**Orchestration Runtime plugin**

The Orchestration - Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration - Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration - Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor, which gives users access to custom activities for their applications and allows them to reuse data from the databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.
Dependencies

The Orchestration - Runtime plugin is activated by these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

Access to activities

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Activity designer components on page 1359.
Activate an Orchestration workflow

Users can activate a workflow using the Workflow Editor.

Request the Orchestration - Examples plugin to install sample Orchestration workflows on your instance. The following Orchestration example workflows are installed in an inactive state to prevent them from running unexpectedly during routine operations:

- Request Password Reset Incident
- MySQL - Get processlist

1. Navigate to Workflow Workflow Editor.
2. Select the Workflows tab in the palette and click an inactive workflow in the list.
   The selected workflow opens in the workflow canvas.
3. Click the menu icon and select Set Active from the context menu.

Figure 310: Activating a workflow

Orchestration examples

These examples demonstrate how Orchestration can be used to automate common tasks.
Active Directory automation example

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the Active Directory activity pack on page 1219 are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User [sys_user] table.

Note: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller’s IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to Workflow Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
   - Name: Sync AD User
   - Table: Global [global]
3. Click Submit.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select Edit Inputs from the context menu.
5. In the Workflow Inputs form, click New in the Variables record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click Submit.

7. In the Custom tab, expand Custom Activities Active Directory.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow. This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Update user data.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement: <code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
<tr>
<td>Type</td>
<td>Type of AD object. In this case, the type is User, which is the default.</td>
</tr>
<tr>
<td>Object name</td>
<td>This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: <code>${workflow.inputs.u_user.user_name}</code></td>
</tr>
<tr>
<td>Object data</td>
<td>Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated: <code>{&quot;title&quot;: &quot;QA&quot;}</code></td>
</tr>
</tbody>
</table>

10. Click Submit.

The workflow looks like this:

Figure 312: Updating an AD user

11. Attach both activity outcomes (Success and Failure) to the end point.
At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

**Note:** In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an email notification if the workflow failed to update the record.

12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Create user data.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>Same as for the update activity. ${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Ou</td>
<td>The organizational unit to which this object belongs. For the purpose of this example, you can enter OU=HQ,OU=Managed Objects</td>
</tr>
<tr>
<td>Object name</td>
<td>Same as for the update activity. ${workflow.inputs.u_user.user_name}</td>
</tr>
<tr>
<td>Object data</td>
<td>Creates an account with only the user name in it. For the purpose of this example, you can enter {&quot;givenName&quot;: &quot;${workflow.inputs.u_user.first_name}&quot;, &quot;SN&quot;: &quot;${workflow.inputs.u_user.last_name}&quot; }</td>
</tr>
</tbody>
</table>

14. Click Submit.

15. Connect the Failure outcome of the Create AD Object activity to End.

For this example, we are ignoring errors. The workflow now looks like this:
This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User [sys_user] table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.
17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Search for existing account.</td>
</tr>
<tr>
<td>Domain controller</td>
<td><code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
<tr>
<td>Search filter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: (samaccountname= <code>${workflow.inputs.u_user.user_name}</code>)</td>
</tr>
</tbody>
</table>

18. Click Submit.
19. Connect the Failure outcome for the query activity to the End point.
   Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity. The workflow now looks like this:

![Workflow Diagram]

Figure 314: Querying AD for user accounts

The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Account exists.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the Script field.</td>
</tr>
</tbody>
</table>
For the If activity to work correctly, we must return a yes or no in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.

```javascript
var queryResults = JSON().decode(data.get(5).output);
answer = (queryResults.length > 0 ? 'yes' : 'no');
```

**Note:** The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.
23. Click Submit.

24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.

25. Create a transition from the No outcome of the If activity to the Create AD Object activity.

This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.
Orchestration activities perform these automated tasks when added to a workflow.

Orchestration automates simple or complex, multi-system tasks on remote servers that are normally done manually.

For instructions on using activities to construct a workflow, see Add an activity to a workflow on page 2815.

Workflow designers can construct custom activities using the Orchestration activity designer. Activities created by the activity designer can:

- Be uploaded and shared in the ServiceNow App Store.
- Parse data from standard input formats.
- Share data between activities.
- Use versioning.

**Note:** A number of activities have been converted to use the new template format and databus offered with the activity designer. These custom activities are organized into activity packs that are easier to use than their legacy counterparts and do not require scripting. Workflows in upgraded instances that use legacy activities will continue to work normally. However, all new workflows must use activities from the activity packs.

Credential tagging for Orchestration activities

Credential tagging gives an administrator more control over the credentials used in Orchestration activities.
This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential tagging interacts with *credential affinity* to determine which credentials should be used for an Orchestration activity.

**How credential tagging works**

A *business rule* called Insert Discovery Affinity (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper credential_id (the sys_id of the record in the Credentials [discovery_credentials] table) to use in the generated probe. When the platform encounters an affinity with a credential tag value defined (credential_tag in the business rule), the business rule determines if the credential referenced by the affinity has the specified tag. If it does, the business rule selects the credential_id of the tagged credential and passes that value to the probe. If the credential does not have the specified tag, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials [discovery_credentials] table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.
Figure 317: Orchestration credential tagging logic

List of Orchestration activities

Orchestration provides the following activities for use in workflows:

A number of the Orchestration activities have been rewritten as scoped activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.
Deprecation activities

These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Probe</td>
<td>Launches a MID Server probe on behalf of a document.</td>
</tr>
<tr>
<td>SOAP Request</td>
<td>Executes a SOAP request on a target server. This activity is replaced by the SOAP Message activity.</td>
</tr>
<tr>
<td>Run Command</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Run SCP</td>
<td>Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Run SCP activity is replaced by the Secure Copy activity.</td>
</tr>
<tr>
<td>Run Powershell</td>
<td>Executes Windows PowerShell commands on a MID Server.</td>
</tr>
</tbody>
</table>

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to determine if the target system is alive.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.</td>

<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td><strong>SNMP Query</strong></td>
<td>Queries a SNMP device.</td>
</tr>
</tbody>
</table>

### SCCM activities

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add to Device Collection</strong></td>
<td>Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td><strong>Add to User Collection</strong></td>
<td>Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
<tr>
<td><strong>Get Applications</strong></td>
<td>Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td><strong>Get Deployments</strong></td>
<td>Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td><strong>Get Device Collections</strong></td>
<td>Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td><strong>Get User Collections</strong></td>
<td>Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td><strong>Remove from Device Collection</strong></td>
<td>Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td><strong>Remove from User Collection</strong></td>
<td>Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
</tbody>
</table>

### SSH activities

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File Copy</strong></td>
<td>Copies a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td><strong>File Read</strong></td>
<td>Reads a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td><strong>File Write</strong></td>
<td>Writes a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td><strong>File Replace String</strong></td>
<td>Finds and replaces a string in a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td><strong>Files Compare</strong></td>
<td>Compares two files on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td><strong>Reset Linux User Password</strong></td>
<td>Resets the password for a given user on a Linux computer.</td>
</tr>
</tbody>
</table>
### SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Copy File</strong></td>
<td>Copies a file from an SFTP server (source host) to another SFTP server (target host).</td>
</tr>
<tr>
<td><strong>Create Directory</strong></td>
<td>Creates a new directory on an SFTP server.</td>
</tr>
<tr>
<td><strong>Get File List</strong></td>
<td>Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).</td>
</tr>
<tr>
<td><strong>Remove File or Directory</strong></td>
<td>Removes a file or a directory on an SFTP server, including subdirectories, when configured.</td>
</tr>
<tr>
<td><strong>Rename File or Directory</strong></td>
<td>Renames a file or directory to a new name on an SFTP server.</td>
</tr>
<tr>
<td><strong>Set File Attributes</strong></td>
<td>Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.</td>
</tr>
</tbody>
</table>

### Workday activities

All these activities are scoped and part of the Workday Orchestration activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Get Employee Info</strong></td>
<td>Gets an employee's information from Workday.</td>
</tr>
<tr>
<td><strong>Update Employee Contact</strong></td>
<td>Updates employee contact information in Workday.</td>
</tr>
<tr>
<td><strong>Update Employee Work Email</strong></td>
<td>Updates an employee's work email address in Workday.</td>
</tr>
<tr>
<td>GlideActions</td>
<td></td>
</tr>
<tr>
<td><strong>Check User Exists</strong></td>
<td>Checks the ServiceNow sys_user table to determine if a record exists for a new employee named in a Workday onboarding notification.</td>
</tr>
<tr>
<td><strong>Create User in Users Table</strong></td>
<td>Uses the employee information returned from Workday to create a user record in the ServiceNow sys_user table.</td>
</tr>
<tr>
<td><strong>Update User in Users Table</strong></td>
<td>Uses the employee information returned from Workday to update an existing user record in the ServiceNow sys_user table.</td>
</tr>
</tbody>
</table>
Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

**Note:** Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the `databus` and input variable testing.

1. Navigate to Workflow Administration Activity Definitions.
2. In the list of activities, clear the condition Category != deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category. This can be an arbitrary string.
6. Click Update.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the workflow editor.

Orchestration basic activities

This topic provides reference information on orchestration basic activities. Basic Orchestration activities are not intended for any type of special configuration.

**Run Probe**

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the activity designer `Probe template` to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Source for probe</th>
<th>Enter the IP address of the host system against which the probe runs (the probe's target).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

### SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

**Attention:** This activity is deprecated and is replaced by the *SOAP Message workflow activity* on page 1209 activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

### Table 484: SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

### SOAP Message workflow activity

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP

### Input variables

### Table 485: SOAP Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. ( System Web Services Outbound SOAP Message )</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
</tbody>
</table>
| Variables            | variables          | Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string:  

name1=value1,  
name2=value2, . . .

If either the name or value contains a comma or equal sign, escape these characters with a backslash. |
| Use MID Server        | use_midserver      | Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server. |
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>use_midserver parameter is disabled. No: This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can only select a specific MID Server in the legacy SOAP message activity and REST messages. These legacy activities do not use the MID</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Server selection criteria available starting with the Istanbul release.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

### PowerShell activities

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see [PowerShell activity pack](#) on page 1296.

### HResult codes

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the Condition value of activity.hresult = -2146022651. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.
Run PowerShell activity

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the *PowerShell activity designer* to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

**Result Values**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure

**Scratchpad Entries**

Information written to stdout by the executing script is captured and returned to the activity in the `activity.output` variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the `get-date` command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```powershell
get-date
```

// Save full output for a later processing in a scratchpad variable 'currentdatetime'
workflow_scratchpad.currentdatetime = activity.output;

// Process the output and fetch the time and store it in a scratchpad variable 'time'
var time = get-date.systime().tostring();
workflow_scratchpad.time = time[1] + 'No time found';

**Figure 318: PowerShell activity**
Note: This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.

### Input Variables

#### Table 486: Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the $computer variable for use in commands (see the example in the Command field). A PowerShell credential variable called $cred that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
</tbody>
</table>
| Command          | Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is:  
get-wmiobject <class> -computer $computer -credential $cred  
If no credentials authenticate on the computer, the command runs in the context of the MID Server user.  
You cannot run both a command and a script file. Specifying a command hides the Script file variable. |
| Sensor script    | The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error. |
| Script file      | The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable. |
| PowerShell script variables | Additional parameters, in JSON format, used by the specified script file. |

### States

The activity state tells the workflow engine what to do with the activity.
Add workflow variables for the command line using the normal workflow variable syntax.
In the example above, if the `<class>` was in a workflow input variable called `myclass`, the command would look like:

```
get-wmiobject $ {workflow. inputs. myclass } -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named `myclass`, the command would look like:

```
get -wmiobject $ {workflow. scratchpad. myclass } -computer $computer -credential $cred
```

### SSH activities

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

### Run Command activity

The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

**Attention:** The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the **SSH provider template** in the ServiceNow® activity designer.

### Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

**Run SCP activity**

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

**Note:** This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom [Secure Copy activity](page 1343) replaces the Run SCP activity in the Geneva release.

**Input variables**

**Table 489: Run SCP input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the From File variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>

**Orchestration activity packs**

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate a number of common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Additionally, activity packs can automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.
Note: A number of activities have been converted to use the new template format and databus offered with the activity designer. These custom activities are organized into activity packs that are easier to use than their legacy counterparts and do not require scripting. Workflows in upgraded instances that use legacy activities will continue to work normally. However, all new workflows must use activities from the activity packs.

Activate an activity pack

Activity packs are available by request with a subscription to Orchestration.

Role required: admin

You can request any of these activity pack plugins:

- Orchestration - Active Directory (com.snc.orchestration.ad)
- Orchestration - Azure Active Directory (com.snc.orchestration.azure.ad)
- Orchestration - Exchange (com.snc.orchestration.exchange)
- Orchestration - SFTP (com.snc.orchestration.sftp)
- Orchestration - Infoblox DDI Activity Pack (com.snc.orchestration.infoblox)
- F5 Network Management activity pack on page 1264 (com.snc.orchestration.f5)
- Orchestration - SSH (com.snc.orchestration.ssh)
- Orchestration - PowerShell (com.snc.orchestration.powershell)
- Orchestration - System Center Configuration Manager (com.snc.orchestration.sccm_mgnt)

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Global activity pack

The Global activity pack contains Orchestration activities that are created in the global scope.
Any activities you create in the global scope are listed in the Global category in the Packs and Custom tabs of the Workflow Editor.

**Note:** The Global activity pack is included with the base Orchestration plugin and does not require activation of any other plugin.
Test Server Alive activity

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol. This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity designer on page 1502, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_probes</td>
<td>A comma separated list of protocols to use to check for signs of activity on the target machine (example: wmi,wins,https,ssh,http,https,snmp,dns)</td>
</tr>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target system to check.</td>
</tr>
</tbody>
</table>

Output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alive</td>
<td>Code that indicates whether or not the server is alive. If any value but ‘1’ is returned, the server is not alive.</td>
</tr>
</tbody>
</table>

Conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity determined that the device is running.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.</td>
</tr>
</tbody>
</table>
Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by a Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note: All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Powershell activity designer template, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.
Input variables

Table 493: Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>UserName</td>
<td>Name of the user to add to the group.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Name of the group to which this user is added.</td>
</tr>
</tbody>
</table>

Output variables

Table 494: Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 1381.</td>
</tr>
</tbody>
</table>

Conditions

Table 495: Add User to Group conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user’s current password to run, unlike the Reset AD User Password activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the workflow editor.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1445.
Input variables

Table 496: Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The sAMAccountName of the Active Directory user account.</td>
</tr>
<tr>
<td>New_password</td>
<td>The new password to assign this user.</td>
</tr>
<tr>
<td>Old_password</td>
<td>The user's current password.</td>
</tr>
</tbody>
</table>

Output variables

Table 497: Change AD User Password output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>One of the following outcomes:</td>
</tr>
<tr>
<td></td>
<td>• failure</td>
</tr>
<tr>
<td></td>
<td>• success</td>
</tr>
<tr>
<td></td>
<td>• Policy Failure</td>
</tr>
<tr>
<td></td>
<td>• Incorrect old password</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 1381.</td>
</tr>
<tr>
<td>hresult</td>
<td>Powershell command result.</td>
</tr>
</tbody>
</table>

Conditions

The activity provides the following conditions:

Table 498: Change AD User Password conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Password successfully reset.</td>
</tr>
<tr>
<td>Policy Failure</td>
<td>Password does not comply with the organization's Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>
Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory. This activity fails if it finds an existing object with matching input variables.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1445.

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. Object name is also used for the nameattribute in Active Directory. This behavior is available in ActiveDirectory.psm1. Whatever is passed as the Object name becomes both the sAMAccountName and the name of the new user in Active Directory.</td>
</tr>
</tbody>
</table>
Variable | Description
---|---
ObjectData | A JSON object containing Active Directory property names and their corresponding values. For example:

```json
{
  "givenName" : "John",
  "SN" : "Doe",
  "title" : "Sr. Account Specialist",
  "allowLogin" : true
}
```

This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.

Output variables

</thead>
<tbody>
<tr>
<td>Success</td>
<td>A Windows Active Directory object was created successfully.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.
Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1445.

</table>

### Is AD Account Locked activity

The *Is AD Account Locked* activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the *Unlock AD User Account* activity.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after
upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1445.

### Input variables

</tr>
</tbody>
</table>

**Query AD activity**

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to
work normally after upgrading to Istanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1445, which stores input and output variables in the *databus* instead of the scratchpad.

### Input variables

**Table 511: Query AD input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName,SN,title. If this field is blank, then all properties are returned.</td>
</tr>
<tr>

</tbody>
</table>
Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory. If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the workflow editor.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer* on page 1445.

Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the Is AD Account Locked activity on page 1225 activity to determine if an account is locked.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer on page 1445.

### Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the [Run PowerShell activity](#) instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the [PowerShell activity designer](#) on page 1445.

### Input variables

Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST activity designer template.

Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer on page 1463 template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

**Get User Info Azure AD activity**

The Get User Info activity returns the named user's information from the Azure Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer on page 1463 template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

### Input variables

**Table 541: Check If User Exists input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <a href="mailto:someuser@a830edad9050849NDA1.onmicrosoft.com">someuser@a830edad9050849NDA1.onmicrosoft.com</a>.</td>
</tr>
</tbody>
</table>

### Output variables

**Table 542: Check If User Exists output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
</tbody>
</table>
### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| user_info | The user_info array contains attributes that can be leveraged by other activities as inputs. For example, the user objectid output (GUID) can be passed to the Add User to Group activity as the user_id input.  
- objectid: User's Azure AD identifier.  
- accountEnabled: Boolean variable indicating whether the user's account is active or inactive.  
- displayName: Users display name, such as jacinto.gawron.  
- userPrincipalName: User's name in email format, such as jacinto.gawron@wammo.com.  
- mailNickname: User's email alias. |

### Conditions

Table 543: Check If User Exists conditions

<table>
<thead>
<tr>

<tr>
<td>User does not exist</td>
<td>Activity was unable to find the named user in the customer's tenant domain.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

### Remove User from Group Azure AD activity

The Remove User from Group activity removes an existing user from a security group in Azure Active Directory.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer on page 1463 template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

### Input variables

Table 544: Remove User from Group input variables

<table>
<thead>

</tr>
</tbody>
</table>

### Remove User License Azure AD activity

The Remove User License activity revokes the specified Office 365 software license for the named user.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer on page 1463 template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.
Input variables

</table>

Reset User Password Azure AD activity

The Reset User Password activity changes the named user's Azure Active Directory password. The Azure password policy imposes constraints on the complexity, length, and re-use of a password.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Azure AD. This activity was built with the REST Web Service activity designer on page 1463 template.
Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

</tbody>
</table>
Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

• Microsoft Exchange 2010 or 2013.
• A MID Server configured to run Powershell 2.0
• A target Exchange server in the same Active Directory domain as the instance.
• Powershell Remoting enabled on the target Exchange server.

Note: These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

Note: Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the Exchange category for the activity you want to use.
Configure MID Server for Exchange

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the Name field.
4. Right-click the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of your Exchange server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format. The Optional parameters shared input variable allows you to set multivalued properties.

- To set a multivalued property, replacing any existing values, use this format: "PropertyName":"(value1, value2, value3)"
- To add values, use this format: "PropertyName":"+(value1, value2, value3);"
- To remove values, use this format: "PropertyName":"-(value1, value2, value3);"
- To both add and remove values, use this format: "PropertyName":"-(value1, value2, value3);+(value1, value2, value3);"

Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange New-AddressList command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-------------</td>
<td>----------------</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the new address list to create.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. <strong>Note:</strong> When passing a switch parameter, such as ForceUpgrade, you must use the format &quot;parameter&quot;:&quot;true&quot;.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

**Delete Address List activity**

The Delete Address List activity removes an existing address list from an Exchange server. This activity implements the Microsoft Exchange `Remove-AddressList` command.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list. This activity implements the Microsoft Exchange `Get-AddressList` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

### Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange *Move-AddressList* command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the *Update Address List* activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

</tbody>
</table>
Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange Set-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange `Update-AddressList` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

### Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange `New-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the `PowerShell`
activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

</tr>
</tbody>
</table>

Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user.

Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange Remove-Mailbox command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.
Input variables

Table 574: Delete Mailbox input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
<tr>
<td>user</td>
<td>Active Directory user to delete. The activity passes this value to Exchange as the Identity Exchange variable.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.</td>
</tr>
</tbody>
</table>

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format “parameter”: “true”.

Output variables

</table>

### Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange **Disable-Mailbox** command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer** on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

### Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange `Enable-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated
activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange *Get-Mailbox* command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1445, which gives workflow administrators the ability to store input and output variables in the *databus*.

</tbody>
</table>

Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox. Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange `Set-Mailbox` command.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Exchange Mailbox.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

### F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

#### Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST Web Service activity designer on page 1463. To access the activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

#### REST settings

- REST message: F5 POOL Membership Management
- REST function: post

#### Input variables

#### Table 589: Add F5 Pool Member input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as testPool.</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
</tbody>
</table>
### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MemberName</td>
<td>Pool member IP address and port, such as 192.168.2.19:80.</td>
</tr>
</tbody>
</table>

#### Output variables

<td>Activity successfully added an F5 load balancer pool member.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to add an F5 load balancer pool member.</td>
</tr>
</tbody>
</table>

**Get F5 Pool Member activity**

The Get F5 Pool Member activity returns the pool members and verifies the pool's status.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST Web Service activity designer on page 1463. To access the activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Active Directory.

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox WAPI REST web services to access the Infoblox GRID server.

**Important:** Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Supported for Infoblox:
- Web API version 2.0 for REST messages
- NIOS appliance version 7.0

**Note:** To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before starting this procedure, make sure you have the following:
- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

Infoblox workflows

The Infobox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:
- **IPAM Register IP Address**
• **IPAM Reserve IP Address**
• **Register DNS A-Record**
• **Get Network Details**

### Table 619: Infoblox Reserve/Register IP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

### Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- **IPAM List IP Reservations**
- **List DNS Record**
- **DNS Delete**
- **IPAM Delete**

### Table 620: Infoblox Release IPAM Reservations input variables

<table>

<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

### Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

#### Admin groups

There are three types of admin groups on an Infoblox server:

- **Superuser**
To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the “About Admin Groups” section in the Infoblox NIOS Administrator Guide.

**Permission hierarchy**

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consists of specific resource permissions.

**Required permissions**

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.
Figure 321: Infoblox permissions
Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network.

Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the **REST Web Service activity designer** on page 1463 template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

**Input variables**

**Table 621: DHCP Reserve IP v4 Address Range input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>startIpAddress</td>
<td>Beginning IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>endIpAddress</td>
<td>Ending IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys._id of the REST credentials from the ServiceNow instance.</td>
</tr>
</tbody>
</table>

**Output variables**

**Table 622: DHCP Reserve IP v4 Address Range output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPIpAddressRange</td>
<td>Range of reserved IPv4 addresses.</td>
</tr>
<tr>

### Variable Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IPv4 address range.</td>
</tr>
</tbody>
</table>

### DHCP Delete IP Reservation activity

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:
- [DHCP List IP Reservations](#)
- [DHCP Reserve IPv4 Address Range](#)

The DHCP activities use the [REST Web Service activity designer](#) on page 1463 template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

#### Input variables

**Table 624: DHCP Delete IP Reservation input variables**

<td>Activity failed to delete the specified IP address range.</td>
</tr>
</tbody>
</table>

**DHCP List IP Reservations activity**

The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST Web Service activity designer on page 1463 template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DHCP.

## Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server.

Use these activities to register, list, or delete DNS records managed on an Infoblox server.

### List DNS C-records activity

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST Web Service activity designer on page 1463 template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

## Input variables

<td>Activity failed to list the DNS C records.</td>
</tr>
</tbody>
</table>

Register DNS A-record activity

The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST Web Service activity designer on page 1463 template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

**Input variables**

<table>
<thead>
<tr>

Register DNS C-Record activity

The Register DNS C-Record activity creates a DNS canonical (CNAME) record on a specified Infoblox server.

The DNS activities use the REST Web Service activity designer on page 1463 template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

</tr>
</tbody>
</table>

List DNS Record activity

The List DNS Record activity generates a list of all the DNS entries on a specific InfoBlox server.

The DNS activities use the REST Web Service activity designer on page 1463 template to manage DNS records using an InfoBlox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities InfoBlox DDI DNS.

</tbody>
</table>

**DNS Delete activity**

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the REST Web Service activity designer on page 1463 template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI DNS.

**Note:** It is faster to create a new record than recover one that has been deleted.

Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server. Use these activities to register, reserve, list, or delete IP addresses.

IPAM Register IP Address activity

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.
The IPAM activities use the *REST Web Service activity designer* on page 1463 template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

**Input variables**

**IPAM Reserve IP Address activity**

The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM.
The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the REST Web Service activity designer on page 1463 template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI IPAM.

</table>
Infoblox network activities

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.

Create Network activity

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the [REST Web Service activity designer](#) on page 1463 template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI Network.

**Input variables**

Table 657: Create Network input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>network</td>
<td>Address of the network to create.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
</tbody>
</table>

**Output variables**

Table 658: Create Network output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkCreated</td>
<td>Address of the network created.</td>
</tr>
<tr>
<td>error</td>
<td>Displays the message for any REST error encountered.</td>
</tr>
</tbody>
</table>

**Conditions**

Table 659: Create Network conditions

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully created the network.</td>
</tr>
</tbody>
</table>
Get Network Details activity
The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the REST Web Service activity designer on page 1463 template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI Network.

Input variables

Table 660: Get Network Details input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>network</td>
<td>Address of the network whose details you want to see.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
</tbody>
</table>

Output variables

The output variables from this activity are objects on the Infoblox server used to identify network details. For more information, refer to the Infoblox documentation.

Table 661: Get Network Details output variables

<td>Activity failed to retrieve network details from the Infoblox server.</td>
</tr>
</tbody>
</table>

*Delete Network activity*

The Delete Network activity deletes a network from an Infoblox server.

The network activities use the *REST Web Service activity designer* on page 1463 template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Infoblox DDI Network.
Input variables

Table 663: Delete Network input variables

</table>

PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the `databus`. 

**Note:** Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the workflow editor on the Custom tab. Expand the Custom Activities tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

### PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

#### Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- **Managed objects and WMI providers:** A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.
- **WMI infrastructure:** The WMI infrastructure is a Microsoft Windows operating system component known as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as root\default, root\cimv2, and root\subscription, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.
- **WMI consumers:** A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

**WMI installation and configuration**

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

#### Windows Remote Management (WinRM)

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API:** This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service:** The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as Win32_Process.

**WinRM configuration**
WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter winrm quickconfig. This command is not case sensitive.

2. When the console displays Make these changes [y/n]?, enter y.

   The winrm quickconfig command performs the following operations:
   • Starts the WinRM service, and sets the service startup type to auto start.
   • Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
   • Creates a firewall exception for the current user profile.

**MID Server PowerShell files**

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell

**PSScript.ps1**

This script performs a number of tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the credential.psm1 module for testing access to remote hosts.

The PowerShell variables are generally used directly in the **PowerShell execution command** or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as credType.
### Figure 322: Using credType in execution parameters

#### General

- **Target host**: $(activityInput.sccmServer)
- **Script type**: MID Server script file
- **MID Server script file**: AddToDeviceCollection.ps1

#### Execution Command

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>$(activityInput.collection)</td>
<td>Plain</td>
</tr>
<tr>
<td>device</td>
<td>$(activityInput.device)</td>
<td>Plain</td>
</tr>
<tr>
<td>credType</td>
<td>SCCM</td>
<td>Plain</td>
</tr>
</tbody>
</table>

#### Credential tag

- **Required MID Server capabilities**: PowerShell

---

© 2018 ServiceNow. All rights reserved.
These are the possible credential types:

### Table 669: PowerShell credTypes

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

### Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

### Table 670: PSScript.ps1 exit codes

<table>
<thead>
<tr>
<th>Type</th>
<th>Test function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PowerShell command/script ran successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Test finished successfully, but the command/script failed to execute.</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect syntax passed to script.</td>
</tr>
<tr>
<td>3</td>
<td>All credentials including MID Server service account failed to execute the command/script.</td>
</tr>
<tr>
<td>4</td>
<td>Passed test and executed the activity, but an error was returned. Example user cannot be found.</td>
</tr>
</tbody>
</table>

### Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (credType) defined. All ServiceNow® authored PowerShell activities are hardcoded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

### Table 671: PowerShell test functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the Get-WMI object.</td>
</tr>
</tbody>
</table>
### Function Table

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentilAD</td>
<td>Tests the given user and password on the target host using the built-in DirectoryEntry object.</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the Get-WMI object. This test is used when no credType is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
Figure 323: PowerShell credential selection criteria
ActiveDirectory.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Active Directory activity pack.

Exchange.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack

SCCM.psm1

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

Set up credential tags for a PowerShell activity

Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

Role required: admin, activity_creator or workflow_admin

Tagging is useful when the activity requires specific credentials to perform a task. By populating the Credential tag field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the SCCMCred tag and have it point to both a development and test instance.

1. Navigate to Orchestration Credentials.
2. Select the credential you want to tag.
3. Enter a unique name in the Tag field that is descriptive of the credentials purpose.
4. Click Update.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the Credential tag field.

Figure 324: Credential tag definition
PowerShell troubleshooting

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

Figure 326: Authentication error message

Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create accounts on Active Directory

Validate that the account you are using has the proper permissions to run the activity.

1. Log on to the target machine using the account under which you want to run the activity. Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.

If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

- User name is invalid.
- Password entered incorrectly.
- Domain controller is unreachable.

Note: The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.
An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create mailboxes on the Exchange server

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the New-mailbox Exchange commandlet.
If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs.

Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

**Note:** Ensure that the error is NOT WinRM cannot process the request.

Remote Procedure Call (RPC) server unavailable or access denied

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

**Possible causes of error**

The target host might have one of these issues:

- WinRM isn’t configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.
Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Response

---

Authenticate failure with the local MID server service credential.

---

Figure 328: Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of 1.

```plaintext
Running command: "C:\Windows\System32\WindowsPowerShell\v1.0\powershell.exe -executionpolicy remotescript.ps1 -computer '10.11.129.140' -script 'C:\users\joel.zamalloa.adm\desktop\x.ps1' -useCred True -isDiscovery $false -debug True; exit $LASTEXITCODE"

Attempting to use credential with username 'service-now\joel.zamalloa'.

Running command: C:\Windows\System32\WindowsPowerShell\v1.0\powershell.exe -executionpolicy remotescript.ps1 -computer '10.11.129.140' -script 'C:\users\joel.zamalloa.adm\desktop\x.ps1' -useCred True -isDiscovery $false -debug True; exit $LASTEXITCODE"

Thread name is Powershell.exe is executing...

Figure 329: MID Server error code

The exit value from waitfor() is 1.

The status code returned from running the command is 1. Windows credentials all failed... Attempting to use the credential from the local MID server.
```
Join Domain activity

The Join Domain activity joins a Windows computer to a domain. If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

**Table 672: Join Domain input variables**

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server that is joining the domain.</td>
</tr>
<tr>
<td>Domain</td>
<td>Name of the domain to join.</td>
</tr>
<tr>
<td>Domain_user</td>
<td>The name of a user who has domain administration privileges or privileges to join a computer to the domain.</td>
</tr>
<tr>
<td>Domain_user_password</td>
<td>The password for the user who has domain administration privileges or privileges to join a computer to the domain.</td>
</tr>
</tbody>
</table>

### Output variables

</tbody>
</table>

## Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

## Input variables

### Table 675: Install Windows App input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS MID Server capability to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installerpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as winzip150.msi. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0. These arguments are dependent on what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>
</table>
Output variables

<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources</td>
</tr>
</tbody>
</table>

Conditions

The activity state tells the workflow engine what to do with the activity.

Table 677: Install Windows App conditions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Windows application was successfully installed on the target machine.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine</td>
</tr>
</tbody>
</table>

Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

Note: See WMI Providers for a list of Windows operating systems that provide this tool by default.

1. Open the Control Panel.
2. Go to Add or Remove Programs.
3. Select Add/Remove Windows Components.
   This action opens a secondary window displaying additional selections.
5. Select WMI Windows Installer Provider check box.
6. Click OK to return to the Windows Components Wizard window.
7. Click Next.
   You might be asked for the Windows installation CD to complete this process.
Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer on page 1445, which gives workflow administrators the ability to store input and output variables in the databus.

Input Variables

Table 678: Change Service State input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The service parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: StartService or StopService.</td>
</tr>
</tbody>
</table>

Output variables

<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>
Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer** on page 1445, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Input variables**

**Table 681: Restart Windows Server input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server to restart.</td>

Uninstall Windows App activity

The Uninstall Windows App activity uninstalls an application from a Windows target machine.
The only applications that can be uninstalled using this activity are those that were installed by a Windows Installer.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer* on page 1445, which gives workflow administrators the ability to store input and output variables in the *databus*.

### Input variables

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Probe activity designer on page 1502, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: resolved_ip and resolved_ips. If multiple IP addresses are returned, the first IP address is stored in the resolved_ip variable, and all the addresses are stored in the resolved_ips variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity designer on page 1502, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Table 687: Resolve DNS Name input variables

SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity. This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity designer on page 1502, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

### SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:
- SCCM 2012 R2.
- Powershell 3.0.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM cmdlet library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

### Activate SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution [com.snc.orchestration.sccm_mgnt] plugin is activated, but can be activated separately.

**Note:** The activities in the SCCM plugin run in the System Center Configuration Manager scope.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
### Istanbul

#### ServiceNow

#### Now Platform Capabilities

<table>
<thead>
<tr>
<th>Specify the date and time you would like this plugin to be enabled</th>
<th>Date and time must be at least 2 business days from the current time.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.</td>
<td></td>
</tr>
</tbody>
</table>

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

---

## Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Role required:** admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select `eth0` or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

---

## Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the *PowerShell activity designer* on page 1445 template to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToDeviceCollection.ps1` to edit the collection.

To access this activity in the workflow editor, select the Custom tab, and then navigate to **Custom Activities** System Center Configuration Manager (SCCM).

**Note:** The Add to Device Collection activity does not use pre-processing or post processing scripts.

</table>

Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the PowerShell activity designer on page 1445 template to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called AddToUserCollection.ps1 to edit the collection.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

Note: The Add to User Collection activity does not use pre-processing or post processing scripts.
Input variables

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the PowerShell activity designer on page 1445 template to access the applications on the SCCM server. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called GetApplications.ps1. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).
Note: The Get Applications activity does not use a pre-processing script.

**Input variables**

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

The Get Deployments activity uses the *PowerShell activity designer* on page 1445 template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetDeployments.ps1 that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

*Note:* The Get Deployments activity does not use pre-processing scripts.

### Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the *PowerShell activity designer* on page 1445 template to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetUserCollections.ps1 that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities System Center Configuration Manager (SCCM).

**Note:** The Get User Collections activity does not use pre-processing scripts.

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

**Note:** To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.
SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.

The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

Accessing the workflow

- Navigate to Workflow Workflow Editor and select the Workflows tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

Input variables

Table 717: SFTP File Transfer workflow input variables

<tr>
<td>Excluded files</td>
<td>Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semicolons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
<td>Default value</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Target host</td>
<td>Name or IP address of the server to which the files are being moved.</td>
<td></td>
</tr>
<tr>
<td>Target port</td>
<td>Port number to use to communicate with the target host.</td>
<td>22</td>
</tr>
<tr>
<td>Datetime format</td>
<td>Timestamp format to apply when the $[DateTime]$ variable is used in the Target directory or Target files field. The system uses the current time from the instance to create timestamp values.</td>
<td>yyyy-MM-dd</td>
</tr>
<tr>
<td>Target directory</td>
<td>Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the $[DateTime]$ variable to the directory name. For example, you might enter this path to a target directory: /user/jacinto.gawron/documents/projects_$[DateTime]$. This produces the projects_20150505 directory. When the timestamp variable is used, the system uses the format specified in the Datetime format field.</td>
<td></td>

<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
</tbody>
</table>
| Target file                   | Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables:  
  - $\{\text{DateTime}\}$: Current timestamp, using the format defined in the Datetime format field.  
  - $\{\text{SourceFile}\}$: Complete file name.  
  - $\{\text{SourceFile:Base}\}$: Base file name without the extension.  
  - $\{\text{SourceFile:Ext}\}$: File extension only.  
  
  A target file name with the timestamp added as a prefix is expressed as: $\{\text{DateTime}\}_{\{\text{SourceFile}\}}$. This produces a file name that looks like this:  
  20150505_file1.txt  
  
  A target file name with the timestamp inserted into the name is expressed as: $\{\text{SourceFile:Base}\}_{\{\text{DateTime}\}\{\text{SourceFile:Ext}\}}$. This produces a file name that looks like this:  
  file1_20150505.txt |                                                          | false         |
<p>| Apply move conditions         | Check box to apply conditions to the file transfer. If this check box is selected, additional fields appear for setting conditions.                                                                          |               |
| Minimum file size, in bytes   | Condition that defines a target file's minimum size requirement. This setting can help determine if the file is valid. This field appears when the Apply move conditions check box is selected. | 0             |
| Maximum file size, in bytes   | Condition that defines a target file's maximum size requirement. This field appears when the Apply move conditions check box is selected.                                                                  | -1            |</p>

</table>

**File selection logic**

When selecting the files to move from the source host, the system uses this logic:

- If the Source files and Excluded files fields are empty, the system moves all the files in the source directory.
- When the Include subfolders check box is selected, the following dependencies exist:
  - If no files are specified in the Source files and Exclude files fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the Source files field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the Exclude files field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to move or exclude.

**Copy File activity**

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to transfer.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the source server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file to copy from the source host.</td>
</tr>
<tr>
<td>targetHost</td>
<td>Name or IP address of the server to which you want to move the files.</td>
</tr>
<tr>
<td>targetPort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>

<td>The activity failed to rename the file or directory.</td>
</tr>
</tbody>
</table>

### Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.
# Input variables

## Table 733: Set File Attributes input variables

</table>

SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the SSH activity designer on page 1517, which gives workflow administrators the ability to store input and output variables in the databus.

Note: Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.

Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer on page 1517, which gives workflow administrators the ability to store input and output variables in the databus.
Input variables

Table 736: Secure Copy input variables

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_host</td>
<td>Host name or IP address of the source machine.</td>
</tr>
<tr>
<td>from_scp_file</td>
<td>Name of the file to copy, including the absolute path.</td>
</tr>
<tr>
<td>to_host</td>
<td>Host name or IP address of the target machine.</td>
</tr>
<tr>
<td>to_scp_file</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory.</td>
</tr>
<tr>
<td>debug_mid</td>
<td>Check box that enables debug logging when selected.</td>
</tr>
<tr>
<td>debug_ssh</td>
<td>Check box that enables J2SSH debug logging when selected.</td>
</tr>
</tbody>
</table>

Output variables

<td>The executionResult.payload from the Activity designer parsing sources on page 1381.</td>
</tr>
<tr>
<td>output</td>
<td>The executionResult.output from the parsing sources.</td>
</tr>
</tbody>
</table>

Conditions

Table 738: Secure Copy conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully copied the file from one host to another.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to copy the file from one host to another.</td>
</tr>
</tbody>
</table>

Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of
this activity. This activity was built with the `SSH activity designer` on page 1517, which gives workflow administrators the ability to store input and output variables in the `databus`.

To access this activity in the workflow editor, select the Custom tab, and then navigate to `Custom Activities Global Orchestration - SSH`.

**Input variables**

**Table 739: Files Compare input variables**

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>OldFile</td>
<td>Name of the first file to compare.</td>
</tr>
<tr>
<td>NewFile</td>
<td>Name of the second file to compare.</td>

<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the <code>Activity designer parsing sources</code> on page 1381.</td>
</tr>
</tbody>
</table>

**Conditions**

**Table 741: Files Compare conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully compared the specified files.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity could not compare the specified files.</td>
</tr>
</tbody>
</table>

**File Read activity**

The File Read activity reads a file on a Linux or UNIX computer.
This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer on page 1517, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Global Orchestration - SSH.

**Input variables**

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>File</td>
<td>The name of the file to read.</td>
</tr>
</tbody>
</table>

**Output variables**

<table>
<thead>
<tr>
<th>Output variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contents</td>
<td>Content of the file to read.</td>
</tr>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources on page 1381.</td>
</tr>
</tbody>
</table>

**Conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully read the contents of the specified file.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity could not read the contents of the specified file.</td>
</tr>
</tbody>
</table>

**File Write activity**

The File Write activity writes a file on a Linux or UNIX computer.
The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the Directory field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer on page 1517, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of the working (target) directory.</td>
</tr>
<tr>
<td>file</td>
<td>Name of the file to be written.</td>
</tr>
<tr>
<td>behavior</td>
<td>Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• overwrite: Creates the file if it does not exist and overwrites the file if it does exist.</td>
</tr>
<tr>
<td></td>
<td>• append: Creates the file if it does not exist and appends the new content to an existing file.</td>
</tr>
<tr>
<td></td>
<td>• create only: Creates the file if it does not exist and fails if the file does exist.</td>
</tr>
<tr>
<td>contents</td>
<td>What to write or append (depending on the behavior) to the file</td>
</tr>
</tbody>
</table>

**Output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return_code</td>
<td>Indicates whether or not the file write operation was successful.</td>
</tr>
<tr>
<td>error_message</td>
<td>Message that indicates if an error has occurred. Any value other than 0 indicates a failure.</td>
</tr>
</tbody>
</table>
Conditions

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity wrote a file in the target directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to write a file in the target directory.</td>
</tr>
</tbody>
</table>

File Copy activity

The custom File Copy activity copies a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer on page 1517, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Global Orchestration - SSH.

Input variables

Table 748: File Copy input variables

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>

**File Replace String activity**

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity designer](#) on page 1517, which gives workflow administrators the ability to store input and output variables in the [databus](#).

**Input variables**

Reset Linux User Password activity

The Reset Linux User Password activity resets the password for a given user on a Linux computer.

This activity requires that the user executing the command be able to run the chpasswd command and, if expiring the password immediately, to run chage with `sudo privileges`.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer on page 1517, which gives workflow administrators the ability to store input and output variables in the databus.

### Workday Orchestration activity pack

The Workday Orchestration activity pack allows users to change and get employee information from Workday.

An Orchestration workflow can gather information such as an employee's phone number and email address from Workday and update the employee's sys_user record automatically.

To access each activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Workday Orchestration. For configuration details about the Workday integration, see Employee Orchestration on page 1558.

The Workday Orchestration activity pack is loaded with the Orchestration - Workday plugin, which is active by default with a subscription to Orchestration.

**Note:** This application is in custom scope. To run it globally, you must edit the activity.

### Get Employee Info activity

The Get Employee Info activity gets an employee's information from Workday.
To access this activity in the workflow editor, select the Custom tab, and then navigate to Custom Activities Workday Orchestration. This activity was built with the Soap Web service activity designer on page 1389 template.

**Note:** Before using this activity, configure the SOAP message “Get Worker” with the SOAP endpoint, and update Workday credentials accordingly. To update Workday credentials, navigate to Employee Orchestration Workday Credential.

### Input variables

Table 757: Get Employee Info input variables

</tbody>
</table>
Workday Orchestration GlideActions activities

The Workday Orchestration GlideActions activities take employee information returned from Workday and use it to create or update user records in the ServiceNow® instance.

The GlideAction activities were built with the Run Script activity designer on page 1534.

Check User Exists activity

The Check User Exists activity checks the ServiceNow sys_user table to determine if a record exists for a new employee named in a Workday onboarding notification.

When the ServiceNow instance receives a notification from Workday that a new employee has been hired, Orchestration runs a workflow called Employee On/Off Boarding to retrieve additional information about the new employee. This workflow uses the Check User Exists GlideActions activity to determine if a user record already exists for this employee on the instance. If a user record does exist, another GlideActions activity checks the sys_user record and updates it if necessary. If a user record does not exist, another activity in the workflow creates a new ServiceNow user record.

Input variables

Table 766: Check User Exists input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>employee_number</td>
<td>Employee identification number received from a Workday notification. This is the field in the sys_user table used to store the Workday employee_id created when the employee was hired.</td>
</tr>
</tbody>
</table>

Output variables

Table 767: Check User Exists output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exists</td>
<td>True/false value that indicates whether or not the employee exists in the ServiceNow sys_user table.</td>

<tr>
<td>User does not exist</td>
<td>This user does not exist in the ServiceNow instance, or the employee identification number is not valid.</td>
</tr>
</tbody>
</table>
**Create User in Users Table activity**

The Create User in Users Table activity uses the employee information returned from Workday to create a user record in the ServiceNow sys_user table.

When the ServiceNow instance receives a notification from Workday that a new employee has been hired, Orchestration runs a workflow called Employee On/Off Boarding to retrieve additional information about the new employee. This workflow runs an activity called Check User Exists that determines if the ServiceNow sys_user table already has a record for this employee. If no record exists, the Create User in Users Table activity creates one.

### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_name</td>
<td>First name of the employee that the activity is adding to the sys_user table.</td>
</tr>
<tr>
<td>last_name</td>
<td>Last name of the employee that the activity is adding to the sys_user table.</td>

Update User in Users Table activity
The Update User in Users Table activity uses the employee information returned from Workday to update an existing user record in the ServiceNow sys_user table.

When the ServiceNow instance receives a notification from Workday that a new employee has been hired, Orchestration runs a workflow called Employee On/Off Boarding to retrieve additional information about the new employee. This workflow runs an activity called Check User Exists that determines if the ServiceNow sys_user table already has a record for this employee. If a record exists, the Update User in Users Table activity updates the record, if necessary.

**Orchestration activity designer**

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization's business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse *custom activities* in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
- Automatically map values from a test payload to an activity's output variables.
- Share data between activities.
- View and revert to previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see *Workflow activities* on page 2734.

For a list of available activity templates provided with Orchestration, see *Activity designer components* on page 1359.

**Activity designer components**

Orchestration installs the activity templates and provides access to the controls required to create and manage custom activities in the Workflow Editor.

Orchestration also installs the activity_creator role, which gives users the ability to create custom activities. The activity_creator role is included with the activity_admin role and provides access to the Custom tab in the Workflow Editor.

**Activity templates**

ServiceNow provides the following templates for creating custom activities:

- SOAP
- JDBC
- JavaScript Probe
- Powershell
- REST
- Probe
- SFTP
- Run Script
- SSH
- JMS
Custom activity controls

Use the following tabs in the workflow editor palette to create and manage custom activities.

- Packs: View all activity packs downloaded from the ServiceNow Store or created for upload.
- Custom: Create custom activities for use in workflows. Access to the Custom tab is limited to users with the activity_creator role. This role is included in the activity_admin role.
- Data: View all activities on the current workflow that produce data. Workflow designers can use the data from these activities as the input for other activities.

Use an activity designer pack

The Packs tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Roles required: admin, activity_admin, activity_creator

You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the Packs tab, regardless of the current scope setting for the instance.

1. In the Workflow Editor palette, select the Packs tab.
2. Click the download icon.

   The hierarchy in the tab organizes packs by vendor, scope, category, and activity.
Create custom activities

From the Custom tab, you can create and update custom activities without leaving the workflow editor.

Roles required: admin, workflow_admin, activity_creator

Custom activities can:

- Share data between activities in a workflow.
- Parse data from standard input formats.
- Be purchased from and shared on the ServiceNow Store.
- Be versioned.
- Be copied.

**Note:** The information displayed in the Custom tab depends on the current view in the workflow editor. When you display a workflow on the canvas, the Custom tab shows all available custom activities categorized by application, but does not display any input or output data.

1. Click the + icon to create a new activity and select the appropriate *template* from the list.

The Activity Designer form appears, with a stage indicator at the top. All new activities start at the General stage. The current stage is indicated by a blue underscore.
2. Enter a name for your activity and click Continue. This action saves the activity and opens the Inputs form.

3. Create the input variables for your activity.
   For additional information about configuring variables in custom activities, see Activity designer variables on page 1368 and Orchestration activity parsing rules on page 1376.

4. Proceed to the next stage by taking one of these actions:
   • Click Continue to open the Execution Command form and map the variables to input fields. To save the activity from this point on, you must click Save.
   • Click Go to Pre-Processing (Advanced) to create a pre-processing script. If you create a script, Orchestration adds this step to the indicator.

5. In the Execution Command form, map the input variables by dragging and dropping them into the activity’s input fields.
6. Complete the other fields and click Continue.
7. In the Outputs form, create the output variables and map them to the output fields by dragging and dropping the variables into the parsing rules structure.
8. Proceed to the next stage by taking one of these actions:
   • Click Continue to open the Conditions form.
   • Click Go to Post-Processing (Advanced) to create a post-processing script. If you create a script, Orchestration adds this stage to the indicator.

9. Create exit conditions for your activity and click Save.

**Publish a custom activity**

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is visible only to the user who created it.

Roles required: admin, activity_admin, activity_creator

1. When you finish configuring the activity, click Publish.
   
   This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click Checkout.
When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.

The system adds a new version of this activity to the Custom tab in the workflow editor palette.

**Note:** Activities you create and publish are visible in the Packs tab only if they were created in the current application scope.

Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

Role required: admin, activity_admin, activity_creator

An administrator can return a locked activity to a published state.

1. Open the workflow editor.
2. From the Custom tab, open the activity that is locked.
3. Click the menu icon in the title bar and select Versions from the context menu.

A list of all the versions of that activity appears. The locked version displays the user who checked it out.

4. Select the checked out version.

   The system opens the record in the activity designer.

5. Click the menu icon again and select Force Checkout from the context menu.

   The activity fields become editable.

6. Click Publish.

   The activity becomes available to users with the appropriate roles.

*Copy a custom activity*

You can copy activities for reuse from the Custom tab in the global scope.
Role required: admin, activity_admin, activity_creator

**Note:** You cannot copy an activity in a private scope.

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:
   - Copy into global scope as new activity: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the Custom tab.

   ![Figure 333: Naming an activity copy](image)

   **Figure 333: Naming an activity copy**

   - Copy into global scope as new version: Copies the activity using the same name, increments the version number, and moves it to the global scope in the Custom tab. The system automatically adds the parent category to the Custom tab if it does not already exist. This action will overwrite another activity with the same name and version number.

   ![Figure 334: Creating a new activity version](image)

   **Figure 334: Creating a new activity version**

   **Note:** If the activity is in any other scope but global, the system displays this message: Cannot copy privately scoped activity.

**Orchestration databus**

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the *Orchestration activity designer* on page 1359. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the Data tab and are available for use as inputs in subsequent activities.

**Note:** Orchestration does not filter the data you are given for reuse in the Data tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.
When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don’t accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.

**Reuse data in the activity designer**

The Data tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

**Roles required:** workflow_creator

Activities are categorized by application in this tab and are available for use as data sources for other activities. The Data tab is a graphical representation of the workflow databus, which manages all the temporary data used by the current workflow.

1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the Data tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.

2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the Databus Output field of the the pop-up window.
Activity scoping

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Activity designer variables

The ServiceNow Activity Designer enables users with the activity_creator role to create input variables, map them to values on a target host or endpoint, and then pass the data returned to other activities in a workflow through output variables.

The system populates these output variables with selected data from payloads returned from the target hosts through the use of parsing rules.

**Note:** Variable strings in the Inputs tab of the activity designer have a 255 character limit.
Data encryption for activity variables

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue’s input payload is encrypted if an encrypted output variable is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

- Workflows: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- Service catalog requests: These input values are provided to an activity as encrypted variables from a service catalog item.
- GlideRecord: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- Activity outputs: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- Empty string: The system allows you to define encrypted input variables but never pass a value into the variable.

Map an input variable

After you create the input variables, map them to the fields in the Execution Command form.

Role required: activity_admin, activity_creator

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

To map a variable, drag it into the appropriate field.

The designer automatically expresses the variable in the syntax the system requires.
Map to optional variables

Several activity templates offer a list of optional variables that you can pass to the host.

Roles required: activity_admin, activity_creator

In most cases, the list allows you to define the variable and a value only.

1. Use the following controls to populate the list:
   - Click the add icon + to add new rows to the list.
   - Click the delete icon (−) to delete a variable from the list.
   - Click the clear icon (☐) to clear the contents of a row without removing the row.
2. To see a complete variable name if it is not entirely visible in the field, point at the value to display the name in a pop-up window.

Map to PowerShell variables

Map to the specific data types that PowerShell requires.

Roles required: activity_admin, activity_creator

Specify a data Type that PowerShell requires for certain variables. The following choices are available.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plain</td>
<td>Plain text value in the ServiceNow ECC Queue.</td>
</tr>
<tr>
<td>Encrypted</td>
<td>Encrypted value in the ECC Queue. Use this type for PowerShell passwords.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Specific type expected by PowerShell for true and false values.</td>
</tr>
<tr>
<td>Null</td>
<td>Specific variable type expected by PowerShell.</td>
</tr>
</tbody>
</table>
Map to SOAP and REST web service attributes

Specify the attributes that SOAP and REST variables require.

Roles required: activity_admin, activity_creator

Specify an additional attribute for this variable. The following choices are available.

<table>
<thead>
<tr>
<th>None</th>
<th>Do not escape text</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The system does not escape the value specified for the value attribute. For details see either Create a JavaScript array in a REST template on page 1477 or Create a JavaScript array in a SOAP template on page 1405.</td>
</tr>
</tbody>
</table>

Map variables to a check box

If you map a variable to a check box, the variable value is always used to determine if the field is true or false.

Roles required: activity_admin, activity_creator

Check boxes mapped to a variable are marked with a link icon and set to read-only. If the check box is already selected when you map a variable to it, the system clears the check box, adds the link icon, and then makes the field read-only.

1. Point the cursor to the link icon to see the variable name.
2. Click the icon to delete the mapping.

Map a variable to a reference field

Several of the activity templates contain reference fields in the Inputs tab that require a sys_id to function properly.

Roles required: activity_admin, activity_creator
Examples of these fields are the Web Service message field in the REST template and the MID Server script include field in the JavaScript Probe template.

1. Select a value using the lookup icon in the field.
   The system populates the field with the appropriate sys_id.

2. Drag a variable from the variable builder and drop it into a reference field.
   The system populates the field with an empty variable string, such as ${activityInput.Amazon}, and not the sys_id.

   **Note:** The activity cannot run correctly unless you manually assign the appropriate sys_id as the variable value. The best practice is to always select your reference values from the list populated from the lookup icon.

---

Create an output variable

The Outputs form in the designer contains a variable builder for creating data structures of objects and arrays.

Roles required: activity_admin, activity_creator

Elements in this structure are mapped with parsing rules to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

1. Click the + icon in the Outputs column to create a local or output variable.
   Local variables are only available within an activity and are not visible in the data structures displayed in the Custom tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of Local1 or Output1.

2. Type your new variable name in the field and select a data type.
   Variable names must be unique within an array or an object. You can assign a data type of Encrypted to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press Enter.
   The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon (▲▼).

5. Drag and drop the row into another location.

6. To reuse a variable from another activity, drag it from the Custom tab in the palette and drop it onto the Local or Output heading at the top of the variable list. To copy an entire data structure, drag the parent object or array into the variable list header.
   The designer duplicates the copied data structure in the outputs variable builder.
7. To delete a variable, click the delete icon (−) in the row.

Create an object or an array output variable

You can create output variables that are objects or arrays.

Role required: activity_admin, activity_creator

1. To create an object in the data structure, double-click the Type value and select Object from the choice list.
2. Click the + icon in the object to add variables, arrays, or other objects.

![Diagram showing object structure with variables and arrays]

3. Move individual variables between objects as needed.
   The system prevents you from moving a variable to an object if a variable with the same name already exists in the object.

4. To add an array to the structure or to an object, select a data type of Array.
   The system automatically opens an array element row that allows you to select the data type for the array.

![Diagram showing array structure with variable and array elements]

5. To delete an object or an array, click the delete icon in the row.
   When you delete an object, you also delete all the elements it contains.
Map an output field

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Role required: activity_admin, activity_creator

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

To map a variable, drag it from the Outputs variable builder and drop it into an empty Variable name field in the Parsing rules section.

See *Orchestration activity parsing rules* on page 1376 for instructions on configuring parsing for output variables.

Orchestration activity parsing rules

Activity designer parsing rules populate output variables defined in a custom activity with payload data returned from an external host or endpoint.
You can populate output variables directly from payload data or create and test expressions that isolate specific data from a payload. For instructions about creating output variables in the activity designer, see *Create an output variable* on page 1373.

Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Roles required: activity_admin, activity_creator

1. Navigate to *Workflow Workflow Editor*.
2. From the Custom tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the Output stage.
4. Drag an output variable from the data structure builder into the Variable name field in the Parsing rules builder.

![Figure 336: Mapping variables to parsing rules](image)
The parsing rules form appears for the selected variable. By default, the parsing type is set to Direct, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.

In this example, the parsing type selected is XML, which allows you to select specific parameters from the payload to parse.
### Parsing rule for localBody

<table>
<thead>
<tr>
<th>Parsing source:</th>
<th>executionResult.body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Name:</td>
<td>activityLocal.localBody</td>
</tr>
<tr>
<td>Parse sample data:</td>
<td>Get sample payload from test</td>
</tr>
</tbody>
</table>

#### Sample payload data

```xml
<xml version="1.0"?>
<data>
  <user>
    <user one>
      <name>user one</name>
      <age>42</age>
    </user>
  </user>
  <user>
    <name>user two</name>
    <age>27</age>
  </user>
  <user>
    <name>user three</name>
  </user>
</data>
```

### Parsing result

```
27
```
## Table 775: Parsing rules fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing source</td>
<td>Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see <a href="#">Activity designer parsing sources</a> on page 1381.</td>
</tr>
<tr>
<td>Expression</td>
<td>Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the Parsing type field.</td>
</tr>
<tr>
<td>Variable name</td>
<td>Revised variable name as it is used in the final output expression. The system adds the activityOutput or activityLocal prefix to the variable you specify.</td>
</tr>
<tr>
<td>Parsing type</td>
<td>The language to use for querying the target host's payload. The selections are:</td>
</tr>
<tr>
<td></td>
<td>• Direct: Maps to the entire content of the payload selected in the Parsing source field, without any parsing. This is the default parsing type.</td>
</tr>
<tr>
<td></td>
<td>• XML: XPath query used for selecting nodes from an XML payload.</td>
</tr>
<tr>
<td></td>
<td>• JSON: JSONPath query for selecting parts of a JSON payload.</td>
</tr>
<tr>
<td></td>
<td>• RegEx: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this parsing rule.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Sample payload data | Sample data from the source containing the data requested. This field is not available for Direct parsing types. After you click Parse sample data, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click Edit sample data to make the field editable again.

Parsing results | Displays the data returned from the source by the selected expression. This field is not available for Direct parsing types.

6. To retest the inputs, click Get sample payload from test. This action reopens the test form, allowing you to substitute different test values and create a different payload.

7. Click Save to have the parsing rules overwrite the previous payload with the one you just created.

8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload. The value for that parameter appears in the Parsing result field, and the system creates the appropriate expression in the Expression field.

9. Click Submit to save the parsing rule for that variable.

Activity designer parsing sources

This table lists the parsing sources available with each execution template.

<table>
<thead>
<tr>
<th>Template</th>
<th>Source</th>
</tr>
</thead>
</table>
| SOAP Web Service  | • executionResult.body (Default)  
                   | • executionResult.status_code  
                   | • executionResult.header  
                   | • executionResult.error  |
| JDBC              | • executionResult.output (Default)  
                   | • executionResult.errorMessages  
                   | • executionResult.probeCompletedEccId  
                   | • executionResult.totalRows  |
| JavaScript Probe  | • executionResult.payload (Default)  
                   | • executionResult.output  
                   | • executionResult.eccSysId  
                   | • executionResult.errorMessages  |
### Activity designer parsing rule example

In this example, the parsing rule is configured to populate the activityOutput.ipv4 variable with the value for the IP address from a domain server, using PowerShell.

**Role required:** activity_creator, activity_admin

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the Sample payload data field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: ipv4 and ipv6. In this example, the system produces two expressions to use for the parsing rule.

1. Navigate to **Workflow Workflow Editor** and open the activity that runs on the host.
2. Click the Inputs tab, and note the Command.

<table>
<thead>
<tr>
<th>Template</th>
<th>Source</th>
</tr>
</thead>
</table>
| Powershell        | • executionResult.output (Default)  
                    • executionResult.tags  
                    • executionResult.hresult  
                    • executionResult.eccSysId  
                    • executionResult.errorMessages |
| REST Web Service  | • executionResult.body (Default)  
                    • executionResult.status_code  
                    • executionResult.header  
                    • executionResult.error |
| SFTP              | • executionResult.output (Default)  
                    • executionResult.eccSysId  
                    • executionResult.errorMessages  
                    • executionResult.tags |
| Probe             | • executionResult.output (Default)  
                    • executionResult.payload  
                    • executionResult.eccSysId |
| SSH               | • executionResult.output (Default)  
                    • executionResult.eccSysId  
                    • executionResult.errorMessages  
                    • executionResult.tags |
| JMS               | • executionResult.status  
                    • executionResult.standardHeaders  
                    • executionResult.customHeaders  
                    • executionResult.messagePayload  
                    • executionResult.eccSysId  
                    • executionResult.errorMessages |
3. In a PowerShell console, run the Command on the host to extract the XML sample that contains the values you need.

4. Copy the data that is returned to the clipboard.

5. In the activity designer, click the Outputs tab and paste the returned data into the Sample payload data field.

   In this example, the data includes IP addresses in two different formats and the domain name.

6. Select the parsing type for the source. In this example, select XML.

---

**Figure 337: Parsing rule PowerShell inputs command**

If ($cred) {
    $networkAdapter = Get-WmiObject WIN32_NetworkAdapterConfiguration -ComputerName $computer -Credential $cred | where {$_ IPAddress} | Select-Object -first 1
} else {
    $networkAdapter = Get-WmiObject WIN32_NetworkAdapterConfiguration | where {$_ IPAddress} | Select-Object -first 1
}

write-host "<adapter><ip type='ipv4'">"$networkAdapter.IPAddress[0]"</ip><ip type='ipv6'>"$networkAdapter.IPAddress[1]"</ip><domain>"$networkAdapter.DNSDomain"</domain><adapter>"
7. Click Parse sample data.

The system displays the XML in the proper format, and it becomes clickable. In this view, the system can translate clicked data from the sample into an expression.
8. To create the expression, click the elements in the data sample you want to map to the variable. Based on the sample data you clicked, the system creates two expressions.
9. Select an expression from the list.

The desired result is the IP address that has a type attribute of ipv4. The system populates the Expression field with this choice.
10. Click Test expression.

The system parses the payload using the selected expression and returns the requested data in the Parsing result field.
11. Click Submit.

The view returns to the Outputs tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.
Use the Simple Object Access Protocol (SOAP) Web Service template to create activities that return data from a SOAP endpoint.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376

Prerequisites

To create and use a SOAP Web service workflow activity, you must first do the following:

- Create a SOAP message if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom SOAP activity.
- Determine an application, or scope, for this activity.
- Determine the SOAP endpoint to use for the activity. Use this value to override the endpoint configured in the SOAP message.
- Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

Create a SOAP web service activity

Use this procedure to create a custom SOAP Orchestration activity.

Role required: web_service_admin, activity_admin, activity_creator

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the SOAP Web Service template.
The template opens in the General stage.

<table>
<thead>
<tr>
<th>General</th>
<th>Inputs</th>
<th>Execution Command</th>
<th>Outputs</th>
<th>Conditions</th>
</tr>
</thead>
</table>

**Figure 338: Activity designer stage indicator**

5. Complete the fields shown in the table.
Table 777: Fields common to all activity designer templates

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Protection policy</td>
<td>Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property: • None: Script is unprotected. • Read-only: Script is in plain text, but read-only. • Protected: Script is encrypted and read-only.</td>
</tr>
<tr>
<td><strong>Important:</strong></td>
<td>Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Accessibility setting for this activity, by scope. The following options are available: • All application scopes: This activity is available to all application scopes. • This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>

</tr>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

*Create SOAP template input variables*

Create the variables to pass into the SOAP activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: web_service_admin, activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.

   The designer creates a default variable called Input1.

   ![Image of input variable creation](image)

   

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>{}</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:
### Table 778: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (↑/↓).

6. To delete a variable, click the delete icon ( ) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

**Configure the SOAP execution command**

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

---

**Note:** You can test the SOAP connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see Test SOAP activity template inputs on page 1397.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
Table 779: SOAP template execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create variables to map</em> to available fields.</td>
</tr>
<tr>
<td>Web service message</td>
<td><em>SOAP message</em> to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Web service message function</td>
<td><em>SOAP message function</em> to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.</td>
</tr>
<tr>
<td>SOAP message parameters</td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${()} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using <em>variable substitution</em> in the SOAP message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate <em>capabilities</em> for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Authentication         | Determines what type of authentication is required for the endpoint. The options are:  
  - Use existing credentials in SOAP message: Uses credential definitions from the SOAP message definition.  
  - Override with Basic Authentication credentials: Uses basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection.  
  - Override with Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with certificate authentication credentials.  
  - Override with Both Basic and Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.  
  - Override with WS-Security Username profile: Overrides the credentials in the SOAP message definition with credentials defined in a WS Security Profile. |
| Credentials            | Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5. |
| Protocol Profile       | Protocol profile to use for authentication. This field is available when the authentication type is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials. |
Test SOAP activity template inputs

You can test the input parameters of a custom SOAP activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.

2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.

3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.

4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory input variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
   - Reset default values: Replaces any test values set in this form with the default values, if they are present.
   - Clear values: Clears all values in the input variable list, even if default values exist.
6. When your test values are configured correctly, click OK. The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.

Figure 340: Response payload from inputs test

```json
{
  "status_code": 200,
  "body": "<?xml version="1.0" encoding="utf-8"?>
  <soap:Body>
    <GetQuoteResponse xmlns="http://www.webserviceX.NET/">
      <StockQuotes>&lt;StockGet;&lt;Symbol&gt;NOK&lt;/Symbol&gt;&lt;Last&gt;78.92&lt;/Last&gt;&lt;Date&gt;7/16/2013&lt;/Date&gt;&lt;Time&gt;4:05pm&lt;/Time&gt;&lt;Change&gt;+1.34&lt;/Change&gt;&lt;Open&gt;78.15&lt;/Open&gt;&lt;High&gt;79.15&lt;/High&gt;&lt;Low&gt;77.83&lt;/Low&gt;&lt;Volume&gt;6654061&lt;/Volume&gt;&lt;Hit1Cap&gt;12.1486&lt;/Hit1Cap&gt;&lt;Hit2Cap&gt;77.5562&lt;/Hit2Cap&gt;&lt;PreviousClose&gt;77.5562&lt;/PreviousClose&gt;&lt;PercentageChange&gt;+1.73%&lt;/PercentageChange&gt;&lt;AnnRange&gt;54.85 - 83.526&lt;/AnnRange&gt;&lt;Earnings&gt;1.31&lt;/Earnings&gt;&lt;P-E&gt;N/A&lt;/P-E&gt;&lt;Name&gt;ServiceNow&lt;/Name&gt;&lt;Stock&gt;&lt;/StockGet&gt;)
    </GetQuoteResult>
  </soap:Body>
</soap:Envelope>

"error": null,
"header": {
  "X-AspNet-Version": "4.0.30319",
  "Date": "Thu, 16 Jul 2015 23:25:01 GMT",
  "Content-Length": "979",
  "Content-Type": "text/xml; charset=utf-8",
  "Server": "Microsoft-HTTPAPI/2.0",
  "X-Powered-By": "ASP.NET",
  "Cache-Control": "private, max-age=0"
}
}
```
7. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an *auto-mapping option*.

8. Alternately, you can click Save for parsing rules to copy the entire payload to the *parsing rules*. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

9. Click the X in the upper right corner of the window to close it.

Auto-map SOAP activity output variables

The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the Outputs stage automatically.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.

2. Define an appropriate MID Server, if requested.

   The test fails if the MID Server cannot be found or if it cannot connect to the target.

3. Click Test Activity to test the input parameters.

   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.

4. Provide test values, if requested, and click OK to display the payload.

   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.

   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Provide credentials to access a SOAP message WSDL

If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:
• SOAP message: Credentials for a SOAP message are used if no other credentials are defined.
• SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.
• SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

1. Navigate to System Web Services Outbound SOAP Message.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the Download WSDL check box.
4. In the Authentication type field, select Basic.
   The Basic auth profile field appears.
5. Select the basic auth profile to use with this SOAP message.
Figure 341: Basic authentication for a SOAP message

6. Alternately, you can configure basic authentication credentials in *Configure the SOAP execution command* on page 1393.
   a) In the Authentication field, select Override with Basic Authentication credentials.
The Credentials field appears.

b) Select the basic auth credentials to use to access the WSDL. This setting overrides any credentials configured in the SOAP message.

Figure 342: Override basic auth credentials

*Figure 342: Override basic auth credentials*

**SOAP template pre-processing fields**
From the Pre Processing form of the activity designer, you can define a script to run before the activity executes.
Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

Logging

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
Figure 343: ActivityLogger API

**SOAP template execution parameters**

You use execution parameters to create the input process script in the Pre processing form of the activity designer.

For descriptions of the SOAP web service command fields, see the table in *Configure the SOAP execution command* on page 1393.

