
<td>Select the type of attribute:</td>
</tr>
<tr>
<td></td>
<td>• Action: An action to take on the instance, as defined by a script.</td>
</tr>
<tr>
<td></td>
<td>• String: An arbitrary string to send as part of the message content.</td>
</tr>
<tr>
<td></td>
<td>The string can specify items like a button label in the message.</td>
</tr>
<tr>
<td>Default Script</td>
<td>Select the mobile action script that tells the instance what to do when it receives a response from the push notification. This option appears if you select Action for the Type.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select String for the Type.</td>
</tr>
</tbody>
</table>
See [Push notification example](#) for an example of a push attributes.

Create an attribute value or action for a push message

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Create default definitions on the Push Message Attribute Definitions related list of the Push Message Content form.

Role required: admin or push_admin

These push message attribute values override values that you set in an [attribute definition](#) on the Push Content form.

2. Select a message.
3. In the Push Message Attribute Values related list, click New.
4. Fill out the fields on the form (see table).
5. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select a push message attribute definition.</td>
</tr>
<tr>
<td>Value/Action</td>
<td>Enter the value for the attribute or select the push action. This field changes to Value or Action depending on the type of attribute you select in the Attribute field.</td>
</tr>
</tbody>
</table>
See **Push notification example** for an example of a push message attributes.

Push notification example

This example illustrates a customized push notification, including customized push actions and content. In this example, you will learn how to create a push notification for incidents that are not assigned to anyone. This example assumes you created your own custom push application that is referred to in this example as MyPushApp. The notification will be sent to a user who can respond by accepting assignment to the incident or ignoring it.

The push actions

First you will create push actions that give the user options on how to respond to the push notification. In this example, create two actions: assign to me and ignore. The content of the actions is as follows:

- **Assign to me**:

  ```javascript
  (function runAction(/*Optional GlideRecord*/ current) {
    if (current.getTableName() == "incident" && current.assigned_to == undefined) {
      current.comments = "I have self assigned this incident to myself";
      current.assigned_to = gs.getUser();
      current.update();
    }
  })(current);
  ```

- **Ignore**:

  ```javascript
  (function runAction(/*Optional GlideRecord*/ current) {
    gs.log(gs.getUser() + " ignored this record: " + current.number);
    //writes a message to the system log that the user ignored this incident.
  })(current);
  ```

See **Create a push action** for specific steps on how to create these actions.

The push content

Next, you will create the JSON content that specifies two buttons that the user will use to respond to the incident. The content is as follows:

```javascript
(function buildJSON(/*GlideRecord*/ current, /*String*/ message, /*Object*/ attributes) {
  var json = {};

  json = {
    "aps" : {
      "sound" : "default"
    },
    "record" : {
      "table" : current.getTableName(),
      "sys_id" : current.sys_id
    },
    "action" : {
      "button1_text" : attributes.name_of_button1,
      "button1_action" : attributes.action_of_button1,
      ...  // More action properties
    }
  }
})
```
The content script specifies two labels and two actions, one for each button. You must create
definitions for these. But later you will override these definitions with the actual button labels and actions
on the push message. Here are the definitions:

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Attribute Type</th>
<th>Default Value</th>
<th>Default Script</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_on_button1</td>
<td>Action</td>
<td></td>
<td></td>
</tr>
<tr>
<td>action_on_button2</td>
<td>Action</td>
<td></td>
<td></td>
</tr>
<tr>
<td>name_of_button1</td>
<td>String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>name_of_button2</td>
<td>String</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Figure 144: Attribute definition examples

The push message

Next you will create a push message that specifies the message that appears to the user: Can you
take on a new incident?. The push message associates your custom application MyPushApp with the
content you just created.
The Push Message Attribute Values related list specifies the four items needed for the button label and the action the instance takes when the user clicks that button:

Table 238: Push message attribute values

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_on_button2</td>
<td>Ignore</td>
<td>Ignore</td>
<td>The Ignore action is what you specified as a push action. This is associated with button 2.</td>
</tr>
<tr>
<td></td>
<td>The value is ignored because this attribute specifies an action.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>action_on_button1</td>
<td>Assign to me</td>
<td>Assign to me</td>
<td>The Assign to me action is what you specified as a push action. This is associated with button 1.</td>
</tr>
<tr>
<td></td>
<td>The value is ignored because this attribute specifies an action.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>name_of_button2</td>
<td>Ignore</td>
<td>none</td>
<td>Ignore is the label the user sees for button 2.</td>
</tr>
<tr>
<td>name_of_button1</td>
<td>Assign to me</td>
<td>none</td>
<td>Assign to me is the label the user sees for button 1.</td>
</tr>
</tbody>
</table>
The push notification

Finally, you will create a notification that is triggered when a new incident is unassigned. It is sent to a group named Incident Manager. You will then associate the push message that you just created with it. The notification is as follows:

![Notification form]

When to send

Who will receive

What to send

Figure 146: Push notification example

Set up a mobile notification device for a user

When a user registers their mobile application to an instance, a notification device is automatically created for them in their notification preferences. You can still set up or modify mobile notification devices for your users.

If your users have the ServiceNow mobile application installed on their devices, you do not need to follow these instructions.

1. Navigate to User Administration Users.
2. Select a user.
3. Click Notification Preferences.
4. Click New Device.
5. In the Type field, select Push.
6. In the Push app field, select the application that is already configured to handle push notification for the instance.

See Set up a notification device for more information on the other fields in this form.

You can also disable the push device for the user if the user should no longer receive push notifications.
7. Subscribe to the push notifications or instruct the user to subscribe in their notification settings.

Failed push notification messages

Push notification delivery might fail for a number of reasons. You can view which messages failed and re-queue them to be sent out if necessary.

Role required: admin

Note: There is no way for the instance to guarantee or confirm push message delivery. See the iOS developer library for more information about how Apple handles push notifications.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:

- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. See the iOS Developer Library payload documentation for more information on Apple payload limitations.

1. Navigate to System Logs Push Notifications.
   By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:
   - failure: The message could not be sent.
   - pending: The message is queued and will be processed.
   - success: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting Re-queue failed push notifications from the choice list.

3. If a number of push notifications continue to fail, consider increasing the value in the glide.push.notification.ttl_seconds property. See Push notification properties for more information.

Push notification properties

Push notifications provides several properties to customize the setup.

Add these properties to the System Properties (sys_properties) table.

Table 239: Push notification properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.push.debug</td>
<td>Creates entries in the system log for push notification errors.</td>
<td>false</td>
</tr>
</tbody>
</table>
### Subscription-based notifications

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification devices, such as mobile phones, that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

In previous releases, users had to wait until they received a notification before the subscription-based notification appeared in their notification settings. Starting with the Helsinki release, notifications that administrators marks as subscribable are automatically available in user notification settings.

Administrators should create subscription-based notification when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.

### Subscriptions 2.0 plugin

The Subscription Based Notifications 2.0 plugin must be active to use the new functionality available with the Helsinki release. This plugin is active by default on all new and upgraded Helsinki instances.

The plugin installs the Notification Subscription (sys_notif_subscription) table, which holds user subscriptions to all notifications.

---

**Note:** The mobile interface does not support the new user notifications page.

### Set up a notification device

You can add devices for a user to receive notifications. A **device** is a mobile device, email account, or voice message system that the user has access to.

**Role required:** admin

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.push.feedback.debug</td>
<td>Creates entries in the system log for feedback sent by the APNs.</td>
<td>false</td>
</tr>
<tr>
<td>glide.push.notification.ttl_seconds</td>
<td>Specifies a time period after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the Push Notifications log for more information.</td>
<td>21600 seconds (6 hours)</td>
</tr>
<tr>
<td>glide.push.enabled</td>
<td>Enables or disables push notifications.</td>
<td>true</td>
</tr>
</tbody>
</table>
Notification devices include email addresses, service providers for SMS messages, and mobile applications.

1. Navigate to User Administration Users.
2. Select a user.
3. Click Notification Preferences.
4. Click Create New Device.
5. Fill in the fields on the form (see table).
6. Click Submit.

### Table 240: New Device form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name of the device or account.</td>
</tr>
<tr>

<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related list</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider’s advanced script. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

Note: If you inactivate a device, it still appears in the user preferences, but the switches that allow users to select the notifications are grayed out for that device column.

Edit a notification device

Any user can edit their notification preferences, including notification devices.

Role required: any user

1. Navigate to Self-Service My Profile.
2. Click Notification Preferences.
3. Click the name of the existing device.

The device form opens allowing you to make certain modifications, depending on your user role. See Set up a notification device for a description of all fields.

Add personal subscriptions

After setting up your devices, you can subscribe to notifications that are configured as subscribable.

The Subscription Based Notifications 2.0 plugin must be active.

If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

Note: Conditions that you apply to personal subscriptions do not override the filters that the administrator creates for the subscribable notifications. Your conditions are evaluated after the conditions on the subscribable notification are met. If the administrator’s notification filter fails, the filter conditions on your personal subscription are not evaluated.

1. Navigate to Self-Service My Profile to open your user profile.
2. Click the Notification Preferences related link.
   The Notification Preferences page opens. You can see your personal subscriptions and the general notifications that you are subscribed to.
3. Click Subscriptions.
4. Click Add Personal Subscriptions.
5. Fill in the fields as described in the table.

![Add Personal Subscription](image)

**Table 241:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the subscription.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the incident is configured to run on. You cannot modify the table from this form. To select another table, configure the notification. See <em>Create an email notification</em>.</td>
</tr>
<tr>
<td>Active</td>
<td>If the subscription is active. Users can receive notifications for subscriptions only if the subscription is active. If it is not active, the on-off switch for the subscription is set to off and is read-only.</td>
</tr>
<tr>
<td>Send to</td>
<td>The devices that this subscription is sent to. Selecting the devices in this field is the same as turning on the switch for the subscription on the Subscriptions page.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the subscription is based on. Click the lookup icon, and then select the table and the specific record in that table.</td>
</tr>
<tr>
<td>Send when</td>
<td>An additional condition that must be met to send the notification. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions in the administrator’s notification filter.</td>
</tr>
</tbody>
</table>

Figure 147: Add personal subscriptions
6. Click Submit.
7. You can turn the subscription for active subscribable notifications on or off using the switch on the Subscription management screen.

![Subscription Table](image)

Figure 148: Personal subscriptions

Personal subscriptions are saved in the Notification Subscriptions (sysnotif_subscription) table. The records in this table are made active or inactive when you click the switch to subscribe or unsubscribe from the notification.

8. You can edit the subscription at any time by clicking Edit next to it.

Select notifications

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

1. Navigate to Self-Service My Profile to select your own notifications, or if you have admin access, navigate to User Administration Users to select notifications for another user.
2. Click a user record to open it.
3. On the User form, click Notification Preferences under Related Links.

The notification preferences page appears. The preferences pages show all the notifications available to the user and the devices that the user has configured, such as email or mobile phone. If a user does not have read access to the table on which the notification is based, the notification does not appear.

Every user has the Primary email device, where subscriptions to email notifications can be enabled.
4. Click the switch next to the notification to subscribe the user to it.

Modify notifications for a specific user device

After you set up the devices through which users can receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications you can receive.

Role required: admin

1. On the Notification Preferences page for a user, find the notification from the list of notifications.
2. Click Edit next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click Submit.
Notification Preferences allow users to prevent notifications from being sent to them with Filters and Schedules. Schedule allows users to only have notifications sent to them when generated within a specific schedule. Filters give the ability to prevent notifications from being sent with pre-defined filters. Advanced Filter allows definition of a custom filter.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification Message</td>
<td>Select the notification. Related fields appear for certain notifications. For example, if you select CI affected or Location affected, a field appears for selecting the CI or the location. Duplicate messages are not permitted on a device.</td>
</tr>
<tr>
<td>Device</td>
<td>Modify the device if necessary.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Filter | Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions in the administrator’s notification filter. This field is not available when an advanced filter is configured.

Advanced filter | Select this option if you want to use the condition builder to create additional criteria. When you select the check box, the Filter field is replaced by the Table and Conditions fields.

Table | Select the table for the notification. For example, if you select the CI affected notification message, you might select the Incident (incident) or Change Request (change_request) table. This field appears when you check the Advanced filter check box.

Conditions | Define as many conditions as needed to limit the notifications you receive.

Create a service provider

Administrators can configure service providers for devices that use SMS.

Role required: admin

Administrators also have the option of configuring how a device’s service provider affects the construction of the device’s email address.

1. Navigate to the Notification Service Provider (cmn_notif_service_provider) table by typing cmn_notif_service_provider.list in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click Update.
4. Click Save on the Notification Preferences page.
Table 243: The Notification Service Provider form fields

<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + <a href="mailto:def@text.att.net">def@text.att.net</a> would construct an email address of <a href="mailto:abc2223344444def@text.att.net">abc2223344444def@text.att.net</a>. <strong>NOTE:</strong> Current is a reference to the device, not the service provider, hence the current.phone_number variable that uses the device’s phone_number value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device’s specified phone number; for example: <a href="mailto:PREFIX2223344444@text.att.net">PREFIX2223344444@text.att.net</a></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after ’@’ sign; for example: 2223344444@SUFFIX</td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider’s Advanced script. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

### Select a service provider

You can configure how a device’s service provider affects the construction of the device’s email address.

**Role required:** admin

1. Navigate to User Administration Users and open any user’s record.
2. Under Related Links, click Notification Preferences, and then click an SMS notification device.
3. If no SMS device is present, click New Device and configure one.
4. Select the appropriate service provider, and then click the reference icon for the Service provider field. The service providers are saved in the Notification Service Provider [cmn_notif_service_provider] table. Only active providers are visible.

### SMS notification advanced scripting

You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

**Table 244: Objects and attributes**

Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

Role required: admin

1. Navigate to System Notification Email Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Mandatory field. This field does not display by default.
4. Select the Mandatory check box.

That notification is now locked in user preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule. In the user’s notification preferences, the control button for the mandatory notification is on and is read only.

Force a notification to be sent

To force a notification to be sent to the specified users, enable forced delivery.

Role required: admin

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the Notification field is set to Disable.

1. Navigate to System Notification Email Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Force delivery field.
4. Select the Force delivery check box.
5. Click Update.

Unlike using the Mandatory option, forcing the delivery does not lock the user’s preference or prevent the user from unsubscribing from the notification.

Add an unsubscribe link to an email message

You can add an Unsubscribe link to the bottom of any email body so users can unsubscribe from any subscription-based notification.

Role required: admin

• Paste the following code into an email notification or template:
Create a notification filter

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Role required: admin

For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. Notification filters are available for selection in the Filter field of a user's Notification Preferences form.

Note: The system applies the user’s filter conditions after the administrator’s conditions have been evaluated. If the administrator’s conditions fail, the system ignores notification filters.

1. Navigate to System Notification Email Notification Filters and create a record.
2. In the Notification conditions related list of the new record, create and submit filter conditions on one or more tables.
3. Repeat the procedure to create additional conditions on other tables for this filter.

Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Role required: admin

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the Weekdays schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

1. Define schedules as needed using System Scheduler Schedules Schedules.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the Schedule field.
4. In the Schedule field, select the schedule for the device.
5. Click Submit.

Edit the schedule or filter of an existing notification message

You can update a schedule or filter that was previously created for an email notification.

Role required: admin

To edit the schedule or filter of an existing notification message:

1. In the Notification Preferences screen, click the message to edit.
   You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Click Update.
Notify

Notify allows you to integrate with telephony providers such as the Twilio service to manage phone calls and SMS messages from within your instance.

You must activate the Notify plugin to access the Notify product.

Notify with the Twilio service

Notify allows you to send and receive phone calls and SMS messages from your instance using the Twilio telephony service.

Notify automatically creates a TwiML application in the Twilio service and configures the application to use the instance as an endpoint. Phone numbers associated with the Twilio subaccount are imported to Notify.

To manage phone numbers per instance, set up one Twilio subaccount for each instance and configure all relevant phone numbers for the instance under that subaccount.

The Notify plugin must be active to access the Notify product.

Note: Only one Twilio account (or subaccount) can be configured on Notify at a time.

Configure Notify with the Twilio service

You can configure Notify to use the Twilio telephony service.

The Notify plugin must be active to use Notify.

You must have an SID and authentication token for an active Twilio subaccount (https://www.twilio.com/).

Important: Ensure that each instance you configure Notify on uses a different Twilio subaccount. Each subaccount specifies a unique SID, authentication token, telephone numbers, and endpoint. Using the same subaccount across multiple instances may cause your Twilio service configuration to be overwritten.

Role required: notify_admin

1. Navigate to Notify Twilio Configuration.
2. Enter your Account SID and Auth Token.

Note: These values are only visible to users with the admin role.

3. Click Save.

A read-only list of E.164 and short code phone numbers associated with this Twilio subaccount appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group the number belongs to.

Note: If you buy or release numbers on the Twilio subaccount, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the Active field set to false. Use only active phone numbers for inbound or outbound communication.

Create a number group

E.164 and short code phone numbers you import to Notify are stored on the Notify Phone Numbers (notify_number) table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

Create a number group

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Role required: notify_admin

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

1. Navigate to Notify Number Groups.
2. Click New.
3. Enter a Name, and select Notify: (Re)join Conference Call for the Incoming call workflow field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the number group.</td>
</tr>
<tr>
<td>Incoming call workflow</td>
<td>Workflow to run when there is an incoming phone call for this group.</td>
</tr>
<tr>
<td>Incoming SMS workflow</td>
<td>Workflow to run when there is an incoming SMS message for this group.</td>
</tr>
<tr>
<td>Outgoing call workflow</td>
<td>Workflow to run when there is an outgoing phone call for this group.</td>
</tr>
<tr>
<td>Outgoing SMS workflow</td>
<td>Workflow to run when there is an outgoing SMS message for this group.</td>
</tr>
</tbody>
</table>
Incoming call workflows must run on the Notify Call (notify_call) table. Incoming and outgoing SMS workflows must run on the Notify Message (notify_message) or Global (global) tables.

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click Submit.

**Associate a number to a number group**

After creating a number group, associate numbers with that group to use the selected workflows.

Note: Each phone number can only be associated with one number group.

---

**Associate a number to a number group**

Associate a Notify number to a number group to use inbound and outbound workflows.

Role required: notify_admin

1. Navigate to Notify Numbers.

   ![Notify Numbers](image)

2. Click the listed phone number and assign it to a Number Group, as appropriate.

   Note: Each phone number can only be associated with one number group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number for the entry.</td>
</tr>
<tr>
<td>Phone number</td>
<td>E.164 phone number, if applicable.</td>
</tr>
<tr>
<td>Notify group</td>
<td>(Optional) Group to which this number is assigned.</td>
</tr>
<tr>
<td>Number owner</td>
<td>Service provider of the number.</td>
</tr>
<tr>
<td>Short Code</td>
<td>Short code number, if applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that indicates whether the number is active or not.</td>
</tr>
</tbody>
</table>

3. Click Update.

**Outbound communication requirements**

Outbound communications initiated through Notify, such as phone calls and SMS messages must satisfy certain requirements.
These requirements apply to all outbound communications initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running, and cause an error to be logged. Set the glide.notify.debug property to true to create detailed error logs.

Recipient number requirements

These requirements apply to any number that receives a Notify phone call or message.

- Calling country must be authorized from Twilio
- The number must be E.164 compliant
- The number must be different than the phone number used to initiate the call or message

Notify calls

As a Notify administrator, you can view a list of calls made to or from Notify.

To view a list of calls, navigate to Notify Calls.

Call records are generated automatically when a user calls a Notify number, or when a user makes an outbound call through Notify. You cannot create call records manually. You can delete call records.

---

**Note:** Deleting a call record may result in cascade deletion of related records.

<table>
<thead>
<tr>
<th>Call status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No answer</td>
<td>The call is not answered, or if the number is configured for voicemail, a message is left on the voice mailbox.</td>
</tr>
<tr>
<td>In-progress</td>
<td>The call is answered and is active.</td>
</tr>
<tr>
<td>Completed</td>
<td>The conference call is completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The provided phone number is invalid.</td>
</tr>
</tbody>
</table>

How incoming Notify calls are processed

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity (notify_wf_activity) table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity onExecute() function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a State value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record State changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity response_args field.

9. The notify_wf_activity State changes to complete.

10. The JSON data from the notify_wf_activity record is copied to the Last action field in the Notify call record that triggered the workflow.

11. The workflow invokes the onUpdate() function in executing activities.

12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.

13. The workflow transitions to the next activity.

Notify conference calls

Notify allows you to connect multiple callers to a single conference call.

Conference call records are stored on the Notify Conference Call [notify_conference_call] table. Conference call participant records are stored on the Notify Participant [notify_participant] table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the Duration of a call are set automatically using business rules.

Notify administrators can manage conference call participants, such as by muting or kicking them.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: Join Conference Call Via SMS

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

Mute or kick a conference call participant

You can mute or kick conference call participants.

Role required: notify_admin

Before starting this procedure, ensure there is an active conference call with one or more participants.

1. Navigate to Notify Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

You can unmute a muted participant but cannot add a kicked participant back to the conference call. A kicked participant may rejoin the conference call, such as by calling in again.

Using SMS with Notify

You can send and receive SMS messages using Notify.

You can send SMS messages using the Notify API sendSMS method, or using the send SMS workflow activity.

Inbound and outbound SMS messages are stored on the Notify Messages [notify_message] table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost as each
message can incur a cost. Some mobile carries, such as Sprint, do not support concatenated SMS messages.

Properties for Notify

These are the properties related to Notify.

Table 245: Properties for Notify

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_twilio_driver.max_conference_participants</td>
<td>Twilio max limit for number of participants in the conference call.</td>

<td>Update Participant Session Active</td>
<td>notify_call</td>
<td>Synchronizes the state of the call between notify_call and notify_participant</td>
</tr>
<tr>
<td>State</td>
<td>_session</td>
<td>_session. Upon disconnecting from the call, updates notify_participant</td>
</tr>
<tr>
<td></td>
<td></td>
<td>_session with the duration of the call.</td>
</tr>
</tbody>
</table>

Notify workflow activities

Notify activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the Table field value is Notify Call (notify_call).

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the current.is_human variable, such as with an If workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a Timer activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow If condition matches field to -- None --. Notify controls which workflow to run based on the configured number groups.

Join conference call workflow activity

The Join Conference Call connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

Input variables

Input variables determine the initial behavior of the activity.

**Table 247: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki

#### Now Platform Capabilities

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

#### Conditions

The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

#### Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

**Table 248: Values read from scratchpad**

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the join conference call activity will log an error. When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

#### Call workflow activity

The Call activity makes outbound phone calls using a Notify workflow.

#### Input variables

Input variables determine the initial behavior of the activity.

**Table 249: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as <code>{notify_number: ‘sys_id’, phone_number: ‘+316...’}</code></td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

Send SMS workflow activity

The Send SMS activity sends short text messages to users’ phones using Notify.

Input variables

Input variables determine the initial behavior of the activity.

Table 250: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
</tbody>
</table>
Table 251: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

Forward call workflow activity

The Forward Call activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the forward call activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

Input variables

Input variables determine the initial behavior of the activity.
Conditions

The conditions determine which transition comes after this activity. The forward call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

Input workflow activity

The Input activity creates a phone menu by presenting a list of options on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

Table 252: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:</td>
</tr>
<tr>
<td></td>
<td>answer = { 1: { &quot;say&quot;: &quot;https://some_url.com/options/one.mp3&quot;, &quot;myCustomData&quot;: &quot;some data here&quot; }, 2: { &quot;say&quot;: &quot;type 2 to speak to a representative&quot;, &quot;language&quot;: &quot;en-US&quot;, &quot;myCustomData&quot;: &quot;some more data here&quot; } };</td>
</tr>
<tr>
<td></td>
<td>The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as myCustomData in the example above.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine the transition that comes after this activity.

The input activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition Name to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format xx-XX: ⟨Message⟩. For example, add fr-CA: for Canadian French. Available languages are stored on the Notify Language (notify_language) table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition Condition value to parseInt(workflow.scratchpad.digits) == ⟨expected digits⟩. For example, to transition through a condition when the caller presses the number 3, set the Condition to parseInt(workflow.scratchpad.digits) == 3.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

Scratchpad Entries

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu⟨activity name⟩</td>
<td>The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using var previousActivity = &quot;choices&quot;; var choicesMenu = workflow.scratchpad.menu[previousActivity]; var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input. var selectedValue = menuItem.myCustomData; //get the custom data for the selected menu item.</td>
</tr>
</tbody>
</table>

Hangup workflow activity

The Hangup activity disconnects an active Notify phone call.

You can use the hangup activity to disconnect only calls that have been answered. Use the reject activity to disconnect calls that have not been answered.

Play workflow activity

The Play activity plays a sound file on a Notify call.
Input Variables

Input variables determine the initial behavior of the activity.

Table 254: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity

The Record workflow activity records audio from a user on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

Table 255: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.
Table 256: Values written to scratchpad

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller’s phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

Reject workflow

The Reject workflow activity rejects an incoming Notify call. You can use the reject activity to disconnect only calls that have not yet been answered. Use the hang up activity to disconnect calls that have been answered.

Input variables

Input variables determine the initial behavior of the activity.

Table 257: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity

The Say activity plays a message, using text-to-speech, on a Notify call.

Input variables

Input variables determine the initial behavior of the activity.

Table 258: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
</tbody>
</table>
Forward to notify client workflow activity
The Forward to Notify Client workflow activity connects a phone call to a Notify WebRTC client.

Input variables
Input variables determine the initial behavior of the activity.

Table 259: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

Conditions
The conditions determine which transition comes after this activity. The Forward to Notify Client activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Queue workflow activity
The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Notify activity event handlers
Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.
When a telephony provider such as the Twilio service broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

Creating Notify activities

Default Notify workflow generally perform a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the onCompleted function.

```javascript
onCompleted: function() {
    activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.

- Within onExecute event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the notify_wf_activity table.
- Within the onUpdate event handler function, deserialize the NotifyAction object from the notify_wf_activity table and use this object to perform any other operations.
- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the Reject activity ends the call before the caller connects so the onNoAnswer function is never invoked from this activity.

Note: When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

<table>
<thead>
<tr>
<th>Table 260: Event handlers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Handler</strong></td>
</tr>
<tr>
<td>onExecute</td>
</tr>
<tr>
<td>onUpdate</td>
</tr>
<tr>
<td>onCompleted</td>
</tr>
<tr>
<td>onRinging</td>
</tr>
<tr>
<td>onInProgress</td>
</tr>
<tr>
<td>onNoAnswer</td>
</tr>
<tr>
<td>Handler</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>onBusy</td>
</tr>
<tr>
<td>onFailed</td>
</tr>
</tbody>
</table>

Notify languages

Notify supports multiple languages when using text-to-speech.

For example, when using the input or say workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Language (`notify_language`) table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

Notify on task

Notify allows you to send SMS alerts and initiate conference calls from any task record.

Notify on task functionality is available for all tables that extend the Task table, such as Incident, Problem, or Change.

All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property `glide.notify.task.phone_number`.

Send an SMS message from a task

You can use Notify to send SMS alerts from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows. Also ensure the property `glide.notify.task.phone_number` is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change.
2. Click the Send SMS related link.
3. Select one or more Recipients to send the SMS to.
4. Enter the Message to send.
   - The task record number is added to the message automatically.
5. Click Send.
   - Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the SMS Messages related list. You may need to configure the form to add the related list.

Start a conference call from a task

You can use Notify to start conference calls from a task record.

Role required: itil
Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflows. Also ensure the property glide.notify.task.phone_number is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change.
2. Click the Start conference call related link.
3. Select one or more Recipients to send the SMS to.
4. Click Start.

Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the Conference calls related list. You may need to configure the form to add the related list.

Notify with incident alert

You can use Notify with Incident Alert to send SMS messages or start conference calls based on incident alerts.

Notify with incident alert requirements

Certain configuration steps are required to use Notify with Incident Alert.

To use Notify with incident alert:

- Both Notify and Incident Alert must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property com.snc.iam.notify_number must be set to an active Notify number.
- This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

Note: The Conference Call Group number group is configured with conference call workflows by default.

Numbers and Number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Number groups allow you to provide consistent functionality in different geographic regions using local phone numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

Launch a conference call

As part of processing an incident alert, a conference call can be created between involved users. Call participants can include:

- Those users who have been assigned specific responsibilities.
- Any required ad-hoc user contacts.
- Other involved parties who are not recorded as users, such as third-party contacts.
Note: Only one conference call at a time can be active for each incident.

1. Navigate to Incident Management Open.
2. Open the relevant incident alert.
3. Click the Initiate Conference Call related link.
4. Within the dialog box that appears, select the participants for the conference.

The dialog box displays the recommended and selected participants for the conference. All users from the User Contacts list in the incident alert are selected by default. If a rotation schedule exists for the group contacts, the primary and secondary on-call resources are shown in the Recommended list. This way, the current on-call persons can quickly be invited to join the conference call. Calls are placed to the number in the Mobile phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user’s location and, if possible, converted into a valid E.164 number.

5. To select ad-hoc participants, do one of the following:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant’s phone number in the field beside the telephone icon.</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, click OK. The conference call starts and a Conference call initiated message is displayed at the top of the Incident Alert form. Each user is called and can accept the call to join the conference. Several response types are possible from users invited to join the conference call, apart from Accepted.

7. Click the Conference call initiated message to see details of that conference call. When the final participant leaves the conference, the conference call closes.

Note: VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

Viewing conference call information

Conference calls are listed as system activities in the Activity section of the Incident Alert form and also are listed in the Conference Calls related list.
Send an SMS notification

Notify sends an SMS to the users defined as default contacts for the alert.

When you create a new incident alert, Notify sends an SMS notification to the users defined as default contact responsibilities for the alert.

This text message is sent to the user’s mobile phone number: IA(number): a (Severity) severity (Event Type) incident alert for (CI Name) has been opened.

Administrators can modify the content of this message by editing the SMS on new Incident Alert business rule.
Notify with on-call scheduling

When using both Notify and On-call scheduling you can send scheduling notifications as SMS messages, in addition to emails.

Notify with on-call scheduling requirements

Certain configuration steps are required to use Notify with On-call scheduling.

• You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses that accept or reject an on-call assignment.
• You must configure any outbound SMS workflows, such as the On-Call: Assign by Acknowledgement workflow to use this Notify phone number to send SMS messages. Edit all Send SMS activities in these workflows to use this number as the From value.

Set up Notify with on-call scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: admin

Set up Notify with On-call scheduling for the first time or migrate from On-call scheduling with NotifyNow.

1. Navigate to Notify Numbers.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the Notify group field, select the On-Call Group.
   The On-Call Group is configured with the on-call workflow by default.
4. Navigate to Workflow Workflow Editor.
5. Select the On-Call: Assign by Acknowledgement workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See KB0551603 for more information.
6. Click the workflow menu icon in the title bar and select Copy to copy the On-Call: Assign by Acknowledgement workflow. Save the copied workflow under a different name than what it is named by default.

   Note: You must avoid modifying default workflows and instead choose to copy and then modify the required workflow.

7. Select a Send SMS activity.
8. In the To (script) field, modify the getRecipientsAndNumberToSendFrom() function and uncomment the line //notify_number : getNotifyNumber(),.
9. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify a static number</td>
<td>Within the getRecipientsAndNumberToSendFromChange() function, change getNotifyNumber() to the sys_id of the Notify phone number you selected in step 2.</td>
</tr>
<tr>
<td>Specify a number procedurally</td>
<td>Update the getNotifyNumber() function to return the sys_id of the Notify phone number you selected in step 2.</td>
</tr>
</tbody>
</table>
10. Repeat the previous 2 steps for each Send SMS activity on the workflow.
11. Click the workflow actions icon and select Publish.
12. Close the workflow editor interface.
13. Navigate to On-Call Scheduling Trigger Rules.
14. Select a trigger rule that launches an assignment workflow
15. In the Trigger action field, select Workflow.
16. In the Trigger workflow field, select the On-call: Assign by Acknowledgement workflow.
17. Click Update.
18. Repeat the previous 3 steps for each assignment trigger rule.

Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.

On-call: assign by acknowledgement workflow

The On-Call: Assign by Acknowledgement workflow is provided with Notify.

The workflow uses data from the escalation settings of rotas and rosters. Depending on these settings, the workflow iterates through the defined escalation chain and sends notifications by SMS or email to users asking them for incident assignment.

The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-call scheduling and Notify, the message_number column is added to the Notify Messages (notify_messages) table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

Controlling the on-call communication channel with Notify

You can configure On-call scheduling with Notify to always use a user’s preferred communication channel.

If Force communication channel is specified in the Escalation settings for rosters, the preferred user device is used, either SMS or email.

If the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

The setting Force communication channel is only available if Notify is installed.

Key differences between on-call scheduling with NotifyNow and with Notify

There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call: Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-call scheduling with Notify, the message_number column is added to the Notify Messages (notify_messages) table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.
Scripting Notify

You can use scripts with Notify to interact with calls and SMS messages, or to provide a custom client interface.

Notify

The Notify API allows you to interact with Notify calls and SMS messages using scripts.

Notify - getPhoneNumbers()

Get all phone numbers and short codes available to Notify, as an array.

Table 261: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 262: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of NotifyPhoneNumber objects, each object representing one phone number available to Notify.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate notify
var notify = new SNC.Notify();

// get all available phone numbers
var phoneNumbers = notify.getPhoneNumbers();

// iterate over phone numbers
for (var i = 0; i < phoneNumbers.size(); i++) {
    var number = phoneNumbers.get(i);
    //perform any actions using each phone number
}
```

Notify - getShortCodes()

Get all short codes available to Notify, as an array.

Table 263: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 264: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of NotifyPhoneNumber objects, each object representing one short code available to Notify.</td>
</tr>
</tbody>
</table>

```
// instantiate notify
var notify = new SNC.Notify();

// get all available shortcodes
var shortCodes = notify.getShortCodes();

// iterate over phone numbers
for (var i = 0; i < shortCodes.size(); i++) {
  var shortCode = shortCodes.get(i);
  gs.log(shortCode.getNumber());
  //perform any actions using each shortcode
}
```

Notify - call(String notifyPhoneNumber, String toPhoneNumber)

Make a call to an E.164-compliant phone number.

Table 265: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>The phone number to make the call from. This number appears as the caller ID.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>The phone number to call.</td>
</tr>
</tbody>
</table>

Table 266: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
var from = '+14048007337';
var to = '+31646810495';

// set up call
new SNC.Notify().call(from, to);
```

Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)

Call a number to add that number to an active conference call.

This method is intended specifically for conference calls. To initiate calls between only two participants, use the call(String notifyPhoneNumber, String toPhoneNumber) method instead.
Table 267: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs. Ensure this workflow includes a join conference call activity to connect the user to the conference call.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>The phone number to call. Called numbers are added to the conference call.</td>
</tr>
<tr>
<td>conferenceCall</td>
<td>GlideRecord</td>
<td>A GlideRecord for the Notify Call (notify_call) table identifying the conference call record. This record is automatically added to the outgoing call workflow scratchpad as the workflow.scratchpad.conference_call variable.</td>
</tr>
</tbody>
</table>

Table 268: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

// feedback
gs.log(gs.getMessage('set up a conference call with number {0} and (re)join code: {1}',
                     [ conferenceCall.getValue('number'), conferenceCall.getValue('code') ]));
```

Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody)

Send an SMS text message to an E.164-compliant phone number.

This function creates a new record on the Notify Message (notify_message) table.
Table 269: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>The Notify phone number or short code to send this SMS from.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the SMS to.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>The SMS text.</td>
</tr>
</tbody>
</table>

Table 270: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the Notify Message (notify_message) record created by this function.</td>
</tr>
</tbody>
</table>

Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)

Send an SMS text message to an E.164-compliant phone number.

This function creates a new record on the Notify Message (notify_message) table and associates it with the source record.

Table 271: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>The Notify phone number or short code to send this SMS from.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the SMS to.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>The SMS text.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

Table 272: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the Notify Message (notify_message) record created by this function.</td>
</tr>
</tbody>
</table>

Notify - getChildCallIDs(GlideRecord callRecord)

Get the sys_id values of calls that are children of a specified call.
Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.

Table 273: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A record on the Notify Call [notify_call] table.</td>
</tr>
</tbody>
</table>

Table 274: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>The sys_id values of all calls that are children of the specified call.</td>
</tr>
</tbody>
</table>

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecffffffff28");

var notify = new SNC.Notify();
var childCallIDs = notify.getChildCallIDs(callRecord);

for(var callID in childCallIDs)
  //perform any operations with the child callID values
```

Notify - getParentCallID(GlideRecord callRecord)

Get the sys_id of a specified call’s parent call.

Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.

Table 275: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A record on the Notify Call [notify_call] table.</td>
</tr>
</tbody>
</table>

Table 276: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the parent call record.</td>
</tr>
</tbody>
</table>

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecffffffff28");

var notify = new SNC.Notify();
var parentCallID = notify.getParentCallID(callRecord);
```

Notify - getTokens()

Get client tokens for any installed telephony drivers for use in WebRTC or mobile clients.
This function uses the currently logged-in user record as the client.

Table 277: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 278: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The client tokens, as a JSON string.</td>
</tr>
</tbody>
</table>

```javascript
// get Notify Client Tokens per active Notify Driver for the currently logged in user
var json = new SNC.Notify().getTokens();

// parse the json that was return into a tokens object
var tokens = JSON.parse(json);

// log line
gs.log('Notify Client Tokens for the currently logged in user');

// iterate over the driver tokens
for (var driver in tokens) {
gs.log(driver + ' Driver token: ' + tokens[driver]);
}
```

Output:

Notify - `getTokens(GlideRecord record)`

Get client tokens for any installed telephony drivers for use in WebRTC or mobile clients.

Table 279: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>GlideRecord</td>
<td>A record used to generate the client tokens.</td>
</tr>
</tbody>
</table>

Table 280: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The client tokens. The value of the string depends on the GlideRecord parameter.</td>
</tr>
</tbody>
</table>

This example demonstrates getting Notify client tokens for every Notify group.

```javascript
// instantiate Notify
var notify = new SNC.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
```
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
    // generate Notify Client tokens per active Notify Driver for this group
    var json = notify.getTokens(notifyGroup);
    var tokens = JSON.parse(json);

    for (var driver in tokens) {
        gs.log(gs.getMessage("Notify Client token for {0} driver and Notify Group '{1}': {2}", [driver, notifyGroup.getValue('name'), tokens[driver]]));
    }
}

Notify - getAvailableClients(String notifyNumber)
Get a list of client sessions that are available to receive calls.

Table 281: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyNumber</td>
<td>String</td>
<td>Any valid Notify phone number.</td>
</tr>
</tbody>
</table>

Table 282: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of JSON objects with the following format:</td>
</tr>
<tr>
<td></td>
<td>[{ sys_id: &quot;...&quot;, // user's sys_id name: &quot;...&quot; // user's name</td>
</tr>
</tbody>
</table>

Notify - conferenceCall()
Create a new conference call GlideRecord.

Table 283: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 284: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>A new Notify Call (notify_call) record for a conference call.</td>
</tr>
</tbody>
</table>
```
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789',
                   '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
  var to = participants[i];
  notify.call(from, to, conferenceCall);
}

// feedback
gs.log(gs.getMessage('set up a conference call with number {0} and (re)join code: {1}',
                      [ conferenceCall.getValue('number'),
                        conferenceCall.getValue('code') ]));
```

**Notify - queueCall(GlideRecord callRecord)**

Put a call into a queue.

Resume a queued call using the dequeueCall method.

<table>
<thead>
<tr>
<th>Table 285: Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>callRecord</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 286: Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

```
var call = new GlideRecord('notify_call');
  call.get('<call record sys_id>');
  if (call.isValid()) {
    new SNC.Notify().queueCall(call);
  }
```

**Notify - dequeueCall(GlideRecord callRecord)**

Resume a call after it was put in a queue.

Use this method to resume calls that were put in a queue with the queueCall method.
Table 287: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>A GlideRecord object on the Notify Call (notify_call) table with the held call you want to resume.</td>
</tr>
</tbody>
</table>

Table 288: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var call = new GlideRecord('notify_call');
call.get('some sys_id');
if (call.isValid()) {
    new SNC.Notify().dequeueCall(call);
}
```

### Notify - kick(GlideRecord participant)

Kick a specified user from a Notify conference call.

Table 289: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>A GlideRecord object containing the Notify Participant (notify_participant) to kick from the conference call.</td>
</tr>
</tbody>
</table>

Table 290: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var participant = new GlideRecord('notify_participant');
participant.get('<sys_id>');
if (participant.isValid()) {
    new SNC.Notify().kick(participant);
}
```

### Notify - forwardCall(GlideRecord call, String destination, String dtmf)

Forward a call to connect that call with a different recipient.

Table 291: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call</td>
<td>GlideRecord or String</td>
<td>A Notify call record, or the telephony provider call ID.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>destination</td>
<td>GlideRecord or String</td>
<td>A Notify phone number record, or an E.164-compliant phone number.</td>
</tr>
<tr>
<td>dtmf</td>
<td>String</td>
<td>A DTMF code to play upon connection.</td>
</tr>
</tbody>
</table>

Table 292: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**NotifyAction**

The NotifyAction API allows you to define actions to send to a telephony provider. You add actions to a NotifyAction object by calling the respective add function for each type of action. Each add function returns an Action object, such as a SayAction object for the addSay() function. Refer to each method example for information about returned objects.

**NotifyAction - addDial()**

Make an outbound call.

Table 293: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 294: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DialAction</td>
<td>The action added to the NotifyAction object. Use the DialAction object to define.</td>
</tr>
</tbody>
</table>

```javascript
var action = new SNC.NotifyAction();
var dial = action.addDial();
dial.setRecord(activity.vars.record);
dial.setClientRecord(activity.vars.user, "sys_user");
```

**NotifyAction - addGather()**

Present an interactive phone menu to the user.
Table 295: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 296: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatherAction</td>
<td>The action added to the NotifyAction object. Use the GatherAction object to define the menu settings and options to present to the user.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1); // the user can type 1 digit
gather.setFinishKey('#');   // # or *, usefull for > 1 digits
gather.setTimeout(10); // time to enter answer, in seconds

// add first menu item
var usSay = gather.addSay();
usSay.setText('Press 1 for english');
usSay.setLanguage('en-US');

// add second menu item
var nlSay = gather.addSay();
nlSay.setText('Kies 2 voor Nederlands');
nlSay.setLanguage('nl-NL');

// add third menu item
var frSay = gather.addSay();
frSay.setText('Choisissez 3 pour le français.');
frSay.setLanguage('fr-FR');

// and finish off with an applause
var play = gather.addPlay();
play.setURL('http://www.wavsource.com/snds_2015-04-12_5971820382841326/sfx/applause_y.wav');
```

NotifyAction - addHangUp()

End an active phone call.

Table 297: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 298: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HangUpAction</td>
<td>The action added to the NotifyAction object.</td>
</tr>
</tbody>
</table>

```java
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// hang up
notifyAction.addHangUp();
```

**NotifyAction - addQueue()**

Queue the call, putting it on hold.

Table 299: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 300: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QueueAction</td>
<td>The action added to the NotifyAction object. Use the QueueAction object to define the queue name, and queueing or dequeuing behavior.</td>
</tr>
</tbody>
</table>

```java
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
var queue = notifyAction.addQueue();
queue.setDequeue(true);
```

**NotifyAction - addPlay()**

Play an audio file on the call.

Table 301: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 302: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PlayAction</td>
<td>The action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and number of times to loop the audio.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);
```

NotifyAction - addReject()

Reject an incoming call.

Table 303: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Table 304: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RejectAction</td>
<td>The action added to the NotifyAction object. Use the RejectAction object to define the reason for rejecting the call.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'
```

NotifyAction - addSay()

Use text-to-speech to read text on the call.

Multiple languages are supported with text-to-speech. Available languages depend on the telephony provider.

Table 305: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>
Table 306: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SayAction</td>
<td>The action added to the NotifyAction object. Use the SayAction object to define the text and language to read.</td>
</tr>
</tbody>
</table>

This example demonstrates reading text in several languages.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kan auch deutsch sprechen');
deSay.setLanguage('de-DE');
```

NotifyAction - addSMS()

Send an SMS message.

When using this function with an active call, you do not need to call the setTo function on the returned SMSAction object. The SMS is automatically sent to the caller.

Table 307: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 308: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMSAction</td>
<td>The action added to the NotifyAction object. Use the SMSAction object to define the message text and the phone number to send the message to.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
```
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur adipiscing elit.);
sms.setTo(number);

NotifyAction - fromJson(String json)

Deserialize a NotifyAction object from a JSON string.

Table 309: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>json</td>
<td>String</td>
<td>A JSON string representation of a NotifyAction object.</td>
</tr>
</tbody>
</table>

Table 310: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates deserializing a NotifyAction object.

```javascript
var json = ".... some json obtained from toJSON ....";

// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// deserialize and reconstruct the notify action instance
notifyAction.fromJson(json);
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```
NotifyAction - toJson()

Serialize the NotifyAction object to a JSON string.

Table 311: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 312: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON representation of this NotifyAction object.</td>
</tr>
</tbody>
</table>

This example demonstrates serializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add one or more notify actions
// ...

// and serialize to json
var json = notifyAction.toJson();
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```
Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]
*** Script: new serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]
*** Script: the same: true

**NotifyAction - addConference()**

Add a call to a Notify conference call.

Table 313: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 314: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConferenceAction</td>
<td>The action added to the NotifyAction object. Use the ConferenceAction object to define the conference call name, and the behavior of the conference call when a participant joins or leaves.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber**

The NotifyPhoneNumber API allows you to query information about a Notify phone number.

**NotifyPhoneNumber - getDialCode()**

Get the international dialing code for a Notify phone number.

Table 315: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 316: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>International phone code for a country.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - getId()**

Get the ID of this phone number as defined by the telephony provider.
### Table 317: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 318: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The ID of the number within the telephony provider.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - getNumber()**

Get the numerical phone number for a NotifyPhoneNumber.

Additional information about the method that does not belong in the short description.

### Table 319: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 320: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>An E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - getOwner()**

Get the telephony provider associated with this phone number.

### Table 321: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 322: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td>The telephony provider associated with the number, such as the Twilio service.</td>
</tr>
</tbody>
</table>
**NotifyPhoneNumber - getTerritory()**

Get the country associated with the phone number.

**Table 323: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 324: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the country the phone number belongs to.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - supportsConferenceCall()**

Determine if the Notify phone number supports conference calling.

**Table 325: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Table 326: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports conference calling.</td>
</tr>
</tbody>
</table>

Output:

**NotifyPhoneNumber - supportsIncomingPhoneCall()**

Determine if the Notify phone number supports receiving phone calls.

**Table 327: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 328: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports receiving incoming phone calls.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - supportsIncomingSMS()

Determine if the Notify phone number supports receiving SMS messages.

Table 329: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 330: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports receiving incoming MMS messages.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - supportsOutgoingPhoneCall()

Determine if the Notify phone number supports initiating phone calls.

Table 331: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 332: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports initiating outgoing phone calls.</td>
</tr>
</tbody>
</table>

NotifyPhoneNumber - supportsOutgoingSMS()

Determine if the Notify phone number supports sending SMS messages.
### Table 333: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 334: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports sending SMS messages.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - supportsRecording()**

Determine if the Notify phone number supports recording phone calls.

### Table 335: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 336: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports recording phone calls.</td>
</tr>
</tbody>
</table>

**NotifyPhoneNumber - supportsWebRTC()**

Determine if the Notify phone number supports calls to a browser, such as in a WebRTC implementation.

### Table 337: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Table 338: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if the Notify phone number supports calls to a browser.</td>
</tr>
</tbody>
</table>
Notify Client

The Notify Client API allows you use Notify telephony functionality, such as making and receiving calls, from a web browser.

Several Notify Client methods take a callback function as a parameter. Because Notify Client calls are made asynchronously, these methods cannot return a value directly. Use the callback function to parse the returned data, such as by assigning variables or making other API calls.

Notify Client - Client(Object notifyConfig)

Instantiate a new Notify WebRTC Client object.

Table 339: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyConfig</td>
<td>Object</td>
<td>The configuration settings for the Notify WebRTC Client, as a JSON object.</td>
</tr>
</tbody>
</table>

```
var notifyConfig = {
    vendor: SNC.Notify.Vendor.TWILIO,
    callerId: 'xyz',
    autoReconnect: true,
    onReady: function() {},
    onOffline: function() {},
    onError: function( message ) {},
    onConnect: function( status ) {},
    onDisconnect: function() {},
    onIncoming: function( {from, to, callSid} ) {},
    onOutgoing: function( callSid ) {},
    onAccept: function() {},
    onMute: function() {},
    onUnmute: function() {},
    onCancel: function() {}
};

$j(function() {
    notifyClient = new SNC.Notify.Client(notifyConfig);
    notifyClient.init();
});
```

Notify Client - call(Object identifier)

Call a specified phone number or the phone number associated with a specified user.
Table 340: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>Object</td>
<td>Enter a JSON object that provides either the phone number to call or the sys_id of a user record to get the phone number from. Note: If you provide both a phone number and user sys_id, only the phone number is used.</td>
</tr>
</tbody>
</table>

Table 341: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates passing a phone number as the function parameter.

```
notifyClient.call({
    phoneNumber: "+18001112223"
});
```

This example demonstrates passing a user record sys_id as the function parameter.

```
notifyClient.call({
    userId: "6816f79cc0a8016401c5a33be04be441"
});
```

Notify Client - hangupCall()

End the current call.

Table 342: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 343: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates mapping a client function to an interface button using jQuery.

```
$j("#pickupCallBtn").on("click", function() {
    notifyClient.hangupCall();
});
```
Notify Client - pickupCall()

Brief description of the method.
Additional information about the method that does not belong in the short description.

Table 344: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 345: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Notify Client - mute(Boolean muted)

Mute or unmute the current client.
Additional information about the method that does not belong in the short description.

Table 346: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>muted</td>
<td>Boolean</td>
<td>Set this value to true to mute the current client, false to unmute.</td>
</tr>
</tbody>
</table>

Table 347: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

NotifyClient - forwardCall(Object argument)

Forward the current call to a different phone number or Notify client session.

Table 348: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>argument</td>
<td>Object</td>
<td>A JavaScript object detailing the number or Notify client to forward the call to.</td>
</tr>
</tbody>
</table>
Table 349: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates forwarding a call to a different phone number. The dtmf attribute allows you to send DTMF dial tones to the receiving number.

```javascript
var arg = {
  type: "number",
  id: "+17012345678",
  dtmf: "1234"
}
client.forwardCall(arg);
```

This example demonstrates forwarding a call to a different Notify client.

```javascript
var arg = {
  type: "userId",
  id: "6816f79cc0a8016401c5a33be04be441"
}
client.forwardCall(arg);
```

NotifyClient - sendDtmf(String digits)

Send one or more DTMF-valid digits over the current call.

Table 350: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>digits</td>
<td>String</td>
<td>One or more DTMF-valid digits.</td>
</tr>
</tbody>
</table>

Table 351: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Notify client event handlers

Notify Client event handlers allow you to define scripted behavior for responding to events from a telephony provider such as the Twilio service.

Event handlers

A communication between the Notify WebRTC Client and a telephony provider is asynchronous. The client function calls, such as notifyClient.call() do not wait for a response from the telephony provider. Instead, event handler methods define how to respond to certain events from the telephony provider.

You can create event handler implementations when creating the Notify Client configuration object. Fully define the handlers in the configuration object before instantiating a Notify Client object.
onReady

The onReady function runs after you call the init function on the client object. The onReady function indicates that the WebRTC session is ready.

onOffline

The onOffline function runs if the WebRTC session is not active.

onError

The onError function runs if the client encounters an error.
This function exposes one parameter. Use this parameter when implementing the event handler function.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The error message text.</td>
</tr>
</tbody>
</table>

onConnect

The onConnect function runs when the client receives a call connection event for an incoming or outgoing call.
This function exposes one parameter. Use this parameter when implementing the event handler function.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>The call status, as a string constant.</td>
</tr>
</tbody>
</table>

Note: When evaluating call status, use the constants provided by SNC.Notify.Status.

onConnect: function(status) { // webRTC receives a call connection event (incoming or outgoing).
    if (status == SNC.Notify.Status.OPEN) {
        setStatus(getTimeStamp() + " -- Successfully established call");
        showHangupButton(); //update the UI
    }
},

onDisconnect

The onDisconnect function runs when a call disconnects.
onIncoming

The onIncoming function runs when a call is made to the client and the telephony provider returns the parent call ID.

This function exposes these parameters as a single JSON object. Use these parameters when implementing the event handler function.

Table 354: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callInfo.from</td>
<td>String</td>
<td>The caller’s phone number.</td>
</tr>
<tr>
<td>callInfo.to</td>
<td>String</td>
<td>The called phone number.</td>
</tr>
<tr>
<td>callInfo.callSid</td>
<td>String</td>
<td>The SID of the call from the telephony provider.</td>
</tr>
</tbody>
</table>

```javascript
onIncoming: function(callInfo) {
  gs.log('incomming call from : ' + callInfo.from);
  var gru = new GlideRecord('sys_user');
  gru.addQuery('phone', callInfo.from);
  gru.query(function() {
      while (gru.next()) { // there may be more than one person with same number?
        // fetch caller's info
        gs.log('caller : ' + gru.name);
      }
  });
},
```

onOutgoing

The onOutgoing function runs when an outgoing call is made from the client.

This function exposes one parameter. Use this parameter when implementing the event handler function.

Table 355: Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callSid</td>
<td>String</td>
<td>The SID of the call from the telephony provider.</td>
</tr>
</tbody>
</table>

onAccept

The onAccept function when the client accepts an incoming call.

onMute

The onMute function runs when the client is muted.
onUnmute

The onUnmute function runs when the client is unmuted.

onCancel

The onCancel function runs if the caller cancels the call.

Notify client building a configuration object example

This example demonstrates how to construct the configuration object needed to instantiate a Notify WebRTC Client object.

The configuration object is a JSON object that specifies properties such as the telephony service provider and caller information, and event handler functions.

This sample code demonstrates how to create a simple configuration object.

```javascript
var notifyConfig = {
    vendor: SNC.Notify.Vendor.TWILIO, //Pass one of the supported vendor constants. Supported value is SNC.Notify.Vendor.TWILIO. Do not pass raw string values.
    callerId: '19991231234', //Pass a valid phone number to use as the caller ID. This number is usually provided by your telephony vendor.
    autoReconnect: true, //Pass true to automatically create a new WebRTC vendor session when the current session expires.
    onReady: function() {},
    onOffline: function() {},
    onError: function( message ) {},
    onConnect: function( status ) {},
    onDisconnect: function() {},
    onIncoming: function( {from, to, callSid} ) {},
    onOutgoing: function( callSid ) {},
    onAccept: function() {},
    onMute: function() {},
    onUnmute: function() {},
    onCancel: function() {}
};
```

Activate Notify

The Notify plugin (com.snc.notify) requires a separate subscription. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Notify activates these related plugins if they are not already active.

Table 356: Plugins for Notify

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number</td>
<td>Provide E-164 compliant phone number support.</td>
</tr>
<tr>
<td>[com.glide.phone_number]</td>
<td></td>
</tr>
</tbody>
</table>

To purchase a subscription, contact your ServiceNow account manager. After purchasing the subscription, activate the plugin within the production instance.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Migrating from legacy Notify

When migrating to Notify from the legacy Notify functionality, several changes are made to the instance.

Automatic changes

Several automatic changes occur when you activate Notify if the legacy Notify functionality is already enabled.

- The legacy Notify application menu is removed.
- Two separators are added to the new Notify application menu, Legacy Notify and Legacy Notify Admin. New modules that replace the legacy Notify modules are added to these sections.

  Note: The added modules are not the same modules that were in the legacy Notify application menu. Any customizations made to the legacy Notify modules are not preserved.

- The notifynow_admin role allows access to Notify modules.
- The notify_admin role allows access to legacy Notify modules.
- All workflow activities from the legacy Notify application are moved to the Legacy Notify group.

Legacy Notify

Notify enables organizations with a Twilio account to send notifications using text and voice messages.

  Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

It also allows conference calls between ServiceNow users to enable quick communications.

When Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident alert is raised in the incident alert management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.
Notify has been implemented for use within incident alert management. Refer to the Notify API documentation for details on how to implement Notify for use within other ServiceNow applications.

Working with Legacy Notify

Follow this process to enable and use Notify.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within incident alert management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

View a Legacy Notify question

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to Notify Questions.
2. Click the question On-Call responsibility Accept/Reject to see the question details.
3. Click the Notify Response Choices related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the Response action can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

Create a question in Legacy Notify

Define a question that can be sent to users.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify Questions.
2. Click New.
3. Fill in the fields, as appropriate.
Table 357: Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the { } tags, for example, {0}. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from {0}. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, number, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example short_description.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

*Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.*

1. Navigate to Notify Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

Table 358: Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>

5. Click Submit.

### View Legacy Notify messages

Applications implementing Notify, such as incident alert management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident alert has been created.

**Role required:** notifynow_admin

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify Messages.
2. Click a message to see the message details.

![Figure 155: SMS Outbox Details](image)

### View Legacy Notify conversations

The Notify Conversation (notifynow_conversation) table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

**Role required:** notifynow_admin

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are automatically...
deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the nn.thread.release.age property.

1. Navigate to Notify Conversations.
2. Click a conversation record to see the conversation details.

![Notify Conversation Details](image)

Figure 156: Notify Conversation Details

The State of the conversation can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

Note: The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

View Legacy Notify conference calls

Applications that use Notify, such as incident alert management, can launch and maintain conference calls between involved parties.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify Conference Calls.
2. Click a conference call in the list to view details.
3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
Legacy public conference calls

A Notify conference call can be public.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The Private field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Alert Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated Code which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

Administering Legacy Notify

An administrator can set up Notify, manage Notify properties and conference call participants.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

After the Twilio account is set up, perform the following to use that account with Notify:

- Associate the account with Notify
- Configure Twilio with ServiceNow endpoints

Associate a Twilio account with Legacy Notify

Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify Administration Properties.
2. Enter the AccountSID, AuthToken and phone number values. These values can be obtained from the Twilio dashboard:
When the Twilio account details are entered in the Notify Properties page, the account status is updated.

3. (Optional) To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

Note: Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: `isSMSCapable` and `isVoiceCapable`.

Configuring the Twilio service with endpoints in legacy Notify

In order for the Twilio service to receive Notify commands, the Request URL field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the Request URL fields are blank.

Set these values from within the Twilio service dashboard.
The notifyusa values underlined in the image should be replaced with your ServiceNow instance name, for:

- Voice Request URL: https://notifyusa.service-now.com/NotifyNowCallProcessor.do
• Status Callback URL: https://notifyusa.service-now.com/NotifyNowCallStatusProcessor.do
• Messaging Request URL: https://notifyusa.service-now.com/NotifyNowSmsProcessor.do

View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify Administration Properties.

![Figure 162: Notify Properties form](image-url)
2. Fill in the fields.

Table 360: Notify Properties form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Twilio SMS and voice enabled phone number</td>
<td>The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Number of frequent conference call participants to be displayed</td>
<td>The number of people to display in the frequently called list.</td>
</tr>
<tr>
<td>Voice</td>
<td>The voice used for Notify communications. Select woman or man to provide female or male voice support for English, Spanish, French, German, and Italian. Select alice to provide female voice support for a wider range of languages.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Legacy Notify account status messages

Account status messages are visible on the Notify Properties page.

Table 361: Account Status Message Descriptions

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>
</tr>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid</td>
<td>An incorrect value has been entered in the AccountSID or AuthToken fields in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>

Manage Legacy Notify conference call participants

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

Role required: notifynow_admin
Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the Response field for the participant session to kicked.

1. Navigate to Notify Conference Calls.
2. Select an active conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click the button for the action you want to perform, such as Mute to mute the participant.

You can perform these actions for multiple participants as a single operation using the Actions on selected rows choice list on the Notify Conference Call Participants related list.

Installed with Legacy Notify

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer (notifynow_answer)</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation (notifynow_conversation)</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call (notifynow_conference_call)</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session (notifynow_participant_session)</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant (notifynow_participant)</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question (notifynow_question)</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
<tr>
<td>Response_action (notifynow_response_action)</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice (notifynow_response_choice)</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages (notifynow_message)</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

Properties

Notify adds the following system properties.
Table 363: Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

User Roles

Notify adds the following user roles.

Table 364: User Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>

<tbody>
<tr>
<td>SMS on new Incident Alert</td>
<td>Incident Alert (incident_alert)</td>
<td>Sends an SMS to any default contacts added when an incident alert record is created.</td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Alert (incident_alert)</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>
<td>Update Conference Call Started IA Activity</td>
<td>NotifyNow Conference Call (notifynow_conference_call)</td>
<td>Logs when a conference call started by writing to an incident alert’s comment field if the source record is from the incident_alert table.</td>
</tr>
<tr>
<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call (notifynow_conference_call)</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident alert’s comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>
Workflow Activities

Notify adds the following workflow activities.

Table 368: Workflow Activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>

Legacy Notify API

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

Note: This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

NotifyNow - getReadyState()

Indicate whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.
Table 369: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 370: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```

**NotifyNow - getStatus()**

Get the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

Table 371: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 372: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Status</td>
<td>Description</td>
</tr>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.

Table 373: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>
This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = [ '+31205655548', '+31205655552', '+31652825393' ];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall( participants, "testing12" );
gs.log('started conference call: ' +
    conferenceCall.getUniqueValue());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)**

Initiate a new conference call.

**Table 375: Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

**Table 376: Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.
// define phone number participants
var participants = ['+31205655548', '+31205655552',
  '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
  gs.log('adding user ' + user.getValue('name') + ' with phone number ' +
  user.getValue('mobile_phone') + ' to the participant array');
  participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord('cmdb_ci');
source.query('asset_tag', 'P1000167');
if (source.hasNext() && source.next()) {
  // set up conference call
  var nn = new SNC.NotifyNow();
  var conferenceCall = nn.initiateConferenceCall(participants,
    "testing 1 2", source);

  // check if the conference call was successfully created
  if (conferenceCall != null) {
    gs.log('started conference call: ' +
    conferenceCall.getUniqueValue());
  } else {
    gs.log('could not start the conference call :(');
  }
}

NotifyNow.isCallable(String participant)
Determine whether a user is callable or not.
A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

Table 377: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Table 378: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106f6ea9');
if (user.hasNext() && user.next())
  gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106f6eb9');
if (participant.hasNext() && participant.next())
  gs.log('by participant: ' + nn.isCallable(participant));

NotifyNow - isSMSCapable()
Check if the telephone number associated with the Twilio account is capable of sending SMS messages.

Table 379: Parameters
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 380: Returns
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));

NotifyNow - isSMSCapable(String userID)
Check if a user is able to send SMS messages.

Table 381: Parameters
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

Table 382: Returns
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('<user sys_id>')) ? 'yes' : 'no'));

### NotifyNow - isVoiceCapabilities()

Check if the telephone number associated with the Twilio account is capable of setting up phone calls.

#### Table 383: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Table 384: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));

### NotifyNow - isVoiceCapabilities(String userId)

Check if a user is able to make voice calls.

#### Table 385: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

#### Table 386: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ? 'yes' : 'no'));
NotifyNow - kick(GlideRecord participant)

Remove a participant from a conference call.

Table 387: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

Table 388: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```java
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
```

NotifyNow - mute(GlideRecord participant)

Mute a participant on a conference call.

Table 389: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

Table 390: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```java
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```
NotifyNow - unmute(GlideRecord participant)

Unmute a participant on a conference call.

Table 391: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

Table 392: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
  // unmute participant
  result = new SNC.NotifyNow().unmute(participant);
  gs.log('participant unmuted: ' + result);
}

NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.

The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

Table 393: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

Table 394: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>
This example demonstrates using the default email subject.

```javascript
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");

new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
  "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f", current,
  "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f",
  "Please answer this question");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)**

Send an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.
Table 397: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

Table 398: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
  // send a text message
  var nn = new SNC.NotifyNow();
  var message = "this is just a test";
  var number = "+31612345678";
  nn.sendSMS(number, message, source);
}
```

This example uses dot-walking and the current record as the source record.

```javascript
new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);
```

NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)

Send an SMS question.

Table 399: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td></td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
</tbody>
</table>
Table 400: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

```javascript
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
  // send the sms question
  var number = "+31612345678";
  var nn = new SNC.NotifyNow();
nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}
```

NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Add ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant’s phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant’s phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

Table 401: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Table 402: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

```javascript
// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));
```
// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));

    // you could have added the user by sys_id as well:
    //
    nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39',
        user.getValue('sys_id'));
} else {
    gs.log('no such user');
}

// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call');
}

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)
Convert a local phone number to an E.164-compliant phone number based on a user’s location.

Table 403: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

Table 404: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';
var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(), localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number +'
    based on ' + user.getValue('name') + 's location (' + user.getValue('location') + ')');

NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)
Get all participants for a conference call.

Table 405: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

Table 406: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

var nn = new SNC.NotifyNow();
var user =
nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');
while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}

var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';
// get all participants
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId, false);
gs.log(user);

NotifyNow - getFrequentlyCalledUsers(Number limit)
Return a number of frequently-called users, up to the limit parameter, in alphabetical order.

Table 407: Parameters
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

Table 408: Returns
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);

while (fc.hasNext() && fc.next()) {
gs.log("got user "+ fc.getValue('name') + ' - ' + fc.getValue('sys_id'));
}

NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)
Get a user’s preferred E.164-compliant phone number for voice calls.

Table 409: Parameters
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>
Table 410: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is '+E164Number+' for user with id: '+userID);
```

**NotifyNow - getPreferredE164SMSNumber (GlideRecord user)**

Get a user’s preferred E.164-compliant phone number for SMS messages.