**Note:** You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding SOAP message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web-service_message_function</td>
<td>Reference</td>
<td>The sys_id of the SOAP message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the SOAP endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. For instructions on creating arrays using this parameter, see <em>Create a JavaScript array in a SOAP template</em> on page 1405.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------</td>
<td>--------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>When true, indicates that a MID Server is used.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time_out</td>
<td>String</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
</tbody>
</table>
| Value Capabilities | valueCapabilities | Array of hashmap         | Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value:
```
var valueCapability = {
  'NEW_MID_CAPACITY': 'NEW_MID_CAPACITY_VALUE'};
executionParam.valueCapabilities.push(valueCapability);
```
| Auth Type          | auth_type         | Boolean                  | Type of credentials to use. The choices are:
|                    |                   |                          | • basic_auth_pick_credentials
|                    |                   |                          | • use_existing_credentials |
| Credentials        | credentials       | Reference                | Credentials to use for this SOAP message when the auth_type is basic_auth_pick_credentials. |

Create a JavaScript array in a SOAP template
These are instructions for creating JavaScript arrays using SOAP execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam parameter array:
```
var newParameter = {
  'name': 'parameterName',
  'value': 'parameterValue',
  'additional_attribute': 'none'};
executionParam.parameters.push(newParameter);
```
By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the SOAP message parameters input field to Do not escape text.

In this case, the system does not escape the value specified for the value attribute. An example of this is:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue",
  "additional_attribute": "do_not_escape_text"
};
executionParam.parameters.push(newParameter);
```

**Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

**SOAP template outputs**

SOAP output variables contain values returned from a host or an endpoint that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see *Activity designer variables* on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see *Orchestration activity parsing rules* on page 1376.

**Table 781: Activity designer output fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**SOAP template post-processing fields**

From the Post Processing form, define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: activityInput.variable. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

![Figure 344: ActivityLogger API](image-url)
**SOAP template post-processing parameters**
Use these parameters to create a post-processing script.

**Table 782: Activity designer post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the web service.</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the SOAP message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the SOAP web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

**SOAP template conditions**
Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

**Table 783: Sample activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
</tbody>
</table>
JDBC activity designer

Create a custom JDBC activity to automate database queries and updates in a ServiceNow instance and perform operations on the data from external databases.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376

**Note:** If you are transferring data into a ServiceNow instance from an external data source, use Import sets. The JDBC custom activity transfers data between external data sources and is not intended to bring data into ServiceNow tables.

JDBC activities initially used JDBC Data Sources for connection information. The JDBC connection table and JDBC credentials table were introduced to decouple Orchestration Activities from Data Sources. The upgrade process, starting with Helsinki, copies all database connection information from existing JDBC data source records. This data is used to create records in the JDBC connection table and the JDBC credentials table. Existing JDBC custom activities are then updated with the appropriate fields and configured to use the new connection and credential records. Custom JDBC activities use connection information from the JDBC connection table and the **JDBC credentials table.**
Note: If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets. The JDBC activities allow you to transfer data between external data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

Create a JDBC connection

The JDBC Connection [jdbc_connection] table provides the information custom JDBC Orchestration activities need to connect to various target databases.

You need to have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: We supply ojdbc6.jar as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, will need a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

JDBC connections do not supply credentials. The necessary credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

Note: The Helsinki upgrade process copies all database connection information from existing JDBC data source records and uses the data to create new records in the JDBC Connection table and the Credentials table. Existing JDBC custom activities are then updated with the appropriate fields and configured to use the new connection and credential records. All new custom JDBC activities must use connection information from the jdbc_connection table and JDBC credentials from the discovery_credentials table. The original JDBC data source records are available for use elsewhere in the ServiceNow platform.

1. Navigate to Orchestration Credentials & Connections JDBC Connections and click New.
2. Complete the form using the fields in the table.
   The database selection in the Format field determines which fields are subsequently available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Application</td>
<td>All</td>
<td>Scope for this table. By default, the JDBC Connection [jdbc_connection] table runs in the Global scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection [jdbc_connection] table runs in the global domain.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Format</td>
<td>All</td>
<td>Database type for this connection. The default choices are: • MySQL • Oracle • SQLServer • None You can add Sybase or DB2 Universal to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.</td>
</tr>
<tr>
<td>Server</td>
<td>Oracle, MySQL, SQLServer</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle</td>
<td>The Oracle database site identifier. The default value is orcl.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Oracle</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
</tr>
<tr>
<td>Database name</td>
<td>MySQL, SQLServer</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Database port</td>
<td>MySQL, SQLServer</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td>Instance name</td>
<td>SQLServer</td>
<td>Instance name for the selected SQLServer</td>
</tr>
<tr>
<td>Connection URL</td>
<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.</td>
</tr>
</tbody>
</table>

**Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.

| JDBC driver   | None, DB2 Universal, Sybase | The JDBC driver to use for this connection when it is not a default database.                                                                                                                                                                                                                                                        |

**Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.
Create a JDBC activity

Use this procedure to create a custom JDBC Orchestration activity.

Role required: activity_admin, activity_creator

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select JDBC from the list.
The template opens in the General stage.

5. Complete the fields shown in the table.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
</tbody>
</table>
| Protection policy   | Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:  
  • None: Script is unprotected.  
  • Read-only: Script is in plain text, but read-only.  
  • Protected: Script is encrypted and read-only.  
  **Important:** Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only. |
| Execution template  | Predefined template selected for this activity.                                                                                                                                                                 |
| Application         | Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor. |
| Accessible from     | Accessibility setting for this activity, by scope. The following options are available:  
  • All application scopes: This activity is available to all application scopes.  
  • This application scope only: Use of this activity is restricted to the scope named in the Application field.                                      |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

Create JDBC template input variables
Create the variables to pass into the JDBC activity in the Inputs form of the activity designer.
You must name your activity in the General form before you can advance to the Inputs stage.
Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   The designer creates a default variable called Input1.

2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:
### Table 786: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td><strong>Mandatory</strong></td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (up/down arrow icon).

6. To delete a variable, click the delete icon in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

---

**Configure the JDBC execution command**

Use the variables you created to configure the command that Orchestration executes on the JDBC target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: `activity_creator, admin`

**Note:** You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see Test JDBC activity template inputs on page 1420.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 347: JDBC execution command
2. Complete the fields shown in the table.

**Table 787: JDBC execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Input            | Input variable builder. *Create variables to map* to available fields.  
  Note: The auto-mapping feature provides the variables when enabled. |
| JDBC Connection  | Appropriate *JDBC connection* for the database. The connection selected provides the activity with the following information:  
  • Target database information, such as server and data base names.  
  • Connection URL  
  • Target database port (if different from standard port number)  
  • Database instance name  
  For more information, see JDBC connections. |
| Credential       | JDBC credential to use for this connection. |
| SQL statement    | Customer provided SQL statement. This field is hidden when the Stored Procedure check box is selected.  
  By default, this activity is allowed to run the following SQL statements:  
  • select  
  • insert  
  • update  
  • delete  
  • show  
  • create  
  • describe  
  The JDBC Activity template allows you to execute any ANSI SQL or stored procedure on a target database, if the supplied credential has permission. As an added security measure, the operations that the JDBCOrchestrationProbe can execute are controlled by a MID Server property which restricts the SQL commands that can be used by the JDBC Activity template. This ensures you cannot use potentially destructive commands, such as drop database. The mid.property.jdbc_operations contains the MID Server property controls.  
  Note: You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity. |
<table>
<thead>

<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Stored procedure parameters | Parameters from the selected stored procedure. Add the parameter values you want for each type.  
  • Mode: Parameter type.  
  • SQL Type: Data type of the parameter.  
  • Name: Parameter name.  
  • Value: Value you want passed to the parameter. |

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test JDBC activity template inputs

You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.
**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star.

![Fill in your test values](image)

**Figure 348: JDBC input test values**

4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
• Reset default values: Replaces any test values set in this form with the default values, if they are present.
• Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK. The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.
7. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an auto-mapping option.

8. Alternately, you can click Save for parsing rules to copy the entire payload to the parsing rules.
This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

9. Click the X in the upper right corner of the window to close it.

Auto-map JDBC activity output variables

The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the Outputs tab automatically.

Role required: admin

1. In the JDBC provider template form, select the Inputs tab.
2. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

4. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

JDBC template pre-processing fields

From the Pre Processing form, you can define a script to run before the activity executes.

Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
</tbody>
</table>
## Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

## Logging

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- ActivityLogger.debug("Pre Processing Log Message");
- ActivityLogger.info("Pre Processing Log Message");
- ActivityLogger.warn("Pre Processing Log Message");
- ActivityLogger.error("Pre Processing Log Message");
You use execution parameters to create the input process script in the Preprocessing form. For detailed descriptions of the JDBC command fields, see the table in Configure the JDBC execution command on page 1416.

**Note:** You must use the executionParam. prefix with all variables in this table.

### Table 788: JDBC execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC connection</td>
<td>jdbc_connection</td>
<td>Reference</td>
<td>Selected JDBC connection. See Create a JDBC connection on page 1410 for details.</td>
</tr>

<td>connection_timeout</td>
<td>Integer</td>
<td>Length of time to wait for connection to occur.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>query_timeout</td>
<td>Integer</td>
<td>Length of time to wait for the query to return results.</td>
</tr>
<tr>
<td>Stored procedure</td>
<td>stored_procedure</td>
<td>Boolean</td>
<td>Selects whether to use a stored procedure rather than an SQL statement.</td>
</tr>
<tr>
<td>Stored procedure name</td>
<td>stored_procedure_name</td>
<td>String</td>
<td>Names the stored procedure to use.</td>
</tr>
<tr>
<td>Stored procedure variables</td>
<td>stored_procedure_variables</td>
<td>Array of JavaScript objects</td>
<td>Lists the variables from the selected stored procedure.</td>
</tr>
</tbody>
</table>

**JDBC template outputs**

JDBC output variables contain values returned from a database that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see Activity designer variables on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see Orchestration activity parsing rules on page 1376.

**Table 789: Activity designer output fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**JDBC template post-processing fields**

From the Post Processing form, define a script to run after the activity executes.
Post-processing fields

To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: activityInput.variable. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

Logging

Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- ActivityLogger.debug("Post Processing Log Message");
- ActivityLogger.info("Post Processing Log Message");
- ActivityLogger.warn("Post Processing Log Message");
- ActivityLogger.error("Post Processing Log Message");
Figure 351: ActivityLogger API

**JDBC template post-processing parameters**
Use these parameters to create a post-processing script that runs after the activity executes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned by the query.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the Reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages returned from the query. If no error messages are returned, this value is null.</td>
</tr>
<tr>
<td>Total rows</td>
<td>totalRows</td>
<td>Integer</td>
<td>Number of rows successfully executed by the SQL statement. See the explanation below of how the system calculates the row count.</td>
</tr>
</tbody>
</table>
**Row count calculations**

The total number of rows successfully executed by the SQL statement varies depending on the type of statement or stored procedure that was run. For a select statement, this value could be the Maximum rows configured in the Inputs tab, or the total number of rows in the database that match the query. Stored procedures can only execute select statements.

If the SQL statement executes an insert, update, or delete, the statement might be only partially successful. The total number of successful rows is based on the number of rows matching the statement with respect to the maximum rows allowed by the activity. For example, if the number of rows to be inserted is greater than the maximum rows allowed, not all the desired rows can be inserted. The Total rows number is the number of rows that are successfully inserted, which is equal to or less than the maximum rows. An error message shows the results of the statement when any part of the operation fails.

**JDBC template conditions**

Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>
JavaScript Probe activity designer

Use the JavaScript Probe template to create an activity that runs a JavaScript probe on a target host that is configured to return specific information.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376

Create a JavaScript probe activity

Use these instructions to create a custom JavaScript Probe Orchestration activity.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the +icon.
4. Select the JavaScript Probe template.
The template opens in the General stage.

Figure 352: Activity designer stage indicator

5. Complete the fields shown in the table.
### Table 792: Fields common to all activity designer templates

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td><strong>Short description</strong></td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td><strong>Image</strong></td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
</tbody>
</table>
| **Protection policy**   | Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:  
  • None: Script is unprotected.  
  • Read-only: Script is in plain text, but read-only.  
  • Protected: Script is encrypted and read-only. |
| **Important:** Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only. |
| **Execution template**  | Predefined template selected for this activity.                                                         |
| **Application**         | Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor. |
| **Accessible from**     | Accessibility setting for this activity, by scope. The following options are available:  
  • All application scopes: This activity is available to all application scopes.  
  • This application scope only: Use of this activity is restricted to the scope named in the Application field. |
### Fields

<table>
<thead>
<tr>
<th>Fields</th>

<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.
7. To configure the input variables for this activity, see *Create JavaScript Probe template input variables* on page 1434.

*Create JavaScript Probe template input variables*
Create the variables to pass into the JavaScript Probe activity in the Inputs form of the activity designer.
You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   
   The designer creates a default variable called Input1.

   ![Variable creation](image)

   Right clicking on () Input allows you to add the variable.

   ![Variable creation](image)

   **Table:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ } input</td>
<td>String</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:
Table 793: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (קודש).)

6. To delete a variable, click the delete icon (ıyor) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

Configure the JavaScript Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the JavaScript Probe connection between the MID Server and the target without having to run the activity in a workflow context. For details, see Test JavaScript Probe template inputs on page 1437.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 353: JavaScript Probe execution command

```
var str = new Packages.java.lang.String("TestString");
this.probe.createOutputResult(str);
```
2. Complete the fields shown in the table.

Table 794: JavaScript Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create variables to map</em> to available fields.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>• MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe. This field is available when the</td>
</tr>
<tr>
<td></td>
<td>Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe. This field is available</td>
</tr>
<tr>
<td></td>
<td>when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these</td>
</tr>
<tr>
<td></td>
<td>parameters manually, or drag input variables into the Parameters fields</td>
</tr>
<tr>
<td></td>
<td>and assign a value.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test JavaScript Probe template inputs

You can test the input parameters of a custom JavaScript Probe activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, the JavaScript probe returns the requested value, ServiceNow, from the host.
4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
   - Reset default values: Replaces any test values set in this form with the default values, if they are present.
   - Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.
7. Click Save for parsing rules to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

8. Click the X in the upper right corner of the window to close it.

JavaScript probe template pre-processing fields
From the Pre Processing form of the activity designer, you can define a script to run before the activity executes.
Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script.</td>
</tr>
<tr>
<td></td>
<td>Click the arrow above the field to open the variables list. Click an item in the tree to add</td>
</tr>
<tr>
<td></td>
<td>it to your script in the appropriate syntax. The list displays execution parameters and input</td>
</tr>
<tr>
<td></td>
<td>variables you passed into the activity on the Inputs form. All activity variables added in the</td>
</tr>
<tr>
<td></td>
<td>Inputs form are read-only and are expressed in the pre-processing script with this syntax:</td>
</tr>
<tr>
<td></td>
<td>activityInput.variable. Before the activity executes and makes a call to the service or host,</td>
</tr>
<tr>
<td></td>
<td>you can override the effective execution value of this variable by assigning values to the</td>
</tr>
<tr>
<td></td>
<td>executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

Logging

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
You use execution parameters to create the input process script in the Preprocessing form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command on page 1435.

**Note:** You must use the `executionParam.` prefix with all variables in this table.

**Table 795: JavaScript template execution parameters**

<table>

Create a JavaScript object with the following syntax, and add it to the executionParam parameter array. This assigns additional parameters to the message:</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

**JavaScript probe template outputs**

JavaScript Probe output variables contain values returned from a host or an endpoint that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see Activity designer variables on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see Orchestration activity parsing rules on page 1376.
Table 796: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a</td>
</tr>
<tr>
<td></td>
<td>local variable to identify metadata that is processed within an activity</td>
</tr>
<tr>
<td></td>
<td>before the final value is exported to an output variable.</td>
</tr>

</tr>
<tr>
<td></td>
<td>activityInput.variable. For parameter descriptions, refer to the table in the</td>
</tr>
<tr>
<td></td>
<td>post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

Logging
Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

Important: To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:
- ActivityLogger.debug("Post Processing Log Message");
- ActivityLogger.info("Post Processing Log Message");
• ActivityLogger.warn("Post Processing Log Message");
• ActivityLogger.error("Post Processing Log Message");

Figure 355: ActivityLogger API

*JavaScript probe template post-processing parameters*
Use these parameters to create a post-processing script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the JavaScript Probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>Error Messages</td>
<td>errorMessage</td>
<td>String</td>
<td>Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.</td>
</tr>
</tbody>
</table>

*JDBC template conditions*
Create the exit conditions for your activity in the Condition column and set the order for each.
The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

Table 798: Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>

PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:
ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

Create a PowerShell activity

Use these instructions to create a custom PowerShell Orchestration activity.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the PowerShell template.

The template opens in the General stage.
Figure 356: Activity designer stage indicator

5. Complete the fields shown in the table.

Table 799: Fields common to all activity designer templates

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Protection policy</td>
<td>Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:</td>
</tr>
<tr>
<td></td>
<td>• None: Script is unprotected.</td>
</tr>
<tr>
<td></td>
<td>• Read-only: Script is in plain text, but read-only.</td>
</tr>
<tr>
<td></td>
<td>• Protected: Script is encrypted and read-only.</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong>: Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

*Create Powershell template input variables*

Create the variables to pass into the Powershell activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.

The designer creates a default variable called Input1.
2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (△).  

6. To delete a variable, click the delete icon (−) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

Configure the PowerShell execution command  
Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.  
Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.  
Role required: activity_creator, admin

**Note:** You can test the Powershell connection between the MID Server and the target computer without having to run the activity in a workflow context. For details, see Test Powershell activity template inputs on page 1453.

1. Drag variables from the list of inputs and drop them into command fields.  
The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

Table 801: Powershell command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create variables to map to available fields.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Script type</td>
<td>Type of script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom Powershell command</td>
</tr>
<tr>
<td></td>
<td>• MID Server script file</td>
</tr>
<tr>
<td>MID Server script file</td>
<td>MID Server script file to run. This field is available when the Script type selected is MID Server script file.</td>
</tr>
<tr>
<td>Command</td>
<td>Command that this activity runs on the target host. This field is available when the Script type selected is Custom Powershell command. You can drag and drop input variables from the variable builder into this field to create your command.</td>
</tr>
<tr>
<td>Powershell variables</td>
<td>Name-value pairs to pass to the host with Powershell. You can create these variables manually, or drag input variables into the Value field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the Encrypted data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td>Use MID service account</td>
<td>Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the Credential tag field is not available.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>Specific [credential tag] this activity must use to run Powershell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials for that tag only and does not try the MID Server service account. This field is not available when the Use MID service account check box is selected.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying Powershell, by capabilities. By default, the system selects a Powershell MID Server.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test Powershell activity template inputs
You can test the input parameters of a custom Powershell activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, Powershell values are configured to uninstall WinZip from a target host.

4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory variables.
• Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
   • Reset default values: Replaces any test values set in this form with the default values, if they are present.
   • Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.

```json
{
  "tags": {
    "__text__": "\n"
  },
  "errorMessages": null,
  "eccSysId": "3eca6f62d7110200f2215a5f75e5083f70",
  "hresult": null,
  "output": "\n"
}
```

If all the credentials available to the activity fail, and the activity cannot authenticate on the target, a message describing the failure appears in the debugMessages tab. The format of the message is identical for all provider templates and displays the target IP address, the credential type (SSH in this example), and the details of all failed credentials, expressed as a JSON string.
Figure 358: Credential debug message

7. Click Save for parsing rules to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

8. Click the X in the upper right corner of the window to close it.

**Powershell template pre-processing fields**

From the Pre Processing form of the activity designer, you can define a script to run before the activity executes.

**Pre-processing fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info ("Pre Processing Log Message");`
- `ActivityLogger.warn ("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the Powershell command fields, see the table in *Configure the PowerShell execution command* on page 1450.

**Note:** You must use the executionParam. prefix with all variables in this table.

**Table 802: Powershell execution parameters**

<table>
<thead>

<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
</tbody>
</table>

**Powershell template outputs**

Powershell output variables contain values returned from a host that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see Activity designer variables on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see Orchestration activity parsing rules on page 1376.
### Table 803: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

*Powershell template post-processing fields*

From the Post Processing form of the activity designer, define a script to run after the activity executes.

#### Post-processing fields

To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: activityInput.variable. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

#### Logging

Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
• `ActivityLogger.warn("Post Processing Log Message");`
• `ActivityLogger.error("Post Processing Log Message");`

Figure 360: ActivityLogger API

*Powershell template post-processing parameters*

Use these parameters to create a post-processing script.
### Table 804: Powershell post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| Tags       | tags     | Hashmap of tag values to return from the PowerShell command. Contains the tags used to extract output using the PowerShell commands. The tag output is delimited by double percentage signs, as in %%tagname%% ... %%. Set up the command using the format in this example:  
  ```powershell
  Write-Host %tagname1%%  
  output1 line 1  
  output1 line 2  
  ...  
  Write-Host%%
  Write-Host %tagname2%%  
  output2 line 1  
  output2 line 2  
  ...  
  Write-Host%%
  ```
  
The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname.
  ```javascript
  {"__text__": "",  
  "tagtagname1": "output1 line1
  output1 line2
  
  output1 line1
  output1 line2"
  ,  
  "tagtagname2": "output2 line1
  output2 line2"
  }"`,
| Hresult    | hresult  | String | Contains any hresult returned from the PowerShell command. If no hresult is returned, this parameter is null.                                                                                      |
| Output     | output   | String | Contains the raw output from the PowerShell command.                                                                                                                                                   |
| EccSysID   | eccSysID | String | Contains the reference ID associated with the ECC Queue input message returned by the activity.                                                                                                   |
Powershell template conditions
Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>
Istanbul    ServiceNow    Now Platform Capabilities

REST Web Service activity designer

Representational State Transfer (REST) workflow activities are configured to return data to a workflow from a specific endpoint, using a preconfigured REST message.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

• Orchestration activity designer on page 1359
• Activity designer variables on page 1368
• Orchestration activity parsing rules on page 1376

Prerequisites

To create and use a REST Web service workflow activity, you must first do the following:

• Create a REST message if an appropriate one is not already configured.
• Assign the web_service_admin role to any user who must create or edit a custom REST activity.
• Determine an application, or scope, for this activity.
• Determine the REST endpoint to use for the activity. Use this value to override the endpoint configured in the REST message.
• Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Role required: web_service_admin, activity_admin, activity_creator
For instructions on using the activity template process flow, see *Create custom activities* on page 1361.

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the REST Web Service template.

The template opens in the General stage.

![General stage](image)

**Figure 361: Activity designer stage indicator**

5. Complete the fields shown in the table.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Protection policy</td>
<td>Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:</td>
</tr>
<tr>
<td></td>
<td>• None: Script is unprotected.</td>
</tr>
<tr>
<td></td>
<td>• Read-only: Script is in plain text, but read-only.</td>
</tr>
<tr>
<td></td>
<td>• Protected: Script is encrypted and read-only.</td>
</tr>
<tr>
<td>Important:</td>
<td>Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
</tbody>
</table>
### Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

*Create REST template input variables*

Create the variables to pass into the REST activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: web_service_admin, activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.

   The designer creates a default variable called Input1.

   ![Input variable creation](image)

   2. Type your new variable name in the field.
   3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
   4. Configure your variable using these fields:
Table 807: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (↓↑).

6. To delete a variable, click the delete icon (🗑️) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

Configure the REST execution command
Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.
Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

Note: You can test the REST connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see Test REST activity template inputs on page 1471.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Figure 362: REST execution command
2. Complete the fields shown in the table.

### Table 808: REST execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create variables</em> to map to available fields.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag and drop input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default the text sent to the REST message is escaped. The Name column is automatically populated if the users have provided variables using <em>variable substitution</em> in the REST message.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
</tbody>
</table>

**Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in REST message: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with OAuth Authentication credentials: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its Authentication type set to OAuth 2.0 and its OAuth profile configured appropriately.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Credentials | Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.

Protocol Profile | Certificate authentication to use. This field is available when the selections in the Authentication field is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.

OAuth profile | Profile for the OAuth provider for this REST message. See Specify an OAuth profile for more information.

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test REST activity template inputs
You can test the input parameters of a custom REST activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, the stock symbol name in the REST activity is a variable.
4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
   - Reset default values: Replaces any test values set in this form with the default values, if they are present.
   - Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.
7. Click Save for parsing rules to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

8. Click the X in the upper right corner of the window to close it.

Auto-map REST activity output variables

The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the Outputs stage automatically.

Role required: web_service_admin, activity_admin, activity_creator

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.

3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against
   the specified target and returns the resulting payload. If you mapped input variables to fields and
   parameters, the system displays a dialog box for assigning test values to those variables.

4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the
     workflow. Auto-mapping to an output variable creates an array of objects, each of which contains
     the column names from the query result.

REST template pre-processing fields
From the Pre Processing form of the activity designer, you can define a script to run before the activity
executes.

Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: <code>activityInput.variable</code>. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the <code>executionParam.variable_name</code> execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the pre-processing using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is `ACTIVITY`.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
**Figure 363: ActivityLogger API**

REST template execution parameters

You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the REST web service command fields, see *Configure the REST execution command* on page 1467.

**Note:** You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding web service message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web_service_message_function</td>
<td>Reference</td>
<td>The sys_id of the REST message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the REST endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. For instructions on creating arrays using this parameter see <em>Create a JavaScript array in a REST template</em> on page 1477.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------</td>
<td>--------------------------</td>
<td>-------</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>Selects whether or not to use the MID Server. A value of true uses the MID Server, and a value of false does not use the MID Server.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time-out</td>
<td>String</td>
<td>Allowable time out duration, expressed in seconds.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
<tr>
<td>Auth Type</td>
<td>auth-type</td>
<td>Boolean</td>
<td>Type of credentials to use. The choices are: • basic_auth_pick_credentials • use_existing_credentials</td>
</tr>
<tr>
<td>Credentials</td>
<td>credentials</td>
<td>Reference</td>
<td>Contains the credentials to use for this REST message when the auth_type selected is basic_auth_pick_credentials.</td>
</tr>
</tbody>
</table>

Create a JavaScript array in a REST template
These are instructions for creating JavaScript arrays using REST execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:
var newParameter = 
  {
    "name": "parameterName",
    "value": "parameterValue",
    "additional_attribute": "none"
  }
executionParam.parameters.push(newParameter);

By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the REST message parameters input field to Do not escape text.

In this case, the system does not escape the value specified for the value attribute. An example of this is:

    var newParameter = 
    {
        "name": "parameterName",
        "value": "parameterValue",
        "additional_attribute": "do_not_escape_text"
    }
    executionParam.parameters.push(newParameter);

**Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

**REST template outputs**

REST output variables contain values returned from an endpoint that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see *Activity designer variables* on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see *Orchestration activity parsing rules* on page 1376.

**Table 810: Activity designer output fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**REST template post-processing fields**

Using the Post Processing form in the activity designer, define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: activityInputvariable. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

![ActivityLogger API](image)

*Figure 364: ActivityLogger API*
REST template post-processing parameters
Use these parameters to create a post-processing script.

Table 811: Activity designer post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the REST web service.</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with <code>executionResult.header[keyName]</code>.</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the REST message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the REST web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

REST template conditions
Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

Table 812: Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Condition</td>
<td>Evaluation</td>
</tr>
<tr>
<td>-----------</td>
<td>------------</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>

### SFTP activity designer

You can use the SFTP activity designer to create custom activities that execute basic SFTP commands on a remote server.

The SFTP activity designer allows you to create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

**Note:** This activity requires the credentials of a user who can execute SFTP commands on the source host. The Copy File activity, provided in the activity pack, requires separate credentials to access the target host.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376

### Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Roles required: activity_creator or workflow_admin
For instructions on using the activity template process flow, see *Create custom activities* on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the SFTP template.

The template opens in the General stage.

```
| General |   |   |   |
```

**Figure 365: Activity designer stage indicator**

5. Complete the fields shown in the table.
Table 813: Fields common to all activity designer templates

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
</tbody>
</table>
| Protection policy   | Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:  
  • None: Script is unprotected.  
  • Read-only: Script is in plain text, but read-only.  
  • Protected: Script is encrypted and read-only.  
  
  Important: Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only. |
| Execution template  | Predefined template selected for this activity.                                                                                               |
| Application         | Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor. |
| Accessible from     | Accessibility setting for this activity, by scope. The following options are available:  
  • All application scopes: This activity is available to all application scopes.  
  • This application scope only: Use of this activity is restricted to the scope named in the Application field. |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

*Create SFTP template input variables*

Create the variables to pass into the SFTP activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.

The designer creates a default variable called Input1.

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:
### Table 814: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon ( inconvenience symbol).

6. To delete a variable, click the delete icon in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

*Configure the SFTP execution command*

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see *Test JDBC activity template inputs* on page 1420.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
**Figure 366: SFTP execution command**

2. Complete the fields shown in the table.
### Table 815: SFTP command fields

<table>
<thead>

<tr>
<td>Field</td>
<td>Description</td>
<td>Command</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>Suffix for temporary file</td>
<td>Temporary suffix to use for a file name if the file already exists on a target host. If this field contains a value, the activity deletes the duplicate target file if it exists, and then copies the source file to a temporary file using targetFilePath + tempFileSuffix as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.</td>
<td>Copy file</td>
</tr>
<tr>
<td>UID</td>
<td>User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>GID</td>
<td>Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x. The permissions number is an internal value returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow on page 1330.</td>
<td>Set file attributes</td>
</tr>
</tbody>
</table>
### Field | Description | Command
--- | --- | ---
Access timestamp | Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. | Set file attributes
Modification timestamp | Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. | Set file attributes
Size in bytes | Size of a file, expressed in bytes. | Set file attributes
Required MID Server capabilities | MID Server with the appropriate capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server. | All

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the Excluded files field does not get into the selection, even though it would be selected by the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test SFTP activity template inputs

You can test the input parameters of a custom SFTP activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.
**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, the variables identify the source host and path of the file to copy and the file's destination on the target host.
4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory input variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
- Reset default values: Replaces any test values set in this form with the default values, if they are present.
- Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK. The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.

```
{
  "tags": {
    "__text__": "Transfer complete, 19 bytes transferred"
  },
  "errorMessages": null,
  "eccSysId": "fd8f685a3f11c0b0d0dcf75b1b2e701e",
  "output": "Transfer complete, 19 bytes transferred"
}
```

If all the credentials available to the activity fail, and the activity cannot authenticate on the target, a message describing the failure appears in the debugMessages tab. The format of the message is identical for all provider templates and displays the target IP address, the credential type (SSH in this example), and the details of all failed credentials, expressed as a JSON string.
This MID Server stores the failed credentials in a blacklist cache for a period of 5 minutes. If you repeat the test within this time period, the credential debugger does not display the failed credentials and indicates that blacklisting is being applied. However, if you add or modify a credential for that provider template during the 5 minute blacklist window, and if all credentials are invalid, a test displays the entire list of failed credentials. After the 5 minutes has expired, any new attempt to re-run the invalid credentials results in a full listing. The value of the blacklist cache interval cannot be changed.

7. Click Save for parsing rules to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.
8. Click the X in the upper right corner of the window to close it.

**SFTP template pre-processing fields**

Use the Pre Processing form to define a script to run before the activity executes.

### Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

### Logging

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
Figure 369: ActivityLogger API

SFTP template execution parameters
You use execution parameters to create the input process script in the Preprocessing form.

For descriptions of the command fields, see Configure the SFTP execution command on page 1485.

Note: You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>

</tbody>
</table>
## Table 817: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
</tbody>
</table>

### SFTP template outputs

SFTP output variables contain values returned from a source host that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see *Activity designer variables* on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see *Orchestration activity parsing rules* on page 1376.
### Local
Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.

### Output
Variable that contains a value that is passed to other activities in the workflow.

**SFTP template post-processing fields**

Use the Post Processing form to define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output process script</strong></td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td><strong>Variables</strong></td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: <code>activityInput.variable</code>. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is `ACTIVITY`.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`
SFTP template post-processing parameters
Use these parameters to create a post-processing script.

Table 818: SFTP post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned by the query.</td>
</tr>

</tbody>
</table>
| Tags | tags     | Hashmap of tag values returned from the SSH command | Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in %%tagname%% ... %%%. Set up the command using the following format: 
%
tagname1%
output1 line 1
output1 line 2 ...
%
%
tagname2%
output2 line 1
output2 line 2 ...
%
The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname. 

```
{"__text__": 
"tagtagname1":"output1 line1
output1 line2
",
"tagtagname2":"output2 line1
output2 line2
"}
```

**SFTP template conditions**
Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

**Table 819: Sample activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
</tbody>
</table>
### Condition Evaluation

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>

### Condition defaults

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
<th>Else</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>activityOutput.cpuCount == 2</td>
<td>false</td>
<td>100</td>
</tr>
<tr>
<td>Retry</td>
<td>activityOutput.cpuCount != 2</td>
<td>false</td>
<td>200</td>
</tr>
<tr>
<td>Failure</td>
<td>true</td>
<td></td>
<td>300</td>
</tr>
</tbody>
</table>

Insert a new row...

---

**Probe activity designer**

Use the Probe template to create an activity that runs a ServiceNow probe on the target host that is configured to return specific information.

For example, you might run a probe that returns all hardware information from a Linux server. You must purchase Orchestration on page 1181 to use the Probe template.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376

**Create a probe activity**

Use these instructions to create a custom Probe Orchestration activity.

Role required: activity_creator or workflow_admin
For instructions on using the activity template process flow, see *Create custom activities* on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the +icon.
4. Select the Probe template.

The template opens in the General stage.

![Activity designer stage indicator](image)

**Figure 371: Activity designer stage indicator**

5. Complete the fields shown in the table.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>

<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

Create Probe template input variables
Create the variables to pass into the Probe activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   The designer creates a default variable called Input1.

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:
Table 821: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (↑/↓).

6. To delete a variable, click the delete icon (🗑️) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

Configure the Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the activity connection between the MID Server and the target without having to run the activity in a workflow context. For details, see Test Probe activity designer template inputs on page 1508.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

![Probe execution command](image)

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_discovery_payload_size</td>
<td>$(activityInput.maxDiscoveryPayload)</td>
</tr>
<tr>
<td>max_exec_payload_size</td>
<td>$(activityInput.maxExecPayload)</td>
</tr>
<tr>
<td>must_sudo</td>
<td>$(activityInput.mustSudo)</td>
</tr>
<tr>
<td>strung/ai</td>
<td>$(activityInput.iaString)</td>
</tr>
</tbody>
</table>

**Figure 372: Probe execution command**
Table 822: Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test Probe activity designer template inputs

You can test the input parameters of a custom Probe activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, a Linux - CPU probe, configured to authenticate on the host with sudo, returned CPU information about the host.
4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory input variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
   - Reset default values: Replaces any test values set in this form with the default values, if they are present.
   - Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.
If all the credentials available to the activity fail, and the activity cannot authenticate on the target, a message describing the failure appears in the debugMessages tab. The format of the message is identical for all provider templates and displays the target IP address, the credential type (SSH in this example), and the details of all failed credentials, expressed as a JSON string.

None of the credentials are valid for this host. Provide the correct credentials.

"debug_info": [{"credential_type": "SSH"},
{"credential_type": "root"},
{"credential_type": "100"},
{"credential_type": "6383e9913b422003e5f6f32244b0e1"},
{"credential_type": "ssh"},
{"credential_type": "false"},
{"credential_type": "a587cdede8b7b222003f6d177f434de4"},
{"key_to_target_blacklist": true},
{"connection_parameters": [{"credential_type": "SSH Password", "SSH Private Key"}, "target": "10.0.217.131"]}]

Figure 374: Debug payload for blacklisted credentials

This MID Server stores the failed credentials in a blacklist cache for a period of 5 minutes. If you repeat the test within this time period, the credential debugger does not display the failed credentials and indicates that blacklisting is being applied. However, if you add or modify a credential for that provider template during the 5 minute blacklist window, and if all credentials are invalid, a test displays the entire list of failed credentials. After the 5 minutes has expired, any new attempt to re-run the invalid credentials results in a full listing. The value of the blacklist cache interval cannot be changed.
7. Click Save for parsing rules to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

8. Click the X in the upper right corner of the window to close it.

Probe template pre-processing fields
Use the Pre Processing form of the activity designer to define a script to run before the activity executes.

Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: activityInput.variable. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

Logging

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

Important: To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
You use execution parameters to create the input process script in the Pre Processing form.

For descriptions of the command fields, see Configure the Probe execution command on page 1506.

**Note:** You must use the executionParam. prefix with all variables in this table.

### Table 823: Probe activity execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>probe</td>
<td>Reference</td>
<td>The sys_id of the MID Server probe.</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target host</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JS object</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array. This assigns additional parameters to the message: var newParameter = {&quot;name&quot;:&quot;parameterName&quot;,&quot;value&quot;:&quot;parameterValue&quot;}; executionParam.parameters.push(newParameter);</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID server capabilities.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
</tbody>
</table>

**Probe template outputs**

Probe output variables contain values returned from an endpoint that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see Activity designer variables on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see Orchestration activity parsing rules on page 1376.
Table 824: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

Probe template post-processing fields
Use the Post Processing form of the activity designer to define a script to run after the activity executes.

Post-processing fields
To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: activityInput.variable. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

Logging
Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

Important: To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- ActivityLogger.debug("Post Processing Log Message");
- ActivityLogger.info("Post Processing Log Message");
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

**Figure 376: ActivityLogger API**

**Probe template post-processing parameters**

Use these parameters to create a post-processing script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
</tbody>
</table>

**Probe template conditions**

Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:
Table 826: Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>

SSH activity designer

The Secure Shell (SSH) template extracts data from a target host that uses the SSH network protocol.

You must purchase Orchestration on page 1181 to use the SSH template.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376
Create an SSH activity

Use these instructions to create a custom SSH Orchestration activity.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the SSH template.

The template opens in the General stage.
5. Complete the fields shown in the table.

### Table 827: Fields common to all activity designer templates

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Protection policy</td>
<td>Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:</td>
</tr>
<tr>
<td></td>
<td>• None: Script is unprotected.</td>
</tr>
<tr>
<td></td>
<td>• Read-only: Script is in plain text, but read-only.</td>
</tr>
<tr>
<td></td>
<td>• Protected: Script is encrypted and read-only.</td>
</tr>
<tr>
<td>Important:</td>
<td>Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current <code>scope</code> set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>

<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

*Create SSH template input variables*

Use the Inputs form of the activity designer to create variables to pass into the SSH activity.

You must name your activity in the General form before you can advance to the Inputs stage.

Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.

   The designer creates a default variable called Input1.
2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:

Table 828: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon.

6. To delete a variable, click the delete icon in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

*Configure the SSH execution command*

Use the input variables you created to configure the command that Orchestration executes on the host target.

Create the input variables you need in the Inputs form before you advance to the Execution Command stage.

Role required: activity_creator, admin

*Note:* You can test the SSH connection between the MID Server and the target without having to run the activity in a workflow context. For details, see Test SSH activity template inputs on page 1524.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
### Table 829: SSH activity inputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create variables</em> to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that is supported by the SSH command line. For more information, see Advanced SSH script options below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The Orchestration <em>credential tag</em> to use when running the command.</td>
</tr>
<tr>
<td>Select MID Server by capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities</td>
</tr>
<tr>
<td>Long running</td>
<td>Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>Check box to allow the use of <em>sudo</em> to run commands.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

**Test SSH activity template inputs**

You can test the input parameters of a custom SSH activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: *web_service_admin, activity_admin, activity_creator*

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.
**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, a Files Compare SSH activity compares two files specified as input variables.

![Fill in your test values](image)

**Figure 379: Testing input variables**

4. Filter the variable list with these controls:
   - All Inputs: Displays all input variables. This is the default view.
   - Mandatory Inputs: Displays only mandatory input variables.
   - Inputs Without Defaults: Shows input variables that do not have assigned default values.

5. Reset values as needed.
- Reset default values: Replaces any test values set in this form with the default values, if they are present.
- Clear values: Clears all values in the input variable list, even if default values exist.

6. When your test values are configured correctly, click OK.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.

![Response window](image)

Figure 380: Input test payload

If all the credentials available to the activity fail, and the activity cannot authenticate on the target, a message describing the failure appears in the debugMessages tab. The format of the message is identical for all provider templates and displays the target IP address, the credential type (SSH in this example), and the details of all failed credentials, expressed as a JSON string.
This MID Server stores the failed credentials in a blacklist cache for a period of 5 minutes. If you repeat the test within this time period, the credential debugger does not display the failed credentials and indicates that blacklisting is being applied. However, if you add or modify a credential for that provider template during the 5 minute blacklist window, and if all credentials are invalid, a test displays the entire list of failed credentials. After the 5 minutes has expired, any new attempt to re-run the invalid credentials results in a full listing. The value of the blacklist cache interval cannot be changed.

Figure 382: Debug payload for blacklisted credentials

7. Click Save for parsing rules to copy the entire payload to the parsing rules.
This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.
Click the X in the upper right corner of the window to close it.

**SSH template pre-processing fields**

Use the Pre Processing form of the activity designer to define a script to run before the activity executes.

### Pre-processing fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: <code>activityInput.variable</code>. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the <code>executionParam.variable_name</code> execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

### Logging

Activity designers can add logging to the pre-processing using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
Figure 383: ActivityLogger API

**SSH template execution parameters**

Use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the command fields, see *Configure the SSH execution command* on page 1522.

**Note:** You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target or host.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Comment to run on the host.</td>
</tr>
<tr>
<td>Directory</td>
<td>directory</td>
<td>String</td>
<td>Directory on the host in which to run the command.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------</td>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
<tr>
<td>Long running</td>
<td>long_running</td>
<td>Boolean</td>
<td>Indicates whether or not the command is long running. A value of true indicates that the command is long running.</td>
</tr>
<tr>
<td>Must sudo</td>
<td>must_sudo</td>
<td>Boolean</td>
<td>Indicates whether or not this activity must use sudo to run root commands. A value of true indicates that sudo must be used.</td>
</tr>
</tbody>
</table>

**SSH template outputs**

SSH output variables contain values returned from an endpoint that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see *Activity designer variables* on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see *Orchestration activity parsing rules* on page 1376.

Table 831: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
</tbody>
</table>
### Field  Output  Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**SSH template post-processing fields**

Use the Post Processing form of the activity designer to define a script to run after the activity executes.

### Post-processing fields

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: <code>activityInput.variable</code>. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

### Logging

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`
Figure 384: ActivityLogger API

SSH template post-processing parameters
Use these parameters to create a post-processing script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains the output returned from the SSH command.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages retrieved from the SSH command. This value is null if there are no error messages.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>--------</td>
<td>----------</td>
<td>-------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Tags   | tags     | Hashmap of tag values returned from the SSH command | Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%tagname%% ... %`. Set up the command using the following format:  
`%%tagname1%% output1 line 1 output1 line 2 ... %`
`%%tagname2%% output2 line 1 output2 line 2 ... %`

The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the `tagname`.  

```
{"__text__": "",  
"tagtagname1":"output1 line1
output1 line2
",
"tagtagname2":"output2 line1
output2 line2
"}
```

**SSH template conditions**

Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

**Table 833: Sample activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Condition</td>
<td>Evaluation</td>
</tr>
<tr>
<td>-----------</td>
<td>------------</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>

**Run Script activity designer**

Use the Run Script template to create an activity that runs any script.

This activity is identical to the Run Script activity provided in the core system, with the advantages of a custom activity. You must purchase Orchestration on page 1181 to use the Run Script template.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer on page 1359
- Activity designer variables on page 1368
- Orchestration activity parsing rules on page 1376

**Create a run script activity**

Use these instructions to create a custom Run Script Orchestration activity.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the Run Script template.

5. Complete the fields shown in the table.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
</tbody>
</table>
| Protection policy| Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:  
  - None: Script is unprotected.  
  - Read-only: Script is in plain text, but read-only.  
  - Protected: Script is encrypted and read-only.  
  **Important:** Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only. |
| Execution template| Predefined template selected for this activity.                              |
| Application      | Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor. |
| Accessible from  | Accessibility setting for this activity, by scope. The following options are available:  
  - All application scopes: This activity is available to all application scopes.  
  - This application scope only: Use of this activity is restricted to the scope named in the Application field. |
| Category         | Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy. |
| Description      | Detailed description of the activity.                                       |

6. Use the variable builder in the Inputs tab to create variables to pass into the script that the activity runs.
   For more information, see *Map an input variable* on page 1369.
7. Create variables in the Outputs tab that contain values returned from the execution script that are available to other activities in a workflow.

   For more information, see Activity designer variables on page 1368.

8. Create a script for this activity to execute.

   You can access the activityInput and activityOutput variables by using activityInput.variableName and activityOutput.variableName, respectively.

Create Run Script template input variables
Create the variables to pass into the Run Script activity in the Inputs form of the activity designer.

You must name your activity in the General form before you can advance to the Inputs stage.
Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   The designer creates a default variable called Input1.

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (▲▼).

6. To delete a variable, click the delete icon (🗑️) in the row.

7. Click Continue to advance to the Outputs stage.

Run Script output variables

For details about creating data structures using output variables, see Activity designer variables on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see Orchestration activity parsing rules on page 1376.

Table 836: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of an output variable that this activity passes.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

Run Script template processing script

Table 837: Run Script processing script

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing script</td>
<td>Script that the activity runs.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the processing script with this syntax: activityInput.variable.</td>
</tr>
</tbody>
</table>

**Run Script template conditions**
Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

**Table 838: Sample activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>
JMS activity designer

Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

You must purchase Orchestration on page 1181 to use this template. For specific information about using the tools in the activity designer, refer to these resources:

• Orchestration activity designer on page 1359
• Activity designer variables on page 1368
• Orchestration activity parsing rules on page 1376

The ServiceNow JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

• Use JNDI to find a ConnectionFactory object.
• Use JNDI to find one or more destination objects.
• Use the connection factory to create a JMS connection object.
• Use the JMS connection to create one or more JMS session objects.
• Use a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
• Start the JMS connection to enable delivery or consumption of messages.

Note: To connect to a JMS provider, refer to your third party user documentation.

The JMS activity designer has been tested with these providers:

• ActiveMQ
• Tibco EMS
Configure an instance to use JMS

Use this procedure to prepare your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Role required: admin

Ensure that the MID Server has the correct JMS connection factories for your organization. Configure those values in the mid.property.jms.command.allowed_factory_names property, found in MID Server Properties. The default values for this property can be changed to any value or comma separated list of values that the 3rd party JMS provider advertises.

1. Navigate to MID Server JAR Files.
2. Click New.
3. Upload the JMS driver jar file, using the procedures in Synchronize a JAR file to MID Servers on page 1166.

   The JMS driver jar file should be available as part of JMS Provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS Provider documentation to determine which JMS client driver jar files are required by the client applications to connect to the JMS Provider. For example, if you are trying to connect to ActiveMQ V5.10, (JMS Provider), you need the activemq-all-5.10.1.jar file.

4. Navigate to Orchestration Definition JMS Connection Factory.
5. Click New.
6. Complete the form using the fields from the table.
Table 839: JMS connection factory

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. Using this Initial Context Factory, various JMS objects, such as JMS Connection, are created. For example, to connect to ActiveMQ V5.10, (JMS Provider), the value in this field would be org.apache.activemq.jndi.ActiveMQInitialContextFactory</td>
</tr>
<tr>
<td>Provider URL</td>
<td>Location of the running JMS Provider installation. The information in this URL tells JNDI how to find and access the JMS Provider. An example value for connecting to ActiveMQ V5.1, is tcp://ipAddressOrHostName:61616</td>
</tr>
</tbody>
</table>

7. Click Submit.
8. Navigate to Orchestration Credentials.
9. Click New.
10. In the list of credential types, select JMS Credentials.
11. Provide the user name and password the MID should use to communicate with the JMS provider. For more information, see JMS credentials on page 836.
12. Click Submit.
   You are now ready to create a custom JMS activity.

Create a JMS activity

Use these instructions to create a custom JMS Orchestration activity.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see Create custom activities on page 1361

1. Navigate to Workflow Workflow Editor.
2. In the workflow palette, select the Custom tab.
3. Click the + icon.
4. Select the JMS template.
The template opens in the General stage.

![Diagram showing Custom Activities with various options like SOAP Web Service, JDBC, JavaScript Probe, Powershell, SAP JCo, REST Web Service, SFTP, SSH, JMS, System Center Configuration Manager (SCCM), SFTP File Transfer, and SSH.]

**Figure 386: Activity designer stage indicator**

5. Complete the fields shown in the table.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the workflow editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Protection policy</td>
<td>Setting that controls access to the code in the Pre Processing and Post Processing script fields of this activity. Use these settings to protect your intellectual property:</td>
</tr>
<tr>
<td></td>
<td>• None: Script is unprotected.</td>
</tr>
<tr>
<td></td>
<td>• Read-only: Script is in plain text, but read-only.</td>
</tr>
<tr>
<td></td>
<td>• Protected: Script is encrypted and read-only.</td>
</tr>
<tr>
<td>Important:</td>
<td>Make sure to set this field properly before submitting the record. After you save the activity, this field becomes read-only.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td>Application</td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the workflow editor.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

6. Click Continue to advance to the Inputs stage.

*Create JMS template input variables*
Use the Inputs form of the activity designer to create JMS variables to pass into the activity.
You must name your activity in the General form before you can advance to the Inputs stage.
Roles required: activity_admin, activity_creator

**Note:** Variable strings in the Inputs form have a 255 character limit.

1. Click the + icon to create a new input variable.
   The designer creates a default variable called Input1.

   ![Input variable creation](image)

   - Type your new variable name in the field.
   - To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
   - Configure your variable using these fields:
Table 841: Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

When you select a row to move it, the pointer icon changes to an up/down arrow icon (étique).

6. To delete a variable, click the delete icon in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

Configure the JMS execution command

Use the input variables you created to configure the command that Orchestration executes on the JMS provider.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see Test JDBC activity template inputs on page 1420.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
### Table 842: JMS execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input</strong></td>
<td>Input variable builder. <em>Create variables to map</em> to available fields.</td>
</tr>
<tr>
<td><strong>Connection factory</strong></td>
<td>Connection factory that is configured to connect to a JMS provider. This value contains the name of the initial context factory and the URL of the JMS provider location.</td>
</tr>
<tr>
<td><strong>Destination type</strong></td>
<td>Type of destination used for this message. The choices are:</td>
</tr>
<tr>
<td></td>
<td>• Queue: Message is queued for point-to-point communications. Get operation is only supported for the Queue destination type.</td>
</tr>
<tr>
<td></td>
<td>• Topic: Message is used for publish and subscribe communication.</td>
</tr>
<tr>
<td><strong>Destination name</strong></td>
<td>Name of the queue or topic destination that is configured on the JMS provider.</td>
</tr>
<tr>
<td><strong>Message type</strong></td>
<td>Type of the message. This is the same as the JMS message type value. Currently, only the TextMessage type is supported. Make sure that a queue or topic destination is configured to receive or send only TextMessage. Other message types are dropped, since the JMS Activity cannot process them.</td>
</tr>
<tr>
<td><strong>Operation</strong></td>
<td>The programatic operation to perform on the destination. The choices are Put and Get.</td>
</tr>
<tr>
<td><strong>Timeout (Secs)</strong></td>
<td>Allowed time to wait for a message in the message queue before it times out, in seconds. The default is 30.</td>
</tr>
<tr>
<td><strong>Custom message headers</strong></td>
<td>Custom header values in a name/value pair format, that is available on the JMS destination</td>
</tr>
<tr>
<td><strong>Message payload</strong></td>
<td>Actual message content or payload that is sent to the JMS destination.</td>
</tr>
<tr>
<td><strong>Credential tag</strong></td>
<td>Specific <em>credential tag</em> this activity must use to run JMS commands on the host.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>

3. Click Save.
4. Click Continue to advance to the Outputs stage.

Test JMS activity template inputs
You can test the input parameters of a custom JMS activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

**Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint or host and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star. In this example, the destination name in the JMS activity is a variable. When the variable is provided with a queue name, it returns the content of the message on that queue.

   ![Fill in your test values](image)

   - **Input Source**: `activityInput.queueName`
   - **Substitute Value**: `IncidentQueue`

4. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This is the default view.
   - **Mandatory Inputs**: Displays only mandatory input variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

5. Reset values as needed.
   - **Reset default values**: Replaces any test values set in this form with the default values, if they are present.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.
6. When your test values are configured correctly, click OK. The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the Raw Output window.

```
"messagePayload": "Message with some header value",
"errorMessages": null,
"standardHeaders": "(JMSMessageID=ID:MSANIT1000025-60071-1436479117566-5:1:1:1:1, JMSExpiration=0, JMS
edelivered=true, JMSDeliveryMode=2, JMSPriority=4, JMSTimestamp=1436479633056)",
"status": "success",
"customheaders": "{JMSXDeliveryCount=2, routing_param=incident}",
"cccSysId": "5a4cc5618f110200f58e5f2a37bdec5e"
```

If all the credentials available to the activity fail, and the activity cannot authenticate on the target, a message describing the failure appears in the debugMessages tab. The format of the message is identical for all provider templates and displays the target IP address, the credential type (SSH in this example), and the details of all failed credentials, expressed as a JSON string.
This MID Server stores the failed credentials in a blacklist cache for a period of 5 minutes. If you repeat the test within this time period, the credential debugger does not display the failed credentials and indicates that blacklisting is being applied. However, if you add or modify a credential for that provider template during the 5 minute blacklist window, and if all credentials are invalid, a test displays the entire list of failed credentials. After the 5 minutes has expired, any new attempt to re-run the invalid credentials results in a full listing. The value of the blacklist cache interval cannot be changed.

```

null,
"errorMessages": "SSHCommand: Target is blacklisted. No valid credential found for types [SSH Password, SSH Private Key]",
"debugMessages": "None of the credentials are valid for this host. Provide the correct credentials."
"debug_info": "["10.0.217.131"]",
"credentials_attempted": "["credential_type": "SSH",
"credential_name": "root", "connection_parameters": "["credential_type": "SSH Private Key","target": "10.0.217.131"]",
"credentials_valid": "true", "credentials_exception": "false", "connection_exception": "false", "connection_parameters": "null"
"
```

Figure 388: Credential debug message

7. Click Save for parsing rules to copy the entire payload to the parsing rules.

This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

```

"output": null,
"errorMessages": "SSHCommand: Target is blacklisted. No valid credential found for types [SSH Password, SSH Private Key]",
"debugMessages": "None of the credentials are valid for this host. Provide the correct credentials."
"debug_info": "["10.0.217.131"]",

"credentials_valid": "true", "credentials_exception": "false", "connection_exception": "false", "connection_parameters": "null"
"
```

Figure 389: Debug payload for blacklisted credentials
8. Click the X in the upper right corner of the window to close it.

_JMS template pre-processing fields_

Use the Pre Processing form of the activity designer to define a script to run before the activity executes.

**Pre-processing fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: <code>activityInput.variable</code>. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the <code>executionParam.variable_name</code> execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the pre-processing using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is `ACTIVITY`.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info("Pre Processing Log Message");`
- `ActivityLogger.warn("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`
Enter a script to run after the input variable substitutions and before the activity executes. Click variables in the panel on the right have them substituted at the cursor.

```
ActivityLogger.info("Pre Processing Log Message");
```

**Figure 390: ActivityLogger API**

**JMS template execution parameters**

You use execution parameters to create the input process script in the Preprocessing form.

For detailed descriptions of the JMS execution command fields, see *Configure the JMS execution command* on page 1547.

**Note:** You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jms ds</td>
<td>jms_ds</td>
<td>Reference</td>
<td>Selected JMS data source.</td>
</tr>
<tr>
<td>Destination type</td>
<td>destination_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Destination name</td>
<td>destination_name</td>
<td>String</td>
<td></td>
</tr>

</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td></td>
</tr>
</tbody>
</table>
Istanbul    ServiceNow    Now Platform Capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| ValueCapabilities   | valueCapabilities | Array of hashmap    | Capability values used to select the MID Server. For more information, see MID Server capabilities on page 1179. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  
```javascript
var valueCapability =
  {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
executionParam.valueCapabilities.push(valueCapability);
```

**JMS template outputs**

JMS output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

For details about creating data structures using output variables, see Activity designer variables on page 1368. These variables can be mapped to all or part of the data returned from a selected payload. For details about mapping output variables to payload data, see Orchestration activity parsing rules on page 1376.

Table 844: Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

**JMS template post-processing fields**

Use the Post Processing form of the activity designer to define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
</tbody>
</table>
### Variables

Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: `activityInput.variable`. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: <code>activityInput.variable</code>. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

## Logging

Activity designers can add logging to the post-processing script using the ActivityLogger API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to true.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

![Figure 391: ActivityLogger API](image)
**JMS template post-processing parameters**
Use these parameters to create a post-processing script.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>status</td>
<td>String</td>
<td>Status of the operation (Put or Get) on the JMS destination.</td>
</tr>
<tr>
<td>StandardHeaders</td>
<td>standardHeaders</td>
<td>String</td>
<td>All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>CustomHeaders</td>
<td>customHeaders</td>
<td>String</td>
<td>All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>MessagePayload</td>
<td>messagePayload</td>
<td>String</td>
<td>Message payload that is obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains any error messages retrieved from the JMS command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

**JMS template conditions**
Create the exit conditions for your activity in the Condition column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an Else value set to true until all conditions with an Else value set to false are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for Else is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.
The following are possible conditions you might create for an activity:

### Table 846: Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. Else is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. Else is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. Else is set to true.</td>
</tr>
</tbody>
</table>

---

**Employee Orchestration**

Employee Orchestration retrieves new employee information from Workday during the onboarding process and updates the ServiceNow sys_user table automatically.

The ServiceNow instance receives a notification from Workday that a new employee has been added. Orchestration analyzes the notification and extracts the identification number of the new employee. Email triggers on the instance launch a workflow containing *Workday activities* that are configured to retrieve additional information about the new employee. The instance uses this information to create a new sys_user record for the employee or update an existing record.
This process requires configuration on Workday to send onboarding notifications to the ServiceNow instance. Orchestration identifies notifications from a preconfigured Workday source and extracts the ID number of the new employee from delimited text specified in system properties. Configured values on both Workday and the ServiceNow instance must match for the exchange of information to occur.

Activate Employee Orchestration

Employee Orchestration requires the Orchestration - Workday plugin (com.snc.orchestration.workday), which is available by request with a subscription to Orchestration.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

3. Click Submit.

Create the Workday credential

The Workday credential allows Orchestration activities to retrieve employee information from Workday.

Role required: admin

1. Navigate to Employee Orchestration Workday Credential.
   The WS-Security Username Profiles form appears, prepopulated for the Workday Orchestration application. If the instance is in any other scope, the form is read-only.
2. To enable editing of the form, click the link at the top.
3. Update the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifying name for this credential. For example, you might enter Workday.</td>
</tr>
<tr>
<td>Username</td>
<td>Workday user who has integration rights using Workday Web Services. For example, you might enter workday_username.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the workday_username user.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this credential record. This field is not editable.</td>
</tr>
</tbody>
</table>

4. Click Update.

Configure Workday notifications

You must configure Workday to send notifications to the ServiceNow instance when a new employee is hired, using values that allow the instance to extract the employee identification number.

Administrative privileges on Workday.

Consult the Workday documentation for instructions on performing these procedures.

Important: The values configured in the Workday notification must match values configured on the ServiceNow instance. For details about configuring the ServiceNow instance to receive Workday
notifications and parse the data for the employee ID, see Employee Orchestration properties on page 1561.

1. Set up email alerts based on the completion of a process on Workday.
   a) In Notification Delivery Settings, ensure that Custom Business Process Notifications is enabled and set to Immediate.
   b) Go to your company's Hire business process and either add a new notification or open an existing notification for edit.
   c) Provide this information for the notification.

   **Table 848: Workday notification information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger on Status</td>
<td>Set to Completed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>Provide the email ID of the ServiceNow instance, such as <a href="mailto:acme@service-now.com">acme@service-now.com</a>.</td>
</tr>
<tr>
<td>Text</td>
<td>In the Message Content form, provide the Subject content. Employee Orchestration is configured to look for Workday Notification - Employee Hired in the subject line of the notification. This value must match the email trigger that launches the Employee Orchestration workflow.</td>
</tr>
<tr>
<td>Body</td>
<td>Define the delimiters containing the employee information that Workday will pass to the ServiceNow instance, and name the field containing the data. You can define any delimiters you want, such as #EmpStart# and #EmpEnd# delimiters. Select the Employee ID field as the source for the information. The delimiters you define here must match the values defined in the Workday Orchestration system properties.</td>
</tr>
</tbody>
</table>

2. Hire the person for an open position and provide information such as the employee's address and email ID.
   This is the data that the Employee Orchestration workflow returns to the instance and uses to populate the sys_user table.

**Employee Orchestration properties**

The Employee Orchestration properties allow a ServiceNow® instance to receive notifications from Workday and to parse the notification for new employee identification numbers.

These properties define important connection settings between the ServiceNow® instance and Workday. Notifications from Workday sent to the email IDs defined here are parsed for the employee ID contained within specified delimiters.
To configure these properties, navigate to Employee Orchestration Properties.

**Important:** The values in these properties must match values configured in the Workday notification. For details about configuring Workday to send expected values to a ServiceNow instance, see *Configure Workday notifications* on page 1560.

### Table 849: Workday properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workday.email.body.delimiter.start</td>
<td>Email body delimiter start. This is the starting delimiter that sets off the data in a Workday notification that the ServiceNow instance uses to retrieve information about a new employee. For example, you might use #EmpStart#.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: null</td>
</tr>
<tr>
<td>workday.email.body.delimiter.end</td>
<td>Email body delimiter end. This is the ending delimiter that sets off the employee ID in the Workday notification that the ServiceNow instance uses to retrieve information about a new employee. For example, you might use #EmpEnd#.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: null</td>
</tr>
<tr>
<td>workday.email.sender</td>
<td>List of comma separated email IDs. Workday uses these email IDs to send notifications to the ServiceNow instance when new employees are hired.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: null</td>
</tr>
</tbody>
</table>

### Create a Workday email trigger

An email trigger runs an Employee Orchestration workflow when a specific value appears in a Workday notification subject line.

Role required: admin

An email trigger must match the appropriate subject line of an onboarding Workday notification. For example, you can create a trigger that launches the User Provisioning workflow when the ServiceNow instance receives a notification with Workday Notification - Employee Hired in the subject line.

1. Navigate to Employee Orchestration Email triggers and click New.
2. In the Email Subject Line field, enter the content of a Workday notification subject line that you want to use to trigger the User Provisioning workflow.
3. Select a Notification Type of Onboard.

© 2018 ServiceNow. All rights reserved.
Create a new notification type

You can add new Workday notification types to your instance.
Role required: admin

If you add notification types, they must match the Workday notifications exactly. Also, each notification type must be accompanied with a workflow capable of updating ServiceNow® records using the data retrieved from Workday.

1. Navigate to Employee Orchestration Email Triggers and click New.
2. In the new record, add the exact name of the Workday notification you want to have trigger the workflow in the Email Subject Line field.
   For example, you might enter Life Event - Change of Address.
3. Save the record.
4. Right-click the label in the Notification Type field.
5. In the context menu that appears, select Configure Choices.

Figure 393: Workday email trigger

4. Click Submit.
The choice selection lists appear in read-only format.

6. To edit the choice list, click the link in the notice in the header bar.

7. Enter a logical name for the new notification type in the Enter new item field. For example, you might enter Change of address.

8. Click Add.
Figure 396: Adding a new notification type

The system adds the new choice to the Selected list.

9. Click Save to save your new type.

10. In the Email Trigger form, select the new type from the choices in the Notification Type field.
11. Click Update.

**Workday notifications log**

Orchestration keeps a log record of all inbound emails from Workday regarding employee onboarding activities.

Workday notification records show all the information received from Workday for an employee onboarding event. The employee ID of the new employee is contained within delimiters that the ServiceNow instance is configured to recognize. The value in the notification's subject line is configured to trigger the *Orchestration workflow* that retrieves additional employee information from Workday. To access notification records, navigate to Employee Orchestration Notifications.
Delimited content containing the Workday employee ID

Workday email ID configured in system properties

Email trigger that launches the Workday Orchestration workflow
Employee Orchestration workflow

Employee Orchestration provides a default workflow that retrieves employee information from Workday, and then uses that information to update a ServiceNow sys_user record and create an Active Directory account.

The User Provisioning workflow is included with Workday Orchestration. This workflow includes Workday and Active Directory activities that retrieve employee information from Workday, based on the employee's identification number. The workflow then uses this information to create an Active Directory account for the new employee and to ensure that an up-to-date ServiceNow user record exists for that employee.
Figure 398: User Provisioning workflow

Orchestration applications

Orchestration provides several applications with your subscription.
Orchestration ROI

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics Premium to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

**Note:** When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

**Create Orchestration ROI labor rate cards**

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to Orchestration ROI Labor Rate Cards.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click Submit.
4. Create additional rate cards as needed.

**Create an Orchestration ROI automation entry record**

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate labor rate cards were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings:** Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings:** Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to Orchestration ROI Automation Entry Form.
2. Fill in the fields on the form, as appropriate.

### Table 850: Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>• Access &amp; Identity Management</td>
</tr>
<tr>
<td></td>
<td>• Datacenter Automation</td>
</tr>
<tr>
<td></td>
<td>• IT Service Management</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
<tr>
<td>Note</td>
<td>To create a category, open the dictionary record for the Automation Entry Form [automation_entry_form] table and add an option to the choice list.</td>
</tr>
<tr>
<td>Item</td>
<td>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as Password Reset.</td>
</tr>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>
</tr>
<tr>
<td>Associated Workflows</td>
<td>Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.</td>
</tr>
<tr>
<td>Estimated Duration (min) per Task</td>
<td>Estimated time to perform this task manually.</td>
</tr>
<tr>
<td>Estimated Volume per Month</td>
<td>Estimated number of times needed to perform this task manually per month.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Start time</td>
<td>Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>End time</td>
<td>End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>Calculated average duration per task (min)</td>
<td>Actual time required to perform this task manually.</td>
</tr>
</tbody>
</table>
### Field Description

| Calculated average volume per month | Actual average number of times this task is performed manually per month. |

3. **Select one of these submission options:**
   - Submit: Saves the record to the table without running any calculations.
   - Submit and process now: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

### Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

**Role required:** orchestration_manager

Before starting this procedure, make sure you have created *labor rate cards* and the appropriate *automation entry records* for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- [Subcategory] [is] [Employee OnBoarding]
- [Sort description] [contains] [new employee]

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. Navigate to Orchestration ROI Task Correlation Correlated Tasks Rules.
2. Click New.
3. Fill in the fields on the form, as appropriate.

### Table 851: Automation entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
</tbody>
</table>
### Read-only fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processed on</td>
<td>Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.</td>
</tr>
</tbody>
</table>

4. Select one of these submission options:
   - Submit: Saves the record to the table without running any calculations.
   - Submit and process now: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.

5. To view a rule, select the link in the Table column of the Correlated Tasks Rules related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to Orchestration ROI Task Correlation Correlated Tasks.

7. To view the list of tasks that match this rule in the system, click Correlated Tasks under Related Links in this form.

### Configure the time range for Orchestration ROI calculations

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

**Role required:** orchestration_manager

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. Navigate to Orchestration ROI Task Correlation Time Range for Calculated Averages.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click Calculate to recalculate the ROI based on the new time range and to save your settings.

### Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

**Tables installed with Orchestration ROI**

Orchestration - ROI adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings [run_rate_predicted_savings]</td>
<td>Contains the data for the reports in Orchestration ROI Reports Predicted Savings.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Savings Report</td>
<td>Contains the number of automations that have been run before the date specified in the Processed On column, based on:</td>
</tr>
<tr>
<td>[savings_report]</td>
<td>• Each automation entry’s associated workflows</td>
</tr>
<tr>
<td></td>
<td>• Estimated savings based on the estimated duration per task.</td>
</tr>
<tr>
<td></td>
<td>• Calculated savings based on calculated duration.</td>
</tr>
<tr>
<td>Detailed Savings Report</td>
<td>Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation’s run date and savings for that automation.</td>
</tr>
<tr>
<td>[detailed_savings_report]</td>
<td></td>
</tr>
<tr>
<td>Automation Entries</td>
<td>Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.</td>
</tr>
<tr>
<td>[automation_entry_form]</td>
<td></td>
</tr>
<tr>
<td>Roadmap Planning</td>
<td>Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.</td>
</tr>
<tr>
<td>[roadmap_planning]</td>
<td></td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Contains all matching manual tasks for each automation entry. Each task’s information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.</td>
</tr>
<tr>
<td>[manual_mapping_records]</td>
<td></td>
</tr>
<tr>
<td>Correlated Tasks Rules</td>
<td>Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.</td>
</tr>
<tr>
<td>[manual_mapping_conditions]</td>
<td></td>
</tr>
</tbody>
</table>

**Plugins installed with Orchestration ROI**

These plugins are installed with the Orchestration - ROI plugin, if they are not already active.
Table 853: Plugins for Orchestration ROI

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost Management</td>
<td>Provides the labor rate cards Orchestration ROI uses to determine the savings for each automated task. See Cost Management for more information.</td>
</tr>
</tbody>
</table>

User roles installed with Orchestration ROI

These roles are installed with the Orchestration - ROI plugin.

Orchestration - ROI adds the following roles.