Table 411: Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Table 412: Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);
```

Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.

Live feed includes different types of feeds.
### My Live Feeds

#### WM Approver added as an approver
- **WM Approver added as an approver**
  - Like • Copy Link • Comment
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.

Live Feed browser support

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality.

Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

Activate Live Feed

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   
   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Administer live feed

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

Document feeds

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
- Improving visibility into progress for end users.
- Providing a single place to see updates on multiple records.
• Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use live feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

• Is unlisted; it does not appear when users view all groups on live feed.
• Automatically approves membership for every user who can access the record.
• Uses the record number as the group name.
• Uses the record short description as a group description.
• Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
• Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

Add a live feed UI action on a table
You can add UI actions on a table to allow users to follow records in live feed.
Role required: ui_action_admin or admin
1. Navigate to System Definition UI Actions.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Add the Show Live Feed button in the form header
You can add the Show Live Feed button in the form header for a table.
Role required: personalize_dictionary or admin
1. Navigate to System Definition Tables.
2. Open the table record.
3. Select the Live feed check box.
4. Click Update.
5. If the check box is selected and the live feed functionality is not active, open the dictionary entry for the table and add live_feed=true in the Attributes field. Click Update.

Configure document feeds
You can configure a table to support document feeds.
Role required: personalize_dictionary or admin
Configuring a table to support document feeds includes the following steps.
1. Add the Show Live Feed button in the form header.
2. Add Follow on Live Feed and Show Live Feed as list and form UI actions.
Security configuration for document feeds

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.

• If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

Note: Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

Disable a record feed

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition Dictionary.
2. Open the dictionary entry for the table.
3. Add live_feed=false in the Attributes field.
4. Click Update.

Note: If the Collaboration feature is activated, you can remove the show live feed icon from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Disable a document feed

You can disable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition Tables.
2. Open the table record.
3. Clear the Live feed check box.
4. Click Update.

Business rule installed with Live Feed Document

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

Record feeds

A record feed is a live feed group that is associated with a record, such as an incident or change.
Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:

• Improve communication between users working on the same record.
• Improve visibility into progress for end users.
• Provide a single place to see updates on multiple records.
• Save feed history in the record so that knowledge is not lost in an email chain.

Note: Many of these features are part of live feed v2.

Activate live feed document

The Live Feed Document plugin is active by default.

Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

If the plugin depends on other plugins, these plugins are listed along with their activation status.
If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

Configure record feeds

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.

Add live feed to a form header

Add the Show Live Feed button in the form header for a table.

1. Navigate to System Definition Tables.
2. Open the table record.
3. Select the Live feed check box.
4. Click Update.

Alternatively, you can add live_feed=true to the Attributes field in the dictionary entry for the table.

Add live feed to a context menu

Add live feed UI actions on a table.

1. Navigate to System Definition UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Disable a record feed

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition Dictionary.
2. Open the dictionary entry for the table.
3. Add live_feed=false in the Attributes field.
4. Click Update.
Note: If the Collaboration feature is activated, you can remove the show live feed icon ( ) from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Configure security

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

Note: Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

Live feed table notifications

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the live_feed_admin or chat_admin roles can set up table notifications for any table in an instance.

Set up table notifications for task tables

You can set up a table notification for a task table to enable automatic live feed messages.

Role required: live_feed_admin or chat_admin

1. Navigate to Collaborate Feed Administration Table Notifications.
2. Click New or select a notification to open it.
3. Complete the form.

Table 415: Live Table Notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td></td>
<td>Note: The list shows only tables and database views that are in the same scope as the table notification.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record. This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Post to live feed | Select the check box to generate the notification on live feed.  
If record feeds are not set up and the Feed group field is blank, the notification is posted to the company feed. |
| Record Feeds  | Select the fields to post for record feeds.  
This field is available only if Post to live feed is selected. |
| Application   | Select the application that contains this record.                           |
| Active        | Select the check box to enable the notification.                             |
| Insert        | Select the check box to generate the notification when a record is inserted into the database. |
| Update        | Select the check box to generate the notification when a record is updated.  |
| Feed          | Select the live feed team to which you want to post messages.  
This field is available only if Post to live feed is selected.  
Clear the field to post notifications on the company feed. |
| Conditions    | Create the condition that must be met to generate the notification.  
If you add a condition statement, the system evaluates the condition first and parses the Before scriptfield only if the condition is met.  
You may choose to leave this field blank and include conditions in the script. |
| Description   | Enter a description of the table notification.                              |
| Message       | Construct the automatic message you want to generate.  
You can include field values as variables and a link to the record.  
To add a variable, position the cursor in the text and then click the field name in the Select variables field.  
To add a link to the record, enter ${URI} in the message text as shown in the following example.  
High priority incident opened: ${URI}  
Short description: ${short_description}  
Note: For security reasons, any HTML code is automatically stripped out of a message before it is posted. |
Field | Description
--- | ---
Before script | Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script:
- `current`: the GlideRecord object that triggered the notification.
- `changedFields`: an ArrayList of fields changed on submit. Use `changedFields.contains('fieldname')` to check for change.
- `answer`: set `answer` to false to cancel the notification.
- `profileSource`: set to a valid GlideRecord object to define the profile that is posting the message.
- `profileID`: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides `profileSource` if both are specified.

Any custom variable created in the script is also exposed to the message in the form of `${myVariableName}`.

4. Click Submit or Update.

Set up table notifications for non-task tables

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

Role required: live_feed_admin or chat_admin

1. Navigate to System Definition Business Rules.
2. Open the live feed events business rule.
3. In the Advanced section, select and copy the text in the Script field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click New.
6. Enter the following values at the top of the form:
   - Name: Enter a name, such as live feed events for my table.
   - Table: Select the table for which you are setting up a notification.
   - Active and Advanced: Select these check boxes.

7. In the When to run section, enter the following values:
   - When: Select before.
   - Insert, Update, and Delete: Select the check boxes.

8. In the Advanced section, paste the script from the live feed events business rule into the script box.
9. Click Submit.

The live feed events business rule runs on the non-task table. It fires the live_feed.update event, which is associated with the Live Feed Update script action. The script action sets up variables and processes the table notifications.
After saving the business rule, create a live feed table notification record for the new table as you would for a task table.

Live feed table notification examples

The following examples demonstrate how to set up different types of table notifications that are useful for live feed.

**Workaround posted**

This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- **Table**: Problem (problem)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (State) [is] (Open)
- **Description**: Workaround Posted
- **Message**:

  ${sys_updated_by} posted a workaround for ${URI}.
  Short description: ${short_description}

- **Before script**:

  ```java
  // only post to live feed when the Workaround field changes
  answer = changedFields. contains ( "work_around" ) ;
  ```
Problem resolved (advanced)
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem {problem}
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: {Problem State} {is} [Closed/Resolved]
- **Description**: Problem Resolved
- **Message**:
  Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}

- **Before script**:
  ```
  //cancel if we didn't just change the problem state if ( !changedFields.
  contains ( "problem_state" ) )
  answer = false ;

  //if we have an assigned_to value add a comment about who it was //create a
  new variable fixedByMsg that we can access from the message
  fixedByMsg = "" ; if ( !current. assigned_to. nil ( ) )
  fixedByMsg = " Thank you " + current. assigned_to. getDisplayValue ( ) ;

  //make the message appear to come from the assignment group if we have one
  if ( !current. assignment_group. nil ( ) )
  profileSource = current. assignment_group. getRefRecord ( ) ; //need
  GlideRecord object
Opportunity won (non-task)
This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.

Create a business rule on the Opportunity [sales_opportunity] table that matches the live feed events business rule on the task table.

Create a table notification with the following values:
- Table: Opportunity [sales_opportunity]
- Active: Select the check box.
- Update: Select the check box.
- Post to live feed: Select the check box.
- Conditions: \[\text{State} \text{ is} \ \text{Closed Won}\]
- Description: Opportunity won
- Message:
  \${owner} closed a sale with \${account}!
- Before script:

  ```java
  //make the message appear to come from the assigned salesperson if there is one
  if ( !current.owner.nil() )
    profileSource = current.owner.getRefRecord(); //need GlideRecord object
  ```

---

**Figure 167: Example opportunity won message**

**Related feeds table notification**

This example demonstrates table notifications to be sent out to related feeds.

For this example, whenever the status of a story changes to Complete, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.
- Table: Story \{rm_story\}
- Active: Select the check box.
- Update: Select the check box.
- Post to live feed: Select the check box.
- Record feeds: Move Sprint, Release, and Epic to the Selected column.
- Conditions: \{State\} changes to \{Complete\}
• Description: Story is done; message to Epic, Release, and Sprint
• Message:

${URI} status changed to ${state}

Live feed security and table access

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

• Live Table Notification \{live_table_notification\}: set up automatic messages that are generated when specific records are updated throughout the system.
• Live Feed Message \{live_message\}: modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

Domain separation in live feed

Using domain separation with the live feed application allows administrators to keep user content within a specific domain.

Parent and child domains define the live feed content that can be viewed and shared with other users.

• A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
• A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.

Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

Show or hide the live feed application for a domain

The administrator can live feed visibility for a domain. This includes:

• Displaying live feed in the application navigator.
• Following a document feed for a record.
• Viewing live feed from a record.

Use live feed with domain separation

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

• Posting and sharing content
• Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
• Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

• Viewing content
• Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
• Users in a parent domain can view content that resides within their domain and within any child domains.
• My Feed shows messages, teams, and hashtags based on the user’s domain. Showing another user’s feed only shows posts visible in the current user’s domain.

• Using hashtags
• Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
• Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

• Using teams
• Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
• Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

• Exceptions to teams
• New teams are created in the user’s domain. However, if the team has a record associated with it, the team is created in record’s domain.
• New threads in an existing team are created in the domain of the existing team.
• When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document’s domain.
• For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

• Subscribing to email notifications
• Users can subscribe to email notifications from users and teams within their domain only.

Limit live feed access by role
All active users in the instance have access to live feed by default.

live_feed_admin and admin
1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a) Perform the appropriate action for your version of the UI:
      • UI16: Navigate to System Definition Application Menus Collaborate and select Live Feed.
      • UI15 or UI11: Right-click the icon beside the Live Feed module and select Edit Module.

   b) Enter the roles that have access in the Roles field.
c) Click Update.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a) Navigate to System Definition Applications (Mobile).
   b) Click Live Feed.
   c) Enter the roles that have access in the Roles field.
   d) Click Update.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   • Type: ui page
   • Operation: read
   • Name: create one access control rule record for each of the following pages
     • live_feed
     • live_feed_small
     • $live_feed
     • $live_feed_small
   • Requires role: in this related list, add roles to define who can access the live feed pages. Users who do not have these roles cannot access live feed.

Manage live feed message content

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.

live_feed_admin and admin

For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

1. Navigate to Collaborate Feed Administration Messages.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.

Live feed team security

You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule.
   • Table: Live Group Profile (live_group_profile)
   • Operation: create

Restrict hashtag renaming

You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:
• Table: Live Tag (live_tag)
• Operation: write

Provide access to live feed from CMS pages

You can provide access to live feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

Role required: content_admin or admin

The ESS Portal template includes the Portal - Live page and Live Feed dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include Portal - Live page in a site.

1. Navigate to Content Management iFrames.
2. Click New.
3. Enter the iFrame block details.

Table 416: iFrame block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as Live Frame.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as live_frame.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a></td>
</tr>
<tr>
<td></td>
<td>where INSTANCE is your instance URL (example, {instance name}.service-now.com)</td>
</tr>
<tr>
<td>Application</td>
<td>Displays scoping information.</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select Fixed Size and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. Add the block to a page.

Components installed with live feed

Several types of components are installed with Live Feed.
Demo data is available with Live Feed.

Tables installed with live feed

Live Feed plugin installs the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link attachments (live_link)</td>
<td>Stores links and attachments that are added to messages.</td>
</tr>
<tr>
<td>Live Favorite (live_favorite)</td>
<td>Stores the favorite conversations, user groups, and messages.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Feed Searches</td>
<td>Stores live feed text searches. Access at Collaborate Feed Administration Search Log.</td>
</tr>
<tr>
<td>(live_feed_search)</td>
<td></td>
</tr>
<tr>
<td>Live Follows</td>
<td>Maintains users’ follow preferences for user feeds.</td>
</tr>
<tr>
<td>(live_follow)</td>
<td></td>
</tr>
<tr>
<td>Live Group Profile</td>
<td>Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.</td>
</tr>
<tr>
<td>(live_group_profile)</td>
<td></td>
</tr>
<tr>
<td>Live Group Member</td>
<td>Maintains the member lists for conversation and user group.</td>
</tr>
<tr>
<td>(live_group_member)</td>
<td></td>
</tr>
<tr>
<td>Live Mention</td>
<td>Stores the profiles mentioned in a message. References sys_user table.</td>
</tr>
<tr>
<td>(live_mention)</td>
<td></td>
</tr>
<tr>
<td>Live Message Tag</td>
<td>Stores messages associated with user-created tags. Appears as a related list on Live Tag records.</td>
</tr>
<tr>
<td>(live_message_tag)</td>
<td></td>
</tr>
<tr>
<td>Live Messages</td>
<td>Stores messages. References sys_user table. Access at Collaborate Feed Administration Messages.</td>
</tr>
<tr>
<td>(live_message)</td>
<td></td>
</tr>
<tr>
<td>Live Poll</td>
<td>Stores a poll question.</td>
</tr>
<tr>
<td>(live_poll)</td>
<td></td>
</tr>
<tr>
<td>Live Poll Cast</td>
<td>Stores profiles of users who voted for a particular option in a poll.</td>
</tr>
<tr>
<td>(live_poll_cast)</td>
<td></td>
</tr>
<tr>
<td>Live Poll Options</td>
<td>Stores poll options.</td>
</tr>
<tr>
<td>(live_poll_option)</td>
<td></td>
</tr>
<tr>
<td>(live_profile)</td>
<td></td>
</tr>
<tr>
<td>Live Table Notification</td>
<td>Generates automatic table notifications, such as when a user reads live feed for the first time and when a high priority incident is opened. Access at Collaborate Feed Administration Table Notifications.</td>
</tr>
<tr>
<td>(live_table_notification)</td>
<td></td>
</tr>
<tr>
<td>Live Tag</td>
<td>Maintains user-created tags. Access at Collaborate Feed Administration Tags.</td>
</tr>
<tr>
<td>(live_tag)</td>
<td></td>
</tr>
<tr>
<td>Live Tag Follows</td>
<td>Maintains users’ follow preferences for tags.</td>
</tr>
<tr>
<td>(live_tag_follow)</td>
<td></td>
</tr>
<tr>
<td>Messages Liked by</td>
<td>Maintains like ratings for posts. Access at Collaborate Feed Administration Likes.</td>
</tr>
<tr>
<td>(live_message_like)</td>
<td></td>
</tr>
</tbody>
</table>

User roles installed with Live Feed

Live Feed plugin installs the following user roles.
### Role Description

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>live_feed_admin</td>
<td>Can manage live feed functions.</td>
</tr>
<tr>
<td>chat_admin</td>
<td>Can manage chat functions (if the Chat plugin is activated)</td>
</tr>
</tbody>
</table>

### Script includes installed with Live Feed

Live Feed plugin installs the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LiveMsgUtil</td>
<td>Provides helper functions for working with live_message records.</td>
</tr>
<tr>
<td>LiveFeedFilter</td>
<td>Queries filters for working with live_feed records.</td>
</tr>
<tr>
<td>LiveFeedUtil</td>
<td>Provides helper functions for working with live_feed records.</td>
</tr>
</tbody>
</table>

### Business rules installed with Live Feed

Live Feed plugin installs the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Group Creator Becomes Admin</td>
<td>Live Group Profile (live_group_profile)</td>
<td>Designates the group creator as the group administrator.</td>
</tr>
<tr>
<td>live feed events</td>
<td>Task (task)</td>
<td>Runs on task insert, update, and delete. Triggers event associated with the Live Feed Update Script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live feed member update events</td>
<td>Live Group Member (live_group_member)</td>
<td>Generates a notification event when member state changes (invited, accepted, declined, left, rejected, request, request_accepted).</td>
</tr>
<tr>
<td>Live feed integration</td>
<td>Journal Entry (sys_journal_field)</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
<tr>
<td>Live feed new member events</td>
<td>Live Group Member (live_group_member)</td>
<td>Generates a notification event when new members are added.</td>
</tr>
<tr>
<td>live feed profile events</td>
<td>Live Profile (live_profile)</td>
<td>Runs on live_profile insert/update/delete, triggers event associated with the Live Feed Update script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live Feed message events</td>
<td>Live Feed Message (live_message)</td>
<td>Runs on live_message, notification event trigger for new live messages.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live message like events</td>
<td>Live Group Member</td>
<td>Ensures users can only see the members list for public groups and groups they belong to.</td>
</tr>
<tr>
<td>Live Feed Group Visibility 2.0</td>
<td>Live Group Profile</td>
<td>Ensures that a public group is visible.</td>
</tr>
<tr>
<td>Live Feed Group Profile Validation</td>
<td>Live Group Profile</td>
<td>Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.</td>
</tr>
<tr>
<td>Live Feed Group Profile Visibility 2.0</td>
<td>Live Group Profile</td>
<td>Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.</td>
</tr>
<tr>
<td>Live Feed Membership Changes</td>
<td>Live Group Member</td>
<td>Ensures that only the group administrator and users with live_feed_admin role can manage membership for a group.</td>
</tr>
<tr>
<td>Live Feed Single Group Membership</td>
<td>Live Group Member</td>
<td>Ensures that a user is not added multiple times to the same group.</td>
</tr>
<tr>
<td>Live Message Likes</td>
<td>Live Message Like</td>
<td>Updates the number of likes for a message.</td>
</tr>
<tr>
<td>Live Feed Join Group Check</td>
<td>Live Group Member</td>
<td>Ensures that users can not automatically join private visible groups.</td>
</tr>
<tr>
<td>Update Follow/Follower Counts</td>
<td>Live Follow</td>
<td>Updates the following/followers counts.</td>
</tr>
<tr>
<td>Live Feed Group</td>
<td>Assessable Record</td>
<td>Creates/Deletes a live feed group for an assessable record</td>
</tr>
<tr>
<td>Live Feed Message Visibility</td>
<td>Live Feed Message</td>
<td>Ensures user’s access to live feed messages</td>
</tr>
</tbody>
</table>

**Email notifications installed with Live Feed**

Live Feed plugin installs the following email notifications:

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request Accepted</td>
<td>Sends an email when a user’s request to join a team is accepted.</td>
</tr>
<tr>
<td>Live Team Member Request Rejected</td>
<td>Sends an email when a user’s request to join a team is rejected.</td>
</tr>
<tr>
<td>Live Message All Subscription</td>
<td>Sends an email to subscribed users when any message (new or reply) is posted.</td>
</tr>
<tr>
<td>Live Message Feed Subscription</td>
<td>Sends an email when a new message is inserted into a feed.</td>
</tr>
<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

**Use Live Feed**

Live Feed provides many methods you can use to share content with others in your organization. Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.
Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (＃) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note: Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

• Limit the number of hashtags per message (no more than 3 is a good guideline).
• Use hashtags only in messages that are relevant to the tagged topic.
• Write a message first, and then add hashtags only if they add value. Answer the question, “What are you working on?”, rather than “What hashtags apply to what you are working on?”
• Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
Figure 169: Tag

View an available hashtag

1. Navigate to Collaborate Live Feed.
2. Click Hashtags in the sidebar.

Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to Collaborate Live Feed.
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag icon appears.
5. Click the edit tag icon.

![Hashtags]

Figure 172: Edit tag

6. Enter a new hashtag name.
7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

Note: If a hashtag is removed from the message, renaming that hashtag does not change the message text.

Add an image to a hashtag

You can add an image at the domain level of already defined hashtags if you have the admin role.

1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

![#VPN Feed](image)

Figure 173: Tag with image icon

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon.
4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.

When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to Collaborate Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.
A confirmation message appears.

5. Click X to dismiss the message.
   
   To unfollow a hashtag, repeat the same steps and click Unfollow.

**Bookmark hashtags**

The live feed interface uses the standard bookmarking functionality for hashtags.

In UI15 and UI11, the live feed interface uses the standard *bookmarking functionality* for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click Hashtags in the message posting.
3. Click the removal icon.

Use live feed to work on records

A record feed is associated with a record, such as an incident or change. Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from My Feed.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
How document feeds work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select View all groups on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

Document group creation

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

1. Click Add content at the top of the homepage.
2. Select Live Feed in the left panel.
3. On the bottom of the window, click Add here in the appropriate layout position, then close the window.

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.
The record feed appears in a pop-up window. The record feed also appears on the record form’s activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the Show Live Feed button in the form header. This displays the live feed pop-up.
- Right-click the form header and select Show Live Feed. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - Live Feed: click to show a text box to type in the feed.
  - Activity: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Go to System Definition Tables, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds live feed to the activity formatter.
• Go to Collaborate Feed Administration Properties and enable the following property: Toggle the display of the live feed tab in the activity formatter

Working with record feeds

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

• View the record feed from live feed.
• View a list of group members (other users who are following the record).
• Invite another user to join the group. Only users who have access to the record have access to the record feed.
• Subscribe to email notifications.
• Leave the team to stop following the record.

Follow a record feed from a form

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record in a list or form.
2. Click the Show on Live Feed icon in the header.
Follow a record feed from a list
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, Assigned to me).
2. Select the Action check box beside each record to follow.
3. In the Actions choice list, select Follow on Live Feed.
Post a message to a record feed

1. Open the record feed in one of the following ways:
   • From your homepage (must already be following the record)
   • As a team in live feed (must already be following the record)
   • From My Live Feed (must already be following the record)
   • From the Live Feed pop-up window
   • From the Live Feed tab on the activity formatter
   • Click the Show Live Feed button in the form header.

2. Compose the message and add images and links.

3. [My Live Feed only] In the To list, select the record where you want to post the message.

4. [Optional] Select the Work Notes check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.

5. Click Post.

Note: If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard
Using groups in Live Feed

Groups allow users to create focused discussions in live feed.

Users can view or join groups based on the access level of the group:

- **Public**: any user can see the name on the list of all groups, see the feed, and join. Messages appear on the company feed with a link to the group feed.
- **Private**: any user can see the name on the list of all groups, but only invited members can see the feed and join. Messages do not appear on the company feed.
- **Unlisted**: only invited users can see the name on the list of all groups, see the feed, and join. Messages do not appear on the company feed. Private groups may be listed or unlisted.

The group access level is configured by the user who creates the group. The group creator is also the group administrator. Any user can create a group; however, ServiceNow administrators can restrict the ability to create groups.

Automatic group creation

If you create records on tables that have live feed enabled, such as the Incident table, a live feed group is automatically created at the same time.

Automatic group participation

Users who view records on tables that have live feed enabled, such as the Incident table, automatically join the document group.

If the user creates a record on a table with live feed enabled, the user becomes the document group administrator. Document groups like these are not public. Any user who has access to the record also has access to the document group associated with that record.

Create a group (group administrators)

When you create a group, you become the group administrator.

Group administrators can:

- Modify group properties
- Accept or reject membership requests
- Delete the group
- Perform all group member functions

1. Navigate to Collaborate Live Feed.
2. Click Create Group (Create Group).
3. Enter a Name to appear at the top of the group feed and in messages posted to the group (links to the group feed).
4. Enter a Description to appear at the top of the group feed and under the group name in the list of all groups.
5. Configure the access level for the group:
   - For a public group, select Public.
   - For a private group, select Private and select the Show this group when viewing all groups check box.
• For an unlisted group, select Private and clear the Show this group when viewing all groups check box.

6. (Optional) Select a picture for the group.
   1. Click the picture beside the group name.
   2. Browse to the desired picture file and click Open.

7. Click Create. The group is created with you as the group administrator.

![Figure 184: Group Properties](image)

Delete a group

1. Navigate to Collaborate Live Feed.
2. Click Groups (💬) and select the group name.
3. Click Delete Group (❌).
4. Click Yes to confirm deletion. The group is deleted from live feed. Messages posted to a private group are deleted; messages posted to a public group remain on the company feed without a group link.

   If you delete a group that is associated with an active record, such as an incident that has not yet been closed, the group becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the group administrator. The previous messages that existed as part of the document feed are not deleted.

Invite new members

Any group member can invite another user to join a group.

1. Navigate to Collaborate Live Feed.
2. Click Groups (💬) and select the group name.
3. Click Invite Member.
4. Begin entering a user name and select a user from the list, or click the reference lookup icon and select a user from the table.
5. Click OK. The invited user receives an email notification.

Join a group (group members)

When you join a group, you become a group member.

Group members can:
- View messages posted to the group (group feed). Non-members can also view the feed for a public group.
- View a list of group members.
- Invite another user to join the group.
- Subscribe to group email notifications.
- Leave the group.

1. Navigate to Collaborate Live Feed.
2. Click Groups and select View all groups.
   - If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the group.
   - If the group is public, click Join.
   - If the group is private, click Request. The group administrator receives an email notification and must accept your request before you can join the group.

Leave a group

1. Navigate to Collaborate Live Feed.
2. Click Groups and select the group name.
3. Click Leave.

Note:
If you leave a document group associated with a record, such as an incident, you automatically rejoin that group if you modify the associated record again.

Manage membership requests

When a user requests membership for a private group, the group administrator receives an email.

1. Navigate to Collaborate Live Feed.
2. Click Groups and select the group name.
3. Click Members

4. In the Pending Members section, click Accept or Reject for each membership request. The user receives an email notification to confirm whether the request was accepted or rejected.

![Pending members](image)

**Figure 185: Pending Membership**

Modify a group

1. Navigate to Collaborate Live Feed.
2. Click Groups
3. Click Modify Group
4. Modify the group properties or picture.
5. Click Update.

Subscribe to email notifications

1. Navigate to Collaborate Live Feed.
2. Click Groups
3. Click Subscribe
4. You can click Unsubscribe from a group to stop receiving email notifications.

View a group feed

1. Navigate to Collaborate Live Feed.
2. Click Groups. A list of groups you belong to and an option to view all groups appear.
   - To view a group you belong to, select the group name.
   - To view a public group you do not belong to, select View all groups and then click the group name. You must be a member to view the feed for a private group.
View group members

1. Navigate to Collaborate Live Feed.
2. Click Groups (and select the group name).
3. Click Members.

The list of group members appears, organized by group administrators, group members, and pending members.
Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note:** The concept of groups has changed in live feed v2 (starting with the Fuji release).

Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to Collaborate Live Feed.
2. Click Group Feeds and click All Feeds.
3. Click Create Group Feed.
4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - Public Feed: Select this to allow anyone to view and join the group feed.
   - Private Feed: Select this to restrict membership to only members invited by the administrator.
     When Private Feed is selected, the Show this feed for anyone to find and request to join check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.
6. Click Create.

Create record feeds

When a user views a record on a table that has live feed enabled, such as the Incident (incident) table, the user can click the Show live feed button at the top of the form to automatically create a record feed.

When a user who has write access to a record’s work notes journal field clicks the Show live feed button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks Show live feed on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how live feed is enabled for records

A property called glide.ui.show_live-feed_activity controls whether live feed is automatically enabled for all records.
This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live-feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks Show Live Feed.

**View the activity stream in record feeds**

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Figure 189: Live feed activity stream

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
Participate in a feed

When you join a feed, you become a feed member.

Feed members can:

- **View messages** posted to the feed. Non-members can also view the messages for a public feed.
- **View a list of feed members**.
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- **Leave the feed**.

1. Navigate to **Collaborate Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
### All feeds

<table>
<thead>
<tr>
<th>Feed Name</th>
<th>Description</th>
<th>Type</th>
<th>Members</th>
<th>Messages</th>
</tr>
</thead>
<tbody>
<tr>
<td>AngularJS discussions</td>
<td>Share your experiences and technical challenges using AngularJS</td>
<td>Private Feed</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Application Development using ServiceNow platform</td>
<td>For anyone interested in tips to develop apps using ServiceNow</td>
<td>Public Feed</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Competitive Analysis</td>
<td>For those who involve in pre-sales, sales and product strategy</td>
<td>Private Feed</td>
<td>2</td>
<td>1</td>
</tr>

<td>Public Feed</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>Orchestration</td>
<td>A feed to discuss orchestration</td>
<td>Public Feed</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Figure 190: All feeds**

- If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the feed.
- If the feed is public, click Join.
- If the feed is private, click Request. The feed administrator receives an email notification and must accept your request before you can join the feed.

**Mark a feed as a favorite**

Top-level messages in feeds can be marked as favorites on a per user basis only.
You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds, and then click All Feeds.
3. In the list of feeds, click the star icon (.favorite) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (favorite) of a message that is already a favorite.

**View a feed**

You have several options for viewing a feed.

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds.
   This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select Show All and then click the feed name. You must be a member to view the feed for a private feed.

Note: If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

**View a feed member**

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

**Invite a new member to a group feed**

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.
   The invited user or team members receive an email notification.

**Invite a new member to a record feed**

The feed administrator can invite another user or a team to join a record feed.
When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.

When users are invited, their membership state is initially Invited. When they accept the invitation, the system checks their access to the work_notes journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to Collaborate Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.

   If you invite a team, the individual members of the team are invited.

   The invited users receive an email notification.

Remove a member from a feed

The feed administrator can remove any member from the feed.

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click Remove.
Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification’s subject will be Live Feed IT Support.

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the subscribe icon ( ).
You can click the unsubscribe icon ( ) to stop receiving email notifications.

Note: If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

Navigate between live feed and other modules

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

Leave a feed

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Leave.

Note: If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

Delete a feed

If you are a feed administrator, you can delete the feed.

1. Navigate to Collaborate Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Delete.
4. Click Yes to confirm deletion.

The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

1. Navigate to Collaborate Live Feed.
2. Click your name or title displayed below your picture.
3. Click the pencil icon next to About Me and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:
• Locate the photo file you want to use, and drag-and-drop it over the existing photo.
• Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.

![Upload a picture](image)

Figure 194: Upload a picture

---

**Note:** Your profile picture is used by the Connect and legacy chat features as well if they are activated.

---

**Work with Live Feed messages**

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
Table 417: Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user’s picture, information for the user appears from the Business Card view of the User (sys_user) table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
Figure 195: View profile

If you click a user’s name or title, the user’s profile appears. Click the tabs to view different types of information for the user.
Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user’s name or point to the user’s picture.
   A Follow link appears in the user’s profile.
3. Click Follow.
4. To stop following the user, navigate to People Following.
5. Click Unfollow.
6. To view people who are following you, navigate to People Followers.

Select feeds

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the Search field to locate any type of feed. As you type in the Search field, the results are dynamically displayed. For example, if you type INC, records that are incidents are forced to the top of the results list.
2. You can also select the following types of feed information.

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>• messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>• messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
Follow feeds

You can view users who are following you or other users you are following.

To view users who are following you or other users you are following, click People in the sidebar.

The system shows 10 most recent followers or users you are following.

![People](image)

Figure 200: People

If either list contains more than 10 users, a Show More link appears.

---

Note: If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

---

Bookmark feeds and hashtags

The live feed interface uses the standard bookmarking functionality for feeds and hashtags.

In UI15 and UI11, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon ( ) in top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. Users with any role can add live feed to their homepage; however, administrators can restrict this ability.

Use Live Feed with UI11

Using Live Feed with UI11 requires the UI11-Navpage layout with multiple panes plugin.

1. If you do not see a gray toolbar on the left side of the screen (called your edge), click the Switch to the new UI link in the banner.
2. Navigate to Collaborate Live Feed.
3. Drag the Live Feed module to the edge.
4. Point to the bookmark on your edge. When the tip window appears, click Edit Bookmark.
5. Select the Flyout check box.
6. Click Update.

   • You can now access live feed in a flyout window without navigating away from your working panes.
   • Notifications appear on the edge when new messages are posted in your My Feed.

![Figure 203: UI11 notification](image)

• When you open the bookmark, a blue circle appears beside new messages.
Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds.

Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Create a team

When you create a team, you become the team administrator.

As team administrator, you can:

- Modify team properties
- Accept or reject membership requests
- Remove members from the team
- Delete the team

1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.

3. Click Create Team.

4. Enter a Name to appear at the top of the feed and in messages posted to the team. This name links to the team feed.
5. Enter a Description to appear at the top of the feed and under the team name in the list of all teams.

6. Select the access level for the team:
   - Public Team: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - Private Team: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When Private Team is selected, the Show this team for anyone to find and request to join check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click Create.
   The team is created with you as the team administrator.

---

Note: A team administrator can create one or more group feeds specifically for the members of this team by clicking the Group Feeds tab and Create Group Feed. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.
Automatic team creation

If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

Join a team

As a team member, you can:

- **View messages** posted to the team (team feed). Non-members can also view the feed for a public team.
- **View a list of team members**.
- **Invite another team** to join the team.
- **Subscribe to team email notifications**.
- **Leave** the team.

1. Navigate to Collaborate Live Feed.
2. Click Teams and click All Teams.
   - If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the team.
   - If the team is public, click Join.
   - If the team is private, click Request. The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select All Teams and then click the team name.
     You must be a member to view the feed for a private team.

View a team member

1. Navigate to Collaborate Live Feed.
2. Click Teams and select the team name.
   You must be a member of the team to view the members.
3. Click Members.
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Pending members tab.
5. In the Add User field, enter the name of the user you want to invite. The invited member’s picture appears.

Remove a member

If you are team administrator, you can remove any member from the team.

1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Members tab.
5. Click Remove below the member name.
6. Click Remove again in the confirmation box that opens.

Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

Subscribe to team and email notification

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification’s subject will be Live Feed IT Support.

1. Navigate to Collaborate Live Feed.
2. Click Teams and select the team name.
3. Click the subscribe icon ( ).
You can click the unsubscribe icon ( ) to stop receiving email notifications.

Subscribe a team to feed notification

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to Collaborate Live Feed.
2. Click Teams and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click Feeds.
4. Click the subscribe icon ( ) beside the feed name.

You can click the unsubscribe icon ( ) to stop receiving email notifications.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team

You can give up membership to a team by leaving that team.

1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Leave beside the team name.

Modify a team

If you are team administrator, you can modify an existing team.

1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request

When a user requests membership to a private team, the team administrator receives an email.

If you are the team administrator, you can manage membership requests.

1. Navigate to Collaborate Live Feed.
2. Click Teams and select the team name.
   If one or more users have been invited to the team, the Pending members tab shows the number of invitations sent.
3. Click Pending members.

This shows the users who have received invitations, but who have not yet accepted.
4. You can cancel a user’s invitation by clicking Remove.
5. You can invite another user to the team by entering their name in the Add user field and clicking the Invite member button.

Delete a team

If you are the team administrator, you can delete a team.
1. Navigate to Collaborate Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon.
5. Click Delete.
6. Click Yes to confirm deletion. The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a live feed message

You can post a message to open a new feed.
1. Navigate to Collaborate Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.
1. Navigate to Collaborate Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
### Message Thread

**Navakanth Reddy**  #suggestion(s) A common black vertical line just before the bars would help with this. Also, line spacing between two options should be more than single-spaced.  

Also, the bar says 5 people voted and it shows up 5 people and 1 more. Is this a #bug?  

**Siva Dirisalu** issues to improve. We have some UI poll, or perhaps fix the one that contains a #fui. We might simply provide #suggestions and #feedbacks

**Nirupam Biswas** I guess we need some visual distinction between the poll question and the options. After voting, I got confused for some moments why there are four options in result. See screenshot.

**Shouvik Goswami** We have enabled polls in Live Feed. Please review and provide #suggestions and #feedbacks

#### How do you like the poll in Live Feed?

- [ ] Exactly what I was looking for
- [ ] Wanted something more
- [ ] Did not visualize it this way

[Vote]

**Peter Smith** about a minute ago. I set up a poll with 5 options. I feel like I can improve it.

- Get some opinions from people.
- It still shows 'the total acknowledged' when I try to edit the field.
- When I view the Live Feed, it shows 5 people voted.
- When I view the Live Feed, it shows 5 people voted.

[Like] [1] [Reply] [Share] [Tags] (2)
Attach files, links, images, and knowledge articles to messages

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance’s knowledge base.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

Attach a file to a post or reply

There are two methods that can be used to attach files to posts, drag-and-drop and using the paperclip icon ( ). Additionally, you can paste images into a post or reply from the clipboard.