Table 854: Roles for Orchestration - ROI

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration manager</td>
<td>Manages all activities in the Orchestration ROI module.</td>
<td>• pa_admin</td>
</tr>
<tr>
<td>[orchestration_manager]</td>
<td></td>
<td>• report_admin</td>
</tr>
</tbody>
</table>

UI actions installed with Orchestration ROI

Orchestration - ROI adds the following UI actions.

Table 855: UI actions for Orchestration - ROI

<table>
<thead>
<tr>
<th>UI action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Savings Report</td>
<td>Automation Entry Form [automation_entry_form]</td>
<td>Displays the savings report specific to this automation entry, if the associated workflows are not empty.</td>
</tr>
<tr>
<td>Estimated and Projected</td>
<td>Automation Entry Form [automation_entry_form]</td>
<td>Displays the estimated savings, based on the estimated duration of the task, and calculated savings, based on the calculated duration of the task.</td>
</tr>
<tr>
<td>Submit AND process now</td>
<td>Automation Entry Form [automation_entry_form]</td>
<td>Processes this new entry</td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Correlated Tasks Rules [manual_mapping_conditions]</td>
<td>Displays all matching tasks from the Correlated Tasks [manual_mapping_records] table.</td>
</tr>
<tr>
<td>Detailed Savings Report</td>
<td>Automation Entry Form [automation_entry_form]</td>
<td>Displays the list of automations that have been run, based on associated workflows.</td>
</tr>
</tbody>
</table>
### UI action

<table>
<thead>
<tr>
<th>Task</th>
<th>Correlated Tasks [manual_mapping_records]</th>
<th>Displays the task record.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submit AND process now</td>
<td>Correlated Tasks Rules [manual_mapping_conditions]</td>
<td>Processes a correlated task rule. This action performs matching on the specified table and the filter conditions.</td>
</tr>
</tbody>
</table>

**Script includes installed with Orchestration ROI**

Orchestration - ROI adds the following script includes.

#### Table 856: Script includes for Orchestration ROI

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OrchestrationROIAjax</td>
<td>Script that calculates the actual duration and volume of a task.</td>
</tr>
<tr>
<td>OrchestrationROI</td>
<td>Script that calculates the number of workflow contexts, looks up all matching tasks, calculates savings, and other functions used in the UI actions.</td>
</tr>
<tr>
<td>ROIDemoDataUtil</td>
<td>Script that updates demo data timestamps.</td>
</tr>
</tbody>
</table>

**Client scripts installed with Orchestration ROI**

Orchestration ROI adds the following client scripts.

#### Table 857: Client scripts for Orchestration ROI

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display info for processing rules</td>
<td>Correlated Tasks Rules [manual_mapping_conditions]</td>
<td>Displays annotation on the Correlated Task Rule form advising that new task rules are not evaluated until the time specified in the ROI schedule.</td>
</tr>
</tbody>
</table>

**Business rules installed with Orchestration ROI**

Orchestration ROI adds the following business rules.

#### Table 858: Business rules for Orchestration ROI

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete corresponding records</td>
<td>Automation Entry Form [automation_entry_form]</td>
<td>When a record is deleted from the Automation Entry Form [automation_entry_form] table, this business rule deletes all records in other ROI tables that reference this entry.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Insert into Run Rate &amp; Savings</td>
<td>Automation Entry Form</td>
<td>When a new automation entry is provided, this business rule calculates the estimated savings, based on the estimated duration of a task and its associated labor rate card.</td>
</tr>
<tr>
<td>Insert into Savings Reports</td>
<td>Automation Entry Form</td>
<td>When a new automation entry is provided, this business rule inserts a new record into the Savings Report [savings_report] table with the automations_run field set to 0.</td>
</tr>
</tbody>
</table>

**Orchestration ROI reports**

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the *Orchestration - ROI Premium* plugin.

**Orchestration ROI standard reports**

The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes.

To access the ROI standard dashboard, navigate to *Orchestration ROI Reports Dashboard*.

**Summary tab**

The Summary tab contains four reports on automation categories.
Figure 399: ROI summary report sample
# Table 859: Standard ROI summaries by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual Tasks by Category Over Time</td>
<td>Trend of manual tasks by category over time. For example, if you use automations to perform a portion of the necessary tasks, the report shows the number of tasks still executed manually, decreasing over time.</td>
</tr>
<tr>
<td></td>
<td>• Type: Line chart</td>
</tr>
<tr>
<td></td>
<td>• Table: Detailed Savings Report</td>
</tr>
<tr>
<td></td>
<td>[detailed_savings_report]</td>
</tr>
<tr>
<td>Automations by Category Over Time</td>
<td>Trend of automated tasks by category over time. For example, this chart can show the increase in the number of automated tasks as a workflow automation rolls out slowly over time.</td>
</tr>
<tr>
<td></td>
<td>• Type: Line chart</td>
</tr>
<tr>
<td></td>
<td>• Table: Detailed Savings Report</td>
</tr>
<tr>
<td></td>
<td>[detailed_savings_report]</td>
</tr>
<tr>
<td>Automation Savings by Category Over Time (Uses Estimated Duration)</td>
<td>Amount of savings from automated tasks over time, based on the estimated duration of the task, the number of automations performed, and the cost from the labor rate card.</td>
</tr>
<tr>
<td></td>
<td>• Type: Line chart</td>
</tr>
<tr>
<td></td>
<td>• Table: Detailed Savings Report</td>
</tr>
<tr>
<td></td>
<td>[detailed_savings_report]</td>
</tr>
<tr>
<td>Automation Savings by Category Over Time (Uses Calculated Duration)</td>
<td>Amount of savings from automated tasks over time, based on the calculated duration of the task, the number of automations performed, and the cost from the labor rate card.</td>
</tr>
<tr>
<td></td>
<td>• Type: Line chart</td>
</tr>
<tr>
<td></td>
<td>• Table: Detailed Savings Report</td>
</tr>
<tr>
<td></td>
<td>[detailed_savings_report]</td>
</tr>
</tbody>
</table>

**Estimated Costs tab**

The Estimated Costs tab contains eight reports on estimated time and expense for automations.
Figure 400: ROI estimated time and expense report samples
Predicted Hours Spent Annually by Category (Uses Estimated Duration & Volume)

- Datacenter Automation: 4,080.00 hours (64.20%)
- IT Service Management: 1,500.00 hours
- Access & Identity: 500.00 hours
<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>

### Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

**Role required:** orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from System Scheduler Scheduled Jobs Scheduled Jobs and click Configure Job Definition. To execute the schedule directly from the job definition, click Execute Now

To control the running of the schedule job with the Orchestration properties:

1. Navigate to Orchestration ROI Properties.
2. Configure the following properties:
### Table 862: ROI schedule properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default: true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default: 24</td>
</tr>
</tbody>
</table>

3. Click Save to save your changes.

*Orchestration ROI premium reports*

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using Performance Analytics concepts. The Orchestration - ROI Premium plugin is dependent on the Performance Analytics - Premium plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics scheduled collection job before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to Orchestration ROI Reports Premium Dashboard.

**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.
Figure 402: Calculated savings monthly by category

Table 863: Premium reports for calculated savings over time by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Activate Orchestration ROI premium reports
To view the Orchestration ROI premium reports, you must activate the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin.
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

3. Click Submit.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Role required: orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

1. Navigate to Performance Analytics Data Collector Jobs.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the Active check box.
4. The scheduling options appear for the value selected in the Run field. For instructions on creating a schedule, see Schedule a data collection job.
5. To execute the schedule directly from the job definition, click Execute Now.
6. Click Update.

Client software distribution

The client software distribution (CSD) application allows administrators to distribute software from the service catalog using third party management systems.
Client software distribution allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom SCCM activity pack. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

Figure 404: Client Software Distribution process flow using SCCM
Activate client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.

The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution on page 1594.

**Note:** The Orchestration - Client Software Distribution plugin runs in its own application scope.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Installed with client software distribution

Several types of components are installed with client software distribution (CSD).

Tables installed with client software distribution

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Table 865: Client software distribution tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>

</thead>
<tbody>
<tr>
<td>Order Client Software</td>
<td>Runs automatically when a user orders software from the service catalog.</td>
</tr>
<tr>
<td>Deploy SCCM Application</td>
<td>Triggered by the Order Client Software workflow to deploy software through SCCM server. This workflow adds either the user or the device into the SCCM collection.</td>
</tr>
<tr>
<td>Revoke Client Software</td>
<td>Begins the software revocation process for software deployed by an external provider. Administrators run this workflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This workflow triggers the appropriate provider workflow that performs the actual revocation. For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td>Revoke SCCM Application</td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
</tbody>
</table>

### Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

**Role required:** sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

1. Navigate to Software Asset Software Licenses.
2. **Add a new software license** for the software model you used in CSD.
3. Navigate to Software Asset Reconciliation Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

**Client software distribution ordering process**

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.
**Lease start and end dates**

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the Lease start field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the Lease end field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The Lease end field is not mandatory and can be left blank to order software with no end date.

**Note:** For systems deploying software from Microsoft System Center Configuration Management (SCCM), the Lease end field is only available if the SCCM configuration specifies an uninstall collection.

**Software offered only to the logged in user**

If the software catalog item is configured with the Order on behalf of check box cleared, the User field does not appear on the order form. The logged in user selects the device on which to deploy the software from the Device to install this software on field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the Lease end field is not available.
If the software catalog item is configured with the Order on behalf of check box selected, the User field appears on the form. The logged in user can select any user from this field. The Device to install this software on field only lists the devices assigned to the user selected in the User field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the User field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to Service Catalog My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click OK. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.
Client software distribution from SCCM

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server
To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to Administration Security Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
Figure 408: Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select Connect via Windows PowerShell.

**Figure 409: Connect to PowerShell**

9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

_Update the SCCM cmdlet libraries_
Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

_WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version._

Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   - Per-user: Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0
   - Per-system: Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0

   **Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the Get-CMCmdletUpdateCheck command to refresh the console and check the settings.
6. Ensure that the value of the IsEnabled configuration variable has changed to False.
   This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the -IsUpdateCheckEnabled 1 command for either the current user or for the system.

### Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Role required:** admin

1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

### Create Windows credentials for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

**Role required:** sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to Orchestraton Credentials.
2. Click New.
3. In the list of credential types, select Windows Credentials.
4. Provide a user name and password with administrative rights on the SCCM server.

   **Important:** Ensure the following:
   - This user must have the Application Administrator role on the SCCM server.
• Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.
   For details, see Windows credentials on page 856.

6. Click Submit.

Retrieve SCCM data for client software distribution
Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:
• Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
• Configure a user with the Application Deployment Manager role on the SCCM server.
• Set up the MID Server to communicate with the SCCM server.
• Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:
1. Navigate to Client Software Distribution SCCM SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.
   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.
SCCM server Discovery for client software distribution
A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the Discover SCCM workflow from an SCCM Server Instance record to populate the following ServiceNow tables:

Table 871: SCCM data populated in ServiceNow tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM Application</td>
<td>• name</td>
</tr>
<tr>
<td>[sn_client_sf_dist_sccm_application]</td>
<td>• publisher</td>
</tr>
<tr>

</tr>
</tbody>
</table>
**Set up a software model for an SCCM application**

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See *Retrieve SCCM data for client software distribution* on page 1607 for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to Client Software Distribution SCCM SCCM Applications.
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.<info>

![SCCM Application record](image)

**Figure 411: SCCM application record**

4. To create a model, click Create Software Model under Related Links.
   a) Complete the software model fields.
      See for details.
   b) Click Submit.
      The view returns to the SCCM Applications form.

**Define an SCCM configuration**

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.
Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
Figure 412: SCCM table references

1. Navigate to Client Software Distribution SCCM SCCM Applications.
2. Open an application that has a configured software model.
3. Under Related Links, click Create Software Configuration.
4. Complete the form, using the fields in the table.
Figure 413: SCCM configuration form

Table 872: SCCM configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the install deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection | Name of the collection associated with the uninstall deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
  • Define a lease end date for deployed software.  
  • Allow lease extensions.  
  • Revoke software from a user's machine. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery model</td>
<td>Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user’s machine that the user is not entitled to use.</td>
</tr>
</tbody>
</table>

*Create a catalog item for an SCCM application*

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to Client Software Distribution SCCM SCCM Applications.
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under Related Links, click Create Catalog Item.
   A new SCCM Application Catalog Item record appears with preconfigured information. For information about common service catalog fields, see *Create or edit a catalog item.*
Catalog items are available to order software applications from the service catalog. Update name and short description to display for the item. Configure approval process, license check, order on behalf of, software configuration and other information as needed.

<table>
<thead>
<tr>
<th>Name</th>

</tbody>
</table>

Short description: Web file backup & sharing

Dropbox is a service that keeps your files safe, synced, and easy to share. Bring your photos, docs, and videos anywhere and never lose a file again.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Orchestration - Client Software Distribution plugin:

**Table 873: SCCM fields in the catalog item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the Order on behalf of field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the Skip approval check box to determine if the software item requires approval by the requester's manager.</td>
</tr>
<tr>
<td>Check license compliance</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Order on behalf of            | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the Skip approval check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
  - User: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
  - Device to install this sofware on: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.  
  - Lease start: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. |
| SCCM configuration           | Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server. |

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the Approved By Group related list. By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered, looking for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the Skip approval check box to determine if approval by the requester’s manager is required.

6. Click Update.
The view returns to the SCCM Applications list.
7. To see all client software distribution (CSD) catalog items, navigate to Client Software Distribution Maintain Items Software Items.

**Workflow process for SCCM deployment**

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the Skip approval check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.

2. If the Check license compliance check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the *Add to User Collection* or *Add to Device Collection* SCCM activity.

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.
- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses *CSD property* settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the sn_client_sf_dist.softwareInstallExpDays property.
- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software's status is Installed and the application associated with the software configuration has an uninstall collection configured.

- Create an *SCCM configuration record* for the application that names an appropriate uninstall collection.
- Associate the *CSD catalog item* for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A workflow called *Revoke SCCM Application* moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check...
and finds the user or device in the uninstall collection, SCCM removes the related software package from
the client computer.

1. Navigate to Client Software Distribution Reports Requested Software.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a Status of Installed to be revocable.
3. Under Related Links, click Revoke software.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application
   subflow that moves the user or device from the install collection to the uninstall collection. When
   SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM
   removes the related software package from the client computer.

Revoke unentitled software
An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that
a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an SCCM configuration record for the application, in
which the appropriate software Discovery model is defined. See Software discovery models.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management to identify unentitled software
installations. Discovery detects the software on the user's machine, and SAM determines if the user
or device is entitled to use that software. This might include software that was not installed through a
catalog request or software that the user installed without approval. If the software installation's Discovery
model is associated with an SCCM software configuration that has an uninstall collection defined, then an
administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to Client Software Distribution Reports Installed Software Not Entitled.
2. Select the record for the installation that has unentitled users.
3. Under Related Links, click Revoke software.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application
   subflow that moves the user or device from the install collection to the uninstall collection. When
   SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM
   removes the related software package from the client computer.
SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation workflow to run, the software package must have a status of *Installed* and must be pre-configured for an appropriate uninstall collection. See *Revoke software deployed through the service*
catalog on page 1617 for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, *Remove from User Collection* and *Remove from Device Collection*, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the *Add to User Collection* or *Add to Device Collection* activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.

### Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application. To access the CSD dashboard, navigate to **Client Software Distribution** > **Requested Software Dashboard**.

![Sample report from CSD dashboard](image)

### Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

**Caution:** The use of CSD extension points is an advanced procedure intended for use by experienced ServiceNow platform developers only. Instructions for customizing your instance
Configure client software distribution providers

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to Client Software Distribution Extensions Providers.
2. Click New.
3. Complete the form using the fields in the table.

![Figure 417: Provider information for Casper integration](image)

Table 875: Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].</td>
</tr>
<tr>
<td>Discovery workflow</td>
<td>Workflow that discovers the provider server and returns the data from that server back to the instance. This is the workflow you create with custom activities that query the provider server.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Software configuration</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment workflow.</td>
</tr>
<tr>
<td>Deployment workflow</td>
<td>Workflow that deploys software from the provider server. This is the workflow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
<tr>
<td>Revocation workflow</td>
<td>Workflow that revokes an installation from a provider server. This is the workflow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
</tbody>
</table>

**Client software distribution extension keys**

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- SetDeploymentData: Sets the software order information and generates the input variables for the deployment workflow.
- SetRevocationData: Generates the input variables for the revocation workflow.
- CheckRevocable: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the csdExtensionResult object with these attributes:
• deploymentWorkflowInputs: Object that specifies the deployment workflow input variables.
• softwareModel: Software model sys_id.
• deploymentType: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
• softwareApplication: Software application sys_id.

CheckRevocable

The script associated with this extension key gets the input parameter csdExtensionInputs.softwareConfiguration, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers’ software configurations are extended from this table, but may have different attributes.

This script must set the csdExtensionResult object to true or false, depending on whether the software configuration specifies uninstallation.

SetRevocationData

The script associated with this extension key gets the input parameter csdExtensionInputs.softwareConfiguration, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers’ software configurations are extended from this table, but may have different attributes.

The script must set the csdExtensionResult object with these attributes:

• revocationWorkflowInput: Object that specifies the revocation workflow input variables.
• softwareModel: Software model sys_id.
• deploymentType: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

Legacy: Configuration Automation

Configuration Automation is deprecated in the Istanbul release. It is still available on instances upgraded from a previous release but is not available for new instances.

Configuration Automation allows you to use Orchestration, Puppet, and Chef to provision and configure individual servers or groups of servers in your network. You define and manage the configuration of Chef and Puppet servers through the service catalog and CMDB. You can configure your ServiceNow instance to act as an external node classifier for Chef and Puppet.

Activating the Provider Configuration Automation plugin also installs the Configuration Automation plugin.

Legacy: Configure properties for Configuration Automation

How to configure Configuration Automation properties.

Navigate to Configuration Automation Properties, edit the properties as described in the table, and then click Save.

<table>
<thead>
<tr>
<th>Property</th>

</tr>
</tbody>
</table>

### Legacy: Chef configuration automation

Chef is a server management application that can use ServiceNow configuration item (CI) data to bring Linux or Windows computers into a desired state by managing files, services, or packages installed on physical or virtual machines.

The ServiceNow system can interact with Chef systems that run on Linux or Windows. The Chef server controls Chef nodes and uses a standalone utility to discover the components in the Chef environment. The system uses information about server CIs from the Chef server to classify the servers as Chef nodes. Chef then evaluates a node’s current state and modifies the node to achieve the desired state.

### How the Chef integration works

To access the Chef server, the ServiceNow admin configures a Chef server and sets up a Chef user. The Chef server evaluates the current and desired state of each node based on the node definition and modifies any nodes that are not in the desired state.

Using the ServiceNow system to control Chef resources allows you to maintain a single source of record within the system.

- You can use the ServiceNow system as an external node classifier for Chef nodes.
- Workflow activities allow you to create workflows that affect Chef behavior.
- You can manage and automate the request and approval process when making changes to Chef resources.

Using the ServiceNow system to manage Chef nodes follows this process:

![Figure 418: Chef Management Process](image)

© 2018 ServiceNow. All rights reserved. 1625
Chef terms

- Chef servers: Hubs that store and manage Chef configuration data.
- Node definitions: Details of the configuration items to be applied to nodes for a specific management server.
- Recipes: The most fundamental configuration element. A recipe is a collection of resources. Each recipe is stored in a cookbook.
- Cookbooks: The fundamental unit of configuration. After discovery, the cookbook is populated with version information and one or more recipes.
- Chef roles: A way to define certain patterns and processes that exist across nodes. A Chef role consists of zero or more attributes and a run list. Each node can have zero or more roles assigned to it.
- Chef attributes: Specific details about a node. Attributes are used by the Chef client to understand the current state of the node, the state of the node at the end of the previous Chef client run, and the state the node should be at the end of the current Chef client run.

Legacy: Activate and configure Chef Configuration Automation
To use Chef configuration automation, set up a user account and optionally set whether to enable change management to control any updates to node definitions.

Prerequisites

Before you can use the ServiceNow system as a Chef external node classifier, an administrator must:

Legacy: Activate Chef Configuration Automation
Chef Configuration Automation is deprecated in the Istanbul release. It is still available on instances upgraded from a previous release but is not available for new instances. Activating the Chef Configuration Management plugin, which is available as a separate subscription, also activates the Configuration Automation, Orchestration, and Orchestration Activities - Chef plugins. Chef configuration automation uses Orchestration, which requires a separate subscription.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
Specify the date and time you would like this plugin to be enabled

Date and time must be at least 2 business days from the current time.

**Note:** Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.

<table>
<thead>
<tr>
<th>Reason/Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Legacy: Installed with Chef
Activating the Chef Configuration Management plugin adds or modifies tables, user roles, properties, and other components. Demo data that demonstrates the Chef features is available.

### Table 876: Chef tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chef Server [cmdb_ci_chef_server]</td>
<td>The server part of a client-server Chef deployment. A Chef server serves the configuration to the Chef client that runs on each client node.</td>
</tr>
<tr>
<td>Chef Node Components [chef_node_components]</td>
<td>The declaration of a node from within a node definition.</td>
</tr>
<tr>
<td>Chef Node Definition [chef_node_definition]</td>
<td>A collection of node information to be applied to a Chef node.</td>
</tr>
<tr>
<td>Chef Node Definition Attribute [chef_node_def_attribute]</td>
<td>The declaration of a Chef node attribute from within anode definition.</td>
</tr>
<tr>
<td>Chef Node Definition Draft [chef_node_definition_draft]</td>
<td>An editable draft of a node definition record. ServiceNow creates these records when modifying a node definition using change management.</td>
</tr>
<tr>
<td>Chef User Account [chef_user_account]</td>
<td>A collection of user information required by Chef to communicate with Chef resources.</td>
</tr>
<tr>
<td>Chef Object [chef_object]</td>
<td>A base class that most of the Chef tables extend. It provides a name and a reference to the parent Chef server.</td>
</tr>
<tr>
<td>Chef Attribute [chef_attribute]</td>
<td>The declaration of an attribute from within a node definition.</td>
</tr>

</tbody>
</table>

Legacy: Set up Chef key stores
The ServiceNow instance requires an X.509 certificate to communicate with Chef resources.

To set up a key store:
1. Navigate to Chef Setup Key Stores.
2. Click New and then enter a Name and Short description for the key store. Fill in the form.

Table 881: X.509 Certificate form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expiration notification</td>
<td>Select the check box to activate the expiration notifications: Notify on expiration, Warn in days to expire, and Expires in days</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate the key store.</td>
</tr>
<tr>
<td>Format</td>
<td>Key store format. If you select DER, you are prompted to attach a DER-encoded certificate file.</td>
</tr>
<tr>
<td>Type</td>
<td>Key store type.</td>
</tr>
</tbody>
</table>

Note: Attach the chef_user.pkcs12 file in the X.509 Certificate record and not in the user record.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid from</td>
<td>Starting date when the key store is valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>Date that the key store expires.</td>
</tr>
<tr>
<td>Issuer</td>
<td>Key store issuer.</td>
</tr>
<tr>
<td>Subject</td>
<td>Key store subject.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>For PEM key store format, the key certificate.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Key store password, if required.</td>
</tr>
</tbody>
</table>

3. To validate the key store alias, click the Validate Stores/Certificates related link.
4. Click Submit.

*Legacy: User roles in Chef Configuration Automation*

**Chef user [chef_user] role**
- Assign node definitions to Chef nodes
- View all Chef records
- Request changes to existing node definition assignments

**Chef administrator [chef_admin]**
- Perform all Chef user actions
- Create and modify node definition records
- Modify Chef properties

*Legacy: Node definitions*
Chef and Puppet management configurations use *node definitions* to group all configuration items to be applied to a group of nodes. A node definition is called a *configuration template* in ServiceNow Provider.

Node definitions allow you to automate the process of maintaining machines by applying a single definition to multiple machines.

The Node Definitions form lists and allows you to edit node definitions.

*Legacy: Managed nodes for Configuration Automation*
Managed nodes are virtual machines (VMs) or machines that are managed by a configuration automation provider.

*Legacy: View a managed node*
Managed nodes are virtual machines (VMs) or machines that are managed by a configuration automation provider.

**Role required: chef_user or chef_admin**
- To view the list of managed nodes, navigate to Configuration Automation Managed Nodes >.
- Click a Name to view or edit the node definition.
- Click a Provider to view or edit the configuration automation provider (Chef, Puppet, or ServiceNow) for the node.
• Click a Management Server to view or edit the settings for the server that manages the node.

Legacy: Use Chef
Chef users can request changes to a Linux computer configuration item (CI) assigned to them.

Chef change management ensures that requested changes go through a controlled change process that includes approvals. After a change is approved and the requesting user proceeds with the change, the Chef server modifies the computer to bring it to the desired state.

Legacy: Work with Chef resources
The ServiceNow system can store data about several Chef resource types including environments, cookbooks, roles, recipes, and attributes.

Legacy: Discover a Chef server
Chef discovery is the process by which a Chef server and Chef resources, including environments, cookbooks, roles, recipes, and attributes, are imported into a ServiceNow instance. Discovery is accomplished by the Discover Chef workflow.

Role required: chef_admin
Chef resources are maintained in Chef and can be viewed in ServiceNow. A Chef administrator can retrieve the records from a Chef server. It is not necessary to activate ServiceNow Discovery to discover the Chef environment.

1. Navigate to Chef Chef Servers.
2. Click New and then enter a Name and Description for the Chef server.
3. Fill in the form.

Table 882: Chef Server form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hosted Chef</td>
<td>Select the check box to indicate that the Chef server is within the Chef hosted environment. Clear the check box to indicate that the Chef server is outside of the Chef hosted environment.</td>
</tr>
<tr>
<td>IP address</td>
<td>IP address of the server. Required if Hosted Chef is not selected.</td>
</tr>
<tr>
<td>Organization</td>
<td>Name of the organization that hosts the Chef server. Required if Hosted Chef is selected.</td>
</tr>
<tr>
<td>User</td>
<td>[Required] User who has been set up to access the Chef server.</td>
</tr>
</tbody>
</table>

4. Save the form.
5. Click the Discover Chef Details related link.
   • The system detects the Chef server and completes the remaining fields in the form.
   • The system discovers the Chef resources and creates records for them in the appropriate tables.

Legacy: Manage a Chef node
You can configure Chef settings for a specific node directly in the CI form.

Role required: chef_admin
To view a list of CIs that use Chef configuration automation and are assigned to the logged-in user, navigate to Configuration Automation Managed Nodes. By default, a Chef user cannot directly modify the Chef fields on the CI form, and must request changes through a controlled change process.

**Note:** Updates to a CI reset the Node group assignment state to Ready. The Ready state ensures that assignment rules are applied and that the CIs are re-assigned based on the new values. For example, updating FQDN or IP address might reassign a CI to a different node group.

1. Navigate to Configuration Automation Managed Nodes or Configuration Servers Linux.
2. Open the node and then edit the fields in the Configuration Automation related list.

### Table 883: CI form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully qualified domain name</td>
<td>FQDN that Chef uses to access this CI.</td>
</tr>
<tr>
<td>Provider</td>
<td>Configuration Automation provider that manages this CI.</td>
</tr>
<tr>
<td>Management Server</td>
<td>Server that manages this CI.</td>
</tr>
<tr>
<td>Node group assignment state</td>
<td>State of automatic assignment of this CI to a node group, as described in the following table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>Default state for newly discovered CIs. Assignment rules are applied only to CIs in the Ready state.</td>
</tr>
<tr>
<td>In Progress</td>
<td>CI is currently experiencing a configuration change.</td>
</tr>
<tr>
<td>Assigned</td>
<td>CI is part of one or more node groups.</td>
</tr>
<tr>
<td>Processed</td>
<td>Assignment rules have been applied to the CI. There may or may not be a match.</td>
</tr>
<tr>
<td>Excluded</td>
<td>Configuration admin role can exclude a CI from being processed by the assignment rules.</td>
</tr>
</tbody>
</table>

3. Click Update.

Legacy: Create a Chef node definition
Chef node definitions can be composed of environments, cookbooks, roles, recipes, and attributes.

Role required: chef_admin
A Chef node definition needs to be associated with a specific management server.

1. Navigate to Chef Node Definition.
2. Click New Draft.
3. Fill in the form, as described in the table.
4. Save the form.
5. To add an environment, select the environment in the Environment field.
6. To edit node components, click Edit in the Chef Node Components related list and make any changes on the form.
   The slushbucket shows up to 100 available components. If you do not see a component in the Collection list, search for the component name.

7. To add or modify attributes, click New or Edit under the Chef Node Attribute related list, and update the form.

8. To create a managed node, click New under the Managed Node related list, and fill out the form.

9. Click Publish.

<table>
<thead>
<tr>
<th>Table 884: Chef node definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Environment</td>
</tr>
<tr>
<td>Provider</td>
</tr>
<tr>
<td>Change Request</td>
</tr>
<tr>
<td>Chef Server</td>
</tr>
<tr>
<td>State</td>
</tr>
<tr>
<td>Replaces</td>
</tr>
</tbody>
</table>

Legacy: Add and edit Chef node attributes
Chef node attributes are discovered from the Chef server.

You can add additional attributes within the ServiceNow instance. Attributes that you have created inside a ServiceNow instance are editable; however, you cannot edit discovered Chef attributes.

Legacy: Add a Chef node attribute
How to add a Chef node attribute.

Role required: chef_admin

In a node definition draft, click New from the Chef Node Attribute related list and fill out the form (see table).

If there is an existing attribute with the same path and name as the newly created attribute, the new attribute replaces the old attribute.

<table>
<thead>
<tr>
<th>Table 885: Chef node attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Data Type</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>------------</td>
</tr>
<tr>
<td>Attribute level</td>
</tr>
<tr>
<td>Path</td>
</tr>
<tr>
<td>Value</td>
</tr>
</tbody>
</table>

Legacy: Edit a Chef node attribute
How to edit Chef node attributes.

To edit attributes that you have created within the ServiceNow instance, click Edit from the Chef Node Attribute related list In a node definition draft. Then, edit the form and click Submit.

Legacy: Choose the discovered Chef node attributes
You can choose which discovered attributes to include in a node definition.

In a node definition draft, click Edit under the Chef Node Attribute related list. Select the attributes from the discovered collection in the slushbucket, and then click Save.

If you select multiple attributes with the same path and name, only the first is added to the node definition.

Legacy: Edit a CI-level attribute
Chef node attributes can be edited at the CI level.

Role required: chef_admin

Editing CI-level attributes overrides the attributes for a specific CI. For example, if you have applied a node definition to several CIs but want to modify an individual CI to use a different timezone, you can edit the attribute for that CI.

To access CI-level attributes:
1. Navigate to Configuration Automation Managed Nodes or Configuration Servers Linux.
2. Open a server.
3. In the Configuration Automation related list, edit the fields as necessary.
4. Click Update.

Legacy: Use change management with Chef
By default, the system allows changes to Chef configurations only as part of a controlled change management process.

With change management, users cannot directly edit Chef records such as node definitions or the relationships between CIs and node definitions. For all changes to Chef resources, the requesting user's manager must approve the request. If the user record does not have a value in the Manager field, the request is approved automatically.

When a user requests a change, each change management approver and the requesting user receive a notification. Additionally, the Assigned to field on the change request is populated with the requesting user. This user receives a notification when the request is approved or rejected.

Legacy: Modify a Chef node
How to modify a Chef node with change management enabled.
Role required: chef_admin

Change management prevents Chef users from directly editing the Configuration automation or Node definition fields on the CI form. Additionally, the Create New Configuration Change related link appears on the CI form for Chef node CIs.

1. Navigate to Configuration Servers Linux.
2. Select a Linux CI record that is assigned to the logged-in user.
3. Go to the Configuration Automation section to view the current configuration automation settings.
4. Click the Create New Configuration Change related link.
   A new Configuration Automation Change form appears.
5. Edit the fields, as necessary (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase</td>
<td>The phase of the configuration automation change: Draft, Requested, Approved, Rejected, In Progress, Completed, Canceled, or Error.</td>
</tr>
<tr>
<td>Computer</td>
<td>The CI affected by the change.</td>
</tr>
<tr>
<td>Fully qualified domain name</td>
<td>The fully qualified domain name that Chef uses to access this CI.</td>
</tr>
<tr>
<td>Provider</td>
<td>The configuration automation provider managing this CI.</td>
</tr>
<tr>
<td>Management server</td>
<td>The server managing this CI.</td>
</tr>
<tr>
<td>Node definition</td>
<td>The node definition for this CI.</td>
</tr>
<tr>
<td>Change request</td>
<td>The change request number.</td>
</tr>
<tr>
<td>Requested CI Node attributes</td>
<td>Node attributes included in this change request.</td>
</tr>
</tbody>
</table>

6. Click the Request Change related link.
7. Click OK in the confirmation pop-up.
8. Click Update.
   • If there is an active change associated to the CI, the Cancel Change related link replaces Create New Configuration Change on the CI form. Only one active Chef change request for a CI is allowed at any time.
   • After the requesting user’s Manager approves the request, the Proceed with Change related link appears with Cancel Change.

After the user's manager approves the request:
1. Navigate to the relevant CI record.
2. Click the Proceed with Change related link. This link is available only when a change has been approved.
Figure 419: Chef configuration automation change

Legacy: Modify a node definition

The Checkout Draft related link on the Chef Node Definition form creates an editable draft copy of the record. Before a Chef user or Chef administrator can commit changes to a node definition, the user's manager must approve the change request.

Role required: chef_admin
When making a change to a node with one or more associated components and attributes, the system duplicates these related records and associates the duplicate with the new node definition draft record. Use the slushbucket to add or remove roles, recipes, and attributes from Chef node definition.

1. Navigate to Chef Node definition or Configuration Automation Node definition.
2. Select a published node definition.
3. Click the Checkout Draft related link.
   - This creates an editable copy of the current record as a draft and opens the form for that record.
4. Update the draft record.
5. Click the Publish related link.
   - This related link creates a change request record. A draft can have only one active change request at a time.
   - After the requesting user's manager approves the request, the Proceed with Change related link appears on the Chef Node Definition Draft form.

After the user’s manager approves the request:

1. Navigate to the relevant node definition draft record.
2. Click Proceed with Change to push the changes to the original node definition record and delete the draft record.

Legacy: Request a change to Chef using the service catalog

A user can request a change to a Chef node through the service catalog.

Role required: chef_user or chef_admin

Changes to nodes through the service catalog require the same change requests and approvals as changes made through the CI form.

1. Navigate to Self-Service Service Catalog.
2. Click Software.
3. Click Modify computer configuration.
4. Select a Computer to modify.
   - Only computers Assigned to the requesting user can be selected.
   - The Configuration automation provider and Management server are inserted.
5. Select the Node definition to apply to the selected computer.
6. Click Order Now.
When the request is approved, a Proceed with change related link appears on the computer's CI form.

Legacy: Disable change management
Disabling change management with the Chef, Puppet, or ServiceNow provider allows users to make and save changes on the definition forms and templates and the Configuration Automation section of the CI form.

Role required: puppet_admin or chef_admin

1. Navigate to one of the following:
   - Chef Properties
   - Puppet Properties
   - Configuration Automation Properties

2. Separately disable change management for either or both of the properties that are associated with the provider:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable change management to control updates to node definitions (node definitions) [glide.config_auto.chef.node_definition.use_change]</td>
<td>Disable this property for Chef</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Enable change management to control assignments of Chef definitions to CIs [glide.config_auto.chef.ci_assignment_use_change]</td>
<td>Disable this property for Chef</td>
</tr>
<tr>
<td>Enable change management to control updates to node definitions (node definitions) [glide.node_definition_use_change]</td>
<td>Disable this property for Puppet</td>
</tr>
<tr>
<td>Enable change management to control assignments of definitions to CIs [glide.ci_assignment_use_change]</td>
<td>Disable this property for Puppet</td>
</tr>
<tr>
<td>Enable change management to control updates to node definitions (node definitions)</td>
<td>Disable this property for ServiceNow provider</td>
</tr>
<tr>
<td>Enable change management to control updates to CI</td>
<td>Disable this property for ServiceNow provider</td>
</tr>
</tbody>
</table>

**Legacy: Use Chef with Cloud Management**

By using both Chef and cloud management, you can automate the entire provisioning process including installing software packages on provisioned virtual machines.

Using this automation, you can offer fully-configured virtual machines through the service catalog.

You must activate and configure both Chef and VMware for Cloud Management before performing the procedures on this page.

**Legacy: Offer a VM with the Chef client**

All Chef nodes require the Chef client service to communicate with the Chef server.

Role required: chef_admin

1. Create a Linux virtual machine template that includes the Chef client software.
2. After creating the template, create a catalog item for a Linux virtual machine using that template.

For information on creating a virtual machine template, see the [VMware template documentation](#).

**Legacy: Create a Chef virtual catalog item**

Role required: chef_admin

1. Create a catalog item using the new virtual machine template.
2. On the VMware Catalog Item form, select Guest customization to display the Customization specification field.
3. [Required] Select a Customization specification.
4. Click Update.
Legacy: Create a Chef VM template

Role required: chef_admin

1. Provision a virtual machine in vCenter with a name that identifies it as a Chef node. You can use the ServiceNow system to provision the virtual machine, or use vCenter to provision the virtual machine manually.

2. As described in the Chef documentation, install the Chef client software on the new virtual machine.

3. Create a user account on the virtual machine with permission to run Chef. There must be a credential record for this user within the ServiceNow system.

4. In vCenter, mark this virtual machine as an available template.

5. Discover the template to add it to the list of available virtual machine templates. The ServiceNow system cannot detect whether the Chef client is included with a template. It is the responsibility of the vCenter administrator to ensure that the template has the Chef client installed.

Legacy: Provision virtual machines with Chef

The procedure for ordering a virtual machine with Chef is the same as for ordering a standard virtual machine through the service catalog.

Provisioning a virtual machine with Chef does not add the virtual machine information as a virtual machine CI. Instead, the ServiceNow system records the new CI as a Linux server.

Legacy: Complete a provisioning task

A cloud operator must complete the provisioning task generated by the catalog request to provision the virtual machine.

Role required: chef_admin

1. Ensure that Guest customization is set to Yes.
2. Ensure that Node Definition is set to a node definition.

Legacy: New Chef VMs
When provisioning a new virtual machine with Chef, the Chef server can authenticate and configure the virtual machine.

Provisioning a new virtual machine with Chef bypasses the standard Chef approval process. Only cloud provisioning approvals are required.

After the virtual machine has been provisioned, the Chef client included on the virtual machine attempts to retrieve configuration information from the Chef server. If the Chef client and Chef server successfully communicate, the Chef client configures the virtual machine according to the node definition assigned to that virtual machine without further user interaction.

Legacy: Chef Orchestration activities
Chef is a server management application that can use the ServiceNow system configuration item (CI) data to bring computers into a desired state.

The ServiceNow system can interact with a Chef automation server through various Orchestration activities.

Legacy: Shared input variables of chef activities
All Chef activities share certain input variables.

Table 888: shared input variables table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use hosted Chef</td>
<td>Value that indicates if the Chef server is hosted by Opscode. This value can be true, false, or a JavaScript function that returns either true or false.</td>
</tr>
<tr>
<td>Chef server</td>
<td>The IP address of a Chef server hosted in your own environment. This variable is mandatory if Hosted Chef is False. Leave this variable blank if Hosted Chef is True.</td>
</tr>
<tr>
<td>Organization</td>
<td>The Chef organization. Organizations contain groups and users. This variable is mandatory if Hosted Chef is True or when using self-hosted Enterprise Chef. For more information, see the Chef Organizations documentation.</td>
</tr>
<tr>
<td>User account</td>
<td>A Chef user account record. This record holds the information necessary to make Chef API calls including the username, keystore, and alias of a Chef user.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>JavaScript that processes the results of requests made to the Chef server.</td>
</tr>
</tbody>
</table>

Legacy: Chef activity: Chef Request
The Chef Request activity sends a Chef API request to a Chef server.

The Chef Request activity sends a Chef API request to a Chef server. This activity stores returned data in the responses sensor script variable as an array of JavaScript objects. Each object in the array contains the following fields.
Table 889: Array object fields

<table>
<thead>
<tr>
<th>Object</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>response_code</td>
<td>The HTTP response code for the request</td>
</tr>
<tr>
<td>success</td>
<td>A boolean value that indicates whether the request was successful or not</td>
</tr>
<tr>
<td>request_url</td>
<td>The endpoint for the request</td>
</tr>
<tr>
<td>response_body</td>
<td>The raw data returned from the Chef server</td>
</tr>
</tbody>
</table>

**Note:** All other Chef activities implement a specific Chef request and contain these fields in their sensor script variable. Some activities also contain additional fields in their sensor script variable.

Table 890: Results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Chef server returned a response. The activity returns a successful result even if one or more Chef requests failed. To determine the success of a specific request, use the success value from an object stored in the responses variable</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef server was not available or rejected the supplied credentials</td>
</tr>
</tbody>
</table>

Table 891: Input variables table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>The type of REST function to execute. Possible values are GET, POST, PUT, and DELETE</td>
</tr>
<tr>
<td>Target data</td>
<td>An array of JavaScript objects. Each object specifies these values:</td>
</tr>
<tr>
<td></td>
<td>• targetPath: the target endpoint for this request. See the Chef API endpoint documentation for information on specifying an endpoint.</td>
</tr>
<tr>
<td></td>
<td>• content: the body of the message, written in JSON, when using a PUT or POST REST message.</td>
</tr>
</tbody>
</table>

Legacy: Chef activity: Get Cookbooks

The Get Cookbooks activity retrieves name and version information about cookbooks installed on a Chef server.

The activity stores the retrieved cookbook information in the cookbooks sensor script variable as an array of JavaScript objects. Each object in the array contains the following fields:
Table 892: Array object fields

<table>
<thead>
<tr>
<th>Object</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookbook</td>
</tr>
<tr>
<td>version</td>
<td>The version of the cookbook</td>
</tr>
</tbody>
</table>

For more information, see the Chef *cookbook documentation*.

Table 893: Results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Chef request was successful</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef request failed, the Chef server was unavailable, or the Chef server rejected the supplied credentials</td>
</tr>
</tbody>
</table>

The Get Cookbooks activity uses only *shared input variables*.

Legacy: Get cookbook data

The Get Cookbook Data activity retrieves the recipes and attributes from a given cookbook.

The activity stores the retrieved cookbook data in the cookbookData sensor script variable as an array of JavaScript objects. Each object contains the following fields, as well as all fields returned by the *Chef Request* activity:

Table 894: Array object fields

<table>
<thead>
<tr>
<th>Object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookbook</td>
</tr>
<tr>
<td>recipes</td>
<td>A list of recipes stored in the cookbook</td>
</tr>
<tr>
<td>attributes</td>
<td>A parameter that controls the behavior of a node, such as the port used by a web server</td>
</tr>
</tbody>
</table>

Table 895: Results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>the Chef server returned a response. The activity returns a successful result even if one or more Chef requests failed. To determine the success of a specific request, use the success value from an object stored in the cookbookData variable</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef server was not available or rejected the supplied credentials</td>
</tr>
</tbody>
</table>
Table 896: Input variables table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cookbook data</td>
<td>An array of JavaScript objects that defines which cookbooks to get data from. Each object contains the following fields:</td>
</tr>
<tr>
<td></td>
<td>• cookbook_name: the name of the cookbook to get data for.</td>
</tr>
<tr>
<td></td>
<td>• cookbook_version: the version of the cookbook to get data for.</td>
</tr>
</tbody>
</table>

Legacy: Chef activity: Get Environments
The activity stores retrieved environment names as an array of strings in the environments sensor script variable.

The Get Environments activity retrieves the names of all environments on a given Chef server.

Table 897: results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Chef request was successful</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef request failed, the Chef server was unavailable, or the Chef server rejected the supplied credentials</td>
</tr>
</tbody>
</table>

The Get Environments activity uses only shared input variables.

Legacy: Chef activity: Get Recipes
The Get Recipes activity retrieves all recipes stored in a version of a cookbook.

Unlike the Get Cookbook Data activity, the Get Recipes activity does not get attribute information. The activity stores retrieved recipes in the recipes sensor script variable as an array of JavaScript objects. Each object in this array contains the following fields, as well as all fields returned by the Chef Request activity:

Table 898: Array object fields

<table>
<thead>
<tr>
<th>Object</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookbook_name</td>
<td>The name of the cookbook, passed in the Cookbook data activity input variable</td>
</tr>
<tr>
<td>cookbook_version</td>
<td>The version of the cookbook, passed in the Cookbook data activity input variable</td>
</tr>
<tr>
<td>recipes</td>
<td>An array of JavaScript objects that lists the recipes contained in the cookbook. Each object in this array contains the name of a single recipe and the description of that recipe</td>
</tr>
</tbody>
</table>
Table 899: Results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Chef request was successful</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef request failed, the Chef server was unavailable, or the Chef server rejected the supplied credentials</td>
</tr>
</tbody>
</table>

Table 900: Input variables table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cookbook data</td>
<td>An array of JavaScript objects that lists the cookbooks to get recipes from. Each object in the array contains the following fields:</td>
</tr>
<tr>
<td></td>
<td>• cookbook_name: the name of the cookbook to get recipes from.</td>
</tr>
<tr>
<td></td>
<td>• cookbook_version: the version of the cookbook to get recipes from.</td>
</tr>
</tbody>
</table>

Legacy: Chef activity: Get Roles

The Get Roles activity retrieves roles installed on a given Chef server.

The activity stores a list of retrieved role names in the roles sensor script variable.

Table 901: Results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Chef request was successful</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef request failed, the Chef server was unavailable, or the Chef server rejected the supplied credentials</td>
</tr>
</tbody>
</table>

The Get Roles activity uses only shared input variables.

Legacy: Get role data

The Get Role Data activity retrieves additional information about a given Chef role.

The activity stores retrieved role data in the roleData sensor script variable as a JavaScript object. The object contains the following fields, as well as all fields returned by the Chef Request activity:

Table 902: Object fields

<table>
<thead>
<tr>
<th>Object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>The name of the role, passed in the Role data activity input variable</td>
</tr>
<tr>

<td>A description of the role, if available</td>
</tr>
<tr>
<td>Object</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>run_list</td>
<td>The list of recipes and other roles that the role contains</td>
</tr>
<tr>
<td>default_attributes</td>
<td>Attributes that apply to nodes with this role</td>
</tr>
<tr>
<td>override_attributes</td>
<td>Attributes that apply to nodes with this role. These attributes can override a default attribute inherited from a parent role</td>
</tr>
</tbody>
</table>

Table 903: Results table

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Chef server returned a response. The activity returns a successful result even if one or more Chef requests failed. To determine the success of a specific request, use the success value from an object stored in the roleData variable</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef server was not available or rejected the supplied credentials</td>
</tr>
</tbody>
</table>

Table 904: Input variables table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role data</td>
<td>An array of JavaScript objects that defines which roles to get more information about. Each object contains the following field:</td>
</tr>
<tr>
<td></td>
<td>• role_name: the name of the role to get more information about.</td>
</tr>
</tbody>
</table>

Legacy: Chef activity: Update Node

The Update Node activity updates a given Chef node with a run list.

A run list defines which recipes, roles, and attributes to apply to a Chef node, and the order to apply them. For more information, see the Chef run list documentation. The activity stores returned data in the nodeData sensor script variable as an array of JavaScript objects. The object contains the following fields, as well as all fields returned by the Chef Request activity:

Table 905: Array objects table

<table>
<thead>
<tr>
<th>Object</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>fqdn</td>
<td>The given fully-qualified domain name for the node</td>
</tr>
</tbody>
</table>

<td>The Chef server returned a response. The activity returns a successful result even if one or more Chef requests failed. To determine the success of a specific request, use the success value from an object stored in the nodeData variable.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Chef server was not available or rejected the supplied credentials.</td>
</tr>
</tbody>
</table>

### Table 907: Input variables table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run list</td>
<td>An array of JavaScript objects that defines the configuration settings to push to Chef. Objects in this array contain the following fields:</td>
</tr>
<tr>
<td></td>
<td>• type: the type of Chef resource. Valid types are recipe or role.</td>
</tr>
<tr>
<td></td>
<td>• name: the name of the recipe or role.</td>
</tr>
<tr>
<td>Environment</td>
<td>The Chef environment the specified node should belong to.</td>
</tr>
<tr>
<td>Node data</td>
<td>An array of JavaScript objects that defines additional configuration settings, including attributes, for the Chef node. Objects in this array contain the following fields:</td>
</tr>
<tr>
<td></td>
<td>• fqdn: the fully-qualified domain name of the node to update.</td>
</tr>
<tr>
<td></td>
<td>• attribute: an array of JavaScript objects that defines the attributes to apply. Objects in this array contain the following fields:</td>
</tr>
<tr>
<td></td>
<td>• name: the name of an attribute.</td>
</tr>
<tr>
<td></td>
<td>• value: the value to assign the specified attribute.</td>
</tr>
<tr>
<td></td>
<td>• type: [Optional] the type of attribute. Supported values are normal, default, and override. The attribute type is normal by default.</td>
</tr>
<tr>
<td></td>
<td>• namespace: [Optional] an array of strings that defines the attribute path. For example, to access an attribute called db_name with a path of mysql/db/db_name, enter a namespace value of ['mysql', 'db'].</td>
</tr>
</tbody>
</table>
Legacy: Configuration automation roles

Table 908: Configuration Automation roles

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Automation user</td>
<td>Can assign node definitions to nodes assigned to the user through the Self Service Service Catalog page.</td>
</tr>
<tr>
<td>[config_auto_user]</td>
<td></td>
</tr>
<tr>
<td>Configuration Automation administrator</td>
<td>Can create and modify node definition records, assign node definitions to nodes, view all configuration automation records, request changes to existing node definition assignments, and define new configuration automation providers using extension points.</td>
</tr>
<tr>
<td>[config_auto_admin]</td>
<td></td>
</tr>
</tbody>
</table>

Note: A node definition is called a configuration template in the ServiceNow Provider.

Legacy: ConfigAutomationDiffBase script includes

The ConfigAutomationDiffBase script include allows you to define how to handle changes to a CI or node definition from the change management system. The script include as the basis for creating the Difference Extension by CI and Difference Extension by Node Definition scripts.

Script Use

To create both of the scripts, make a copy of the ConfigAutomationDiffBase script include and implement the process method for the new configuration provider. The method should return a single JavaScript object with the two properties described in the following table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>short description</td>
<td>String</td>
<td>Returns the information for the Change Request short_description field.</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Returns the information for the Change Request description field.</td>
</tr>
</tbody>
</table>

Difference Extension by CI

This script checks for changes from the change management system that affect the ServiceNowConfiguration CI. Implement the process method to check for any changes. In this case, the input parameter is the CI sys_id.
Difference Extension by Node Definition

**Note:** A node definition is called a configuration template in the ServiceNowProvider.

This script checks for changes from the change management system that affect the ServiceNow node definition. Implement the process method to check for any changes. In this case, the input parameter is the node definition ID.

*Legacy: Example node definition diff script for Chef: ConfigAutomationDiffBase*

```javascript
ChefNodeDefinitionDiff.prototype = Object.extendObject(
  ConfigAutomationDiffBase , {
    initialize : function () { } ,
    process : function (draftNodeDefId ) { var gr  = new GlideRecord ('chef_node_definition' ) ;
      gr. get (draftNodeDefId ) ; var nodeDefId = '' + gr. peer. sys_id ; return
      this. getDiff (nodeDefId , draftNodeDefId ) ; } ,
    getDiff : function (nodeDefId , draftNodeDefId ) { var orgNodeData =
      this._getNodeData (nodeDefId , 'chef_node_definition' ) ; var draftNodeData =
      this._getNodeData (draftNodeDefId , 'chef_node_definition' ) ;

      //Get the differences between node definition and draft node definition
      for the specific sys id. var diff = this._getNodeComponentDiff (orgNodeData.
      nodeComponents , draftNodeData. nodeComponents ) ;

      // Get the differences in attributes.
      diff += this._getAttributeDiffs (orgNodeData. nodeAttributes ,
      draftNodeData. nodeAttributes ) ;

      //Create messages var Name = gs. getMessage ( 'Name' ) ;
      var ChefManagementServer = gs. getMessage ( 'Chef Management
      Server' ) ; var Environment = gs. getMessage ( 'Environment' ) ;
      var ChangeChefNodeDefinition = gs. getMessage ( 'Change Chef node
      definition' ) ; var ThisIs = gs. getMessage ( 'This is a change generated by
      modifying Chef node definition.' ) ;

      var nodeDiff = { } ; var nodeDef = orgNodeData. nodeObj ; var
draftNodeDef = draftNodeData. nodeObj ;

      nodeDiff. shortDescription = ChangeChefNodeDefinition ;
      nodeDiff. description = ThisIs + "\n " ;
      nodeDiff. description += this._getDiff ( Name , nodeDef. name ,
      draftNodeDef. name ) ;
      nodeDiff. description += this._getDiff (ChefManagementServer , nodeDef.
      chefManagementServer. name , draftNodeDef. chefManagementServer. name ) ;
      nodeDiff. description += this._getDiff (Environment , nodeDef.
      environment_name , draftNodeDef. environment_name ) + diff ;

      return nodeDiff ; } ,
  }
}

_getNodeData : function (nodeDefId , tableName ) { var nodeData = { } ; if
    (!gs. nil (nodeDefId )) { var nodeObj = this._getNodeInfo (nodeDefId ,
    tableName ) ; if (!gs. nil (nodeObj )) {
      nodeData. nodeObj = nodeObj ; }

    // Get associated node definition classes and parameters
    nodeData. nodeComponents = this._getNodeComponents (nodeDefId ) ;
    nodeData. nodeAttributes = this._getNodeAttributes (nodeDefId ) ; }

    return nodeData ; }
```
/**
 * Retrieves the node information for the specified node definition.
 */
_getNodeInfo : function (sysId , tableName ) { var gr  = new GlideRecord (tableName ) ;

    if (gr. get (sysId ) ) { var nodeObj = { } ; // Common fields for Node definition

value {1} to {2}" , [draft. name , this._getAttrDisplayValue (orig ) ,
this._getAttrDisplayValue (draft ) ] ) ) ; } return '' ; },

_getAttrDisplayValue : function (attr ) { return attr. value ; },

 Legacy: Extending Configuration Automation
Configuration automation extensions allow you to customize an instance to support configuration
t automation providers in addition to those offered by ServiceNow.

Change manager extensions scripting is available to users with the Chef Administrator [chef_admin] or
Puppet Administrator [puppet_admin] role.

To support a new provider, you need to define:

• The change manager script
• A difference by CI extension script
• A difference by node definition script
• Workflows, if needed
• The change manager
• The provider

Legacy: Defining a Difference by CI Extension script
The Difference by CI Extension script generates the differences between the current CI definition and
upcoming changes.

These differences are inserted into the change request detail. Extend the ConfigAutomationDiffBase
script include to create this script and implement the process(String configuration_automation_changeId)
method, which is called to generate the diff message.

Legacy: Defining a Difference by Node Definition script
The Difference by Node Definition script generates the differences between the current node definition and
upcoming changes.
Note: A node definition is called a configuration template in the ServiceNowProvider.

These differences are inserted into the change request detail. Extend the ConfigAutomationDiffBase script include and implement the processString draft_node_definition_Id) method, which is called to generate the diff message.

Legacy: Defining a change manager script
Defining the change manager

1. Define the script.
2. Register the script.
3. Configure the change manager in the Change Manager module.

The change manager is a script that manages changes between the ServiceNow system node definitions or CIs and the definitions on the configuration automation provider server. Use the CfgAutoChangeManager script include as your starting point, and implement the required functions so that they provide the necessary information. Register your script in the Config Automation Provider [config_automation_provider] table.

2. Click New.
3. Fill in the fields and then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider</td>
<td>Name of the configuration automation provider.</td>
</tr>
<tr>
<td>Change Manager</td>
<td>Script that defines how to manage the configuration information for this provider. This is the script defined in Defining the Change Manager script.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that contains the configuration automation information.</td>
</tr>
</tbody>
</table>
Figure 422: Change Manager script include

```javascript
var ChefServerChangeManager = class.create();
ChefServerChangeManager.prototype = Object.extendObject(CfgAutoChangeManager, {
    UPDATE_NODE_WF: 'Deploy Chef Change Master',
    CK_PROP_NAME: 'glide.config.auto.chef.ci_assignment_use_change',
    CHEF_ADMIN: 'chef_admin',
    CHEF_USER: 'chef_user',
    CFG_AUTO_ADMIN: 'cfg_auto_admin',
    CFG_AUTO_USER: 'cfg_auto_user',
    CK_FIELD_NAME: 'cfg_auto_change',
    IN_PROGRESS: 'In Progress',

    prepare: function(ciGr) {
        var change = ciGr.cfg_auto_change;
        if (!util.notNull(change)) {
            var phaselist = new ChoiceList('cfg_auto_change', 'phase');
            var gr = new GlideRecord('cfg_auto_change');
            gr.get(change.sys_id);
            gr.setValue('phase', phaselist.getValue(this.IN_PROGRESS));
            gr.update();
        } return ciGr;
    },

    cleanupAfterCancelChange: function(ciGr) {
        if (ciGr.cfg_auto_change) {
        }
    },
});
```
**Legacy: Define a new Configuration Automation provider**

The Configuration Automation Provider form gathers all script and table information required by the configuration automation provider.

Role required: admin

1. Navigate to Configuration Automation > Extension > Providers.
2. Click New, provide a Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Difference Extension by CI</td>
<td>Script that defines the difference extension by CI. This is the script defined in Defining a Difference by CI Extension Script.</td>
</tr>
<tr>
<td>CI Push Subflow</td>
<td>[Optional] If required by the configuration automation provider: Sub workflow that defines how changes are pushed for a CI.</td>
</tr>
<tr>
<td>Difference Extension by Node Definition</td>
<td>Script that defines the difference extension by node definition, created in Defining a Difference by Node Definition Script.</td>
</tr>
<tr>
<td>Node Definition Push Subflow</td>
<td>[Optional] If required by the configuration automation provider: Sub workflow that defines the changes pushed to a node definition.</td>
</tr>
</tbody>
</table>

**Legacy: Workflows for a custom Configuration Automation provider**

Workflows are optional depending on the requirements of the new configuration automation provider.

For example, Puppet does not use workflows; instead, the Puppet Master pulls the changes from the instance. Chef, however, uses the following workflows to pull changes.

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push CI Change to Chef Server</td>
<td>Pushes the configuration automation change to the Chef server.</td>
</tr>
<tr>
<td>Push Chef Changes By Node Definition</td>
<td>Pushes configuration automation changes triggered by a node definition change.</td>
</tr>
</tbody>
</table>

If the new configuration automation provider requires workflows, register the workflows in Configuration Automation Provider form, and make sure to implement the getPushWorkflowName() and getWorkflowVariables(String workflowName, GlideRecord record) method in the change manager script.

**Legacy: Define the Change Manager script**

The change manager script is responsible for the logical change process and exposes customization hooks for provider implementations, which are scripts that determine how the assets are handled.

1. Create a new script that extends the CfgAutoChangeManager script include.
2. Implement the following mandatory functions:
   - isAuthorized(GlideRecord record)
   - isChangeRequired()
   - getChangeId(GlideRecord current)
   - setChangeId(GlideRecord record, String changeld)
• prepare(GlideRecord record)
• finalizeChange(GlideRecord record)
• getWorkflowVariables(String workflowName, GlideRecord record)
• getPushWorkflowName()
• cleanupAfterCancelChange(GlideRecord record)

3. Implement the optional getPushWorkflowName() override function if it applies to the provider.

Example Change Manager Script

```
var ChefNodeDefinitionChangeManager = Class.create();
ChefNodeDefinitionChangeManager.prototype = Object.extendObject(CfgAutoChangeManager, { // Code body omitted for brevity });
```

Legacy: Puppet Configuration Management

Puppet is a server management application that can use CMDB data to bring computers into a desired state by managing files, services, or packages installed on physical or virtual machines. The ServiceNow application can interact with Puppet systems that run on Linux.

ServiceNow identifies a Puppet Master, which controls Puppet nodes, and uses a standalone utility to discover the components in the Puppet environment. The ServiceNow system uses information about server CIs from the Puppet Master to classify the servers as Puppet nodes. Puppet then evaluates a node's current state and modifies the node to achieve the desired state. For more information, see What is Puppet?.

Legacy: Puppet Integration

A script, available in the ServiceNow instance, must run on a Puppet Master to designate the ServiceNow system as an ENC. The Puppet Master evaluates the current and desired state of each node, based on the node definition, and modifies any nodes that are not in the desired state.

Using the ServiceNow instance to control Puppet resources allows you to maintain a single source of record within the instance. You can:

• Classify Puppet nodes: You can use the instance as an external node classifier for Puppet nodes.
• Create Puppet workflows: Workflow activities allow you to create workflows that affect Puppet behavior.
• Control changes: The instance can manage and automate the request and approval process when making changes to Puppet resources.
Legacy: Set up Puppet
To use Puppet Configuration Automation, configure a ServiceNow instance to act as an external node classifier (ENC) for a Puppet Master installation.

Prerequisites
Before you can use an instance as a Puppet external node classifier, you must:

- Puppet Master: Install the Puppet Master software. The Puppet Master communicates with Puppet nodes and the ServiceNow instance. For more information, see the Puppet Labs Installing Puppet documentation.
- MID Server: Install a MID Server and configure it to access both the Puppet Master and ServiceNow.
- Puppet User: Create a user record in the instance that Puppet can use to access records related to Puppet. This user must have the SOAP role. Enter this user’s credentials in the external node classifier (ENC) script.

Legacy: Activate Puppet configuration management
Puppet Configuration Management is deprecated in the Istanbul release. It is still available on instances upgraded from a previous release but is not available for new instances. This integration requires the Puppet Configuration Management plugin, which requires a separate subscription. It uses Orchestration, which is also available as a separate subscription. The Puppet Configuration Management plugin also activates the Configuration Automation plugin and the Orchestration Activities - Puppet plugins, which provide Puppet-specific components.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.
<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Legacy: Installed with Puppet

The Puppet Configuration Automation plugin adds or modifies tables, user roles, properties, and other components.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet Master [cmdb_ci_puppet_master]</td>
<td>The server part of a client-server Puppet deployment. A Puppet Master serves the configuration catalogs to the Puppet agents that run on each client node.</td>
</tr>
<tr>
<td>Module [puppet_module]</td>
<td>A collection of Puppet resources such as classes, files, and templates. Pre-built modules are available that can provide a wide array of functionality. A single module can describe, for instance, an entire web application. Modules are the highest-level resource available with Puppet. You cannot create module records in the instance, but must discover this content from a Puppet Master.</td>
</tr>
<tr>
<td>Manifest [puppet_manifest]</td>
<td>A file that contains resource declarations such as classes, variables, and defined types. These files are written in the Puppet language and have a .pp file extension. You cannot create manifest records in the instance, but must discover this content from a Puppet Master.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Class [puppet_class]</td>
<td>Defines a collection of resources that can then be treated as a single logical unit and applied to an agent by way of a node definition. You cannot create class records in the instance, but must discover this content from a Puppet Master.</td>
</tr>
<tr>
<td>Node Definition [puppet_node_definition]</td>
<td>A collection of classes which will be applied to an agent node.</td>
</tr>
<tr>
<td>Node Definition Draft [puppet_node_definition_draft]</td>
<td>An editable draft of a node definition record. The instance creates these records when modifying a node definition using change management.</td>
</tr>
<tr>
<td>Parameter [puppet_parameter]</td>
<td>A piece of information that a class accepts upon declaration.</td>
</tr>
<tr>
<td>Puppet Object [puppet_object]</td>
<td>A base class that most of the Puppet tables extend. It provides a name and a reference to the parent Puppet Master.</td>
</tr>
<tr>
<td>Class Declaration [puppet_class_declaration]</td>
<td>The declaration of a class from within a node definition.</td>
</tr>
<tr>
<td>Parameter Value [puppet_parameter_value]</td>
<td>The value of a parameter in the context of a class declaration.</td>
</tr>
</tbody>
</table>

**Legacy: Configure Puppet properties**

Properties installed with Puppet.

**Table 911: The following properties appear at Puppet Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.puppet.use_sudo</td>
<td>Perform commands on the Puppet Master using elevated (sudo) privileges.</td>
</tr>
<tr>
<td>puppet.cmdb_ci.fqdn_field</td>
<td>The name of the field that contains the fully-qualified domain name of the Puppet node.</td>
</tr>
</tbody>
</table>

**Legacy: Puppet scripted Web Services**

Scripted Web Services installed with Puppet.

**Table 912: Scripted Web Services**

<table>
<thead>
<tr>
<th>Web Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Legacy: Puppet user roles
User roles installed with Puppet.

Table 914: User Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet User [puppet_user]</td>
<td>Can assign node definitions to Puppet nodes and request changes to existing node definition assignments.</td>
</tr>
<tr>
<td>Puppet Administrator [puppet_admin]</td>
<td>Can create and modify node definition records, and perform all Puppet User actions.</td>
</tr>
</tbody>
</table>

Legacy: Define Puppet credentials
The user account on the Puppet Master server must have rights to run Puppet and view all Puppet files.
Role required: puppet_admin
Before the instance can communicate with Puppet, an administrator must define a credential record for a user on a Puppet Master server. See the official Puppet role documentation for more information about setting up users on the Puppet server.

1. Navigate to Orchestration Credentials.
2. Click New.
3. Select the credential Type appropriate for the Puppet Master server.
4. Enter the User name and Password for a user on the Puppet Master server. This user must have rights on the Puppet Master server to run Puppet and view all Puppet files.
5. [Optional] Select Specific MID Servers from the Applies to field, and select the MID Server that has access to the Puppet Master.
6. Click Submit.

Legacy: Modify the external node classifier script
Puppet uses an external node classifier (ENC) Python script to determine which node definitions to use.
Role required: puppet_admin
The instance provides a version of the script that identifies the instance as an external node classifier. An administrator can enable a Puppet Master to use the script.

1. Navigate to Puppet ENC Scripts.
2. Select snc_enc.py. Alternatively, select snc_enc_with_proxy.py to send puppet requests through a proxy server.
3. [Optional] Modify the Script to use your existing node classifications. A history of modifications to the script appears in the Versions related list.
   To use an outside source for node definitions, modify the default enc.py script to use your existing configuration information.
4. Click Download.
5. Use a text editor to edit the downloaded `snc_enc.py` file to include your instance name as well as the Puppet user credentials.

Do not add the credentials to the script before downloading a copy. Adding credentials before downloading the script poses a security risk.

6. Configure the Puppet Master to use the new `snc_enc.py` file as the external node classifier script.

For more information, see the Puppet Labs external node documentation.

Figure 424: Puppet ENC Script

Legacy: Puppet key concepts

Puppet uses these concepts:

- Puppet node: A computer that runs the Puppet agent service. The ServiceNow product supports managing Puppet nodes on Linux computers.
- Puppet Master: A computer that runs the Puppet Master service. A Puppet Master can install and configure software on a Puppet node, serving the configuration catalogs to the Puppet agents that run on each client node.
- Resource: A building block that describes an aspect of a system, such as a file, a user, a service that must be running, or a package that must be installed.
- Class: A collection of Puppet resources. A class can be treated as a single logical unit and can be applied to an agent by way of a node definition. You cannot create class records in the instance, but must discover this content from a Puppet Master.
- Manifest: A file that contains resource declarations such as classes, variables, and defined types. Manifests are written in the Puppet language and have a .pp file extension. You cannot create manifest records in the instance, but must discover the content from a Puppet Master.
- Module: A self-contained bundle of Puppet code and data. Pre-built modules are available that can provide a wide array of functionality. A single module can describe, for instance, an entire web...
application. Modules are the highest-level resource available with Puppet. You cannot create module records in the instance, but must discover this content from a Puppet Master.

- **Node definition**: A collection of classes. A node definition specifies which classes should apply to a Puppet node.
- **External node classifier (ENC)**: A source of Puppet node configurations separate from the Puppet Master. The instance provides an External Node Classifier Script (ENC) that you can modify and run from a Puppet Master to use the instance as an external node classifier.

*Legacy: Node definitions*

Chef and Puppet management configurations use node definitions to group all configuration items to be applied to a group of nodes. A node definition is called a configuration template in ServiceNow Provider.

Node definitions allow you to automate the process of maintaining machines by applying a single definition to multiple machines.

The Node Definitions form lists and allows you to edit node definitions.

*Legacy: Use Puppet*

Puppet users can request changes to a Linux computer configuration item (CI) assigned to them. Puppet change management ensures that requested changes go through a controlled change process that includes approvals.

Role required: puppet_user or puppet_admin

After a change is approved and the requesting user proceeds with the change, the Puppet Master modifies the computer to bring it to the desired state.

The instance can store data about several Puppet resource types including modules, manifests, classes, and nodes.

Puppet module, manifest, and class records are maintained in Puppet and can be viewed in the instance. A Puppet administrator can retrieve these records from a Puppet Master. It is not necessary to activate Discovery to discover the Puppet environment.

1. Navigate to Puppet Puppet Masters.
2. Click New.
3. In the Puppet Master form, enter the Name of the Puppet Master and the IP Address of the host computer.
4. Right-click the form header and select Save.
5. Click Discover Puppet Details under Related Links.
   - The instance detects the Puppet Master and completes the remaining fields in the form.
   - The instance discovers the Puppet modules, manifests, and classes, and creates records for them in the respective tables.
You can configure an instance to discover Puppet modules, manifests, and classes based on a schedule.

Role required: puppet_admin

1. Navigate to Puppet Puppet Masters.
2. Select a Puppet Master record.
3. In the Scheduled discoveries related list, click New.
5. [Optional] Select Conditional and specify a scripted Condition that must evaluate to true before the scheduled discovery can run.
6. Click Submit.
Legacy: Managing Puppet nodes

A Puppet administrator can directly configure Puppet settings for a specific node from the CI form.

To view a list of CIs assigned to the logged-in user that use Puppet configuration automation, navigate to Configuration Automation Managed Nodes. By default, a Puppet user cannot directly modify the Puppet fields on the CI form, and must request changes through a controlled change process. These fields appear on the Configuration Automation related list of the CI form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully qualified domain name</td>
<td>FQDN that Puppet uses to access this CI.</td>
</tr>
<tr>
<td>Provider</td>
<td>Configuration Automation provider managing this CI.</td>
</tr>
<tr>
<td>Management Server</td>
<td>Server managing this CI.</td>
</tr>
<tr>
<td>Node definition</td>
<td>Node definition for this CI.</td>
</tr>
<tr>
<td>Node Attributes</td>
<td>CI-level attributes defined for this CI.</td>
</tr>
</tbody>
</table>

Legacy: Create a Puppet node definition

A node definition groups several classes together.

Role required: puppet_admin

A Puppet administrator must create a node definition before a Puppet user can assign it to Puppet nodes. When a Puppet user assigns a node definition to a Puppet node, the Puppet node uses the classes specified by the node definition.

To create a new node definition, create an editable node definition draft and then publish the draft.

1. Navigate to Puppet Node Definitions.
2. Click New Draft.
3. Fill in and then save the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider</td>
<td>[Read-only] The configuration automation provider for this definition.</td>
</tr>
<tr>
<td>Inherits</td>
<td>[Optional] The parent node definition that contains class declarations to be inherited.</td>
</tr>
<tr>
<td>Puppet master</td>
<td>The Puppet Master that manages the nodes that use this node definition.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-only] The state of the node definition: Draft or Published.</td>
</tr>
<tr>
<td>Environment</td>
<td>[Optional] An additional parameter that allows you to group Puppet nodes. See Puppet Environments documentation for more information.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Replaces</td>
<td>[Read-only] For node definition draft records, the original node definition record that the draft replaces when published.</td>
</tr>
<tr>
<td>Change request</td>
<td>[Read-only] The change request generated when the draft is published.</td>
</tr>
</tbody>
</table>

4. Click Publish.

Legacy: Declaring classes with Puppet

A node definition may have Class Declaration related records.

Class declarations associate a Class record to a Node definition. You can add class declarations only to draft node definition.

The Type selection specifies how Puppet nodes that use this node definition should handle the class. Available Type choices are:

- Exclude: removes the specified class from the node definition if previously included by a parent node definition. If the parent node definition does not include the class, the Exclude choice has no effect.
- Include: adds the specified class to Puppet nodes that use this node definition.
- Override: uses the class Parameters from the declared class in place of the existing parameters for that class in the parent node definition. If the parent node definition does not include the class, the Override choice functions as Include.

For node definitions that extend a parent node definition, the Exclude and Override choices remove or update classes defined by the parent node definition. node definitions that do not extend another node definition can only Include classes.

![Figure 426: Puppet class declaration](Image)

Legacy: Edit CI-level attributes

Editing CI-level attributes overrides the attributes for a specific CI. For example, if you have applied a node definition to several CIs but want to modify an individual CI to use a different timezone, you can add the attribute for that CI.

Role required: admin

1. Navigate to Configuration Automation Managed Nodes or Configuration Servers Linux.
2. Select a server and then click the Configuration Automation related list.
3. Edit the attributes as necessary and then click Update.

Legacy: Using change management with Puppet
By default, the system allows changes to Puppet configurations only as part of a controlled change management process.

With change management, users cannot directly edit Puppet records such as node definitions or the relationships between CIs and node definitions. For all changes to Puppet resources, the requesting user’s manager must approve the request. If the user record does not have a value in the Manager field, the request is approved automatically.

When a user requests a change, each change management approver and the requesting user receive a notification. Additionally, the system populates the Assigned to field on the change request with the requesting user. This user receives a notification when the request is approved or rejected.

Legacy: Modify a Puppet node
Change management prevents Puppet users from directly editing the Configuration automation or Node definition fields on the CI form.

Role required: puppet_admin

A Puppet administrator can directly configure Puppet settings for a specific node from the CI form. To view a list of CIs that use Puppet configuration automation and are assigned to the logged-in user, navigate to Configuration Automation Managed Nodes. By default, a Puppet user cannot directly modify the Puppet fields on the CI form, and must request changes through a controlled change process.

**Note:** Updates to a CI reset the Node group assignment state to Ready. The Ready state ensures that assignment rules are applied and that the CIs are re-assigned based on the new values. For example, updating fqdn or IP address might reassign a CI to a different node group.

1. Navigate to Configuration Automation Managed Nodes or Configuration Servers Linux.
2. Open the node to update.
3. Edit the fields under the Configuration Automation related list.

### Table 917: CI form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully qualified domain name</td>
<td>The fully qualified domain name that Puppet uses to access this CI.</td>
</tr>
<tr>
<td>Provider</td>
<td>The configuration automation provider managing this CI.</td>
</tr>
<tr>
<td>Management Server</td>
<td>The server managing this CI.</td>
</tr>
<tr>
<td>Node group assignment state</td>
<td>The state of automatic assignment of this CI to a node group, as described in the following table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>Default state for newly discovered CIs. Assignment rules are applied only to CIs in the Ready state.</td>
</tr>
<tr>
<td>In Progress</td>
<td>CI is currently experiencing a configuration change.</td>
</tr>
<tr>
<td>Assigned</td>
<td>CI is part of one or more node groups.</td>
</tr>
<tr>
<td>Processed</td>
<td>Assignment rules have been applied to the CI. There may or may not be a match.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Excluded</td>
<td>Configuration admin role can exclude a CI from being processed by the assignment rules.</td>
</tr>
</tbody>
</table>

4. Click Update.

Legacy: Modify a Puppet node definition

The Checkout Draft related link on the Puppet Node Definitions form creates an editable draft copy of the record.

Role required: puppet_admin

Before a Puppet user or Puppet administrator can commit changes to a node definition, the user’s manager must approve the change request.

When making a change to a node with one or more class declarations, the system duplicates these related records and associates the duplicates with the new node definition draft record.

To update a node definition:

1. Navigate to Puppet Node Definitions.
2. Select a published node definition.
3. Click Checkout Draft.
   This step creates an editable copy of the current record as a draft and opens the form for the record.
4. Update the draft record as needed and then click Publish.
   • This related link creates a change request record. A draft can have only one active change request at a time.
   • After the requesting user's Manager approves the request, the Proceed with Change related link appears on the Puppet Node Definition Draft form.

After the user's manager approves the request:

1. Navigate to the relevant node definition draft record.
2. Click Proceed with Change to push the changes to the original node definition record and delete the draft record.

Legacy: Request a change to Puppet using the service catalog

A user can request a change to a Puppet node through the service catalog. Changes to nodes through the service catalog require the same change request and approvals as changes made through the CI form.

Role required: puppet_user or puppet_admin

1. Navigate to Self-Service Service Catalog.
2. Click Software.
3. Click Modify computer configuration.
4. Select a Computer to modify.
   Only computers Assigned to the requesting user can be selected.
5. Select Puppet for the Configuration automation provider.
6. Select the Node definition to apply to the selected computer.
7. Click Order Now.

Legacy: Disable change management
Disabling change management with the Chef, Puppet, or ServiceNow provider allows users to make and save changes on the definition forms and templates and the Configuration Automation section of the CI form.

Role required: puppet_admin or chef_admin

1. Navigate to one of the following:
   - Chef Properties
   - Puppet Properties
   - Configuration Automation Properties

2. Separately disable change management for either or both of the properties that are associated with the provider:

   Table 918: Disabling change management

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable change management to control updates to node definitions (node definitions) [glide.config_auto.chef.node_definition.use_change]</td>
<td>Disable this property for Chef</td>
</tr>
<tr>
<td>Enable change management to control assignments of Chef definitions to CIs [glide.config_auto.chef.ci_assignment_use_change]</td>
<td>Disable this property for Chef</td>
</tr>
<tr>
<td>Enable change management to control updates to node definitions (node definitions) [glide.node_definition_use_change]</td>
<td>Disable this property for Puppet</td>
</tr>
<tr>
<td>Enable change management to control assignments of definitions to CIs [glide.ci_assignment_use_change]</td>
<td>Disable this property for Puppet</td>
</tr>
<tr>
<td>Enable change management to control updates to node definitions (node definitions)</td>
<td>Disable this property for ServiceNow provider</td>
</tr>
<tr>
<td>Enable change management to control updates to CI</td>
<td>Disable this property for ServiceNow provider</td>
</tr>
</tbody>
</table>

Legacy: Using Puppet with cloud management

By using both Puppet and Cloud Management, you can automate the entire provisioning process including installing software packages on provisioned virtual machines.

Using this automation, you can offer fully-configured virtual machines through the service catalog.

You must activate and configure both Puppet and VMware for Cloud Provisioning before performing the procedures on this page.

Legacy: Offer a virtual machine with the Puppet agent

All Puppet nodes require the Puppet agent service to communicate with the Puppet Master.

Role required: puppet_admin

To provision and configure virtual machines with Puppet, create a Linux virtual machine template that includes the Puppet agent software. After creating the template, create a catalog item for a Linux virtual
machine using that template. See the VMware template documentation for information on creating a virtual machine template.

1. Provision a virtual machine in vCenter with a name that identifies it as a Puppet node.
   You can use the instance to provision the virtual machine, or use vCenter to provision the virtual machine manually.
2. Install the Puppet agent software on the new virtual machine.
   Refer to the Puppet documentation for more information on installing the Puppet agent.
3. Create a user account on the virtual machine with permission to run Puppet. There must be a credential record for this user within the instance.
4. In vCenter, mark this virtual machine as an available template.
5. Discover the template to add it to the list of available virtual machine templates.
   The instance cannot detect whether the Puppet agent is included with a template. It is the responsibility of the vCenter administrator to ensure this template has the Puppet agent installed.

Create a Puppet virtual machine catalog item

Create a catalog item using a virtual machine template.

Role required: puppet_admin

1. On the VMware Catalog Item form, select Guest customization to display the Customization specification field.
2. [Required] Select a Customization specification.
3. Click Update.

Figure 427: Puppet Vmware Catalog Item

Legacy: Provision a virtual machine with Puppet

The procedure for ordering a virtual machine with Puppet is the same as for ordering a standard virtual machine through the service catalog.

Provisioning a virtual machine with Puppet does not add the virtual machine information as a virtual machine CI. Instead, the instance records the new CI as a Linux server.
Completing Provisioning Tasks

A cloud operator must complete the provisioning task generated by the catalog request to provision the virtual machine. To provision a virtual machine with Puppet, ensure that:

• Guest customization is set to Yes.
• Node definition is set to a node definition.

Authenticating New Puppet Virtual Machines

When provisioning a new virtual machine with Puppet, the Puppet Master can authenticate and configure the virtual machine. Provisioning a new virtual machine with Puppet bypasses the standard Puppet approval process, only cloud provisioning approvals are required.

After the virtual machine has been provisioned, the Puppet agent included on the virtual machine attempts to retrieve configuration information from the Puppet Master. If the Puppet agent and Puppet Master successfully communicate, the Puppet agent configures the virtual machine without further user interaction according to the node definition assigned to the virtual machine.

Legacy: Orchestration Puppet activities
Several Orchestration activities are available for managing Puppet configurations.

Legacy: Determine Puppet activity result values
Puppet activities communicate with a Puppet Master through a MID Server.

When a Puppet activity sends a request, the MID Server sends a response to the ECC queue. All Puppet activities set their activity.result value based on the response payload from the MID Server. If this payload contains an error, the activity result value is failure. If the payload contains no error, the activity result value is success.

Legacy: Puppet activity: Install Module
The Install Module activity installs a module to a Puppet Master or puppet node.

This activity implements the behavior detailed by the puppet-module Install action.

Table 919: Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of the Puppet Master or node you want to install the module to. A Puppet Master must have a module before it can push that module to individual puppet nodes.</td>
</tr>
<tr>
<td>Module name</td>
<td>The name of the module you want to install. Enter module names using the format provider/module name, such as puppetlabs/apache. You can find a list of module names by viewing your module repository.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of the module you want to install, in the format #.#.#, such as 0.0.3. Leave this field blank to install the latest available version of the module.</td>
</tr>
<tr>
<td>Module path</td>
<td>The directory path you want to install the module to. This path can be any location on the puppet node.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Module repository | The repository that contains the module you want to install. For example, you can access the Puppet Forge repository at forge.puppetlabs.com.
Ignore dependencies | Option to have this activity not attempt to install dependencies along with the specified module. For example, when installing the apache package, if you select Ignore Dependencies, ServiceNow does not install the stdlib or firewall package dependencies.
Force | Option for overwriting any existing module with the same Module name.

Legacy: Puppet activity: Uninstall Module Puppet
The Uninstall Module activity removes a specified module from a Puppet Master or Puppet node.
This activity implements the behavior detailed by the puppet-module Uninstall action.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of the Puppet Master or node you want to uninstall the module from.</td>
</tr>
<tr>
<td>Module name</td>
<td>The name of the module you want to uninstall. Enter module names using the format provider/module name.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of the module you want to uninstall. Leave this field blank to uninstall the latest version of the module.</td>
</tr>
<tr>
<td>Module path</td>
<td>The directory path of the module you want to uninstall.</td>
</tr>
<tr>
<td>Force</td>
<td>The option to uninstall the specified module even if doing so causes dependency issues on the Puppet Master or node.</td>
</tr>
</tbody>
</table>

Legacy: Puppet activity: Sign Puppet Node
The Sign Puppet Node activity signs the certificate request for a Puppet node.
Use this activity to allow a Puppet Master to recognize a certificate from a Puppet node.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of the Puppet Master that should manage the Puppet node.</td>
</tr>
<tr>
<td>Node FQDN</td>
<td>The fully qualified domain name of the Puppet node whose certificate the Puppet Master needs.</td>
</tr>
</tbody>
</table>
Legacy: Puppet activity: Get Manifests

The Get Manifests activity retrieves a list of the manifests that are part of the installed modules on a Puppet Master or node.

When successful, the activity stores the manifests as a JavaScript array called puppetManifests. Access this JavaScript array in the sensor script by calling the puppetManifests variable. The activity does not add this variable to the workflow scratchpad.

Each object in the array contains:
- basename: the name of the manifest file.
- path: the path where the manifest is installed.
- content: full textual content of the manifest file.
- classes: JavaScript array of the classes in the manifest. Each class has these fields:
  - name: name of the class.
  - inherits: name of the class that this class inherits, or blank if the class does not inherit anything.
  - params: JavaScript array of the input parameters this class takes. Each parameter has these fields:
    - name: the parameter's name.
    - defaultValue: the parameter's default value, or blank if there is no default value.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of Puppet Master you want to retrieve manifests from.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>JavaScript that runs after the command executed by the activity completes. Use this script to process any data returned by the command.</td>
</tr>
</tbody>
</table>

Legacy: Puppet activity: Get Modules

The Get Modules activity retrieves a list of the modules that are installed on a Puppet Master or Puppet node.

When successful, the activity stores the modules as a JavaScript array called puppetModules. Access this JavaScript array in the sensor script by calling the puppetModules variable. The activity does not add this variable to the workflow scratchpad.

Each object in the array contains these fields:
- name: the name of the installed module.
- path: the path where the module is installed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of the Puppet Master that contains the module you want to retrieve.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Sensor script | JavaScript that runs after the command executed by the activity completes. You can use this script to process any data returned by the command.

Legacy: Puppet activity: Get Node Certificates

The Get Node Certificates activity retrieves a list of the node certificates that are signed, requested, or revoked for a Puppet Master.

When successful, the activity stores the certificates as a JavaScript array called puppetNodeCerts. Access this JavaScript array in the sensor script by calling the puppetNodeCerts variable. The activity does not add this variable to the workflow scratchpad. Each object contains the arrays signed, revoked, and requested.

Each array contains these fields:
- hostname: the hostname of the node making the request.
- cert_line: the full text returned by the Puppet Master for each node.

Table 924: Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of the Puppet Master that has pending certificate requests you want to retrieve.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>JavaScript that runs after the command executed by the activity completes. You can use this script to process any data returned by the command.</td>
</tr>
</tbody>
</table>

Legacy: Puppet activity: Get Properties

The Get Properties activity retrieves configuration properties from a Puppet Master or Puppet node.

When successful, the activity stores the configuration properties as a JavaScript array of name-value pairs called puppetProperties. Access this JavaScript array in the sensor script by calling the puppetProperties variable. The activity does not add this variable to the workflow scratchpad.

Table 925: Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puppet master</td>
<td>The IP address of the Puppet Master that has the properties you want to retrieve.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>JavaScript that runs after the command executed by the activity completes. You can use this script to process any data returned by the command.</td>
</tr>
</tbody>
</table>

Legacy: Change Manager script include

The CfgAutoChangeManager script include provides methods for defining a configuration automation change manager.
Implement the methods described here to customize a configuration automation provider or define a new provider.

**Where To Use**

Use this script include to define a custom configuration automation change manager.

**Method Summary**

To use this script include, implement the following methods.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>isAuthorized(GlideRecord record)</td>
<td>Tests if the current user can create or update changes that are associated with the passed record.</td>
</tr>
<tr>
<td>boolean</td>
<td>isChangeRequired()</td>
<td>Tests if change management is required by checking the property for the configuration automation provider.</td>
</tr>
<tr>
<td>String</td>
<td>getChangeId(GlideRecord current)</td>
<td>Returns the change request ID associated with the passed current record. If change management is required, a change record must be associated with the resource to be changed.</td>
</tr>
<tr>
<td>void</td>
<td>setChangeId(GlideRecord record, String changeId)</td>
<td>Associates the passed change request ID with the passed record.</td>
</tr>
<tr>
<td>GlideRecord</td>
<td>prepare(GlideRecord record)</td>
<td>Prepares the upcoming changes. This method is called before the change execution.</td>
</tr>
<tr>
<td>void</td>
<td>finalizeChange(GlideRecord record)</td>
<td>Finishes the change process. This method is called before the change request is closed. Anything that needs to be done before the change request closes goes here.</td>
</tr>
<tr>
<td>void</td>
<td>getWorkflowVariables(String workflowName, GlideRecord record)</td>
<td>Returns the variables that the workflow consumes. Even if you do not need to use a workflow, implement this function and return an &quot;undefined&quot; value.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Method Summary</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Object</td>
<td>getPushWorkflowName()</td>
<td>If a workflow is required by the provider, returns the master workflow name. Even if you do not need to use a workflow, implement this function and return an &quot;undefined&quot; value.</td>
</tr>
<tr>
<td>void</td>
<td>cleanupAfterCancelChange(GlideRecord)</td>
<td>Cleans up any resource or data when a change is canceled. This method is called after the change request is canceled.</td>
</tr>
</tbody>
</table>

**Legacy: Method Detail**

**isAuthorized(GlideRecord record)**

Determines if the user is authorized to make changes.

**Input Fields**

Parameters:

- record - (GlideRecord) The current record.

**Output Fields**

Returns: (boolean) true if the user is authorized to make changes.

**Example**

```javascript
isAuthorized : function (current ) { return gs. hasRole ( 'chef_admin' ) ; }```

**isChangeRequired()**

Determines if change management is required.

**Input Fields**

Parameters:

- None

**Output Fields**

Returns: (boolean) true if change management is required; otherwise, false.
**Example**

```javascript
isChangeRequired: function () { return gs.getProperty ('glide.config_auto.chef.node_definition.use_change') == 'true'; }
```

**getChangeId(GlideRecord current)**

Returns the change ID associated with the passed current record. If change management is required, a change record must be associated with the resource to be changed.

**Input Fields**

Parameters:

- `current` - (GlideRecord) The current record.

**Output Fields**

Returns: (String) the Change ID.

**Example**

```javascript
getChangeId : function (current ) {
    if (JSUtil.nil (current ) ) return null ;
    if ( !current. instanceOf ('node_definition' )) { return null ; }
    return current [ 'change' ];
}
```

**setChangeId(GlideRecord record, String changeld)**

Associates the passed change request ID with the passed record.

**Input Fields**

Parameters:

- `record` (GlideRecord) The current record.
- `changeld` (String) The Change Request ID.

**Output Fields**

Returns: void
Example

```javascript
setChangeId : function (current, changeId) {
    if (JSUtil.nil(current)) return;
    current['change'] = changeId;
    current.update();
}
```

**prepare(GlideRecord record)**

Prepares the changes. This method is called before the execution of the changes.

**Input Fields**

Parameters:
- record - (GlideRecord) The current node definition draft record.

**Output Fields**

Returns: (GlideRecord) the current node definition draft record.

Example

```javascript
prepare : function (current) {
    var change = current.cfg_auto_change;
    if (JSUtil.notNull(change)) {
        var phaseList = new ChoiceList('cfg_auto_change', 'phase');
        var gr = new GlideRecord('cfg_auto_change');
        gr.get(change.sys_id);
        gr.setValue('phase', phaseList.getValue(this.IN_PROGRESS));
        gr.update();
    }
    return current;
}
```

**finalizeChange(GlideRecord record)**

Finishes the change process. This method is called before the change request is closed. Anything that needs to be done before the change request closes goes here.

**Input Fields**

Parameters:
- record - (GlideRecord) The current node definition draft record.
Output Fields

Returns: void

Example

finalizeChange : function (current) {
    var changeId = current.cfg_auto_change.sys_id;
    //Update current node definition from requested
    var changeGr = new GlideRecord('cfg_auto_change');
    changeGr.get(changeId);
    current.fqdn = changeGr.fqdn;
    current.cfg_auto_provider = changeGr.provider;
    current.cfg_auto_management_server = changeGr.management_server;
    current.node_definition = changeGr.node_definition;
    current.update();
    ...
}

getWorkflowVariables(String workflowName, GlideRecord record)

If a workflow is required by the provider, returns the variables that the workflow consumes. Even if you do not need to use a workflow, implement this function and return an "undefined" value.

Input Fields

Parameters:
• workflowName - (String) The workflow name.
• record - (GlideRecord) The current record.

Output Fields

Returns: (Object) the workflow variables.

Example

getWorkflowVariables : function (wfName, nodeDefGr) {
    var wfVars = { 'u_node_def_id' : nodeDefGr.getValue('sys_id') };
    return wfName === 'Deploy Chef Change Master' ? wfVars : {};
}

© 2018 ServiceNow. All rights reserved.
getPushWorkflowName()

If a workflow is required by the provider, returns the master workflow name. Even if you do not need to use a workflow, implement this function and return an "undefined" value.

Input Fields

Parameters:
• None

Output Fields

Returns: (String) The workflow name.

Example

getPushWorkflowName : function ( ) { return 'Deploy Chef Change Master' ; }

cleanupAfterCancelChange(GlideRecord record)

Cleans up any resource or data if a change is canceled. This method is called after the change request is canceled.

Input Fields

Parameters:
• record - (GlideRecord) The node definition draft record.

Output Fields

Returns: void

Example

cleanupAfterCancelChange : function (nodeDefDraftGr ) { 
    new Workflow ( ). cancel (nodeDefDraftGr ) ; // cancel the flows against our extended table
    nodeDefDraftGr. change = '' ;
    nodeDefDraftGr. update ( ) ; }

Password Reset setup guide

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.
Requirements

Role required: admin

Note: The Password Reset application is not available during upgrade.

What is installed

- Password Reset is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see Credential stores for Password Reset on page 1702.
- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See Activate the Password Reset - Orchestration Add-on plugin on page 1680.

Next steps

Plan and configure the Password Reset processes for your organization. See the Password Reset admin guide on page 1695.

Activate the Password Reset - Orchestration Add-on plugin

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and 'Remote (SOAP) ServiceNow instance' credential store types. No other components are installed.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
Reason/Comments

Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.

3. Click Submit.

Installed with Password Reset

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

</tbody>
</table>

### Password Reset UI macros

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_validation</td>
<td>CSRF validation for Password Reset Application. If violation is detected, the page will be redirected to the error page.</td>
</tr>
<tr>
<td>$pwd_display_password</td>
<td>Displays a temporary password on the success page if the process is configured to auto-generate.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>UI for question and answer security validation enrollment.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui_js</td>
<td>JavaScript code that requires server-side data for security question and answer enrollment.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Sample UI macro for enrollment for Mock Verification Type.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui and $pwd_verify_sms_ui</td>
<td>UI for SMS enrollment and verification.</td>
</tr>
<tr>
<td>$pwd_enrollment_form_title</td>
<td>Jelly macro function that prints the title for the enrollment form. A verification ID is mandatory.</td>
</tr>
<tr>
<td>$pwd_error_message</td>
<td>UI for displaying error messages.</td>
</tr>
<tr>
<td>$pwd_process_flow</td>
<td>UI for indicating current stage.</td>
</tr>
<tr>
<td>$pwd_process_footer</td>
<td>JavaScript code to get the footer macro name.</td>
</tr>
</tbody>
</table>
UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script> Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, [UI Script Name]+".jsdbx" is the name of the script:

```xml
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui</td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td>$pwd_enrollment_submit_event</td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td>$pwdWfManager</td>
<td>Helper class to handle workflow activities and post-processing.</td>
</tr>
</tbody>
</table>

Password Reset workflows

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Reset - AD</td>
<td>Connects to an AD server.</td>
</tr>
<tr>
<td>Pwd Reset - Local ServiceNow</td>
<td>Current (local) instance.</td>
</tr>
<tr>
<td>Pwd Reset - Master</td>
<td>Password Reset master workflow.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Fatal</td>
<td>Example workflow to use in Password Reset testing to simulate a fatal error. No retries.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Pwd Reset - Mock Non Fatal</td>
<td>Example workflow to use in Password Reset testing to simulate a non-fatal error.</td>
</tr>
<tr>
<td>Pwd Reset - Mock Success</td>
<td>Example workflow to use in Password Reset testing to simulate a successful completion.</td>

</tbody>
</table>

### Password Reset Windows Application

If a user forgets the password or is locked out of a Windows computer, the user can reset the password directly from the Windows login screen.

#### Installer and documentation

Download the installer and installation instructions from KB0542328 in the [ServiceNow Knowledge Base](https://knowledge.dialthru.com). The installer uninstalls any earlier version of the Password Reset Windows Application.

#### How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

**Restrictions on the Password Reset Windows Application**

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in Configure your Password Reset or Password Change process on page 1701.
- The Password strength indicator is not supported. See Configure and test the Password Reset connection to a credential store on page 1704.
- For some verification types, you can use only one verification. Custom verifications are not supported. See Password Reset verifications on page 1708 for details.
- Custom UI macros configured on the Process Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See Configure and test the Password Reset connection to a credential store on page 1704.

**Password Reset Windows Application installation requirements**

You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.
### Requirement

**Required ServiceNow release**
- Password Reset Windows Application version 2.x is supported on Helsinki and newer releases.
- Password Reset Windows Application version 3.x is supported on Kingston and newer releases.

**Required hardware**
- 1 GHz or faster processor
- 512 MB of RAM
- 10 MB of available hard disk space (x86)
- 10 MB of available hard disk space (x64)

**Required software**

<table>
<thead>
<tr>
<th>Version of Password Reset Windows Application</th>
<th>Microsoft .NET Framework</th>
<th>Microsoft Visual C++ Redistributable Package</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.9, 3.2, and earlier</td>
<td>4.5.2 and newer</td>
<td>2013</td>
</tr>
<tr>
<td>2.10, 3.3</td>
<td>4.7.1 and newer</td>
<td>2013</td>
</tr>
</tbody>
</table>

**Supported operating systems**
- Windows 7
- Windows 8.1
- Windows 10 Enterprise
- Windows 10 Pro

**Supported processor architecture**
- X86
- X64

**Supported network architecture**
- Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured.
- The ServiceNow SHA certificate must not be blocked by the corporate network. Information on the ServerCertificateSHA256 file appears in the documentation for Password Reset Windows Application.
- To reset an AD password, the client must be on the corporate network.
Password Reset admin guide

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: Introducing Password Reset (Video)

Password Reset processes

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- Self-service process: Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
- Service desk-assisted process: A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.

End-user experience of the self-service process

The following example is typical:

1. On the login page, the user clicks the Forgot Password? link to start the process.

2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default CAPTCHA security feature:
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (The user had earlier selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was texted to a mobile device — the SMS verification.
How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.

2. Set up the elements of the password reset and password change processes according to the plan:
   • Connection to the credential store.
   • User groups that will use the password reset process.
   • Identification type to use.
   • Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application on page 1691.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record.

2. On the Change Password page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.

4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes on page 1698

Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
   • Self-service process: Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with
Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the Public access property.

- Service desk-assisted process: Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

2. Understand how groups and roles differ in their access and security needs.
   Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

   Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

   Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Consider how to manage credentials.
   Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Consider how to implement enrollment in the Password Reset program.
   For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Consider which Password Reset options to offer to users.
   - If your organization uses single sign-on, how will users reset their password if they are unable to log on?
   - What options are available to users working off-site?

Domain separation in the Password Reset application

A password reset process that you define in any domain is isolated from a process that you create in any other domain.

Overview of the Password Reset application

Each password reset process follows these steps:

1. The end user asks to reset the password.
2. The user provides identifying information (typically username or email address).
3. The user verifies the identity — proves that they are who they say they are (typically by answering questions or submitting a code number that was delivered securely).
4. The instance connects to the credential store to confirm the user credentials.
5. The instance generates the new password and displays it to the user.
Elements of a password reset process

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.
- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.
- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Process tables include a sys-overrides column on business rules, UI actions, and so on.
- The Password Reset application is built using Orchestration. Orchestration does not fully support domain separation.

Self-service and Service desk-assisted processes

In addition to configuring the connections, user groups, identifications, and verifications that are used in each process, the admin specifies one of the following operational methods for the organization:

- Self-service process: End users reset passwords over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).
- Service desk-assisted process: End users do not reset passwords. An end user requests the assistance of a service desk agent, over the phone or in person. The agent processes the request. Each service desk agent has the Password Reset Admin service desk role. The “reset request” form that the agent works in presents a User field and a Process field. On the form, the agent can view all processes in the end user’s domain, even if the agent is not a member of one or more of the domains.

Password Change process

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.
Configure your Password Reset or Password Change process

To implement the process, you configure credentials, verifications, and users.

Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes on page 1698.
2. Create the credential store record for user names and passwords that are managed.

   **Note:** For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the password reset plugin that is installed.
   - The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
   - The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self-service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
   - The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.

3. Define the verifications that the process will use.

   A Password Reset process consists of the following elements:
   - The credential store that contains user login credentials.
   - Optionally, the user groups that are authorized to use the Password Reset process.
   - The verifications (extension script includes) that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password.

1. Navigate to Password Reset Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box and/or the Password change check box.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th><strong>Apply to all users setting</strong></th>
<th><strong>Result</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>

6. If you selected Password Reset, fill in the Password Reset Details tab and, optionally, the Advanced tab. See Settings on the Password Reset Details tab on page 1711 and Settings on the Password Reset ‘Advanced’ tab on page 1717.

7. Save the form. The form refreshes and additional related lists appear.

8. From the Password Reset Process Verifications related list, select one or more verifications. See Password Reset verifications on page 1708.

9. From the Password Reset Process Groups related list, select the user groups that will use the process that you are defining.
The Password Reset Process Groups related list appears only if the Apply to all users check box is not selected.

10. Select the Active check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.

11. Click Update.

12. Navigate to Password Reset Properties to set the properties that configure the Password Reset experience for end users.

**Credential stores for Password Reset**

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User [sys_user] table or an Active Directory server.

Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

**Remote credential stores**

A remote credential store refers to any credential store other than the local ServiceNow instance. Remote credential stores, such as Active Directory, manage user names and passwords outside of the local instance. A remote credential store can also be a remote ServiceNow instance, a UNIX or Linux server, or any other directory-like service that relies on the SOAP protocol. The Password Reset Orchestration Add-on plugin is required to connect to remote credential stores. Review the information in the section on credential store types before you create, test, or delete credential stores.

**Credential store types**

A credential store type is a set of workflows that specify how to connect to a credential store. The base system includes example credential store types that you can use as models to create custom types.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Orchestration add-on.</td>
</tr>
<tr>
<td>Remote (SOAP) ServiceNow instance</td>
<td>Represents a remote ServiceNow instance. Installed with the Orchestration add-on.</td>
</tr>
</tbody>
</table>

**Connection workflows for credential store types**

A credential store type requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the Pwd reset – AD and Pwd Reset - Local subflows as models for your custom connection workflows.
Figure 428: Pwd Reset Local sub workflow
Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset on page 1728.

Configure and test the Password Reset connection to a credential store

You specify a credential store to access during the Password Reset or Password Change process and configure other settings that control the process.

Role required: password_reset_admin or password_reset_credential_manager

| Note: | The Password Reset Windows Application supports only Active Directory (AD) credential stores. |

1. Navigate to Password Reset Credential Stores.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>You can use credential store types (templates that provide a desired set of capabilities). Credential stores inherit the functionality of the credential store type.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Note: The Password Reset Windows Application supports only AD Credential Store.</td>
</tr>
</tbody>
</table>

Installed credential store types:

- Local ServiceNow Instance installed with Password Reset.
- AD Credential Store installed with the Orchestration Add-on.
- Remote (SOAP) ServiceNow installed with the Orchestration Add-on.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-generate password</td>
<td>Script include that generates a temporary password for use during the reset process.</td>
</tr>
<tr>
<td>Note</td>
<td>If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.</td>
</tr>
<tr>
<td>Enforce history policy</td>
<td>Note: This option appears only if you select a credential store Type of AD Credential Store. To enforce the history policy that is configured for the credential store:</td>
</tr>
<tr>
<td></td>
<td>1. Select the Enforce history policy check box.</td>
</tr>
<tr>
<td></td>
<td>2. Follow the procedure that appears after this table.</td>
</tr>
<tr>
<td>Note</td>
<td>Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords.</td>
</tr>
<tr>
<td></td>
<td>For example, the history policy might be configured to not allow the user to reuse any of the previous three passwords when resetting a password.</td>
</tr>
<tr>
<td>Hostname</td>
<td>URL or IP address of the credential store that contains the user credential (for example, user names and passwords).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name.</td>
</tr>
<tr>
<td>Password rule hint</td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.</td>
</tr>
<tr>
<td>Note</td>
<td>The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>• Display the text box for the Strength rule script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>• Display the graphical Password Strength bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td>Note</td>
<td>The Password Reset Windows Application does not support Password Strength.</td>
</tr>
</tbody>
</table>
3. Click Submit.
   The connection is created. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to Password Reset Credential Stores and then open the credential store.

5. In the header bar, click Save and Test Connection.
   A progress page displays the result of the test.

If you selected the Enforce history policy check box, then follow these steps:

1. Open the associated Password Reset process definition: Password Reset Processes.

2. On the Details tab of the Password Reset Process form, clear the Auto-generate password check box and then save the process definition.

3. On the domain controller, set Password Aging (MIN_PASSWORD_AGE) to zero.

4. On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last three passwords are not repeated, set the history policy to six.

**Note:** To enforce the history policy that is configured for the credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you have cleared the Auto-generate password check box on the Password Reset Process form. Because the user immediately replaces the temporary password with a new password, two passwords are created for each reset cycle.

Set up SOAP credentials for Password Reset
When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Role required: admin or web_service_admin

1. Navigate to System Web Services Outbound SOAP Message.
2. Click Password Reset Request.
3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a) In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b) In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c) Select Use basic auth.
   d) Click Update.

   You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.

Configure Password Reset for Active Directory
When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.

Active Directory must have a user role with the following privileges:

Descendent User objects:
• Reset password
• Read/Write pwdlastset
• Read/Write UserAccountcontrol
• Write Account Restrictions
• Read/Write lockouttime
• Read MemberOf

Descendent Group objects:
• Read Members
• Read MemberOf

1. Install MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. In the ServiceNow instance, navigate to Orchestration Credentials.
4. Click New and then complete the form with the following values for the credential.
   • Type: Select Windows.
   • User name: Enter your Active Directory domain user. For example, domain\admin.
   • Password: Enter your Active Directory domain user password.
   • Applies to: Select the MID Server that is used to access the Active Directory server.
5. Click Submit.
6. Create a credential store for Active Directory.

Delete a connection to a credential store for Password Reset
Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset Credential Stores and then select the check box for the credential store.  
2. In the Actions choice list, select Delete.

Password Reset verifications
Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

<table>
<thead>
<tr>
<th>Table 934: Password Reset verifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>QA verification</td>
</tr>
</tbody>
</table>
| Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for.  
  This verification is based on the Security Questions verification type.  
  When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity.  
  For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers on page 1764. |
| SMS verification                       |
| Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. This verification is based on the SMS Code verification type.  
  When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page.  
  You can use the ServiceNow Notify feature to send the codes.  
  For information on the user enrollment experience, see Users: Enroll in the Password Reset program using SMS codes on page 1764. |
| Personal Data — Confirm Email Address  |
| Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance.  
  This verification is based on the Personal Data Confirmation verification type. |
Verifications included with the demo data

The following demo data is based on the Mock verification type:

- Sample Mock verification #1
- #2

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

**Personal data identification types**

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

**Personal data confirmation verifications**

- Personal data verification: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
- Personal data confirmation verifications allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the label parameter (the text that the end user should see) to Email (that is, label=Email).
2. Set the column parameter (the column in the table that holds the verification data) to email (that is, column=email).

**Note:** You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.
Personal data and personal data confirmation type verifications

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Label that the user sees during the password reset request.</td>
</tr>
<tr>
<td></td>
<td>Data Type: string</td>
</tr>
<tr>
<td></td>
<td>Default Value: n/a</td>
</tr>
<tr>
<td>column</td>
<td>Column of the sys_user table that provides the data that is used to verify the identity of the user.</td>
</tr>
<tr>
<td></td>
<td>Data Type: string</td>
</tr>
<tr>
<td></td>
<td>Default Value: n/a</td>
</tr>
</tbody>
</table>

Create a custom identification type for Password Reset
A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Role required: password_reset_admin or admin

**Note:** The Password Reset Windows Application does not support custom identification types.

1. Navigate to Password Reset Extensions Identification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script, or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.

SMS Code Verification type for Password Reset
Using the Simple Message Service (SMS) Code Verification type, a user can verify identity through any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user enters the code on the password reset page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table
- Update property settings for the Password Reset application

**Note:** The system allows only one instance of each SMS code parameter.
Use NotifyNow to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using ServiceNow NotifyNow (via Twilio SMS Messaging). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Role required: admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at https://www.twilio.com/
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or reset receive SMS codes through NotifyNow.

Settings on the Password Reset Details tab

The settings define the user experience when resetting or changing a password.

The Password Reset Details tab appears when you are configuring a Password Reset process (Password Reset Processes).

### Table 935: SMS Code Verification type parameters

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>

<tr>
<td>Minimum verifications</td>
<td>Number of verifications that a user must successfully submit to reset the password. If the number exceeds the number of mandatory verifications, then the user must submit enough additional optional verifications to meet the number specified for Minimum verifications. By default during the password reset process, the system presents optional verifications to the user based on the Order values for the verifications. <strong>Note:</strong> Each user must submit all mandatory verifications regardless of the number specified.</td>
</tr>
<tr>
<td>Email Password Reset URL</td>
<td>Select the check box to enable users to reset the password by clicking a link in an email that the instance sends to them. By default, the self-service Password Reset processes enable this option. When you select this option, the Auto-generate password check box is not available. <strong>Note:</strong> See Self-service Password Reset process: overview for an outline of the process that is enabled by default.</td>
</tr>
<tr>
<td>Enable account unlock</td>
<td>This check box is available only when Password reset is selected. Select the check box to allow user accounts on credential stores to be unlocked without resetting the password. <strong>Note:</strong> Not supported by the default self-service Password Reset process.</td>
</tr>
<tr>
<td>Unlock user account</td>
<td>Select the check box to unlock user accounts on credential stores after a password reset.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Auto-generate password | This check box is available only when:  
  • The Password reset check box is selected.  
  • The Email Password Reset URL check box is not selected  
  
  Select the check box to auto-generate a new password for the user. When this check box is selected, you must select the Email password or Display password check box, or both. This setting is useful for service desk-assisted processes.  
  
  **Note:** Clear the check box to enable the Enforce history policy option for a credential store. See `Configure and test the Password Reset connection to a credential store` on page 1704. |
| User must reset password | This check box is available only when Auto-generate password is selected.  
  
  Select the check box to require users to reset their password immediately after logging in with the auto-generated password.  
  
  **Note:** Users whose credentials are held in the local ServiceNow instance credential store are prompted to change their password the first time that they log in. Users whose credentials are held in an Active Directory credential store are not prompted to change their passwords in the instance. Such users must change their passwords from a computer on the domain. |
| Display password    | This check box is available only when Auto-generate password is selected.  
  
  Select the check box to display the new password on the screen. In a self-service process, the password appears on the user screen. In a service desk-assisted process, the password appears on the service desk agent screen. |
Field | Description
--- | ---
Email password | This check box is available only when Auto-generate password is selected. Select the check box to email the new password to the user. The setting is useful in both self-service and service desk-assisted processes. The setting can add a layer of security by requiring that users access their email to view the password. In a service desk-assisted process, emailing the password to users ensures that only the user requesting the password reset can view the password.

Related lists

Verifications | This related list is available only after the record has been saved.
One or more verifications that the process uses. See Password Reset verifications on page 1708.

Groups | The Groups related list is available only after the record has been saved and if the Apply to all users check box is cleared.
ServiceNow user groups to associate with the Password Reset process.

Configure Google reCAPTCHA

To use the Google reCAPTCHA service, instances that are running on a domain other than service-now.com require an API key pair from Google. The process described in this topic is optional for instances that are running on the service-now.com domain.

Role required: admin

Note:

Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the process described in this topic. Instead, set the password_reset.captcha.google.enabled system property to false. This setting enables the CAPTCHA service that is provided with the base system.

The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha
2. Set the following system properties:

<table>
<thead>
<tr>
<th>System Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>password_reset.captcha.google.enabled</td>
<td>Set to true.</td>
</tr>
<tr>
<td>Type: string</td>
<td>Default: true</td>
</tr>
</tbody>
</table>
Settings on the Password Reset 'Advanced' tab

UI macros and script includes can extend the basic functionality of a Password Reset process.

The Advanced tab appears when you are configuring a Password Reset process (Password Reset Processes).

Table 937: Advanced tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>

<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the Post reset script category as described in Password Reset extension scripts on page 1748.</td>
</tr>
</tbody>
</table>

Configure the required strength for passwords

The password that a user defines must meet certain requirements — it must contain at least eight characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

Role required: password_reset_admin

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating password. The default requirements for a new password are:

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral
Note: This topic describes the procedure for configuring password strength requirements only. You can configure several other settings for the credential store, as described in Configure and test the Password Reset connection to a credential store on page 1704.

1. Navigate to Password Reset Credential Stores.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.</td>
</tr>
<tr>
<td>Note:</td>
<td>The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule Client script</td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>• Display the text box for the Strength rule script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>• Display the graphical Password Strength bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td>Note:</td>
<td>The Password Reset Windows Application does not support Password Strength.</td>
</tr>
</tbody>
</table>
Strength rule: This text box appears only if you select Enable Password Strength.

Note: The Password Reset Windows Application does not support Password Strength.

Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

Default settings:

- Selected for local ServiceNow credential stores
- Not selected for other credential stores

Note:

To guide the user during the reset process, the system displays a graphical bar labeled Password Strength under the New password field.

3. Click Submit.
   You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to Password Reset Credential Stores and then open the credential store.

5. In the header bar, click Save and Test Connection.
   A progress page displays the result of the test.

Configure the number of questions for a 'Security Questions' verification

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll and the number to display when a user requests password reset.

Role required: password_reset_admin or admin

1. Navigate to Password Reset Verifications and then open a verification that uses the Security Questions Verification Type.

2. Configure the parameters in the Password Reset Verification Parameters related list.
Table 938: Parameters for Security Questions Verification

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_enroll</td>
<td>Number of security questions that are displayed while a user is enrolling for Password Reset. Data Type: Positive integer that does not exceed the number of questions in the security questions list (Password Reset Security Questions). Default Value: 5</td>
</tr>
<tr>
<td>num_reset</td>
<td>Number of security questions that are displayed while a user is attempting to reset the password. The questions are selected at random and are presented in random order. Data Type: Positive integer that does not exceed the value of the num_enroll parameter Default Value: 3</td>
</tr>
</tbody>
</table>

3. Click Update.

Configure Password Reset properties
You can specify properties that configure the Password Reset experience for end users.

Role required: password_reset_admin

While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is three attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between five and seven.

Note: The following properties affect Password Reset, but do not appear on the Password Reset Properties page:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the Forgot password? button. See the glide.security.password_reset.uri property in High Security Settings.
- You can add the glide.pwd_reset.onetime.token.validity property to the System Properties [sys_properties] table to specify the number of hours that the Password Reset token should be valid. Default: 12.

1. Navigate to Password Reset Properties.
2. Update settings as needed and then click Save.
### Table 939: Password Reset properties

<table>
<thead>
<tr>

</tbody>
</table>
| Workflow polling frequency | password_reset.wf.refresh_rate | Time period in milliseconds between checks on status of the workflow.  
- Type: integer  
- Default value: 500 |
| Workflow expiration | password_reset.wf.timeout | Maximum wait time in milliseconds for the workflow to complete. The workflow is triggered during the password reset request when the user clicks Submit.  
- Type: integer  
- Default value: 90000 |
| Disable CAPTCHA validation functionality | password_reset.captcha.ignore | Enables or disables CAPTCHA functionality.  
- Type: true|false  
- Default value: false  

The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. To use the base-system CAPTCHA, change the password_reset.captcha.google.enabled system property to false.  
See [Configure Google reCAPTCHA](#) |
| Password Reset Request properties | | |
| Number of unsuccessful attempts allowed to reset/change password | password_reset.request.max_attempts | Number of password reset attempts a user has before they are locked out for a period determined by the value in max_attempt_window.  
- Type: integer  
- Default value: 3 (attempts) |
<table>
<thead>
<tr>
<th>Text on the Password Reset properties page</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of minutes a user must wait to reset/change password after exceeding the maximum allowed unsuccessful attempts | password_reset.request.max_attempt_window | Time period that users are blocked or prevented from changing their passwords after trying the maximum number of times.  
• Type: integer  
• Default value: 1440 (minutes) |
| Number of minutes a user must wait to reset/change password after the last successful reset/change | password_reset.request.success_window | Time period that a user must wait after successfully resetting the password to reset the password again.  
• Type: integer  
• Default value: 1440 (minutes) |
| Number of minutes a user must wait to start a reset request after the last successful unlock account | password_reset.request.unlock_window | Time period that a user must wait after a successful unlock operation before starting a new request.  
• Type: integer  
• Default value: 1440 (minutes) |
| Number of minutes before a password reset request expires | password_reset.request.expiry | Time period that a user is allowed to perform the Password Reset process.  
• Type: integer  
• Default value: 10 (minutes) |

<table>
<thead>
<tr>
<th>Password Reset Security Question properties</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Minimum number of characters in any answer | password_reset.qa.ans_min_len | Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question.  
Default value: 3 characters |
<table>
<thead>
<tr>
<th>Text on the Password Reset properties page</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of security questions required during the password reset request | `password_reset.qa.num_reset` | Number of questions that a user must answer to verify identity during the Password Reset process.  
- Type: integer  
- Default value: 3 (questions)  
- Possible values: Integers that are less than the number specified for the `num_enroll` property.  
  
  **Note:** You can override this security question property by adding the `num_reset` parameter in the security question verification. |
| Number of security questions required during enrollment | `password_reset.qa.num_enroll` | During the enrollment process, the number of questions that a user must answer to be enrolled in the Password Reset program.  
- Type: integer  
- Default value: 5 (questions)  
  
  **Note:** You can override this security question property by adding the `num_enroll` parameter in the security question verification. |

Password Reset SMS Code properties
<table>
<thead>
<tr>

### Text on the Password Reset properties page

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of minutes before the SMS code expires | Time, in minutes, until the SMS code sent to the user expires.  
• Type: integer  
• Default value: 5 (minutes)  

**Note:** You can override this SMS code property by the expiry parameter in the SMS code verification.

### Password Reset Monitoring and Reporting properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Time interval, in minutes, for counting blocked users | Time window to count the number of blocked users.  
• Type: integer  
• Default value: 60 (minutes)  

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of blocked users, in the defined time interval, that triggers a system log event | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
• Type: integer  
• Default value: 10 (blocked users) |

---

**Specify lockout for failed login attempts**

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to **System Policy Script Actions** to view or activate the scripts.

### SNC User Lockout Check with Auto Unlock

- Uses the value of the glide.user.max_unlock_attempts property to set the limit for failed login attempts.
- Unlocks the user account after the time period that is specified for the glide.user.unlock_timeout_in_mins property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.

### SNC User Lockout Check

Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).
Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to System Policy Event Logs.
2. Filter for login.failed in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.

Integrate Password Reset with a CMS integration
You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: content_admin

Each Password Reset process requires a separate CMS page.

1. Navigate to Content Management Specialty Content iFrames and create an iFrame record.
2. Go to Content Management Sites and create a site that has no login page.

3. Go to Content Management Pages and create a password reset page.
4. Enter the name of the site that you created in the Content site field (Password Reset self-service in the example).
5. Right-click the form header and click Save.
6. Click the Edit Page related link and then click Add content.
7. In the Content Blocks section, select the iFrame that you created. Add more content as needed.
8. Click Update.

Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in Password Reset extension script categories on page 1747.
   Extension scripts enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).
2. Follow the configuration steps described in Configure your Password Reset or Password Change process on page 1701.
3. Select the new types that you created. You can customize the following components:
   • Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See Create a credential store type for Password Reset on page 1728.
   • Verification types: Define new types for how users are verified. See Create a custom Password Reset verification type on page 1734.
   • Identification types: Define new types for how users can identify themselves. See Create a custom identification type for Password Reset on page 1710.

Add a custom question to the Security Questions verification

To enroll for the ‘Security Questions’ verification, the user selects several questions and supplies answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Role required: password_reset_admin or admin

The default language is English, and you can create a custom question in a non-English language. If you create the appropriate non-English language questions, then the questions appear in the language that the user requested during login.

1. Navigate to Password Reset Security Questions and then click New.
2. Enter the English language question in the Security question field and then click Submit.
   The question appears in the Translations related list.
3. To add the same question in another language, complete the following steps.
   a) Click the English language question to translate.
      Note: Do not change the Language value for the default questions that come with the base system.
   b) On the Password Reset Question page, in the Translations related list, click New.
c) Select the language in the Language field.
d) Enter the non-English text in the Security question field.
e) Click Submit.

The question appears in the Translations related list on the Password Reset Question page. If a user selects the language while logging in, then the verification question appears in that language.

Create a credential store type for Password Reset
You can create a custom credential store type if the base-system types do not meet your needs.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset Extensions Credential Store Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

**Note:** You may need to configure the form to see the Get user lock state workflow and the Unlock user workflow.

### Table 940: New credential store fields

<table>

| Password Reset Verification Parameters | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the default specified in the Password Reset properties. |
|                                        | The available parameters are described separately for each verification type.                                                                     |

3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Verification type components

You can configure the Password Reset app to enroll users in the Password Reset process automatically, or you can define an enrollment check.

To define an enrollment check, you must define:

- An enrollment processor script, which specifies how enrollment is processed
- A corresponding enrollment UI macro, which specifies how the enrollment information is displayed to the user

The following example uses PwdEnrollISMSProcessor as the enrollment processor script and pwd_enroll_sms_ui as the enrollment UI macro.
A verification type must also define a verification processor script and a corresponding verification UI macro. The example uses `PwdVerifySMSProcessor` as the verification processor script and `pwd_verify_sms_ui` as the verification UI macro. The following shows the verification processor script:
Figure 431: Verification type SMS processor

The following is the corresponding UI macro:
Create a custom Password Reset verification type

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin or admin
Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

1. Navigate to Password Reset Extensions Verification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when Automatic Enrollment is selected, a default script is provided.</td>

<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users. If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that provides the UI for the enrollment.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes the enrollment.</td>
</tr>
<tr>
<td>Verification UI</td>
<td>Verification UI macro that provides the UI for the verification.</td>
</tr>
<tr>
<td>Verification processor</td>
<td>Verification processor script (extension scripts) that processes the verification.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Verification type components
You can configure the Password Reset app to enroll users in the Password Reset process automatically, or you can define an enrollment check.

To define an enrollment check, you must define:

- An enrollment processor script, which specifies how enrollment is processed
- A corresponding enrollment UI macro, which specifies how the enrollment information is displayed to the user

The following example uses PwdEnrollISMSProcessor as the enrollment processor script and pwd_enroll_sms_ui as the enrollment UI macro.
A verification type must also define a verification processor script and a corresponding verification UI macro. The example uses `PwdVerifySMSProcessor` as the verification processor script and `pwd_verify_sms_ui` as the verification UI macro. The following shows the verification processor script:
Figure 434: Verification type SMS processor

The following is the corresponding UI macro:
Password Reset script includes
The Password Reset plugin adds several Password Reset script includes. Use the base-system script includes as they are or call custom extension scripts at the provided extension points.

Figure 435: Verification type SMS UI macro
Extension scripts enable you to extend functionality in a password reset process. The *extension script category* refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

**'Enrollment check' script includes**

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: `sys_user`).
- `params.verificationId`: The sys_id of the verification being checked (table: `pwd_verification`).

<table>

</tbody>
</table>

**'Identification form processor' script includes**

Identification form processor script includes provide functionality for extending identification processing. All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- `params.processId`: The sys_id of the calling Password Reset process (table: `pwd_process`).
- `param request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. The supported request parameter is `sysparm_user_id`, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

**'Enrollment form processor' script includes**

Enrollment form processor script includes provide functionality for extending enrollment form processing. All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.
• params.userId: The sys_id of the user trying to enroll (table: [sys_user]).
• params.verificationId: The sys_id of the verification used to enroll (table: [pwd_verification]).
• params.enrollmentId: The sys_id of this enrollment process.
• request: The form request object. Fields in the form can be accessed with request.getParameter("<element-id>").

You should add the following information to the state of the enrollment process:

• gs.getSession().putProperty("result.status",status): Whether the user was successfully enrolled.
• gs.getSession().putProperty("result.message",message): An associated message to be returned to the UI, such as a detailed error message.
• gs.getSession().putProperty("result.value",value): A custom value associated with the enrollment.

<table>
<thead>
<tr>

<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

**User account lookup script includes**

User account lookup script includes return the credential store account_id for a given user.

The following parameter returns the credential store account_id for a given user.

• params.userId: The sys_id of the user being checked (table: [sys_user]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

**Password generator script includes**

Password generator script includes take the following parameter, and return an auto-generated string password.

• params.credentialStoreId: The sys_id of the calling Password Reset process (table: [pwd_process]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>
'Verification processor' script includes

If the user identity is verified, the verification processor script includes return true.

Verification processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: `pwd_reset_request`).
- `params.userId`: The sys_id of the user to be verified (table: `sys_user`).
- `params.verificationId`: The sys_id of the verification (table: `pwd_verification`).
- `request`: The form request object. Access the fields in the form with `request.getParameter('<element-id>')`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user's answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

'Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: `pwd_reset_request`).
- `params.wfSuccess`: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

Example custom scripts for Password Reset
The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.

Perform a user account lookup and process an identification form
The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.
// User account lookup
var lookupExtensionSysId = 
    getExtensionScriptSysId('SampleUserAccountLookupExtension', 
    'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter() ;
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

//Form processor sample - Identification form processor
var identExtensionSysId = 
    getExtensionScriptSysId('SampleIdentificationProcessorExtension', 
    'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter() ;
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request = new SNC.PwdExtensionPointParameter() ; // A real life case will inject it's own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script
function getExtensionScriptSysId(scriptName, category) {
    var result;
    var gr = new GlideRecord('sys_script_include');
gr.addQuery('name', scriptName);
    gr.addQuery('script', 'CONTAINS', 'category: \'password_reset.extension.' + category + '\\');
    gr.query();
    if (gr.next()) {
        result = gr.getValue('sys_id');
    }
    return result;
}

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to Password Reset Extensions New extension script and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Simple account lookup that returns the supplied user id</description>
        <...>
Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset Extensions New extension script and create a new script as described in Create an Extension Script.
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
  <sys_script_include action="INSERT_OR_UPDATE">
    <active>true</active>
    <client_callable>false</client_callable>
    <description>Script that processes an identification form. Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.</description>
    <name>SampleIdentificationProcessorExtension</name>
    <script><![CDATA[var SampleIdentificationProcessorExtension =
Class.create();
SampleIdentificationProcessorExtension.prototype = {
  category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

  /*
   * Process the identification form request, and returns the user's sys_id. if user was not identified return null.
   *
   * @param params.processId The sys-id of the calling password-reset process (table: pwd_process)
   * @param request The form request object. fields in the form can be accessed using: request.getParameter('<element-id>')
   * Supported request parameters:
   *   sysparm_user_id - the user identifier value entered in the form.
   * @return The sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.
   */
  processForm: function(params, request) {
    return request.getParameter('sysparm_user_id') + '_' + params.processId;
  },

type: 'SampleIdentificationProcessorExtension'
}]]></script>
  </sys_script_include>
</sys_script_include>
</record_update>
Use the process and processForm extensions

This example shows a script that uses two sample extensions, one process extension and one processForm extension.

```javascript
// User account lookup
var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension =
  new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params =
  new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer =
  lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
  getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension =
  new SNC.PwdExtensionPoint(identificationExtensionSysId);

// Setup parameters required for this extension type - processId
var params =
  new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request =
  new SNC.PwdExtensionPointParameter();
  request.setParameter('sysparm_user_id', 'joe.employee');
var userIdentity =
  identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);
```

---

```xml
<?xml version="1.0" encoding="UTF-8"?><record_update table="sys_script_include"><sys_script_include
action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Simple account lookup that returns the supplied user id</description><name>SampleUserAccountLookupExtension</name><script><![CDATA[
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = { 
  category:'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!
}]]></script></sys_script_include></record_update>
```
Istanbul    ServiceNow    Now Platform Capabilities

/**********
* Returns the credential-store account id for a given user
* @param params.userId  The sys-id of the user being checked (table: sys_user)
* @return               The credential-store account-id (string) for a given user
**********/
process:function(params){return params.userId;},
type:'SampleUserAccountLookupExtension'

processForm function:

```xml
<?xml version="1.0" encoding="UTF-8"?><record_update
table="sys_script_include"><sys_script_include
action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Script that processes an identification form.&#13;
Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.&#13;</description><![CDATA[var SampleIdentificationProcessorExtension =Class.create();
SampleIdentificationProcessorExtension.prototype={
category:'password_reset.extension.identification_form_processor',// DO NOT REMOVE THIS LINE!

/**********
* Process the identification form request, and returns the user's sys_id.
* if user was not identified return null.
*
* @param params.processId   The sys-id of the calling password-reset process (table: pwd_process)
* @param request            The form request object. fields in the form can be accessed using: request.getParameter('element-id')
*
* entered in the form.
```
Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

### Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, category: `password_reset.extension.enrollment_check`. The ServiceNow platform installs several scripts in each category. A script in the Enrollment check category can perform the enrollment check for a verification. Detailed information on each extension script appears in [Password Reset extension scripts](#) on page 1748.

<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enrollment check</strong></td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td><strong>Enrollment form processor</strong></td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>
## Extension script category

<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

### Password Reset extension scripts

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

### Password Reset extension script includes

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

**Note:** Create extension scripts only from the Password Reset Extension Script form (Password Reset Extensions New extension script). Extension scripts are special purpose script includes that are not created in the System Definition Script Includes interface. To use a script include as an extension script, you must set it to Active status.
'Enrollment Check' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Check</td>
<td>Checks whether a user is enrolled for a given verification.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to check (table: sys_user).</td>
<td>true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to check (table: pwd_verification).</td>
<td></td>
</tr>
</tbody>
</table>

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the Script field of an extension script named SampleEnrollmentCheck:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
    category : 'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!

    process : function (params) { return (params.userId && params.verificationId) ? true : false; },

    type : 'SampleEnrollmentCheck'
};
```

© 2018 ServiceNow. All rights reserved.
### 'Enrollment Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Enrollment Form Processor | Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password. | `process(params)` | Parameters:  
  - `params.resetRequestId` - The sys_id of the current Password Reset request (table: `pwd_reset_request`).  
  - `params.userId` - The sys_id of the user to be verified (table: `sys_user`).  
  - `params.verificationId` - The sys_id of the verification to be processed (table: `pwd_verification`).  
  - `request` - The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. | Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false. |

The following information should be added to the state of the enrollment process:

- `gs.getSession().setProperty("result.status", status)` - Whether the user was successfully enrolled.
- `gs.getSession().setProperty("result.message", message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().setProperty("result.value", value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the Script field of an extension script named SampleEnrollmentProcessor:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category: 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function (params, request) {
        var verificationId = params.verificationId;
        var sampleInput = request.getParameter('sample_input');

        if (gs.nil(verificationId) || (sampleInput != 'success')) { return false; }

        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled');
        return true;
    },

    type: 'SampleEnrollmentProcessor'
};
```

© 2018 ServiceNow. All rights reserved.
This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the Script field of an extension script named PwdIdentifyViaUsername:

```java
var PwdIdentifyViaUsername = Class.create();
PwdIdentifyViaUsername.prototype = {
    category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

    initialize: function() {},

    processForm: function (params, request) {
        var processId = params.processId;
        var sysparm_user_id = request.getParameter('sysparm_user_id');

        gr = new GlideRecord('sys_user');
        gr.addQuery('user_name', sysparm_user_id);
        gr.runQuery()
        sysId = gr.sys_id;
        return sysId;
    }
};
```
gr. query ( ) ; if ( !gr. next ( ) ) { return null ; } return gr.
sys_id ; }

  
type : 'PwdIdentifyViaUsername' }

'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.processId</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

var SamplePasswordGenerator = Class. create ( ) ;
SamplePasswordGenerator. prototype = {
  category : 'password_reset.extension.password_generator' , // DO NOT REMOVE THIS LINE!

  /***************************************************************************/
  * Returns an auto-generated string password.
  * This sample randomly generates 4 digits to add to the password.
  *
  * @param params.credentialStoreId The sys_id of the target Password Reset credential store to generate a password for (table: pwd_cred_store)
  * @return An auto-generated string password
  ***************************************************************************/
  process : function (params) { var basePassword ;

  var gr = new GlideRecord ( 'pwd_cred_store' ) ;
  gr. addQuery ( 'name' , 'Local ServiceNow Instance' ) ;
  gr. query ( ) ; if (gr. next ( ) ) { if (params. credentialStoreId == gr.
  getValue ( 'sys_id' ) )
    basePassword = "Password" ; else
    basePassword = "Dorwssap" ; } return this. generateSimple
  (basePassword ) ; }

  generateSimple : function (base ) { var pwd = base ; var numbers = '0123456789' ; var length = 4 ;

    for ( var i = 0 , n = numbers. length ; i < length ; i ++ ) {
      pwd += numbers. charAt (Math. floor (Math. random ( ) * n ) + 1 ) ;
    }

    return pwd ; }

  type : 'SamplePasswordGenerator' } ;
'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post Reset</td>
<td>Performs additional operations after the completion of the Password Reset process.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: void</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.resetRequestId</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.wfSuccess</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A flag indicating whether the workflow completed successfully. True if, and only if, successful.</td>
<td></td>
</tr>
</tbody>
</table>

This example adds failed reset requests to the system log. The code would be contained in the Script field for an extension script named PwdPostProcessor:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
    category: 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!

    initialize: function() { },

    process: function(params) {
        if (!params.wfSuccess) {
            gs.log('[PwdPostProcessor.process] failure post processing for request [' + params.resetRequestId + ']');
        }

        // We could place actions here that we always want executed
        return;
    },

    type: 'PwdPostProcessor'
};
```

© 2018 ServiceNow. All rights reserved.
'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Account Lookup</td>
<td>Gets the credential store account ID for a given user.</td>
<td>process(params)</td>
<td>Parameters: - params.userId - The sys_id of the user being checked (table: sys_user).</td>
<td>Returns: (String) the credential store account ID for the given user.</td>
</tr>
</tbody>
</table>

This example gets the credential store account for a user. This code would be contained in the Script field of an extension script named SampleUserAccountLookupExtension:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
    category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

    process: function (params) {
        return params.userId; // returns the credential store account ID for a given user.
    },

    type: 'SampleUserAccountLookupExtension'
};
```

© 2018 ServiceNow. All rights reserved.
### 'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verification Form Processor</td>
<td>Processes a verification form request and indicates whether the user was verified or not.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td>Returns: (boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td>true, if the user is verified; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;').</td>
<td></td>
</tr>
</tbody>
</table>

This example shows a verification processor that returns true only if the user sent "ok" in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named SampleVerificationFormProcessor:

```javascript
var SampleVerificationFormProcessor = Class.create();
SampleVerificationFormProcessor.prototype = {
    category : 'password_reset.extension.verification_form_processor', // DO NOT REMOVE THIS LINE!

    // Process the verification form request, and return whether the user was successfully verified.
    // This is a sample verification processor returns true only if the user sent "ok" in the input field;
    // otherwise, it returns false.

    processForm : function(params, request)
    {
        return request.getParameter('element-id') == 'ok';
    }
};
```

© 2018 ServiceNow. All rights reserved. 1756
Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition Script Includes interface.

Role required: password_reset_admin or admin

**Note:** To use a script include as an extension script, you must set it to Active status.

1. Navigate to Password Reset Extensions New extension script.
2. Enter a name in the Extension script name field.
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   - Enrollment check
   - Enrollment form processor
   - Identification form processor
   - Password generator
   - User account lookup
   - Verification form processor
4. Click Submit.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function, depending on the script category. You can add additional functions as long as the process or processForm function accepts the defined parameters and returns the expected results.

**Note:** Do not edit or delete the Category declaration.
6. Click Update.

Service desk: Reset a password for a user

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords. Users do not reset passwords. Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Role required: password_reset_admin or password_reset_service_desk

Note: You must set the Public access property to enable the service desk-assisted process. See Settings on the Password Reset Details tab on page 1711.

1. Navigate to Password Reset Service Desk.
2. Select a user and the Password Reset process to use.
3. Click Verify Identity.
4. On the Verify Identity form, enter the answers that the user provides and then click Continue. If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
   • If the user is not locked, the form displays the Reset password button. Enter the new password and click Reset password.
   • If the user is locked, the form displays the Reset password and Unlock account buttons. You can enter a new password and click Reset password to reset the password and unlock the account.
If the Enable account unlock check box is selected for the password process, you can unlock the account without resetting the password by clicking Unlock account.

6. To reset the password for a different user, you must first navigate out of the Service Desk and then navigate to Password Reset Service Desk.

_Service desk: View user requests for password reset_

The Reset Requests module displays the status of each password reset request from the Password Reset Request table [pwd_reset_request].

Role required: password_reset_admin or password_reset_service_desk

Navigate to Password Reset Reset Requests.

<table>

<td>Whether the request is open or closed.</td>
</tr>
<tr>
<td>Retry</td>
<td>The total number of times the user has attempted to complete a password reset request.</td>
</tr>
</tbody>
</table>

**Service desk: Unblock a Password Reset user**

If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Role required: password_reset_admin or password_reset_service_desk

Blocking events include:

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked, or locked, users and the time interval required to generate the log event by setting the password_reset.activity_monitor.incident_threshold and password_reset.activity_monitor.incident_window properties.

1. To view the list of blocked users, navigate to Password Reset Blocked Users.
2. To unblock a self-service user:
   a) Navigate to Password Reset Blocked Users.
   b) Select a user from the list.
   c) Select Delete on the Actions on selected rows list.
3. To unblock a user whose password was reset by a service desk agent:
   If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not
   allowed to use the Password Reset application). When the password reset request is made through
   self-service, the user is unblocked when the password is successfully reset.

   In contrast, service desk agents are allowed any number of retries. The max_attempt_reached limit
does not apply and the Blocked status for the user is not reset after the password is reset. As a result,
after you successfully reset a user password, you must unblock the user manually.

   If the user is not unblocked manually, then the system resets the blocked state only when the
max_attempt_window time period elapses and the user tries to reset the password using self-service.

   a) After you successfully reset a user password, navigate to Password Reset Blocked Users .

   b) Change the Blocked setting for the user from true to false.

Password Reset and Password Change reports

The Password Reset application provides several tools for monitoring and troubleshooting password reset
activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status
of password reset activities, identify potential security threats, and monitor for compliance with password
security policies.

The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset
activities and for troubleshooting password reset issues. They also provide access to more detailed
information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset
monitoring and reporting.

Password Reset Overview module

The Password Reset Overview module displays reports on password reset and password change
activities. Users with the password_reset_admin role can customize the layout of the reports that appear in
the Overview module.