1. Do one of the following:
   - While composing a post or reply (see Post a live feed message or Reply to a live feed message), locate one or more images or other supported types of files, and drag them into the message box.
   - Click the paperclip icon

               ( )

   in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.
4. Enter a comment to share your thoughts about the image.

   Note: The Post button is enabled only after you add the comment.

5. Click Post or Reply.
6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.
7. Click the link to download the files.

Copy an image from the clipboard

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the Comment box and add a comment.

Figure 209: Copy paste

2. Click the Add an image button.
   The Screenshots dialog box opens.
3. Right-click the Paste an image here box and select Paste to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click Done.
6. To change the link text, click Pasted Image and enter a new label.
7. When you finish, click Post or Reply.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon (自来水笔).

Figure 210: Copy pasted
Add a link to a post or reply

1. Click into the Comment box. The Add a link button appears.
2. Click the Add a link button. The URL and Link text fields appear.
3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the URL field.
5. When you have finished entering your message, click Post or Reply.

Figure 211: Add a URL

Figure 212: URL Saved
Add a knowledge article link to a post or reply

1. While composing a post or reply, type the ID of the knowledge article you want to link to. It is not necessary to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click Post or Reply.

Add a poll to a message

When you are posting a message, you have the option of creating a poll in order to record your viewers’ opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll (.poll) icon.
4. In the Question field, enter the question on which you are soliciting opinions.
5. In the Option fields, enter possible responses to the query.
6. To add more response options, click Add more options.
7. Click Post.

After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

---

Note: Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

Add mentions to a message

An @mention is any posted update that contains @username anywhere in the body of the message. The user’s name, with a link to that user’s feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user’s My Feed.

Note: If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.
2. Click the user you want to add.
That user’s name is inserted into the @mention in the body of the message.

Note: My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message

1. Navigate to Collaborate Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.

If the message has previously been liked, the number of likes for a message displays next to the Like link.

For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the # more link. If the logged-in user has liked the message, that user’s image will appear first, followed by the image of the user who last liked the message.

For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

Note: After a message has been liked, it cannot be unliked.

Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
   The message disappears from the feed.

Legacy chat

Legacy chat provides real-time communication via instant messaging between users in a ServiceNow instance.

Note: The Connect feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Get started with the legacy chat feature

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the ServiceNow ITSA Suite. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
   - Chat rooms may be Public (any user can join) or Private (only invited users can join).
• Administrators can limit who can read chat messages on tasks and who can create chat rooms.

**Activate legacy chat**

You can activate the Chat plugin within the instance if you have the admin role.

**Role required:** admin

Before activating the Chat plugin, consider the installed components, dependencies, and impact.

• **Installed Components:** Include tables, a field, business rules, a script include, an application, a user role, properties, an event, and an email notification. For more information, review the components that are installed with chat.

• **Dependencies (installed automatically):** Social IT Infrastructure.

• **Impact:** The plugin installs new features; it does not overwrite or impact current configurations. It has minimal impact on the system. However, when the system is configured to use short polling (see the Properties in **Installed with legacy chat**) and the client is in debug mode, users may experience a performance impact. Polling also keeps the session alive when the chat desktop is open.

1. Navigate to **System Definition Plugins**.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files will not be installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

**Installed with legacy chat**

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see **Set Up Chat Queues for Help Desk Chat**.

**Other:**

• **Event:** A new event called chat.invite is registered to trigger an email notification when users are invited into a chat room.

• **Email Notification:** An email notification called Chat Room Invite is added to send when users are invited to a chat room.
Fields installed with legacy chat

Legacy chat adds the following fields.

<table>
<thead>
<tr>
<th>Display name (Table name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header (content_block_header)</td>
<td>Adds the Help Desk Chat link to the ESS portal page.</td>
</tr>
</tbody>
</table>

Properties installed with legacy chat

Legacy chat adds the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.chat.invite_fields</td>
<td>Comma-separated list of fields used to generate the invites when creating a chat room from a task. The user is presented with check boxes for each of the specified fields to select the invites for the chat room. The fields should be references or glide_lists of sys_user or sys_user_group.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: assignment_group,watch_list</td>

Script includes installed with legacy chat

Legacy chat adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChatUtils</td>
<td>Provides utilities for chat conversations.</td>
</tr>
</tbody>
</table>

Tables installed with legacy chat

Legacy chat adds the following tables.
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Actions (chat_actions)</td>
<td>Defines additional chat window menu items. Access at Social IT Chat Administration Actions (administrator and chat_admin).</td>
</tr>
<tr>
<td>Chat Channel (chat_channel)</td>
<td>Stores chat channels, which are chats between members. This table is extended by Chat thread (chat_thread) (a one-to-one chat) and chat_room (a multi-user chat). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Channel Member (chat_channel_member)</td>
<td>Relationship table that associates channels and members. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Message (chat_message)</td>
<td>Stores instant messages sent from any chat window. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Presence (chat_presence)</td>
<td>Stores presence (status) information for a user. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Queue (chat_queue)</td>
<td>Stores the groups and schedules for providing support via instant message. Defined at Social IT Chat Administration Queues (administrator and chat_admin).</td>
</tr>
<tr>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Stores user requests for live support. Extends Task (task). On a chat queue record, the Chat queue entries related list displays the entries that are associated with that chat queue. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Room (chat_room)</td>
<td>Stores chat rooms (multi-user chat). Extends Chat channel (chat_channel). Can be modified if necessary (such as to change a chat room from public to private), but should almost always be managed by system functionality.</td>
</tr>
<tr>
<td>Chat Roster (chat_roster)</td>
<td>Maintains users that are associated with a user’s My Friends list. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Roster Member (chat_roster_member)</td>
<td>Tracks users that are members of a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Thread (chat_thread)</td>
<td>Stores one-to-one chats. Extends Chat channel (chat_channel). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live Headline (live_headline)</td>
<td>Sends system messages. For example, the system may send a message when a user enters or leaves a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live Poll Message (sys_live_message)</td>
<td>System table that stores and manages chat messages. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live User (sys_live_user)</td>
<td>System table that stores and maintains chat users. Extending or modifying data in this table is not recommended.</td>
</tr>
</tbody>
</table>
Table: Stores the last live sequence number (sys_live_last_sequence) | Description: Stores the last sequence ID. Extending or modifying data in this table is not recommended.

Business rules installed with legacy chat

Legacy chat adds the following business rules.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue (Task.active) Updater</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Sets the chat queue entry Action field to Waiting when the action changes.</td>
</tr>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>When a chat queue entry is accepted, calculates the average wait time for the queue by averaging the last 20 chat queue entries.</td>
</tr>
</tbody>
</table>

Legacy chat use

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:

- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to Social IT Chat.

Note: Service desk staff may also provide live support to other users via help desk chat.
Update your profile

Your profile identifies your contributions to legacy chat conversations.

Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

Table 419: Profile

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
</tbody>
</table>
To update your profile picture:
1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click Open.

Note: Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

![Chat profile picture](image)

Figure 218: Chat profile picture

Update your status

In legacy chat, your status lets other users know whether you are available to chat.

Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:
1. Click the status icon beside your name.
2. Select a status (see table).
Table 420: Change status

</tbody>
</table>

To expand or collapse a section in the favorites list, click the section header or click the arrows ( ) on the section header.
Add a favorite user

How to add a user to your favorite users list in legacy chat.
1. Click the Add User button.

![Figure 230: Add friend](image)

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

![Figure 231: Search icon](image)

3. Click OK.

Remove a favorite user

How to remove a favorite user in legacy chat.

To remove a user from your favorite users list, right-click the user’s name and select Remove From List.

View an online user

How to view a list of all users who are available to chat (status of Online) in legacy chat.

1. Right-click the Users section header or click Options on the toolbar.

![Figure 232: Chat window menu](image)

2. Select Show Online Users.
   - Start a one-to-one chat with a user on the list by double-clicking a name.
   - Send Message or Add To Friend List by right-clicking a name.
View a room

How to view a list of all public chat rooms in legacy chat.

1. Right-click the Rooms section header or click Options on the toolbar.

   ![Chat window menu](image)

   Figure 234: Chat window menu

2. Select Public Rooms.
   - To join a room, double-click a name or right-click and select Join Room. See [Joining Chat Rooms](#).
Start a one-to-one chat

How to start a one-to-one chat in legacy chat.

- To start a chat with one user in your favorites list, double-click the user’s name or right-click and select Send Message.
- To start a chat with one available user, double-click the user’s name on the online users list. See Viewing Online Users. Send a message to start a conversation.

Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click Create Room on the favorites list toolbar.

2. Enter the room details (see table).
3. Click Create Room. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.
Create Room

Room name: Chat Room for INC0000003

Description: Wireless access not available on floor 3

Password: ********

Room avatar:

Features:
- Public
- Members Only
- Temporary

Invite:
- Fred Luddy
- Beth Anglin
- ITIL User

Create Room Cancel

Figure 237: Chat task create
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Room name</td>
<td>Enter a name to appear on the chat window header or click the Generate a unique room name button (Figure 238: Room name generator) to use a system-generated name. The default name for a room created from a task is Chat Room for ⟨Task Number⟩.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a room description that appears under the name in the rooms list. The default description for a room created from a task is ⟨Short Description⟩.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a password, if desired. If a password is specified, only users with the password can join the chat room.</td>
</tr>
<tr>
<td>Room avatar</td>
<td>Upload an image that appears beside the room name in the list of rooms. Click the picture and browse to the desired image file.</td>
</tr>
</tbody>
</table>
| Features     | Select all applicable check boxes:  
• Public if all users can see the room in the rooms lists.  
• Members Only if only invited users can join the room.  
• Temporary if the room is not saved once all participants have left. This feature is not available for rooms created from tasks; task chat rooms are always available on the task record. |
| Invite       | Add invited users by using the glide list. For a room created from a task, you can also select all applicable check boxes:  
• Assignment group: invite all users in the assignment group for the task.  
• Watch list: invite all users on the watch list for the task. |

Create a chat room for a task

How to start a legacy chat with multiple users from a task record.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the record (example, an incident on which you are working).
2. Click the Create or Join Chat Room related link.
3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

4. Click the create link at the bottom of the window.
5. Enter the room details as you would for a chat room.
6. Click Create Room. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).
7. In the New Room Created message, click Join Room.
   • A new chat window opens on your chat desktop.
• All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

Join one-to-one chats

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

Join a chat room

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

Figure 241: Chat invitation

2. To respond, click the invitation.

A window opens that displays the room name, room description, and the name of the user who invited you.

• To join the chat, click Join. When the chat window opens on your chat desktop, click the window.
• To ignore the invitation, click Decline.

Figure 242: View invitations

To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

To join a public chat room without an invitation, right-click the Rooms section header and select Public Rooms. Double-click a room name on the list.

Join a chat room for a task

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.

Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press Enter. The message appears in the other users’ chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:))). When the message is sent, a smiley face (😊) appears in place of the text. For more emoticons, see Sending Emoticons in Messages (Smileys).

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
• When a user joins or leaves a room, a message appears in the other room members’ chat windows.

Send emoticons in legacy chat messages (smileys)

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (:) and a smiley face (😊) appears in your message.

Table 423: Emoticons

<table>
<thead>
<tr>
<th>Text</th>
<th>Image</th>
</tr>
</thead>
<tbody>
<tr>
<td>:) :-</td>
<td>Figure 244: Smiley</td>

<td>Figure 250: Wink</td>
</tr>
</tbody>
</table>
Change the display

How to change the display of legacy chat.

To view the chat window menu, click the gear button ( ☻

Figure 258: Chat window menu

) in the bottom left.

• To show or hide timestamps, select Show Timestamps from the chat window menu or press F2.
• To show or hide the chat member list, select Show Members from the chat window menu or press F4.
To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the X in the upper right corner.

Invite a user into a chat

How to invite another user into a chat in legacy chat.

1. Select Invite User from the chat window menu.

![Figure 259: Chat window menu]

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

![Figure 260: Search icon]

3. Click OK.

   An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.

Add a favorite room

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select Add To Favorites from the chat window menu.

![Figure 261: Chat window menu]

Remove a favorite room

How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select Remove From List.

Set your chat preferences

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in Changing the Display.

To view your chat preferences, click your name in the upper left corner of the chat desktop and select Chat Preferences.
To set your preferences, select or clear the check boxes next to the options, then click Update.

Table 424: Preferences

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audio</td>
<td>Turn audio notifications on or off.</td>
</tr>
<tr>
<td>Conversation Windows</td>
<td>Set default options for showing timestamps and members in one-to-one chats.</td>
</tr>
<tr>
<td>Group Chat Windows</td>
<td>Set default options for showing timestamps members in chat rooms.</td>
</tr>
</tbody>
</table>

Delete a chat room

You can delete chat rooms in legacy chat.

Role required: chat_admin

Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter chat_room.list.
2. Delete multiple chat rooms from the list or open a chat room record and click Delete.

Legacy chat administration

Users with the chat_admin role can administer various aspects of legacy chat.

Define chat room access rights

Control the access rights for creating a chat room so that not all users can create a chat room.

Role required: chat_admin
To define the access rights for creating chat rooms:
1. Navigate to Social IT Chat Administration Properties.
2. Locate the property Comma-separated list of roles that are allowed to create chat rooms.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

Change chat room message read access

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a Chat Activity journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

- Modify the Chat message access control rule or create a new rule.

Read access to the messages displayed is handled by the access control list security operation chat_messages_read on the Chat room [chat_room] table.

View a legacy chat message as a journal field

You can view all chat messages in one place by viewing them as a journal field.

Chat rooms can be linked to any task record in the following ways:

- Create a room from the record.
- Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:

- Configure the task record form to select the Chat Activity field.

The maximum number of chat messages that are displayed by this field is 1000.
Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu

You can create new actions and add them to the chat window menu.

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as Show User Type and opens a popup window that indicates a current user of queue_agent.

- Action Name: Show User Type
- Active: Select the check box.
- Order: 100
- Client Show Condition:
  
  answer = g_chat.getChatType() == 'queue_agent';

- OnClick Action Script:
  
  alert('The current user is: ' + g_chat.getChatType());
Chat action details
You can define a chat action name and the script that runs when the action is selected.

### Chat action details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the predefined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

### Available methods associated with the g_chat variable

The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

The following table defines the available methods associated with this object.

### Method Summary

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>getActiveUsers()</td>
</tr>
<tr>
<td></td>
<td>Returns the active users.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td>getChannelJID()</td>
</tr>
<tr>
<td></td>
<td>Returns the channel JID, which is a sys_id for a record chat_channel table.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns the channel JID.</td>
</tr>
<tr>
<td>String</td>
<td>getChatType()</td>
</tr>
<tr>
<td></td>
<td>Determines the chat window type.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td>Return Object</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| String        | String - Returns one of the following values that specifies the type of user:  
• queue_agent: Help Desk Chat support agent  
• queue_user: Help Desk Chat end user  
• group_chat: The individual is a member of a chat room (multiple users)  
• conversation: The individual is a member in a private chat with another user |

String

getChatQueueAgent()

Returns the sys_id for agent that is administering this thread.

Returns:
String - Returns the sys_id of the chat queue agent.

String

getChatQueueUser()

Returns the sys_id for end user of the chat queue.

Returns:
String - Returns the sys_id of the chat queue user.

String

getThreadID()

Returns the thread ID. This returns the same value as g.chat.getChannelJID().getID().

Returns:
String - Returns the thread ID.

Help desk chat

Communicate with service desk staff using instant messaging.

Note: The Connect Support feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)
• Users access live support from the Employee Self-Service portal.  
• Service desk staff provide support from the chat desktop.

Use help desk chat to get support

You can contact service desk staff.
2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the Service Desk Chat button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press Enter.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.

5. Chat with your service desk agent via instant messaging.
   Service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

Note: Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.

Figure 265: Service Desk Chat Window

Use help desk chat to provide support

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

To provide users with live support using chat:

1. Navigate to Social IT Chat to open your chat desktop.
   • A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.
• The chat queue agent window displays the number of users in the queue and how long they have been waiting.
• Every member of the assignment group sees the associated chat queue agent window.

2. Click Answer Next User to answer the next user or click Answer beside a specific user in the queue. A chat window opens.
• Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:
• Invite User: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.
• Create Incident from Chat: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the Create or Join Chat Room related link on the Incident form).

Note: Administrators can edit this action or add additional actions to the chat window menu.

Figure 266: Chat Queue Agent
Set up chat queues for help desk chat

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.

Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat

How to define a chat queue for legacy chat.

Note: The Chat Queue (chat_queue) table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT Chat Administration Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

Table 425: Chat queue details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>
Assign service desk staff to a chat queue

Chat queue agents are Service Desk staff that are members of a chat queue’s assignment group.

To assign agents to a chat queue:

1. Navigate to User Administration Groups.
2. Select an existing assignment group or click New.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select Save.
5. In the Group members related list, click Edit.
6. Using the slushbucket, add support staff to the group.
7. Navigate to Social IT Chat Administration Queues.
8. Select the chat queue for which the group provides support.
9. In the Assignment Group field, select the group.

![Figure 267: Chat queue group](image)

Make help desk chat accessible to an end user

Users access live support from the Employee Self-Service Portal (ESS Portal).

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).
To change the default link in the ESS header:
1. Navigate to Content Management Headers.
2. Open Portal - Header.
3. In the Chat queue field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click Update.

Figure 268: Chat queue link

Add a custom link elsewhere on the ESS portal
How to add a custom help desk chat link on the ESS portal.
1. Navigate to Content Management Static HTML.
2. Click New.
3. Enter a Name.
4. In the Static content field, click Toggle HTML Source to edit the field in HTML source mode.
5. Create a link to the desired Help Desk Chat queue (see Link Syntax).
6. Click Submit.
7. Add the new content block to the desired location on the portal (see Adding Content to the Page).

Link syntax
To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the CustomEvent.fire method using appropriate arguments.

API Call:
CustomEvent.fire(LiveEvents.LIVE_EVENT, LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID, CHAT_QUEUE_SYS_NAME);

where the variables are:

- **CHAT_QUEUE_SYS_ID**: Specifies the sys_id for the chat queue.
- **CHAT_QUEUE_SYS_NAME**: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).

Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT, LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, 'c54f0abf0a0b452db84664f409c79c', 'Help Desk Chat'); return false;">
  Help Desk Chat
</a>
```

Monitor chat queues

Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

- **Queue Wait Time**: amount of time a user waits in the queue before a help desk agent accepts the request.
- **Percentage of Chats Abandoned**: users that exit the queue before an agent responds (user stopped waiting).
- **Percentage of Chats Accepted**: requests that are answered by an agent.

Note: This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

Monitor help desk chat tasks

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

Knowledge Management

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.
Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users. For this task, you must be an administrator with the admin role.

Requirements

Role required
admin

Before you begin

Meet with the following stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
</tbody>
</table>
With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do knowledge articles need to be translated into other languages?

What to do

Assign knowledge roles to users and groups
Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows
If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for knowledge bases, create custom workflows for those knowledge bases.

Configure Knowledge properties
If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

Activate support for other languages besides English
If languages other than English must be supported, activate the Knowledge Management Internationalization plugin.

Coordinate with knowledge managers for knowledge base setup
Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.
Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Multiple knowledge bases can be created for different groups within your organization to share information within and between those groups.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required

knowledge_administrator, knowledge_manager, or admin

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?
- Will Social Q&A be leveraged for this knowledge base?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.

5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A.

6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

Knowledge Management guide for users

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.

Requirements

Role required

None. All users can read, create, and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to it.

If you need these permissions, contact the knowledge manager for the knowledge base.

What to do

Create knowledge articles

If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents. You can also create knowledge articles from incidents and problems.

Search for knowledge articles

From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access. You can also search knowledge from within an incident.
Access to knowledge using your mobile device is supported.

Ask and answer questions

If Social Q&A was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

Next steps

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- Move a knowledge article
- Retire a knowledge article
- Request a knowledge base

Knowledge Management roles

Certain roles are required to use Knowledge Management functionality.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any role</td>
<td>All users with at least one ServiceNow role can read, create, and edit knowledge articles. However, the knowledge manager of a knowledge base can select criteria to restrict this access.</td>
</tr>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create knowledge bases and manage the default knowledge base.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
</tbody>
</table>

Administrators assign these roles to the users and groups who maintain the knowledge content.

Knowledge homepage

The Knowledge homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage navigate to Self-Service Knowledge.
Note: The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.

![Knowledge homepage screenshot]

- **Import a Word document**
- **Create an article**
• Ask a question

Note: You must have user criteria “Can contribute” permission for at least one active knowledge base, otherwise these buttons do not appear. See Knowledge Management v3 migration and Knowledge manager.

You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Figure 271: Browsing articles by category

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories) to true.
Knowledge search

You can search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar at the top of the page.

Search results include only articles and questions you are authorized to read. The search results count does not take into consideration any security rules set for the articles; therefore, the number of articles you could access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results (for those articles to which you have access).

Note: To change how the attachments are displayed in the search results, set the How to display attachments in Knowledge Search Results property. Attachments can be displayed with a snippet, link only, or not at all.

To use wildcards in your search, navigate to Contextual Search Search Contexts Knowledge Base Search and enable wildcard search.

You can sort knowledge content by relevancy, most recent update, or number of views.

You can filter results using the check boxes that appear. Filtering options appear depending on the search text.

Table 427: Filtering options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Knowledge Bases</td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar.</td>
</tr>
<tr>
<td>Categories</td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td>Authors</td>
<td>Select one or more authors.</td>
</tr>
</tbody>
</table>
Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.
Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

---

Note: Social Q&A is not compatible with Internet Explorer 9 or earlier. Navigating to a Social Q&A page using one of these browsers will cause a browser support warning to appear.

---

Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions. A user must meet the criteria defined in the knowledge base Can Read related list to view or contribute to Social Q&A questions, answers, and comments associated with that knowledge base.

---

Note: The Can Contribute related list does not control the ability to contribute to Social Q&A. Users that meet the Can Read criteria for a knowledge base can also contribute questions, answers, and comments.

---

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.

You can disable Q&A for a knowledge base by clearing the Enable social questions and answers check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

Social Q&A questions

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (Self-Service Knowledge). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details.

Ask a question

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to Self-Service Knowledge.
2. Click Post a Question.
3. Enter a value for the following fields.
Table 428: Question fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click Post Question.

To accept the answer, click the Accept link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking Unaccept.

Note: You must be the owner of the question or the knowledge manager to accept an answer.

Answer a question

As a user, you can answer a question another user has asked. The owner of the question or the knowledge manager can then accept the answer.

Roles required: none

As a knowledge manager or the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Enter an answer in the Your answer field.
4. Click Submit.

Comment on a question or answer

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Within the question or answer you want to comment on, click the Comment link.
4. Enter the comment text.
   Comments have a maximum length of 140 characters.
5. Click Post comment or press the Enter key.
Edit a question, answer, or comment

You can edit questions, answers and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click Edit.
4. Edit the details as needed.
5. When editing a question, click Advanced to make changes to the question record.
6. Click Update.
   Click Undo to discard the changes and close the editor.

Vote on a question or answer

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

Note: You cannot vote for your own questions or answers.

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.

Subscribe to a question

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another use, you can manually subscribe to the question.

Role required: none

1. Navigate to Self-Service Knowledge.
2. Select a question.
3. Click the subscribe icon.

If you want later to stop receiving notifications about this question, click the unsubscribe icon.

Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.
You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to Self-Service Knowledge.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click Delete.
   Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.

Share a question
You can generate a URL directly to a question and related answers.

Role required: none

1. Navigate to Self-Service Knowledge.
2. Select the question that you want to share.
3. Click Share.
   Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the window that appears.

Distribute the URL to share the question.

Social Q&A internationalization support
The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

Note: For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.

Social Q&A search
Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags
Tags organize questions and provide information about the question subject matter.
Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags (label) table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Knowledge feedback

You can view and contribute to feedback on knowledge articles.

Feedback options

You can submit feedback for knowledge articles in these ways:

• Flag an article as incorrect or inappropriate.
• Provide a rating value for the article.
• Mark an article as helpful or not helpful.
• View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge  Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form when creating a knowledge base. Administrators can configure feedback options using properties.

Flagging articles

You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

Suggestions you make when flagging an article do not appear in the public comments for that article.

Rating articles

The five stars below the article title allow you to indicate the article’s effectiveness on a scale of 1 to 5.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments.
Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to Self-Service Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage (pin) articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

Users with at least one role can create and edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. Navigate to Self-Service Knowledge.
2. Click Create An Article.

Note: You must have user criteria “Can contribute” permission for at least one active knowledge base, otherwise the Create An Article button does not appear. See Knowledge Management v3 migration and Knowledge manager.

3. Fill in the fields on the form, as appropriate.

Table 429: Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Published</td>
<td>When this knowledge article was published. This value is set when the article is created, and updated when the article is published.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid to</td>
<td>When this knowledge article expires. Articles do not appear in search results after the valid to date, or if the valid to date is empty.</td>
</tr>
<tr>
<td>Image</td>
<td>An image that appears beside the article when searching from the legacy knowledge portal.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki.</td>
</tr>
<tr>
<td>Workflow</td>
<td>(Read-Only) The publication state of the article, such as Draft or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option. Note: You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td>Text</td>
<td>Content for the article. Use the WYSIWYG HTML editor to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
</tbody>
</table>

4. Click Submit to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.

Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.
As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the Category field.

2. Select an existing category, or click the add category icon (+) to add a new category. After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   Note: Clicking Cancel while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Select or add a subcategory.
5. Click OK.

Move a knowledge article

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the Knowledge Base field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click OK to overwrite fields with the default values, or Cancel to leave all fields unchanged.
   A knowledge manager can define default values for articles in knowledge bases you manage using the Set default knowledge field values field on the Knowledge Base form.
4. Click Update.

Retire a knowledge article

Retired knowledge articles are no longer available for users to view.
A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click Retire to launch the retirement workflow associated with that article.

Create knowledge from an incident or problem

To create knowledge from an incident or problem, select the Knowledge check box on the incident or problem form and close the incident or problem record.

The short description from the incident or problem becomes the knowledge article title. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

Depending on the value of the glide.knowman.submission.workflow property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

Approving a submission creates a new knowledge article using the submission content.

1. Navigate to Knowledge Open Submissions.
2. Select a submission record.
3. Review the submission to ensure the content and settings are correct.
4. Click Create Article.

A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

You can edit the new knowledge article before publishing it, such as to select a category.

Import a Word document to a knowledge base

Import a Microsoft Word document to create a new knowledge article.

Role required: None. You must have user criteria “Can contribute” permission for at least one active knowledge base. If you cannot contribute, the Import Articles button does not appear.

Note: An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the ‘Import’ functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.

Importing documents to knowledge is available only from a computer browser. You cannot import documents from a mobile device.

You can import Microsoft Word .doc and .docx files.

Note: The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. All HTML supported by the TinyMCE editor such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

Note: You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.
The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images
- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
- Tables

Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Self-Service Knowledge.
2. Perform one of the following actions.
   - Click Import Articles and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Select the Knowledge base to add the new article to.
   You can select only knowledge bases you can contribute to.
4. Select a Category from within that knowledge base.
5. Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.
   This check box applies only when importing to v3 knowledge bases and only if the Show publish checkbox on the knowledge import pop-up property is set to Yes on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.
   Knowledge v2 articles go into Draft state. Knowledge v3 articles go into Review or Published state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).
6. Click Import.
   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.
   If any errors occur during the upload, a popup window appears to display the error.

Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.
The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. All managers of a knowledge base, including the owner, automatically receive the knowledge_manager role.

The following podcast offers additional information on using the Knowledge Management.

Pin a knowledge article

You can pin an article to appear at the top of knowledge search results and in the Featured content section of the knowledge homepage.

Pinning associates an article to specific keywords. Searching for a keyword causes articles with that keyword to appear at the top of search results. You can pin articles that need to be distributed broadly, such as a maintenance notice or new HR policy.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Featured content related list, click New.
4. Select a Knowledge article
5. Click the lock icon to expand the Keywords field.
6. Select or create knowledge keywords using the reference lookup icon.

   Note: Only articles with the keyword homepage are shown in the Featured Content section of the knowledge homepage.

7. After adding all keywords, click Submit.

Select user criteria for a knowledge base

You can specify user criteria to control which users can create, read, write, and retire knowledge articles.

Knowledge bases use these user criteria records to determine which sets of users can read or contribute knowledge within that knowledge base. If a knowledge base has no user criteria selected, articles within that knowledge base are available to all users. Only users with at least one role can create and edit articles. Users without any role can read articles but cannot contribute. If a knowledge base has Can read user criteria defined, but no Can contribute user criteria, all users with at least one role can access and modify the knowledge base.

This video demonstrates how to control Knowledge Management access through user criteria.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. Access one of these related lists, and then select or create user criteria records.

<table>

</tbody>
</table>

**Note:** In the tables of rules, an implicit last rule is: All Users -> Denied Create, Read.

**Define a knowledge article category**

Each knowledge base has a hierarchy of categories that organize the articles.

A category can be a top-level category or a child category. The parent of a child category can be a top-level category or another child category. By making a category the child of another child category you can create a category structure with any number of levels.

You can create and edit categories separately for each knowledge base.

1. Navigate to **Knowledge Administration Knowledge Bases**.
2. Select a knowledge base you manage.
3. Choose an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a top-level category.</td>
<td>Navigate to the Knowledge Categories related list and click New.</td>
</tr>
<tr>
<td>Create a child category.</td>
<td>Expand an existing category and click New within the expanded section.</td>
</tr>
</tbody>
</table>
4. Enter a Label for the category. The label appears as the name of the category.
5. Enter a Value you can use when referencing the category in scripts.
6. Click Submit.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.
Assign a knowledge base manager

You can assign users as managers of a knowledge base.

1. Navigate to Knowledge Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Managers field, click the unlock icon.
4. Add one or more users.
5. Click Update.

After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the Managers field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

Knowledge administration

As an administrator, you are responsible for setting up knowledge bases, configuring knowledge workflows, and customizing knowledge homepages. Most day-to-day management functions are performed by knowledge managers.

The following podcast offers additional information on using the Knowledge Base Application.

Create a knowledge base

An administrator can set knowledge base field values when creating a new knowledge base. Knowledge managers can set field values for knowledge bases they manage.

Table 431: Knowledge Base form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The name of the knowledge base.</td>
</tr>
<tr>

<td>A check box that indicates if the knowledge base allows Social Q&amp;A questions.</td>
</tr>
<tr>
<td>Description</td>
<td>A text description of the knowledge base.</td>
</tr>
<tr>
<td>Set default knowledge field values</td>
<td>Default values for knowledge articles in this publication. To define a default value, select a field in the left column, then use the right column to enter the data to automatically populate the selected field. Knowledge contributors can choose to apply default field values when selecting a knowledge base for an article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot set a default value for the Author field.</td>
</tr>
</tbody>
</table>

**Knowledge workflows**

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the `getApprovers()` function in the `KBWorkflow` script include.

Table 432: Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the published state. The workflow is canceled and the article remains in the draft state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

Knowledge properties

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to Knowledge Properties.

Knowledge portal properties

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns on Knowledge portal pages. (glide.knowman.columns)</td>
<td>Set the number of columns for arranging topics on the knowledge portal.</td>
</tr>
<tr>
<td></td>
<td>Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Maximum number of articles per content block on the home page</td>
<td>Enter the maximum number of articles to display in the Most Useful and Most Viewed sections of the knowledge homepage.</td>
</tr>
<tr>
<td>(glide.knowman.content_block_limit)</td>
<td>Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td></td>
<td>Note: This property applies only to the default knowledge base and the legacy knowledge portal. Knowledge v3 articles do not specify a topic. Therefore, this property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td></td>
<td>Note: This property does not apply to the News category.</td>
</tr>
<tr>
<td></td>
<td>Note: This property does not apply to the default knowledge base and the legacy knowledge portal. Knowledge v3 articles do not specify a topic. Therefore, this property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Show Knowledge section descriptions.                                    | Select the Yes check box to display topic descriptions in the knowledge portal. To enter these descriptions:  
1. Edit an existing knowledge article.  
2. Right-click the Topic field label and choose Show Choice List.  
3. Open the record for the topic name and enter the description into the Hint field.  
Clear the check box to omit section descriptions from the knowledge portal.  
Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
| Number of Knowledge Base items to preview in a section.                 | Set the maximum number of articles per topic for the knowledge portal. The specific articles shown depends on the Knowledge section sort field property setting.  
Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.                                                                                      |
| Knowledge section sort field.                                           | Select the default order for articles within each topic section on the knowledge portal.  
• Published: uses the date published.  
• View count: uses the number of times articles have been viewed during the period specified in the Number of days used when summing article views property.  
• Alphabetically: uses the first letter of the article title (Short description field).  
Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
| Knowledge Base section sort direction.                                  | Select the order, ascending or descending, in which articles are listed within each topic section on the knowledge portal. The value used for sorting is set in the Knowledge section sort field property.  
Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.                                                                 |

<td>Enter role names exactly as they appear in User Administration Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, define the custom field and role as workflow state: (roles);. The users with these roles see articles in the custom workflow state on the knowledge portal.</td>
</tr>
<tr>
<td>The number of articles that are asynchronously loaded when scrolling down in the new search results page.</td>
<td>Enter the number of articles to be displayed during a search.</td>
</tr>
<tr>
<td><strong>Note:</strong> This property applies only to Knowledge v3 pages. This property is not supported on Knowledge v2 pages.</td>
<td></td>
</tr>
<tr>
<td>Show only Knowledge topic titles on portal page (no article links).</td>
<td>Select the Yes check box to omit all article titles from the knowledge portal and show only the topic names. Users can click the topic title to see the list of related articles.</td>
</tr>
<tr>
<td><strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
<td></td>
</tr>
<tr>
<td>Number of days (integer, default 30) used when summing article views.</td>
<td>Enter a number of days to consider when calculating view count. This is used only when the Knowledge section sort field property is set to View count. Enter 0 to have ServiceNow consider all views, regardless of date.</td>
</tr>
</tbody>
</table>
### Knowledge search properties

Knowledge search properties give you control over the search options available to users and the presentation of search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatically place cursor in Knowledge portal search box.</td>
<td>Select the Yes check box to have ServiceNow place the cursor in the search field when a user opens the knowledge portal. Clear the check box to have users click in the search field before entering a search term.</td>
</tr>
<tr>
<td>(glide.knowman.portal_search_focus)</td>
<td>Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Knowledge search result order.</td>
<td>Select the order for displaying search results:</td>
</tr>
<tr>
<td>(glide.knowman.order.search)</td>
<td>• Number of Views: orders search results based on the Number of days used when summing article views property.</td>
</tr>
<tr>
<td></td>
<td>• Relevancy: orders search results based on content that is similar to the search term.</td>
</tr>
<tr>
<td></td>
<td>• Last Modified: orders search results based on modification date.</td>
</tr>
<tr>
<td>Search method used when searching Knowledge from a task or directly in the Knowledge Base.</td>
<td>Select the search approach to use when the search term includes multiple words.</td>
</tr>
<tr>
<td>(glide.knowman.search.operator)</td>
<td>• OR query: returns articles that contain at least one word from the search term.</td>
</tr>
<tr>
<td></td>
<td>• AND then OR query: first searches for articles that include all words in the search term (an AND query). If no matches are found, an OR query is performed.</td>
</tr>
<tr>
<td>Show author in knowledge search results.</td>
<td>Select this check box to include the author of each article in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_author)</td>
<td></td>
</tr>
<tr>
<td>Show last modified date and time in knowledge search results.</td>
<td>Select this check box to include the date and time each article was last edited in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_last_modified)</td>
<td></td>
</tr>
<tr>
<td>Show publish date in knowledge search results.</td>
<td>Select this check box to include the date each article was published in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_published)</td>
<td></td>
</tr>
<tr>
<td>Show category in knowledge search results.</td>
<td>Select this check box to include the category breadcrumbs of each article in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_category)</td>
<td></td>
</tr>
<tr>
<td>Show number of views in knowledge search results.</td>
<td>Select this check box to include the number of times each article was viewed in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_view_count)</td>
<td></td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| How to display attachments in Knowledge Search Results. *(glide.knowman.search.attachment)* | Select the behavior of how the attachments are shown in the search results:  
• Do not show attachment  
• Show only link for attachment  
• Show attachment with text snippet (default)  
For best performance, select Do not show attachment, or Show only link for attachment. |
| Show relevancy in knowledge search results. *(glide.knowman.search.show_relevancy)* | Select this check box to show how relevant each search result is based on the search string.  
Relevancy value is only shown when Knowledge search result order property is set to Relevancy. |
| Enable instant search results for knowledge. *(glide.knowman.search.instant_results)* | Select this check box to enable instant search for search results. The default is No. |
| Show article number in knowledge search results. *(glide.knowman.search.show_article_number)* | Select this check box to display the article number for each article in the search result.  
Note: This property does not apply to contextual search results. |

**Knowledge article view properties**

Article view properties give you control over the meta data and rating options that appear with articles. They also enable you to grant access to individual feedback options based on user role.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show tasks to which an article has been recently attached. <em>(glide.knowman.recent_tasks.display)</em></td>
<td>Select the Yes check box to have article view include a list of tasks associated with the article. Knowledge articles can be attached to a task by clicking the Attach to Task button after searching from a form.</td>
</tr>
<tr>
<td>Number of attached tasks to display when viewing an article. <em>(glide.knowman.recent_tasks)</em></td>
<td>Specify the maximum number of tasks to list in article view.</td>
</tr>
</tbody>
</table>
| Show article rating section, which may optionally include yes/no rating, star rating, and flagging options. *(glide.knowman.show_rating_options)* | Select the Yes check box to display the rating options for users with specific roles. Clear this check box to omit the rating section for all users, regardless of role.  
The Feedback field is always displayed for all users. |
| List of roles (comma separated) that can see an article’s rating section, which may optionally include yes/no rating, star rating, and flagging option. *(glide.knowman.show_rating_options.roles)* | Enter role names exactly as they appear in User Administration > Roles. If Show article rating section... is selected, users with the roles listed here see the yes/no rating, star rating, and flagging options, according to related property settings.  
Be sure to include all roles that should be permitted to see any of these rating options. Separate properties enable you to identify specific roles for each option separately. All roles in those properties must also be listed here. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show the “Was this article helpful?” yes/no rating option. (glide.knowman.show_yn_rating)</td>
<td>Select the Yes check box to display the “Was this article helpful?” rating to users with roles set in the associated property. This appears only if the Show article rating section... property is selected.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see yes/no &quot;Was this article helpful?” rating option. (glide.knowman.show_yn_rating.roles)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show the “Was this article helpful?” properties are selected, users with the roles listed here see the “Was this article helpful?” rating in article view. All roles listed here must also be listed in the List of roles that can see an article’s rating section... property.</td>
</tr>
<tr>
<td>Show &quot;Create Incident&quot; link after a Knowledge article is rated not helpful. (glide.knowman.create_incident_link.display)</td>
<td>Select the Yes check box to display the Create Incident link after a user rates an article as not helpful.</td>
</tr>
<tr>
<td>URL used for the “Create Incident” link after rating a Knowledge article not helpful. (glide.knowman.create_incident_link)</td>
<td>Enter the URL for the page where users can create an incident only if the Show “Create Incident” link... property is selected. To find the URL, open the appropriate page, then right-click the header bar and choose Copy URL. Highlight the URL that appears and use the browser’s copy and paste feature to place it into this property field.</td>
</tr>
<tr>
<td>Show five-star rating option. (glide.knowman.show_star_rating)</td>
<td>Select the Yes check box to display the five-star rating to users with roles set in the associated property. This appears only if the Show article rating section... property is selected.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see five-star rating option. (glide.knowman.show_star_rating.roles)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show five-star rating option properties are selected, users with the roles listed here see the five-star rating option in article view. All roles listed here must also be listed in the List of roles that can see an article’s rating section... property.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can flag incomplete/inaccurate articles. (glide.knowman.show_flag.roles)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show “Flag Article” option properties are selected, users with the roles listed here see the flag article option in article view. All roles listed here must also be listed in the List of roles that can see an article’s rating section... property.</td>
</tr>
<tr>
<td>Show user comments on knowledge articles. (glide.knowman.show_user_feedback)</td>
<td>Select an option for showing user comments When article loads, When user clicks link to show comments, or Never for users with roles set in the associated property:</td>
</tr>
</tbody>
</table>
### Property | Description
---|---
List of roles (comma separated) that can see user comments on an article. *(glide.knowman.show_user_feedback.roles)* | Enter role names exactly as they appear in User Administration > Roles. If the Show user comments on knowledge articles property is selected, users with the roles listed here see user comments in article view.

Maximum number of user comments displayed on a knowledge article. *(glide.knowman.feedback.display_threshold)* | Set a maximum number of user comments to display. This property applies only to the legacy Knowledge article view.

Use Live Feed for Knowledge feedback. *(glide.knowman.use_live_feed)* | Select this option to use live feed to manage and display feedback on knowledge articles.

### Knowledge homepage properties

Knowledge homepage properties control the featured content on the knowledge homepage.

#### Table 433: Table title

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default keyword for getting pinned articles. <em>(glide.knowman.default_keyword)</em></td>
<td>Enter a default keyword for pinned articles. Articles pinned with the specified keyword appear in the Featured Content section of the knowledge homepage.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default header title for the pinned articles section on knowledge home pages. <em>(glide.knowman.default_pinned_section_header_title)</em></td>
<td>Enter a title for the Featured Content section of the knowledge homepage.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display or hide the count of articles and questions in the category and child categories <em>(glide.knowman.show_number_on_categories)</em></td>
<td>Select to display the count of articles and questions within each category, including subcategories, when browsing or searching knowledge bases.</td>
</tr>
</tbody>
</table>

### Other knowledge properties

Additional knowledge properties let you control general knowledge management features.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| When attaching an article to an incident, copy the content into this field. *(glide.knowman.attach.fields)* | When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the Attach to Task button for an article, the system copies the article number and content into the field specified here.

You can specify a separate field for each table you want to attach articles to as a comma-separated list. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management logo to display if running out of the ServiceNow frames. (glide.knowman.frameless_logo)</td>
<td>Click the reference lookup tool (Figure 274: Icon Reference Lookup) and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the Name of an image stored in the database to use that image. Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Hide the ‘Import’ functionality (button and drag-n-drop) for all users. (glide.knowman.import.hide_import_functionality)</td>
<td>Select Yes to hide the Import Articles button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the Import Articles button to prevent users from importing articles to knowledge bases.</td>
</tr>
<tr>
<td>Show publish check box on the knowledge import pop-up. (glide.knowman.import.show_publish_checkbox)</td>
<td>Select No to remove the Publish check box on the knowledge import form so that an article cannot be published as part of the import process. Default is yes.</td>
</tr>
<tr>
<td>Use submission workflow. (glide.knowman.submission.workflow)</td>
<td>Select the Yes check box to use the knowledge submission workflow instead of the standard knowledge workflow. If this option is selected, each time a user creates knowledge from an incident or problem, the content is placed into a submission record instead of a draft article. Transforming knowledge submissions into articles follows a specific workflow.</td>
</tr>
<tr>
<td>The sys_id of the knowledge base when creating knowledge from task records. (glide.knowman.task_kb)</td>
<td>Enter the sys_id of the knowledge base to put new knowledge articles created from tasks in.</td>
</tr>
<tr>
<td>Before displaying an article’s text in search results or the article view, check field-level ACLs on appropriate field: kb_knowledge.text (HTML article) or kb_knowledge.wiki (wiki text article). (glide.knowman.text.check_can_read)</td>
<td>Select this check box if users must have ACL-based permission to view text fields on the Knowledge (kb_knowledge) table to read article previews in knowledge search results.</td>
</tr>
</tbody>
</table>

Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Role required: admin

1. Right-click the application label in the application navigator and select Edit Application.
2. In the Modules related list click New.
3. Enter a Title for the module.
4. In the Link type field, select URL (from Arguments).
5. In the Arguments field, append one or more of the following values to $knowledge.do#/search?.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_kb=&lt;knowledge base sys_id&gt;</td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default. If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module. Note: The category passed in this parameter must belong to the knowledge base passed in the sysparm_kb parameter.</td>
</tr>
<tr>
<td>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</td>
<td>Enter the default sort order for articles to appear in.</td>
</tr>
</tbody>
</table>

To create a homepage for a Facilities knowledge base with a sys_id of d582764047022100158b949b6c9a7145 and sorting by last modified date, enter $knowledge.do#/search? sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified in the Arguments field on the Module form.

I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

Note: To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the glide.knowman.search.default_language system property.

For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles.

If no language is specified in the system property, articles default to the logged in language of the user.
Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user’s selected language is French.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N:Knowledge Management Internationalization v2 plugin
- Internationalization plugins for each appropriate language (for example, I18N: French Translations and I18N: Korean Translations)

Activate a plugin

Installed Components

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user’s selected language.
- A UI macro named kb languages.
- Two fields, named Language and Parent, in the Knowledge (kb_knowledge) table and the Knowledge form.

Knowledge Form Changes

Activating knowledge management internationalization adds these fields to the Knowledge form.

- Language: select the language for the article.
- Parent: enter the number of the article that represents the base language. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

Create a translation for a knowledge article

Create a translation for an article from the Translated Versions related list on the knowledge article record. Before creating a translation, activate the internationalization plugin for the desired language which, in turn, activates the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2).

1. Open the knowledge article record.
2. In the Translated Versions related list, click New.
3. Select the desired language for the translation in the Language field.
4. Provide a description in the Short Description field.
5. Click Submit.

The translation is created and added to the Translated Versions related list.
Duplicate knowledge article numbers

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge Number field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the Number field is 10,000. To customize this number:

1. Navigate to System Definition Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Controls related list tab.
4. Enter a new Number and click Update.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge Number field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: kb_view.do?sysparm_article=KB0000033. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

Avoiding duplicate Knowledge article numbers

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

• Do not import demo data articles in production environment.
• Verify the numbers of the articles to be inserted to make sure they are not already in use.
• Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge Number field so that newly created articles do not conflict with existing articles.

1. Navigate to System Definition Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Controls related list tab.
4. In the Number field, update the count to a number greater than the largest value already in the system.
5. Click Update.

Use knowledge on mobile devices

All ServiceNow ITSA Suite users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

Browse knowledge on mobile devices

You can browse knowledge bases using a mobile device.

Navigate to SELF-SERVICE Knowledge Base.
Browse Knowledge by tapping on a category and browsing articles or subcategories.
Note: Select the desired category and click the close icon (close icon) for the selected category to reflect in the search results.

View knowledge articles and questions on mobile devices

You can read knowledge content using a mobile device.
Tap a title to view the article or question.
Note: You cannot edit or add comments to knowledge articles on the mobile interface. If using Social Q&A, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

Figure 277: Mobile Knowledge Article View

Search knowledge on mobile devices
Find a specific article or question by searching on a particular term.
Knowledge Management v3 migration

Knowledge management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge v3 has several key differences from knowledge v2, the version of knowledge management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.
Table 434: Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with Topic and Category. A single organizational taxonomy shared by all articles.</td>
<td>Category structure with any number of levels. Each knowledge base has a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base using user criteria.</td>
</tr>
</tbody>
</table>

Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

2. Migrate knowledge content to use the knowledge v3 enhancements with your existing knowledge articles.

After migration to Knowledge v3

These items are relevant to getting the full range of new functionality after you migrate.

• You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.

• If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.

Automatic changes after KMv3 migration

Upgrading to Knowledge v3 automatically changes knowledge functionality including the knowledge user interface and security model.

Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.

Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.
Knowledge search changes
By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options.
You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

Knowledge security changes
Knowledge v3 manages access to articles with user criteria rather than roles and ACLs.
Existing ACLs on the Knowledge (kb_knowledge) table are preserved, but with the following changes.
• A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
• A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.
When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge (kb_knowledge) records where this field value is 2.

Note: These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge (kb_knowledge) table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

Because Knowledge v3 introduces ACLs for the Knowledge (kb_knowledge) table, if you do not have high security enabled, you may notice differences in default behavior. See KB0549970 for information about configuring Knowledge v3 without high security.

Knowledge article view changes
The Knowledge application uses the kb_view UI page to display knowledge articles.

UI page
The following changes apply automatically when you upgrade from Eureka or earlier:
• The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.
• A new kb_view page is used. This becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.
• URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
• Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
• Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.
Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback (kb_feedback) table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to true by default.

Knowledge portal changes

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Knowledge submissions

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties (sys_properties) table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

Important: If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.
To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to KB0550924 Understanding User Criteria and ACLs in Knowledge v3.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

Knowledge functionality migration

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

Replaced knowledge modules

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the enablev3anddisablev2menus.txt backup script to enable knowledge v3 menus and disable knowledge v2 menus.

### Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

### Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

### Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.
To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message (live_message) table to ensure previously submitted feedback is available for knowledge v3 articles.

Managed Documents

Use the Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

| Note: Step through the process below on your test (or any non-production) instance. |

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

Table 437: Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check-in/Check-out</td>
<td>Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.</td>
</tr>
<tr>
<td>Categorization</td>
<td>Classify documents for organization and search.</td>
</tr>
<tr>
<td>Access control</td>
<td>Share documents with selected users.</td>
</tr>
<tr>
<td>Revision control</td>
<td>Track changes to documents.</td>
</tr>
<tr>
<td>Digital signature for approval</td>
<td>Integration with the Approval with E-Signature plugin.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Support consistent content review and approval.</td>
</tr>
<tr>
<td>Security</td>
<td>Use high security setting.</td>
</tr>
</tbody>
</table>

Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.
### Table 438: Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The Document (dms_document) table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The Document Collection (dms_collection) table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>
| Document Parameters   | Attention: Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.  
  - Type: Defines the type of document being controlled. Documents of the same type use the same controls.  
  - Classification: Defines document restriction level, such as public, restricted, or confidential.  
  - Audience: Defines the groups with access to the document, such as internal or external.  
  - Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.  
  - Name Components: Defines the document values used in the name formats.  
  - Approval Rules: Defines the approvals the document must have before it can be published. |

---

**Install the Managed Documents plugin**

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to **System Definition Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
3. If the plugin depends on other plugins, these plugins and their activation status are listed.
4. (Optional) Select the **Load demo data** check box.
Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.

Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document ( dms_document )</td>
<td>The document details.</td>
</tr>
<tr>
<td>Revision ( dms_revision )</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Audience ( dms_audience )</td>
<td>The intended document readers.</td>
</tr>
<tr>
<td>Classifications ( classification )</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type ( dms_type )</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component ( dms_component )</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format ( dms_name_format )</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence ( approval_sequence )</td>
<td>The approval sequences that users need to follow.</td>
</tr>
<tr>
<td>Approval Rule ( dms_approval_rule )</td>
<td>The criteria that records of the ( dms_document ) table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection ( dms_collection )</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>

Scripts

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>
</tr>
<tr>
<td>Add Approvers</td>
<td>Populates the list of approvers in the document.</td>
</tr>
</tbody>
</table>
Table 441: Script includes that will be added to sys_script_include

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagement</td>
<td>Contains the main logics for the Managed Documents plugin.</td>
</tr>
<tr>
<td>DocumentManagementDB</td>
<td>Contains methods to perform CRUD operations on the database.</td>
</tr>
<tr>
<td>DocumentManagementSecurity</td>
<td>Helps manage the security of the Managed Documents system.</td>
</tr>
<tr>
<td>DocumentManagementAjax</td>
<td>Updates the details of the temporary revision that is created when opening the upload/check in revision form.</td>
</tr>
<tr>
<td>DocumentAttachmentAjax</td>
<td>Renames an attachment file.</td>
</tr>
<tr>
<td>DocumentRevisionWorkflowHelper</td>
<td>Helps perform basic workflow operations on a revision.</td>
</tr>
<tr>
<td>DocumentManagementApprovalMatcher</td>
<td>Helps obtain the user and group approvers for a document that matches approval rules.</td>
</tr>
<tr>
<td>DocumentApproverHelper</td>
<td>Contains logics to handle document approvers.</td>
</tr>
<tr>
<td>DocumentManagementUtils</td>
<td>Useful methods.</td>
</tr>
<tr>
<td>DocumentReferenceQualifiers</td>
<td>Static methods that return reference qualifiers.</td>
</tr>
</tbody>
</table>

Table 442: Client script that is added to sys_script_client

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document type change</td>
<td>Updates the name format field in the revision settings section of the document. Each type has a default name format.</td>
</tr>
</tbody>
</table>

Roles

This plugin introduces two new roles:

Table 443: Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>
Note: Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

Create a new managed document record

1. Navigate to Managed DocumentsCreate New.
2. In the Name field, type Policy.
3. In the Requested by field, add your name.
4. In the Owner field, add your name.
5. In the Reviewer field, add your name.
6. In the Type field, select Policy.
7. In the Classification field, select Confidential.
8. In the Audience field, select Internal.
9. Under Revision Settings, select the Auto increment revision option.

![Figure 279: Revision Settings]

10. Click Submit.

Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

1. Open the document record.
2. Click the Upload/Check in Revision related link.
3. Click Choose File, select the revised file, and click Open.
4. Check that the Name and Revision Number contain the updated number.
5. Ensure that the Check in option is selected.
6. Click OK.

![Figure 280: Document Revisions]

The Document Revisions list updates to contain the most recent revision.
Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

1. Open the document record.
2. Select the Check Out Document related link.

4. Click Check Out.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, Policy_POL_02.txt.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click Publish Revision.
4. In the Publish revision dialog box, check that the name and revision number are correct and click Publish.
   In the Document Revisions list, the revision you just published is now in the Published stage.

Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select Submit Revision.

Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to Click here to view Approval Request.
3. (Optional) View the document by clicking the attachment name under Document Revision.
4. Click Approve.
   The Approvals page displays and lists the document you just approved.
5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

1. Open the document record.
2. Select the Upload/Check in Revision related link.

3. Click Choose File.
4. Select a simple document, such as a text file, and click Open.
5. Check that the name reads Policy_POL_0.1.
6. Click OK.

The document is listed under Document Revisions.

Defining Document Parameters

Before using the Managed Documents application, the user with the document_management_admin role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the Reviewers specified on the document record).

Defining Types

To define a new type, navigate to Managed Documents › Administration › Type and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Type choice list.</td>
</tr>
</tbody>
</table>
The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>

Note: For documents with a Type of Contract, a Contracts related list appears on the document record, listing any contracts the document is associated with.

Defining Approval Rules

To define a new approval rule, navigate to Managed Documents > Administration > Approval Rules and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ^ department=Development</td>
</tr>
</tbody>
</table>

Defining Audiences

To define a new audience, navigate to Managed Documents > Administration > Audience and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Audience Code</td>
<td>A short code for the audience. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Audience choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this audience’s sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following audiences are available in the base system.

<table>
<thead>
<tr>
<th>Audience</th>
<th>Audience code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>INT</td>
<td>Internal</td>
<td>1</td>
</tr>
<tr>
<td>external</td>
<td>EXT</td>
<td>External</td>
<td>2</td>
</tr>
</tbody>
</table>

Defining Classifications

Define a new classification on the Classification form.

Navigate to Managed Documents > Administration > Classification and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the classification. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Classification choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this classification’s sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

Defining Name Components

Name components define the document values used in the name format.

For example, the name component document.audience.codedot-walks from the document record to the audience Code.

To define a new name component, navigate to Managed Documents > Administration > Components and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
</tbody>
</table>
### Defining Name Formats

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components Type Code, Document Name, and Revision Number and the separator -, would be formatted as:

`TYPECODE-Name-RevNumber.fileformat`

In this example, a policy (code POL) named IT Off-Boarding Policy, with revision number 1.0, and uploaded as a .docx file would have the name:

`POL-IT Off-Boarding Policy-1.0.docx`

To define a new name format, navigate to Managed Documents > Administration > Name Formats and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Separator | A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.
Description | A description of the name format.

Use the related list to add name components. Use the Order field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the Managed Documents workflow after the Active check box is selected.
The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different kinds
of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

Knowledge document

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

Installed with knowledge document

These elements are installed with the knowledge document plugin.

Dependencies

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

Tables

Table 444: Tables

<table>
<thead>
<tr>
<th>Display Name (table_name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

UI Actions

Table 445: UI actions

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

Scripts

Table 446: Script includes

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
<tr>
<td>KnowledgeDocumentDB</td>
<td>Class that gets, inserts, and updates data for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
Knowledge settings fields

These fields appear on the Managed Document form Knowledge Settings section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Defines the process performed when the Link to Knowledge related link is clicked. Select Always create record to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select Update existing record to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The Update existing record option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the kb_knowledge table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the Type field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

View knowledge linked to a document

You can view the knowledge linked to a document from the document record.

1. Navigate to the document record.
2. Select the Knowledge Records related list.
3. Select the knowledge article to view.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version. Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Approval process

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
Figure 286: Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list:

**Figure 287: Document Management Default workflow result**

**Process modification for multiple approvers**

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

- **Sequence 1**: approvers A and B
- **Sequence 2**: approvers C and D
- **Sequence 3**: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B’s status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B’s status is changed to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the
Review process

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B’s status is changed to No Longer Required.

Enable electronic signature for approval

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with e-signature to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

![Digital signature](image)

**Figure 288: Digital signature**

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
6. Click Submit.

Publish an approved revision

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

Note: Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked Ready for Publishing.
3. Click Publish Revision to display the Publish dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click Publish.
The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired:

Figure 291: Revision published

Note: If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.

Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

The revision stage is set to Awaiting Review.
Create or request a new document

1. Navigate to Managed Documents Create New.
2. Complete the following fields:

Table 448: New document fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### Specify an approver

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select Add Approver.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click Add User.
6. Repeat steps 2-5 to add more approvers.

### Check in a document

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the Upload/Check In Revision related link.
3. Click Browse and navigate to the revised file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.

The Document Revisions related list updates to contain the most recent revision:

![Document Revisions](image)

Figure 294: Document revisions

**Copy a document**

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select Copy Document.

   An information message with a link to the new document displays:

3. Click OK.

   The new document is renamed and includes the word “Copy.”

   **Note:** Only the latest revision is copied.

**Deactivate a document**

To change the document state to Inactive, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select Deactivate Document.

**Reopen a deactivated document**

A document that has been deactivated can be reopened.

1. Navigate to the document record.
2. Right-click the header bar and select Reopen Document.
Roll back a document

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select Rollback. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click OK. The latest revision is now the revision you selected for rollback.

Cancel a document

Change the document state to Cancelled when no more changes will be made to the document.

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

1. Navigate to the document record.
2. Right-click the header bar and select Cancel Document.
   An info message confirms the cancellation:
   The State is set to Cancelled:

Figure 295: Rollback

Figure 296: MDOC cancel 3
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.

4. Click Check Out.

After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents Document My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed.
Upload a document

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the Upload/Check In Revision related link.
3. Click Choose File and navigate to the file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.
MID Server

The MID Server facilitates communication and movement of data between the ServiceNow platform and external applications, data sources, and services.

Introducing the MID Server

The MID Server facilitates communication and movement of data between the ServiceNow platform and external applications, data sources, and services.

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon. The MID Server performs the following tasks:

- Communicates securely with the ServiceNow instance to determine what Discovery probes to run.
- Runs Discovery probes on the local network to gather data on network devices
- Sends Discovery probe results back to the ServiceNow instance for processing

Note: MID Server communications are initiated inside the enterprise’s firewall and therefore do not require any special firewall rules or VPNs.

The MID Server is used by the following applications:

- Discovery
- Orchestration
- Import Sets
- Altiris
- Microsoft SMS/SCCM
- Avocent LANDesk
- HP OpenView Operations
- Microsoft System Center Operations Manager (SCOM)
- Borland Starteam Integration
- Microsoft MIIS
- Service Assurance
MID Server Records that can not be altered

The following records can not be modified or deleted.

MID Server architecture

The MID Server is a Java application that runs on a server on your local network. The MID Server facilitates communication and movement of data between the ServiceNow instance and external applications, data sources, and services.

The Management, Instrumentation, and Discovery (MID) Server runs as a Windows service or UNIX daemon. The MID Server initiates communications with the ServiceNow instance. The ServiceNow instance never initiates communications with the MID Server.

The ECC Queue is the portal through which Discovery communicates with the MID Server.

- The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server to waiting jobs assigned to it.
- If a job exists in the ECC Queue for that MID Server, the MID Server sets the status to “I’m working on it”
- Does the work that is requested.
- Reports the findings of the job back to the ECC queue.

System clones and the MID server

See KB0547597 for a information on what to do with MID servers when you are cloning your instance.

How MID Server gets work from the queue

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB) Client, which notifies the MID Server that it has pending tasks in the ECC queue.

The MID Server opens a persistent connection to the instance through AMB and listens on the /mid/server/<mid_sys_id> AMB channel. When an output record is inserted into the Queue (ecc_queue) table, an AMB message is sent to the MID Server’s channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the interval defined in the mid.poll.time configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
MID Server heartbeat

The ServiceNow platform checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.

When the MID Server changes status from Up to Down or from Down to Up, a system event is triggered which can be used for script actions or to send notifications.
Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to be Up.

Note: Make sure that your MID Server can communicate on port 443. See MID Server external connectivity requirements and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- mid_server.up: The MID Server goes from a status of Down to a status of Up.
- mid_server.down: The MID Server goes from a status of Up to a status of Down.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler Scheduled Jobs Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
The Management, Instrumentation, and Discovery (MID) Server is a Java server that facilitates communication and movement of data between an instance and external applications, data sources, and services.

**Figure 300: MID Server heartbeat trigger interval**
Important: All new MID Servers must be validated before use. This ensures that the MID Server is trusted to access credentials used by the instance for automations. For instructions, see Validate a MID Server.

MID Server system requirements

Use these minimum system requirements to allocate resources for computers hosting MID Servers.

MID Server supported systems

The following systems support the MID Server.

• Windows server: To discover Windows-based servers, run Service Mapping patterns, or execute Orchestration commands on Windows devices, the MID Server must be installed on a Windows server. Windows MID Servers support the following:
  • All Windows Server 2008, 2012, and 2016 editions
  • Virtual machines
  • 64-bit systems
  
  Note: .NET Framework version 3.5, 4.0, or 4.5 is required for Service Mapping support and for Windows pattern-based discovery.

• Linux: Linux MID Servers support virtual machines and 64-bit systems. On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: yum install glibc.i686.

Java version support

The MID Server installs with JRE version 1.8. If you upgrade with a MID Server using JRE 1.6, the system automatically upgrades that MID Server to use version 1.8. Both the 32 bit and 64 bit MID Servers use JRE 1.8.

Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see Set the MID Server JVM memory size for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

Standard deployments

The following products are considered “standard” because their MID Servers share the same minimum disk space and memory requirements:
  • Content Management Platform (CMP)
  • Discovery
  • Event Management
• Integrations
• Orchestration
• Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

High resource deployment

Service Analytics is processing intensive and require more resources for each MID Server than the standard products. Install a MID Server for this product on a dedicated host that does not support MID Servers for other products.

Recommended MID Server minimum requirements

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

Table 452: MID Server minimum system requirements for 25 concurrent threads (base system)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Service Analytics</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Table 453: MID Server minimum system requirements for 200 concurrent threads (customer configured)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Service Analytics</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 1: Single MID Server deployed for multiple standard products

In this example, CMP, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.

Table 454: One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>CMP + Discovery + Orchestration</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>
Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers for standard products are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the OS column to the sum of the values in the MID Server + product column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the OS memory column to the sum of the values in the JVM memory column for all products mapped.

</tr>
<tr>
<td>MID Server 3</td>
<td>4 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Recommended minimum</td>
<td>36 GB</td>
<td>12 GB</td>
</tr>
</tbody>
</table>

**Monitoring performance**

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the *MID Server dashboard*.

**MID Server external connectivity requirements**

The requirements in this page are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is a https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntax:

- ⟨source IP⟩ to ⟨any⟩
- ⟨source IP⟩ to ⟨ServiceNow⟩ any established
- ⟨source IP⟩ to ⟨instance_name.service-now.com⟩ 443

Additionally, ensure the MID Server can connect to install.service-now.com to download and install updates.

**MID Server internal connectivity requirements**

The three methods used for discovering various devices on a network are SSH, WMI and SNMP. SSH is used for accessing UNIX-like machines. Discovery logs into a machine with SSH and runs commands within an encrypted session to gather system information. Orchestration logs in to UNIX and Linux machines using SSH to perform Workflow activities. WMI is used by Discovery for Windows based machines and is used for querying the remote WMI protocol on targets for gathering of Windows
information. Orchestration uses PowerShell to run activities on Windows machines. And lastly, SNMP
v1/v2c/v3 is used on various network devices (Routers, Switches, Printers) by Discovery and
Orchestration. Detailed information is listed below about these methods.

Note: The requirements in this page are specifically for the use of MID Servers with the
ServiceNow Discovery and Orchestration products.

SSH - UNIX

For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target
machines. SSH is a network protocol that allows data to be exchanged using a secure channel between
two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a
login to access the targets using two available methods of authentication: a user name and password
combination and a user name and shared private key. Specify SSH authentication information and
type in the Credentials module. If multiple credentials are entered, the platform tries one after the
other until a successful connection is established or all are ultimately denied. To provide for application
relationships a limited number of SUDO commands must be available to be run. Additional details to
these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and
Orchestration.

WMI - Windows

For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface
to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI
queries must run as a domain user with local (target) administrator privileges. When Discovery detects
activity on port 135, it launches a WMI query. The response from the Windows device is sent over a
Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This
can be any port. Ensure that the MID Server application host machine has access to the targets on all
ports due to the unique nature of the WMI requirements.

Windows PowerShell

PowerShell is built on the Windows .NET Framework and is designed to control and automate the
administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow
activities on Windows machines. PowerShell must be installed on any MID Server that executes
these activities. MID Servers using PowerShell must be installed on a supported Windows operating
system. ServiceNow supports PowerShell 2.0 and 3.0. Orchestration activities for PowerShell require a
credentials Type of Windows.

SNMP - Network

For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a
common protocol used on most routers, switches, printers, load balancers and various other network
enabled devices. Use a community string (password) for authentication when scanning a device via
SNMP. Many devices have a default community string of public which Discovery uses by default when
querying a target. Define additional community strings in the SNMP credentials form which are tried in
succession, along with public, until a successful query returns. In addition to the credentials, the platform
also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If
Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries,
ensure that the IP address of the MID Server is in the ACL. ServiceNow Discovery supports SNMP
versions 1, 2c, and 3.
WBEM

Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. ServiceNow Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

MID Server connection prerequisites

You must install a MID Server on a local network resource and configure it to communicate with the machines it probes.

The local network resource must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

Note: Verify that the baseline public page InstancelInfo is active for the MID Server to connect to the instance.

Pre-installation tasks

Before you can install the MID Server on a target computer, you must perform tasks like configuring connection prerequisites and setting up the MID Server role.

Also verify that the computer meets the MID Server system requirements.

Configure MID Server connection prerequisites

You must perform several prerequisite tasks to allow the MID Server to connect to the instance.

Role required: Admin

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to System Web Services Scripted Web Services Scripted SOAP Services.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstancelInfo
• MIDAssignedPackages
• MIDFieldForFileProvider
• MIDFileSyncSnapshot
• MIDServerCheck
• MIDServerFileProvider

5. Navigate to sys_public.list and verify that the InstanceInfo public page is active to allow the MID Server to validate its version.
6. Make sure that the MID Server computer can access install.service-now.com.

MID Server role

The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place.

Add this role to the MID Server user for any instance on which basic authentication is enabled. The system adds the necessary SOAP roles automatically with the mid_server role.
**Set up the MID Server user and role**

The MID Server uses a role and a user ID to communicate with the instance.

**Role required:** admin
You can set the MID Server user ID and role for connectivity to the instance.

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Each MID Server account must use the mid_server role to access protected tables.

1. From the instance, navigate to User Administration Users.
2. Click New.
3. Fill in the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>The same user ID that will be specified in the mid.instance.username parameter of config.xml. If you use special characters, such as an ampersand (&amp;), you must encode the special character using character references in the config.xml file. See the steps in the post-requisite below.</td>
</tr>
<tr>
<td>Password</td>
<td>The same password that will be specified in the mid.instance.password parameter of config.xml. If you use special characters, such as an ampersand (&amp;), you must encode the special character using character references in the config.xml file. See the steps in the post-requisite below.</td>
</tr>
<tr>
<td>First name</td>
<td>The user’s first name.</td>
</tr>
<tr>
<td>Last Name</td>
<td>The user’s last name.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select Save.
5. Under the Roles related list, click Edit.
6. Select the mid_server role for this user.
7. Each MID Server account must have this role to access protected tables.
8. Click Save.

If you use special characters in the user name or password, such as passw&rd, do the following:

1. Open the config.xml file.
2. Find the following lines:
   
   ```xml
   <parameter name="mid.instance.username" value="mid_user"/>
   <parameter encrypt="false" name="mid.instance.password" value="passw&rd"/>
   ```

3. Make the following change:
   
   ```xml
   <parameter encrypt="false" name="mid.instance.password" value="passw&amp;rd"/>
   ```

4. Save the file.
5. The next time the MID user logs in, they can use passw&rd for the actual password.

   For examples of the character references that must be made for well-formed XML, see Character Entity References.

**MID Server user security**

The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

The tables that the MID Server must access are protected by these ACLs and are unavailable to the MID Server unless the MID Server user has specific roles.
The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. Add this role to the MID Server user for any instance on which basic authentication is enabled. The system adds the necessary SOAP roles automatically with the mid_server role.
Verify the MID Server account access
The MID Server account is used for communication with the ServiceNow instance.
Role required: Admin

You can confirm that the MID Server account was created successfully and the account has connectivity to the ServiceNow instance.

1. On the MID Server host, open a supported web browser.
2. Navigate to the ServiceNow instance.
3. If the account is already logged into the instance, log out.
4. Right-click the header and select Save.
5. Use the previously created MID Server user credentials and sign in. If the user name or password includes special characters, make sure that you edit the config.xml file to allow for well-formed XML.

Download the MID Server files

The MID Server application is downloadable from the ServiceNow service instance.

The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

149.96.5.98 and 149.96.6.98

You download the MID Server and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to Mid Server Downloads on your instance.
2. Select and download the MID Server for the appropriate operating system. If the download does not begin immediately, try the download at a later time as the system may be busy.

![Download MID](http://example.com)

Refer to the installation instructions for details.

<table>
<thead>
<tr>
<th>Linux</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td>32 bit</td>
<td>32 bit</td>
</tr>
<tr>
<td>64 bit</td>
<td>64 bit</td>
</tr>
</tbody>
</table>

The MID server is regularly tested against Windows Server (2012, 2008) and Linux (RedHat 6, Ubuntu 12, CentOS 6).

3. Right-click the header and select Save.
4. Use the previously created MID Server user credentials and sign in.
5. Activate Discovery, Orchestration, or any integration that requires the use of the MID Server.

Step Result: After activation, the MID Server application menu appears in the application navigator.
Performing the MID Server installation

After you verify that the MID Server met the prerequisites and you set up the MID Server credentials and MID Server user role, you can perform the installation.

The installation differs for Linux and Windows machines. You can also install multiple MID Servers on a single system.

Install a MID Server on Linux

This MID Server installer automates the installation of a MID Server on a Linux computer.
Role required: admin, mid_server

You can install a MID Server on a 32-bit or 64-bit Linux computer. Click this link to view the installation video:

1. From the Linux command line, type mkdir -p /servicenow/mid server name to create the installation directory. You need to have read/write/execute permissions on this folder.
2. Extract the downloaded MID Server archive file, mid.os.zip into the servicenow/mid server name/ directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward.
   The resulting directory structure is /servicenow/〈mid server name〉/agent.
3. Change to the servicenow/mid server name /agent directory, and enter the following command to start the MID Server installer: ./installer.sh.
   If you prefer to manually configure the MID Server instead, skip to Step 9.
The system opens the MID Server installer.

4. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID Server name

   Note: The MID Server user must have the mid_server role.

5. From the installer, click Start MID Server.
The local host starts the MID Server.
6. Click Mid Servers List Page.
   The installer opens the MID Server list from your instance.
7. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.
8. From Related Links, click Validate.
   The MID Server Validated changes to Yes.
9. To configure the MID Server manually, change to the servicenow/mid server name /agent
directory, and then edit the config.xml file as follows:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-
now.com" />` and change the value to the URL of your instance.
   b) Enter the MID user credentials in the mid.instance.username  and mid.instance.password
parameters.
      By default, the MID Server, uses basic authentication for SOAP messages. The password
value is also encrypted authentication.
   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />`
      element and change the value for the MID Server name.
   d) Enter connection information for the proxy server. Remove the appropriate comment tags
      from the proxy configuration information.
      For example, you can configure these parameters:
      • mid.proxy.use_proxy
      • mid.proxy.host
      • mid.proxy.port
      • mid.proxy.username
      • mid.proxy.password

10. If you configured the MID Server manually, finalize the configuration as follows:
    a) Execute the shell script start.sh.
        The system starts the new MID Server.
    b) Log into the instance.
    c) Navigate to  MID Servers Servers .
        The system displays a list of MID Server records.
    d) Select the record matching your new MID Server and verify that the Status is listed as Up.

11. To configure the MID Server to restart automatically when the host is restarted, run
    $ {base_install_dir}/agent/bin/mid.sh install as root to add the auto start scripts to the init.d
directory.

Install a MID Server on Windows
This MID Server installer automates the installation of a MID Server on a Windows computer.
Role required: admin or mid_server
You can install one or more MID Servers on a Windows computer. Click this link to view the installation
video:

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as ServiceNow\MID Server1.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select Extract All.
5. Navigate to the \agent folder that was created when the file was extracted.
6. Change directories to the service-now\mid server name\agent folder, and enter the following
command to start the MID Server installer: installer.bat.
   To configure the MID Server manually, skip to Step 12.
The system opens the MID Server installer.

7. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service name
   
   - Note: The MID Server user must have the mid_server role.

8. From the installer, click Start MID Server.
The local host starts the MID Server.
9. Click Mid Servers List Page.
   The installer opens the MID Server list from your instance.
10. Select the MID Server name from the list.

   Note: It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.
11. From Related Links, click Validate.
    The MID Server Validated changes to Yes.
12. To configure the MID Server manually, edit the config.xml file with a text editor such as WordPad:
a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.

b) Enter the MID user credentials in the mid.instance.username and mid.instance.password parameters.
   By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.

c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.

d) Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
   For example, you can configure these parameters:
   • mid.proxy.use_proxy
   • mid.proxy.host
   • mid.proxy.port
   • mid.proxy.username
   • mid.proxy.password

13. If you configured the MID Server manually, finalize the configuration as follows:
   a) Execute the batch file start.bat.
      The system starts the new MID Server.
   b) Log into the instance.
   c) Navigate to MID Servers Servers.
      The system displays a list of MID Server records.
   d) Select the record matching your new MID Server and verify that the Status is listed as Up.

See the following:
• [Set up the MID Server user and role](#)
• [Initial MID Server setup and testing](#)
• [Post installation MID Server administration](#)

Manually install a MID Server as a Windows Service

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be C:\ServiceNow\MID Server 1\agent.
2. Right-click the start.bat file, and select Properties.
3. Select the option to Run as administrator.
4. Double-click the start.bat file to install the Windows service.

Install multiple MID Servers on a single system

You can install multiple MID Servers on the same host computer.
Role required: admin, mid_server

You can install multiple MID Servers on a single host or on a virtual machine using either Linux or Windows. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.

   Make sure you create a unique and descriptive name for each MID Server, such as MIDSrvr_SMS_Int or MIDSrvr_Disc1.

3. Extract the downloaded MID Server archive file into each MID Server directory.

   When the extract completes, there should be a directory path that resembles the following for each MID Server. For example, ServiceNow\(MID Server name\)\agent.

4. For each MID Server, run the installer appropriate to the host’s operating system.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.

   • URL to your instance
   • User credentials to run the MID Server
   • Proxy server connection details
   • MID server name
   • MID server service wrapper name and display name (Windows systems only)

Note: The MID Server user must have the mid_server role.

6. From the installer, click Start MID Server.
The local host starts the MID Server.

7. Click Mid Servers List Page.
The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

The MID Server Validated changes to Yes.
Uninstall a MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. Do one of the following to stop the running MID Server service.
   - Windows command line: From the MID Server home directory, for example from the agent folder, type stop.bat.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select stop.
   - Linux: From the MID Server home directory, for example the agent folder, type stop.sh.

2. From a command prompt, go to the \agent\bin directory in the MID Server installation directory.
3. Do one of the following:
   - Windows: Double-click the UninstallMID-NT.bat file.
   - Linux: Confirm that the MID Server is stopped by executing the bin/mid.sh status shell script. After the MID Server stops, delete the files in the agent directory.

MID Server upgrades

The MID Server is upgraded automatically when you upgrade the instance. However, you can configure the version number to control MID Server upgrades.

The MID Server is configured to check with the ServiceNow instance hourly to determine whether it needs to upgrade. This configurable behavior allows the MID Server to upgrade automatically when the instance upgrades. The system that hosts the MID Server must be able to access one of these URLs to automatically upgrade:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

Note: In versions prior to Eureka, the MID Server upgrade URL was only available on the default HTTP port (80).

Upgrade error messages

The MID Server can display the following upgrade error messages.

Table 457: Upgrade error messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>The MID Server displays this message as a generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is offline or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
</tbody>
</table>
Test the MID Server before an upgrade

Before you upgrade an instance, run these manual tests to ensure that the MID Servers for that instance can upgrade successfully.

Role required: admin

Testing helps you identify issues that could cause a MID Server outage or require reinstallation.

1. Log in to each MID Server using the appropriate user account for that MID Server.
2. Check that there is at least 1GB of free disk space.
   This is necessary to accommodate the download package required for the upgrade.
   You must have access to this server to download the installation package.
4. Check that the MID Server user account has the correct file permissions on the server.
   • Navigate to the agent folder where the MID Server is installed to ensure access.
   • Create a new text file in the agent folder and then delete it to ensure the account has rights to manage the temporary folder created during installation.
5. For Windows MID Servers, verify that the Log on as user for the Windows service is either:
   • Local System (default)
   • A user who is part of the local Administrators group. Domain administrators are part of the local Administrators group by default.

Set the MID Server version

ServiceNow MID Servers are configured to check the instance for the correct MID Server version, but you can configure the MID Server to use a different version.

Role required: admin

If the version has changed since the last check-in, the MID Server upgrades or downgrades itself accordingly. An administrator might want to edit the MID Server version to enable a new feature or get a fix for a defect. There are two properties that control how and when the MID Server can change its version:

| Note: Downgrades are only possible within the same release family. |

• mid.buildstamp
  The mid.buildstamp property identifies the MID Server version with an identifier based on the date of the build. This property uses a date and time format of yyyy-mm-dd-hhmm.
  The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the mid.buildstamp property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time.

• mid.version.override
  Use this property to set an override condition for the current MID Server version. When the MID Server checks the version each hour, it looks at the mid.version.override property first. If this
property is empty, the MID Server will get its version information from the mid.buildstamp property. If an override version is configured, the MID Server uses this value and ignores the version information in the mid.buildstamp property. This override value remains when the instance is restarted and is passed to the MID Server at check in. However, the version in the mid.version.override property is deleted during an upgrade, allowing the MID Server to reset itself to the version in the mid.buildstamp property.

Create the property and then set the value.

1. In the Navigation pane filter, type sys.properties.list.
   The list of system properties appears.
2. Click New.
3. Type mid.version.override in the Name field.
4. Enter a description, such as, Set an override value for the current MID Server version.
5. Enter a version for the MID Server to use that is different from the version ServiceNow has selected in the mid.buildstamp property.
   The date and time format is yyyy-mm-dd-hhmm.
6. Click Submit.

Initial MID Server setup and testing

After you install the MID server, you must perform basic tasks to test that the MID Server is active and functioning properly.

Configure Windows MID Server service credentials

MID Server service credentials are required so the MID Server can communicate with devices on your network.

By default, the MID Server service runs as a Local System account. This account only grants access to the machine on which the MID Server is running, not to other systems on the network. Therefore, you must change the service credentials to one of the following types:

• A Domain User account. This account should have local admin rights to allow automatic MID Server upgrade.
• A specific user account that has local admin access to the MID Server machine as well as access to other systems on the network.

Note: Service credentials are not the same as the MID Server user credentials: the service credentials allow communication between the MID Server and your network, while the MID Server user credentials allow communication between the MID Server and the instance. You must configure both of these credentials separately. See Set up the MID Server user and role for instructions on MID Server user credentials.

1. Open the Windows Services console.
2. Double-click the ServiceNow <MID Server name> service for each MID Server.
3. Select the Log On tab.
4. Set Log on as privileges with the Domain User or another user account that has local admin access to the MID Server machine as well as access to other systems on the network.
   Whatever account you choose, verify that is has local admin access and access to other systems on the network. For local admin access, you can use Windows Explorer to grant write permissions to the MID Server agent folder.
5. In the General tab, set Startup type to Automatic.
6. Click OK.
7. Restart the ServiceNow \(\langle\text{MID Server name}\rangle\) service, and make sure that ServiceNow\(\langle\text{MID Server name}\rangle\)\agent\logs\agent0.log does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance this MID Server is connected to, navigate to MID Server Servers. If Discovery is installed, navigate to Discovery MID Servers.
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is Up.

Network and MID Server validation

You must validate the network connection between the MID server and your instance before the MID server is permitted to access automation credentials or execute any outbound ECC probes.

Network validation involves using network tools such as PING, TRACEROUTE, and SNMP scanning tools.

MID Server validation is a manual, one-click step that you must perform on all new MID servers. The validation restricts access to automation credentials to trusted MID Servers only.

Note: When you upgrade to Geneva and later releases, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrades upgrades for more information on upgrading the MID server.

Validate network connectivity

You confirm network connectivity between the MID Server host and the ServiceNow instance.

Role required: admin

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   • Routing: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   • Firewalls: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer.
   • Access Control Lists (ACL): Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   • Resolve all issues with your network teams to better understand your topology. Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

Confirm connectivity to the MID Server

Confirm connectivity of the MID Server before you run a Discovery schedule.

Role required: admin

1. Verify that the MID Server service is running:
   • Windows: In the Windows Services console, locate the ServiceNow \(\langle\text{MID Server name}\rangle\) and confirm that each MID Server has the Started Status value.
- Linux: Ensure that the `agent0.log.0.lck` appears in the `/servicenow/ MID Server name)/agent` folder.

2. After each MID Server restart, open the `agent0.log.0` and address all error messages.
3. Confirm network connectivity by pinging the instance URL, executing a telnet to instance URL at port 443, and/or performing a traceroute to the instance URL.
4. From the ServiceNow instance, navigate to MID Server Servers.
5. Review and verify that all MID Servers that are connected to the ServiceNow instance are listed.
6. Verify that the Status is Up for the MID Servers.

**Validate a MID Server**
When a new MID Server is installed and launched for the first time, it cannot execute any automation tasks until it is validated.

Role required: discovery_admin, agent_admin, admin

Make sure that the MID Server version is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

1. Install the MID Server using the instructions in [MID Server installation](#).
   - This creates a record in the MID Server (ecc_agent) table.
2. Navigate to MID Server Servers.
3. Open the new MID Server from the list of MID Servers.
4. Under Related Links click Validate.
   - The Validated field on the dashboard is set to Validating, and then set to Yes (starting with patch 4 and later releases).

**Manage MID Server encryption keypairs**
Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission.

When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated it can use the private key to decrypt automation credentials.

Use these procedures to manage the keypairs generated for your MID Server and protect the automation credentials in your system.

**Rekey a MID Server**
Rotate the MID Server keypairs, if necessary, to satisfy your organization’s security requirements.

Role required: admin

Rekeying a MID Server forces it to restart and generate a new private key. When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

1. Navigate to MID Server Servers.
2. Open the MID Server whose keypairs you want to rotate.

**Invalidate a MID Server**
Invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: admin

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

1. Navigate to MID Server Servers.
2. Open the record for the MID Server you suspect has a security issue.

Post installation MID Server administration

You can manually start, stop, restart, and monitor the MID Server after it is installed.

The status of each MID Server activity appears in the MID Servers page. Additional log information appears in the following places:

- The MID Server log is available on the instance.
- The corresponding agent0.log.0 and wrapper logs (wrapper.log) are available in the MID Server agent\logs folder.

Start the MID Server

Start the MID Server to initiate communication with the ServiceNow instance.

Role required: admin

You can manually start the MID Server.

1. Do one of the following:
   - Windows command line: From the MID Server home directory, for example the agent folder, type start.bat.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select Start.
   - Linux: From the MID Server home directory, for example the agent folder, type start.sh.

2. Monitor the MID Server to ensure that it is operating properly.

Stop the MID Server

Stop the MID Server to halt communication with the ServiceNow instance.

Role required: admin

You can manually stop the MID Server.

1. Do one of the following:
   - Windows command line: From the MID Server home directory, for example the agent folder, type stop.bat.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select stop.
   - Linux: From the MID Server home directory, for example the agent folder, type stop.sh.

2. Monitor the MID Server to ensure that it is operating properly.

Restart the MID Server

You can manually restart the MID Server if you already stopped it.

Role required: admin

1. Do one of the following:
• MID Server instance: Navigate to the MID Servers and click a Name. Under Related Links, click Restart MID.
• Windows command line: From the MID Server home directory, for example the agent folder, type Restart.bat.
• Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select Start.
• Linux: From the MID Server home directory, for example the agent folder, type restart.sh.

2. Monitor the MID Server to ensure that it is operating properly.

Monitor the MID Server

Monitoring MID Servers involves verifying entries in log files, confirming network connectivity, and checking MID server status.

Role required: agent_admin or admin

You can monitor MID Servers hosted by Windows or Linux MID servers.

1. For Windows only, navigate to the Windows Services console, locate the service name that matches the name that appears from the wrapper-override.conf file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the ~\agent\conf\wrapper-override.conf folder.
2. Ensure that the agent0.log.0.lck file appears in the ~\agent\logs folder to confirm that the MID Server running and logging system activity in the agent0.log.0 file.
3. Review the following logs for warning, critical, and severe errors:
   • ~\agent\logs\agent0.log.0
   • ~\agent\logs\wrapper.txt

4. **Confirm network connectivity.**

5. From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.

6. Use Windows or Linux tools to monitor:
   • CPU
   • Disk utilization
   • Events
   • Memory
   • syslog

Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See Notifications for details.

Use basic authentication credentials for a MID Server

You can enforce basic authentication on each request.

Role required: admin

The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when
you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You set basic authentication credentials for SOAP requests. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

Note: The setting for enforcing strict security controls how ServiceNow uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

1. Navigate to System Properties Web Services.
2. Select the check box for Require basic authorization for incoming SOAP requests.
3. Click Save.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files \ServiceNow\\MID Server name\agent and edit the config.xml file, as follows:
   a) Find the element <parameter name="mid.instance.username" value=""/> and enter the instance administrator user name as the value. For example, you might enter <parameter name="mid.instance.username" value="admin"/>
   b) Find the element <parameter name="mid.instance.password" value=""/> and enter the configured password for this instance as the value. For example, you might enter <parameter name="mid.instance.password" value="abc123"/>

MID Server configuration

Administrators must configure a MID Server to ensure that it has access to sufficient system resources, probes the proper data sources, and communicates with the instance as expected.

You must complete all the steps in MID Server Installation before attempting any of the configuration steps explained here.

You must restart a MID Server after any configuration change for the changes to take effect.

Note: Using special characters in an XML configuration file requires you to encode them.

Important: All new MID Servers must be validated before use. This ensures that the MID Server is trusted to access credentials used by the instance for automations. For instructions, see Validate a MID Server.

MID Server dashboard

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

To display the MID Server Dashboard, navigate to MID Server Dashboard.

The MID Server status gauge

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status (ecc_agent_status) table.
<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the MID Server.</td>
</tr>
<tr>
<td>Host name</td>
<td>The name of the system that hosts the MID Server.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the MID Server.</td>
</tr>
<tr>
<td>Validated</td>
<td>Whether or not the MID Server was validated.</td>
</tr>
<tr>
<td>Max memory used %</td>
<td>The highest percent usage of memory on the system that hosts the MID Server in the last 24 hours.</td>
</tr>
<tr>
<td>Mean CPU used %</td>
<td>The average percent usage of CPU on the system that hosts the MID Server in the last 24 hours.</td>
</tr>
<tr>
<td>Pending jobs</td>
<td>Number of pending ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Processing jobs</td>
<td>Number of processing ECC queue jobs for that MID Server.</td>
</tr>
</tbody>
</table>

You can edit this gauge just like any report to add or remove columns. Hover your cursor over the top of the MID Server Status gauge and click the edit icon.

**Average Percentage of CPU Used gauge**

This graph shows the average CPU usage on all the systems that host MID Servers in the last 30 days, by percentage.
Average Percentage of Max Memory Used gauge

This graph shows the average memory usage on all the systems that host MID Servers in the last 30 days, by percentage.

Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Role required: admin

In the base ServiceNow system, the MID Server JVM memory is set to 1024MB, which is configured in the \agent\conf\wrapper-override.conf file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

Note: For a complete list of minimum MID Server requirements, see [MID Server system requirements](#).  

1. Open the \ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf file in a text editor. For more information about this file, see [Installing Multiple MID Servers on a Single System](#).
2. Locate the following lines in the file:
   
   # OPTIONAL: Maximum Java Heap Size (in MB) wrapper.java.maxmemory=1024

3. Edit the memory allocation.
4. Remove the comment tag (⁻) from the memory allocation parameter.
5. Save the file.
6. Restart the MID Server service.

Set MID Server thread use

If the MID Server is running on a host containing many other programs that must compete for CPU time, fewer threads than the default of 25 might be necessary.

Role required: admin

You can set the MID Server to use as few as 5 threads without issues. If the MID Server needs more speed, and the host is powerful enough or lightly loaded with other programs, raise the thread setting. The thread limit depends on the hardware and the operating system of the host. You might have to experiment to find the optimal value for your situation. The following general observations may be useful:

• Most MID Server tasks require file handles to do their job.
  • Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  • UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.

• Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.

Follow the steps below to change the config.XML file. Alternatively, use the threads.max connection parameter.

1. Open the \agent\config.xml file using any text editor.
2. Locate the following lines:
   <!-- MID Server Threads -->
   <parameter name="threads.max" value="25"/>
3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

MID Server properties and parameters

Several properties and parameters are available for the MID Server configuration.

Required configuration for MID Server

All MID Servers require configuration settings.
Set up MID Server user credentials

Each MID Server must have a set of ServiceNow user credentials with the mid_server role. This role ensures that the MID Server can communicate with the instance. See MID Server User Security for more information.

Required parameters

The following parameters are required for all MID Servers.

Note: Using special characters in an XML configuration file requires you to encode them.

<table>
<thead>
<tr>
<th>Table 458: Required parameters for all MID Servers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
</tr>
<tr>
<td>Instance URL</td>
</tr>
<tr>
<td>MID Server ID</td>
</tr>
<tr>
<td>MID Server name</td>
</tr>
</tbody>
</table>

- Type: string
- Default value: none

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Instance user name     | mid.instance.username or glide.glidesoap.username | If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields.  
  • Type: string  
  • Default value: none |
| Instance password      | mid.instance.password or glide.glidesoap.password | If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance.  
  • Type: string  
  • Default value: none |

**Available MID Server setting types**

You can configure these setting types on a MID Server.

The setting type determines what components are affected by the MID Servers setting. Choose a MID Servers setting type that matches the scope you want the setting to affect.

<table>
<thead>
<tr>
<th>Type of setting</th>
<th>Components affected</th>
<th>Overrides</th>
</tr>
</thead>
</table>
| MID Server Property | Either:  
  • The behavior of all MID Servers  
  • The behavior of a particular MID Server | MID Server properties override MID Server parameters |
| MID Server parameter | The behavior of a particular MID Server                                             | None                                           |

**MID Server properties**

Use properties to control the behavior of all probes on a MID Server or all probes on all MID Servers.
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Max length of a payload that a MID Server will return | mid.discovery.max_payload_size | Specifies the maximum string length of Discovery probe results that the MID Server will send to the instance. The MID Server verifies the size of the Discovery probe results before sending them to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message. This applies only to probes where the Used by Discovery field is true. Set the value to any negative number to disable the payload limit and allow Discovery payloads of any size to be sent to the instance. For example, -1.  
  - Type: integer (bytes)  
  - Default value: 5000000 |
| Max length of an ECCQ payload XML that a MID Server will send to the instance | mid.eccq.max_payload_size | Specifies the maximum string length of a payload that the MID Server will send to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server saves a copy of the payload to the filesystem on the MID Server host, and returns an error message that contains the location of the file.  
  - Type: integer (bytes)  
  - Default value: 20000000 |
| Allowed JDBC operations                     | mid.property.jdbc_operations | Tells JDBCOrchestrationProbe what JDBC operations are allowed to execute. Uses can edit the property value to allow a JDBC provider template to perform more operations. All operations are comma separated.  
  - Type: string  
  - Default value: select,update,insert,delete,show,create,describe |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable SNCSSH client</td>
<td>mid.property.ssh.use_snc</td>
<td>Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to false to use J2SSH. This property applies to all MID Servers connected to the instance. Important: If you upgrade from Dublin or earlier and want to use the SNCSSH client, you must add this property to the MID Server Properties (ecc_agent_property) table and set it to true. If you do not set this property, all the MID Servers in the upgraded system will use J2SSH. Type: true</td>
</tr>
</tbody>
</table>

Create MID Server properties

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Role required: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the glide.properties file that is located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

1. Navigate to MID Server Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

Table 461: MID Server Properties Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name. See the Name(s) column in Required Parameters or Optional Configuration parameters for a list of parameter and property names.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the value you want the property to have.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.</td>
</tr>
</tbody>
</table>

After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.
Add MID Server parameters

Use a MID Server parameter to control the behavior of a particular MID Server.

Role required: admin

You can set MID Server configuration parameters in either of the following places:
- From the Configuration Parameters related list in the MID Server record.
- From the config.xml file in the \agent directory of your MID Server installation.

Note: Changes to parameters only take effect when the MID Server is started (or restarted).

You can view and manage MID Server configuration from the ServiceNow instance.

1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server Servers
   - Discovery MID Servers
   - Orchestration MID Servers

2. From the list of MID Servers, select a MID Server to configure.
   
The Configuration Parameters related list shows all the parameters currently in the MID Server’s configuration file. If there are any passwords, they are displayed in asterisks for security reasons.
3. To add parameters, click New, and then complete the form.

After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.

Note: ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected properties must be made directly in the config.xml file for that MID Server.
Setting Parameters from the config.xml File

MID Server configuration is controlled by an XML file called config.xml. This file is located in the
\agent directory, immediately under the directory where the MID Server is installed. Edit this file
directly to make any configuration changes to protected parameters. Many configuration changes,
such as those that do not disrupt communication between the MID Server and the ServiceNow
instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner
parameter tags. Each parameter tag has name and value attributes.

• To change the value of a parameter, edit the value attribute.
• To add a parameter, add another parameter tag with its name and value.
• To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in
the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the
comment tags around the proxy sections that you configure.
MID Server CIM parameters

These parameters determine how a MID Server conducts CIM Discovery.

Note: The sample file here is from FireFox. Conventional text editors, such as Notepad, Wordpad, or TextEdit, do not display colors and variable fonts.
### Table 462: MID Server CIM parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of messages sent at once to a CIM server. | mid.cim.batch.size | Specifies the maximum number of messages sent at once to a CIM server.  
  • Type: integer  
  • Default value: 1 |
| Interval to wait between requests to the same CIMOM (ms) | mid.cim.request.interval | Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).  
  • Type: integer (milliseconds)  
  • Default value: 0 |
| The maximum amount of simultaneous connections allowed per CIMOM | mid.cim.host.connection.limit | Specifies the maximum number of simultaneous connections to each Common Information Model Object Manager (CIMOM). A value of zero disables simultaneous connections.  
  • Type: integer (number of connections)  
  • Default value: 0 |

### MID Server connection parameters

These parameters control the MID Server connection to the instance.

### Table 463: MID Server connection parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Instance date format | instance.date.format | Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.  
  • Type: string (Date format)  
  • Default value: yyyy-MM-dd HH:mm:ss |

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server immediate response enable| glide.mid.fast.responses | Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers ends message to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages simultaneously transmitted to the instance. Setting this parameter to true may decrease the time between a probe’s completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter’s value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.  
• Type: true | false  
• Default value: false |
| MID Server JMX enable               | mid.jmx.enabled     | Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to true is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.  
• Type: true | false  
• Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server max transmission queue size         | glide.mid.max.sender.queue.size | Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server’s host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server. The parameter is of the form \( \{number\} \{multiplier\} \), where \( \{number\} \) is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".  
• Type: string  
• Default value: 0.5 GB                                                                                                                                   |
| MID Server maximum number of probe threads     | threads.max                   | Controls the number of execution threads (simultaneous work) that probes may use. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. To decrease the MID Server’s CPU consumption, lower the number of threads. To make the MID Server work faster, increase the number of threads. See [Set MID Server Thread Use](#).  
• Type: integer (threads)  
• Default value: 25                                                                                                                                         |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum amount of interactive messages to queue in memory for processing. | threads.interactive.max | Sets the maximum amount of interactive messages to queue in memory for processing.  
  - Type: integer (threads)  
  - Default value: 4 |
| Maximum amount of expedited messages to queue in memory for processing. | threads.expedited.max | Sets the maximum amount of expedited messages to queue in memory for processing.  
  - Type: integer (threads)  
  - Default value: 4 (threads) |
| MID Server poll time | mid.poll.time | Sets the default MID Server polling interval (in seconds). This is the interval the MID Server waits before polling the ECC queue when the ECC queue is not busy. In addition to reacting to AMB messages, the system also polls the ECC queue at a regular interval in case the AMB connection is dropped.  
  - Type: integer (seconds)  
  - Default value: 40 |

### MID Server credentials parameters

This parameter controls the MID Server credential provider.

Table 464: MID Server credentials parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Credentials provider | mid.credentials.provider | Specifies the Java class name of the credentials provider.  
  - Type: string  
  - Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider |
| Class that the MID server uses to generate secure key pairs. | mid.secure_credentials.key_pairs.provider | Specifies that the MID server uses to generate secure key pairs.  
  - Type: String  
  - Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider |

### MID Server debug parameters

These parameters enable and control debugging for the MID Server.
### Table 465: MID Server debug parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Debug logging enable         | debug.logging                | (Deprecated) Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
  - Type: true | false  
  - Default value: false  
  
  This parameter has been replaced by the mid.log.level parameter. |
| Debug mode enable            | debug                        | (Deprecated) Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.  
  - Type: true | false  
  - Default value: false  
  
  This parameter has been replaced by the mid.log.level parameter. |
| Debug file probe templates.  | file.probe.template.debug    | Specifies whether to debug file probe templates.  
  - Type: True | False  
  - Default: false |
| Enables debug logging for CIM / WBEM / SLP / SMI-S | mid.cim.debug | Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.  
  - Type: true | false  
  - Default value: false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable debug logging for ServiceNow SSH Client| mid.ssh.debug | Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled. When the ServiceNow SSH client is enabled, the parameter functions as follows:  
• Type: String  
• Default value: false  
The following string values are valid for the ServiceNow SSH client:  
• true: Enables SSH debug information in the log file.  
• false: Disables SSH debug information in the log file.  
• (IP Addresses): Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:  
• An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.  
• An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.  
• A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.  
• deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message. |
### MID Server logging level

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server logging level | mid.log.level | Specifies the logging level for the MID Server. Possible values are:  
  - debug  
  - info  
  - warn  
  - error  
  
  Note: Values are case insensitive.  
  - Type: string  
  - Default value: info |

Enables debug logging for the Idle Connection Monitor. | mid.http.idle_connection_monitor.debug | Enables debug logging for the Idle Connection Monitor.  
  - Type: True | False  
  - Default value: false |

---

### MID Server DNS parameters

These parameters control DNS scanning for the MID Server.

#### Table 466: MID Server DNS parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| DNS scanning regulator interval (ms) | mid.dns_scan.regulator.interval_ms | Specifies the interval between DNS scans in milliseconds.  
  - Type: integer  
  - Default value: 10 |

| DNS scanning regulator packets per interval | mid.dns_scan.regulator.packets_per_interval | Specifies the number of regulator packets per DNS scan.  
  - Type: integer  
  - Default value: 1 |

| DNS scanning default name servers | mid.dns_scan.default_name_servers | Specifies the host names or IP addresses of the default name servers.  
  - Type: string  
  - Default value: none |

| DNS scanning additional name servers | mid.dns_scan.additional_name_servers | Specifies the host names or IP addresses of any additional name servers.  
  - Type: string  
  - Default value: none |

<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
</tbody>
</table>

**MID Server logging parameters**

These parameters enable and control MID Server logging.
Table 468: MID Server logging parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable monitor checking</td>
<td>disable_monitors</td>
<td>Specifies whether to disable the MID Server from actively checking for monitors on the instance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Query logging enable</td>
<td>mid.show.queries</td>
<td>Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Remote logging disable</td>
<td>disable.remote.logging</td>
<td>Prevents the MID Server from logging any information to the MID Server log on the ServiceNow instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging to the instance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Status sending disable</td>
<td>disable.status</td>
<td>Prevents the MID Server from sending a status report to the ServiceNow instance every 10 minutes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
</tbody>
</table>

Proxy server parameters
Use these parameters to configure how your MID Server communicates through a proxy server to access the instance.
## Table 469: Proxy server parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance proxy enable</td>
<td>mid.instance.use_proxy or</td>
<td>If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server’s host and port, and perhaps the user name and password as well.</td>
</tr>
<tr>
<td></td>
<td>mid.proxy.use_proxy</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Instance proxy host</td>
<td>mid.proxy.host</td>
<td>If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy’s host.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: none</td>
</tr>
<tr>
<td>Instance proxy password</td>
<td>mid.proxy.password</td>
<td>If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: none</td>
</tr>
<tr>
<td>Instance proxy port</td>
<td>mid.proxy.port</td>
<td>If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy’s port.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: integer (0-65535)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: 80</td>
</tr>
<tr>
<td>Instance proxy user name</td>
<td>mid.proxy.username</td>
<td>If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define that user name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td></td>

</tbody>
</table>

**MID Server Shazzam parameters**

These parameters control several aspects of the MID Server Shazzam probe.
### Table 470: MID Server Shazzam parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port probe packet interval</td>
<td>mid.shazzam.regulator.interval_ms</td>
<td>Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the mid.shazzam.regulator.packets_per_interval parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: 1</td>
</tr>
<tr>
<td>Port probe packets launched per regulator interval</td>
<td>mid.shazzam.regulator.packets_per_interval</td>
<td>Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the mid.shazzam.regulator.interval_ms parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: 1</td>
</tr>
<tr>
<td>Shazzam chunk size</td>
<td>mid.shazzam.chunk_size</td>
<td>Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: 100</td>
</tr>
</tbody>
</table>

### SNMP Discovery parameters

These parameters control several aspects of SNMP discovery, including the inclusion of the community string and the timeout values.

### Table 471: SNMP Discovery parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable automatic inclusion of SNMP public community string</td>
<td>mid.snmp.enable_auto_public</td>
<td>Specifies whether to use the <a href="#">SNMP public community string</a> automatically if no other SNMP credentials were successful.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>Label</td>
<td>Names</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Maximum time to wait for a response for the first OID request. | mid.snmp.request.timeout | Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the mid.snmp.session.timeout configuration parameter (see below) takes effect.  

Note: You can override this parameter with the timeout SNMP probe parameter.  

- Type: Integer  
- Default value: 1500 |
| Maximum time to wait for responses to OID requests once a session has been established. | mid.snmp.session.timeout | Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for mid.snmp.request.timeout.  

Note: You can override this parameter with the establish_session.timeout SNMP probe parameter.  

- Type: Integer  
- Default value: 500 |
| Use the Snmp4j library for SNMP communication. | mid.snmp.use_snmp4j | Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to false based on advice from customer support.  

- Type: True | False  
- Default value: true |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use SNMP v1 and v2c for probes.</td>
<td>mid.snmp.use_snmp_v1_v2c</td>
<td>Attempt communication using these SNMP protocol versions. Requires configuration of SNMP community string credentials or the mid.snmp.enable_auto_public parameter set to true, as applicable for targeted devices.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>Use SNMP v3 for probes.</td>
<td>mid.snmp.use_snmp_v3</td>
<td>Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
</tbody>
</table>

**SNMP proxy parameters**

Use these parameters to translate SNMP addresses when an SNMP proxy is used, either with hardware or software.

Table 472: SNMP proxy parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the SNMP proxy.</td>
<td>mid.snmp.proxy.enabled</td>
<td>Enables the SNMP proxy.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>Path for file-based translation.</td>
<td>mid.snmp.proxy.file_path</td>
<td>Path for file-based translation. Usually, translation tables can be exported to configuration files. This parameter allows you to define the location of such a file after it is exported from the proxy. The value can be any valid location visible to the MID Server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: none</td>
</tr>
<tr>
<td>Parses regular expressions for file-based translation.</td>
<td>mid.snmp.proxy.file_parse_regex</td>
<td>Parses regular expressions for file-based translation. Usually, translation tables can be exported to configuration files. This parameter allows you to define the regular expression for parsing the configuration data within such a file.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: none</td>
</tr>
</tbody>
</table>
### Configure MID Server for SNMP

MID servers support all SNMP protocol versions by default. Use this procedure if you want a MID Server to only support a specific version of SNMP.

**Role required:** admin

You can also use this procedure to enable or disable SNMPv3 for other automation processes, such as Workflow.

1. Navigate to MID Servers > your MID Server name.
2. In the MID Server page, click the Configuration Parameters tab.
3. In the mid.snmp.use_snmp_v1_v2c parameter, set the value to true to enable SNMPv1/v2c packets to be sent.
   - This parameter is enabled by default.
4. In the mid.snmp.use_snmp_v3 parameter, set the value to true to enable SNMPv3 packets to be sent.
   - This parameter is enabled by default.

### SSH Discovery parameters

These parameters control several aspects of SSH discovery, including the number of SSH connections per host and the process commands against localhost.

**Table 473: SSH Discovery parameters**

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server connection cache</td>
<td>mid.connection_cache</td>
<td>Specifies whether to cache connections. Set to false to disable connection caching. This parameter applies to SSH connections only.</td>
</tr>
<tr>
<td>Decide if the PATH environment variable should be set for SSH commands</td>
<td>mid.ssh.set_path</td>
<td>Specifies whether to set the PATH environment variable for SSH commands.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Process commands against localhost via SSH rather than console | mid.ssh.local | Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.  
  - Type: true | false  
  - Default value: false |
| MID Server SSH connections per host | mid.ssh.connections_per_host | Controls the number of concurrent probes that the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.  
  - Type: integer  
  - Default value:  
    - 7 for the ServiceNow client  
    - 3 for the legacy SSH client |
| Enable (or disable) sudo to preserve environment (-E) for SSH | mid.ssh.sudo_preserve_environment | Specifies whether to use **sudo** to preserve the environment for SSH.  
  - Type: true | false  
  - Default value: false |
| Set the PATH environment paths for SSH commands | mid.ssh.path_override | Overrides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:). The default path is `/usr/sbin: /usr/bin: /bin: /sbin`.  
  The ServiceNow SSH client accepts the following prefixes in front of the path Override value.  
  - append: Appends the override path to the end of the host’s path. This is the default behavior.  
  - replace: Replaces the host path with the path Override value.  
  - prepend: Appends the override path to the front of the host path.  
  - Type: string (a colon-separated list of directories)  
  - Default value: None |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable the ServiceNow SSH Client | mid.ssh.use_snc | Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a [MID Server property](#). Enabling the ServiceNow SSH client disables the legacy J2SSH client.  
**Important:** Mixing SSH client types for MID Servers connected to the same instance is not a good practice.  
- **Type:** true | false  
- **Default value:** false |
| The maximum number of times to retry an SSH operation after a timeout | mid.ssh.max_retries | Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to 0 to disable retries.  
- **Type:** integer  
- **Default value:** 1 |
| Sets a different remove file command to replace the default `/bin/rm -f` | mid.ssh.alt_rm | Sets a different SSH remove file command.  
- **Type:** string  
- **Default value:** none |
| Delay sending any SSH commands to a server after connecting | mid.ssh.initial_delay_ms | Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.  
- **Type:** integer (milliseconds)  
- **Default value:** 0 |
| Suppress history file generation for SSH | mid.ssh.suppress_history | Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.  
- **Type:** true | false  
- **Default value:** false |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Timeout in ms for SSH socket read**          | mid.ssh.socket_timeout       | Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.  
  - Type: integer (milliseconds)  
  - Default value: 120000 (2 minutes) |
| **Timeout in ms for SSH channel activity**     | mid.ssh.channel_timeout      | Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.  
  - Type: integer (milliseconds)  
  - Default value: 120000 (2 minutes) |
| **Timeout in ms for SSH socket read**          | mid.ssh.session_timeout      | Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.  
  - Type: integer (milliseconds)  
  - Default value: 300000 (5 minutes) |
| **Timeout for SSH command execution (ms)**     | mid.ssh.command_timeout_ms    | The timeout duration, in milliseconds, for the execution of an SSH command.  
  - Type: integer (milliseconds)  
  - Default value: 300000 (5 minutes) |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Use keyboard interactive authentication for SSH | mid.ssh.use_keyboard_interactive | Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.  
- Type: true | false  
- Default value: false |
| Min size of DH group in bits | mid.ssh.dh_group_length_min | Specifies the minimum group length in bits used for generating a “shared secret” key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
- Type: integer (bits)  
- Default value: 1024 |
| Max size of DH group in bits | mid.ssh.dh_group_length_max | Specifies the maximum group length in bits used for generating a “shared secret” key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
- Type: integer (bits)  
- Default value: 2048 |
| List of bourne-compatible shells | mid.ssh.shells_supported | Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as ksh, dsh, bash and sh.  
- Type: string  
- Default value: ksh,bash,sh |
| Ratio of ssh session pool capacity to mid thread number in percentage. | mid.ssh.pool_thread_ratio | The ratio of SSH session pool capacity to the MID Server thread number, in percentage. The pool capacity is at least 25%.  
- Type: integer  
- Default value: 75 |
| Comma-separated list of sudo alternatives. | mid.ssh.privileged_commands | Currently supported privileged commands are pbrun, pfexec, sudo.  
- Type: string  
- Default value: sudo |
Default paths for SSH commands

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:
• /usr/sbin
• /usr/bin
• /bin
• /sbin

MID Server upgrade parameters

These parameters control the upgrade of the MID Server, including a version number that you can pin the MID server to.

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed MID Server version</td>
<td>mid.pinned.version</td>
<td>Name of the version to which this MID Server is pinned.</td>

</table>
| Upgrade proxy user | glide.mid.autoupgrade.proxy_user | If your MID Server must go through a web proxy to access the upgrade URL, define the proxy’s user name here.  
  - Type: string (URL)  
  - Default value: none |
| Upgrade proxy password | glide.mid.autoupgrade.proxy_password | If your MID Server must go through a web proxy to access the upgrade URL, define the proxy’s password here.  
  - Type: string  
  - Default value: none |

### Windows Discovery parameters

A list of Windows Discovery parameters.

Table 475: Windows Discovery parameters

<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable or disable Powershell parameter passing via the command line. | mid.powershell.command.parameter_passing | Enable this parameter to allow passing Powershell parameters from the command line.  
  - Type: True | False  
  - Default value: false |
| Enable or disable the Powershell script parameter passing via the command line. | mid.powershell.command.script.parameter_passing | Enable this parameter to allow passing Powershell scripts from the command line.  
  - Type: True | False  
  - Default value: true |
| Enable or Disable the enforcement of UTF-8 for command output. | mid.powershell.enforce_utf8 | Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled.  
  Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.  
  - Type: True | False  
  - Default value: true |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable PowerShell for Discovery.                   | mid.use_powershell                       | Specifies whether to enable PowerShell for Discovery. The MID Server requires PowerShell version 2 to operate. If the MID Server cannot find the correct version of PowerShell, it uses WMIRunner instead.  
  • Type: True | False  
  • Default value: true                                                                 |
| Enable/Disable automatically falling back to the MID Server service user credential if all other credentials fail. | mid.powershell.local_mid_service_credential_fallback | Specifies the login credentials the MID Server uses if all other credentials fail.  
  • Type: True | False  
  • Default value: false                                                                 |
| Timeout for Windows probes.                        | mid.windows.probe_timeout                | Specifies the timeout value for the Windows probe, in seconds. The default value is 5 minutes.  
  • Type: Integer  
  • Default value: 600 seconds                                                                   |
| Powershell use credentials table.                  | mid.powershell.use_credentials           | Specifies whether PowerShell Discovery should use the Windows credentials from the credentials table. To use PowerShell Discovery on a single domain, set this parameter to false, and then restart the MID Server. In this case, the MID Server runs the probes with the credentials of the user for the MID Server process.  
  • Type: True | False  
  • Default value: true                                                                   |
<table>
<thead>
<tr>
<th>Label</th>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to Powershell executable.</td>
<td>mid.powershell.path</td>
<td>Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the directory containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell.. ServiceNow automatically appends the string powershell.exe to the path. This parameter might be necessary when both 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. Note that 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If the path is in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. An example would be to specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0\ instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0. Note: On a 64-bit version of Windows Server 2003 or Windows XP, a Microsoft hotfix may be required to enable this capability.</td>
</tr>

Add SSL certificates for the MID Server

Configure the MID Server to connect over SSL.

Role required: admin

Add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

1. Open a command prompt and navigate to the folder containing the JRE keytool.
   An example path might be: C:\Program Files (x86)\ServiceNow\MidServer(s)\agent\jre\bin
2. Enter the following keytool command to import a certificate into the MID Server’s cacerts keystore:
   keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to MID Server(s)>\agent\jre\lib\security\cacerts"
   For example, you might enter: keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files (x86)\ServiceNow\MIDserver\agent\jre\lib\security\cacerts"

Note: Keytool prompts for a certificate password. If the certificate is for a CA, keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see Upload a certificate to an instance.

Enable script file synchronization for Windows enhanced security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Without script file synchronization, Internet Explorer blocks files downloaded for use by the MID Server, forcing ServiceNow administrators to unblock each file manually. File synchronization creates the files on the MID Server rather than downloading them, which does not trigger security blocking. Also, file synchronization between script records on the instance and the MID Server protects any customer updates in those records from being overwritten during a ServiceNow upgrade.

How file synchronization works

Script files synchronized with the MID Server are stored on the ServiceNow instance in the MID Server Script File [ecc_agent_script_file] table (MID Server Script Files).

When the MID Server first connects to the instance, ServiceNow creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table. The MID Server Script File [ecc_agent_script_file] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Create domain-specific MID server files.

The record for the parent directory looks like this:
The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:
Configure an IP address range for the MID Server

Configure an IP address range on the MID server to let Orchestration and Service Mapping determine which MID Server to use.

Role required: admin

Orchestration uses the IP address of the target machine to select the correct MID Server to use for Orchestration activities. This functionality ensures that a MID Server with connectivity to the target is chosen to perform the Orchestration activity. See Configure a MID Server for an IP address range for more information.

Service Mapping elects the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
• 0A0B909B

• An IP address range in dotted decimal or hexadecimal format. Here are examples:
  • 10.11.144.150-10.11.144.160
  • 0xA0B9096-0xA0B90A0
  • 0.10.11.144.150-0xA0B90A0

• An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Dotted decimal or hexadecimal format is not allowed. Here are examples:
  • 10.11.144.0/24 10.11.144.0/255.255.255.0
  • 10.11.144.0/0xFFFFFFFF00
  • 0x0A0B9000/24
  • 0x0A0B9000/0xFFFFFFFF00

1. Navigate to MID Server IP Ranges.
2. Click New.
3. Fill out the form fields (see table).

<table>
<thead>
<tr>
<th>Field</th>

</tr>
<tr>
<td></td>
<td>• Exclude: Exclude the IP address range.</td>
</tr>
<tr>
<td>Range</td>
<td>Enter the range in an valid format.</td>
</tr>
</tbody>
</table>
4. Click Save.

Configure a dedicated MID Server for Service Analytics

To activate root cause analysis (RCA) with Service Analytics, configure at least one dedicated MID Server with analytics. To ensure uninterrupted services, it is recommended that you also configure a failover MID Server cluster for analytics.

If the Domain Support - Domain Extensions Installer plugin is activated, then you can configure a dedicated MID Server with analytics, per domain. In this case, RCA for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

Role required: admin

The analytics MID Server supports the RCA process by hosting the RCA Learner and the real-time RCA query handler. On the analytics MID Server, the system builds models that support responses to root cause queries. The learner data on the analytics MID Server persists by default for a maximum of 90 days.

The MID Server must be dedicated for Service Analytics, and an attempt to use it for Discovery for example, is prevented.

1. Ensure that the MID Server is validated.
   For more information, see Validate a MID Server.
2. Navigate to MID Server Capabilities, and click Analytics.
3. Select the MID Server that you want to configure analytics on.
   a) In the MID Servers section, click Edit.
   b) On the Edit Members form, select the MID Server and move it to the Analytics list.
   c) Click Save.
4. Click Update.

The Analytics MID Server is automatically configured with a Discovery IP range set to 0.0.0.0-0.0.0.0.

Create a failover cluster for analytics. In this cluster, add the MID Servers that were configured for analytics. For more information, see Configure a MID Server cluster.

MID Server domain separation

MID Servers can be configured in separate domains.

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain’s records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files (ecc_agent_sync_file):

- MID Server MIB File (ecc_agent_mib)
- MID Server JAR File (ecc_agent_jar)
- MID Server Script File (ecc_agent_script_files)

See Set up domain separation for MID servers for instructions on setting up domain separation through the MID server.

Note: Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. This occurs because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.
Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. Configure a MID Server user within a specified domain with the proper mid_server role.
2. Specify this user within the MID Server config.xml file. When you set the MID Server user credentials in the config.xml file, make sure they are in the proper domain.

When the MID Server connects to the instance, the MID Server record is created in the proper domain.

If you must change the MID Server domain, stop the MID Server and delete the ecc_agent record. Then update the MID Server config.xml with the new user in the new domain and restart the MID Server service.

Create domain-specific MID server files

You can create versions of specific MID Server files that only MID Servers in your domain can use.

Role required: admin, agent_admin

1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
   - JAR Files
   - Script Files

2. Update an existing policy or submit a new record.
   The system overrides the global domain configuration with your domain and saves a new copy of the record. The MID Servers in your domain can only access records in the global domain and records overridden by your specific domain.

   Note: Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. This occurs because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Privileged commands for the MID Server

To discover certain information on a host server, Discovery must run SSH commands with higher privilege.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the fdisk -I command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands.

   Note: You can have different privileged commands set up for different hosts. However, Discovery supports only one privileged command per host.
Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific privileged commands, using a configuration parameter.

Role required: admin

Starting with Helsinki Patch 2, users can specify any privileged command for a MID Server to run, not just the supported commands. All new privileged commands use a common processor that runs this command on the target to determine if the privileged command exists: command -v priv_command. When applying the privileged command, the processor assumes:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| sudo    | • Host must support the sudo -S -p password command and return the correct list of allowed SSH commands.  
          • Credentials provided for Discovery must be able to run the command sudo -S -p password <commands>. Possible SSH commands are those listed in [UNIX and Linux commands](https://en.wikipedia.org/wiki/Commands) requiring root privileges for Discovery and Orchestration. |
| pbrun   | • Host must support the pbrun -v command and return the correct version of PowerBroker.  
          • Credentials provided for Discovery must be able to run pbrun <commands>. Possible SSH commands are those listed in [Unix and Linux commands](https://en.wikipedia.org/wiki/Commands).  
          • Discovery does not support any other pbrun - options, such as a password prompt.  
          • The instance must be able to reach the target host via SSH. |
| pfexec  | • Host must support the pfexec id -a command and return the correct ID.  
          • Credentials provided for Discovery must be able to run pfexec <commands>. Possible SSH commands are those listed in [Unix and Linux commands](https://en.wikipedia.org/wiki/Commands).  
          • Discovery does not support any other pfexec - options, such as a password prompt. |
| dzdo    | • Host must support the command -v dzdo command and return the path to dzdo in standard output.  
          • Credentials provided for Discovery must be able to run dzdo <commands>. Possible SSH commands are those listed in [Unix and Linux commands](https://en.wikipedia.org/wiki/Commands).  
          • Discovery does not support any other dzdo - options, but Discovery supports password authentication for dzdo. |
• All shell commands are allowed.
• No password is required.
• TTY is always required.

1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server Servers
   - Discovery MID Servers
   - Orchestration MID Servers

2. Open the MID Server to which you want to add the privileged command.
3. In the Configuration Parameters related list, click New.
4. Complete these fields in the form:
   - Parameter name: Select the mid.ssh.privileged_commands parameter from the list.
   - Value: List the privileged commands you want this MID Server to use in a comma separated list. The supported commands are: dzdo, pfexec, pbrun, and sudo. Starting with Helsinki Patch 2, you can use the value in this Value field to execute any privileged command, such as a customized sudo command or any privileged command in your environment. You can also use it to create special configurations of supported privileged commands. For example, you can set pbrun -u admin as one privileged command to run with an admin profile. Only one of these special configurations is allowed per privileged command on a MID Server. You can configure pbrun, dzdo for a specific MID Server, but not pbrun -u admin, pbrun -u system.

   Note: Remember that the target host must support the command you specify.

5. Click Submit.

MID Server cluster configuration

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection

External data sources

For performance and reliability reasons, these data sources should not be used with MID Server clusters:
- LDAP
- Export sets
- JDBC data sources

These external data sources should only be used with dedicated MID Servers.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.
Table 479: MID Server cluster event

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
<tr>
<td></td>
<td>(ecc_agent_cluster)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

How clusters work

MID Servers in clusters must be able to connect to all the devices with which they are expected to communicate. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. Put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Combining clusters

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster.
If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

Configure a MID Server cluster

Configure a cluster of MID Servers for either failover or load balancing.

Role required: admin
1. Navigate to MID Server Clusters.
2. Click New.
3. Name the cluster and select the cluster type: Failover or Load Balance.
4. Right click in the header bar and select Save from the context menu.
5. Click Edit in the Includes MID Servers Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

Note:
All MID Servers in a cluster must have capabilities defined. Ensure that each MID Server has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

How MID Server gets work from the queue

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB) Client, which notifies the MID Server that it has pending tasks in the ECC queue.

The MID Server opens a persistent connection to the instance through AMB and listens on the /mid/server/<mid_sys_id> AMB channel. When an output record is inserted into the Queue [ecc_queue] table, an AMB message is sent to the MID Server’s channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the interval defined in the mid.poll.time configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
Deploy multiple MID Servers

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.
You can install each MID Server on a separate machine or install multiple MID Servers on a single machine (including virtual machines).

**MID Server integrations**

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network
- The amount of traffic between ServiceNow and the integrations
- The reliability of the MID Server machines.

**Security**

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration’s data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

**Load balancing**

In some cases, a single MID Server can handle all the transactions that occur between an instance and an external integration. However, in a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
- Reading files

**High availability model**

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

---

**Note:** Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

---

**Multiple MID Server deployment for Discovery and Service Mapping**

The same considerations for deploying multiple MID Servers apply to both Discovery and Service Mapping.

**Deployment considerations**

When determining if you need multiple MID Servers to discover the configuration items in your network efficiently, consider these factors:
• **WAN deployment**: When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

• **DMZ**: Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.

• **High capacity**: Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly.

• **Security**: If your security policy controls access to network devices (e.g. switches and routers) with an *access control lists (ACL)*, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.

• **Probe types**: If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

**Domain separation**

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID servers at the lowest domain level.
When determining if multiple MID Servers are necessary to execute Orchestration activities, consider the following factors:

- **WAN deployment**: When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of the WAN connections is comparable to that of the Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

- **DMZ**: Network policy might require the installation of one or more MID Servers in the DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
• Security: If a security policy controls access to computers with an access control list (ACL), it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
• Probe types: If Orchestration launches probes for different operating systems, network policy might require a separate MID Server for each type of probe (e.g., one MID Server for Windows PowerShell and another for SSH probes on UNIX).

Encrypt MID Server login credentials

The MID Server login credentials appear in the config.xml file in clear text. If access to the MID Server host machine is not secure, store the login credentials in this file in encrypted form.

Role required: admin

Note: Any field in this file can be encrypted, but once encrypted, a field can be managed only from within the instance. Encrypt password fields only (for the MID Server and any proxy server specified).

1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.

The instance credentials section of the config.xml file looks like this:

<!-- If your instance has authentication enabled (the normal case), set these parameters to define the user name and password the MID Server will use to log into the instance. -->

<parameter name="mid.instance.username" value="midsrvadmin" />
<parameter name="mid.instance.password" value="securepassw0rd" />

2. Add the encrypt="true" attribute to the password tag.

<parameter name="mid.instance.username" value="midsrvadmin" />
<parameter name="mid.instance.password" encrypt="true" value="securepassw0rd" />

3. Save the config.xml file, and then restart the MID Server service.

The password is now encrypted.

The password cannot be decrypted (or displayed in clear text again) by changing the encryption attribute to false or by deleting the attribute. If the password is changed in the config.xml file and the MID Server restarted, the new password is encrypted.

MID Server web services calls

The MID Server makes various Web Services calls to the instance with which it is configured to work. If your environment includes a Web Services proxy or firewall, you might need to enumerate all of the Web Services it makes.

MID Server web services URL

Every MID Server Web Services call is made with a URL that looks like this: https://your-instance.service-now.com/name.do?SOAP
Table 480: Anatomy of a MID Server Web Services URL

<table>
<thead>
<tr>
<th>URL Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="https://your-instance.service-now.com/">https://your-instance.service-now.com/</a></td>
<td>This portion of the URL is specified by the URL parameter in the MID Server config.xml file.</td>
</tr>
<tr>
<td>name</td>
<td>The names of any of any Web Services may appear in this portion of the URL.</td>
</tr>
<tr>
<td>.do?SOAP</td>
<td>The remainder of the URL is static (for example, it is the same for every Web Services call).</td>
</tr>
</tbody>
</table>

MID Server web services names

If your environment includes a Web Services proxy or firewall, you might need to enumerate all of the Web Services your MID Server calls:

- sys_data_source
- ecc_agent_script_include
- ecc_mi
- sys_impex_map
- sys_impex_entry
- ecc_agent_log
- ecc_queue
- ecc_event
- ecc_monitor
- ecc_mi_result
- ecc_mi_parameter
- ecc_agent_property
- sys_properties
- discovery_snmp_mib
- dscy_credentials_affinity
- discovery_credentials
- ecc_disco_cmd_scan
- sys_attachment
- sys_attachment_doc

The mid_server role and SOAP security

The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place.

Add this role to the MID Server user for any instance on which basic authentication is enabled. The system adds the necessary SOAP roles automatically with the mid_server role.
<table>
<thead>
<tr>
<th>Role</th>
<th>State</th>
<th>Inherited</th>

</tr>
</tbody>
</table>

Figure 309: MID Server roles
MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