Table 943: Password Reset reports

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Requests (last 7 days)</td>
<td>Number of password reset requests by type during the last 7 days.</td>
</tr>
<tr>
<td>Blocked Users (last 7 days)</td>
<td>Number of users blocked over the last 7 days.</td>
</tr>
<tr>
<td>Password Reset Request Status (last 7 days)</td>
<td>The status of all password reset requests by process.</td>
</tr>
<tr>
<td>Password Reset Request by Action (last 30 days)</td>
<td>Number of password reset requests by action type: Reset Password, Unlock Account, or Reset and Unlock.</td>
</tr>
<tr>
<td>Password Reset Top Users (last 30 days)</td>
<td>Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password Reset Failed Verifications (last 7 days)</td>
<td>Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.</td>
</tr>
<tr>
<td>Password Reset Enrollment By Verification</td>
<td>Number of users by verification type who have and have not enrolled in the password reset program. A large number for users who have not enrolled could indicate a compliance or communication issue within the organization.</td>
</tr>
<tr>
<td>Password Change Top Users (last 30 days)</td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>

**Password Reset activity log**

The activity log (Password Reset Activity Log) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log [pwd_reset_activity] table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

**Password Reset event log**

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) Administrative Tools Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications Service Logs.

You must have the admin role to view the log.

**To write to the Password Reset event log**

Edit the DebugFlag registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}

By default, the key is set to 0. Set the key to 1 to write log entries to the ServiceNowPwdReset event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

**Password Reset blocked user notification**

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.
To subscribe: Add an email notification device or modify an existing device and then subscribe to the Password Reset-Activity Monitor Lockout notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

**Schedule for purging Password Reset data**

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge. Contact ServiceNow Technical Support to modify purge intervals.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Purge interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>[pwd_reset_request]</td>
<td>90 days (7,776,000 seconds).</td>
</tr>
<tr>
<td></td>
<td>Depending on your organizational data monitoring requirements, you could configure the rule to:</td>
</tr>
<tr>
<td></td>
<td>• Purge successful requests after 90 days</td>
</tr>
<tr>
<td></td>
<td>• Keep failed requests for 120 days</td>
</tr>
<tr>
<td>[pwd_user_lockout]</td>
<td>90 days (7,776,000 seconds).</td>
</tr>
<tr>
<td></td>
<td>Depending on your organizational data monitoring requirements, you could configure the rule to:</td>
</tr>
<tr>
<td></td>
<td>• Purge successful requests after 90 days</td>
</tr>
<tr>
<td></td>
<td>• Keep failed requests for 120 days</td>
</tr>
<tr>
<td>[pwd_reset_activity]</td>
<td>90 days (7,776,000 seconds).</td>
</tr>
<tr>
<td>[pwd_activity_monitor]</td>
<td>90 days (7,776,000 seconds).</td>
</tr>
<tr>
<td>[pwd_dvc_enrollment_code]</td>
<td>1 day (86,400 seconds).</td>
</tr>
<tr>
<td>[pwd_sms_code]</td>
<td>1 day (86,400 seconds).</td>
</tr>
</tbody>
</table>

*View log of failed login attempts*

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

Role required: admin

1. Navigate to System Policy Event Logs.
2. Filter for login.failed in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.

**Users: Enroll in the Password Reset program**

Some organizations auto-enroll users in a Password Reset program. Your organization could offer you the option to enroll for one or more methods of verifying your identity when you reset your password.
You might enroll for any combination of the following methods:

**Verify your identity using security questions (QA verification)**
To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely. Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity.

**Verify your identity using an SMS code (SMS verification)**
To enroll, you authorize a device like a cellular phone for SMS verification. Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

---

**Users: Enroll in the Password Reset program using questions and answers**

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity.

Role required: none

**Note:** You cannot enroll on a mobile device.

1. Navigate to Password Reset Enroll and then click the QA Verification tab.
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each Question field, select a question from the list and then enter the answer in the Answer field. Repeat the process until the required number of Question and Answer fields are filled in.
3. Click Submit.
4. Enroll for an extra identity verification using any of the other methods that your organization offers.
   See:
   - *Users: Enroll in the Password Reset program using SMS codes* on page 1764

---

**Users: Enroll in the Password Reset program using SMS codes**

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device.

Role required: none

**Note:** You cannot enroll on a mobile device.

1. Navigate to Password Reset Enroll and then click the SMS Verification tab.
   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).
2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click Add Device and then follow the instructions. Provide a meaningful Name for each device. Repeat the process for as many devices as you need.
3. After you have verified each device, select the Authorized check box for each device that you expect to use to change or reset your password.

**Note:** You can deauthorize a device at any time by clearing the Authorized check box.
4. Click Submit.
5. Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   • *Users: Enroll in the Password Reset program using questions and answers* on page 1764

Users: Reset your password on Windows systems

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

Role required: none

1. Start your computer or press Ctrl+Alt+Delete to go to the Windows login screen.
2. Click the Forgot Password? link. (Your administrator may have configured different text for the link.)
3. On the Identify page, enter the requested information and then click Next.
4. On the Verify page, enter the requested information, and then click Next.

**Note:** You might be given the option to choose the method used to verify your identity.

If your identity is verified, the Reset page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the Reset Password button. Enter and reenter the new password and then click Reset Password.
   - If your account is locked, the page displays the Reset Password and Unlock Account buttons.
     - You can enter a new password and click Reset password to reset the password and unlock the account.
     - If your administrator has selected Enable account unlock for the password process, you can unlock the account without resetting the password by clicking Unlock account.

---

**Orchestration MID Servers**

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

To allow a MID Server to work with Orchestration, it must have the Orchestration application or the ALL application assigned to it. See [Specify MID Server applications](#) on page 1110 for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- [Configure an IP address range for the MID Server](#) on page 1111
- [MID Server capabilities](#) on page 1179

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See [Select the default MID Server for Orchestration](#) on page 1769.
Configure an IP address range for the MID Server

Configure an IP address range on the MID Server to limit the MID Server to work with only a specific set of IP ranges.

Role required: agent_admin or admin

Applications, such as Discovery and Orchestration, can specify an IP range or a specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server that has corresponding IP range that includes the application's IP range or specific IP address. Applications also use other criteria, such as the MID Server supported application and capabilities. See MID Server selection on page 1106 for more information.

Tip: You can also use the ALL IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. The MID server would need to have access to the IP ranges that the applications need for it to be actually used. The ALL IP range is new, starting with the Istanbul release.

Orchestrator

Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. See the steps below to configure the IP address.

Service Mapping

Elects the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.

Discovery

Can also use this IP address range, starting with the Istanbul release. Discovery can also use the quick IP range that you specify in the Discovery schedule.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0x0A0B909B
  - 0A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0x0A0B9096-0x0A0B90A0
  - 10.11.144.150-0x0A0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Dotted decimal or hexadecimal format is not allowed. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFF00
  - 0x0A0B9000/24
• 0xA0B9000/0xFFFF00

1. Navigate to MID Server IP Ranges.
2. Click New.
3. Fill out the form fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of range:</td>
</tr>
<tr>
<td></td>
<td>• Include:</td>
</tr>
<tr>
<td></td>
<td>• Exclude: Exclude the IP address range.</td>
</tr>
<tr>
<td>Range</td>
<td>Enter the range in an valid format.</td>
</tr>
<tr>
<td>Related list</td>
<td>The MID Servers that can use this IP address range.</td>
</tr>
</tbody>
</table>

4. Click Save.

Open the ALL IP range and configure the MID Servers that you want to use with any set of IP addresses.

Map an IP address to a DNS name

If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.
Role required: admin
The association of an IP address to a DNS name ensures that the appropriate MID Sever is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must creating the mapping manually, using this procedure.

1. Enter cmdb_ci_dns_name.list in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.

Select the default MID Server for Orchestration

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The Default MID Server field on the Orchestration application record. See Set a default MID Server for an application on page 1110 for instructions.
- The Default MID Server to use for Orchestration Activities property. Navigate to Orchestration MID Server Properties to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

Probes used by Orchestration

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an output record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an input record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

Note: The probe parameters are set by the activities that launch the probe.
Figure 437: How Orchestration uses probes

**Probe List**

The base system includes the following Orchestration probes (Orchestration Definition Probes).

<table>

</tr>
</tbody>
</table>
| Windows - PowerShell| PowerShell      | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in .ps1. Two variables are available to the script:  
  • $computer: The computer pointed to as the source for this probe  
  • $cred: A PowerShell credential, using a user name and password from the Credentials table, that logs into $computer successfully. |

**Password Reset setup guide**

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.

**Requirements**

Role required: admin
What is installed

- Password Reset is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see Credential stores for Password Reset on page 1702.

- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See Activate the Password Reset - Orchestration Add-on plugin on page 1680.

Next steps

Plan and configure the Password Reset processes for your organization. See the Password Reset admin guide on page 1695.

Activate the Password Reset - Orchestration Add-on plugin

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and 'Remote (SOAP) ServiceNow instance' credential store types. No other components are installed.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least 2 business days from the current time.</td>
</tr>
</tbody>
</table>

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments.
Reason/Comments

<table>
<thead>
<tr>
<th>Reason/Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows.</td>
</tr>
</tbody>
</table>

3. Click Submit.

### Installed with Password Reset

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

#### Table 946: Password Reset tables

<td>UI for SMS enrollment and verification.</td>
</tr>
<tr>
<td>$pwd_enrollment_form_title</td>
<td>Jelly macro function that prints the title for the enrollment form. A verification ID is mandatory.</td>
</tr>
<tr>
<td>$pwd_error_message</td>
<td>UI for displaying error messages.</td>
</tr>
<tr>
<td>$pwd_process_flow</td>
<td>UI for indicating current stage.</td>
</tr>
<tr>
<td>$pwd_process_footer</td>
<td>JavaScript code to get the footer macro name.</td>
</tr>
</tbody>
</table>
UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, `[UI Script Name]+".jsdbx"` is the name of the script:

```xml
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui</td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td>$pwd_enrollment_submit_event</td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td>$pwdWfManager</td>
<td>Helper class to handle workflow activities and post-processing.</td>
</tr>
</tbody>
</table>

Password Reset workflows

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

Table 947: Workflows that connect to a credential stores

</table>

Password Reset Windows Application

If a user forgets the password or is locked out of a Windows computer, the user can reset the password directly from the Windows login screen.

Installer and documentation

Download the installer and installation instructions from KB0542328 in the ServiceNow Knowledge Base. The installer uninstalls any earlier version of the Password Reset Windows Application.

How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

Restrictions on the Password Reset Windows Application

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in Configure your Password Reset or Password Change process on page 1701.
- The Password strength indicator is not supported. See Configure and test the Password Reset connection to a credential store on page 1704.
- For some verification types, you can use only one verification. Custom verifications are not supported. See Password Reset verifications on page 1708 for details.
- Custom UI macros configured on the Process Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See Configure and test the Password Reset connection to a credential store on page 1704.

Password Reset Windows Application installation requirements

You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

</tbody>
</table>
Password Reset admin guide

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: *Introducing Password Reset (Video)*

**Password Reset processes**

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- Self-service process: Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
- Service desk-assisted process: A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.

**End-user experience of the self-service process**

The following example is typical:

1. On the login page, the user clicks the Forgot Password? link to start the process.

2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default CAPTCHA security feature:
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (The user had earlier selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was texted to a mobile device — the SMS verification.
How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.

2. Set up the elements of the password reset and password change processes according to the plan:
   - Connection to the credential store.
   - User groups that will use the password reset process.
   - Identification type to use.
   - Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application on page 1691.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record.

2. On the Change Password page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.

4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes on page 1698

Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
• Self-service process: Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the Public access property.

• Service desk-assisted process: Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

2. Understand how groups and roles differ in their access and security needs.

Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Consider how to manage credentials.

Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Consider how to implement enrollment in the Password Reset program.

For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Consider which Password Reset options to offer to users.

• If your organization uses single sign-on, how will users reset their password if they are unable to log on?
• What options are available to users working off-site?

Domain separation in the Password Reset application

A password reset process that you define in any domain is isolated from a process that you create in any other domain.

Overview of the Password Reset application

Each password reset process follows these steps:

1. The end user asks to reset the password.

2. The user provides identifying information (typically username or email address).

3. The user verifies the identity — proves that they are who they say they are (typically by answering questions or submitting a code number that was delivered securely).

4. The instance connects to the credential store to confirm the user credentials.

5. The instance generates the new password and displays it to the user.
Elements of a password reset process

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.
- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.
- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Process tables include a sys-overrides column on business rules, UI actions, and so on.
- The Password Reset application is built using Orchestration. Orchestration does not fully support domain separation.

Self-service and Service desk-assisted processes

In addition to configuring the connections, user groups, identifications, and verifications that are used in each process, the admin specifies one of the following operational methods for the organization:

- Self-service process: End users reset passwords over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).
- Service desk-assisted process: End users do not reset passwords. An end user requests the assistance of a service desk agent, over the phone or in person. The agent processes the request. Each service desk agent has the Password Reset Admin service desk role. The “reset request” form that the agent works in presents a User field and a Process field. On the form, the agent can view all processes in the end user’s domain, even if the agent is not a member of one or more of the domains.

Password Change process

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.
Configure your Password Reset or Password Change process

To implement the process, you configure credentials, verifications, and users.

Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes on page 1698.
2. Create the credential store record for user names and passwords that are managed.

   **Note:** For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the password reset plugin that is installed.
   - The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
   - The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self-service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
   - The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.

3. Define the verifications that the process will use.

A Password Reset process consists of the following elements:

   - The credential store that contains user login credentials.
   - Optionally, the user groups that are authorized to use the Password Reset process.
   - The verifications (extension script includes) that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password.

1. Navigate to Password Reset Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box and/or the Password change check box.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th>Apply to all users setting</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>

6. If you selected Password Reset, fill in the Password Reset Details tab and, optionally, the Advanced tab. See Settings on the Password Reset Details tab on page 1711 and Settings on the Password Reset 'Advanced' tab on page 1717.
7. Save the form. The form refreshes and additional related lists appear.
8. From the Password Reset Process Verifications related list, select one or more verifications. See Password Reset verifications on page 1708.
9. From the Password Reset Process Groups related list, select the user groups that will use the process that you are defining.
The Password Reset Process Groups related list appears only if the Apply to all users check box is not selected.

10. Select the Active check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.

11. Click Update.

12. Navigate to Password Reset Properties to set the properties that configure the Password Reset experience for end users.

Credential stores for Password Reset

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User [sys_user] table or an Active Directory server.

Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

Remote credential stores

A remote credential store refers to any credential store other than the local ServiceNow instance. Remote credential stores, such as Active Directory, manage user names and passwords outside of the local instance. A remote credential store can also be a remote ServiceNow instance, a UNIX or Linux server, or any other directory-like service that relies on the SOAP protocol. The Password Reset Orchestration Add-on plugin is required to connect to remote credential stores. Review the information in the section on credential store types before you create, test, or delete credential stores.

Credential store types

A credential store type is a set of workflows that specify how to connect to a credential store. The base system includes example credential store types that you can use as models to create custom types.

Table 953: Credential store types installed with the base system

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Orchestration add-on.</td>
</tr>
<tr>
<td>Remote (SOAP) ServiceNow instance</td>
<td>Represents a remote ServiceNow instance. Installed with the Orchestration add-on.</td>
</tr>
</tbody>
</table>

Connection workflows for credential store types

A credential store type requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the Pwd reset – AD and Pwd Reset - Local subflows as models for your custom connection workflows.
Figure 438: Pwd Reset Local sub workflow
Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset on page 1728.

Configure and test the Password Reset connection to a credential store

You specify a credential store to access during the Password Reset or Password Change process and configure other settings that control the process.

Role required: password_reset_admin or password_reset_credential_manager

**Note:** The Password Reset Windows Application supports only Active Directory (AD) credential stores.

1. Navigate to Password Reset Credential Stores.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.
### Type

You can use credential store types (templates that provide a desired set of capabilities). Credential stores inherit the functionality of the credential store type.

**Note:** The Password Reset Windows Application supports only AD Credential Store.

### Installed credential store types:

- Local ServiceNow Instance installed with Password Reset.
- AD Credential Store installed with the Orchestration Add-on.
- Remote (SOAP) ServiceNow installed with the Orchestration Add-on.

### Auto-generate password

Script include that generates a temporary password for use during the reset process.

**Note:** If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.

### Enforce history policy

**Note:** This option appears only if you select a credential store Type of AD Credential Store.

To enforce the history policy that is configured for the credential store:

1. Select the Enforce history policy check box.
2. Follow the procedure that appears after this table.

**Note:** Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous three passwords when resetting a password.

### Hostname

URL or IP address of the credential store that contains the user credential (for example, user names and passwords).

### User account lookup

Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name.

### Password rule hint

Text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.

**Note:** The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).

### Password rule

Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.
Enable Password Strength | Select the check box to:
---|---
- Display the text box for the Strength rule script so you can update the script.
- Display the graphical Password Strength bar to the user while the user changes or resets the password.

**Note:** The Password Reset Windows Application does not support Password Strength.

| Strength rule | This text box appears only if you select Enable Password Strength. |
|---|---

**Note:** The Password Reset Windows Application does not support Password Strength.

Client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

Default settings:
- Selected for local ServiceNow credential stores
- Not selected for other credential stores

**Note:**
To guide the user during the reset process, the system displays a graphical bar labeled Password Strength under the New password field.

3. Click Submit.
   The connection is created. You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset Credential Stores** and then open the credential store.

5. In the header bar, click Save and Test Connection.
   A progress page displays the result of the test.

If you selected the Enforce history policy check box, then follow these steps:

1. Open the associated Password Reset process definition: **Password Reset Processes**.
2. On the Details tab of the Password Reset Process form, clear the Auto-generate password check box and then save the process definition.
3. On the domain controller, set Password Aging (MIN_PASSWORD_AGE) to zero.
4. On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last three passwords are not repeated, set the history policy to six.

Note: To enforce the history policy that is configured for the credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you have cleared the Auto-generate password check box on the Password Reset Process form. Because the user immediately replaces the temporary password with a new password, two passwords are created for each reset cycle.

Set up SOAP credentials for Password Reset

When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Role required: admin or web_service_admin

1. Navigate to System Web Services Outbound SOAP Message.
2. Click Password Reset Request.
3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a) In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b) In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c) Select Use basic auth.
   d) Click Update.

You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.

Configure Password Reset for Active Directory

When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.

Active Directory must have a user role with the following privileges:

Descendent User objects:
- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:
- Read Members
- Read MemberOf

1. Install MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. In the ServiceNow instance, navigate to Orchestration Credentials.
4. Click New and then complete the form with the following values for the credential.
   - Type: Select Windows.
   - User name: Enter your Active Directory domain user. For example, domain\admin.
   - Password: Enter your Active Directory domain user password.
   - Applies to: Select the MID Server that is used to access the Active Directory server.
5. Click Submit.
6. Create a credential store for Active Directory.

Delete a connection to a credential store for Password Reset

Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset Credential Stores and then select the check box for the credential store.
2. In the Actions choice list, select Delete.

Password Reset verifications

Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

**Verifications included with Password Reset**

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

**Note:** The Password Reset Windows Application does not support custom verifications.

**Table 954: Password Reset verifications**

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QA verification</td>
<td>Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. This verification is based on the Security Questions verification type. When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers on page 1764.</td>
</tr>
</tbody>
</table>
SMS verification

Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. This verification is based on the SMS Code verification type.

When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page.

You can use the ServiceNow Notify feature to send the codes.

For information on the user enrollment experience, see Users: Enroll in the Password Reset program using SMS codes on page 1764.

<table>
<thead>
<tr>
<th>Personal Data — Confirm Email Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the Personal Data Confirmation verification type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Personal Data — Enter UserName</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the Personal Data verification type.</td>
</tr>
</tbody>
</table>

Verifications included with the demo data

The following demo data is based on the Mock verification type:

- Sample Mock verification #1
- #2

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

Personal data confirmation verifications

- Personal data verification: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
• Personal data confirmation verifications allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the label parameter (the text that the end user should see) to Email (that is, label=Email).
2. Set the column parameter (the column in the table that holds the verification data) to email (that is, column=email).

*Note:* You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.

**Personal data and personal data confirmation type verifications**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Label that the user sees during the password reset request. Data Type: string Default Value: n/a</td>
</tr>
<tr>
<td>column</td>
<td>Column of the sys_user table that provides the data that is used to verify the identity of the user. Data Type: string Default Value: n/a</td>
</tr>
</tbody>
</table>

*Create a custom identification type for Password Reset*

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Role required: password_reset_admin or admin

*Note:* The Password Reset Windows Application does not support custom identification types.

1. Navigate to Password Reset Extensions Identification Types .
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script, or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.
SMS Code Verification type for Password Reset

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity through any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user enters the code on the password reset page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table
- Update property settings for the Password Reset application

---

**Note:** The system allows only one instance of each SMS code parameter.

### Table 955: SMS Code Verification type parameters

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
</table>
| expiry         | Number of minutes the verification code is valid.  
Data Type: integer (any positive integer)  
Default Value: 5 |
| complexity     | Number of digits in the numerical verification code.  
Data Type: integer (any positive integer)  
Default Value: 4 |
| pause_window   | Number of minutes before the user can request another SMS code for verification.  
Data Type: integer (any positive integer)  
Default Value: 2 |
| max_per_day    | Maximum number of codes sent for verification in one day.  
Data Type: integer (any positive integer)  
Default Value: 10 |

---

*Use NotifyNow to send SMS codes for enrollment and verification*

You can configure the Password Reset application to send SMS codes for enrollment and verification using ServiceNow NotifyNow (via Twilio SMS Messaging). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Role required: admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at [https://www.twilio.com/](https://www.twilio.com/)
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or reset receive SMS codes through NotifyNow.
Settings on the Password Reset Details tab

The settings define the user experience when resetting or changing a password.

The Password Reset Details tab appears when you are configuring a Password Reset process (Password Reset Processes).

Table 956: Password Reset Details tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Public access | The check box is available only when Password reset is selected.  
• Clear the check box to define a service desk-assisted process in which only service desk agents and not users can reset a password.  
• Select the check box to enable a self-service process with public user access to the Password Reset or Password Change form through a URL. |
| Public URL  | This field is available only when Public access is selected.  
URL of the page where users go to reset or change the password. The value from the URL suffix field is appended to the URL when you tab out of the URL suffix field. For the Default self-service Password Reset process, this value must be /$pwd_reset.do?sysparm_url=default. |
| URL suffix  | This field is available only when Public access is selected.  
Suffix used to create a unique URL for the Password Reset or Password Change form. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display CAPTCHA</td>
<td>This check box is available only when Public access is selected. Select the check box to display a CAPTCHA on the user identification page. The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. See Configure Google reCAPTCHA on page 1716. Note: The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA. To use the CAPTCHA service that is provided with the base system, change the password_reset.captcha.google.enabled system property to false. Note: Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Set the password_reset.captcha.google.enabled property to false for on-premises instances.</td>
</tr>
<tr>
<td>Identification type</td>
<td>Method that the user employs to claim their identity for the public Password Reset or Password Change process. Any selection overrides the default identification that is associated with the process. The base system includes the Email and Username Identification identification types. You can create a custom identification type (some knowledge of JavaScript is recommended). See Personal data identification types and confirmation type verifications on page 1709.</td>

<tr>
<td></td>
<td><strong>Note:</strong> Users whose credentials are held in the local ServiceNow instance credential store are prompted to change their password the first time that they log in. Users whose credentials are held in an Active Directory credential store are not prompted to change their passwords in the instance. Such users must change their passwords from a computer on the domain.</td>
</tr>
<tr>
<td>Display password</td>
<td>This check box is available only when Auto-generate password is selected.</td>
</tr>
<tr>
<td></td>
<td>Select the check box to display the new password on the screen. In a self-service process, the password appears on the user screen. In a service desk-assisted process, the password appears on the service desk agent screen.</td>
</tr>
</tbody>
</table>
### Configure Google reCAPTCHA

To use the Google reCAPTCHA service, instances that are running on a domain other than service-now.com require an API key pair from Google. The process described in this topic is optional for instances that are running on the service-now.com domain.

**Role required:** admin

**Note:**

Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the process described in this topic. Instead, set the password_reset.captcha.google.enabled system property to false. This setting enables the CAPTCHA service that is provided with the base system.

The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha
2. Set the following system properties:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| password_reset.captcha.google.enabled | Set to true.  
Type: string  
Default: true |
Istanbul   ServiceNow   Now Platform Capabilities

google.captcha.site_key
Set to the site key that Google provided.
Type: string
Default: A site key that Google provided to ServiceNow

google.captcha.secret
Set to the secret that Google provided.
Type: password2
Default: An encrypted secret that Google provided to ServiceNow

Settings on the Password Reset 'Advanced' tab
UI macros and script includes can extend the basic functionality of a Password Reset process.
The Advanced tab appears when you are configuring a Password Reset process (Password Reset Processes).

Table 957: Advanced tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>
</tr>
<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the Post reset script category as described in Password Reset extension scripts on page 1748.</td>
</tr>
</tbody>
</table>

Configure the required strength for passwords
The password that a user defines must meet certain requirements — it must contain at least eight characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

Role required: password_reset_admin
The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating password. The default requirements for a new password are:
• At least eight characters
• At least one uppercase and one lower case letter
• At least one numeral
Note: This topic describes the procedure for configuring password strength requirements only. You can configure several other settings for the credential store, as described in Configure and test the Password Reset connection to a credential store on page 1704.

1. Navigate to Password Reset Credential Stores.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements. <strong>Note:</strong> The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule client</td>
<td>Client script that validates the password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
</tbody>
</table>
| Enable Password Strength | Select the check box to:  
  • Display the text box for the Strength rule script so you can update the script.  
  • Display the graphical Password Strength bar to the user while the user changes or resets the password. **Note:** The Password Reset Windows Application does not support Password Strength. |
3. **Click Submit.**
   You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. **Navigate to Password Reset Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection.**
   A progress page displays the result of the test.

### Configure the number of questions for a 'Security Questions' verification

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll and the number to display when a user requests password reset.

**Role required:** password_reset_admin or admin

1. **Navigate to Password Reset Verifications** and then open a verification that uses the Security Questions Verification Type.

2. **Configure the parameters in the Password Reset Verification Parameters related list.**
Table 958: Parameters for Security Questions Verification

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_enroll</td>
<td>Number of security questions that are displayed while a user is enrolling for Password Reset. Data Type: Positive integer that does not exceed the number of questions in the security questions list (Password Reset Security Questions). Default Value: 5</td>
</tr>
<tr>
<td>num_reset</td>
<td>Number of security questions that are displayed while a user is attempting to reset the password. The questions are selected at random and are presented in random order. Data Type: Positive integer that does not exceed the value of the num_enroll parameter. Default Value: 3</td>
</tr>
</tbody>
</table>

3. Click Update.

Configure Password Reset properties

You can specify properties that configure the Password Reset experience for end users.

Role required: password_reset_admin

While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is three attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between five and seven.

**Note:** The following properties affect Password Reset, but do not appear on the Password Reset Properties page:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the Forgot password? button. See the glide.security.password_reset.uri property in High Security Settings.
- You can add the glide.pwd_reset.onetime.token.validity property to the System Properties [sys_properties] table to specify the number of hours that the Password Reset token should be valid. Default: 12.

1. Navigate to Password Reset Properties.
2. Update settings as needed and then click Save.

</table>
| Workflow polling frequency | password_reset.wf.refresh_rate | Time period in milliseconds between checks on status of the workflow.  
  - Type: integer  
  - Default value: 500 |
| Workflow expiration | password_reset.wf.timeout | Maximum wait time in milliseconds for the workflow to complete. The workflow is triggered during the password reset request when the user clicks Submit.  
  - Type: integer  
  - Default value: 90000 |
| Disable CAPTCHA validation functionality | password_reset.captcha.ignore | Enables or disables CAPTCHA functionality.  
  - Type: true|false  
  - Default value: false  
  The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. To use the base-system CAPTCHA, change the password_reset.captcha.google.enabled system property to false.  
  See Configure Google reCAPTCHA |
| Password Reset Request properties | | |
| Number of unsuccessful attempts allowed to reset/change password | password_reset.request.max_attempts | Number of password reset attempts a user has before they are locked out for a period determined by the value in max_attempt_window.  
  - Type: integer  
  - Default value: 3 (attempts) |
<table>
<thead>
<tr>
<th>Text on the Password Reset properties page</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of minutes a user must wait to reset/change password after exceeding the maximum allowed unsuccessful attempts | `password_reset.request.max_attempt_window` | Time period that users are blocked or prevented from changing their passwords after trying the maximum number of times.  
  - Type: integer  
  - Default value: 1440 (minutes) |
| Number of minutes a user must wait to reset/change password after the last successful reset/change | `password_reset.request.success_window` | Time period that a user must wait after successfully resetting the password to reset the password again.  
  - Type: integer  
  - Default value: 1440 (minutes) |
| Number of minutes a user must wait to start a reset request after the last successful unlock account | `password_reset.request.unlock_window` | Time period that a user must wait after a successful unlock operation before starting a new request.  
  - Type: integer  
  - Default value: 1440 (minutes) |
| Number of minutes before a password reset request expires | `password_reset.request.expiry` | Time period that a user is allowed to perform the Password Reset process.  
  - Type: integer  
  - Default value: 10 (minutes) |

**Password Reset Security Question properties**

| Minimum number of characters in any answer | `password_reset.qa.ans_min_len` | Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question.  
  Default value: 3 characters |
<table>
<thead>
<tr>
<th>Text on the Password Reset properties page</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of security questions required during the password reset request                                   | password_reset.qa.num_reset                        | Number of questions that a user must answer to verify identity during the Password Reset process.  
• Type: integer  
• Default value: 3 (questions)  
• Possible values: Integers that are less than the number specified for the num_enroll property.  

**Note:** You can override this security question property by adding the num_reset parameter in the security question verification.                                                                                                                                                        |
| Number of security questions required during enrollment                                                 | password_reset.qa.num_enroll                       | During the enrollment process, the number of questions that a user must answer to be enrolled in the Password Reset program.  
• Type: integer  
• Default value: 5 (questions)  

**Note:** You can override this security question property by adding the num_enroll parameter in the security question verification.                                                                                                                                                        |
<p>| Password Reset SMS Code properties                                                                        |                                                    |                                                                                                                                                                                                                                                                                                                                             |</p>

<table>
<thead>
<tr>
<th>Password Reset Monitoring and Reporting properties</th>
</tr>
</thead>
</table>
| Time interval, in minutes, for counting blocked users | password_reset.activity_monitor.incident_window | Time window to count the number of blocked users.  
  • Type: integer  
  • Default value: 60 (minutes) |
| Number of blocked users, in the defined time interval, that triggers a system log event | password_reset.activity_monitor.incident_threshold | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
  • Type: integer  
  • Default value: 10 (blocked users) |

Specify lockout for failed login attempts

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to **System Policy Script Actions** to view or activate the scripts.

<table>
<thead>
<tr>
<th>SNC User Lockout Check with Auto Unlock</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Uses the value of the glide.user.max_unlock_attempts property to set the limit for failed login attempts.</td>
<td></td>
</tr>
<tr>
<td>• Unlocks the user account after the time period that is specified for the glide.user.unlock_timeout_in_mins property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.</td>
<td></td>
</tr>
<tr>
<td>SNC User Lockout Check</td>
<td>Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SNC User Clear</td>
<td>Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.</td>
</tr>
</tbody>
</table>

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to System Policy Event Logs.
2. Filter for login.failed in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.

Integrate Password Reset with a CMS integration

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: content_admin

Each Password Reset process requires a separate CMS page.

1. Navigate to Content Management Specialty Content iFrames and create an iFrame record.
2. Go to Content Management Sites and create a site that has no login page.
3. Go to Content Management Pages and create a password reset page.
4. Enter the name of the site that you created in the Content site field (Password Reset self-service in the example).
5. Right-click the form header and click Save.
6. Click the Edit Page related link and then click Add content.
7. In the Content Blocks section, select the iFrame that you created. Add more content as needed.
8. Click Update.

Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in Password Reset extension script categories on page 1747.

   Extension scripts enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).
2. Follow the configuration steps described in Configure your Password Reset or Password Change process on page 1701.

3. Select the new types that you created. You can customize the following components:
   - Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See Create a credential store type for Password Reset on page 1728.
   - Verification types: Define new types for how users are verified. See Create a custom Password Reset verification type on page 1734.
   - Identification types: Define new types for how users can identify themselves. See Create a custom identification type for Password Reset on page 1710.

Add a custom question to the Security Questions verification

To enroll for the 'Security Questions' verification, the user selects several questions and supplies answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Role required: password_reset_admin or admin

The default language is English, and you can create a custom question in a non-English language. If you create the appropriate non-English language questions, then the questions appear in the language that the user requested during login.

1. Navigate to Password Reset Security Questions and then click New.
2. Enter the English language question in the Security question field and then click Submit. The question appears in the Translations related list.
3. To add the same question in another language, complete the following steps.
   a) Click the English language question to translate.
      
      **Note:** Do not change the Language value for the default questions that come with the base system.

   b) On the Password Reset Question page, in the Translations related list, click New.
   c) Select the language in the Language field.
   d) Enter the non-English text in the Security question field.
   e) Click Submit.

The question appears in the Translations related list on the Password Reset Question page. If a user selects the language while logging in, then the verification question appears in that language.

Create a credential store type for Password Reset

You can create a custom credential store type if the base-system types do not meet your needs.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset Extensions Credential Store Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

   **Note:** You may need to configure the form to see the Get user lock state workflow and the Unlock user workflow.
Create a Password Reset verification from an existing verification

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin

Note: The Password Reset Windows Application does not support custom verifications. Custom verifications might work, but you must test and verify.

1. Navigate to Password Reset Verifications and select a verification.
2. If needed, modify the parameters on the Password Reset Verification Parameters tab. The parameters are described in the instructions for the type of verification that you are working on.

3. Click Submit.
3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification

Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Role required: password_reset_admin

Table 961: Verification types in the base system

| Password Reset Verification Parameters | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the default specified in the Password Reset properties. The available parameters are described separately for each verification type. |

3. Click Submit.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Verification type components

You can configure the Password Reset app to enroll users in the Password Reset process automatically, or you can define an enrollment check.

To define an enrollment check, you must define:

• An enrollment processor script, which specifies how enrollment is processed
• A corresponding enrollment UI macro, which specifies how the enrollment information is displayed to the user

The following example uses PwdEnrollSMSProcessor as the enrollment processor script and pwd_enroll_sms_ui as the enrollment UI macro.
A verification type must also define a verification processor script and a corresponding verification UI macro. The example uses PwdVerifySMSProcessor as the verification processor script and pwd_verify_sms_ui as the verification UI macro. The following shows the verification processor script:
**Figure 441: Verification type SMS processor**

The following is the corresponding UI macro:
Create a custom Password Reset verification type

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Figure 442: Verification type SMS UI macro
Role required: password_reset_admin or admin

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

1. Navigate to Password Reset Extensions Verification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when Automatic Enrollment is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users. If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that provides the UI for the enrollment.</td>

<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes the enrollment.</td>
</tr>
<tr>
<td>Verification UI</td>
<td>Verification UI macro that provides the UI for the verification.</td>
</tr>
<tr>
<td>Verification processor</td>
<td>Verification processor script (extension scripts) that processes the verification.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Verification type components

You can configure the Password Reset app to enroll users in the Password Reset process automatically, or you can define an enrollment check.

To define an enrollment check, you must define:

- An enrollment processor script, which specifies how enrollment is processed
- A corresponding enrollment UI macro, which specifies how the enrollment information is displayed to the user

The following example uses PwdEnrollSMSProcessor as the enrollment processor script and pwd_enroll_sms_ui as the enrollment UI macro.
Figure 443: Verification type example

A verification type must also define a verification processor script and a corresponding verification UI macro. The example uses PwdVerifySMSProcessor as the verification processor script and pwd_verify_sms_ui as the verification UI macro. The following shows the verification processor script:
Figure 444: Verification type SMS processor

The following is the corresponding UI macro:
Password Reset script includes

The Password Reset plugin adds several Password Reset script includes. Use the base-system script includes as they are or call custom extension scripts at the provided extension points.
Extension scripts enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

### 'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification being checked (table: [pwd_verification]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Provides a default check that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Provides an example check that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>

### 'Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- `params.processId`: The sys_id of the calling Password Reset process (table: [pwd_process]).
- `param request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. The supported request parameter is sysparm_user_id, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

### 'Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.
• params.userId: The sys_id of the user trying to enroll (table: [sys_user]).
• params.verificationId: The sys_id of the verification used to enroll (table: [pwd_verification]).
• params.enrollmentId: The sys_id of this enrollment process.
• request: The form request object. Fields in the form can be accessed with request.getParameter('<element-id>').

You should add the following information to the state of the enrollment process:
• gs.getSession().putProperty("result.status",status): Whether the user was successfully enrolled.
• gs.getSession().putProperty("result.message",message): An associated message to be returned to the UI, such as a detailed error message.
• gs.getSession().putProperty("result.value",value): A custom value associated with the enrollment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>

<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

'User account lookup' script includes
User account lookup script includes return the credential store account_id for a given user.
The following parameter returns the credential store account_id for a given user.
• params.userId: The sys_id of the user being checked (table: [sys_user]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

'Password generator' script includes
Password generator script includes take the following parameter, and return an auto-generated string password.
• params.credentialStoreId: The sys_id of the calling Password Reset process (table: [pwd_process]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>
'Verification processor' script includes

If the user identity is verified, the verification processor script includes return true.

Verification processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- `params.userId`: The sys_id of the user to be verified (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification (table: [pwd_verification]).
- `request`: The form request object. Access the fields in the form with `request.getParameter("<element-id>")`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user's answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

'Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- `params.wfSuccess`: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

Example custom scripts for Password Reset

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.

**Perform a user account lookup and process an identification form**

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.
// User account lookup
var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension',
    'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
  getExtensionScriptSysId('SampleIdentificationProcessorExtension',
    'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case will
  inject it's own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script
function getExtensionScriptSysId(scriptName, category) {
  var result;
  var gr = new GlideRecord('sys_script_include');
  gr.addQuery('name', scriptName);
  gr.addQuery('script', 'CONTAINS', 'category: \'password_reset.extension.' +
    category + '\');
  gr.query();
  if (gr.next()) {
    result = gr.getValue('sys_id');
  }
  return result;
}

**Define a credential store**

The following is an example of an extended process function in the User Account Lookup category used to
define a credential store. To create this extension script, go to Password Reset Extensions New extension
script and create a new script as described in Create an Extension Script. To configure the User Lookup in
a Password Reset process, see Credential Stores.

```xml
<record_update table="sys_script_include">
  <sys_script_include action="INSERT_OR_UPDATE">
    <active>true</active>
    <client_callable>false</client_callable>
    <description>Simple account lookup that returns the supplied user id</description>
```
<name>SampleUserAccountLookupExtension</name>
<script><![CDATA[var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
    category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

    /**
     * Returns the credential-store account id for a given user
     *
     * @param params.userId The sys-id of the user being checked (table: sys_user)
     * @return The credential-store account-id (string) for a given user
     */
    process: function(params) {
        return params.userId;
    },

type: 'SampleUserAccountLookupExtension'
};]]></script>

Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset Extensions New extension script and create a new script as described in Create an Extension Script.
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
  <sys_script_include action="INSERT_OR_UPDATE">
    <active>true</active>
    <client_callable>false</client_callable>
    <description>Script that processes an identification form. It returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.</description>
    <name>SampleIdentificationProcessorExtension</name>
    <script><![CDATA[
      var SampleIdentificationProcessorExtension = Class.create();
      SampleIdentificationProcessorExtension.prototype = {
        category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!
        processForm: function(params, request) {
          return request.getParameter('sysparm_user_id') + '_' + params.processId;
        }
      },
      type: 'SampleIdentificationProcessorExtension'
    ]]>></script>
  </sys_script_include>
</record_update>
Use the process and processForm extensions

This example shows a script that uses two sample extensions, one process extension and one processForm extension.

```javascript
// User account lookup
var lookupExtensionSysId = getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId = getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter();
request.setParameter('sysparm_user_id', 'joe.employee');
var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);
```

```
// Simple helper to return the sys-id for a given extension script
function getExtensionScriptSysId(scriptName, category){
  var result;
  var gr = new GlideRecord('sys_script_include');
  gr.addQuery('name', scriptName);
  gr.addQuery('script', 'CONTAINS', 'category: ' + category + 'password_reset.extension.');
  gr.query();
  if(gr.next()){
    result = gr.getValue('sys_id');
  }
  return result;
}
```

```
<?xml version="1.0" encoding="UTF-8"?><record_update table="sys_script_include" action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Simple account lookup that returns the supplied user id</description><name>SampleUserAccountLookupExtension</name><script><![CDATA[
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype={
  category:'password_reset.extension.user_account_lookup',
  // DO NOT REMOVE THIS LINE!
}]]></script><sys_script_include_action>1</sys_script_include_action><sys_script_include_owner>admin</sys_script_include_owner><sys_script_include_name>SampleUserAccountLookupExtension</sys_script_include_name><sys_script_include_file>SampleUserAccountLookupExtension.js</sys_script_include_file><sys_script_include_version>1.0.0</sys_script_include_version><sys_script_include_license>Simplified BSD License</sys_script_include_license><sys_script_include_rls>1.10.0</sys_script_include_rls><sys_script_include_class>SampleUserAccountLookupExtension</sys_script_include_class><sys_script_include_class_file>SampleUserAccountLookupExtension.js</sys_script_include_class_file><sys_script_include_class_version>1.0.0</sys_script_include_class_version><sys_script_include_class_license>Simplified BSD License</sys_script_include_class_license><sys_script_include_class_rls>1.10.0</sys_script_include_class_rls></record_update>
```
/**
 * Returns the credential-store account id for a given user
 * @param params.userId  The sys-id of the user being checked (table: sys_user)
 * @return               The credential-store account-id (string) for a given user
 */
process:function(params){return params.userId;},
type:'SampleUserAccountLookupExtension'
}

processForm function:
<?xml version="1.0" encoding="UTF-8"?><record_update table="sys_script_include" action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Script that processes an identification form.&lt;#13;
Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.&lt;#13;</description><name>SampleIdentificationProcessorExtension</name><!--!
[CDATA[var SampleIdentificationProcessorExtension =Class.create();
SampleIdentificationProcessorExtension.prototype={
    category:'password_reset.extension.identification_form_processor',// DO NOT REMOVE THIS LINE!
    process:function(params){return params.userId;},
type:'SampleUserAccountLookupExtension'
};]

*/

/* Process the identification form request, and returns the user's sys_id. if user was not identified return null.
 * @param params.processId   The sys-id of the calling password-reset process (table: pwd_process)
 * @param request            The form request object. fields in the form can be accessed using: request.getParameter('element-id')
 * Supported request parameters: 
 * sysparm_user_id - the user identifier value

Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>
### Extension script category

<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

#### Password Reset extension scripts

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

#### Password Reset extension script includes

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

---

**Note:** Create extension scripts only from the Password Reset Extension Script form (Password Reset Extensions New extension script). Extension scripts are special purpose script includes that are not created in the System Definition Script Includes interface. To use a script include as an extension script, you must set it to Active status.
## 'Enrollment Check' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Check</td>
<td>Checks whether a user is enrolled for a given verification.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to check (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to check (table: pwd_verification).</td>
<td></td>
</tr>
</tbody>
</table>

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the Script field of an extension script named SampleEnrollmentCheck:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
  category: 'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!

  process: function (params) {
    return (params.userId && params.verificationId) ? true : false;
  },

  type: 'SampleEnrollmentCheck'
};
```

### 'Enrollment Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Form Processor</td>
<td>Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;').</td>
<td></td>
</tr>
</tbody>
</table>

The following information should be added to the state of the enrollment process:

- `gs.getSession().putProperty("result.status",status)` - Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the Script field of an extension script named SampleEnrollmentProcessor:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category : 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    /* Process the enrollment form request, and return whether the user was successfully enrolled.
     * @param params.userId         The sys_id of the user trying to enroll (table: sys_user)
     * @param params.verificationId The sys_id of the verification to be enrolled into (table: pwd_verification)
     * @param params.enrollmentId   The sys_id of this enrollment process
     * @param request               The form request object. Fields in the form can be accessed with
     * return boolean telling whether the user was successfully enrolled
     * The following information should be added to the state of the enrollment process
     * gs.getSession().putProperty("result.status",status) - whether the user was successfully enrolled
     * gs.getSession().putProperty("result.message",message) - an associated message to be returned
     * to the UI. Eg. a detailed error message
     * gs.getSession().putProperty("result.value",value) - custom value associated with the enrollment
     */
    processForm : function (params , request) {
        var verificationId = params.verificationId;
        var sampleInput = request.getParameter('sample_input');

        if (gs.nil(verificationId) || (sampleInput != 'success')) { return false; }

        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled' );
        return true;
    }
}
```
### 'Identification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
<td>Returns: the sys_id of the user that corresponds to the requested input. Returns null, if no user was found.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.processId - The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered into the form.</td>
<td></td>
</tr>
</tbody>
</table>

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the Script field of an extension script named PwdIdentifyViaUsername:

```javascript
var PwdIdentifyViaUsername = Class. create( ) ;
PwdIdentifyViaUsername.prototype = {
  category : 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

  initialize : function ( ) { } ,

  /**
   * Process the identification form request, and returns the user's sys_id. If user was not identified return null.
   * @param params.processId - The sys_id of the calling Password Reset process (table: pwd_process)
   * @param request - The form request object. Fields in the form can be accessed with request.getParameter('<element-id>').
   * Supported request parameters: sysparm_user_id - the user identifier value entered in the form
   * @return The sys_id of the user that corresponds to the requested input; if no user was found, null should be returned
   **/**

  processForm : function (params , request ) { var processId = params. processId ; var sysparm_user_id = request. getParameter ( 'sysparm_user_id' ) ;
    gr = new GlideRecord ( 'sys_user' ) ;
    gr. addQuery ( 'user_name' , sysparm_user_id ) ;
  }
```

© 2018 ServiceNow. All rights reserved.
gr. query ( ) ; if ( !gr. next ( ) ) { return null ; } return gr. sys_id ; } ,

type : 'PwdIdentifyViaUsername' }

'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

```javascript
var SamplePasswordGenerator = Class.create ( ) ;
SamplePasswordGenerator.prototype = {
    category : 'password_reset.extension.password_generator', // DO NOT REMOVE THIS LINE!

    process : function (params ) { var basePassword ;
        gr = new GlideRecord ( 'pwd_cred_store' ) ;
        gr. addQuery ( 'name' , 'Local ServiceNow Instance' ) ;
        gr. query ( ) ; if (gr. next ( ) ) { if (params. credentialStoreId == gr. getValue ( 'sys_id' ) )
            basePassword  = "Password" ; else
                basePassword  = "Dorwssap" ; } return this. generateSimple (basePassword ) ; },

    generateSimple : function (base ) { var pwd = base ; var numbers = '0123456789' ; var length = 4 ;
        for ( var i = 0 , n = numbers. length ; i < length ; i ++ ) {
            pwd += numbers. charAt (Math. floor (Math. random ( ) * n ) + 1 ) ;
        } return pwd ; },

    type : 'SamplePasswordGenerator' } ;
```
'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post Reset</td>
<td>Performs additional operations after the completion of the Password Reset process.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: void</td>
</tr>
</tbody>
</table>

- params.resetRequestId - The sys_id of the calling Password Reset process (table: pwd_process).
- params.wfSuccess      - A flag indicating whether the workflow completed successfully. True if, and only if, successful.

This example adds failed reset requests to the system log. The code would be contained in the Script field for an extension script named PwdPostProcessor:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
  category : 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!

  initialize : function () { } ,

  /**************************************************************************
  * Execute custom actions after the Password Reset process has completed.
  *
  * @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
  * @param params.wfSuccess A flag indicating if the workflow completed successfully.
  *  True if (and only if) successful.
  * @return no return value
  **************************************************************************/
  process : function (params ) { if ( !params.wfSuccess ) {
    gs. log ( '[PwdPostProcessor.process] failure post processing for request [' + params.resetRequestId + ']');
  }

  // We could place actions here that we always want executed
  return ; } ,

  type : 'PwdPostProcessor' }
```

'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Account Lookup</td>
<td>Gets the credential store account ID for a given user.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.userId - The sys_id of the user being checked (table: sys_user).</td>
<td></td>
</tr>
</tbody>
</table>

This example gets the credential store account for a user. This code would be contained in the Script field of an extension script named SampleUserAccountLookupExtension:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
  category : 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

  process : function (params) { return params.userId; },

  type : 'SampleUserAccountLookupExtension'
};
```

© 2018 ServiceNow. All rights reserved.
### 'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Verification Form Processor | Processes a verification form request and indicates whether the user was verified or not. | processForm(params, request) | Parameters:  
  - params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).  
  - params.userId - The sys_id of the user to be verified (table: sys_user).  
  - params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).  
  - request - The form request object. Fields in the form can be accessed with request.getParameter('<element-id>'). | Returns: (boolean) true, if the user is verified; otherwise, false. |

This example shows a verification processor that returns true only if the user sent *ok* in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named SampleVerificationFormProcessor:

```javascript
var SampleVerificationFormProcessor = Class.create();
SampleVerificationFormProcessor.prototype = {
  category : 'password_reset.extension.verification_form_processor', // DO NOT REMOVE THIS LINE!

  processForm : function(params, request){
    // Implementation...
  }
};
```

Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition Script Includes interface.

Role required: password_reset_admin or admin

Note: To use a script include as an extension script, you must set it to Active status.

1. Navigate to Password Reset Extensions New extension script.
2. Enter a name in the Extension script name field. Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   • Enrollment check
   • Enrollment form processor
   • Identification form processor
   • Password generator
   • User account lookup
   • Verification form processor
4. Click Submit.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function, depending on the script category. You can add additional functions as long as the process or processForm function accepts the defined parameters and returns the expected results.

Note: Do not edit or delete the Category declaration.
6. Click Update.

Service desk: Reset a password for a user

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords. Users do not reset passwords. Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Role required: password_reset_admin or password_reset_service_desk

---

**Note:** You must set the Public access property to enable the service desk-assisted process. See Settings on the Password Reset Details tab on page 1711.

1. Navigate to Password Reset Service Desk.
2. Select a user and the Password Reset process to use.
3. Click Verify Identity.
4. On the Verify Identity form, enter the answers that the user provides and then click Continue.
   - If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
   - If the user is not locked, the form displays the Reset password button. Enter the new password and click Reset password.
If the user is locked, the form displays the Reset password and Unlock account buttons. You can enter a new password and click Reset password to reset the password and unlock the account. If the Enable account unlock check box is selected for the password process, you can unlock the account without resetting the password by clicking Unlock account.

6. To reset the password for a different user, you must first navigate out of the Service Desk and then navigate to Password Reset Service Desk.

Service desk: View user requests for password reset

The Reset Requests module displays the status of each password reset request from the Password Reset Request table [pwd_reset_request].

Role required: password_reset_admin or password_reset_service_desk

Navigate to Password Reset Reset Requests.

Table 962: Password Reset request fields

<table>
<thead>
<tr>

<tr>
<td>Status</td>
<td>The result of the Password Reset request:</td>
</tr>
<tr>
<td></td>
<td>• Completed With Failure: User completed all steps in the Password Reset process, but the password was not reset in the credential store.</td>
</tr>
<tr>
<td></td>
<td>• Completed With Success: User completed all steps in the Password Reset process and the password was reset in the credential store.</td>
</tr>
<tr>
<td></td>
<td>• Expired: User did not complete all steps in the Password Reset process in the time allowed.</td>
</tr>
<tr>
<td></td>
<td>• In Progress: User is working through the steps to reset the password.</td>
</tr>
<tr>
<td></td>
<td>• Max Number of Attempts: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed.</td>
</tr>
<tr>
<td></td>
<td>• Verified: User has completed the identity verification step and is verified. The user can move to the Password Reset step.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the request is open or closed.</td>
</tr>
<tr>
<td>Retry</td>
<td>The total number of times the user has attempted to complete a password reset request.</td>
</tr>
</tbody>
</table>

Service desk: Unblock a Password Reset user

If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Role required: password_reset_admin or password_reset_service_desk

Blocking events include:

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked, or locked, users and the time interval required to generate the log event by setting the `password_reset.activity_monitor.incident_threshold` and `password_reset.activity_monitor.incident_window` properties.

1. To view the list of blocked users, navigate to Password Reset Blocked Users.
2. To unblock a self-service user:
   a) Navigate to Password Reset Blocked Users.
   b) Select a user from the list.
c) Select Delete on the Actions on selected rows list.

3. To unblock a user whose password was reset by a service desk agent:
   If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.
   In contrast, service desk agents are allowed any number of retries. The max_attempt_reached limit does not apply and the Blocked status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.
   If the user is not unblocked manually, then the system resets the blocked state only when the max_attempt_window time period elapses and the user tries to reset the password using self-service.
   a) After you successfully reset a user password, navigate to Password Reset Blocked Users .
   b) Change the Blocked setting for the user from true to false.

Password Reset and Password Change reports

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.

The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

Password Reset Overview module

The Password Reset Overview module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Requests (last 7 days)</td>
<td>Number of password reset requests by type during the last 7 days.</td>
</tr>
<tr>
<td>Blocked Users (last 7 days)</td>
<td>Number of users blocked over the last 7 days.</td>
</tr>
<tr>
<td>Password Reset Request Status (last 7 days)</td>
<td>The status of all password reset requests by process.</td>
</tr>
<tr>
<td>Password Reset Request by Action (last 30 days)</td>
<td>Number of password reset requests by action type: Reset Password, Unlock Account, or Reset and Unlock.</td>
</tr>
</tbody>
</table>
### Password Reset activity log

The activity log (Password Reset Activity Log) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log [pwd_reset_activity] table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

### Password Reset event log

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) Administrative Tools Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications Service Logs.

You must have the admin role to view the log.

### To write to the Password Reset event log

Edit the DebugFlag registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}

By default, the key is set to 0. Set the key to 1 to write log entries to the ServiceNowPwdReset event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

---

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Password Reset Top Users (last 30 days)</strong></td>
<td>Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.</td>
</tr>
<tr>
<td><strong>Password Reset Failed Verifications (last 7 days)</strong></td>
<td>Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.</td>
</tr>
<tr>
<td><strong>Password Reset Enrollment By Verification</strong></td>
<td>Number of users by verification type who have and have not enrolled in the password reset program. A large number for users who have not enrolled could indicate a compliance or communication issue within the organization.</td>
</tr>
<tr>
<td><strong>Password Change Top Users (last 30 days)</strong></td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>
Password Reset blocked user notification

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the Password Reset-Activity Monitor Lockout notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

Schedule for purging Password Reset data

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge. Contact ServiceNow Technical Support to modify purge intervals.

Table 964: Purge intervals for Password Reset tables

<table>
<thead>
<tr>
<th>Table name</th>
<th>Purge interval</th>
</tr>
</thead>
</table>
| [pwd_reset_request]         | 90 days (7,776,000 seconds). Depending on your organizational data monitoring requirements, you could configure the rule to:
|                             | • Purge successful requests after 90 days
|                             | • Keep failed requests for 120 days                 |
| [pwd_user_lockout]          | 90 days (7,776,000 seconds). Depending on your organizational data monitoring requirements, you could configure the rule to:
|                             | • Purge successful requests after 90 days
|                             | • Keep failed requests for 120 days                 |
| [pwd_reset_activity]        | 90 days (7,776,000 seconds).                       |
| [pwd_activity_monitor]      | 90 days (7,776,000 seconds).                       |
| [pwd_dvc_enrollment_code]  | 1 day (86,400 seconds).                             |
| [pwd_sms_code]              | 1 day (86,400 seconds).                             |

View log of failed login attempts

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

Role required: admin

1. Navigate to System Policy Event Logs.
2. Filter for login.failed in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.
Users: Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer you the option to enroll for one or more methods of verifying your identity when you reset your password.

You might enroll for any combination of the following methods:

<table>
<thead>
<tr>
<th>Method Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify your identity using security questions (QA verification)</td>
<td>To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely. Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity.</td>
</tr>
<tr>
<td>Verify your identity using an SMS code (SMS verification)</td>
<td>To enroll, you authorize a device like a cellular phone for SMS verification. Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.</td>
</tr>
</tbody>
</table>

Users: Enroll in the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity.

Role required: none

**Note:** You cannot enroll on a mobile device.

1. Navigate to Password Reset Enroll and then click the QA Verification tab.
   - If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each Question field, select a question from the list and then enter the answer in the Answer field.
   - Repeat the process until the required number of Question and Answer fields are filled in.
3. Click Submit.
4. Enroll for an extra identity verification using any of the other methods that your organization offers.
   - See:
     - *Users: Enroll in the Password Reset program using SMS codes* on page 1764

Users: Enroll in the Password Reset program using SMS codes

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device.

Role required: none

**Note:** You cannot enroll on a mobile device.

1. Navigate to Password Reset Enroll and then click the SMS Verification tab.
If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).

2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click Add Device and then follow the instructions. Provide a meaningful Name for each device. Repeat the process for as many devices as you need.

3. After you have verified each device, select the Authorized check box for each device that you expect to use to change or reset your password.

   **Note:** You can deauthorize a device at any time by clearing the Authorized check box.

4. Click Submit.

5. Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - *Users: Enroll in the Password Reset program using questions and answers* on page 1764

---

### Users: Reset your password on Windows systems

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

**Role required:** none

1. Start your computer or press Ctrl+Alt+Delete to go to the Windows login screen.
2. Click the Forgot Password? link. (Your administrator may have configured different text for the link.)
3. On the Identify page, enter the requested information and then click Next.
4. On the Verify page, enter the requested information, and then click Next.

**Note:** You might be given the option to choose the method used to verify your identity.

If your identity is verified, the Reset page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the Reset Password button. Enter and reenter the new password and then click Reset Password.
   - If your account is locked, the page displays the Reset Password and Unlock Account buttons.
     - You can enter a new password and click Reset password to reset the password and unlock the account.
     - If your administrator has selected Enable account unlock for the password process, you can unlock the account without resetting the password by clicking Unlock account.
Self-service

The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

Service catalog requests

This page contains links to content on service catalog requests.

Add new request items

Use ServiceNow's web-based interface to add new items to a request.

Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog Open Records Requests and open an existing request.
2. Click Add New Item.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click OK.

Amazon EC2 instance request from the Service Catalog

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

Request an instance

Request the provisioning of a new Amazon EC2 instance through the service catalog.

1. Navigate to Self-Service Service Catalog.
2. Select Amazon EC2 Instance from the Request Application Infrastructure category.
3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.

See the specifications for Large and Small instances in Amazon EC2 Instance Types.

4. Type a reason for the request.
5. Click Order Now to order the instance.

The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.
Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

**Terminate an instance**

Shut down an Amazon EC2 instance through the service catalog.

1. Navigate to **Service Catalog Routine Changes Terminate Amazon EC2 Instance**.
   
   A list appears displaying the instances that are assigned to you.

2. Select an instance from the list and click **Order**.
   
   This list does not support multi-line selection, and there is no undo feature.

**Check-out redirect property**

A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to false, which redirects the view to the Order Status form when the requester clicks Order Now. When this property is set to true, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in **Cloud Management Administration Properties**.

**Delete request items**

Use ServiceNow's web-based interface to delete items from a request.

All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

1. Navigate to **Service Catalog Open Records Requests** and open an existing request.

2. In the Requested Items related list, select the check box beside the item to delete.
3. In the Actions choice list, select Delete. ServiceNow recalculates the price and delivery date for the order.

Place a request

Use ServiceNow's web-based interface for ordering predefined goods and services.

1. Navigate to Self-Service Service Catalog.

The default catalog view organizes items in categories and subcategories.

![Screen shot of Service Catalog]

Figure 449: Default catalog view

2. Select an item to order.

**Note:** Some items are order guides, which combine related items for easier ordering. For example, an order guide called New Employee Hire presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

The order screen requests any additional information that's needed, such as the requester's name or location and the date the item is needed. It also displays the item's delivery time after approval.
Figure 450: Delivery time

3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click Order Now when the order is complete.

ServiceNow displays a confirmation screen for your order:
You can view the order's progress in the Stage column.

**Note:** It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

**View request status**

Use ServiceNow's web-based interface to view the status of a request.

1. Navigate to Self-Service Requested Items.
2. Click your order number to view details.
3. View the order's progress in the Stage field.

Customize homepages

If you are assigned at least one role in the system, you can create a customized homepage that you can see when you log in.

The content on your homepage comes from a variety of sources, such as graphs and charts generated from a report, application modules, a service catalog category, the scrolling news widget, which is the News knowledge category.

1. Navigate to Self-Service Homepage.

2. Add any item to the homepage by clicking the add content icon or the Add content link at the top.

A window will open that lets you select from a number of different homepage items you can add. Some items pertain to specific features and applications, such as CMS content blocks and the Work Management dispatch map. So the list of items varies depending on what is active on your system.

3. Reposition elements on your homepage by dragging and dropping them to a new location.

4. To remove a homepage item, click the [X] on the right side of the item's header.

Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

1. Click the Delete page link at the bottom of the homepage.

2. Click Ok to confirm the deletion.
How Help the Help Desk identifies devices

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found.

These queries attempt to match devices using the three criteria listed here, in this order. Updates to an existing CI require only a single match as the list is evaluated. For example, if a device's name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the cmdb_ci_computer table
- MAC address in the cmdb_ci_network_adapter table
- Computer name in the cmdb_ci_computer table

**Note:** Discovery Identifiers are incompatible with Help the Help Desk queries.

Script Include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Running Help the Help Desk

Help the Help Desk is a tool that enables users to populate the CMDB automatically with information about their Windows computer. Help the Help Desk is a small Web application that downloads and runs locally, using a login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more.

To detect all system software successfully on a 64-bit machine, make sure to run the Help the Help Desk script from a 64-bit browser. A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

1. On your instance, navigate to Self Service > Help the Help Desk.
2. Click Start the Scan to Help the Help Desk.
   You are prompted to run or save the discovery.hta script.
3. If your browser is Internet Explorer, run the script. If you are using any other browser, click Save and save the script to the local machine.
4. To execute the saved script, double click the file.
   The script runs a series of WMI queries to gather information about the Windows machine. When it is done, the data is sent back to your ServiceNow instance and used to populate the configuration database (CMDB).

Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals and tasks assigned or sent to you, and to receive copies of all email notifications sent to you.

**Note:** Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.
Add the Delegates related list to a user profile

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

Role required: personalize_form or admin.

1. Navigate to Self-Service My Profile.
2. On the form context menu, navigate to Configure Related Lists, and then add the Delegate->User related list.

The Delegates related list displays at the bottom of the user profile form.

Delegate approvals and tasks to another user

If a user is out of the office, that user can delegate responsibilities to other users for a period of time.

1. Navigate to Self Service My Profile.
2. In the Delegates related list, click New.

**Note:** Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications.
Figure 453: Delegates Related List

If the list is not visible, configure the form to add the Delegate->User related list.

3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the check boxes. You can delegate:
   - Approvals: The delegate can approve items on your behalf.
   - Assignments: The delegate can view and work on tasks assigned to you.
   - CC Notifications: The delegate receives a copy of email notifications sent to you, except those marked Meeting Invitation.
   - Meeting Invitations: The delegate receives a copy of email notifications sent of the type Meeting Invitation.
Note: You must select an active user as your delegate. The instance only delegates to active users.

A sample delegation looks like this:

Figure 454: Delegation Options

Note: If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see "Incident assigned to you" emails, so make sure they know they are a delegate.

Service administration

Configure settings for services that support business applications or the platform.

Assessments

Use assessments to evaluate, score, and rank records from any table in the system.

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor’s goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another.
The Assessments plugin is enabled by default.
For information about update sets, see *Create an update set*.

**Assessment roles**

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment administrator</td>
<td>assessment_admin</td>
<td>Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to. <strong>Note:</strong> By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.</td>
</tr>
<tr>
<td>ITIL user</td>
<td>itil</td>
<td>ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.</td>
</tr>
<tr>
<td>Administrator</td>
<td>admin</td>
<td>Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.</td>
</tr>
</tbody>
</table>
Assessments: important terms

Assessment admins use several terms when working with assessments.

Assessment terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A <em>metric type</em> defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An <em>assessable record</em> links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A <em>metric category</em> represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Metric</td>
<td>A <em>metric</em> is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A <em>category user</em> is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A <em>stakeholder</em> is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
<tr>
<td>Assessment instance</td>
<td>An <em>assessment instance</em> represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:</td>
</tr>
<tr>
<td></td>
<td>• The assessment generation scheduled job runs.</td>
</tr>
<tr>
<td></td>
<td>• An assessment administrator creates an on-demand assessment.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>A <em>scorecard</em> provides a visual illustration of an assessable record's performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>A <em>decision matrix</em> is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrixes to determine the relative standing of assessable records in selected categories.</td>
</tr>
</tbody>
</table>
Assessment methods

The available methods are Assessment, for non-scripted metrics, and Script, for scripted metrics. Each method serves a different function and can be used with certain data types.

Use the Method field to specify how to use the metric.

Assessment method

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these Data type values:

- Attachment
- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

Script method

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these Data type values:

- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:
Figure 455: Metric form script field

You must use the following variables in your script:

- primary: Input variable used to access the sys_id of the record being assessed.
- actual_result: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each actual_result, you must specify a corresponding scaled_result value.
- scaled_result: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the Scaled value field on the Metric Result form. Ensure the scaled values you specify are between or equal to the Min and Max values for the metric. The Scale definition field determines how the system uses the scaled value. A scale definition of Low means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. High means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

Script example

The metric Number of active devices uses the script pictured below. The primary variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the actual_result, the number of CIs associated to the vendor, then calculates the correct scaled_result. The script uses a series of scaled values, from the Min to the Max value, to represent actual values. Because the Scale definition is set to High, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.
Figure 456: Scripted metric example

Data types for assessments

Metric data types have functions that depend on the method that you select.

</tr>
</tbody>
</table>

**Assessment generation**

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- Assessment group
- Assessment instances
- Assessment results

**Assessment groups**

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.

The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in Assessments Assessment Groups.

The Assessment Group form displays the group Number, the associated Metric type, and these related lists:

- Assessment Instances: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
• Metric Results: Lists all metric results for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.

• Assessment Category Results: Lists all category results for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

**Note:** To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

Installed with assessments

Several types of components are installed with Assessments.

Demo data is available for assessments and surveys. **Vendor Performance** offers an additional set of vendor assessment demo data.

Tables installed with assessments

**Tables**

Assessments adds the following tables.

### Table 966: Tables for assessments

<table>
<thead>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Create Business Rule on Remote table      | Assessment Metric Type [asmt_metric_type] | Generates the following business rules if an assessment administrator creates or updates a metric type:  
- Business rule called Auto business rule for Assessments, which monitors the Table selected for the metric type. When someone adds a record that meets the metric type conditions, this business rule generates an assessable record. If someone changes the metric type’s Table or conditions, the Create Business Rule on Remote table business rule updates the automatic business rule script to reflect the changes.  
- Business rule called Auto deletion rule for Assessments, which prevents users from deleting a record on the metric type’s Table if the record is associated to metric or category results. If the record has no associated results and a user deletes it, this business rule deletes any associated assessable records.  
  
The Create Business Rule on Remote table business rule generates automatic business rules only for metric types with Evaluation method set to Assessment. |
<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create Scheduled Job              | Assessment Metric Type [asmt_metric_type]  | Assessments: Generates a scheduled job for the creation of assessment components if either of these conditions is met:  
  • Someone creates a new metric type with the schedule type set to Scheduled.  
  • The schedule type changes from On demand to Scheduled.  
Surveys: Generates a scheduled job for the creation of survey components if the schedule period for a survey definition is set to Daily, Weekly, Monthly, or Yearly. |
<p>| Create Survey Records             | Assessment Metric Type [asmt_metric_type]  | Generates various records and populates certain fields on those records when someone creates a new survey definition, which is a metric type with Evaluation method set to Survey. More specifically, this business rule generates a survey category and assessable record, both associated to the survey definition. |
| Create UI Action on Remote table  | Assessment Metric Type [asmt_metric_type]  | Reserved for future use.                                                                                                                                                                                   |
| decision_matrix_axis              | Global [global]                            | Limits available categories for X- and Y-axes to those that belong to the type if there is a metric type specified on the Decision Matrix form.                                                               |
| Delete Live Feed Group            | Assessable Record [asmt_assessable_record] | Deletes the assessable record's live feed group, if there is one, when an assessment administrator deletes an assessable record.                                                                          |
| delete related users              | Category Assessable Records [asmt_m2m_category_assessment] | Deletes any stakeholders for the assessable record and category when an assessment administrator disassociates a category from an assessable record.                                                        |</p>

| Update records that match filter | Metric Category [asmt_metric_category] | Automatically performs these tasks when an assessment administrator edits the Filter field:  
  • Associates the category to assessable records that meet the filter conditions.  
  • Disassociates the category from assessable records that do not meet the filter conditions.  
  The Assessable records related list reflects these changes when the record is saved.                                                                                                                                                                                                                         |
| Update scheduled job on schedule change | Assessment Metric Type [asmt_metric_type] | Updates the survey creation scheduled job to reflect schedule period changes.                                                                                                                                                                                                                                                         |
| Validate mandatory and not applicable | Assessment Metric [asmt_metric] | Sets the Mandatory and Allow not applicable fields to false if the metric method is Script. If the metric data type is Percentage, the business rule sets the Allow not applicable field to false.                                                                                                                                 |
| Verify min/max               | Assessment Metric [asmt_metric]       | Ensures that the Min is greater than or equal to zero and less than the Max. Sets the Min to 0 and the Max to 1 if the data type is Checkbox or Yes/No.                                                                                                                                                                                                 |
### Assessment administrator tasks

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization's options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.

### Create an assessment category

Assessment categories are used with assessment metric types and assessment metrics to generate bubble charts.

**Role required: assessment_admin or admin**

The Demand Management application comes with the Demand assessment metric type, five assessment metric categories, and assessment metrics. From the Assessment Categories section of the application menu, you can modify existing assessment categories and create ones.

1. Navigate to Demand Settings Assessments .
2. Click Create New to create a new record.

#### Table 972: Default demand management assessment categories

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>Assesses demand size relative to the size of other demands.</td>
</tr>
<tr>
<td>Strategic Alignment</td>
<td>Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.</td>
</tr>
<tr>
<td>Risk</td>
<td>Assesses demand risks compared to other demands.</td>
</tr>
<tr>
<td>ROI</td>
<td>Assesses demand return on investment compared to other demands.</td>
</tr>
</tbody>
</table>
Assessment metric categories
In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

Weight categories and metrics
When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- Determine a weighting scale and use it consistently. In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
- Use the same weighting scale for metric categories and metrics. Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

**Note:** If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records
After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Role required: none

1. Navigate to Assessments Metric Definition Categories.
2. Click New to create a new metric category.
3. Complete the Metric Category form.

### Table 973: Metric Category form

<table>
<thead>
<tr>

</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Assessment Metrics | All metrics associated to this category. There must be at least one metric associated to the category to use any assessments with the category.
Assessable records | All assessable records associated to this category. There must be at least one assessable record associated to the category to use any assessments with the category. This related list is hidden if the Evaluation method is Attestation.
Users | All users associated to this category. There must be at least one category user to create scheduled assessments using metrics in this category. This related list is available only when the associated metric type has schedule type set to Scheduled. Category users are not a part of the on-demand assessment process.

**Weight categories and metrics**

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics. The greater the weight value, the more important the item is.

The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values:

- **Determine a weighting scale and use it consistently** In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
- **Use the same weighting scale for metric categories and metrics** Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

**Note:** If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

**Assessable record associations**

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

**Note:** You can also manage which categories an assessable record is associated to using the *Assessable Record* form.

**Manage an assessable record automatically**

You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Categories.
2. Open a category.
3. In the Filter field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type. For example, for a category in the Vendor type, you might create the condition [Country] [is] [Germany]. Metrics in the category will be used only to evaluate vendors that meet this condition.
4. Save the record.

The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter condition, the system removes and creates assessable record associations, as appropriate. Note the following:

- The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
- The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
- The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the Country of one of the vendor records from Germany to Canada. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

**Note:** To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example, if the Vendor metric type has the condition [Vendor] [is] [true], create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition [Sys ID] [is not empty], which includes all records from any table.

**Manage an assessable record manually**

You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Role required: assessment_admin or admin

Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

1. Navigate to Assessments Metric Definition Categories.
2. Open a category.
3. In the Assessable records related list, click Edit and use the slushbucket to add or remove one or more assessable records.

Only assessable records associated to this category's metric type are available for selection.

**Delete a category**

When you delete a category, the system also deletes the associated category users and stakeholders.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Categories.
   Alternatively, navigate to a record that contains a related list for categories.
2. Open a record from the list.
3. On the Metric Category form, click Delete.
4. Click OK when asked to confirm the action.
The system displays messages at the top of the form describing the actions taken.

**Assessment metrics**

In the Assessments application, a metric is a trait or value used to evaluate assessable records.

Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one *metric category* and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors’ customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and *metric templates*, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

---

**Note:** Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

---

*Create a metric for a category*

After you create a category, create metrics you can use to evaluate the assessable records for that category.

**Role required:** assessment_admin or admin

When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess. If you plan to use metrics for assessment questionnaires, you may want to review *tips for writing good questions*.

1. **Navigate in one of the following ways:**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assessments Metric Definition Categories</strong></td>
<td>Open a category, and locate the Assessment Metrics related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
</tbody>
</table>

| **Assessments Metric Definition Metrics** |

2. **Click New.**

3. **Fill in the fields, as appropriate.**

</table>

Additional fields you can add by customizing the form
## Field Description

### Details

Text field containing an HTML editor. Use this field to present important details about this metric to assessment recipients. Details can include formatted lists, images, videos, or links to external websites.

* What type of men's trousers are expressly forbidden by company policy?

Female employees may mark this question "Not Applicable".

---

### General Section

#### Question

Text to use as the question on assessment questionnaires. Enter a clear, straightforward question that is easy to answer, such as **How likely are you to recommend this vendor for the purchase of office supplies?**

---

#### Description

Information about the metric and what it evaluates. If the Method is Assessment, include details that help users understand how to answer the question. This text appears as a hint when a user points to the question text on the questionnaire.

---
### Field | Description
---|---
Depends on | Setting used to make this metric a conditional question. Select an existing metric question from the list, which displays Checkbox, Choice, Likert Scale, Template, and Yes/No metrics of the same category as this metric. Then, use the Displayed when field to set the conditions that display this metric question on questionnaires. The system prevents the creation of recursive dependencies between metrics. For example, if Metric A depends on Metric B, Metric B cannot depend on Metric A.

This field is visible only if the Method is Assessment.

Displayed when | Answer options for the selected Depends on metric question that, when chosen on questionnaires, display this metric question.

This field is visible and required only if the Depends on field is set.

### Field Type Section

| Data type | [Required] Format of the expected response data. The function of the data type depends on the selected Method. If the method is Assessment, the data type determines how users answer the corresponding question on questionnaires. If the method is Script, the data type determines how the system calculates assessment results.

Note: If another metric depends on this metric, you cannot change the data type.

| Randomize answers | Check box that determines whether to present the answer options for this metric question in a random order. The order of answer options can influence users, which creates biased results. Randomizing answer options can help prevent this bias.

This field is visible only if a data type that requires metric definitions is selected.

Note: Randomizing answer options for certain questions can make those questions confusing for the person answering. In general, only randomize answer options that do not follow a logical order. For example, the following question is confusing when randomization is enabled:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Template</strong></td>
<td>Metric template to use for the metric question. A metric template is a set of predefined answer options. This field is visible and required only if the Data type is Template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another metric depends on this metric, you cannot change the template.</td>
</tr>
<tr>
<td><strong>Dependent plugin</strong></td>
<td>Plugin that contains the tables queried in the script. The system executes the metric script only if the plugin is active. The default available values are Asset Management, CMDB, Core, Cost Management, Procurement, and Software Asset Management. If the Method is Script, select a plugin.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the Method is Script.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An administrator may need to add more choices of plugins to the field.</td>
</tr>
<tr>
<td><strong>Scale definition</strong></td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select Low if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select High if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is High.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data Types.</td>
</tr>
<tr>
<td><strong>Min</strong></td>
<td>Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the smallest metric definition Value.</td>
</tr>
<tr>
<td><strong>Max</strong></td>
<td>Highest numerical value to be used as an answer option or scaled value.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the largest metric definition Value.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>Script that obtains the desired system information.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the Method is Script.</td>

</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related List</td>
<td>Lists all metric definitions, which appear as answer options for questions on assessment questionnaires. Click New to create a new metric definition.</td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

4. Save the record.
   When you create a Choice or Likert Scale question, reopen the Assessment Metric form after you submit it to create a metric definition. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.

#### Create a metric definition

Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

Role required: assessment_admin or admin

Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: Very satisfied, Somewhat satisfied, and Not at all satisfied.

1. Open the metric record you want to edit.
2. In the Assessment Metric Definitions related list, click New to create a new metric definition.
3. Fill in the fields:
   - Display: Enter the text you want to appear as the answer option.
   - Value: Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.
4. Click Submit.

#### Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of Choice or Likert Scale.

Role required: assessment_admin or admin

The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the Value setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the Order field and not the Value field.

The Order column is hidden in the base system.

To edit these records, configure the Assessment Metric Definitions related list in the question record to show the Order column, and then edit the order number in the list. The Value setting remain the same for each answer option after reorganization.
Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks on page 1899.

Create metric types and generate assessable records

Each metric type sets a table and filter conditions that define a set of records to evaluate.

Role required: assessment_admin or admin

For example, the Vendor Performance application provides the Vendor metric type, which defines an assessable record for each source record in the Company [core_company] table that has the Vendor field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

1. Navigate to Assessments Metric Definition Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click Generate Assessable Records to save the record and create assessable records. The page redirects to the list of assessable records created.

You must click Generate Assessable Records to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. Generate Assessable Records is located under Related Links.

**Note:** Clicking Generate Assessable Records can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record on page 1921.
## Table 975: Metric types

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the type. It may be practical to give the type a name that indicates which records it defines.</td>
</tr>
<tr>
<td>Assessment duration</td>
<td>Amount of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated. The assessment duration sets the Due date that appears on assessment instances. Changes made to the duration of an attestation in the GRC Control Test Definition form are updated dynamically in this field. The default duration is 14 days.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that determines whether to enable (selected) or disable (cleared) the Live Feed view in scorecards for all assessable records created from this type.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box that determines whether to send (selected) email notifications a user's manager when that user fails to submit an assigned questionnaire on time.</td>
</tr>
<tr>
<td>Assessment manager</td>
<td>Manager for this assessment metric type. These users are responsible only for managing the assessment process and not the results. The system notifies the assessment manager when an assessment for this metric type is past due.</td>
</tr>
<tr>
<td>Scoring type</td>
<td>Scoring method to use for questions with a data type of attestation. The possible selections are:</td>
</tr>
<tr>
<td></td>
<td>• Percent: Attestation score as a weighted percentage of correct answers for scored questions. When you select this scoring type, categories can be scored as Percent or All or nothing.</td>
</tr>
<tr>
<td></td>
<td>• All or nothing: Requires all answers for attestation type questions to be correct, or the score is zero for the entire attestation. When you select this scoring type, all categories are scored automatically as All or nothing.</td>
</tr>
<tr>
<td>Scale factor</td>
<td>[Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor.</td>
</tr>
</tbody>
</table>

**Note:** This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor you are satisfied with before you save the metric type.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roles</td>
<td>Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record as well as to associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrices.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Users with these roles do not have access to Assessments modules unless they are also assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to easily grant certain users access to specific assessment data in special cases. For example, the Vendor metric type provides access to users with the vendor_manager role so they can view results and compare assessable records when they open scorecards or decision matrices in the Vendor Performance application.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to an assessment. For more information, see Create an assessment signature on page 1918.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit an assessment for this metric type. When a return URL is configured, the end note content does not appear.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-Only] Status of the assessment: Draft or Published.</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the specified table. When a new record is added to the table that meets the metric type conditions, the business rule generates a corresponding assessable record. If someone changes the metric type's table or conditions, the system updates the business rule to reflect the changes. Existing assessable records associated with the metric type are not affected.</td>
</tr>
<tr>
<td>Schedule type</td>
<td>Setting that determines which assessment process to use. Select On demand or Scheduled.</td>
</tr>
<tr>
<td>Scheduled job</td>
<td>[Admin only] Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format &lt;type name&gt; Assessment Creation. Administrators can configure a recurring assessment generation schedule for the metric type. This field is visible only when the schedule type is Scheduled.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you change the schedule type from Scheduled to On demand, the system deletes the scheduled job. If you change the schedule type back to Scheduled, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Evaluation method    | [Admin only] Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are:   
  • Assessment: Default filter value for metric types. Only this evaluation method uses *assessable records*, conditions, and *stakeholders*.  
  • Attestation: For details, see .  
  • Survey: For details, see *Survey definitions* on page 2095.                                                                                           |
| Scale factor         | [Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor.  
  **Note:** This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you are satisfied with before you save the metric type. |
| Allow retake         | Check box that allows users to modify their answers to a completed assessment, quiz, survey, or attestation. After the due date, the system removes the assessment from the user’s My Assessments and Surveys page. |
| Active               | Check box that determines whether the metric type is active. When the metric type is inactive (cleared), assessment generation is disabled and users cannot take existing assessments. |
| Description          | Helpful information about this type. Enter a clear description of the type and its purpose.                                                                                                                                         |
| Introduction         | Introductory content to display on assessment questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions. You may need to configure the form to see this field. |
| End note             | Content to display on the screen that appears when someone submits an assessment questionnaire. Consider adding a thank you message, followup instructions, or other applicable information. You may need to configure the form to see this field. End notes are not displayed if a Return URL is specified. |
| Send notifications   | Select the check box to send notifications for this assessment, survey, or attestation. You may need to configure the form to see this field.                                                                                           |
| Condition section    |                                                                                                                                                                                                                                    |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Table                  | [Required] Table that contains the records you want to evaluate. The system creates assessable records for records on this table that meet the conditions you specify, if any. The number of matching records appears as a link by the Condition field. The link dynamically updates if you change the table selection. Click the link to open the list of matching records in a new tab or window.  
  
  **Note:** Additional roles are required to view the records on certain tables. If you select a table that you do not have access to, a warning message appears by the Condition field where the number of matching records would be. You cannot generate assessable records for tables you do not have sufficient roles for.                                                                                                                                 |
<p>| Enforce condition      | Check box that determines what happens to assessable records when you change the selected table or conditions.                                                                                                                                                                                                                                                                                                                                                             |
| Condition              | Condition builder that defines specific records to assess from the selected table. If you do not specify any conditions, the system creates assessable records for all records on the selected table. Click the refresh icon to update the adjacent record count.                                                                                                                                                                                                                                 |
| Decision Matrix section|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter field</td>
<td>[Required] Field on the selected table that can be used to filter results on decision matrices and scorecards. For example, if the selected table is Company[core_company] and you choose Vendor type as the filter field:</td>
</tr>
<tr>
<td></td>
<td>• When you view decision matrices for this type, the decision matrix menu to filter plotted items lists vendor types: Applications, Hardware, Services, and Software.</td>
</tr>
<tr>
<td></td>
<td>• On scorecards for this type, the Averages view displays ratings by vendor type.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Condition builder that defines which records from the table are available as choices on the filter menu. For example, if the filter field is Vendor type and you create the filter condition [Name] [does not contain] [Hardware], only records with vendor types of Applications, Services, and Software are possible choices as decision matrix filters.</td>
</tr>
<tr>
<td>Default matrix filter</td>
<td>Record to use as the default filter choice on decision matrices and scorecards. The selected Filter field and Filter condition control the available record choices. To see the records, if any, click the refresh icon next to the field. Consider the case that the filter field is Vendor type and you select Applications as the default matrix filter. The filter choice on decision matrices for this type is set to Applications by default. If you change the value of the Table or Filter condition field, you must click the refresh icon to view the updated Default matrix filter choices. If you do not, the system selects the first available choice from the updated field choices when you save the record.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric Categories</td>
<td>All metric categories associated with the type.</td>
</tr>
<tr>
<td>Assessable Records</td>
<td>All assessable records associated with the type. This related list is hidden in the Attestation view of this form.</td>
</tr>
</tbody>
</table>

**Note**: The Generate Assessments button is visible to administrators in certain cases for scheduled assessments. Do not click the button until after completing the prerequisite tasks.

---

**Delete a metric type**

Deleting a metric type entails deleting many related records.

**Role required**: assessment_admin or admin

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

1. **Delete the records associated with the type to delete**:
   - *Assessment results* (metric and category results)
   - *Assessment instance* (questions and assessment instances, in that order)
   - *Assessment groups*

2. **Delete the type**.
   - A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. **Click OK to delete the type and these related records**:
   - Scheduled job for assessment generation
   - Business rule for assessable record generation
   - Assessable records
   - Metric categories
   - Category users
   - Stakeholders
   - Metrics
   - Metric definitions
   - Decision matrixes

---

**Export an assessment**

You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

**Role required**: assessment_admin or admin

**Note**: Update sets are available in the Istanbul release and should be used to move data from one instance to another. For information about update sets, see *Update sets*.

**Note**: The system exports a single XML file that does not contain result data.

The XML file contains a metric type [asmt_metric_type] and the following records that are associated with the type:

- Assessable records [asmt_assessable_record]
- Metric categories [asmt_metric_category]
- Metrics [asmt_metric]
- Metric definitions [asmt_metric_definition]
- Category users [asmt_m2m_category_user]
- Stakeholders [asmt_m2m_stakeholder]
- Decision matrixes [asmt_decision_matrix], [asmt_m2m_xcategory_matrix], and [asmt_m2m_ycategory_matrix]

1. Navigate to Assessments Metric Definition Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Import an assessment
Share assessments between ServiceNow instances by importing a previously exported assessment.
Role required: admin

**Note:** Update sets are available in the Istanbul release and should be used to move data from one instance to another. For information about update sets, see [Update sets](#).

1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in [Import a Record as XML Data](#).

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.
Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:
- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

Create an assessment signature
A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Role required: assessment_admin or admin

You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called Require authentication for user signature allows you to require users to provide their user name and password when an assessment asks for a full name signature.

1. Navigate to Assessments Metric Definition Signatures.
    All signatures in the system appear in this list.
2. Click New.
3. Complete and submit the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are Checkbox, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open a record from the list.
   - By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).
### Table 977: Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Read-Only] Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>[Read-Only] Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-Only] Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Live feed group</td>
<td>[Read-Only] Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

**Related Links**

**View Scorecard**

Opens the scorecard for the assessable record.

**Related Lists**

**Category**

All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click Edit to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click Edit to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the Scheduled schedule type.</td>
</tr>
</tbody>
</table>

Enforce a condition to delete an assessable record

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Role required: assessment_admin or admin

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

1. On the Assessment Metric Type form, select the Enforce condition check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.
   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click Generate Assessable Records to delete all assessable records associated with the type that do not match the current table and conditions.
   The system does not automatically delete assessable records, even if the Enforce condition check box is selected. You must click Generate Assessable Records with the check box selected every time you want the system to delete non-matching assessable records.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:
- To delete a single record, open the record and click Delete.
- To delete multiple records, use the Assessable Records list.

Create a metric template

Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Templates.
2. Click New.
3. Fill in the Name field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select Allow Image.
5. Click Submit.
6. Under the Assessment Template Definitions related list, click New.
   Create a template definition for each answer option you want to appear on an assessment question.
7. Fill in the following fields:
   - Display: Enter the text to appear as the answer option.
   - Value: Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - Selected Image: Click to add the image to use for selected state.
   - Unselected Image: Click to add the image to use for unselected state.

When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

Tip: To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click Update.

**Metric templates**
Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

Metric templates are available for metrics that have Template as the Data type. The following metric templates are available by default.

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
</tbody>
</table>

**Update a metric minimum and maximum value to match a template**
For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

Role required: assessment_admin or admin

The system sets the Min and Max fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:
1. Navigate to Assessments Metric Definition Metrics.
2. Configure the list to show the Min and Max columns.
3. Run the following list filter condition: [Template] [is] [<select the template you updated>]

4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.

   If the values do not match, edit the Min and Max directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

---

**Category users and stakeholders**

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

   **Note:** Category users and stakeholders are used only for scheduled assessments.

---

**Category users**

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.

---

**Stakeholders**

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- Configure the system to create stakeholders automatically.
- Associate multiple category users to multiple assessable records.
- Associate multiple category users to one assessable record.
- Associate one category user to one assessable record.

   **Note:** Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

---

*Create a category user*

Create category users by associating users in the system to metric categories.

Role required: assessment_admin or admin
When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor's discount practices.

1. Navigate to Assessments Metric Definitions Categories.
2. Open a category record.

**Note:** The category must be associated to a metric type that has the Schedule type set to Scheduled.

3. In the Users related list, click Edit.
4. Select the appropriate users for this category.

*Create stakeholders automatically*

You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the Create stakeholders check box on the Metric Category form.

Role required: assessment_admin or admin

If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

**Note:** Use the Create stakeholders check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.

1. Navigate to Assessments Metric Definition Categories.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the Create stakeholders check box.
5. Click Update.
   All the category users are associated to all the assessable records as stakeholders.
6. In the Assessable Records related list, click Edit.
7. Using the slushbucket, associate an assessable record to the category.

8. Click Save.
The system makes all category users stakeholders for the new assessable record.

9. Delete stakeholders as needed.

*Associate multiple category users to multiple assessable records*

The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.

Role required: assessment_admin or admin

You can select category users from one category at a time.

**Note:** You cannot edit or delete stakeholders using the list helper.

1. Navigate to Assessments Advanced Create Stakeholders.

The stakeholder list helper appears.
2. Select a metric type from the list of available types.

**Note:** Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

**Note:** Only categories within the selected metric type are available.

The system populates the Category User and Assessable Records lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the Category Users list.

5. Select one or more assessable records from the Assessable Records list.

6. Click the Associate arrow between the lists to complete the association.

A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records

You can delete stakeholders for multiple assessable records.

**Role required:** assessment_admin or admin

1. Navigate to Assessments Advanced Assessment Stakeholders.

2. Sort the list by Assessable Record or Category User depending on the perspective you want.

3. Select the check box for each stakeholder you want to delete.

4. Select Delete in the Actions choice list.

5. Click OK to confirm the action.

The system deletes the stakeholders.
**Associate one category user to one assessable record**

You can create a single stakeholder using the list in the Assessment Stakeholders module.

Role required: assessment_admin or admin

Associate any category user to any assessable record.

1. Navigate to Assessments Advanced Assessment Stakeholders.
2. Click New. On the Assessment Stakeholders form, fill in these fields:
   - Category user: Select a category user.
   - Assessable record: Select an assessable record.
3. Click Submit.
   The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

**Note:** Do not create stakeholders from category users and assessable records of different metric types.

**Associate multiple category users to one assessable record**

You can create many stakeholders for a single assessable record from the Assessable Record form.

Role required: assessment_admin or admin

You can also edit or delete stakeholders from the form.

1. Navigate to Assessments Assessable Records.
2. Open a record from the list.
3. In the Category users related list, click Edit.
   These category users are the stakeholders for this assessable record.
4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders. The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

Delete a stakeholder for one assessable record
You can delete stakeholders for one assessable record.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open an assessable record.
In the Category Users related list, select the check box for each stakeholder you want to delete.
3. Select Delete in the Actions choice list.
4. Click OK to confirm the action.
   The system deletes the stakeholders.

Generate an on-demand assessment

Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Role required: assessment_admin or admin

Select the assessable records to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured stakeholders are not used for on-demand assessments.

1. Create a metric type and set the Schedule type to On demand to allow for testing of your assessment configuration.
2. Generate the assessable records for the metric type you created.
3. Create the metric categories required to evaluate the assessable records selected.
4. Create one or more assessment questions, or metrics, for each category.
5. Publish the assessment.
6. Perform an on-demand assessment to test your categories and metrics.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

On-demand assessments

On-demand assessments can be generated for metric types with the Schedule type field set to On demand.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or multiple assessable records.

Generate an on-demand assessment for one assessable record

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open an assessable record associated to a metric type that has the On demand schedule type.
3. On the Assessable Record form, click Assign Assessment.
The Select Assessor dialog box appears.
4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

*Generate an on-demand assessment for multiple assessable records*

When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Role required: assessment_admin or admin

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

1. Navigate to Assessments Metric Definition Types.
2. Open a metric type that has the On demand schedule type.
3. On the Assessment Metric Type form, click Assign Assessment.

   The Select Assessor dialog box appears.
4. Select a user from the Recent Assessors list or select a different user.
5. Click OK.

The system generates an assessment instance assigned to the selected user.

*Generate an assessment with the on-demand API*

The Assign Assessment buttons call an API to generate on-demand assessments.

Role required: assessment_admin or admin

1. To generate an assessment, call the from any script in the system, such as a business rule or client script.
2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.
Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Role required: assessment_admin or admin

1. Open the metric type you created for the on-demand assessment and set the Schedule type to Scheduled.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually. This procedure must be done by a system administrator.
6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Schedule types

You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Set an assessment generation schedule

You can set assessment generation schedules. You must set a schedule for each metric type individually.

Role required: assessment_admin or admin

1. Navigate to Assessments Metric Definition Types.
2. Open the appropriate metric type record.
3. Click the reference icon next to the Scheduled job field to open the Schedule Item record.
4. Locate the Trigger type field and set a recurring schedule for the scheduled job.

For example, if you want to generate assessment components each month, select the Interval or Repeat trigger type and specify a Repeat value of 30 days. Alternatively, select Day in Month and specify a Run time and Run day of month.

The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type

Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Role required: assessment_admin or admin

The State field on the Assessment Metric Type form indicates whether the type is published. The default state is Draft, which disables the system from generating assessments.

1. Navigate to Assessments Metric Definition Types.
2. Open a metric type record, and click Publish.
   The Publish button is available only if the state is Draft and there is at least one metric associated with
   the type.

   **Note:** A metric type cannot be moved back to the Draft state after it has been published.

**Scheduled assessments**
The system generates a unique scheduled job for each metric type with the Schedule type field set to
Scheduled.

The system generates a unique scheduled job for each metric type with the Schedule type field set to
Scheduled. Each scheduled job generates assessment components for the related metric type. By default,
the scheduled job runs when an administrator executes it manually, but administrators can set a schedule
to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and
published. The metric type must also be associated to at least one metric category. That metric category
must be associated to one or more of each of the following items:

- Assessable record
- Stakeholder associated to one of the assessable records
- Metric

Generate a scheduled assessment manually
Administrators can generate scheduled assessments manually.

Role required: assessment_admin or admin

Use this option, for example, if you have set a schedule but want to generate assessments before the next
scheduled run date.

1. Navigate to Assessments Metric DefinitionTypes.
2. Open the appropriate metric type record.
3. Click Generate Assessments to trigger the scheduled job immediately.

   **Note:** Be careful to click Generate Assessments, not Generate Assessable Records.

Generate a vendor type assessment manually
The Vendor Performance feature provides a direct method of generating assessments for the Vendor
metric type.

Role required: admin

1. Navigate to Vendor Performance Admin Generate Assessments.
2. Click Generate Assessments to execute the scheduled job for the Vendor type.

**Clean up assessment data**
The assessment process generates a considerable amount of data, some of which is not useful after a
short time.

Role required: assessment_admin or admin

The assessment process generates a considerable amount of data, some of which is not useful after a
short time. Assessments include a scheduled job called Remove Old Assessment Data that is available to
administrators only. The scheduled job removes these items if they are more than a year old:

- Assessment instance questions
- Assessment instances
**Metric results**

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

1. Navigate to System Scheduler Scheduled Jobs Scheduled Jobs.
2. Open the Remove Old Assessment Data record.
3. On the Schedule Item form, set the Trigger type field to run the scheduled job on a recurring schedule.
   - It is recommended to set the scheduled job to run on a weekly or monthly basis.
4. Click Execute Now to run the scheduled job.

**Assessment instances**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in *Scheduled assessments* and *On-demand assessments*, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

**Example:**

Recall that there can be multiple stakeholder records associated with one user record. Minh Leclaire is a stakeholder for these items related to the Vendor metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance. Minh must evaluate Amazon, Acme, and Cisco by answering questions from the categories for which she is a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh's questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment for a specific assessable record, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment for a metric type, the assessment instance contains questions about all that metric type's assessable records and their associated categories.

**View an assessment instance**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

Role required: none

1. Navigate to Assessments Assessments Assessment Instances.
2. Click an assessment instance number to open the record.
3. View the record, which displays the following information.
Table 980: Assessment Instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type Assessment duration field. The system generates email notifications related to the due date.</td>
</tr>
<tr>
<td>State</td>
<td>State of the assessment. The possible states are Ready to take, In progress, Complete, and Canceled.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
<tr>
<td>Signature result</td>
<td>Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User [sys_user] table or checked, indicating that the recipient acknowledged reading the assertion by selecting a check box.</td>
</tr>
</tbody>
</table>

4. Click Take assessment to open the questionnaire.
   This button is available if all the following conditions are true for the assessment instance:
   - It is Assigned to you.
   - The State is Ready to take or In progress.
   - The associated metric type is active.

Configure trigger conditions for an assessment

Trigger conditions specify when to send a particular assessment and who to send the assessment to.

Role required: assessment_admin or admin

1. Navigate to Assessments Admin Trigger Conditions.
2. Complete the fields as described in the table:
### Table 981: Trigger Condition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>[Required] Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the On demand schedule type.</td>
</tr>
<tr>
<td>Table</td>
<td>[Required] Table to run the trigger condition on. You can select only tables in the current application scope. The table must have a connection to the assessable records for the selected Assessment. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the Incident [incident] table. After you select a table, ensure there is at least one option for the Assessable Record Field. If there is not, select a different table.</td>
</tr>
<tr>
<td>User field</td>
<td>[Required] Field that stores the users you want to send the assessment. You can select any field, on the selected Table or on a related table, that references the User [sys_user] table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the Probability (%) field.</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the Trigger randomly check box is selected.</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>[Required] Field on the selected Table that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected Table are available to select. If there are no Assessable Record Field options available, you must select a different Table. If the selected Assessment evaluates records on the Company [core_company] table and the selected Table is Incident, the only Assessable Record Field options are fields on the Incident table that reference the Company table. For example, Company or, if vendor ticketing is enabled, Vendor. If you select Vendor, the trigger condition sends an assessment about the Vendor for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record.</td>
</tr>
<tr>
<td>Note</td>
<td>This field is not available if the selected Assessment is a metric type used for surveys. See Survey trigger conditions on page 2116.</td>
</tr>
<tr>
<td>Related Field 1 – Related Field 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected Table. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select Caller and Vendor as related fields. That stores the caller and vendor associated with the incident as Related record 1 and Related record 2 in the assessment instance record. To view these fields, configure the Assessment Instance form.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>[Required] Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>

**Assessment trigger conditions**

A trigger condition tells the system who to send a designated assessment to and when, based on specific conditions.
With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

<table>
<thead>

</tr>
<tr>
<td>Related Field 1</td>
</tr>
<tr>
<td>Related Field 2</td>
</tr>
<tr>
<td>Condition</td>
</tr>
</tbody>
</table>

**Trigger condition example**

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto’s issue and sets the Vendor field to Microsoft. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- Related record 1: User: Modesto Scroggie
- Related record 2: Company: Microsoft

**Note:** Even though the trigger condition is set to be triggered every time the conditions are met, the Repeat Interval setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.

**Enable manager notifications**

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

Role required: assessment_admin or admin
This notification sends emails to assessors’ managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

1. Navigate to Assessments Metric Definition Types.
2. Open a metric type.
3. Select the Notify if overdue check box.

To disable manager notifications, clear the check box.

4. Save the record.

**Note:** The assessor’s user record must have a manager specified in the Manager field to use this notification. You might need to configure the form to use this field.

**Assessment notifications**

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

- **Notify assessment user:** This message notifies you of an assigned assessment and includes the *type*, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

  **Note:** If a user has a pending assessment, then the system will not generate another instance of the same assessment.

- **Remind assessment user:** This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.

- **Notify manager assessment is overdue:** If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

  **Note:** By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the Work in progress or Ready to take states.

**Assessment notification workflow**

The system sends assessment notifications according to the Notify assessment user workflow. Users with the workflow_admin, workflow_creator, or workflow_publisher roles can view workflows.

1. To open the graphical workflow editor, navigate to Workflow Workflow Editor.
2. In the activity menu, click the link to choose an existing workflow.
3. Select Notify assessment user from the Workflow Versions list.

The workflow appears.

Figure 458: Workflow Window
Figure 459: Notify Assessment User Workflow

View a metric result

Metric results contain values that represent an evaluated record's performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Role required: assessment_admin or admin

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user's responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

1. Navigate to Assessments Results Metric Results.
2. Click the reference icon (🔗) to open the metric result record.
3. View the Metric Result form. All fields on the form except Updated and String value are read-only.

**Table 983: Metric Result form fields**

<table>
<thead>
<tr>

<tr>
<td>Assigned to</td>
<td>User who completed the assessment questionnaire. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Instance</td>
<td>Assessment instance completed by the Assigned to user. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Unscaled value from a user response or script, depending on the method:</td>
</tr>
<tr>
<td></td>
<td>• Assessment: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:</td>
</tr>
<tr>
<td></td>
<td>• Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td></td>
<td>• Script: Value the script placed in the actual_result variable.</td>
</tr>
<tr>
<td></td>
<td>This field is hidden and left blank when the data type is Duration.</td>
</tr>
<tr>
<td>Duration value</td>
<td>Specific kind of actual value that is only applicable if the data type is Duration. The duration value is the value obtained by the script query from the actual_result parameter, such as the average duration of outages for a vendor.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Scaled value| Appropriate value from the scaled_result variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where actual_result is the number of CIs, and scaled_result is a representation of the quantity of CIs:  
if (actual_result < 1)  
scaled_result = 0;  
else if (actual_result < 1000)  
scaled_result = 1;  
else if (actual_result < 10000)  
scaled_result = 2;  
else if (actual_result < 25000)  
scaled_result = 3;  
else if (actual_result < 100000)  
scaled_result = 4;  
else  
scaled_result = 5;  
If the script detects 315 CIs for the vendor, the Actual value is 315 and the Scaled value is 1 for this metric result. |
| Normalized value | Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric.                                                                                      |
| String value  | Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the metric data type is Percentage. The string value is N/A for unanswered questions of certain data types. For the Attachment data type, the names of the attached files are displayed as comma-separated values. |

**Assessment results**

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.

The system calculates *metric results* first, normalizes the scores, and then calculates *category results*. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.
**Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in scorecards and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

**Excluded Responses**

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the Not Applicable answer option on a questionnaire.
- The user does not answer the question and the data type is not Checkbox.
- The question data type is one of the following: Date, Date/Time, or String.
- The metric result Actual value, Scaled value, and Normalized value fields are set to -1.

**Metric Attachments**

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the String value field on the Metric Result form.

**Note:** You cannot add or remove attachments from a metric result.

**Assessments overview module**

The assessment overview module is a type of homepage that displays various assessment reports, such as results by category and assessments by state.

**Prerequisites**

You can view the overview page and refresh, add, delete, and rearrange report widgets.

Role required: assessment_admin
To use the Assessments Overview module, navigate to Assessments Overview and click elements within the reports to obtain more information.

The available reports are:

**Table 984: Assessments overview module reports descriptions**

<table>

</tr>
</tbody>
</table>

**Assessment results calculation**

For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

**View a bubble chart for assessments**

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Role required: assessment_admin or admin

1. Navigate to Assessments Admin Bubble Charts.
2. Click a Name to open the bubble chart record.
3. Under Related Links, click View Bubble Chart.
Note: Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See Project Portfolio Suite for more information.

Bubble charts for assessments
A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

Create a bubble chart
Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to Assessments Admin Bubble Charts and create a record (see table for field descriptions).

Note: For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.
Figure 461: Bubble Chart form

<tr>
<td><strong>Default</strong></td>
<td>Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.</td>
</tr>
</tbody>
</table>

**Bubble chart components**

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

The bubble chart page has these components:

- **Bubble Chart**
  - X- and Y-axes: Each axis represents a metric category.
  - Bubbles: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

- **Source record list**: List of all records defined by the Table and Condition fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are associated with the assessable records for each of the listed source records.

Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents.

The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

Figure 463: Bubble chart score summary

View an assessment scorecard

You can open and print assessment scorecards, and export a scorecard as an image. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Role required: assessment_admin or admin

Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a Related Link on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors. For more information about vendor performance, see Project Portfolio Suite.

1. Navigate to Assessments Assessable Records.
2. Open a record.
4. Complete the following steps to export the scorecard as an image.
   a) Click the menu icon and select Save as PNG or Save as JPEG as the download format.
   b) When the export is complete, select Download to save the scorecard image to a storage location.
Create a link to a scorecard
Users with the admin role can create UI actions that allow users to view scorecards from tables.

Role required: assessment_admin or admin

1. Generate *assessable records* you want to evaluate.
   For example, you might create a metric type called Project to assess project management records.
2. Navigate to System Definition UI Actions.
3. Open the View Scorecard record.
4. Right-click the header bar and select Insert and Stay from the context menu to create a duplicate record.
5. Change the Table name to the table on which you want the UI action to appear.
   For example, you might select Project [pm_project].
6. Do not edit the Action name field or the Condition script.

7. Save the record.

8. Navigate to the table on which you created the UI action and open an assessable record.
   a) In this example, navigate to Project Projects All.
   b) Open any record in the list.
   c) Click View Scorecard under Related Links to open the scorecard for that assessable record.

The scorecard appears with the title in the form of <table display name> Scorecard. For example, a scorecard for an assessable record in the Project [pm_project] table is named Project Scorecard.

   **Note:** Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.

9. Insert a new View Scorecard UI action record for each table where you want the related link to appear.

**Averages**

The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).
Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the Filter field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red**: Ratings are below average in this category. The Diff value displays a negative number.
- **Green**: Ratings are above average in this category. The Diff value displays a positive number.
- **White**: Ratings are average in this category. The Diff value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

![Group scorecard with ratings filter](image)

**Figure 464: Group scorecard with ratings filter**

**Categories**

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

- All History
- Last 3 Months
- Last 12 Months
Figure 465: Scorecard categories

Category metrics
The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.

Select a metric category from the choice list to display the chart.
Figure 466: Scorecard category metrics

Head to head compare
The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

Head to head compare
The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.
Overall Rating

The Overall Rating is calculated as:

\[
\frac{\text{sum of normalized values in category result}}{\text{number of assessment groups}}
\]

In the following example, the calculation is

\[
\frac{2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7}{2} = 8.15
\]
<table>

</tr>
</tbody>
</table>

Figure 468: Normalized values
Figure 469: Overall Rating on the Group Scorecard

**History**

The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current assessment against the previous assessment.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Figure 470: Scorecard history - 3 years

- 4 Quarters: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Figure 471: Scorecard history - 4 quarters

*Live feed*

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.
To configure a live feed view, an assessment administrator selects the Live feed check box on the Assessable Record form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:

- **My Feed**: Displays the user’s My Feed preferences.
- **Company**: Displays the user’s company feed.
- **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group’s conversations.
- **Tags**: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.
Figure 472: Scorecard Live Feed group
Ratings
The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

Figure 473: Vendor scorecard trend chart

Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
• Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
• Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

• Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  • Checkbox
  • Choice
  • Duration
  • Likert Scale
  • Numeric Scale
  • Template
  • Yes/No

• A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Set up and administer quizzes
Set up and administer quizzes.
Role required: assessment_admin or admin

1. Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.
Review the results from the submitted quizzes in reports and scorecards.

Data types for quizzes

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Question with a check box or a Yes/No list for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of predefined options. For more information, see the definition for Choices Create quiz questions on page 1970.</td>
</tr>
</tbody>
</table>
### Data type Description

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Time and date field.</td>
</tr>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Predefined Likert scale. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>Numeric scale</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>String</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question.</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
</tr>
</tbody>
</table>

**Quiz roles**

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

#### Table 987: Quiz roles

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator [assessment_admin]</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td>Administrator [admin]</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

**Note:** The itil_admin role and the survey_admin role contain the assessment_admin role.

**Quiz application: Important terms**

The quiz application involves several terms.

#### Table 988: Terms used in quiz application

| Quizzes  | A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient. |

© 2018 ServiceNow. All rights reserved.
### Categories
A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.

### Questions
A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.

### Category user
A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.

### Templates
A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

---

**Activate the quiz designer**
Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.

   If the plugin depends on other plugins, these plugins are listed along with their activation status.

   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files are not installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.

   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.

   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

---

**Quiz Overview module**
The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin
Users with the *assessment_admin* role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to Quizzes Overview.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>

<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
</tbody>
</table>

*Quiz designer*

The quiz designer provides a single interface that users with the *assessment_admin* role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the *assessment engine* to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see *Create quizzes with forms*.

*Tools on the Quiz Designer*

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes Quiz Designer.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

*Controls*

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
### Table 989: Question controls

<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
<td></td>
</tr>
</tbody>
</table>

Header Bar

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- Design: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- Configuration: Create introductions and end notes for quizzes, and select a signature.
- Availability: Select the recipients for each category in the quiz.

Point to the menu icon ( ) in the in the upper right of the quiz designer to select the following options:

- Save: Saves the current quiz.
- Preview: Displays a preview of the quiz as it appears to the recipients.
- Publish: Distributes the quiz to the selected recipients.
- Save and Publish: Saves and distributes the quiz in one step.
- New Quiz: Opens a fresh canvas for a new quiz.
- Load Quiz: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.
Design Canvas

New quizzes open in the Design view. The quiz Name field appears above first category in the canvas. A blank question field appears in the category container.

*Create a quiz*

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes Quiz Designer or Quizzes Quizzes and click Quiz Designer in the list header.

2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category

3. To configure the category, click the gear icon in its title bar.

   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.

4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin
The data type that you select for each question determines how it can be answered by quiz recipients.
You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

Table 990: Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red Introduction_to_Fields#Field_Status_Indicator&quot; --&gt; field status indicator. This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are: • Single line: Single line text field 40 characters in length that allows strings of any length. • String line wide: Full page width text field that allows a single line entry of any length. • Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question Date type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Note: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

**Dependency**

| Displayed when | Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A. |

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

   Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.
8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

Configure a quiz
You can configure an entire quiz.
Role required: assessment_admin or admin
The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

Table 991: Quiz designer configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

**Table 992: Select recipients**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.

2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Create quizzes with forms
As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.
All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

• Create the quiz.
• Set up the categories.
• Create the questions for the quiz.
• Create the answers for the questions.
• Distribute the quizzes to recipients.

Note: The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.

Categories have **weighting values** that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

You can create a new category or edit an existing one from the Metric Categories related list of a quiz record.
Select a user for a category

Category users are the recipients of the questions for each category.

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

To select users for a category, select the Users related list in a category record, and click Edit.
Create questions
A category can have multiple questions associated with it.

Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management Questions and create a new record (see table).

**Warning:** When you create a Choice or Likert Scale question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question.</td>
</tr>
<tr>
<td>Category</td>
<td>[Required] Category the question belongs to. The system populates this category if you create a new question from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the Depends on field is set or if another metric depends on this metric.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Setting that determines how to use the question.</td>
</tr>
<tr>
<td></td>
<td>• Assessment: Makes the question available on a quiz distributed to users. The Assessment method is compatible with all data types except Duration.</td>
</tr>
<tr>
<td></td>
<td>• Script: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user's knowledge of a topic.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you select a Data type that is incompatible with the selected Method, the system automatically changes the Method to the correct value.</td>
</tr>
<tr>
<td>Weight</td>
<td>Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For weighting suggestions, see <a href="#">Weight categories and metrics</a> on page 1902. This field is available and required unless the Data type is Date, Date/Time, or String. These data types are not included in results calculations.</td>
</tr>
<tr>
<td>Order</td>
<td>[Required] Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category's section. By default, the order is 100. <strong>Note:</strong> It does not matter which order value you use for metrics with the Script method, because they do not appear on questionnaires.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is available only if the Method is Assessment, the Depends on field is empty, and the Data type is not Checkbox.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as a possible answer for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results.</td>
</tr>
<tr>
<td>Question</td>
<td>The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Depends on</td>
<td>An existing question that this question is dependent on. You can select Checkbox, Choice, Likert Scale, Template, and Yes/No questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Question Type</td>
<td></td>
</tr>
<tr>
<td>Data type</td>
<td>[Required] Format of the expected response data. See the table of data types for details.</td>
</tr>
<tr>
<td>Note:</td>
<td>You cannot change the data type if another question depends on this question</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the Data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td>Note:</td>
<td>Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select Low if lesser numerical values are better. Select High if greater numerical values are better. The default value is High. This field is available and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations. When the Scored check box is selected, the scale value is set to High and the field is hidden.</td>
</tr>
<tr>
<td>Note:</td>
<td>For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data types for assessments on page 1876.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value that can be used as an answer option. This field is available and required only if Data type is Number, Duration, or Percentage.</td>
</tr>

<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| String option       | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:  
  • Single line: Single line text field 40 characters in length that allows strings of any length.  
  • String line wide: Full page width text field that allows a single line entry of any length.  
  • Multiline: Full page width multiline text field that allows word wrap and returns. |
| Scored              | Check box for using answers in scoring the category results and showing them in the quiz results. Scored questions are available for these data types:  
  • Choice  
  • Likert Scale  
  • Template  
  • Checkbox  
  • Yes/No  

Selecting this check box hides the Scale definition field and sets the value in that field to High. |
| Correct answer      | [Required] Desired answer to a scored question. This field is available when the Scored check box is selected.                                                                                             |
| Template            | Answer template to use with this question. This field is available when the Data type is Template.                                                                                                         |
| Related List        |                                                                                                                                                                                                          |
| Assessment Metric Definitions | List of options for this question. This related list is available only if the Data type is Choice or Likert Scale.                                                                                                                                 |

Create answers for questions

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question What type of men's trousers are not permitted by company policy? might have these three answers configured as metric definitions: Slacks, Jeans, and Casual cotton.

To create an answer option, open the question record you want to edit and click New in the Assessment Metric Definitions related list. Be sure to give each option a Value. The system uses this number to establish the order in which the answers appear in the quiz.
When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz. You can send the quiz to all the category users configured for the quiz or to a single category user.

1. Navigate to Quiz Management Quizzes.
2. Open the quiz record, and click Publish. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See Modifying Published Quizzes to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
   - Assign Quiz: Send the quiz to one category user.
   - Send Quizzes: Send the quiz to all of its category users.

**Note:** These buttons are hidden if there are no category users defined for the quiz.
Modify a published quiz
You can add questions, make changes to existing questions, and delete questions in a published quiz.

You can edit a quiz even after it has been distributed, with these results:

- Added questions are available only on quizzes that are distributed after this change.
- Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed quizzes in users' queues.

Edit a quiz

You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz:

Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Configure a scored question

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box. This check box is not available if the question's data type is not supported for scoring.
6. Select the Correct answer for the question.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question
You can configure template questions when designing quizzes.
Role required: assessment_admin or admin
1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

Question entry fields appear for that template.
4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

Enable a quiz retake
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

1. Navigate to Assessments Metric Definition Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.
View a quiz result
You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Navigate to Quizzes Quiz Results.

Quiz reports
Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

View a quiz scorecard
You can view scorecards for a quiz record.
Role required: assessment_admin or admin
For detailed information about scorecards, see Quiz scorecards.

1. Navigate to Quizzes Quizzes.
2. Open a quiz record.
   The scorecard link is hidden if there are no quiz results to report.
4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:
   • Category Results
   • Question Results
   • Average Ratings
   • History

Quiz scorecards
The Quizzes application prepares printable scorecards.
A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.
The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results
The Category Results view is a stacked bar chart of responses to all questions in a category.
Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 475: Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

![Pie chart example]

Figure 476: Quiz category result details

**Question results**

The Question Results view shows the results for all questions in a quiz.

Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

**Pie chart**

The pie chart shows question results for these *data types*:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 477: Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports Administration Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Figure 478: Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

- 3 Years: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Figure 481: Scorecard history - 3 years

- 4 Quarters: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Figure 482: Scorecard history - 4 quarters

View a category result
Category results contain values that represent an evaluated record's performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based on category and metric weights and from metric result values for the same category.

Role required: assessment_admin or admin

**Note:** The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

1. Navigate to Assessments Results Category Results.
2. Click the reference icon (ęb) next to an assessment group number to open the category result record.
3. View the Assessment Category Result form. All fields on the form are read-only.

Table 994: Assessment Category Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rating | Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:  

\[(\text{Sum of all normalized values that share a particular assessment group, category, and assessable record}) / (\text{Number of assessment instances for the assessment group})\]  

For example: In the Assessment Category Results table example, the assessment group ASG0000801 with category Politeness from group NY DB (the assessable record) has a Rating value 8.86.  

On the associated Metric Results table, you can see that there are 4 instances of this group: AINST0000801, AINST0000802, AINST0000803, and AINST0000804.  

The system calculated the rating using  

\[(5.14+5.14+1.43+5.71+5.14+4.29+4.29+4.29) / 4 = 8.86\] |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the category result is associated. The category result Rating and Normalized value are calculated from metric results in this assessment group only.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Calculated value that measures the Rating relative to the weights of categories used to assess the record evaluated. The normalized value is calculated as follows: Normalized value = Rating x (Associated category weight / Sum of weights of all categories the source record has category results for in this assessment group) Example: A source record has four associated category results in assessment group ASG0000907, one for each of these categories: • Importance Rating (weight = 10) • Product Reliability (weight = 9) • Company Alignment (weight = 9) • Compliance Score (weight = 9) If this source record’s category result for Product Reliability has a Rating of 7.81, the normalized value calculation is: 7.81 x [9 / (10+9+9+9)] = 1.9</td>
</tr>
<tr>
<td>Weight</td>
<td>Weight of the associated category. You may need to configure the form to see this field.</td>
</tr>
<tr>
<td>Source</td>
<td>Record evaluated as the assessment subject. You may need to configure the form to see this field.</td>
</tr>
</tbody>
</table>

### Decision matrixes

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes. Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.

**Note:** Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the Vendor Performance application.

### Decision matrix components

The decision matrix page has these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Options</td>
<td></td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Filter</strong></td>
<td>Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the Filter field and Filter condition field settings for each type. The maximum values in the filter are controlled by the Maximum number of items to show for a decision matrix field filter property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
<tr>
<td><strong>Scale</strong></td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>
</tr>
<tr>
<td><strong>Decision matrix</strong></td>
<td></td>
</tr>
<tr>
<td><strong>X- and Y-axes</strong></td>
<td>Each axis represents one or more metric categories. If multiple categories are used for an axis, their respective <em>weights</em> determine the positioning of the plotted items.</td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plotted items</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record.</td>
</tr>
</tbody>
</table>
### Plotted item rating summaries

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record's average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

![Rating summary](image)

**Figure 483: Decision matrix rating summary**

*Create a decision matrix*

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Role required: assessment_admin or admin

1. Navigate to Assessments Admin Decision Matrixes.
2. Click New and then select the metric Type to plot results for.
3. Right-click the form header and select Save.
   The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.
   The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.

   ![Decision matrix axes](image)

   **Figure 484: Decision matrix axes**

5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.
### Decision Matrix

</tbody>
</table>
Field | Description
--- | ---
Highlight item color | Color of highlighted plotted items. When you view a decision matrix from an assessable record's scorecard, the assessable record plotted item appears in the highlight color. Specify a highlight color that is different than the Plotted item color.

Top right label | Label text for the top right quadrant.
Top right color | Fill color for the top right quadrant.
Bottom right label | Label text for the bottom right quadrant.
Bottom right color | Fill color for the bottom right quadrant.
Related Lists
X Axis | Lists categories that define the X-axis of the decision matrix.
Y Axis | Lists categories that define the Y-axis of the decision matrix.

Take an assessment

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click Take Survey when you are ready.

Role required: none

Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the Modify Assessment button on the card.

1. Navigate to Self-Service My Assessments & Surveys.
Note: Users with the assessment_admin role can display other users' assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

Note: Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click Take Assessment to open the questionnaire. Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon (−) or expand icon (+) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.

4. Answer each question to the best of your ability. Point to a question for more information.
If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.

6. Save or submit the assessment.

   • Save: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   • Submit: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.

If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.
8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click Modify Assessment.

Assessment questionnaires

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.

No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.
Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks on page 1899.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Define a new smartphone table title for more information.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

• To delete a single record, open the record and click Delete.
• To delete multiple records, use the Assessable Records list.

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Read-Only] Assessable record name based on the <em>display value</em> of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>[Read-Only] Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-Only] Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrices of the same metric type. Decision matrices are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrices if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td>Live feed group</td>
<td>[Read-Only] Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

**Related Links**

- **View Scorecard**: Opens the scorecard for the assessable record.
- **Related Lists**

**Category**

All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click Edit to add or remove category associations. Note that it is often more efficient to *associate assessable records* to categories using the Metric Category form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click Edit to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the Scheduled schedule type.</td>
</tr>
</tbody>
</table>

## Approvals

Approvals can be defined for all tasks and allow users or groups to be associated with a task, for either approving or rejecting that task. Approvals are defined by navigating to System Policy Approvals.

The following information defines an approval:

**Table 997: Approval definition information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Not Yet Requested (This state indicates that you are not yet asking your approvers to approve this request. Until you set the status to Requested, they do not receive email notifications about the request.)</td>
</tr>
<tr>
<td></td>
<td>• Requested</td>
</tr>
<tr>
<td></td>
<td>• Approved</td>
</tr>
<tr>
<td></td>
<td>• Rejected</td>
</tr>
<tr>
<td>Approving</td>
<td>A document_id reference field to the record being approved, on any table.</td>
</tr>
<tr>
<td>Comments</td>
<td>A journal field for storing comments regarding the approval.</td>
</tr>
<tr>
<td>Approval Summarizer</td>
<td>A formatter that displays key fields relevant to the approval from the referenced document. This summarizer does not display if there is no record referenced.</td>
</tr>
</tbody>
</table>

## Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.
# Approval engine options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to System Policy Approvals.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table. <strong>Caution:</strong> Not turning off the approval engines might have a performance or behavioral impact on your instance.</td>
</tr>
</tbody>
</table>

## Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

1. Navigate to System Properties Approval Engines.

   The following page appears with the Approval Engine option for each Task table in the system. If the Approval Engine option is grayed out and shows Turn engines off, read the Notes in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
2. Select the **approval engine option** for each Task table from the choice list.
3. Click Save.

These preferences are saved as system properties that are named `glide.approval_engine.<table_name>`.

</tr>
</tbody>
</table>
Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization's budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gating approvals</td>
<td>Must occur before a request can be initiated. For example, allow a manager to reject an employee's request for a company car.</td>
</tr>
<tr>
<td>Process approvals</td>
<td>Take place within an execution plan process that has been initiated. For example, allow the security group to reject a request for access to SSN even though the employee’s manager approved it.</td>
</tr>
</tbody>
</table>

Note: To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules

Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to Requested.

Prerequisites

Role required: admin

Approval rules have two new fields:

- Run rule before: If true, the approval rule runs before the record is inserted/updated.
- Set State: If this rule applies, then the approval state of the task record is automatically set to this value.

Note: The Set State field only behaves as expected if the Run rule before check box is enabled.

- In the example below, this rule automatically sets the state of the task to Approved thus auto-approving the task.
Gating approvals

A gating approval acts as a gate through which a request must pass before it can start.

Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

Table 1000: Gating approvals

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval rules</td>