```javascript
ms.log('Attempting to log in with user: ' + this.getParameter('user'))
```

MID Server Autofinder for Orchestration

MID Servers are associated with IP address ranges and capabilities, enabling Orchestration to select an appropriate MID Server to use for an Orchestration activity.

This functionality ensures that a MID Server with proper privileges is available wherever Orchestration probes need to operate in a network.

Autofinder also enables administrators to define specific capabilities for each MID Server within an IP address range. To find a match, the MID Server must have the appropriate capability and IP address range. If it cannot find a MID Server with both of these criteria, it selects the default MID Server.

MID Server selection criteria

Make sure to define a default MID Server for Orchestration.

If Orchestration finds multiple MID Servers in the target IP range with appropriate capabilities, it selects one of these at random. If no MID Servers are found with the necessary capabilities, Orchestration uses the MID Server defined in Orchestration MID Server properties. For this reason, it is very important to define a default MID Server in the properties that can fulfill this function.

To set the default Orchestration MID Server, navigate to Orchestration MID Server Properties and type the name of the MID Server into the Default MID Server to use for Orchestration Activities property field.
You can set a MID Server as the default by clicking the Set as default related link on the MID Server form.

Map an IP address to a DNS name

If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin

The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.
If Discovery cannot discover the server and resolve the DNS name to an IP address, you must creating
the mapping manually, using this procedure.

1. Enter cmdb_ci_dns_name.list in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.

Configure a MID Server for an IP address range

You can configure a range of IP addresses on the MID Server to use for an Orchestration activity.
Role required: admin
Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly
  prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0x0A0B909B
  - 0A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0x0A0B9096-0x0A0B90A0
  - 10.11.144.150-0x0A0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32
  inclusive) or in IP address notation. Dotted decimal or hexadecimal format is not allowed. Here are
  examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF
  - 0x0A0B9000/24
  - 0x0A0B9000/0xFFFFFFFF

1. Navigate to MID Server IP Ranges .
2. Click New.
3. Fill out the form fields (see table).
When associating MID Servers with IP address ranges, Orchestration uses the IP address of the target machine to select the correct MID Server to use for Orchestration activities. This functionality ensures that a MID Server with connectivity to the target is chosen to perform the Orchestration activity. More Info

<table>

</tr>
</tbody>
</table>

4. Click Save.

**MID Server capabilities**

MID Server capabilities define the specific functions of a MID Server within an IP address range. Service Mapping uses capability to narrow the pool of MID Servers it uses.

At least one capability is required for each MID Server used by Orchestration. The base functionality enables an administrator to select specific capabilities for the probes launched by each MID Server. You can assign multiple MID Servers to the same IP address range and give them different capabilities, or assign a MID Server with specific capabilities to more than one IP address range. When Orchestration initiates a Workflow activity, Orchestration uses the IP address of the target machine to locate the MID Server assigned to that network segment that has the necessary capabilities to execute the activity.

The following capabilities are available for Orchestration:

- SSH
To configure a MID Server to work with Service Mapping, use ServiceMapping capability for it.

Configure MID Server capabilities

At least one capability is required for each MID Server.

Role required: admin or sm_admin

1. Navigate to MID Server Capabilities.
2. Select an existing capability

   Note: Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click New.
   b) Configure the value for a custom capability.
      An example is a capability for DOMAIN, with a value of service-now.
   c) Click Submit.

4. Click Edit in the MID Servers Related List.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click Save.

   The capability defined here also appears in the primary record for this MID Server.
MID Server capability values

Capabilities provided in the base system do not have a defined Value string. A MID Server configured to use a capability that has no Value can locate any device using that capability’s protocol.

If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Scripted value matching for MID Servers

A module called Capability Value Tests enables administrators to create capabilities that find devices using values that do not require exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must
end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server Capability Value Tests and select Resolve DNS from the list.

---

Create an ECC Queue message

One of the capabilities of the MID Server is to be able to send remote commands through the MID Server to the hosting device, and then gather the response.

This feature enables an administrator to issue remote commands directly from the ECC Queue without running Discovery.

1. Navigate to Discovery > Outputs and Artifacts > ECC Queue.
2. Click New.
3. Create a message with the following settings:
   • Agent: The name of the MID Server that executes the command
   • Topic: Command
   • Name: The actual command that you want to process. For Windows, this is expressed in a
     DOS command line structure. For Linux, the structure could be a bash command line entry.
   • Queue: Output
   • Payload: With proper XML tags, you can specify the command here instead of in the Name
     field. The advantage to this is that the command is not restricted by the Name field length of
     120 characters. Use the following XML format for the command:

   ```xml
   <parameters>
   <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
   </parameters>
   ```

   The MID Server takes the XML entry in the ECC Queue and processes the command-line call locally.
The STDOUT is returned to the ECC Queue as an Input queue entry.

   **Note:** The command specified through the Payload field takes precedence over the command
specified in the Name field.

Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers or write custom probes
that use the synchronized JAR file.

Role required: admin, agent_admin

The MID Server JAR File (ecc_agent_jar) table is domain separated. You can create versions of these
policies that only a MID Server from the same domain can use. For instructions, see Create domain-
specific MID server files.

   **Caution:** Attaching a JAR file with this procedure causes all MID Servers connected to the
instance to restart automatically.

1. Navigate to MID Server JAR Files.
2. Click New.
3. Complete the following fields:
   • Name: A unique and descriptive name for identifying the file in the instance.
   • Version: A version number for the file, if one is available.
   • Source: Location of the JAR file for reference purposes. Source information is not used by the
     system.
   • Description: Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner.
5. In the Attachments dialog box, click Browse and select the file you want to attach.
   The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

MID Server reports

The MID Server provides default reports so you can monitor memory and CPU usage.
These reports are available:
• MID: Avg Max Memory Percent Use Last 30 Days
• MID Host: Avg CPU Use Percent Per Last 30 Days

MID Server troubleshooting

Several resources are available for troubleshooting your MID Servers.
See the following resources in the knowledge base on Hi:
• KB0540193: Discovery and MID Server Resources
• KB0535180: Troubleshooting a MID Server that is down or not responding
• KB0535181: Troubleshooting a failed Discovery

You can also see the following video on YouTube:
• Troubleshooting a failed Discovery

Orchestration

Orchestration extends the workflow engine to manage human processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow® platform. See Activate Orchestration for details.

Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

Orchestration extends the workflow engine to manage human processes and to automate things outside of a ServiceNow instance. An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably, with best practices every time.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. This allows subject matter experts to create activities that are consumed by numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well designed orchestrations never require human intervention when automation errors arise.

Orchestration tools

Orchestration provides the ability to make calls outside of a ServiceNow instance, directly to SOAP and REST web services or to systems within an enterprise’s corporate firewall through the MID Server. Orchestration extends the workflow editor by providing these features:

- Activity packs containing ready-to-use activities.
- An activity designer that allows developers to create custom activities without having to rely on scripting.
- Ability to create activity packs using scoped applications.
- A databus for reusable data.

Systems that Orchestration can automate

Orchestration provides custom activity packs you can use to automate tasks such as employee onboarding, user access rights, server management, and managed file transfers. For example, you might use the Active Directory and Exchange activities to set up network accounts and mailboxes for new employees.
If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the Orchestration activity designer.

These are the external systems that Orchestration can automate:

- **VMware** (through vCenter)
- **Amazon EC2 instances**
- Any system presenting web services
- Windows **Active Directory**
- Microsoft **Exchange** mail servers
- Puppet Labs **Puppet** (with configuration automation)
- **Chef** (with configuration automation)
- Any system accessible from the command line
Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and
executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Introductory video

Watch the introductory Orchestration video.

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the ServiceNow platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td></td>
<td>Note:  Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>
List of Orchestration plugins

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

Note: This list does not include plugins used by Cloud Provisioning features, such as VMware or Amazon EC2.

<table>
<thead>

• Performance Analytics - Premium                  |
| Orchestration - SFTP                           | Installs the *SFTP File Transfer* activity pack. These activities manage files and directories on an SFTP server and move files from one SFTP server to another. | Orchestration                                   |
| Orchestration - SSH                            | Installs the *SSH* activity pack. These activities read, write, and copy files, and reset user passwords on Linux computers. | Orchestration                                   |
| Orchestration - System Center Configuration Manager | Installs the *System Center Configuration Manager (SCCM)* activity pack. These activities manage software deployments and collections on an SCCM server. | Orchestration                                   |
| Orchestration - Workday                        | Installs the *Workday Orchestration* activity pack. These activities change and return employee information from Workday. | Orchestration                                   |

**Activate an Orchestration workflow**

Users can activate a workflow using the Workflow Editor.

Request the Orchestration - Examples plugin to install sample Orchestration workflows on your instance. The following Orchestration example workflows are installed in an inactive state to prevent them from running unexpectedly during routine operations:

- Request Password Reset Incident
- MySQL - Get processlist

1. Navigate to Workflow Workflow Editor.
2. Select the Workflows tab in the palette and click an inactive workflow in the list. The selected workflow opens in the workflow canvas.
3. Click the menu icon and select Set Active from the context menu.
Orchestration examples

These examples demonstrate how Orchestration can be used to automate common tasks.

Active Directory automation example

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the *Active Directory activity pack* are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.
These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User (sys_user) table.

Note: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller’s IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to Workflow Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
   - Name: Sync AD User
   - Table: Global {global}
3. Click Submit.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select Edit Inputs from the context menu.
5. In the Workflow Inputs form, click New in the Variables record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. In the Custom tab, expand Custom Activities Active Directory.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow.
This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Update user data.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>The ServiceNow LDAP integration adds a reference to the LDAP server to which the user’s account is linked. To identify the LDAP server, enter the following statement: ${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Type</td>
<td>Type of AD object. In this case, the type is User, which is the default.</td>
</tr>
<tr>
<td>Object name</td>
<td>This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: ${workflow.inputs.u_user.user_name}</td>
</tr>
<tr>
<td>Object data</td>
<td>Updates the user’s account in Active Directory, if the user exists. In this example, the user’s title is updated: {“title”: “QA”}</td>
</tr>
</tbody>
</table>

10. Click Submit.

The workflow looks like this:

![Figure 316: Updating an AD user](image)

11. Attach both activity outcomes (Success and Failure) to the end point.

At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

**Note:** In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an email notification if the workflow failed to update the record.
12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Create user data.</td>
</tr>
</tbody>
</table>
| Domain controller | Same as for the update activity. \[
| Ou             | The organizational unit to which this object belongs. For the purpose of this example, you can enter OU=HQ,OU=Managed Objects                                                                  |
| Object name    | Same as for the update activity. \[
| Object data    | Creates an account with only the user name in it. For the purpose of this example, you can enter \{"givenName" : "\{workflow.inputs.u_user.first_name\}\}, \"SN" : "\{workflow.inputs.u_user.last_name\}\} \]   |

14. Click Submit.

15. Connect the Failure outcome of the Create AD Object activity to End.

For this example, we are ignoring errors. The workflow now looks like this:

![Workflow Diagram]

Figure 317: Creating an AD user

This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User (sys_user) table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.

17. Complete the Workflow Activity property form using the fields in the table.
<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Search for existing account.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
<tr>
<td>Search filter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: (samaccountname=${workflow.inputs.u_user.user_name})</td>
</tr>
</tbody>
</table>

18. Click Submit.
19. Connect the Failure outcome for the query activity to the End point. Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity.
The workflow now looks like this:

![Workflow Diagram](image)

Figure 318: Querying AD for user accounts

The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.
21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.
22. Complete the Workflow Activity properties form using the fields in the table.
### Field | Value
--- | ---
Name | Enter a logical name such as Account exists.
Advanced | Select this check box to open the Script field.
Script | For the If activity to work correctly, we must return a yes or no in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.

```javascript
var queryResults = new JSON().decode(data.get(5).output);
answer = (queryResults.length>0 ? 'yes' : 'no');
```

Note: The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.
23. Click Submit.
24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity.

This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.
Orchestration activities

Orchestration activities perform these automated tasks when added to a workflow. Orchestration automates simple or complex, multi-system tasks on remote servers that are normally done manually.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

Workflow designers can construct custom activities using the Orchestration activity designer. Activities created by the activity designer can:

- Be uploaded and shared in the ServiceNow App Store.
- Parse data from standard input formats.
- Share data between activities.
- Use versioning.

Note: Starting with the Geneva release, a number of activities were converted to use the new template format and databus offered with the activity designer. These custom activities were organized into activity packs that are easier to use than their legacy counterparts and do not require scripting. Workflows in instances upgraded to Geneva or later that use legacy activities will continue to work normally. However, all new workflows must use activities from the activity packs.

Credential tagging for Orchestration activities

Credential tagging gives an administrator more control over the credentials used in Orchestration activities.
This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential tagging interacts with **credential affinity** to determine which credentials should be used for an Orchestration activity.

**How credential tagging works**

A **business rule** called Insert Discovery Affinity (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the **ECC Queue**. This rule determines whether a credential affinity exists for the device and identifies the proper **credential_id** (the sys_id of the record in the Credentials [discovery_credentials] table) to use in the generated probe. When the platform encounters an affinity with a credential tag value defined (credential_tag in the business rule), the business rule determines if the credential referenced by the affinity has the specified tag. If it does, the business rule selects the credential_id of the tagged credential and passes that value to the probe. If the credential does not have the specified tag, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials [discovery_credentials] table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.
List of Orchestration activities

Orchestration provides the following activities for use in workflows:

A number of the Orchestration activities have been rewritten as **scoped** activities using the **activity designer** and grouped into **activity packs**. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.
Deprecated activities

Activities listed in the Orchestration - Deprecated category are all non-scoped and were written using activity definitions. Activities in this category can be used in new workflows, but their use is discouraged. Other deprecated activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. Both types of activities are listed in the table.

Note: You can duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

Table 481: Deprecated Orchestration activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Available for new workflows</strong></td>
<td></td>
</tr>
<tr>
<td>Change Service State - Powershell</td>
<td>Starts or stops a Windows service on a remote system.</td>
</tr>
<tr>
<td>File Replace String - SSH</td>
<td>Finds and replaces a string in a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>File Write - SSH</td>
<td>Writes a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Reset Linux User Password - SSH</td>
<td>Resets the password for a given user on a Linux computer.</td>
</tr>
<tr>
<td>Resolve DNS Name</td>
<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td>SNMP Query</td>
<td>Queries a SNMP device.</td>
</tr>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer, via SSH that determines if a target system is alive.</td>
</tr>
<tr>
<td><strong>Not available for new workflows</strong></td>
<td></td>
</tr>
<tr>
<td>Run Probe</td>
<td>Launches a MID Server probe on behalf of a document.</td>
</tr>
<tr>
<td>SOAP Request</td>
<td>Executes a SOAP request on a target server. This activity is replaced by the SOAP Message activity.</td>
</tr>
<tr>
<td>Run Command</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Run SCP</td>
<td>Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Run SCP activity is replaced by the Secure Copy activity.</td>
</tr>
<tr>
<td>Run Powershell</td>
<td>Executes Windows PowerShell commands on a MID Server.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.
### Table 482: Active Directory Orchestration activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.</td>
</tr>
<tr>
<td>Disable AD User Account</td>
<td>Marks a Windows Active Directory user account disabled, making it inactive.</td>
</tr>
<tr>
<td>Enable AD User Account</td>
<td>Enables a Windows Active Directory user account, making it active.</td>
</tr>
<tr>
<td>Query AD</td>
<td>Retrieves entries from the Windows Active Directory based on a search filter.</td>
</tr>
<tr>
<td>Remove AD Object</td>
<td>Deletes a user account from Windows Active Directory.</td>
</tr>
<tr>
<td>Reset AD User Password</td>
<td>Resets the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Change AD User Password</td>
<td>Changes the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Update AD Object</td>
<td>Updates a user account in Windows Active Directory.</td>

<td>Check F5 Pool</td>
<td>Checks the status of a pool to determine if it is available to accept traffic.</td>
</tr>
<tr>
<td>Delete F5 Pool</td>
<td>Deletes an F5 pool.</td>
</tr>
<tr>
<td>Add F5 Pool Member</td>
<td>Adds a member to an F5 pool.</td>
</tr>
<tr>
<td>Get F5 Pool Member</td>
<td>Returns the pool members and verifies the pool’s status.</td>
</tr>
<tr>
<td>Delete F5 Pool Member</td>
<td>Deletes an F5 pool member.</td>
</tr>
<tr>
<td>Add F5 Virtual Server</td>
<td>Adds a virtual server.</td>
</tr>
<tr>
<td>Modify F5 Virtual Server</td>
<td>Configures a virtual server assigned to an F5 pool with a irules and a vlan.</td>
</tr>
<tr>
<td>Delete F5 Virtual Server</td>
<td>Deletes a virtual server from an F5 pool.</td>
</tr>
<tr>
<td>Add F5 Profile to Virtual Server</td>
<td>Adds a profile to a virtual server assigned to an F5 pool.</td>
</tr>
</tbody>
</table>

Infoblox activities

All these activities are scoped and part of the Infoblox DDI activity pack. They do not have legacy versions.

Table 485: Infoblox Orchestration activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP Reserve IP v4 Address Range</td>
<td>Reserves an IP address range for DHCP use.</td>
</tr>
<tr>
<td>DHCP Delete IP Reservation</td>
<td>Deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.</td>
</tr>
<tr>
<td>DHCP List IP Reservations</td>
<td>Generates a list of all the DHCP range reservations on a specific InfoBlox server.</td>
</tr>
<tr>
<td>List DNS C-records</td>
<td>Retrieves all canonical (CNAME) records from a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS A-record</td>
<td>Creates a DNS A record on a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS C-Record</td>
<td>Creates a DNS canonical (CNAME) record on a specified Infoblox server.</td>
</tr>
</tbody>
</table>
## ServiceNow Helsinki Now Platform Capabilities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>List DNS Record</strong></td>
<td>Generates a list of all the DNS entries on a specific InfoBlox server.</td>
</tr>
<tr>
<td><strong>DNS Delete</strong></td>
<td>Deletes DNS records of any type from in Infoblox server, such as C and A records.</td>
</tr>
<tr>
<td><strong>IPAM Register IP Address</strong></td>
<td>Registers an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td><strong>IPAM Reserve IP Address</strong></td>
<td>Reserves an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td><strong>IPAM List IP Reservations</strong></td>
<td>Returns an array of all IP Address within the named InfoBlox Server.</td>
</tr>
<tr>
<td><strong>IPAM Delete</strong></td>
<td>Deletes an IP Address within a named InfoBlox server.</td>
</tr>
<tr>
<td><strong>Create Network</strong></td>
<td>Creates new networks on a specified Infoblox server.</td>
</tr>
<tr>
<td><strong>Get Network Details</strong></td>
<td>Retrieves the information about a specific network on an Infoblox server.</td>
</tr>
<tr>
<td><strong>Delete Network</strong></td>
<td>Deletes a network from an Infoblox server.</td>
</tr>
<tr>
<td><strong>List Registered Networks</strong></td>
<td>Retrieves all the networks associated with an Infoblox server.</td>
</tr>
</tbody>
</table>

### Microsoft Exchange activities

All Exchange Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Exchange activity pack. All previous version Exchange activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Table 486: Exchange Orchestration activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Create Address List</strong></td>
<td>Creates a new address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions.</td>
</tr>
<tr>
<td><strong>Delete Address List</strong></td>
<td>Removes an existing address list from an Exchange server.</td>
</tr>
<tr>
<td><strong>Get Address List</strong></td>
<td>Retrieves all attributes from the specified Exchange address list.</td>
</tr>
<tr>
<td><strong>Move Address List</strong></td>
<td>Moves an Exchange address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td><strong>Set Address List</strong></td>
<td>Modifies an Exchange address list.</td>
</tr>
<tr>
<td><strong>Update Address List</strong></td>
<td>Adds or removes users from the specified address list and immediately applies any cached address list changes to the server.</td>
</tr>
<tr>
<td><strong>Create Mailbox</strong></td>
<td>Creates a new Active Directory user, if that user does not already exist, and a Exchange mailbox for that user.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Delete Mailbox</strong></td>
<td>Deletes the Exchange mailbox of an Active Directory user.</td>
</tr>
<tr>
<td><strong>Disable Mailbox</strong></td>
<td>Disables the mailbox associated with a specified Active Directory account.</td>
</tr>
<tr>
<td><strong>Enable Mailbox</strong></td>
<td>Creates a new mailbox for an existing Active Directory user.</td>
</tr>
<tr>
<td><strong>Get Mailbox</strong></td>
<td>Gets the mailbox for the specified user or all mailboxes on an Exchange server.</td>
</tr>
<tr>
<td><strong>Set Mailbox</strong></td>
<td>Modifies the settings of an existing Exchange mailbox.</td>
</tr>
</tbody>
</table>

**PowerShell activities**

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. The PowerShell activities not converted to scoped activities are deprecated.

**Table 487: PowerShell Orchestration activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Install Windows App</strong></td>
<td>Installs an application on a Windows target machine.</td>

</tbody>
</table>

SSH activities

These SSH activities were rewritten as scoped activities in the Geneva release and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Deprecated category, but are still available for all workflows.

Table 489: SSH Orchestration activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Copy</td>
<td>Copies a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Read</td>
<td>Reads a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>Files Compare</td>
<td>Compares two files on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>Secure Copy</td>
<td>Copies a file from one host to another, without storing the copied file on the MID Server.</td>
</tr>
</tbody>
</table>

SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

Table 490: SFTP Orchestration activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy File</td>
<td>Copies a file from an SFTP server (source host) to another SFTP server (target host).</td>
</tr>
<tr>
<td>Create Directory</td>
<td>Creates a new directory on an SFTP server.</td>
</tr>
<tr>
<td>Get File List</td>
<td>Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).</td>
</tr>
<tr>
<td>Remove File or Directory</td>
<td>Removes a file or a directory on an SFTP server, including subdirectories, when configured.</td>
</tr>
<tr>
<td>Rename File or Directory</td>
<td>Renames a file or directory to a new name on an SFTP server.</td>
</tr>
</tbody>
</table>
### ServiceNow Helsinki Now Platform Capabilities

<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Set File Attributes</strong></td>
<td>Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.</td>
</tr>
</tbody>
</table>

### Workday activities

All these activities are scoped and part of the Workday Orchestration activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Get Employee Info</strong></td>
<td>Gets an employee’s information from Workday.</td>
</tr>
<tr>
<td><strong>Update Employee Contact</strong></td>
<td>Updates employee contact information in Workday.</td>
</tr>
<tr>
<td><strong>Update Employee Work Email</strong></td>
<td>Updates an employee’s work email address in Workday.</td>
</tr>
<tr>
<td>GlideActions</td>
<td></td>
</tr>
<tr>
<td><strong>Check User Exists</strong></td>
<td>Checks the ServiceNow sys_user table to determine if a record exists for a new employee named in a Workday onboarding notification.</td>
</tr>
<tr>
<td><strong>Create User in Users Table</strong></td>
<td>Uses the employee information returned from Workday to create a user record in the ServiceNow sys_user table.</td>
</tr>
<tr>
<td><strong>Update User in Users Table</strong></td>
<td>Uses the employee information returned from Workday to update an existing user record in the ServiceNow sys_user table.</td>
</tr>
</tbody>
</table>

### Reactivate a deprecated activity

Orchestration activities that were converted to activity packs in the Geneva release are deprecated for upgraded instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

Note: Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the data bus and input variable testing.

1. Navigate to Workflow Administration Activity Definitions.
2. In the list of activities, clear the condition Category != deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category.
This can be an arbitrary string.

6. Click Update.

The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the workflow editor.

Orchestration basic activities

This topic provides reference information on orchestration basic activities. Basic Orchestration activities are not intended for any type of special configuration.

Resolve DNS Name

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses. The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two scratchpad variables: resolved_ip and resolved_ips. If multiple IP addresses are returned, the first IP address is stored in the resolved_ip variable, and all the addresses are stored in the resolved_ips variable. If an IP address is provided instead of an FQDN, this address is output directly to both scratchpad variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

Attention: This activity is deprecated, and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the Probe activity designer.

Table 492: Resolve DNS Name input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FQDN</td>
<td>The fully qualified domain name to resolve or an IP address.</td>
</tr>
</tbody>
</table>

Run Probe

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the activity designer Probe template to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

Table 493: Run Probe input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe’s target).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

### SNMP Query

The SNMP Query activity queries an SNMP device. Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.

**Attention:** This activity is deprecated, and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the [Probe activity designer](#).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the SNMP device being queried.</td>
</tr>
<tr>
<td>OID List</td>
<td>A list of unique object identifiers used to identify SNMP devices.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script that processes the XML payload returned by the query.</td>
</tr>
</tbody>
</table>

### SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

**Attention:** This activity is deprecated and is replaced by the [SOAP Message activity](#). Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>
Test Server Alive

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol. Your ServiceNow instance must have access to a MID Server configured to use an appropriate protocol for accessing the server to run this activity.

**Attention:** This activity is deprecated, and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the [Probe activity designer](#).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port Probes</td>
<td>A comma separated list of protocols to use to check for signs of activity on the target machine (example: wmi,wins,https,ssh,http,snmp,dns)</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the target system to check.</td>
</tr>
</tbody>
</table>

SOAP Message

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server. Your instance must have access to a MID Server configured to use SOAP to run this activity.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin’s Outbound SOAP Message (sys_soap_message) table. (System Web Services Outbound SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>name1=value1, name2=value2, . . .</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and above. However, PowerShell 3.0 does not support Windows Server 2003.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see [PowerShell activity pack](#).

**HResult codes**

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.
For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the Condition value of activity.hresult = -2146022651. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

Note: This activity is deprecated and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the PowerShell activity designer.

Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>Service</td>
<td>Name of the Windows Service to start or stop. The service parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>State</td>
<td>There are two actions to select for a service state change: Start or Stop.</td>
</tr>
</tbody>
</table>

Run PowerShell activity

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the PowerShell activity designer to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

Result Values

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure

Scratchpad Entries

Information written to stdout by the executing script is captured and returned to the activity in the activity.output variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.
An example would be to run the `get-date` command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```
Hostname: $workflow.inputs.hostname
Command: get-date

// Save full output for a later processing in scratchpad variable 'currentdatetime'
workflow.scratchpad.currentdatetime = activity.output;

// Process the output and fetch the time and store it in a scratchpad variable 'time'
var time = ./*(\d\d\d\d)\d\d\d\d 1\d\d\d\d \d\d\s\d\d\s\d\d\]($computer)/exec(output):
workflow.scratchpad.time = time ? time[1] : 'No time found';
```

Figure 322: PowerShell activity

---

Note: This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in `activity.output` and available to process.

---

**Input Variables**

Table 499: Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the <code>$computer</code> variable for use in commands (see the example in the <code>Command</code> field). A PowerShell credential variable called <code>$cred</code> that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by <code>Hostname</code>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Command                      | Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is:  
  `get-wmiobject <class> -computer $computer -credential $cred`  
  If no credentials authenticate on the computer, the command runs in the context of the MID Server user.  
  You cannot run both a command and a script file. Specifying a command hides the Script file variable. |
| Sensor script                | The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.                                      |
| Script file                  | The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable.                                                                       |
| PowerShell script variables  | Additional parameters, in JSON format, used by the specified script file.                                                                                                                                     |

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

**Example**

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called myclass, the command would look like:

```
get-wmiobject $ {workflow. inputs. myclass } -computer $computer -credential $cred
```

Similarly if the variable is a scratchpad variable named myclass, the command would look like:

```
get -wmiobject $ {workflow. scratchpad. myclass } -computer $computer -credential $cred
```
SSH activities

SSH activities allow workflows to perform operations on Linux and Unix computers. Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

File Replace String activity

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer.

Note: This activity is deprecated and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the SSH activity designer.

Input variables

Table 501: File replace string input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>File</td>
<td>Name of the file in which the string is to be replaced.</td>
</tr>
<tr>
<td>Find Pattern</td>
<td>A regular expression of the text to replace</td>
</tr>
<tr>
<td>Replace String</td>
<td>The replacement string for the text found by the expression in the Find Pattern field.</td>
</tr>
<tr>
<td>Options</td>
<td>Select whether to replace only the first occurrence of the string or all occurrences.</td>
</tr>
</tbody>
</table>

File Write activity

The File Write activity writes a file on a Linux or UNIX computer.

The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the Directory field.

Note: This activity is deprecated and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the SSH activity designer.

Input variables

Table 502: File write input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>File</td>
<td>Name of the file to be written.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Behavior</td>
<td>Select one of the following behaviors:</td>
</tr>
<tr>
<td></td>
<td>• Overwrite: Creates the file if it doesn’t exist and overwrites the file if it does exist.</td>
</tr>
<tr>
<td></td>
<td>• Append: Creates the file if it doesn’t exist and appends the new content to an existing file.</td>
</tr>
<tr>
<td></td>
<td>• Create only: Creates the file if it doesn’t exist and fails if the file does exist.</td>
</tr>
<tr>
<td>Contents</td>
<td>What to write or append (depending on the behavior) to the file</td>
</tr>
</tbody>
</table>

Reset Linux User Password activity

The Reset Linux User Password activity resets the password for a given user on a Linux computer.

This activity requires that the user executing the command be able to run the `chpasswd` command and, if expiring the password immediately, to run `chage` with `sudo` privileges.

Note: This activity is deprecated and its use in new workflows is not recommended. To replace the functionality of this activity with a scoped activity, use the **SSH activity designer**.

Input variables

Table 503: Reset Linux user password input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Linux machine.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user whose password is being reset.</td>
</tr>
<tr>
<td>Password</td>
<td>New password set for this user. The password is a workflow variable that is encrypted either as a password2 field or by calling the encryption method of a Packages.com.glide.util.Encrypter object.</td>
</tr>
<tr>
<td>Force user to change password on login</td>
<td>Select the checkbox to make this password temporary and to force the named user to change the password when he logs in.</td>
</tr>
</tbody>
</table>

Run Command activity

The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

Attention: The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the **SSH provider template** in the ServiceNow® activity designer.
Input variables

Table 504: Run command input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

Run SCP activity

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

Note: This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

Input variables

Table 505: Run SCP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user’s home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the From File variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>
Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate aspects of the employee onboarding process, such as managing Active Directory accounts and creating Exchange server mailboxes. Additionally, activity packs can automate IT functions such as starting and stopping Windows servers, joining domains, and assigning IP addresses.

Starting with the Geneva release, a number of activities were converted to use the new template format and databus offered with the activity designer. These custom activities were organized into activity packs that are easier to use than their legacy counterparts and do not require scripting. Workflows in instances upgraded to Geneva or later that use legacy activities will continue to work normally. However, all new workflows must use activities from the activity packs.

Activate an activity pack

Activity packs are available by request with a subscription to Orchestration.

Role required: admin

You can request any of these activity pack plugins:

- *Orchestration - Active Directory* (com.snc.orchestration.ad)
- *Orchestration - Azure Active Directory* (com.snc.orchestration.azure.ad)
- *Orchestration - Exchange* (com.snc.orchestration.exchange)
- *Orchestration - SFTP* (com.snc.orchestration.sftp)
- *Orchestration - Infoblox DDI Activity Pack* (com.snc.orchestration.infoblox)
- *F5 Network Management activity pack* (com.snc.orchestration.f5)
- *Orchestration - SSH* (com.snc.orchestration.ssh)
- *Orchestration - PowerShell* (com.snc.orchestration.powershell)
- *Orchestration - System Center Configuration Manager* (com.snc.orchestration.sccm_mgnt)

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
3. Click Submit.

Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by an Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note: All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Powershell activity designer template, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Helsinki. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.
Input variables

Table 506: Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>UserName</td>
<td>Name of the user to add to the group.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Name of the group to which this user is added.</td>
</tr>
</tbody>
</table>

Output variables

Table 507: Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources.</td>
</tr>
</tbody>
</table>

Conditions

Table 508: Add User to Group conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Change AD User Password

The Change AD User Password activity changes the password for an Active Directory user account. This activity requires the user’s current password to run, unlike the Reset AD User Password activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the workflow editor.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.
Input variables

Table 509: Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The sAMAccountName of the Active Directory user account.</td>
</tr>
<tr>
<td>New_password</td>
<td>The new password to assign this user.</td>
</tr>
<tr>
<td>Old_password</td>
<td>The user’s current password.</td>
</tr>
</tbody>
</table>

Output variables

Table 510: Change AD User Password output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>One of the following outcomes:</td>
</tr>
<tr>
<td></td>
<td>• failure</td>
</tr>
<tr>
<td></td>
<td>• success</td>
</tr>
<tr>
<td></td>
<td>• Policy Failure</td>
</tr>
<tr>
<td></td>
<td>• Incorrect old password</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources.</td>
</tr>
<tr>
<td>hresult</td>
<td>Powershell command result.</td>
</tr>
</tbody>
</table>

Conditions

The activity provides the following conditions:

Table 511: Change AD User Password conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Password successfully reset.</td>
</tr>
<tr>
<td>Policy Failure</td>
<td>Password does not comply with the organization’s Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Create AD Object

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

### Input variables

Table 512: Create AD Object input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. Object name is also used for the name attribute in Active Directory. This behavior is available in ActiveDirectory.psm1. Whatever is passed as the Object name becomes both the sAMAccountName and the name of the new user in Active Directory.</td>
</tr>
<tr>
<td>ObjectData</td>
<td>A JSON object containing Active Directory property names and their corresponding values. For example:</td>
</tr>
</tbody>
</table>

```json
{
  "givenName" : "John",
  "SN" : "Doe",
  "title" : "Sr. Account Specialist",
  "allowLogin" : true
}
```

This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.

### Output variables

Table 513: Create AD Object output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>

<td>A Windows Active Directory object was created successfully.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Disable AD User Account

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.

Input variables

Table 515: Disable AD User Account input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Failure</td>
<td>An error occurred while attempting to disable the account. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Enable AD User Account

The Enable AD User Account activity enables a Windows Active Directory user account, making it active.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

</tr>
</tbody>
</table>

Is AD Account Locked

The Is AD Account Locked activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.

Input variables

</tr>
</tbody>
</table>

Query AD

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki and will continue to store query results in the stratchpad. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer, and stores results on the data bus rather than the stratchpad.

Input variables

Table 524: Query AD input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName,SN,title. If this field is blank, then all properties are returned.</td>
</tr>
<tr>
<td>SearchFilter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. For example, to find user accounts matching the ServiceNow input record, use: $(samaccountname=${workflow.inputs.u_user.user_name})</td>
</tr>
</tbody>
</table>
Output variables

</tr>
</tbody>
</table>

Remove AD Object

The Remove AD Object activity deletes an object from Windows Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.

</tr>
</tbody>
</table>

Reset AD User Password

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the workflow editor.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.

Input variables

</table>

Unlock AD Account

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the Is AD Account Locked activity to determine if an account is locked.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.

Update AD Object

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Helsinki. However, all new workflows must use the custom version of this activity, which was built with the Powershell activity designer.

### Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST activity designer template.

### Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

</tr>
</tbody>
</table>

Assign User License Azure AD activity

The Assign User License activity assigns an additional Office 365 software license to the named user.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.

</table>

Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.
## Input variables

Table 548: Create User input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display_name</td>
<td>Name of the Azure AD user in the accepted display format, such as jacinto.gawron.</td>
</tr>
<tr>
<td>user_principal_name</td>
<td>User principal name (UPN) in an email format. For example, you might enter <a href="mailto:jacinto.gawron@khitomer.com">jacinto.gawron@khitomer.com</a>.</td>
</tr>
<tr>
<td>mailNickname</td>
<td>User’s email alias that redirects to the user’s full address.</td>
</tr>
<tr>
<td>password</td>
<td>User’s Azure AD password. This password must be passed as a workflow input with a type of Password (2 Way Encrypted) and must meet the password policy set in Azure AD.</td>
</tr>
<tr>
<td>change_password</td>
<td>Control that requires the user to change his or her password at the next login, if set to true.</td>
</tr>
<tr>
<td>account_enabled</td>
<td>Control that sets the user’s account is enabled, if set to true.</td>

Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:
• Microsoft Exchange 2010 or 2013.
• A MID Server configured to run Powershell 2.0
• A target Exchange server in the same Active Directory domain as the instance.
• Powershell Remoting enabled on the target Exchange server.

Note: These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with the **Powershell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Note: Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must **request activation** of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the Exchange category for the activity you want to use.
Figure 3.23: Accessing custom Exchange activities

Configure MID Server for Exchange

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the Name field.
4. Right-click the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of your Exchange server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

The Optional parameters shared input variable allows you to set multivalued properties.

- To set a multivalued property, replacing any existing values, use this format: “PropertyName”:“(value1, value2, value3)”
- To add values, use this format: “PropertyName”::“+(value1, value2, value3);”
- To remove values, use this format: “PropertyName”::“-(value1, value2, value3);”
- To both add and remove values, use this format: “PropertyName”::“-(value1, value2, value3); +(value1, value2, value3);”

Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange New-AddressList command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Table 566: Create Address List input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server’s assigned domain.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the new address list to create.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. Note: When passing a switch parameter, such as ForceUpgrade, you must use the format “parameter”:“true”.</td>

Delete Address List activity

The Delete Address List activity removes an existing address list from an Exchange server. This activity implements the Microsoft Exchange Remove-AddressList command. To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list. This activity implements the Microsoft Exchange `Get-AddressList` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the `Powershell activity designer`, which gives workflow administrators the ability to store input and output variables in the `databus`.

### Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange `Move-AddressList` command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the `Update Address List` activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tbody>
</table>

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange `Set-AddressList` command.
The Exchange server caches the changes from this activity but does not immediately apply them. Use the **Update Address List** after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the workflow editor, select the Custom tab, and then navigate to **Custom Activities Exchange Address List**.

---

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **Powershell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange `Update-AddressList` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange `New-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tbody>
</table>
Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user.

Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange `Remove-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user. This activity implements the Microsoft Exchange **Enable-Mailbox** command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **Powershell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange `Get-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to `Custom Activities Exchange Mailbox`.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox.

Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange Set-Mailbox command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application **scope** and are activated by the Orchestration - F5 network management plugin, which must be **activated by request**.

ServiceNow provides custom F5 activities, built from the **REST activity template**, that you can use to perform the following tasks:

- Add, delete, or verify pools.
• Add, delete, or identify pool members.
• Add or delete virtual servers.
• Add a profile to a virtual server.
• Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST Web Service activity designer. To access the activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

REST settings

• REST message: F5 POOL Membership Management
• REST function: post

Input variables

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox WAPI REST web services to access the Infoblox GRID server.

Note: Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Supported for Infoblox:
- Web API version 2.0 for REST messages
- NIOS appliance version 7.0
Note: To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

Create a REST credential record for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server. Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

Infoblox workflows

The Infobox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:

- IPAM Register IP Address
- IPAM Reserve IP Address
- Register DNS A-Record
- Get Network Details

Table 632: Infoblox Reserve/Register IP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

**Infoblox Release IPAM Reservations**

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- [IPAM List IP Reservations](#)
- [List DNS Record](#)
- [DNS Delete](#)
- [IPAM Delete](#)

**Table 633: Infoblox Release IPAM Reservations input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

**Infoblox roles and permissions**

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

**Admin groups**

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the “About Admin Groups” section in the Infoblox NIOS Administrator Guide.

**Permission hierarchy**

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consists of specific resource permissions.
Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.
Figure 324: Infoblox permissions
Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network.

Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the REST Web Service activity designer template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>startIpAddress</td>
<td>Beginning IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>endIpAddress</td>
<td>Ending IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
</tbody>
</table>

Output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPIPAddressRange</td>
<td>Range of reserved IPv4 addresses.</td>
</tr>
<tr>
<td>error</td>
<td>Displays the message for any REST error encountered.</td>
</tr>
</tbody>
</table>

Conditions

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully reserved the specified IPv4 address range.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IPv4 address range.</td>
</tr>
</tbody>
</table>
**DHCP Delete IP Reservation activity**

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:

- [DHCP List IP Reservations](#)
- [DHCP Reserve IPv4 Address Range](#)

The DHCP activities use the [REST Web Service activity designer](#) template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to [Custom Activities Infoblox DDI DHCP](#).

### Input variables

</tr>
</tbody>
</table>
DHCP List IP Reservations activity
The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST Web Service activity designer template to manage IP addresses using an InfoBlox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

Input variables

</tbody>
</table>

Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an InfoBlox DDI Grid Server.

Use these activities to register, list, or delete DNS records managed on an InfoBlox server.
**List DNS C-records activity**

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the [REST Web Service activity designer](https:// servicenow.com) template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>restCredentials</td>

<tr>
<td>Failure</td>
<td>Activity failed to list the DNS C records.</td>
</tr>
</tbody>
</table>
Register DNS A-record activity
The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST Web Service activity designer template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

Input variables

</tbody>
</table>
Register DNS C-Record activity
The Register DNS C-Record activity creates a DNS canonical (CNAME) record on a specified Infoblox server.

The DNS activities use the REST Web Service activity designer template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

Input variables

Table 649: Register DNS C-Record input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>cname</td>
<td>The DNS canonical record to create, as expressed by the c_name value.</td>
</tr>
<tr>
<td>recordName</td>
<td>Name of the record to create.</td>
</tr>
<tr>
<td>zone</td>
<td>The DNS zone containing the canonical record to create.</td>

<td>Activity failed to create the canonical DNS record.</td>
</tr>
</tbody>
</table>

List DNS Record activity
The List DNS Record activity generates a list of all the DNS entries on a specific InfoBlox server.
The DNS activities use the REST Web Service activity designer template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully listed all the available DNS record.</td>
</tr>
</tbody>
</table>
**DNS Delete activity**

The DNS Delete activity deletes DNS records of any type from an Infoblox server, such as C and A records.

The DNS activities use the **REST Web Service activity designer** template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to **Custom Activities Infoblox DDI DNS**.

Note: It is faster to create a new record than recover one that has been deleted.

**Input variables**

</tbody>
</table>
Variable | Description
--- | ---
Failure | Activity failed to delete the specified DNS record.

Infoblox IPAM activities
The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server. Use these activities to register, reserve, list, or delete IP addresses.

**IPAM Register IP Address activity**
The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM. The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the [REST Web Service activity designer](#) template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities. To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>macAddress</td>
<td>Mac address of the computer for which this IP address is registered.</td>
</tr>
<tr>
<td>ipAddress</td>
<td>Specific IP address to register.</td>
</tr>
<tr>
<td>network</td>
<td>Address of the network containing the registered IP address.</td>
</tr>
<tr>

<td>Activity failed to register the specified IP address.</td>
</tr>
</tbody>
</table>

IPAM Reserve IP Address activity
The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/〈encrypted key〉:〈reserved ip address〉/〈view〉.

The IPAM activities use the REST Web Service activity designer template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

Input variables

</table>

**IPAM List IP Reservations activity**
The IPAM List IP Reservations activity returns an array of all IP Address within the named InfoBlox Server.

The IPAM activities use the [REST Web Service activity designer](#) template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

**Input variables**

Table 664: IPAM List IP Reservations input variables

<td>Activity failed to retrieve the list of reserved IP addresses from the Infoblox server.</td>
</tr>
</tbody>
</table>

**IPAM Delete activity**
The IPAM Delete activity deletes an IP Address within a named InfoBlox server.

The IPAM activities use the REST Web Service activity designer template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.