<td>Can apply to the service catalog as well as any other task table.</td>
</tr>
<tr>
<td>Item-based approvals</td>
<td>Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.</td>
</tr>
</tbody>
</table>

Set up a gating approval via an approval rule
You can set up a gating approval via an approval rule.

Role required: admin

1. From the left navigation pane, select System Policy Approval Rules.
2. Click New.
3. Set these to auto start the approval process.
Table 1001: Approval rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Task table to which this rule applies. For most service catalog approvals, select Request.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td>Run Rule Before</td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td>User</td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td>Group</td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td>Set State</td>
<td>Value of the approval field on the task in after this rule runs. Usually, select Requested.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which the rule applies.</td>
</tr>
<tr>
<td>Script</td>
<td>An optional server script to programmatically specify who the approver should be. For example, for the one-line script current.requested_for.manager, ServiceNow checks the requested_for reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

Notes and limitations:

1. You can have as many rules as you want on a given table. If more than one rule applies, you get more than one approver.

2. You cannot get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system only creates one approval entry for him.

3. By default all requests start out in a Not yet requested approval state. Approval notifications do not go out until the approval state of the request is set to Requested. You can do that manually, or you can do it in script, but the easiest way to do it is to use the Set State field to automatically set the request to Requested.

Set up a gating approval based on the item being ordered

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. You can, for example, specify that David Loo is required to approve all Blackberrys.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- Approved By Group: A list of groups that have to approve requests for this item
• Approved By: A list of users who have to approve requests for this item

![Approved By Group](image)

- Approval group
  - Hardware
  - Actions on selected rows...

![Approved By](image)

- Approver
  - David Loo
  - Actions on selected rows...

**Figure 486: Approve list**

In the example above, all members of the Hardware group and David Loo must approve this request.

Notes and limitations:

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he only gets one approval request.

2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

**Process approvals**

Once a request has passed its gating approvals, any relevant execution plans are initiated. Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select Service Catalog Execution Plans, and then select the plan to which to add an approval step. Then click the New Approval button.

![Delivery Plan](image)

- Name: Blackberry Delivery Plan
- Short description: Delivery plan for outfitting an employee with a Blackberry and

**To add an Approval**

![Delivery Plan Tasks](image)

- Name
- Short description

**Figure 487: Add approval**
The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right-click the title bar and select Save. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete

In the example above, Fred Luddy must approve this security approval task.

**Figure 488: Approval task**

In the example above, Fred Luddy must approve this security approval task.
Note: When an in-process approval is rejected, that particular line item is canceled as well, but the request itself is not necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

Approve with a process guide

Process guides work similarly to approval rules in that their execution is controlled via a condition. The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people

You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:

1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to an execution task.

1. From the left navigation pane, select System Policy Process Guides.
2. Create a new guide.
3. Set the table to Catalog task.
4. Fill in a condition under which this guide should attach.

Example #1: Apply to all "Capacity Review" tasks.

Example #2: Apply to all "Capacity Review" tasks where the requester is in Atlanta.

Process guide tips and tricks:

1. All catalog tasks are generated when a request is first submitted, but tasks which are not active yet have a state of "pending." So if you do not want to send out approval requests until a task has started, add "state=open" as part of your condition.
2. There is a "Default" process guide in the system for catalog tasks with a sequence number of 10,000. It behaves the same way the old, pre-process guide code did regarding approvals. Approvals are based on the execution of task-related lists.
Schematic of a hypothetical approval process

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.

Figure 489: Approval process

Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form. The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
Istanbul ServiceNow Now Platform Capabilities

</tr>
</tbody>
</table>
The Deny button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to Accept the item.

**Note:** When the overall request is approved, you must ensure this Deny button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the Accept button on requested items should only appear before the overall request is approved or rejected.

### Summarizers

Approval summarizers are stored in the Macro [sys_ui_macro] table.

From the left navigation pane, select System UI UI Macros. Summarizers use a naming convention of approval_summarizer_ + '<table_name>' (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

**Change a summarizer**

You can modify existing approval summaries to include additional information.

These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

1. Navigate to System UI UI Macros.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click Update.

Create a new custom summarizer
After you add a new table that has approvals to an instance, you can add a custom summarizer by creating a UI macro.
approval_summarizer can only be used on approval forms in the global scope.
1. Navigate to System UI > UI Macros
2. Click New.
3. Give the macro a name that follows the summarizer naming convention:
   approval_summarizer_<tablename>
4. Complete the rest of the form and click Submit.
5. Add the custom summarizer to the appropriate form.

Approval with e-signature
Approval with e-signature allows users to approve requests by reentering their login credentials.
Approval with e-signature supports the following authentication credentials:
• User name and password matching a user in the local database.
• User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

Activate approval with e-signature
To activate approval with e-signatures, refer to the following topic.
Activate a plugin.

De-activate e-signatures
Use this procedure to de-activate e-signatures.
Although plugins cannot be removed, e-signatures can be disabled.
1. Navigate to System Definition > E-Signature Registry.
2. Set Enabled to False on any tables where e-signatures are no longer required.

Use e-signature approvals
Users can approve requests with an e-signature.
Users can approve requests with an e-signature by:
• Selecting the Approve or Reject option on a list context menu.
• Clicking the Approve or Reject button on a form.
• Changing the State of a request record to Approved in either the list-editor or form.
Selecting any of these options presents the user with an Approver Authentication window, which requests the user's credentials again.

E-signature SAML properties
Configurable properties for e-signature with SAML 2.0 update 1.
### Table 1002: E-Signature SAML Properties form

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AuthnRequest URL for eSignature Authentication</strong></td>
<td>Enter the URL that points to the SAML 2.0 Identity Provider AuthnRequest Consumer for eSignature Authentication. Usually, this URL is the same as the AuthnRequest URL used in general authentication. However, if you intend to use the same AuthnRequest Consumer URL that is used for general SAML 2.0 authentication in your instance.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.idp_authnrequest_url]</td>
<td></td>
</tr>
<tr>
<td><strong>The SAML 2.0 Assertion Consumer URL for eSignature Authentication</strong></td>
<td>Usually, this URL is: <a href="https://YOURINSTANCE.service-now.com/consumer.do">https://YOURINSTANCE.service-now.com/consumer.do</a>. However, if you employ a customized method of handling the SAML authentication for eSignature, you can set up your own consumer URL. For example, if you are using Multi-Provider SSO, you do not need to use this property. Configure the Identity Provider form, add the Assertion Consumer URL for eSignature authentication, field, and set the URL in that field.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.approval_consumer_url]</td>
<td></td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>The SAML 2.0 Assertion Consumer Index for eSignature authentication</td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.assertion_consumer_service_index]</td>
<td></td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Width</td>
<td>When a user approves a request using eSignature, a dialog allows the user to enter their credentials. This setting controls the width of that dialog box.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.popup_dlg_width]</td>
<td></td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Height</td>
<td>When a user approves a request using eSignature, a dialog allows the user to enter their credentials. This setting controls the height of that dialog box.</td>
</tr>
<tr>
<td>[com.snc.integration.saml_esig.popup_dlg_height]</td>
<td></td>
</tr>
</tbody>
</table>

Installed with approval with e-signature

Installing approval with e-signature installs certain properties.

- Module — E-Signature Registry
- UI Action — Approve (on table sysapproval_approver, with no action name)
- UI Action — Approve (on table sysapproval_approver, with no action name)
- UI Action — Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page — form_login_validate_dialog
- UI Page — login_validate_dialog
- UI page: saml2_esignature_login, the reauthentication page that appears when an approver tries to approve a request.
- Properties: see [E-signature SAML properties](#)
- Client Script — Authenticate Approver
- Script Include — User
- Script Include — UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two system Approve UI Actions on the sysapproval_approver table.

Select an approval table

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

1. Navigate to System Definition E-Signature Registry.
2. In Table name, use the choice list to select a specific table.

Table 1003: Table Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table choice list to select the table that requires e-signatures.</td>
</tr>
</tbody>
</table>
Set up an approval from a local database

To set up Approvals with e-signature using credentials from a local database:

1. **Activate the Approval with E-Signature plugin.**
2. Create user records for approval users.

Set up an approval from a SAML 2.0 authentication

Setting up e-signature with SAML 2.0 requires configuration on the identity provider and the instance.

The SAML Identity Provider (IdP) must support and honor the forceAuthn attribute in SAML Assertion Requests. E-signature does not function without this IdP setting.

To set up Approval with e-signature using credentials from a SAML 2.0 authentication:

1. Activate or upgrade to a SAML 2.0 Update 1 integration.
2. Activate the Approval with E-Signature plugin.
3. Enter the e-signature SAML properties.
4. Regenerate the service provider metadata and update it on the IdP.
5. Create user records for approval users.

**Note:** Customers on SAML 2.0 Update 1 no longer have to create custom UI pages for logging out the user or deleting session cookies.

**Note:** If you are a Life Science Customer using E-Signature, you must deactivate the User self-lockout prevention business rule. See [KB0547061](https://kb.service-now.com) for more information.

Set up e-signature approvals

The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:

- Setting up approvals from a local database
- Setting up approvals from a SAML 2.0 authentication

**Note:** ADFS 2.0 does not support reauthentication requests that E-Signature requires.

Approval status

The approval status of a change request is determined by looking at the status of all the approvers.

If any approver has rejected the change, the approval status is Rejected. If all approvers have approved the change, the approval status is Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status is Not Requested, otherwise the status is Requested.

For added flexibility when creating approvals, including the ability to set up an "one of" approval where only one person of a group of approvers is required to approve, consider using Workflows.
Generate an approval using approval rules

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.

In the sample below, a change opened in the category network is assigned to the System Administrator:

![Approval Rules](image)

**Figure 493: Approval Rules**

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested."

Generate approvals using the approvers related list

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the Edit button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to "Not Requested." When the status of the approver is changed to "Requested", the approver is sent an email requesting approval action.

Generate approvals using workflows

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

Several variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow activity generates an approval record, the system populates the Workflow activity field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see Approval and Rollback Activities.

**Note:** Conflicts can arise when both the workflow engine and the approval engine manage the approval process for a table. In general, if there is a workflow that manages the approval process for a table, the approval engine should be turned off for that table.

Multiple approvers

With multiple approvers, all approvers must authorize the request before the status changes to "Approved." Should any approver reject the request, the status is immediately set to "Rejected."
Receive notifications

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.

Approval notifications are sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group are sent an email. By default, the email an approver receives contains a "mailto" link that allows the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request receives an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using System Definition Business Rules and System Policy.

Note for Blackberry users: To see the "mailto" links mentioned above to approve or reject a request (that is 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you are not able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements state:approved or state:rejected within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

Dynamic approval forms

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you are looking at a Change Management approval request, you will see details from the relevant change request. For a Service Catalog approval request, you will get details of the request.
Rollback Oracle Version
Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.

Figure 494: Change request approval example

<table>
<thead>

Figure 495: Service Catalog approval example
Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

**Note:** Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. **Before** business rules: Scripts configured to execute before the database operation with an order less than 1000.
2. **Before** engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)
3. **Before** business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The database operation (insert, update, delete).
5. **After** business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. **After** engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. **After** business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.
Geolocation

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent's position each time that agent updates a task record. When the system updates an agent's location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

Activate geolocation

An administrator can activate the Geolocation plugin.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files are not installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.
4. If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Installed with geolocation

The following components are installed with Geolocation:

Modified by Geolocation

The Geolocation plugin adds a field called Geolocation tracked to the User [sys_user] table. This field allows the system to track individual users by their geographical coordinates.

Business rules installed with geolocation
### Table 1004: Business Rules

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeoLocation Data updated</td>
<td>User [sys_user]</td>
<td>Populates the Latitude and Longitude fields on the Geolocation History [geo_history] table when the Latitude and Longitude fields are updated on the User [sys_user] table.</td>
</tr>
</tbody>
</table>

### Client scripts installed with geolocation

#### Table 1005: Client Scripts

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Geolocation on Task</td>
<td>Task [task]</td>
<td>Populates the Latitude and Longitude fields on a user record with GPS coordinates when that user loads any record on the Task table or a table that extends Task. This occurs only when geolocation tracking is enabled for the user.</td>
</tr>
</tbody>
</table>

### Properties installed with geolocation

Geolocation provides the following configurable properties in Geolocation Administration Geolocation Properties.

The Google Maps plugin provides additional map properties that are used to implement and control specific geolocation features. You must have a private key for Google Maps API for Business to take advantage of the properties listed here.

#### Table 1006: Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.allow.toll.roads</td>
<td>Allow toll roads to be used. Allows the system to use toll roads when auto-routing an agent’s tasks.</td>
</tr>
<tr>
<td></td>
<td>• Type: True/false</td>
</tr>
<tr>
<td></td>
<td>• Default value: True</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.geolocation.default.start.time</td>
<td>Default start time for all agents when no schedule is set. This value sets the start time for a day other than the current day, when no scheduled task exists or is continued from the previous day. This property uses a 24 hour clock.</td>
</tr>
<tr>
<td></td>
<td>• Type: String</td>
</tr>
<tr>
<td></td>
<td>• Default value: 08:00</td>
</tr>
<tr>
<td>glide.geolocation.evening.rush.hours</td>
<td>Evening rush hour span, formatted as 14:30-16:00. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.morning.rush.hours and work.management.rush.travel.buffer properties and uses a 24 hour clock.</td>
</tr>
<tr>
<td></td>
<td>• Type: String</td>
</tr>
<tr>
<td></td>
<td>• Default: 0</td>
</tr>
<tr>
<td>glide.geolocation.history.cleanup</td>
<td>Number of days to keep history data. ServiceNow keeps agent geolocation history records for the number of days specified by this value.</td>
</tr>
<tr>
<td></td>
<td>• Type: Integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 30</td>
</tr>
<tr>
<td>glide.geolocation.morning.rush.hours</td>
<td>Morning rush hour span, formatted as 06:30-08:00. This property uses a 24 hour clock. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.evening.rush.hours and work.management.rush.travel.buffer properties.</td>
</tr>
<tr>
<td></td>
<td>• Type: String</td>
</tr>
<tr>
<td></td>
<td>• Default: 0</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| glide.geolocation.proximity               | Minimum distance an agent must move to be considered in a new location (in meters). This setting establishes a geolocation perimeter that prevents ServiceNow from creating unnecessary history records when an agent has multiple tasks in the same vicinity. An example of this might be when an agent has several tasks in one building. The system assumes that all task activity within the specified radius is part of a single record and does not create additional records when the agent moves from task to task around the building.  
  - Type: Integer  
  - Default value: 500                                                                                           |
| glide.geolocation.proximity.location      | Maximum distance an agent can be from a specific location and still be placed at that location (in meters). This setting defines the maximum distance that an agent can be from a specified location and still be placed at that location by the system.  
  - Type: Integer  
  - Default value: 200                                                                                           |
| glide.geolocation.rush.travel.buffer      | Percentage to add to all rush hour travel times. The system uses this percentage to calculate schedules when auto-routing an agent. Use this property when both morning and evening rush hour times are defined. An example of a valid time buffer percentage is 15.  
  - Type: Integer  
  - Default value: 0                                                                                              |
| glide.geolocation.tracking.frequency      | Sets the length of the recurring interval, in seconds, that the system waits between attempts to update a user’s geographic coordinates. The system updates geographic coordinates only for users who have geolocation tracking enabled. Minimum amount of time between updating the user's location (in seconds). This setting defines how long the system waits before updating an agent's location, regardless of task activity or travel. This prevents ServiceNow from creating unnecessary history records if an agent in one location views a task multiple times.  
  - Type: Integer  
  - Default value: 300                                                                                              |
### Glide Geolocation Travel Buffer

- **glide.geolocation.travel.buffer**
  - **Description**: Percentage to add to all travel times. An example of a valid percentage value is 15.
  - **Type**: Integer
  - **Default value**: 0

### Glide Geolocation Work Spacing

- **glide.geolocation.work.spacing**
  - **Description**: Amount of time (in minutes) to add between the end of a task and the travel start of the next. An example of a valid time value is 10.
  - **Type**: Integer
  - **Default value**: 0

### Geolocation Google Key

Geolocation requires a Google Maps API for Business license to enable the use of Google driving time estimates and to use Google Maps. Applications, such as Work Management, have functionality that requires this license.

If you are using auto-routing or auto-dispatch in Work Management, both the Google Maps API for Business private key and the client ID must be set for precise time estimates. Without these values, driving times for auto-routing and auto-dispatch are not available, and a rough estimate or fixed time is used. Use these properties, found in System Properties Google Maps Google Maps, to enable the geolocation feature.

- **Client ID for Google Maps API for Business**: Google client ID for your organization. This ID is from Google and starts with gme-, such as gme-mycompanyname.
- **Private key for Google Maps API for Business**: Key required to get accurate driving time estimates from Google for some features of Geolocation. An example of an encoded key is: vNIXE0xscrmjlyV-12Nj_BvUPaw=

### Geolocation History

The Geolocation History [geo_history] table contains the history of each tracked user's location over time.

To view geolocation history, navigate to GeolocationGeolocation History. The record list shows time stamped location data for all users configured for geolocation tracking.
The following system properties, located in Geolocation Administration Geolocation Properties, control the data that appears in this table.

- Minimum distance an agent must move to be considered in a new location (in meters): Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.
- Maximum distance an agent can be from a specific location and still be placed at that location (in meters): Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
- Number of days to keep history data: Time period for which the system retains history data.
- Minimum amount of time between updating the user's location (in seconds): Time period the system waits before updating a user's location, regardless of how often the user accesses tasks.

Location tracking

Geolocation adds the Geolocation tracked field to the User form. In the default view of a user record, select the Geolocation tracked check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user's geographic coordinates whenever the user opens, or loads, a record from the Task [task] table or from a table that extends Task. After this initial update, the system continues to update the user's geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to Geolocation Administration Geolocation Properties and change the setting for the property that regulates the update interval for the user's location. The default setting for this property is 300 seconds (5 minutes).

Note: The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the Geolocation tracked check box selected may be prompted by their browsers to share or withhold their location.

State flows

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task [task] table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the State field in an incident changes from Active to Awaiting User Info. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see State flow customization.

Installed with state flows

Several types of components are installed with state flows.

Tables installed with state flows

Tables

State flows adds the following tables.
Table 1008: Tables for state flows

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow [sf_state_flow]</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
<tr>
<td>Work Order Flow [sf_work_order]</td>
<td>Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow [sf_work_task]</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.</td>
</tr>
</tbody>
</table>

Business rules installed with state flows

Business rules

State flows adds the following business rules.

Table 1009: Business rules for state flows

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assert Field Uniqueness in State Flow</td>
<td>State Flow [sf_state_flow]</td>
<td>Ensures that business rules and UI actions are not accidentally copied to new state flows.</td>
</tr>
<tr>
<td>Check Client Script</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds a client script to new records.</td>
</tr>
<tr>
<td>Check Event Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds or deletes event rules, as the event field is updated.</td>
</tr>
<tr>
<td>Check Work Notes Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds or deletes work note rules, as the work notes for a state flow are updated.</td>
</tr>
<tr>
<td>Create Business Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Automatically creates a business rule when automatic conditions or script are present.</td>
</tr>
<tr>
<td>Create script for Field controls</td>
<td>State Flow [sf_state_flow]</td>
<td>Create scripts for field controls, when they are in use.</td>
</tr>
<tr>
<td>Create UI Action</td>
<td>State Flow [sf_state_flow]</td>
<td>Automatically creates a UI action when manual conditions or script are filled in.</td>
</tr>
<tr>
<td>Delete Related Elements</td>
<td>State Flow [sf_state_flow]</td>
<td>When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remove script for Field controls</td>
<td>State Flow</td>
<td>If all field controls are disabled, see if any of the client scripts should be removed.</td>
</tr>
<tr>
<td></td>
<td>[sf_state_flow]</td>
<td></td>
</tr>
<tr>
<td>State Change</td>
<td>State Flow</td>
<td>Get the correct state choice value when the state is changed.</td>
</tr>
<tr>
<td></td>
<td>[sf_state_flow]</td>
<td></td>
</tr>
<tr>
<td>Update dependent records</td>
<td>State Flow</td>
<td>When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.</td>
</tr>
<tr>
<td></td>
<td>[sf_state_flow]</td>
<td></td>
</tr>
</tbody>
</table>

### Script includes installed with state flows

#### Script includes

State flows adds the following script includes.

Table 1010: Script includes for state flows

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StateFlow</td>
<td>Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts.</td>
</tr>
<tr>
<td>StateFlowAJAX</td>
<td>Allows access to state flow functionality from client scripts.</td>
</tr>
</tbody>
</table>

### Use state flows

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending email notifications.

Administrators can configure state flows to:

- Limit the choice list for the State field to contain only those states that are valid for the flow.
- Define the behavior and visibility of specific fields on a task form when state transitions occur and for certain end states.
- Configure events that are triggered when a task changes states.
- Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.
Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

**Create a state flow**

Creating State Flows.

2. Fill in the fields, as appropriate.

The system enforces the field controls with the same client script that filters the choice list for the State field.

**Table 1011: Creating state flows**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number</td>
</tr>
<tr>
<td>Table</td>
<td>[Required] Table on which the state flow record runs. Only tables that extend the Task [task] table are available in the list.</td>
</tr>
<tr>
<td>Starting state</td>
<td>Name of the state at the beginning of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Ending state</td>
<td>Name of the state at the end of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Client script</td>
<td>Client script to run for this transition. The client script controls the available states you can select by limiting the contents of the State choice list to valid states. This client script also controls specific field behavior configured for state changes in the Field Controls section of the form.</td>
</tr>
<tr>
<td>Event</td>
<td>Name of an existing event to trigger when this transition occurs. See Triggering Events on State Changes for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of this record. Make sure the name is descriptive of the state transition or the processing that the record is performing. This name does not have to be unique.</td>
</tr>
<tr>
<td>Roles</td>
<td>Not used for any processing.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this state flow record.</td>
</tr>
</tbody>
</table>
| Class          | Defines the state flow class for this record. The system selects the appropriate class from these options:  
  - State Flow: Records created for state flows in all task-based tables except those in work management.  
  - Work Order Flow: Records created for state flows in the Work Order [wm_order] table. This class is available when work management is activated.  
  - Work Task Flow: Records created for state flows in the Work Order Task [wm_task] table. This class is available when work management is activated. |
<p>| Dictionary override | Sets the starting value for the State field on all new records for the table named in the state flow record. See Dictionary overrides for state flows on page 2046 for configuration procedures. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work notes</td>
<td>Noteworthy comments about this state flow transition. For details about how these notes are used, see Work Notes.</td>
</tr>
<tr>
<td>Comment</td>
<td>Details about the customized record.</td>
</tr>
<tr>
<td>Manual (Runs scripts from a UI action that require the user to click a button or related link.)</td>
<td></td>
</tr>
<tr>
<td>Manual condition string</td>
<td>Conditions for enabling a UI action that cannot be defined with the condition builder. For example, you can use this string to define UI actions for mobile devices. This condition has an [and] relationship with the condition in the Manual condition field.</td>
</tr>
<tr>
<td>Manual condition</td>
<td>Conditions for enabling a UI action that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Manual condition string field.</td>
</tr>
<tr>
<td>Manual script</td>
<td>Script that defines what the UI action does when the conditions are true. This script runs when the user clicks a button or a related link.</td>
</tr>
<tr>
<td>UI action</td>
<td>[Read Only] Name of the button that the system creates to enable this transition. The system creates the label using the same name as the state flow record that created it.</td>
</tr>
<tr>
<td>Automatic (Runs a business rule automatically when a task record is changed and updated.)</td>
<td></td>
</tr>
<tr>
<td>Automatic condition string</td>
<td>Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an [and] relationship with the condition in the Automatic condition field.</td>
</tr>
<tr>
<td>Automatic condition</td>
<td>Conditions for running the business rule that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Automatic condition string field.</td>
</tr>
<tr>
<td>Automatic script</td>
<td>Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the Automatic condition must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.</td>
</tr>
<tr>
<td>Field Controls (Determines field properties when a record transitions between states or reaches a specific end state.)</td>
<td></td>
</tr>
<tr>
<td>Mandatory fields</td>
<td>Makes the selected fields required when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Read only fields</td>
<td>Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Visible fields</td>
<td>Displays the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>
### Not mandatory
Makes the selected fields optional when this transition occurs, or when the end state is the current state.

### Not read only
Makes the selected fields editable when this transition occurs, or when the end state is the current state.

### Not visible
Hides the selected fields when this transition occurs, or when the end state is the current state.

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.
   - **Manual**: Click Create UI Action to create a button on the task form that enables users to execute the transition manually. The system uses the value in the Name field as the label for the UI action. The UI action executes the script in the Manual Script field when the conditions are true. For example, a manual transition can create an Activate button when an incident is in the New state that enables a user to mark the incident as active.
   - **Automatic**: Click Create Business Rule to create the business rule. The business rule executes the script in the Automatic Script field when the conditions are true. For example, a business rule created by the system can set an incident state to Assigned when the Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see Business Rules.

4. Click Create Client Script to create the script that limits the values offered in a task record's State field to valid states for that transition.

5. Configure the fields in the Field Controls section to control how specific fields display when a task record changes states.

### Events triggered on state changes
You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

### Dictionary overrides for state flows
A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.

1. In a state flow record, select an Ending state.
   - This is the override value which becomes the starting state for all new records in the table named.

2. Click Create Default Value.
   - The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the Create Default Value button on all subsequent state flow forms for that table.
Field controls

You can define controls for individual fields that are enforced when a record transitions between states. Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

Configure state flow records with an ending state only and create the correct behavior for every ending state you want to control. This ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record's State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

**Note:** State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects as needed to enforce field properties in state flows:

<table>
<thead>
<tr>
<th>Table 1012: Field Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>Business rule</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
</tr>
<tr>
<td>Client script (onChange)</td>
</tr>
</tbody>
</table>

Rebuild state flows

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to State Flows Admin Rebuild State Flows. This module runs a script that compares the numerical value of each item in the State field choice list until it finds a match in the imported state flow record.

State flow cleanup

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.
When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

### Table 1013: State Flow Cleanup

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td>All state flows for the table specified that have events configured are</td>
</tr>
<tr>

</tbody>
</table>

**Work notes**

Work notes are an important part of the state flow process and are used to communicate information about state transitions.

The state flow adds these work notes to the Work notes field of any task making this transition.

These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

**Survey Management**

The ServiceNow® Survey Management application allows you to create, send, and collect responses for basic surveys. You can also use the Survey widget to set up a survey within Service Portal, if installed.

Survey Management does not support domain separation.

**Comparing Survey Management and Legacy Surveys**

Two versions are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.
Survey wizards are not impacted and cannot be migrated.

**Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

### Configuring surveys in Survey Management

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

### Survey Management roles

The Survey Management application uses the following roles.

No role is required to take assigned survey questionnaires.
Table 1015: Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey administrator</td>
<td>Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu.</td>

<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

### Survey responses and results

There is a metric result record for each user's response to each question on every survey instance. Survey results for each question and category are calculated automatically based on these metric result records.

If you use survey result calculations for results and scorecards, ensure that the *positive indicator* field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

**Survey responses**

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients' answers to each question in a category. To view the general results, navigate to Survey Survey Responses. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To
view these results, navigate to Assessments Results Category results and filter the results using the
[Type.Evaluation method] [is] [Survey] condition.

**Figure 497: Assessment category results**

**Survey scorecards**

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard on page 2057.

**View results for all surveys**

You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey Survey Responses.
   Do not confuse this module with Survey Legacy Surveys Survey Responses, which displays legacy survey responses.
The Type column displays the survey definition each response is associated with.

2. Select a response to view its details.

View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to SurveyView Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.

The metric result contains the user’s response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Metric result fields
### Field | Description
---|---
**Assessment group** | Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.

**Metric** | Question that the user answered.

**Data type** | Data type of the question the user answered.

**Method** | Assessment method. Always Assessment for surveys.

**Updated** | Date and time the metric result was last updated.

**Source** | Survey definition from which the associated survey instance was generated.

**Assigned to** | User who completed the survey questionnaire.

**Instance** | Survey instance completed by the Assigned to user.

**Actual value** | Value obtained from the user response to the question. The actual value is determined by the question data type:
- Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.
- Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.
- Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.
- Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.
- Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.

**Normalized value** | Adjusted value that accounts for the question's Scale definition setting, minimum and maximum values, and other factors. The equation that generates the value and an example calculation appear in *Example: calculate the normalized value for a survey metric* on page 2056.

**String value** | Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.

---

*Example: calculate the normalized value for a survey metric*

The normalized value is calculated based on a linear equation and the scale definition of the metric.
Equation used to calculate the normalized value

Normalized value = \frac{(Input Value - Min value defined in metric)}{(Max value defined in metric - Min value defined in metric)} \times \frac{current metric weight}{(sum of valid metric weight)} \times scale_factor

**Note:** The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then Normalized value = 1.0 – Normalized value.

Example

Calculate the normalized value for the Please rate the competency of the technician metric. The metric has the following values:

<table>
<thead>
<tr>
<th>Table 1018: Values of the metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
</tr>
<tr>
<td>Minimum value</td>
</tr>
<tr>
<td>Maximum value</td>
</tr>
<tr>
<td>Current metric weight</td>
</tr>
<tr>
<td>Number of responses</td>
</tr>
<tr>
<td>• 4 of type=number</td>
</tr>
<tr>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
</tr>
<tr>
<td>Scale factor</td>
</tr>
</tbody>
</table>

Normalized value = \frac{(3 - 1)}{(6 - 1)} \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result [asmt_metric_result] table.

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to SurveyView Surveys.
2. Open a survey definition.
   The scorecard link is hidden if there are no survey results to report.

The interactive scorecard displays the name of the survey and results or comparisons of the ratings. You can display results in the following views:

- Category Results
- Question Results
- Average Ratings
- History

*Survey scorecard category results*

The Category Results view is a stacked bar chart showing survey results for all questions in a category by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer
To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Figure 499: Survey scorecard category results detail

**Survey scorecard question results**
The Question Results view shows the results for each question in a category using different chart types, based on a data type.

**Pie chart**
The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (64.29%)
- 5 = 1 (7.14%)

© 2018 ServiceNow. All rights reserved.
Bar chart

A bar chart appears when question results use the Percentage data type.

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports Administration Report Ranges.

Survey scorecard average ratings
The Average Ratings view displays the weighted average rating for each survey question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

- How courteous are...
- How satisfied are...
- How satisfied were...
- Please rate the t...
- Was technician ab...

Average Normalized value
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

Figure 502: Average ratings detail

Survey scorecard history
The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year’s ratings.

</table>

Figure 504: Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd [2015], 1st [2015], 4th [2014], and 3rd [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Figure 505: Survey scorecard history - 4 quarters
Export a scorecard as an image
You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon (≡) and select Save as PNG or Save as JPEG and wait for the export to complete.

2. Click Download and save the scorecard image to a storage location.
Survey administration

Survey administrators, users with the survey_admin role, create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

• Create, customize, and publish surveys.
• Write and maintain survey questions.
• Define trigger conditions for when surveys are sent to users, such as when an incident closes.
• Maintain surveys and survey questions as the organization's needs change.

To set up surveys in *Service Portal*, you must first install Service Portal and then *configure the Survey widget* on the page. The Survey widget is provided on the base instance.

Surveys in Service Portal

If you have Service Portal installed, you can use the Survey widget to set up surveys in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in *Service Portal* on page 2197. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see *configure widget instances*. 
To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Specify how many surveys to show on the Service Portal homepage (default is 5).</td>
</tr>
</tbody>
</table>

Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.
For mobile users, the survey designer property *Pagination setting for Service Portal view* is automatically set to one question per page.

Survey designer

Users with the `survey_admin` role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.
You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

---

**Survey designer elements**

The survey designer is accessible from **Survey Designer**.

The survey designer contains controls, a header bar, and the design canvas.

---

**Controls**

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
Figure 506: Controls
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score between 0 and 10.

### Table 1020: Question data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>

<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>
### Header bar

The tabs on the header bar display views and a menu of functions.

<table>
<thead>
<tr>
<th>Survey Designer</th>
<th>Design</th>
<th>Configuration</th>
<th>Availability</th>
</tr>
</thead>
</table>

Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a [signature](#).
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey.
- **Preview**: Display a preview of the survey as it will appear to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.

### Design canvas

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer
The configuration values you use in this procedure are applied to the entire survey.

Role required: admin or survey_admin

1. Select Configuration in the survey designer.
2. Complete the Survey Designer Configuration form.

Table 1021: Survey Designer Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
</tbody>
</table>

**Note:** The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.

<table>
<thead>
<tr>

<td><strong>Note:</strong> This field is displayed only when Service Portal is installed.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey and assessment instances that are in the Work in progress or Ready to take states.</td>
</tr>
</tbody>
</table>

**Survey categories**

Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to **Survey Survey Designer**.
2. Enter the name of the survey in the Name field.
   - The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box that opens.
   a) Enter a new name and a description for the category.
b) Enter text in the Details field that introduces or explains the category to recipients.
c) Click the X icon to close the Properties dialog box and save your settings.

4. To add a new category, click the + icon in the title bar of an existing category. The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New.
   Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   • There is more than one category for the survey.
   • There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click Save.
   The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.</td>
</tr>
<tr>
<td></td>
<td>- Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- Multiline: Full page width multiline text field that allows word wrap and returns</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.</td>
</tr>
</tbody>
</table>

**Note:** Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low values if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High values if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options. Note: Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.
   The question must have a data type of Boolean, Choice, Scale, or Template.

5. Select a question in the Displayed when field.
   The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.
   You can select more than one answer. Selected answers are indicated by a check mark.
   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.
9. Drag and drop questions to change their order within a category or move them between categories.
10. To delete a question, click the X icon in its title bar.

Survey question data types
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

**Date and Date/Time data types**

The Date and Date/Time data types are very similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

Note: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 509: Single line
On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
Image scale datatype

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
### Equipment Usage Survey

#### Multiple Selection

<table>
<thead>
<tr>
<th>What equipments do you use?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Laptop</td>
</tr>
<tr>
<td>Tablet</td>
</tr>
<tr>
<td>Smart Phone</td>
</tr>
</tbody>
</table>

---

**Ranking data type**

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. **Please rate following device in order of Importance.**

|  |  
|---|---|
| ✔️ | Laptop |
| 1 | Tablet |
| 2 | Smart Phone |
| 3 | MAC |

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

*Edit a survey in the survey designer*

You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in users’ queues.

1. Navigate to Survey Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.

Configure category weights for a survey

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the Weight field. For more information, see Show or hide fields on a form.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to Survey View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click Update.

View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

Navigate to Survey Survey Instances and open a survey instance.

Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>

<td></td>
</tr>
</tbody>
</table>

**Survey users and groups**

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

**Administering survey users**

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:
• The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
• The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

---

**Create a survey user group**
Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin, user_admin, or survey_admin

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

1. Navigate to Survey Administration User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   The Group Members and Groups related lists appear.
5. To add group members, complete the following steps:
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

---

**Select recipients for a survey in the Survey Designer**
You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by: select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

---

**Designate a survey user**
You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to Survey View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

*Designate or remove multiple survey users at one time*

Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   The changes are also reflected in the Survey Users related list on the survey definition.

*Allow recipients to retake a survey*

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see *Show or hide fields on a form*.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to Surveys View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

**Publish a survey**

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.

---

**Note:** You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

---

1. Navigate to SurveyView Surveys and select a survey to publish.
2. Click Publish.
   When you publish a survey, the system generates survey instances for any associated survey users. You can *assign* the survey to other users manually.

**Publish a survey in the Survey Designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.

4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.
   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

Customize the appearance of a survey

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

Note:

- For color properties, enter either an HTML color name or hexidecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   • Assessments Admin Assessment Properties
   • Survey Administration Properties

2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.

3. Click Save.
   You may need to clear the browser's cache to see updates.
Assessment and survey properties

Table 1024: Assessment and survey properties

<td>Assessment caption font color</td>
<td>Sets the font color of the caption text on assessment and survey questionnaires.</td>
</tr>
</tbody>
</table>

Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

*Modify a survey definition*

You can configure additional options for a survey definition.
Role required: admin or survey_admin

1. Navigate to Survey View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.
2. Open a survey definition.
3. Modify the fields on the Survey Definition form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey, which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the Active check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the Active check box to deactivate or activate a published survey.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.</td>
</tr>
<tr>
<td>Send notifications</td>
<td>Check box to send a notification that the survey has been taken.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the survey: Draft or Published.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click New to create a new one. The signature form contains these fields:</td>
</tr>
<tr>
<td></td>
<td>• Name: Descriptive name for this signature.</td>
</tr>
<tr>
<td></td>
<td>• Signature type: Type of signature required. The selections are Check box, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the survey.</td>
</tr>
<tr>
<td></td>
<td>• Assertion: Text you want to display to recipients.</td>
</tr>
<tr>
<td></td>
<td>By default, a property called Require authentication for user signature (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Schedule period</td>
<td>Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule. Note: If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.</td>
</tr>
<tr>
<td>Allow retake</td>
<td>Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user’s My Assessments &amp; Surveys page.</td>
</tr>
</tbody>
</table>
| Scheduled job        | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
                      • The system deletes the old scheduled job.  
                      If you selected a recurring schedule period:  
                      • A new scheduled job is created.  
                      For example, if you change the schedule period from Daily to Weekly and save the record:  
                      • The system deletes the daily scheduled job.  
                      • Creates a weekly one set to run a week from the current date.  
                      This field is visible to administrators only if the schedule period is Daily, Weekly, Monthly, or Yearly. |
| Introduction         | Introductory content to display on survey questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions. |
| End note             | Content to display on the screen that appears when someone submits a survey questionnaire. Consider adding a thank you message, follow-up instructions, or other applicable information. |
| Pagination setting   | The setting on which the pagination is based for desktop or tablet view in Service Portal.  
                      • Category: default  
                      • Question: 1 question per page (automatic for mobile)  
                      • None: no pagination  
                      Note: This field is displayed only when Service Portal is installed. |

<td><strong>Survey Users</strong> All survey users who are authorized to take this survey. If no users are listed, any user can take this survey.</td>
</tr>
<tr>
<td></td>
<td><strong>Assessment Instances</strong> All survey instances for this survey. Configure the form to add this related list to see it.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you add a related list to the form, use list control to omit the New button. The system generates survey instances to produce functional surveys.</td>
</tr>
</tbody>
</table>

4. Save the record.

*Schedule periods*

The available schedule periods are Only Once, No Limit, Daily, Weekly, Monthly, and Yearly.
The default schedule period is No Limit. When you set the schedule period to anything except Only Once or No Limit, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not Complete.

For example, if you set the schedule period to Monthly and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the Expiration date field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except No Limit, the Expiration date field is automatically set to the appropriate date. For example, if the schedule period is Weekly, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is Weekly. The next day, a survey administrator changes the schedule period to No Limit. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal's survey instance was generated.
- A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

Note: If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.

Create a survey designer template question

You can create a question that uses choice lists from a template.

Role required: admin or survey admin

1. Navigate to Survey Survey Designer and load a survey or create a new survey.
2. Drag the Template data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.
Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected Data type.

### Table 1026: Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the data type if another question depends on this question.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the data type is Template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the template if another question depends on this question.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations. This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
</tbody>
</table>
6. Save the record.
   Be sure to create answer options if you select the Choice or Likert Scale data type.

*Survey question data types*

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

### Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

### Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

### Choice data type

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

**Date and Date/Time data types**

The Date and Date/Time data types are very similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 512: Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
Image scale datatype

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of importance.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template
Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction
scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

Figure 515: Template definition

Templates are available for survey questions that have Data type set to Template. The following question templates are available in the base system.

Table 1027: Default question templates

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

Create a survey question template

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to Survey Templates.
2. Click New.
3. Enter a Name.
4. Right-click the form header and click Save.
5. In the Assessment Template Definitions related list, click New.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

Update min and max values to match templates
If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin
When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The system does not, however, update the fields for existing questions if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>].
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.

**Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Create or modify answer options
You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin
Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.

**Table 1028: Assessment Metric Definition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

**Table 1029: Answer option order based on value**

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

*Change the order of survey questions*

You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. You may want to change the order of questions if you add a new question manually after you create other questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. When you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the Assessment Metrics related list.
   b) Edit the values in the Order column.
4. Click Update.
Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

You can configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to SurveyTrigger Conditions.
2. Click New.

**Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

### Table 1030: Trigger condition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident [incident] table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User [sys_user] table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>[Admin only] Application is set to Global.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Related Field 1-4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields.</td>
</tr>
<tr>
<td></td>
<td>For example, select the Incident table, Assigned to and Problem as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>
You can also create a trigger condition directly from the survey creator. If you select Certain users can take this survey, based on conditions in the Survey User Access section, the Trigger Condition form opens automatically when you click Save as Draft or Publish.
Istanbul    ServiceNow    Now Platform Capabilities

**Trigger condition example**

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident [incident]
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie's complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- **User (Related Field 1)**: Boris Catino
- **Problem (Related Field 2)**: PRB010101
- **Task (automatically created)**: INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).

<table>
<thead>
<tr>
<th>Number</th>
<th>Metric type</th>
<th>Due date</th>
<th>State</th>
<th>Assigned to</th>
<th>Trigger table</th>
<th>Trigger ID</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>AINST0010011</td>
<td>Customer Satisfaction Survey</td>
<td>2016-09-20</td>
<td>Ready to take</td>
<td>System Administrator</td>
<td>Incident [incident]</td>
<td>Incident: INC0010008</td>
<td>INC0010008</td>
</tr>
</tbody>
</table>

To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to Reports View/Run and clicking Create a report.
Survey distribution

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

• Send survey invitations to users
• Share a survey URL that opens the survey directly.
• Create a module that opens a survey.

Send survey invitations to users
You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

• Active check box is selected.
• State is Published.
• Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to Survey View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
</tbody>
</table>

| Assign a survey to any user          | Click Assign Survey and select one or more users, and then click OK. |
The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

**Survey URL**s
You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the State of the survey instance (see table).

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready to take: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>In progress: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td>Complete: User has submitted all required responses.</td>
<td>If the schedule period is No Limit or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
</tbody>
</table>

An error message appears if someone opens a URL for an unpublished or deactivated survey.

**Obtain and distribute a general survey URL**
You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

**Role required: admin or survey_admin**
The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to Survey View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the View Survey URL related link.
   This related link is visible only if the survey definition is Active.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email.
   The Email button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys
When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin
1. Navigate to System Notification Email Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin
The survey instance URL is available on the survey instance record.

1. Navigate to Survey Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin
1. Navigate to Survey View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.
Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15 or UI11</td>
<td>Right-click the application menu you want to add the module to and select Edit Application Menu.</td>
</tr>
</tbody>
</table>

2. In the Modules related list, click New.

3. Complete the following fields.
   - Link type: Assessment
     Do not select Survey, which is used for legacy surveys only.
     - Assessment: Select the survey you want the module to open.

4. Complete and save the form.

Sharing surveys: export and import
You can export a survey and then import it to a different ServiceNow instance.

**Note:** Update sets are available in the Istanbul release and should be used to move data from one instance to another. For information about update sets, see *Update sets*.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

- Assessment Metric Template [asmt_template]
- Assessment Template Definition [asmt_template_definition]
- Metric definitions [asmt_metric_definition] (survey question answer options)
- Scheduled Jobs associated with the Survey [sys_trigger]
- Survey categories [asmt_metric_category]
- Survey questions [asmt_metric]
- Survey users [asmt_m2m_category_user]
- Trigger Condition [asmt_condition]

Export a survey
You can export a survey and then import it to another instance.

Role required: admin, survey_reader, or survey_admin

For information about update sets, see *Update sets*.

1. Navigate to Survey View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

Import a survey
You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.
Role required: admin or survey_admin

Note: Update sets are available in the Istanbul release and should be used to move data from one instance to another. For information about update sets, see Update sets.

1. Verify that the target instance has assessments enabled.
2. Follow the steps in Import an XML file to import the assessment.

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.
Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:
- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

Legacy survey migration
Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:
- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

Note: Survey wizards cannot be migrated.

Migrate a legacy survey
Migrate a legacy survey and its related records to take advantage of a more powerful feature set.
Role required: admin or survey_admin
To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to Survey Legacy Surveys Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey.

3. Under Related Links, click Migrate to Assessment.
   A dialog box appears, which describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrating.

4. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

5. Click the reference icon beside the Assessment field to view the new survey definition.

6. Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

7. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey Legacy Administration Survey Conditions.
   b) In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

8. Navigate to Survey Administration Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration
Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

Table 1032: Survey question migration

<table>
<thead>
<tr>
<th>Legacy survey type</th>

</tbody>
</table>

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Table 1033: Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
</table>
| Survey master [survey_master] | • Survey definition [asmt_metric_type]  
|                         | • Assessable record [asmt_assessable_record], for system use only  
|                         | • Survey category [asmt_metric_category]                                                   |
| Survey question [survey_question_new] | • Survey question [asmt_metric]                                                             |
| Question choice [question_choice] | • Assessment metric definition [asmt_metric_definition]                                       |
| Survey instance [survey_instance] | • Assessment group [asmt_assessment], for system use only  
|                                       | • Survey instance [asmt_assessment_instance]                                              |
Survey component | Assessment survey components
---|---
Survey response [survey_response] | • Survey instance question [asmt_assessment_instance_question]
• Survey response [asmt_metric_result]
• Category result [asmt_category_result], for system use only

*Migrated question review*
To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the Multiple Choice and Select Box types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

**Table 1034: Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. Excellent has the lowest Order value, so when the system creates a metric definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.

**Table 1035: Legacy question: Please rate the overall quality of your service.**

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Question choice text</td>
<td>Question choice value</td>
<td>Question choice order</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Table 1036: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.

Table 1037: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none
Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to Self-Service My Assessments & Surveys.
   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click Take Survey on a survey card to open the questionnaire.
   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click Save. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click Submit. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
• A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
• The system can send email notifications to these users:
  • Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  • Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  • Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.
• Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  • Checkbox
  • Choice
  • Duration
  • Likert Scale
  • Numeric Scale
  • Template
  • Yes/No
• A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Quiz application: Important terms

The quiz application involves several terms.

Table 1038: Terms used in quiz application

<table>
<thead>
<tr>
<th>Quizzes</th>
<th>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Categories</td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td>Questions</td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
</tbody>
</table>
A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.

A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

## Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   
   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

Review the results from the submitted quizzes in reports and scorecards.

## Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator [assessment_admin]</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The itil_admin role and the survey_admin role contain the assessment_admin role</td>
</tr>
<tr>
<td>Administrator [admin]</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>
Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Role required: assessment_admin or admin

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   If the plugin depends on other plugins, these plugins are listed along with their activation status.
   If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files are not installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.
4. If available, select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.
   You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.

Quiz Overview module

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the assessment_admin role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to Quizzes Overview.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Total Questions by Quiz</td>
<td>Assessment Metric [asmt_metric]</td>
</tr>
<tr>
<td>Questions by Data Type</td>
<td>Assessment Metric [asmt_metric]</td>
</tr>
<tr>
<td>Correct Answers by Assigned User</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td>Number of Correct Answers</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td>Incorrect Answers by Assigned User</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results [asmt_metric_result]</td>
</tr>
</tbody>
</table>

Quiz designer

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.
You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.

Tools on the Quiz Designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes Quiz Designer.

The designer contains the following elements:

- Controls
- Header bar
- Design canvas

Controls

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
Figure 516: Question controls

</tr>
</tbody>
</table>

**Header Bar**

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a [signature](#).
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.
Design Canvas

New quizzes open in the Design view. The quiz Name field appears above first category in the canvas. A blank question field appears in the category container.

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes Quiz Designer or Quizzes Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category
3. To configure the category, click the gear icon in its title bar.
   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

*Create quiz questions*

You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The *data type* that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

**Note:**

To designate a question as scored, you must use Assessment forms. For instructions, see *Configure a scored question*.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

Table 1041: Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red Introduction_to_Fields#Field_Status_Indicator field status indicator. This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are: • Single line: Single line text field 40 characters in length that allows strings of any length. • String line wide: Full page width text field that allows a single line entry of any length. • Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question Date type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Note: Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

**Dependency**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.
8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.
10. To delete a question, click the X in its title bar.

Configure a template question
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.
Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

*Configure a scored question*

Only *scored* questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the *quiz scorecard*.

1. Navigate to Quizzes Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
This check box is not available if the question's data type is not supported for scoring.

6. Select the Correct answer for the question.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a quiz
You can configure an entire quiz.

Role required: assessment_admin or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Signature</td>
<td>[Optional] Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.
The system also creates a link to the quiz in the recipients' My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

### Table 1043: Select recipients

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

**Publish a quiz**

When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient's My Assessments & Surveys portal displays a link to the quiz.

**Role required:** assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

**Edit a quiz**

You can update a quiz after the quiz has been distributed.

**Role required:** assessment_admin or admin

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the **retake period**:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

**Open the quiz:** Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

**Enable a quiz retake**

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.
Role required: assessment_admin or admin

Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

1. Navigate to Assessments Metric Definition Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

**View a quiz result**

You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Navigate to Quizzes Quiz Results.

![Metric Results](image)

*View a quiz designer scorecard*

The quiz scorecard opens in the Category Results view.

For detailed information about scorecards, see Quiz Scorecards.

1. Navigate to Quizzes Quizzes.
2. Open the quiz whose results you want to view.
   - The scorecard for the selected quiz opens in the Category Results view.
4. Select a category to view from the choice list above the chart.
View a quiz category result

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question.

1. To view category results, navigate to Quizzes Category Results.

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category's weight:
   3. Navigate to Quizzes Categories, and select a category from the list.
   4. In the Metric Category form, edit the default value in the Weight field.
   5. Click Update.

   Note: You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz

All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Role required: none

No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

1. Navigate to Self-Service My Assessments & Surveys.
2. Click Take Quiz on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.

4. Click Save at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.

5. When you are ready to submit the completed quiz, read any assertions that require your attention.

6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.

7. Click Submit.

8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a Modify Quiz button after submission. If retakes are not permitted, the card disappears from your queue.

9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.

10. To edit your answers and resubmit a quiz that permits retakes, click Modify Quiz. You can modify your responses to the quiz until its due date.

Quiz scorecards

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 517: Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Figure 518: Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz. Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart
The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Figure 519: Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

• Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports Administration Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Figure 520: Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics. You can share these reports with specific users or groups and change the display options. For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

Wizards

Administrators can create wizards to provide a step-by-step sequence of dialog boxes that lead the user through a procedure.

Administrators can create wizards to provide a step-by-step sequence of dialog boxes that lead the user through a procedure. For example, a wizard may lead users through reporting an incident (creating an incident record) without opening a list or form.

![Describe your incident](image)

Figure 522: Record generator wizard

Create a basic wizard

This example creates a basic wizard that reports an incident.

1. **Activate the system wizards application**, if necessary.
2. Navigate to System Wizards Wizards.
3. Click New.
4. Enter the wizard Name of Report Incident.
5. Right-click the header and select Save.

Define an example wizard variable

Define an example wizard variable.

**Note:** To learn more, see *Define a wizard variable* on page 2167.

Define wizard variables:

![Wizard Variable](image)

Figure 523: Basic variables

1. In the Wizard Variable related list, click New.
2. Enter the variable details.
Create the first panel

Create the first panel of the example wizard.

**Note:** To learn more, see *Wizard Panels.*

1. In the Wizard Panels related list, click New.
2. Select a Type of A panel that prompts the user to answer questions.
3. Enter the panel details.
   - Name: Service Questions
   - Title: Service Desk Wizard
4. Right-click the header and select Save.
5. In the Variables related list, click Edit....
6. Using the *slushbucket*, select and arrange the variables as listed:
   1. What are you having difficulties with?
   2. Please describe your symptoms
7. Click Update.
Create the second panel option

How to create the second panel option.

1. In the Wizard Panels related list, click New.
2. Select a Type of a panel that creates something (like a change request or an incident).
3. Enter the panel details and click Submit.
   - Name: Email Incident
   - Table: Incident [incident]
   - Final View: ess
4. Right-click the header and select Save.
5. In the Field Setters related list, click New.
6. Enter the field setter details and click Submit.
   • Type: Set field to a variable
   • Field: Short description
   • Variable: description

7. In the Field Setters related list, click New.
8. Enter the field setter details and click Submit.
   • Type: Set field to a specific value
   • Field: Category
   • Value: software

9. Repeat steps 1 – 8 to create additional panels with the values listed in the table.

<table>
<thead>
<tr>
<th>Step 3. Panel Name</th>
<th>Step 8. Category Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Incident</td>
<td>hardware</td>
</tr>
<tr>
<td>Password Incident</td>
<td>network</td>
</tr>
</tbody>
</table>

Test the wizard

Run through several scenarios to test transition logic and record generation.

1. Navigate to System Wizards Wizards.
2. Click Report Incident.
3. Click Test.
4. Enter the following information and click Next.
   • What are you having difficulties with?: Email Issue
   • Please describe your symptoms: Can't access email

5. Verify that a new record is created and the values match step 4.
6. Repeat steps 1 – 5 to test each multiple choice answer.
Wizard transitions

Transitions define logic used to move between panels in wizards.

Transition logic may be based on a predefined order (basic panel flow) or user input (defined transitions).

**Note:** The System Wizards application is not active by default.

Use basic panel flow in a wizard

Basic panel flow moves through wizard panels in order, without the need to define logic for each transition. A wizard may use either basic panel flow or defined transitions, but not both.

1. Open the wizard.
2. Select the Basic panel flow check box. If necessary, configure the wizard form to add the field.
3. Enter the First panel in the reference field.
4. For each panel, define an Order. If necessary, configure the panel form to add the field.

Define a panel transition

1. Open the panel.
2. In the Transitions related list, click New or select the transition to edit.
3. Using the **condition builder**, define a transition condition based on wizard variables. Leave the condition empty to use the transition in all cases.
4. In the **To** field, select the next panel.
5. In the **From** field, select the previous panel.
6. Define a **Transition script** that runs when the transition is used.

Wizard variables

Wizard variables are questions that collect and store user input. Define variables for a wizard and then add them to wizard panels.

Use data collected by wizard variables to:

- Define transition conditions.
- Set field values in **record generators**.
- Define dynamic functionality with UI policy and client scripts.
- Implement advanced functionality with **wizard scripts**.

**Note:** The System Wizards application is not active by default.

**Add a variable to a panel**

You can add variables to wizard panels to prompt users to answer questions and to collect data.

To collect user input, add variables to a panel that prompts user to answer questions (**wizard panel**) or a survey panel (requires **Survey Wizard plugin**):

1. Navigate to System Wizards Wizards.
2. Open the wizard.
3. In the Wizard Panels related list, open the panel to which you are adding a variable.
4. In the Variables related list, click Edit.
5. Using the **slushbucket**, add and arrange the order in which variables appear on the panel. Only variables defined on the wizard are available on a panel.

---

Define a question choice

Some variable types require choices. For example, a multiple choice question — such as **What kind of email account do you want?** — requires options — such as **Exchange** and **UNIX**.

1. Open the variable definition.
2. In the Question Choices related list, click New.
3. Enter the question choice details and save the record.
   - Text — option the user sees
   - Value — value stored in the variable
4. Repeat steps 2 3 for all available options.
Define a wizard variable

Define a wizard variable to specify its type, name, question description, order number, and any other details.

1. Navigate to System Wizards Wizards.
2. Open the wizard to which you are adding a variable.
3. In the Wizard Variable related list, click New.
4. Select the variable Type.
   Wizards use the same variable types as service catalog items.
5. Enter the name used by the system, for example: resolved_to_satisfaction.
6. Enter an order number and select the name of the associated Wizard in the Expert field.
7. Enter a descriptive question in the Question field.
8. Enter the remaining variable details if necessary and save the record.
Publish the basic wizard

Create a wizard launcher to make the wizard available through the service catalog homepage.

**Note:** To learn more, see *Publish a Wizard.*

![Figure 524: Basic publish](image)

1. Navigate to Service Catalog Wizards.
   If you do not see Wizards under Service Catalog, complete the next step.

2. To add the Wizards module to the Service Catalog, perform the appropriate action for your version of the UI:

   | UI16          | 1. Navigate to System Definition Application Menus.  
   |              | 2. Select Service Catalog. |
   | UI15 or UI11 | Right-click the Service Catalog application menu and select Edit Application Menu. |

3. Click New.

4. Enter the wizard launcher details and save the record.
   - Name - Report an Incident
   - Category: Can We Help You?
   - Wizard: Report Incident
   - Active: select the check box

**Link to a Wizard**

Provide access to wizards via links, such as defining a new module or sending a link via email (public wizards only).

<table>
<thead>
<tr>
<th>Desired Action</th>
<th>URL schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start a new wizard or resume an in progress wizard if the user is logged in</td>
<td>https://&lt;base URL&gt;/nav_to.do?uri=expert_shell.do?sysparm_sys_id=&lt;wizard sys_id&gt;</td>
</tr>
</tbody>
</table>
### Desired Action | URL schema
--- | ---
Require the user to restart a wizard from the beginning regardless of previous progress | https://<base URL>/nav_to.do?uri=expert_shell.do?sysparm_sys_id=<wizard sys_id>&sysparm_initial=true

Example - Define a Wizard Module in Self-Service:
1. Navigate to System Wizards Wizards.
2. Open the wizard.
3. In the Roles field, add the user roles that have access to the wizard.
4. Right-click the header and copy the sys_id for the wizard.
5. Click Update.
6. In the navigation pane, right-click Self-Service and select Edit Application.
7. In the Modules related list, click New.
8. Enter the following information and save the record.
   - Title and Order
   - Link type: URL (from arguments)
   - Arguments: /expert_shell.do?sysparm_sys_id=<wizard sys_id from step 2>

Create a public page

A public page is accessible to all users without having to log in or have a particular user role.

Create a **public page**:
1. Navigate to System Definition Public Pages. (You may need to enable the module, as it is not active by default.)
2. Click New.
3. Enter the name of the UI page specified (for example, test_page)

Make a wizard public

Public wizards are available for use without logging in.

Reasons to make a wizard public include:
- Allowing non-users to report an incident
- Collecting anonymous survey responses (requires Survey Wizard Plugin)

Once a wizard is made public, deliver it using a link via email or a module on the welcome page (available before a user has logged in).

**Make a role public**

You can make all relevant roles public to make a wizard available to users who are not logged in.

Add public to all relevant roles for the wizard:
1. Add public to the Roles field.
2. For each **wizard variable** defined for that wizard, add public to the read roles and write roles fields.
   - (You may need to personalize the form to add the read roles and write roles).
3. Similarly, add public to the read roles and write roles fields for each variable associated with each *wizard panel* for that wizard.

*Modify a script*

You can use scripts to implement advanced customizations in a wizard.

Modify the script for all *record generators* (wizard panels) within the wizard.

1. Navigate to *System Wizards Wizards*.
2. Open the relevant wizard.
3. In the Wizard Panels related list, open the record generator panel(s).
4. Enter the following script in the Script field for each record generator (Personalize the form to add the Script field, if necessary):

   ```javascript
   if ( typeof gs.getRoles() == "undefined" || gs.getRoles() == '' ) {
     current.insert();
     current.setAbortAction(true);
   } else {
     var gr = new GlideRecord("expert_instance");
     if (gr.get(wizard_instance_id))
       gr.deleteRecord();
     wizard.redirect = "test_page.do?sysparm_id=" + current.sys_id;
   }
   ```

*Process description*

**Enable and Select the Wizard**

Select the wizard to be made public:

1. **Activate** the Wizards application in the application navigator.
2. Navigate to *System Wizards Wizards*
3. Select and open the wizard to be made public.

**Publish a wizard**

Administrators can provide users with access to wizards:

- Using links
- As an item in the service catalog

Administrators can also restrict user access to wizards by role and make wizards available to the public (users that are not logged in).

---

**Note:** The System Wizards application is not active by default. To use wizards, see *Activate a System Wizard*.

---

To define the user roles that have access to a wizard:

1. Navigate to *System Wizards Wizards*.
2. Open the wizard.
3. In the Roles field, define the user roles that have access to the wizard. Leave the field blank to allow access for all users.
Send a public wizard link via email

After a wizard is configured as public, it can be delivered via email to anyone, including recipients who are not ServiceNow users.

To send a link to the public wizard via email:

1. Navigate to System Wizards Wizards.
2. Open the wizard.
3. Right-click the header and copy the sys_id for the wizard.
4. Create an email with an email link, using the URL schema:
   
   https://<base URL>/nav_to.do?uri=expert_shell.do?sysparm_sys_id=<wizard sys_id from step 3>

   Test the page

   Verify the wizard is functional for a public user.

   Log out, then click the module (in this example, the Test module under the Self-Service application).

Add a wizard to the service catalog

Create a wizard launcher to make the wizard available through the service catalog homepage:

1. Navigate to Service Catalog Wizards.
2. Click New.
3. Enter the wizard launcher details and save the record.
   - Name - name by which the wizard appears in the service catalog
   - Category - category under which the wizard appears
   - Wizard - reference to the wizard
   - Active - select the check box
   - Short Description and Description (optional)
Create module

Create Module

Create a public module within the parent application, pointing to the wizard,

1. Copy the `sys_id` for the wizard: right-click the wizard header, and copy the wizard's sys_id.
2. In the application navigator, right-click the parent application name (for example, Self-Service) and select Edit Application Menu.
3. Add public to the Roles field.
4. In the Modules section, select New to create a new module, with the following fields, then select Submit to save the record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Module title (for example, Test)</td>
</tr>
<tr>
<td>Link type</td>
<td>URL (from Arguments)</td>
</tr>
<tr>
<td>Roles</td>
<td>public</td>
</tr>
<tr>
<td>Arguments</td>
<td><code>expert_shell.do?sysparm_sys_id=&lt;sys_id of the Wizard&gt;</code></td>
</tr>
</tbody>
</table>

Survey wizards

The Survey Wizard plugin creates surveys using wizards.

Advantages versus other survey functionality include the ability to:
• Ask different questions based on responses (dynamic surveys)
• Create multiple page surveys
• Record answers for partially completed surveys

This plugin integrates with the Best Practice - Task Survey Management plugin. Because the plugin relates to the Legacy Surveys application, the plugin is documented on the ServiceNow wiki.

Configure the survey property

How to configure the survey properties (apply to all survey wizards and surveys).

1. Navigate to Survey Wizards Survey Properties.
2. Ensure the Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions. property is enabled (select the check box).

Create a page

How to create the survey pages (wizard panels) and add questions.

1. Navigate to Survey Wizards All and open the survey wizard.
2. In the Survey Panels related list, click New.
3. Enter the Name, Title, and Description.
4. Right-click the header and select Save.
5. In the Variables related list, click Edit....
6. Using the slushbucket, select and arrange survey questions on the panel.
7. Repeat steps 1 – 6 for each page of the survey wizard.

Note: To learn more, see Wizard Panels.

Create a dynamic effect optional

Create dynamic effects, such as hiding or showing fields on a panel based on answers.

1. Navigate to Survey Wizards Wizard Policy Wizard UI Policy or Survey Wizards Wizard Policy Wizard Client Scripts
2. Click New.
3. Enter the UI policy or client script details.

Note: For more information, see wizard scripts.

Define a transition

Transitions define the logic used to move between pages (wizard panels) in a survey.

Use panels and transition logic to implement multiple page surveys and dynamic effects, such as skipping pages based on answers.

Define transitions:

1. Navigate to Survey Wizards All and open the survey wizard.
2. Open a survey panel.
3. In the Wizard Panel Transitions related list, click New.
4. Enter the transition details and click Submit.
5. Repeat steps 1 – 4 for all transitions between pages in the survey wizard.

Note: To learn more, see Wizard Transitions.

Create a survey condition

How to create a survey condition that controls when and to whom the survey wizard is sent.

Create a survey condition that controls when and to whom the survey wizard is sent:

1. Navigate to Survey Wizards Survey Conditions.
2. Click New.
3. Select a Type of Survey Wizard. Only a survey or survey wizard is sent (determined by Type), even if both are defined for the condition.
4. Enter the condition details.
5. Click Submit.

Create the email notification

Create an email notification to deliver the survey wizard.

Role required: admin or survey_admin

1. Navigate to System Policy Email Notifications.
2. Filter the list to view notifications with an Event Name of task.send_survey, which is the event that is triggered when survey conditions are met.
3. Open a survey notification in the filtered list or click New.
4. Enter the email notification details. If you are creating a new notification, be sure to adjust conditions and weight to avoid conflicts with existing survey notifications (Event Name of task.send_survey).
5. Click Update or Submit.

Create the survey wizard

How to create the survey wizard.

The following steps provide an overview of building a survey wizard.

1. Activate the Survey Wizard plugin, if necessary.
2. Navigate to Survey Wizards All.
3. Click New.
4. Enter the survey wizard Name.
5. In the Roles field, add the public role.
6. Right-click the header and select Save.

Define a question

How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click New.
2. Enter the variable details.
3. In the Read roles field, add the public role.
   Configure the form to add the Read roles field, if necessary.
4. Click Submit.
5. Repeat steps 1 – 4 for all questions in the survey.

**Note:** To learn more, see *Define a Wizard Variable*.

### Installed components

Fields, tables, a business rule, a script include, an application, a survey wizard panel, and demo data (optional).

The following tables are modified:

#### Table 1047: New fields

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Modification</th>
</tr>
</thead>
</table>
| Survey Conditions (survey_conditions) | Add fields to determine which survey is sent when conditions are met:  
  - Type - either a survey or survey wizard  
  - Survey_wizard - reference to applicable survey wizard |
| Task Survey (task_survey) | Add fields to track which surveys were sent to users:  
  - Type - either a survey or survey wizard  
  - Survey_wizard - reference to applicable survey wizard |
| Survey Instance (survey_instance) | Add fields to track survey wizard instances along with surveys |
| Wizard (expert) | Add field to support new survey wizard table |

The following tables are added:

#### Table 1048: New tables

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey Panel (expert PANEL_survey)</td>
<td>Adds a survey panel to wizards. Extends the expert_panel table</td>
</tr>
<tr>
<td>Survey Wizard (expert_survey)</td>
<td>Stores survey wizards. Extends expert</td>
</tr>
</tbody>
</table>

The SurveyUtils script include is added to record responses during survey panel transitions.

The Task Survey Events business rule is modified to include logic for sending survey wizards. Customers who have modified this business rule can not install the updated version automatically.

For information about the link generated from the business rule script, see *Survey Wizard - Multiple Instances* on the ServiceNow Community.

The plugin adds Survey as a new type of wizard panel. Survey wizards are created using survey panels.

Survey wizard responses are saved when the user navigates between survey panels (clicks Next or Previous), as opposed to saving responses only at the end (surveys). This feature allows a logged in user to resume a survey that is in progress and allows survey readers to collect response data for partially
completed surveys. To support the ability to resume surveys in progress, survey wizard answers are also
temporarily stored in XML in the expert_instance table. When the user clicks Done on the last panel of the
survey wizard, the record in the expert_instance table is deleted.

For information about having more than one instance of a given Wizard in play at a time, see Survey
Wizard - Multiple Instances on the ServiceNow Community.

Demo data is available with this plugin. If you choose to install demo data, a sample survey wizard, called
Customer Satisfaction Survey, is added to the database.

Request survey wizard

Before activating this plugin, consider the installed components, dependencies, and impact.

- Installed Components - fields, tables, a business rule, a script include, an application, a survey wizard
  panel, and demo data (optional). For more details, see Installed Components.
- Dependencies - Best Practice - Task Survey Management (active by default)
- Impact - adds fields to existing tables, installs the Best Practice - Task Survey Management plugin,
  and modifies the Task Survey Events business rule. You may choose to install a demo survey with
  the plugin. The plugin integrates with standard survey functionality, so there is no need to transition
  existing surveys to survey wizards. However, survey administrators must specify a type (survey or
  survey wizard) for new survey conditions.

1. In the HI Service Portal, click Service Requests Activate Plugin.
2. Fill out the form.

<table>
<thead>
<tr>
<th>Target Instance</th>
<th>Instance on which to activate the plugin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
| Specify the date and time you would like this plugin to be enabled | Date and time must be at least 2 business
|                 | days from the current time.              |
| Reason/Comments | Any information that would be helpful for the ServiceNow personnel activating the plugin such as if you need the plugin activated at a specific time instead of during one of the default activation windows. |

Note: Plugins are activated in two batches each business day in the Pacific timezone, once in the
morning and once in the evening. If the plugin must be activated at a specific time, enter the request in
the Reason/Comments.

3. Click Submit.

Test the survey wizard

How to test the survey wizard.

1. Navigate to Survey Wizards All and open the survey wizard.
2. Click Try it.
3. Answer survey questions and verify the transition logic based on answers, if applicable.
4. At survey completion, click Done.
5. Navigate to Survey Wizards Survey Instances.
6. Search for and open the most recent instance of the survey wizard.
7. Verify that your survey answers are properly recorded.
8. Run through several scenarios to test transition logic and data collection.

Create a survey wizard (demo)

This example creates a survey using a survey wizard.

This example creates a survey using a survey wizard (requires the Survey Wizard plugin). The survey uses dynamic features that are available using wizards.

Create the survey wizard demo

Create the survey wizard.

1. Activate the Survey Wizard plugin, if necessary.
2. Navigate to Survey Wizards All.
3. Click New.
4. In the Name field, enter Software Needs Analysis.
5. In the Roles field, add the public role.
6. Right-click the header and select Save.

Define a survey question

How to define survey questions (wizard variables).

1. In the Wizard Variable related list, click New.
2. Enter the variable details as listed in the table.
3. In the Read roles field, add the public role.
4. Configure the form to add the Read roles field, if necessary.
5. Click Submit.
6. Repeat steps 1 – 4 for all variables in the table.

Test the survey wizard demo
How to test the survey wizard.
1. Navigate to Survey Wizards All and select Software Needs Analysis.
2. Click Try It.
3. In the Business software you use (select all that apply) question, select: Microsoft Office, Other.
4. Verify that the Please specify field appears and is mandatory when Other is selected (UI policy created in *Dynamic Effects*).

5. Click Next.

6. Verify that the Office panel appears.

7. Enter test values for the questions and click Next.

8. Verify that the End Note panel appears (the transition logic skips the Adobe Creative Suite panel when the Adobe Creative Suite check box is not selected on the first panel).

9. Click Done.

11. Search for and open the most recent instance of the Software Needs Analysis survey wizard.

12. Verify that your survey answers are properly recorded.

13. Run through several scenarios to test transition logic and data collection.

---

**Configure the survey**

How to configure the survey.

1. Navigate to Survey Wizards Survey Properties.

2. Ensure the Enable the enhanced task survey capabilities. Survey distribution is controlled by Survey Conditions. property is enabled (select the check box).

4. Click New.

5. Enter the condition details and click Submit.
Table 1053: Condition details

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Survey Wizard</td>

<tr>
<td>Description</td>
<td>Send software survey to all users with software questions</td>
</tr>
<tr>
<td>Condition</td>
<td>Category is Software</td>
</tr>
</tbody>
</table>

6. Navigate to System Policy Email Notifications.
7. Click New.
8. Enter the email notification details and click Submit.

Table 1054: Email notification details

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Software Survey</td>
</tr>
<tr>
<td>Event Name</td>
<td>task.send_survey</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>User field</td>
<td>event.parm1</td>
</tr>
<tr>
<td>Active</td>
<td>select the check box</td>
</tr>
<tr>
<td>Conditions</td>
<td>Category is Software</td>
</tr>
<tr>
<td>Subject</td>
<td>Please take the software survey (Incident ${number})</td>
</tr>
<tr>
<td>Message</td>
<td>Please complete this survey to help us evaluate our ongoing software needs. &lt;a href=${event.parm2}&gt;Click here to take the survey.&lt;/a&gt;</td>
</tr>
</tbody>
</table>

9. Filter the Email Notifications list using the condition: Event Name is task.send_survey and Table is Incident.
10. If any other notifications exist, increase their Weight value so that only the Software Survey is sent when the incident category is software (the Software Survey has a Weight of 0, so it has the highest priority of any notifications for the incident table).

Wizard panels

Wizard panels are screens that appear in a defined order. Each step in a wizard is represented by a panel. A wizard panel prompts users to answer questions. Wizard panel type-specific information is:

- Title - label that appears above the panel in wizard view.
- Description - text that appears above questions in wizard view.
• Variables - questions that collect user input. To learn more, see *Wizard Variables*.

**Note:** The System Wizards application is not active by default.

---

**Catalog order and checkout panels**

What catalog order and checkout panels display.

A catalog order panel displays listings for service catalog items in tabbed view. A catalog checkout panel displays an order confirmation screen for the items on the preceding catalog order panel. Use these panels to create an order guide using wizards.

---

**Change a banner setting**

How to change a banner setting.

Steps displayed in the banner can be manually defined or automatically generated.

To change the banner settings:

1. Navigate to *System Wizards Wizards*.
2. Create or open a wizard.
3. Set the Banner type field:
   • Select Fixed number of (user defined) steps for manually defined steps.
   • Select Generated based on panel history for automatically generated steps. Automatically generated steps do not display initially but are added as the user reaches each step. Automatic banner text is generated using the Title field of each wizard panel.
   • Select None to disable the wizard banner.

---

**Create a fixed wizard banner step**

How to create fixed wizard banner steps.

Steps displayed in this banner can be manually defined or automatically generated.

1. Select Fixed number of (user defined) steps from the Banner type dropdown.
2. Select the Banner steps related list and click New.
3. Assign a name to your banner step. This name is what appears on the wizard.
4. Assign a display order (such as 100, 200, 300).
5. Repeat steps 2 – 4 for each banner step in the wizard.
6. On the wizard record, click the Wizard Panels related list.
7. In the Banner step field, enter the banner step that is completed when the wizard panel is displayed. Completed steps display in green in the wizard banner.

**Note:** You may need to configure the list to add the Banner step field.
Create a panel

How a user creates a panel.

1. Navigate to System Wizards Wizards.
2. Open the wizard to which you are adding a panel.
3. In the Wizard Panels related list, click New.
4. Select the type of panel to create.
5. Enter basic panel information.

<table>

</thead>
<tbody>
<tr>
<td>Name</td>
<td>Brief description of the panel</td>
</tr>
<tr>
<td>Expert</td>
<td>Name of the wizard</td>
</tr>
</tbody>
</table>
6. Enter type-specific information and save the record.
   - *Prompts user to answer questions (wizard panel)*
   - *Catalog Checkout*
   - *Catalog Order*
   - *KB Viewer*
   - *Redirect*
   - *Record Generator*
   - *Survey (requires Survey Wizard Plugin)*

### Edit a panel

An Edit Panel button is available on wizard panels when testing the wizard. The button is available if the user can write to the expert record.

To control who can access this button, edit the write ACL on the Wizard [expert] table.

1. Navigate to **System Wizards Wizards**.
2. Open the wizard containing the panel you want to edit.
3. Click **Try It**.
4. Click **Edit Panel**.
Field setters
A field setter defines a field value for a record created by a record generator. Define field setters using:

Table 1056: Field setters

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>Name of the record generator panel.</td>
</tr>
<tr>
<td>Type</td>
<td>To define a static value (the same for each record created by the record generator), select Set field to a specific value. To define a value based on a wizard variable, select Set field to a variable.</td>
</tr>
<tr>
<td>Field</td>
<td>Select the field name.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the value (static) or select the wizard variable name.</td>
</tr>
</tbody>
</table>

KB viewers
What a KB viewer panel displays.
A KB Viewer panel displays a knowledge base article. KB Viewer type-specific information is:
- KB Article - reference to the desired knowledge base article
- Title - label that appears above the article in wizard view

Record generators
A record generator panel creates a record in a table, such as an incident or change request. There is no transition after the Record Generator. The following table includes fields specific to the Record Generator.

Table 1057: Generator type-specific information

<table>
<thead>
<tr>
<th>Title</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>table in which to create a record (select Global when using a script)</td>
</tr>
<tr>
<td>Template</td>
<td>(optional) define field values on the new record using a template</td>
</tr>
<tr>
<td>Final view</td>
<td>(optional) enter the view in which to show the submitted form (such as ESS)</td>
</tr>
<tr>
<td>Script</td>
<td>script that runs when the panel is used. To learn more, see Wizard Scripts.</td>
</tr>
<tr>
<td>Field setters</td>
<td>define field values in the target table. To learn more, see Field Setters.</td>
</tr>
</tbody>
</table>

Redirect panel
A Redirect panel specifies a URL to which the user is taken upon transition to the panel. Redirect type-specific information is:
- URL - URL location to which user should be taken
• Advanced - select this option to use a script
• Script - script that runs when the panel is used. To learn more, see \textit{Wizard Scripts}.

### Use wizard banners

The wizard banner is a graphical flow of wizard steps displayed at the top of a wizard.

![Wizard banner highlighted](image)

\textbf{Figure 526: Wizard banner highlighted}

### Activate a system wizard

The System Wizards application is not active by default.

To activate system wizards:

1. Navigate to System Definition Application Menus.
2. In the breadcrumbs, click All to display both active and inactive applications.
4. Ensure the Active field is set to true.

![Wizard variables](image)

### Define an example wizard variable

Define an example wizard variable.

\textbf{Note:} To learn more, see \textit{Define a wizard variable} on page 2167.

Define wizard variables:
1. In the Wizard Variable related list, click New.
2. Enter the variable details.
   - Type: Multiple Choice
   - Name: incident
   - Question: What are you having difficulties with?
3. Right-click the header and select Save.
4. In the Question Choices related list, click New.
5. Enter Email Issue in the Text and Value fields, and click Submit.
6. Repeat steps 4 – 5 for the following question choices:
   - Computer Issue
   - Password Reset
7. In the Wizard Variable related list, click New.
8. Enter the variable details and click Submit.
   - Type: Wide Single Line Text
   - Name: description
   - Question: Please describe your symptoms

**Define a basic transition**

How to define a transition.

**Note:** To learn more, see *Wizard Transitions.*
Define transitions:
1. In the Wizard Panels related list, click Service Questions.
2. In the Wizard Panel Transitions related list, click New.
3. Enter the transition details and click Submit.
4. Repeat steps 2 – 3 for all panel transitions in the table.

Table 1058: Panel transition details table

<table>
<thead>
<tr>
<th>Condition</th>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>

<td>requires the <em>Survey Wizard plugin</em></td>
</tr>
</tbody>
</table>

| Variables           | Questions that collect and store user input. Variables are defined in a wizard and can included on more than one panel. |

| Transitions         | Define logic used to move between panels. Transition logic may be based on user input. |

Advanced customization

An advantage of wizards is the ability to implement advanced, custom functionality with a user-friendly interface.

Create advanced wizards using:
- Wizard UI policy and client scripts: create dynamic effects and validation for wizards, panels, and variables.
- *wizard scripts*: run scripts from record generator panels, transitions, and UI policies.

Create an advanced wizard (demo)

This example creates a wizard that associates assets and details and then creates a contract with this information.

The wizard uses a script to create a new record.

Create the wizard

How to create the wizard.

1. *Activate the system wizards application*, if necessary.
2. Navigate to System Wizards Wizards.
3. Click New.
4. In the Name field, enter Contract Creation.
5. Right-click the header and select Save.

Define a variable

How to define a variable.
1. In the Wizard Variable related list, click New.
2. Enter the variable details and save the record.
3. Repeat steps 1 – 2 for all variables in the table.

Table 1061: Wizard Variables Details Table

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Question</th>
<th>Additional configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes/No</td>
<td>assets</td>
<td>Associate assets?</td>
<td></td>
</tr>
</tbody>
</table>
| Select Box      | contract_type | Which type of contract?                     | Mandatory: true  
Choice table: Contract  
[ast_contract]  
Choice field: Contract type |
| Date            | starts      | Start Date                                   |                                                               |
| Date            | ends        | End date                                     |                                                               |
| Single Line Text | short_description | Enter short description for contract |                                                               |
| List Collector  | asset_select | Asset Listing                                | List Table: Configuration Item[cmdb_ci]                      |
Create a panel demo

How to create the first two panels and add variables.
1. In the Wizard Panels related list, click New.
2. Select the panel Type of Prompts user to answer questions.
3. Enter the Name, then right-click the header and select Save.
4. In the Variables related list, click Edit....
5. Using the slushbucket, select and arrange the variables as listed in the table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Add variables</th>
</tr>
</thead>
</table>
| 1 Contract Screen | Associate assets?  
|                  | Which type of contract?                           |
|                  | Start Date                                         |
|                  | End Date                                           |
|                  | Enter short description for contract               |
| 2 Asset Screen   | Asset Listing                                      |

Create the third panel and add a field setter

How to create the third panel and add field setters.
1. In the Wizard Panels related list, click New.
2. Select the panel Type of Creates something (record generator).
3. Enter the following information, then right-click the header and select Save.
   a. Name: 3 Contract No Assets
   b. Table: Contract [ast_contract]
4. In the Field Setters related list, click New.
5. Enter the field setter details and save the record.
6. Repeat steps 4 – 5 for all field setters in the table.

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set field to a variable</td>
<td>Contract type</td>
<td>contract_type</td>
</tr>
<tr>
<td>Set field to a variable</td>
<td>Short description</td>
<td>short_description</td>
</tr>
<tr>
<td>Set field to a variable</td>
<td>Ends</td>
<td>ends</td>
</tr>
<tr>
<td>Set field to a variable</td>
<td>Starts</td>
<td>starts</td>
</tr>
</tbody>
</table>
Create the fourth panel and add a script

How to create the fourth panel and add a script.

1. In the Wizard Panels related list, click New.
2. Select the panel Type of Creates something (record generator).
3. Enter the following information, then right-click the header and select Save.
   - Name: 4 Create Contract and Assets
   - Table: Global
4. Paste the example script into the Script field. Configure the form to add the field, if necessary.

Example script:

```javascript
//Call the createContract function to obtain the ID of the created contract
var contract_id = createContract();

//Construct a url that will be used to redirect the user after submission
var uri =('ast_contract.do?sysparm_query=sys_id='+ contract_id);

//Redirect the user to the url
wizard.redirect= uri;
gs.addInfoMessage('Contract created');

//Create a new contract
function createContract(){
    var cc = new GlideRecord('ast_contract');

    //set values from wizard variables - note the format wizard.variable
    cc.sys_class_name= wizard.contract_type;
    cc.starts= wizard.starts;
    cc.ends= wizard.ends;
    cc.short_description= wizard.short_description;
    var cntr = cc.insert();

    //We created a new contract and have the id so now we need the assets to associate
    associateAssets(cntr);
    return cntr;
}

//This is the way we loop through the elements in a list collector - assets in this case
function associateAssets(id){
    var items = wizard.asset_select.toString();
    items = items.split(',');
    for(var i =0; i < items.length; i++){  
        var sys_id = items[i];
        if(sys_id !=''){
            var rl =new GlideRecord('ast_contract_instance');
            rl.ast_contract= id;
            rl.ci_item= sys_id;
            rl.insert();}}
```
3. Enter the transition details and save the record.
4. Repeat steps 1 – 3 for all panel transitions in the table.

<table>
<thead>
<tr>
<th>Panel</th>
<th>Condition</th>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Contract Screen</td>
<td>assets is Yes</td>
<td>1 Contract Screen</td>
<td>2 Asset Screen</td>
</tr>
<tr>
<td>1 Contract Screen</td>
<td>assets is No</td>
<td>1 Contract Screen</td>
<td>3 Contract No Assets</td>
</tr>
<tr>
<td>2 Asset Screen</td>
<td></td>
<td>2 Asset Screen</td>
<td>4 Create Contract and Assets</td>
</tr>
</tbody>
</table>

Test the wizard for a record with no assets

Run through several scenarios to test transition logic and record generation.

1. Open the wizard record and click Test.
2. Enter the following information and click Next.
   - Associate assets?: No
   - Which type of contract?: select a value other than the default
   - Start Date: enter a date
   - End Date: enter a date
   - Enter short description for contract: enter a description
3. Verify that a new record is created and the values match step 2.
Test the wizard for a record with an asset

Test the wizard for a record with assets.

1. Open the wizard record and click Test.
2. Enter the following information and click Next.
   - Associate assets?: Yes
   - Which type of contract?: select a value other than the default
   - Start Date: enter a date
   - End Date: enter a date
   - Enter short description for contract: enter a description
3. Verify that the asset screen opens.
4. Select assets to add to the list and click Next.
5. Verify that a new record is created and the values match steps 2 and 4.

Publish the wizard demo

Restrict access to users with asset role.

1. Open the wizard.
2. In the Roles field, select asset and save the record.
Add the wizard as a module in the Asset Contracts application

Add the wizard as a module in the Asset Contracts application.

1. Open the wizard.
2. Copy the sys_id.
3. In the navigation pane, right-click Asset Contracts and select Edit Application.
4. In the Modules related list, click New.
5. Enter the following information and save the record.
   - Title: Create Contract
   - Order: 10
   - Link type: URL (from arguments)
   - Arguments: /expert_shell.do?sysparm_sys_id=<wizard sys_id from step 2>

Service Portal

Service Portal is a portal framework that allows administrators to build a mobile-friendly self service experience for users. It interacts with parts of the ServiceNow platform, so users can access specific platform features using Service Portal. It is an alternative to the Content Management System (CMS) based on more modern technologies.

Both expert developers and beginners can configure Service Portal.

Less technical users can make basic configuration changes to the UI using Branding Editor and other components of Service Portal. More advanced users can edit and extend portals, pages, and widgets. Expert users can use the Widget Editor tool to write scripts to power a portal, and even create rich web applications on the ServiceNow.

Understanding Service Portal

Service Portal provides a modular user interface framework for quick and easy building of application portals and dashboards for the platform. It helps developers and non-technical administrators create attractive and engaging user experiences that drive employee adoption of critical enterprise applications.

How do you use Service Portal?

Service Portal is an application included in the platform UI, however it includes a visual layer for you to do most of your configuration. In the application navigator, navigate to Service Portal Service Portal configuration to view the configuration page.

The Service Portal configuration page provides a unique, intuitive way of viewing all the pieces of your portal and how they interact with one another. The configuration page allows you to take advantage of a real-time preview, while configuring portal settings. Use each of the tiles on the configuration homepage to assemble the different components of your portal.

If you prefer the platform layout for configuring Service Portal, you still have the option of creating your portal components within the platform UI. The two options are not separate. Everything you create in the Service Portal configuration page also appears in a table in the platform UI.

Who uses Service Portal?

Several different kinds of users can configure a portal.

- Limited coding: Service Portal was designed so that even users with limited coding ability or knowledge of the platform UI could set up a portal.
- ServiceNow Experts: Users with an understanding of the ServiceNow platform can create portals, set up URL redirects, and view all the components of the portal in a table. Most portal configuration takes place in the Service Portal configuration page, but in specific circumstances, Service Portal administrators may need to do additional configuration directly within the platform.
- Developers: Advanced customizations and new widget creation should be done by a developer or someone who understands AngularJS and Twitter bootstrap.

In all cases, the user configuring a portal must have the admin or sp_admin role.
Basic concepts

You should have a basic understanding of all the following components that make up a portal:

- **Themes**: Themes define the look and feel of the whole portal, but can be overridden by other style configurations.
- **Pages**: Pages control where and how you store portal content. Pages do not have a defined relationship to portal records, they simply exist.
- **Widgets**: Components in Service Portal are called widgets. You can use HTML templates, CSS, client scripts, server scripts, and any JavaScript dependencies to define what a widget does. From an AngularJS standpoint, widgets are essentially a superset of an Angular directive.
- **Most of the data in Service Portal is managed in different locations throughout the system.**

For example, if you are building a knowledge portal, the data exists in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. Take time to understand which tables contain and control the data you are working with in Service Portal.

Additional resources

Service Portal is built using several well known technologies. Use the following websites as resources to help you understand and configure your portal:

- **Twitter Bootstrap**
- **CSS 3 Flexbox**
- **AngularJS**

Service Portal core concepts

Service Portal contains two parts: a framework and a portal. The framework is composed of a set of APIs, Angular services, directives, and tools that help to build portals. The portal is a group of pages linked by page IDs.
After you enter a URL, the framework uses the suffix and picks the appropriate portal to determine the theme and configurations. Then it loads the configured default portal homepage unless the URL has a specified ID.

Each widget added to a page becomes its own instance. A widget instance is basically the application of a widget in a page. Because widgets are reusable and can appear on different pages to do different things, the manifestation of a widget on a page is referred to as a Widget Instance. The page loads with content represented by widgets.

Widget instances get their logic from the base widget template, client scripts, server scripts, and depending on the widget, CSS.

Figure 528: Service Portal overview diagram
For more information on the different pieces that make up a portal, see *Service Portal components* on page 2424.

**Activate Service Portal**

If Service Portal is not active on your instance, you can activate it from the plugin module.

You must have the administrator role to activate a plugin.

Locate the Service Portal [com.glide.service-portal.esm] plugin in the list of plugins. Activate the plugin and select the option to include demo data. For more information on activating a plugin, see the *Activate a plugin* topic.

Activating Service Portal automatically activates the Connect plugin.

**Content Management and Service Portal**

Service Portal is a compelling alternative to the Content Management System (CMS) with a refined user experience. It does not duplicate CMS or platform UI functionality. Users who have sophisticated experiences delivered through CMS may need to invest time into transitioning to Service Portal, especially if the CMS implementation includes complex and customized Service Catalog forms.

**Service Portal compatibility with existing CMS sites**

ServiceNow continues to support CMS in current and upcoming releases. If you have existing CMS sites and activate Service Portal on your instance, your CMS sites will continue to work, as CMS and Service Portal are separate applications.

**Differences between Service Portal and CMS**

Service Portal is an alternative to CMS based on more modern technologies. Major differences include:

<table>
<thead>
<tr>
<th><strong>Underlying technology</strong></th>
<th>CMS uses Jelly, which is not a widely used technology. Service Portal instead uses <em>AngularJS</em>, server-side JavaScript, HTML, and CSS. Any scripts that use Jelly do not work in Service Portal. Building widgets in Service Portal requires knowledge of AngularJS.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Visual layer</strong></td>
<td>CMS uses iFrames which can be difficult to work with, limited in terms of styling, and susceptible to upgrade issues. Service Portal, on the other hand, is a self-contained application that accesses data from other tables on the platform. This enables fine-tuned control over style and responsive design.</td>
</tr>
<tr>
<td><strong>Mobile first</strong></td>
<td>Unlike CMS, Service Portal is optimized for a mobile environment. For this reason, the following apply to the Service Portal environment:</td>
</tr>
<tr>
<td></td>
<td>• Any scripts used in Service Portal can only use APIs supported in a mobile environment. For example, some APIs used in your Service Catalog client scripts may not be supported. For a list of supported APIs, see <em>Service Portal and client scripts</em> on page 2225.</td>
</tr>
</tbody>
</table>
Service Portal forms support a maximum of two-columns. As a result, any highly customized Service Catalog forms, such as catalog items and record producers that use containers and variable sets, must be simplified to work in a two-column layout.

If transitioning to Service Portal, review the following resource: Mobile client GlideForm (g form) scripting and migration.

To understand how core CMS components are configured in Service Portal, refer to the following table.

**Table 1065: CMS and Service Portal components**

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content site</td>
<td>Portal</td>
</tr>
<tr>
<td>Content page</td>
<td>Page</td>
</tr>
<tr>
<td>Content types</td>
<td>Content types link a table to a content page. In Service Portal, content types are no longer required. Record data is queried and displayed using base system widgets. You can add widgets to any number of Service Portal pages. Learn more: Widgets on page 2270.</td>
</tr>
<tr>
<td>Layout and dropzones</td>
<td>In Service Portal, pages are made up of containers, rows, and columns. Learn more: Pages.</td>
</tr>
<tr>
<td>Content block</td>
<td>A content block is a reusable piece of content. In Service Portal, content blocks are replaced by widgets. Learn more: Widgets on page 2270.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Service Catalog pages are rendered using the SC Catalog Item widget in Service Portal. For this reason, Service Catalog forms such as catalog items and record producers are shared between your CMS implementation and Service Portal. If you have a highly customized Service Catalog, you may need to invest time in simplifying your Service Catalog items and client scripts so that they render as expected in Service Portal. Learn more: Service Catalog forms in Service Portal on page 2207.</td>
</tr>
<tr>
<td>Theme</td>
<td>Theme</td>
</tr>
<tr>
<td>CSS</td>
<td>CSS</td>
</tr>
</tbody>
</table>
CMS and Service Catalog customizations

Service Portal comes with base system widgets to address common use cases and to display record data. Even though there is no direct migration path from CMS to Service Portal, there may be some items, such as catalog items or knowledge articles, that render as expected in Service Portal without any effort.

However, because Service Portal is supported in a mobile environment, you may need to modify any customized forms and scripts. This approach ensures that the items display well on a mobile device and present a better user experience. Before transitioning to Service Portal, you may need to:

- Refactor client scripts used in your CMS/Service Catalog to use supported mobile APIs and global objects. For a list of supported APIs, see Service Portal and client scripts on page 2225.
- Build widgets to replace UI Macros and other unsupported scripts. If using a UI Macro in a catalog item form and referencing values on the form, you can use the following workaround instead: Replace a Service Catalog form script with a widget on page 2220.
- Simplify any complex forms used in your Service Catalog to fit the Service Portal two-column form layout.
- Consider which release supports the required functionality. You may want to upgrade your instance before transitioning to ensure that you have the required base system features.

CMS to Service Portal transition

Your CMS may include complex forms and customizations that do not render as expected in Service Portal. Use this guide to understand how best to modify your CMS and Service Catalog implementation for Service Portal adoption, and to understand how a conversion may affect your users.

If you are considering transitioning from CMS to Service Portal, make sure that you understand the impact of moving to a mobile environment. Review the Mobile client GlideForm (g form) scripting and migration.

Support level and transition actions

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data lookups</td>
<td>The client-side component of a data lookup is not supported in Service Portal. However, the data lookup is applied in the platform when a record is submitted or updated in Service Portal.</td>
<td>While data lookups are not applied in the Service Portal, the record updates as expected in the platform UI when submitted or updated in the Service Portal. If your CMS is used by requesters only, this limitation may not affect your implementation.</td>
</tr>
<tr>
<td>Content blocks</td>
<td>Because Content blocks use Jelly, they are not supported in Service Portal.</td>
<td>In the Service Portal, content blocks are replaced by widgets. Widgets are highly customizable components that can query record data, display and update records, and gather user input. Base system widgets generally cover most use cases. Just as you add content blocks to a page in your CMS, you can add widgets to a page using the Service Portal Designer.</td>
</tr>
<tr>
<td>CMS component</td>
<td>Service Portal support</td>
<td>Possible transition actions</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------</td>
<td>-----------------------------</td>
</tr>
</tbody>
</table>
| UI Macros     | Because UI Macros use Jelly, they are not supported in Service Portal. | - In Service Portal, you can use widgets instead of UI Macros. Base system widgets generally cover most use cases, but for custom solutions, you can develop new widgets using AngularJS.  
- If your implementation includes UI Macros in Service Catalog forms that reference other fields or variables in the form, you can embed the widget inside a Service Catalog variable. Learn more: Replace a Service Catalog form script with a widget on page 2220. |
| UI actions    | All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform.  
The form widget ignores all UI actions marked as Client. | - Refactor any UI actions to remove setRedirectURL() operations.  
- Check that UI actions are not marked as client. |
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Catalog client scripts | Only UI Type options Mobile / Service Portal and All are supported. UI type Desktop is not supported in Service Portal. For a list of supported APIs, see Service Portal and client scripts on page 2225. **Note:** Synchronous JavaScript calls are not supported in Service Portal and must be replaced by asynchronous calls. For example, the getXMLWait() method of the GlideAjax class is not supported in Service Portal. Instead, use one of the following supported asynchronous methods:  
  - getXML(Function callback)  
  - getXMLAnswer(Function callback)  
  For additional information on GlideAjax, refer to GlideAjax.  
To understand the impact of updating your CMS to work in a mobile environment, review Mobile client GlideForm (g form) scripting and migration. | - Update your scripts to remove any unsupported client APIs.  
- Check that the script UI Type is set to Mobile / Service Portal or All. |
<p>| UI policies | Scripted UI policies can only use APIs supported in Service Portal. For a list of supported APIs, see Service Portal and client scripts on page 2225. | Update your scripts to remove any unsupported client APIs. |</p>
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Service Catalog variables | Service Catalog variables are supported in Service Portal with the following exceptions:  
  - UI Macros and UI pages variable types are not supported.  
  - Validation Scripts for variables are not supported. Supported validation types include:  
    - The Mandatory field on the variable form.  
    - Read-only variables.  
    - All fields in the Availability tab of the variable form.  
    - Expanding and collapsing help text is not supported. Rather, the Help text and Instructions fields defined in the Annotations tab on the variable form are always expanded. The Help tag does not display.  
    - The List Collector variable displays as a choice list instead of a slushbucket in the Service Portal. | - If embedding a widget in a catalog item form, you can use the UI Macro variable type. Learn more: [Replace a Service Catalog form script with a widget](https://servicenow.com) on page 2220.  
- If using variable with annotations, make sure to test your catalog items in Service Portal to ensure that help text displays as expected. |
| Order guides       | Order Guides in Service Portal use the Order Guide widget.  
  The following are not supported in Service Portal:  
  - Three-step checkout  
  - Uploading attachments | Upgrade to the Kingston release for a base system order guide widget that enables three-step checkout and uploading attachments. However, keep in mind that large order guides can cause performance issues in the Service Portal. If you have large order guides, you can:  
  - Break them into multiple order guides.  
  - Simplify variables used in the order guides.  
  - As a temporary solution, you can render the Service Catalog item using an iFrame. See [Service Catalog forms in Service Portal](https://servicenow.com) on page 2207. |
| Record producers    | Record producers are used in Service Portal with the following differences:  
  - Date values do not honor time zone when the record producer submits a record. | Make sure to test all record producers used in Service Portal to make sure that they behave as expected. |
In CMS, you used the CMSEntryPage script include to define login scenarios. Instead, Service Portal uses the SPEntryPage script include and related system properties to define login scenarios. Redirects are not supported in Service Portal.

In Service Portal, define login behavior by modifying the SPEntryPage script include and setting system properties. For more information, see Service Portal Single sign-on, logins, and URL redirects on page 2422.

Service Catalog forms such as catalog items and record producers are rendered within widgets in a two-column layout. Complex forms may not display as expected.

- Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.
- There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.
- Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.

For more information, see Service Catalog forms in Service Portal on page 2207.

The Service Portal includes a base system Shopping Cart widget.

Use the Shopping Cart widget.

---

### Service Catalog forms in Service Portal

Service Catalog forms are rendered within Service Portal widgets in a two-column layout. Complex forms may not display as expected.

### Recommendations when creating Service Catalog forms

Use the following recommendations as a guide to building scalable forms that can be used in both applications:

- Keep forms simple. Because forms with multiple containers, variable sets, and client scripts do not always display as expected in Service Portal, keep forms short to eliminate conversion and debugging issues.
Think in mobile. Any support for Catalog Client Scripts or Catalog UI Policies is the same as in mobile. Review the following resource: Mobile client GlideForm (g form) scripting and migration.

**Form rendering in Service Portal**

Containers and variable sets within Service Catalog forms are translated into a two-column layout when implemented in Service Portal. Service Catalog forms are rendered in Service Portal using the following rules:

- Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.
- There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.
- Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.

For other forms in the platform, the view determines how the form displays in Service Portal. For base system tables, the form opens in the Service Portal using the Service Portal table form view.

**Example layout conversions**

The following examples demonstrate how Service Catalog forms display in Service Portal.

**Single-column form**

A Service Catalog form with:

- Two containers.
- A single-column layout.
Figure 529: Service Catalog form

In Service Portal, the single-column layout renders as expected.
Two-column layout with subcontainers

A Service Catalog form with:

- A container with a two-column layout.
- A subcontainer with a single-column layout.
- A subcontainer with a two-column layout.
In Service Portal, the two-column layout setting of the subcontainer is ignored. The subcontainer renders as a single column.

**Figure 531: Service Catalog form**
Two-column layout with variable sets and subcontainers

Figure 532: Service Portal result

A Service Catalog form with:
- Containers with single-column and two-column layouts.
- Variable sets with a two-column layout within containers.
In Service Portal, the two-column layout settings of the variable sets are ignored when inside a container column.

Figure 533: Service Catalog form
Figure 534: Service Portal result
Containers within variable sets

A Service Catalog form with:

- Variable sets with single-column layouts.
- A container with a single-column layout with a container split within a single-column variable set.
- A container with a two-column layout within a single-column variable set.

Figure 535: Service Catalog form
In Service Portal, the container split and two-column container settings are ignored when inside a single-column variable set.
Nested containers

A Service Catalog form with:
- Containers that contain variable sets.
- Variable sets that contain nested containers.

Figure 537: Service Catalog form

In Service Portal, nested container formatting is ignored and displays as a single-column.
<table>
<thead>
<tr>
<th>Container1</th>

<td>NestedVariable6</td>
</tr>
</tbody>
</table>

**Figure 538: Service Portal result**
Render a complex form in Service Portal using an iFrame

Because complex forms do not display as expected in Service Portal, you can render catalog items, record producers, and order guides in Service Portal using an iFrame. This workaround is a temporary solution to enable your Service Portal to function as expected while you simplify any complex Service Catalog forms.

When rendering items in an iFrame in Service Portal, the following limitations apply:

- On catalog items and record producers, the attachment icon is not visible. As a result, users cannot attach any files during the submission. As a workaround, you can add the attachment button to your form.
- Click-through for the hover-over icon is not available.
- Forms are not optimized for a mobile environment.

Use the attached resources and follow the instructions detailed in the Community post: Service Catalog on Service Portal.

**Note:** Be sure to make changes in a test environment before updating your production instance.

Replace a Service Catalog form script with a widget

You can use widgets in Service Portal to replace UI Macros. If your Service Catalog form includes a UI Macro that references other fields or variables on the form, you can create a widget to hold reusable code and embed it within the Service Catalog form. Use special syntax to access any variable fields on the form.

Role required: admin or sp_admin

1. Create a widget that performs the action you would like to use in catalog item forms. See step 7 for a simple example widget that accesses another variable on the form.
2. Open a catalog item that previously used a UI Macro or other reusable component not supported in Service Portal.
3. In related lists, add a new variable to the catalog item.
4. Configure the variable form to add the Widget field.
5. In the Type field, select Macro.
6. In the Widget field, select a widget that performs the desired action.
7. Use the $scope.page.g_form() or $scope.page.field syntax in the embedded widget to access the catalog item values.
   This example shows how to modify the value of a single-line text variable with the name color associated with the catalog item.

**Widget HTML Template**

```
<div>
  Data from catalog variable:
  <h1>{{ c.data.message }}</h1>
</div>
```

**Widget client script**

```
function($scope) {
  var c = this;

  //Watch for changes in the color variable
  $scope.$watch(function () {
    return $scope.page.g_form.getValue('color');
  }, function (value) {
```
// Update local data object with data from variable
c.data.message = value ?
'Content of color variable: ' + value : '';
});
}

You can use the following to access variable or catalog item fields:

- `$scope.page.g_form()`: The g_form instance on the form. You can use all supported g_form methods described in Service Portal and client scripts on page 2225. For example, `g_form.setValue('variable_name', 'new value');`.
- `$scope.page.field()`: The object that represents the variable.

When you open the catalog item in the Service Portal, the embedded widget accesses the variable fields associated with the catalog item.

What color would you like?

Blue

Data from catalog variable:

Content of color variable: Blue

Service Portal configuration page

Most Service Portal configuration is accessible through the Service Portal configuration page landing page. In your instance, access the Service Portal configuration page by navigating to Service Portal Service Portal configuration. The Service Portal configuration page opens in a new tab in your browser.
Service Portal
Create rich, engaging and modern experiences to help your business run better
Select one of the options below to continue

- **Branding Editor**
  Customize your portal's title, logo and theme colors.
  Preview changes as you make them

- **Designer**
  Create and layout pages with drag-and-drop functionality.
  Preview pages as you make changes

- **Page Editor**
  Configure the properties of pages, containers and widgets from a map view

- **Widget Editor**
  Create widgets from scratch or customize an existing one. Write HTML, CSS, and Javascript with real-time preview

- **Get Help**
  Browse guides, tutorials and videos to learn how to set up, configure and customize your portals

*Figure 539: Service Portal configuration page*
You can also access the configuration page by appending your URL with sp_config. For example, https://<instance name>.service-now.com/sp_config.

Use each option on the Service Portal config page to set up the different parts of your portal.

# Set up Service Portal

Set up a site for your users using Service Portal.

## Requirements

Configuration for Service Portal takes place in the Service Portal Configuration page. You can access this page by navigating to Service Portal Service Portal Configuration.

Role required
admin or sp_admin

## Before you begin

Take the following into consideration before configuring Service Portal:

- Who are you building your site for and why?
- What information do you want to include in your site?
- What do you want the mobile experience to be for users?
- Which platform applications do you plan to use in your portal?

You can use parts of the platform, such as knowledge articles and catalog items, as the content for your portal.

For example, if you are building a knowledge portal, the content displays in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

- How customized is your service catalog? Catalog client scripts and UI policies only work in Service Portal if they use the mobile GlideForm API, so you may need to make some changes.

## What to do

### Create a portal

A portal is the engine that houses all of the references to content for your site. The portal record defines the URL extension for a site, as well as things like the knowledge base, catalog, and homepage. You can also use the portal record to define the header menu and the portal branding. From the Service Portal configuration page, click the New Portal tile. Use the fields on the form to associate pages to the portal.

- Create a portal on page 2230

### Create a page

Pages are the centerpiece of the end user experience. Page definitions not only control the
layout of the content, they craft the experience for the user. Pages also help define mobile responsiveness, which is a key component in the user experience.

Use any existing page included with Service Portal as an example for your own creation.

Use the Service Portal Designer to create pages, assign layouts, and add widgets.

- Create and edit a page using the Service Portal Designer on page 2250

Create a widget

Widgets are the power behind the portal. Widgets are highly customizable and can be used to provide an endless variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself. That widget instance has its own record so you can configure it specifically for each use. For example, you can add several Icon Link widget to a page, configure them to link to different areas and with different icons, and none of them will be affected by the others.

You can start by cloning an existing widget and making changes to your cloned version. Developers or people with an advanced understanding of AngularJS can create a new widget.

Create a portal homepage

When a portal is referenced by the URL suffix it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

- Assign a homepage to a portal on page 2258

Configure the header menu

The header menu in a portal is actually comprised of two separate widgets: a header widget, which determines the style of the header, and the menu widget, which determines the actual items that appear in the header. You need to configure both before a header menu can appear and act like a header menu in your portal.

- Create a portal header menu on page 2234
- Add a header or footer to a portal on page 2234

Configure the branding for the portal

The Branding Editor allows you to configure the styles and theme of your portal in a view with real time updates. You can see how your portal will appear to users with the click of a button. More advanced users still have the option of creating CSS stylesheets for the portal theme, however they will not be able to take advantage of the real
time update that the Branding Editor provides. Any changes made in the Branding Editor or to specific components of the portal (such as a widget or a page container) override any customizations made to the theme.

- Configure portal branding on page 2241
- Create a portal theme on page 2244

Next steps

- Configure search in the portal
- Set up URL redirects

Unsupported features in Service Portal

Service Portal is an alternative presentation layer for the platform. As such, not all features of the platform are extended to Service Portal. Consider your full application and the abilities of Service Portal before making considerable investments. ServiceNow will continue to enhance Service Portal over time.

Not currently supported

- Domain separation
- Approvals with e-signature

No plans to support

- @ Mentions
- Click-through/pop-ups
- UI macros
- Formatters
- UI actions marked as Client
- Nested container Catalog variables
- Survey wizards

Some client scripting globals are also unavailable in Service Portal. For more information, see Service Portal and client scripts on page 2225.

Service Portal and client scripts

You can use client scripts and catalog client scripts in the Service Portal if the UI Type is set to Mobile/Service Portal or All. Client scripts and catalog client scripts are used with the Form widget and SC Catalog Item widget, as opposed to a widget client controller.

Before flagging a script as Mobile/Service Portal or All, make sure that you are only using the mobile APIs. Setting a client script to Mobile does not ensure that it will work, it simply flags that the script should be attempted by the mobile app or the Service Portal. Many of your existing client scripts can be set to All as long as the API calls are supported by the mobile client scripting environment.
The topics in this section require advanced coding knowledge and an understanding of Service Portal APIs.

**Checking desktop vs mobile runtime**

You might want to mark a client script compatible with both desktop and mobile, but still do something different depending on the runtime. You can use this script:

```javascript
if (window === null)
    // Write your mobile compatible code here
else
    // Write your desktop compatible code here
```

**Unsupported client scripting globals**

Widget client controllers are full Angular controllers and are not subject to the unsupported client script globals listed here. Use jQuery and Angular as needed.

The following globals and APIs are unavailable in client scripts and catalog client scripts used in the Service Portal:

- `window`
- `document`
- `$`
- `jQuery`
- `$$`
- `$$j`
- `angular`

**Embedded widgets & g_form**

When using the Service Catalog variable type Macro and Macro with Label you can pick a widget to embed in a catalog item form. Within the client controller for the embedded widget you can access the field object and catalog item `g_form` instance using:

- `$scope.page.field`
- `$scope.page.g_form()`

**Supported client side APIs**

These are the supported client scripting APIs you can use in `onLoad`, `onChange`, and `onSubmit` client scripts.

For detailed class and method information, see the API reference.

<td>• setSectionDisplay(sectionName, isVisible)</td>
</tr>
<tr>
<td></td>
<td>• setValue(fieldName, value, displayValue)</td>
</tr>
<tr>
<td></td>
<td>• setVisible(fieldName, isVisible)</td>
</tr>
<tr>
<td></td>
<td>• showErrorBox(fieldName, message, scrollForm)</td>
</tr>
<tr>
<td></td>
<td>• showFieldMsg(fieldName, message, type: &quot;info</td>
</tr>
<tr>
<td></td>
<td>• showRelatedList(relatedTableName)</td>
</tr>
<tr>
<td></td>
<td>• showRelatedLists()</td>
</tr>
<tr>
<td></td>
<td>• submit(submitActionName)</td>
</tr>
</tbody>
</table>

**Note:** Using the variables.var_name notation with the g_form API is not supported in Service Portal. g_form as a global object cannot be used in a widget client controller or in a UI script.
<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_list</td>
<td>• get(fieldName)</td>
</tr>
<tr>
<td></td>
<td>• addItem(value, displayValue)</td>
</tr>
<tr>
<td></td>
<td>• removeItem(value)</td>
</tr>
<tr>

<tr>
<td></td>
<td>• setDefaultOperator(operator)</td>
</tr>
<tr>
<td></td>
<td>• getDefaultOperator()</td>
</tr>
<tr>
<td>g_service_catalog</td>
<td>isOrderGuide()</td>
</tr>
<tr>
<td>GlideAjax</td>
<td>new GlideAjax(scriptIncludeName)</td>
</tr>
<tr>
<td></td>
<td>• addParam (name, value)</td>
</tr>
<tr>
<td></td>
<td>• getParam (name)</td>
</tr>
<tr>
<td></td>
<td>• getXML(callback)</td>
</tr>
<tr>
<td></td>
<td>• getXMLAnswer(callback)</td>
</tr>
<tr>
<td></td>
<td>• getJSON(callback)</td>
</tr>
<tr>
<td></td>
<td>• setErrorCallback(errorCallback)</td>
</tr>
<tr>
<td></td>
<td>• getURL()</td>
</tr>
<tr>
<td></td>
<td>• getParams()</td>
</tr>
<tr>
<td></td>
<td>• execute()</td>
</tr>
<tr>
<td></td>
<td>• successCallback(data, status, xhr)</td>
</tr>
<tr>
<td></td>
<td>• errorCallback(xhr)</td>
</tr>
<tr>
<td></td>
<td>• setScope(scope)</td>
</tr>
</tbody>
</table>

**Note:** Because the mobile platform does not allow synchronous GlideAjax calls, the getXMLWait() method in a GlideAjax call will not work in the Service Portal. Instead, use one of the following:

- getXML(Function callback)
- getXMLAnswer(Function callback)
### Usage examples

**g_list**

The g_list global helps you set the filter of a glide list element or a list collector variable. Use this API in place of the g_filter API on desktop client scripts.

```javascript
function onLoad() {
  var myListCollector =
    g_list.get("my_list_collector");
  myListCollector.reset();

  myListCollector.setQuery("active=true^category=8c7b22230b402200b0b02c6317673a62");

  myListCollector.addItem('3a700d39af5f4fc0aab978df90f4c692', 'Power Supply');
  myListCollector.addItem('1cb93419a3a248318da8f814140b42f6', 'Backpack');
}
```

**g_service_catalog**

g_service_catalog is only available in Service Portal service catalog item scripts. Use this API to know if your catalog item script is run as part of an order guide or on its own.

```javascript
function onLoad() {
```
Unsupported form scripts for Service Portal

Because Service Portal doesn’t use Jelly, not all form customizations are available.

Table 1066: Supported and unsupported form scripts

<table>
<thead>
<tr>
<th>Form script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client scripts</td>
<td>Service Portal uses UI type set to All or Mobile/Service Portal. Client Scripts marked as Desktop rely on legacy APIs that aren’t supported by Service Portal. Before flagging a script as Mobile or All, make sure you are only using mobile APIs.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform. Any UI Actions marked as Client are ignored by the form widget.</td>
</tr>
<tr>
<td>UI Policies</td>
<td>Supported, although you should use only declarative UI Policies. Avoid scripting unless the outcome cannot be achieved through the condition builder.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Not supported as UI macros use Jelly.</td>
</tr>
<tr>
<td>Formatters</td>
<td>Not supported as formatters use Jelly.</td>
</tr>
</tbody>
</table>

Create a portal

Create a portal using the Service Portal configuration page.

Users from any coding level can create a portal as long as they have the admin or sp_admin role.

The Branding Editor affects the look of your portal and essentially changes the CSS for the pages. The changes you make in the Branding Editor are recorded in the portal record in the following fields. If you have experience with CSS and HTML you can configure these fields in the portal form directly as accessed through the portal UI. By theming your portal in the Branding Editor instead, you can take advantage of the real-time theme preview.

1. Navigate to Service Portal Portals, then click New.
2. Complete the portal form using the following fields.

### Table 1067: Portal form fields

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The name you use to define your portal. In the browser header and for bookmarks, the title appears as <code>&lt;Portal Title&gt; - &lt;Page Title&gt;</code></td>
</tr>
<tr>
<td>URL Suffix</td>
<td>The value that appears appended to an instance URL when you access a portal. For example, if you use sp, the instance URL for that portal would be <code>&lt;instance name&gt;.service-now.com/sp</code>. Make sure this value is unique and is not the same as any other portal.</td>
</tr>
<tr>
<td>Homepage</td>
<td>The page you want users to see first after they sign in</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Name of the knowledge base you want associated with the portal. The knowledge base you select here determines what information appears for the knowledge base page. For example, if you select IT, only the article categories defined for the IT knowledge base appear in the <code>&lt;KB categories widget&gt;</code>.</td>
</tr>
<tr>
<td>Social QA Knowledge Base</td>
<td>Name of the knowledge base where you want to store questions and answers from portal users</td>
</tr>
<tr>
<td>KB home page</td>
<td>The home page you created that you want users to see when they go to a knowledge base</td>
</tr>
<tr>
<td>Login page</td>
<td>The page you created for users to be authenticated</td>
</tr>
<tr>
<td>Logo</td>
<td>Logo that appears in the page header. You can also configure the logo in the <code>&lt;Branding Editor&gt;</code>.</td>
</tr>
<tr>
<td>Icon</td>
<td>The icon that appears in the address bar for your portal. Each portal you create can have a different icon.</td>
</tr>
<tr>
<td>Default</td>
<td>The portal you want to use as your main portal</td>
</tr>
<tr>
<td>Quick start config</td>
<td>Configuration settings generated by the <code>&lt;Branding Editor&gt;</code></td>
</tr>
<tr>
<td>CSS variables</td>
<td>Portal-specific Sass variables. You can overwrite existing theme variables in here.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope. This field is uneditable and Global by default</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>404 page</td>
<td>The default page your users see whenever a page cannot load properly. You can also define a default 404 page using the system property glide.service_portal.default_404_page.</td>
</tr>
<tr>
<td>Catalog</td>
<td>Catalog listed in the sc_catalog table to use in the portal.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only one Service Catalog can be used with a portal.</td>
</tr>
<tr>
<td>Catalog home page</td>
<td>Catalog page that you created in the portal to represent the catalog</td>
</tr>
<tr>
<td>Main menu</td>
<td>Reference to the menu in the sp_instance_menu table that appears in the header</td>
</tr>
<tr>
<td>Theme</td>
<td>Refers to a theme in the sp_theme table that defines the style and branding for the portal. The theme is the lowest level of style configuration and any changes made in the Branding Editor or to specific portal components (such as widget or container CSS) override those styles.</td>
</tr>
</tbody>
</table>
Navigate by URL

You can navigate to a portal or a page using the URL.

https://<instance name>/<sp url suffix>?id=<page id>&<page parameters>

**Elements:**
- Base Instance URL: Unique, secure web address for each instance. The default format is: https://<instance name>.service-now.com
- sp url suffix: Suffix established for the Service Portal
- id: The id of the Page to navigate to within the portal frame
- page parameters: Some pages require additional parameters to look up a record (table, sys_id)
Configure a portal header menu

Service Portal is designed to allow customers to have deep control over the behavior of their portals. One of the main navigation controls for users is the header main menu. The menu options are determined by the assignment of a main menu to the portal, but the look and behavior of the menu is defined within the theme and associated header.

Configuring a portal header with a menu involves several steps:

1. Create a header and add it to a theme.
   Until you add a theme with a header to a portal, the header menu does not display.
2. Create a main menu with menu items and assign it to the portal.
   The main menu record is where you assign which navigation options appear in the header. For example, you can add a menu item that links to another page within your portal, such as the service catalog.

Add a header or footer to a portal

Use the theme to add a header or footer to your portal.

1. Navigate to the portal theme (Service Portal Service Portal Configuration Portal Tables Themes) then click the theme you want to add the header or footer to.
2. In the header or footer field, select the header or footer you want to use for your portal.
   If you are just getting started, you can reuse the out of box Stock Header or Sample Footer widgets.
3. Select Fixed Header or Fixed Footer to lock the header or footer in one place so when users scroll up or down they remain in the same location on the page.
4. To configure the appearance of the header, in the Service Portal configuration page, open the Branding Editor. Under the Theme Colors tab, use the color selectors in the Navbar section to control the colors in the header.

Create a portal header menu

Create a menu with menu items to display in the header of a portal.

1. In the Service Portal configuration page (Service Portal Service Portal Configuration), navigate to Portal Tables Instance with Menu, then click New.
2. Complete the fields in the menu form.
**Figure 541: Menu form**
Table 1068: Menu fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the header menu. You need to know this when you associate the menu with your portal.</td>
</tr>
<tr>
<td>Additional options, JSON format</td>
<td>Advanced configuration options. For example, use this field to enable the shopping cart in the header menu with the following code:</td>
</tr>
</tbody>
</table>
|                                    | `{  
|                                    |   "enable_cart": {  
|                                    |     "displayValue": "true",  
|                                    |     "value": true  
|                                    | }  
|                                    | }                                                                                                                                 |
| Application                        | The record scope. The header menu record and the source table must have the same application scope.                                         |
| Widget                             | The widget that the header menu is based on. Select a menu-type widget from the list. For example, the header menu widget that is included as an out-of-box widget. |

3. Save the form then click Menu Items from the related lists.
4. Click New and complete the menu item form.

Table 1069: Menu item fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name that appears for the item in the menu</td>
</tr>
<tr>
<td>Parent menu</td>
<td>This field should already contain the name of the menu you are adding items to. You can change the value as needed to other menus</td>
</tr>
<tr>
<td>Parent menu item</td>
<td>Use this field to nest menu items within other menu items</td>
</tr>
<tr>
<td>Order</td>
<td>Value that determines where the item appears in the menu in relation to other menu items</td>
</tr>
<tr>
<td>Type</td>
<td>The kind of page the item links to. For example, you can link to another page in the portal, or an external URL. Form fields vary depending on the option you select from this list. Select Scripted list for more advanced options.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Page</td>
<td>Name of the portal page the item links to. This option is available if you select Page as the menu item type.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For example, the condition <code>gs.hasRole(&quot;sp_admin&quot;)</code> restricts access to menu items to users with the sp_admin role. Hide a menu item by setting this value to false. For more information on what conditions to use in the Condition field, see <a href="#">Create a UI action</a>.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears beside the menu item</td>
</tr>
</tbody>
</table>

Associate the menu you created with a portal, then create a header with a theme for your menu.

*Add a menu to a portal*

After you create a menu and menu items, add the menu to a portal.

Create a menu or use an existing one.

1. Navigate to Service Portal Portals, then open the portal you want to add a menu to.
2. From the main menu field, click the reference lookup icon, then select the appropriate menu by name. Click Save.
Service Portal

Service Portal styles

Pages are made up of containers, columns, rows, widgets, and widget instances. You can configure the CSS of each component, or use the CSS defined in theme and branding as global definitions for the portal. If you do not define CSS in theme or branding, Bootstrap defaults are used.

You can define CSS in your portal at multiple levels.

**Bootstrap defaults**

If no other CSS is defined, all elements use Bootstrap version 3.3.6 defaults.

**Branding editor theme colors/Portal CSS**

CSS defined in the Branding Editor Theme Colors tab. Changes made to the theme colors in the Branding Editor appear in the CSS variables field in the portal table [sp_portal]. Customizing the theme colors overwrites the Bootstrap defaults.

**Theme CSS**

CSS defined in the CSS variables field in the Themes table [sp_theme]. Use the Theme CSS as much as possible to allow for more flexible evolution of your portal in the future.
Using a theme overwrites the Portal CSS/Branding Editor theme colors.

**Page CSS**
CSS defined in the Page Specific CSS field in the Pages table [sp_page].
Page-specific CSS overwrites the theme CSS.

**CSS classes**
You can define CSS classes elements on the page within each respective record.

**Widget CSS**
CSS defined in the CSS field in the Widgets table [sp_widget].
Widget CSS overwrites container, column, and row CSS.

**Widget instance CSS**
CSS defined in the CSS field in the Instance table [sp_instance].
Widget instance CSS overwrites all other CSS definitions.
Figure 543: Hierarchy of style application in the Service Portal

Configure portal branding

Use Branding Editor to give your portal its own look and feel.

To access the Branding Editor, navigate to Service Portal Service Portal Configuration, then click Branding Editor.

Select the portal you want to customize the theme for from the portal list. Then use the options on the Quick Setup and Theme Colors tabs to customize your portal.
Figure 544: Branding Editor

Table 1070: Quick Setup tab options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Title</td>
<td>The name of your portal. Changing the name of the portal in the Branding Editor also changes the title on the portal form field in the platform UI.</td>
</tr>
<tr>
<td>Logo</td>
<td>The logo that appears in the header for your portal. This image is scaled to a maximum height of 46 px and a maximum width of 200 px.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Logo padding</td>
<td>Where you want the logo to sit in location to the edge of the header. This information is stored in the CSS variables section on the portal form.</td>
</tr>
<tr>
<td>Tag line &amp; background</td>
<td>Fields defined by the JSON schema in the Quick start config field on the portal record in the platform UI. The sample Service Portal adds Tag Line and Background to the Branding Editor using the following schema:</td>
</tr>
</tbody>
</table>
|                            | ```json
[{
   "tagline": {
      "table": "sp_instance",
      "sys_id": "34fe3d96cb20020000f8d856634c9cf4",
      "field": "title"
   },
   "hero_background": {
      "table": "sp_container",
      "sys_id": "be98a8d2cb20020000f8d856634c9c63",
      "field": "background_image"
   }
}]
``` |
| Tag line                   | Introduce your users to a portal page with a tag line. This text is stored in an instance of the homepage search widget.                     |
| Tag line color             | Select a color for the tag line.                                                                                                            |
| Homepage background color  | Add a color for your background. You can type in a color name, hex color, decimal (r,g,b), or select from the color palate.                |
| Background image           | Upload an image to appear in the background of your homepage. This image is stored in the container for the widget on your homepage.        |

For any colors on the theme tab, you can use the standard color name, hex code, decimal (r,g,b) code, or select the color from the color palate. All the color definitions are stored in the CSS variables field of the portal form. The theme preview updates in real time as you make changes.

**Table 1071: Theme colors tab**

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Navbar</td>
<td>Use the fields in this section to customize the colors for the header menu</td>
</tr>
<tr>
<td>Brand</td>
<td>Use the fields in this section to customize the page colors. For example, the page background or the widget background.</td>
</tr>
<tr>
<td>Text</td>
<td>Use the fields in this section to customize the color of the text on a page.</td>
</tr>
</tbody>
</table>
Changes made to the theme colors in the Branding Editor appear in the CSS variables field of the portal form in the platform UI.

Create a portal theme

If you need more customization than Branding Editor can provide, you can create your own custom theme. Only users with an understanding of CSS should create custom themes.

1. Navigate to Service Portal Themes, then click New.

2. Complete the form fields and select Save.
Table 1072: Theme form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your theme. Use this name to associate the theme with your portal. This name is not visible to users, you should know it to apply the correct theme to a portal.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Header</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme. Headers and footers are widgets and can be configured the same way.</td>
</tr>
<tr>
<td>Footer</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme.</td>
</tr>
<tr>
<td>Fixed header</td>
<td>Locks the header at the top of the page so that when a user scrolls the header remains on the screen.</td>
</tr>
<tr>
<td>Fixed footer</td>
<td>Locks the footer at the bottom of the page so that when a user scrolls the footer remains on the screen.</td>
</tr>
<tr>
<td>CSS variables</td>
<td>CSS custom properties that you can use to change the color and styles in a portal. For example, the stock theme uses some of the following variables:</td>
</tr>
<tr>
<td></td>
<td>$sp-logo-margin-x: 15px !default;</td>
</tr>
<tr>
<td></td>
<td>$sp-tagline-color: $text-color !default;</td>
</tr>
<tr>
<td></td>
<td>$navbar-inverse-bg: #3a3f51 !default;</td>
</tr>
</tbody>
</table>

3. To add a style sheet to the theme, in the CSS Include related list, click New.
Complete the style sheet form fields, then click Save.

**Table 1073: Style sheet form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
</tbody>
</table>
### Field Description

| **Source** | Select one of the following options:  
|            |   • Style Sheet: Add an internal style sheet that has been uploaded to the CSS table [sp_css]. For example, ng-sortable.min.css. Internal style sheets use standard CSS in the CSS field.  
|            |   • URL: Link to an external style sheet. Use external style sheets to use the same CSS as a corporate website or other online resource.  

| **Style sheet** | Associate a style sheet or CSS file URL, depending on which option you select in the Source field.  

5. To add a JavaScript include to the theme, in the JS Include related list, click New.

![Figure 546: CSS include record](image)

6. Complete the style sheet form fields.
### Table 1074: Style sheet form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• UI Script: Add an internal UI script that has been uploaded to the UI script table [sys_ui_script]. UI scripts allow you to create client-side JavaScript and reuse it in multiple locations. For more information on UI scripts, see <a href="#">UI scripts</a>.</td>
</tr>
<tr>
<td></td>
<td>• URL: Link to an external JavaScript file. Use external URLs to use the same JavaScript as a corporate website or other online resource.</td>
</tr>
<tr>
<td>UI Script or Java file URL</td>
<td>Associate an internal UI script or Java file URL, depending on which option you select in the Source field.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that the JS Include was last updated</td>
</tr>
<tr>
<td>Package</td>
<td>The Service Portal package that the JS include is associated with. For example, Service Portal Configuration Pages. This fields is populated by default.</td>
</tr>
</tbody>
</table>

**Pages**

Use pages to organize content, ensure responsive mobile optimization, and design meaningful portal user experiences for your customers.

A page houses containers and rows, which then contain widgets. By manipulating the layout of the page, and the widgets within it, you can construct your desired user experience. Each page has a page_id that you can use to reference the specific page, therefore any created page can be referenced in more than one portal.

You can use any of the pages provided with Service Portal as a template or a starting point.

Create and edit a page using the Service Portal Designer

Create or edit a page and use layouts to organize the columns that house the widgets. These steps are intended for users with little to no coding experience. The Service Portal Designer includes several layers of customization from simply adding widgets in a particular configuration on a page, to adding CSS classes.

To access the Service Portal Designer, navigate to Service Portal Service Portal Configuration, and then click Designer.

1. Switch to the portal you want to design pages for by selecting the portal name in the header.

2. From the Service Portal Designer, select a page to customize or click Add a new page.

3. Under Layouts, select Container and drag it onto the page.

4. Drag one of the other layouts and drop it in the container.
   This layout defines the structure of your page and the space available to drop widgets. The structure of the layout aligns with the Bootstrap grid template and always adds up to 12.

5. Use the filter to search for a widget, then drag the widget to the layout.
6. Edit page properties.
   a) Click Edit Page Properties. The page record from the Pages table [sp_page] opens.
   b) Edit the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Internal name of the page. Use the title to search for a page in the Service Portal Designer.</td>
</tr>
<tr>
<td>ID</td>
<td>A unique ID for the page. The ID is what you use to assign a page to a portal. It also determines the URL for the page, for example <a href="https://instance">https://instance</a> name.service-now.com/doc_portal/?id=doc_page, where doc_page is the page ID.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Public</td>
<td>Enables the page to be accessed without the need for authentication. If Public is selected, all users can view the page no matter the roles listed.</td>
</tr>
<tr>
<td>Draft</td>
<td>Mark a page as draft to limit user ability to view the page while you are still creating it. Only users with the admin role can view a page in draft, all other users see a 404 page.</td>
</tr>
<tr>
<td>Roles</td>
<td>Limit user access to a page by role.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes the portal page. This field is not public facing.</td>
</tr>
<tr>
<td>Page Specific CSS</td>
<td>Unless a page has Page Specific CSS, the page inherits CSS from the Theme and Branding. If you need a page to look different, the Page Specific CSS overrides the inheritance from the Theme and Branding.</td>
</tr>
<tr>
<td>Dynamic page title</td>
<td>Create variables to generate descriptive titles depending on the content loaded into a page.</td>
</tr>
</tbody>
</table>

7. Edit container properties.
   a) Click within the container you would like to edit, or select Container in the breadcrumbs.
   b) Click the edit icon []. The container record from the Containers table [sp_container] opens.
   c) Edit the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the container.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the containers appear on a page. To set a container to appear above all other containers, give the container the lowest number in the Order field.</td>
</tr>
<tr>
<td>Page</td>
<td>The page in which the container appears.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Screen reader title</td>
<td>The title used by a screen reader.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Width</td>
<td>Width of the container. Options include:</td>
</tr>
<tr>
<td></td>
<td>- Fixed</td>
</tr>
<tr>
<td></td>
<td>- Fluid</td>
</tr>
<tr>
<td>Parent class</td>
<td>Parent CSS class for the container.</td>
</tr>
<tr>
<td>CSS class</td>
<td>The CSS classes for the container. Overwrites pagespecific CSS.</td>
</tr>
<tr>
<td>Background color</td>
<td>The background color of the container.</td>
</tr>
<tr>
<td>Background image</td>
<td>Background image for the container.</td>
</tr>
<tr>
<td>Background style</td>
<td>The display style of a background image. Options include:</td>
</tr>
<tr>
<td></td>
<td>- Default</td>
</tr>
<tr>
<td></td>
<td>- Cover</td>
</tr>
<tr>
<td></td>
<td>- Contain</td>
</tr>
<tr>
<td></td>
<td>- Repeating</td>
</tr>
<tr>
<td>Bootstrap alternative</td>
<td>Selecting this field removes the standard Bootstrap grid classes and disables the Bootstrap grid system in the container. If selected, the following are not applied:</td>
</tr>
<tr>
<td></td>
<td>- The Width field in the container record.</td>
</tr>
<tr>
<td></td>
<td>- Standard Bootstrap class in the row record within the container.</td>
</tr>
<tr>
<td></td>
<td>- The Size - xs, Size - sm, Size - md, and Size - lg fields in column records within the container.</td>
</tr>
<tr>
<td></td>
<td>Only select this field if you plan to provide custom CSS classes and CSS for the container, row, and column records.</td>
</tr>
<tr>
<td>Move to header</td>
<td>If selected, the container sticks to the header and does not scroll. Use this option to create a subheader.</td>
</tr>
</tbody>
</table>

8. To switch to a different page, click the Pages tab in the left pane, then select the next page you want to configure.

9. Use the Preview button in the header to view your page as you design it. You can also use Preview to view your page in mobile or tablet mode through the controls presented in the header.
Figure 549: Designer tablet view
Add a subheader to a page

Select a container record to serve as a page subheader. A subheader sticks to the page header and does not scroll.

Role required: admin

1. From the Service Portal configuration page (Service Portal Service Portal Configuration) open the Service Portal Designer.
2. Open the page you want to add a subheader to.
3. Click the container that you would like to use as a subheader, or select the container using the breadcrumbs.
4. Click the edit icon ( ).
5. Select Move to header.
Figure 550: Container record

As a subheader, the container sticks to the header and does not scroll.

Configure a page in Page Editor

Page Editor provides an easy-to-read tree view of every element as it resides on the page.

1. In the Service Portal configuration page (Service Portal Service Portal Configuration), click Page Editor.
2. Click the nodes within the tree menu to load corresponding records on the page directly below the menu. Use this view to visualize and edit every page element as well as the containers within the layout.
3. Use the page node to complete page details at a more granular level. Use the information in the following table to complete the page node fields.
Table 1077: Page view

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the page. The page title isn't public facing however you can use it to search for a page in the Service Portal Designer. The page title also helps determine the page ID.</td>
</tr>
<tr>
<td>ID</td>
<td>A unique ID for the page. The ID is what you use to assign a page to a portal. It also determines the URL for the page, for example <a href="https://instance">https://instance</a> name.service-now.com/doc_portal/?id=doc_page, where doc_page is the page ID.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes the portal page. This field is also not public facing.</td>
</tr>
<tr>
<td>Page Specific CSS</td>
<td>Unless as page has Page Specific CSS, the page inherits CSS from the Theme and Branding. If you need a page to look different, the Page Specific CSS overrides the inheritance from the Theme and Branding.</td>
</tr>
<tr>
<td>Public</td>
<td>Allows the page to be accessed without the need for authentication. If Public is selected, all users can view the page no matter the roles listed.</td>
</tr>
<tr>
<td>Draft</td>
<td>Mark a page as draft to limit user ability to view the page while you are still creating it. Only users with the admin role can view a page in draft, all other users see a 404 page.</td>
</tr>
<tr>
<td>Roles</td>
<td>Limit user access to a page by role.</td>
</tr>
<tr>
<td>Clone Page</td>
<td>If you want to make a similar but modified page, you can use the Clone Page option. If you clone a Service Portal provided page, the page creates new widget instances for each widget on the page.</td>
</tr>
</tbody>
</table>

Assign a homepage to a portal

Edit your portal record to specify any page as your homepage.

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

1. From any page in the Service Portal Designer, click Edit Portal Properties.
Figure 552: Edit Portal Properties

2. From the Homepage list, select the page you want for your portal homepage and click Save.
Assign a default error page

Create a default 404 error page for your portal using a system property.

You can assign an error page to a portal using the portal form. If you do not assign an error page using that form, the system uses the default 404 page containing the breakout game widget. Use the default 404 page property [glide.service_portal.default_404_page] to configure the default error page.

*Create a page* before adding it as the default error page.

1. Navigate to Service Portal Properties.
2. In the Default 404 page for Service Portals, type the page ID found in the ID field of the page form.

Containers, rows, and columns

Containers, rows, and columns are what give structure and form to the content on a portal page.

**Containers**

Containers are markup artifacts that are put on a page to ‘contain’ the layouts that will ultimately house the widgets.

You can view containers and how they make up a page in the Service Portal Designer (Service Portal Service Portal Configuration Designer). Open a page in the Service Portal Designer, then click anything on the page. In the top left corner, breadcrumbs appear to show you which element on the page you have selected. Use the breadcrumbs to select a container, then click the edit icon ( ).
You can also edit a container by navigating to the Page Editor and selecting the container node in the tree view.

Figure 554: Service Portal Designer breadcrumbs
Figure 555: Container record

- Change the layout of widgets on a page
- Determine the number of columns available to layout widgets
- Determine whether to scale with changes to the browser window
- Add a background color to a portion of a page
- Add an background image to a portion of a page
• View the current layout of the widgets within it

Container CSS

Define container CSS by specifying a parent class or CSS class.
Only users with an advanced understanding of CSS should make CSS configuration changes.
Configure container CSS by selecting the container in the Page Editor tree hierarchy.

Figure 556: Container CSS

You can also edit the container CSS from the Service Portal Designer. Select the container using the
breadcrumbs at the top of the page, then click the edit icon ( ).
Row and column CSS

Use the CSS class to define row and column CSS.

Select a row or column in the tree hierarchy in the Page Editor to add CSS class names to the CSS class field.
You can also edit the CSS class for both rows and columns using the Service Portal Designer. In the Designer, select the row or column using the breadcrumbs, then click the Edit Option icon ( ) to open the modal window.
Define page-specific CSS

Themes control the overall look and feel of a portal, but you can modify a page using the page-specific CSS option to be more specific. CSS applied to a page affects the page and all the elements falling within or below the page, such as containers, rows, or widgets.

1. From the Service Portal Configuration page (Service Portal Service Portal Configuration), click Page Editor.
2. Find the page you want to style in the page list.
3. Select the top-level node in the page hierarchy to open the Editor for that page.

![Page hierarchy diagram](image)

**Figure 560: Page hierarchy**

4. In the page-specific CSS field, enter CSS for the styles you want to change on the page.

```css
body {
    background-color: #fff;
}
```

**Figure 561: Page specific CSS**

Include font icons on a page

Include font icons on a page so that all the widgets on the page have access to the font-icon set.

1. In the platform UI, navigate to Service Portal Pages and click the page you want to add font-icons to.
2. Attach the font-icon file to the page record.

3. In the Page Specific CSS field for the page, add the CSS for the font-icon definition. Use the sys_id of the attachment as the src in the CSS.

Result

You can select an icon from the icon set for any widget on this page. For example, in the HTML widget you can use the source code option to use an icon.
Widgets

Widgets are what define the content in your portal. You can use the base system widgets provided with Service Portal, clone and modify widgets, or develop custom widgets to fit your own needs.

Out of box widgets are read-only so you can benefit from future updates, which means you can't update their code. If you need to make major changes, clone the widget and give it another name and ID.

Widget library

Widgets included with Service Portal can be customized to suit your own needs or as a basic code sample for you to refer to as you are building your own widgets.

Due to the ever-changing number of widgets that exist at any given time in Service Portal, this is not a definitive list. More widget descriptions will be added as they become available.

Depending on your configuration, widgets that do not contain any information do not appear in your Service Portal page.

To view the instance options for a widget, use the widget context menu.

Example widgets

Example widgets

All widgets in Service Portal can be used as example code for how scripts are used in a widget. However, several out-of-box widgets have been included expressly for this purpose.

Use the example widgets to see how to use HTML, CSS, or client and server scripts in Service Portal. You can also clone and extend each widget to suit your needs.

Approvals widget

Users can approve or reject items directly within Service Portal.

**Note:** Service Portal does not currently support Approvals with e-signature.

---

**My Approvals**

**REQ0010001 - Dell Precision 690**

Requestor ITIL User

Price $1,875.00

**Options**

- [X] Reject

- Approve

---

Figure 562: Approvals widget
**Instance options**

Use the instance options to change the appearance of the approvals widget.

![Instance options](image)

**Figure 563: Approvals widget instance options**

**Table 1078: Approvals widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Add an icon to display beside the widget name.</td>
</tr>
<tr>
<td>Buttons stacked side by side</td>
<td>If this check box is selected, the Approve and Reject buttons appear horizontally beside each other. If this check box is cleared, the Approve and Reject buttons appear stacked vertically.</td>
</tr>
</tbody>
</table>

**Approval Info widget**

The Approval Info widget works in tandem with the Approval widget to display details about the approval request.
Figure 564: Approval Info widget

*Approval Record widget*
The Approval Record widget shows the full record for an approval including the activity stream.
Figure 565: Approval Record widget

_Breadcrumbs widget_

The breadcrumbs widget allows users to easily navigate around a portal.
The breadcrumbs widget does not have instance options. It displays information based on where a page is located in a portal.

**Breakout Game widget**
The Breakout Game widget is a fun 404 interaction for pages that don't exist.

The Breakout Game does not have instance option. You can use it as an example of how to use the Link Function as part of an Angular Directive.

**Calculator widget**
The calculator widget does simple calculations.

The calculator widget does not have instance options. You can use it as an example of how to pass data between the client and server.
Figure 568: Calculator widget

Carousel widget
The carousel widget displays a scrolling list of images.

Use the carousel widget to showcase items on your portal page. For example, display items available in a service catalog at the top of the service catalog page.
Add slides to the carousel widget
Use the related lists for an instance of the carousel widget to add images for the carousel widget to scroll through.

Role required: Admin or sp_admin

1. Navigate to Service Portal Widgets Carousel.
2. Open an instance of the Carousel widget.
3. From the instance of carousel form, under Related Lists, click Carousel Slides.
4. Click New and complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the carousel slide. Use the name to differentiate the slide from other slide records.</td>
</tr>
<tr>
<td>Order</td>
<td>Where the slide appears in the list of slides</td>
</tr>
</tbody>
</table>
Repeat this step for as many slides as you want to appear in the carousel widget.

**Cool Clock widget**

The Cool Clock widget uses instance options to show different times around the world.

Cool clocks demonstrates how to use instance options in a widgets. The time zone is loaded using an instance option. If you do not select a time zone, the widget uses a default time zone.
Figure 570: Cool Clock widget
# Instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the clock, for example New York, NY. The name appears below the clock so it helps to use a name related to the time zone.</td>
</tr>
<tr>
<td>Timezone</td>
<td>The location from which the time is displayed. Use the local full name, for example, America/New York, instead of the abbreviated time zone. Using the full name allows time zones to stay consistent with daylight savings time. The default value is America/Los Angeles</td>
</tr>
<tr>
<td>Second hand color</td>
<td>Color of the second hand using the hex code, RGB, or color name. The default value is red.</td>
</tr>
</tbody>
</table>

---

*Data table from instance definition widget*

Data table from instance definition displays a table that you define using the widget instance options.

After you add the data table from instance definition widget to a page, use the instance options to configure the appearance of the table.
Figure 572: Data table from instance definition widget

### Instance options

Table 1079: Data table instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. If you leave this field empty the name of the table displays as the widget name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the widget displays records from.</td>
</tr>
<tr>
<td>Filter</td>
<td>Text field from the condition builder that you can use to limit the items returned in the table. To create a filter, use the context menu to open the widget instance in the platform. Then use the condition builder to create a filter.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Limits the number of items displayed in the table. If there are more entries than allowed in the table, users can scroll to the next page.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title.</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when they click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
</tbody>
</table>
Enable Filter

Select this check box to allow users to create their own filter for the table. This option is currently only supported for the Data Table widgets.

**Data Table from URL definition widget**

The Data Table from URL definition widget displays the table you select from the list.

![Data Table from URL definition widget](image)

**Instance options**

Complete the instance options to define the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. Select the Use Instance Title check box to use this title instead of the name of the table.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when the click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table. For example, short description or priority.</td>
</tr>
</tbody>
</table>
### Use Instance Title
Select to use the title in the Title field instead of the table title

---

**Form widget**
The form widget is a platform form within the Service Portal UI with a few differences.

![Form widget image](image)

*Figure 574: Form widget*
URL Parameters

The form widget accepts the following parameters within the URL:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id or sl_sys_id</td>
<td>The sys_id for the record to be displayed</td>
</tr>
<tr>
<td>table, sl_table, or t</td>
<td>The table for the record to be displayed</td>
</tr>
<tr>
<td>view or v</td>
<td>The view used to display the record</td>
</tr>
</tbody>
</table>

Table 1080: Form widget URL parameters

In the following example, the URL would display an incident with a sys_id of 1c741bd70b2322007518478d83673af3 in the portal view.

https://example.service-now.com/sp?id=form&table=incident&sys_id=1c741bd70b2322007518478d83673af3&view=portal

Table 1081: Supported and unsupported form scripts

<table>
<thead>
<tr>
<th>Form script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client scripts</td>
<td>Service Portal uses UI type set to All or Mobile/Service Portal. Client Scripts marked as Desktop rely on legacy APIs that aren't supported by Service Portal. Before flagging a script as Mobile or All, make sure you are only using mobile APIs.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>All server-side UI actions are supported in Service Portal, although setRedirectURL() operations are ignored because Service Portal forms handle redirection in a different way than the platform. Any UI Actions marked as Client are ignored by the form widget.</td>
</tr>
<tr>
<td>UI Policies</td>
<td>Supported, although you should use only declarative UI Policies. Avoid scripting unless the outcome cannot be achieved through the condition builder.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Not supported as UI macros use Jelly.</td>
</tr>
<tr>
<td>Formatters</td>
<td>Not supported as formatters use Jelly.</td>
</tr>
</tbody>
</table>

Header menu widget

The Header Menu widget controls which options appear in the page header.

Unlike other widgets in Service Portal, the header menu widget isn't something you drag onto a page. Instead you configure the header menu by associating the header menu with a portal. For more information on configuring a header menu, see Configure a portal header menu on page 2234.
Hello World widgets
The Hello World widgets are included with Service Portal as examples of how to use and create widgets.

All three Hello World widgets display the same way. The real difference between them is in their underlying code base. Each version of the widget uses a different method of using the server and client script.

To view the Hello World widgets, navigate to Service Portal Service Portal Configuration then click Widget Editor. In the Widget Editor, click Check out the Hello World Example.
Hello world 1 displays how the HTML template and the client script communicate. For more information on using the client script in Service Portal, see [Widget client script](#).

Use the widget list to switch to Hello World 2 or 3.

**Figure 576: Hello World 1**
Hello World 2 includes an example of how the server script can be used as well.

Figure 577: Hello World 2
Figure 578: Hello World 3

For more information on Service Portal APIs, see the GlideSPScriptable.

**HTML widget**

Use the HTML widget to directly inject HTML, text, lists, or content in general into a page.

Because the HTML widget can contain content of any kind, any example may just appear as regular text. For example, the HTML widget appears as a box of text on the 404 page.
Figure 579: HTML widget

Instance options

Table 1082: HTML widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name for the HTML text. Users do not see this information.</td>
</tr>
<tr>
<td>HTML</td>
<td>Text box for the HTML. Use the toolbar like most word processing tool bars. For more information on using the toolbar, see <em>Formatting in the TinyMCE editor</em>.</td>
</tr>
</tbody>
</table>

*Icon Link widget*

Link to any other item.

Configure Icon Link widgets to link to a specific URL, page within the portal, or a specific category in the knowledge base or the service catalog.

Order Something

Browse the catalog for services and items you need

Figure 580: Icon Link widget
Instance options

**Figure 581: Icon Link widget instance options**

**Table 1083: Instance options fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the icon link. Choose something that defines what the widget is linking to.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon for the widget.</td>
</tr>
<tr>
<td>Bootstrap class name</td>
<td>Use concurrently with page or theme level CSS.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Type             | Defines what the widget links to. The fields that appear on the form vary depending on which option you select. Choose from:  
  - Page: Another page in the Service Portal  
  - URL: Link to an external website.  
  - Catalog category: Link to a specific catalog category within the service catalog.  
  - Catalog item: Link to a specific catalog item.  
  - KB topic: Link to a KB topic page.  
  - KB article: Link to a KB article by number.  
  - KB category: Link to a specific KB category within the knowledge base. |
| Page             | Page within the portal that you want to link to. This field varies depending on the Type you choose. |
| Bootstrap color  | Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list. |
| Template         | The appearance of the link icon widget. Choose from:  
  - Top icon  
  - Circle icon  
  - Color box |

*Icon menu list widget*

A simple list with a glyph icon next to each link.

Configure the icon information using the Menu Items related list.

![Icon information](image)

**Figure 582: Icon Menu list widget**

1. From the instance options for the icon menu list widget, under Related Lists, click Menu Items.
2. Click New.
3. Use the fields on the New Menu Items form to configure the icons for the icon menu list widget.

Table 1084: Icon menu list widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name or description of the icon</td>
</tr>
<tr>
<td>Parent Menu</td>
<td>The name of the menu that the icon appears in. This automatically populates with the name of the icon menu list widget that you created but you have the option to switch it to another menu.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the icons appear in the icon menu list widget.</td>
</tr>
<tr>
<td>Parent menu Item</td>
<td>Nest menu items within a parent menu.</td>
</tr>
<tr>
<td>Page</td>
<td>The page within Service Portal that the icon links to. Select Page from the Type list to enable this option.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of link you want the icon to have. You can link to pages within Service Portal, external URLs, KB articles, Service Catalog, or lists. Different fields will appear on the form depending on the option you select from the list.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For more information on what conditions to use in the Condition field, see Create a UI action.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that you want to display in the icon menu list widget.</td>
</tr>
</tbody>
</table>

Language Switch widget
Add the Language Switch widget to a landing or homepage to allow your users to change the language of the page.
The Language Switch widget does not include any instance options.

**Link button widget**
The Link Button widget is a button you can nest in any other widget that links to another destination.

### Instance options

The login widget controls user access to your site.
Figure 585: Login widget

### Instance options

**Table 1086: Instance options fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show panel</td>
<td>Show or hide the panel that appears behind the login widget. The panel helps the widget stand out from the page background rather than blending in.</td>
</tr>
</tbody>
</table>

*My Requests widget*

The My Requests widget stores all of your open requests in one place.

The list is updated in real time so you can see your requests getting processed. The widget pulls open request information from the `sc_request` table.
My Requests

<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>The maximum number of entries allowed to appear in the widget.</td>
</tr>
</tbody>
</table>

Organization Chart widget
The Organization Chart widget shows employees in a tree structure relative to their manager.

The Organization Chart widget gets data from the Users table [sys_users].
The Simple List widget can be used to display any list in the system within Service Portal.

Figure 587: Organization Chart widget

<tr>
<td>View</td>
<td>The view option for when a list item links to a form. The Link to this page field must be set to a form page for this option to work.</td>
</tr>
</tbody>
</table>

**Sample Footer widget**

The Sample Footer widget is an example of a footer you can use in your portal.

Unlike other widgets in Service Portal, you add a footer to your portal by configuring it in the Theme form. For more information on adding a footer to a portal, see *Add a header or footer to a portal* on page 2234.

**Figure 589: Sample Footer widget**

**Instance options**

The Sample footer widget does not include instance options.

**Stock widget**

The Stock widget displays an example of how widgets communicate with data outside of the system.

The Stock widget pulls information from an online data source for stock information.

**Note:** As of November 2017, the Yahoo Finance API has been discontinued. As the stock widget relies on this functionality, the widget is no longer supported, and has been removed as of the London release.
Figure 590: Stock widget

**Instance options**

The Stock widget does not include instance options.

*Ticket Attachments widget*

Use the attachment widget to attach items to tickets.

Attachments should be less than 24MB. You can drag files into the Attachments widget to add them to a record.
**Attachments**

*Drop files here*

**Figure 591: Ticket Attachments widget**

**Instance options**

**Table 1089: Ticket attachments widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record ID</td>
<td>The ID number of the record for the attachment.</td>
</tr>
<tr>
<td>Record table</td>
<td>Limit the records users can add an attachment to by adding a table to the attachment widget. Users can then only add attachments if they are in a record for that table.</td>
</tr>
</tbody>
</table>

**Ticket Conversations widget**

Record of ticket items. Users can use this to communicate back and forth with the fulfiller and the receiver.

Journal entries are presented in chronological order, with the oldest entries appearing at the bottom of the widget. Entries made by the user that created the record appear on the right side of the center divider. Entries made by other users appear to the left.

The Ticket Conversations widget is intended only for tables that extend task.

Limit the number of journal entries that appears in the ticket conversation widget using the glide.service_portal.stream_entry_limit system property. The default number is 100. Change the number by navigating to Service Portal Properties, and enter the new number in the Maximum number of stream entries displayed in Service Portal field.

Instance options

Table 1090: Instance options fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use dynamic placeholder</td>
<td>Use a placeholder for journal fields. The default value is false.</td>
</tr>
<tr>
<td>No readable journal field message</td>
<td>The message that displays when there are no readable journal fields. Forms that have added journal fields may not display in the Ticket Conversation widget.</td>
</tr>
</tbody>
</table>
Ticket Location widget
Share your location in a ticket.

Figure 593: Ticket Location widget

Instance options

The Ticket Location widget does not include any instance options.

User Profile widget
Store user profile information.
The User Profile widget does not include instance options.

*Weather widget*

The Weather widget shows an example of how the server script interprets data from a source outside of the system.
The Weather widget does not include instance options.

Search widgets
Several search widgets are provided with Service Portal.
You can configure search in Service Portal using any of the search widgets.

*Home Page Search widget*
Add a search bar to your homepage.

Configure your own search sources to constrain what topics appear on search, or just use the default search sources. For more information on configuring search, see "Configure search in Service Portal" on page 2420.
Figure 596: Home Page Search widget

</tbody>
</table>

Knowledge Management widgets

Use Knowledge Management widgets to build a knowledge base for your portal.

Knowledge Management widgets are included as part of the Service Portal - knowledge base plugin [com.glide.service-portal.knowledge-base], which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

For more information on knowledge management, see Knowledge Management on page 969.

KB also in Category widget

List of articles also included within a particular category.

The information that appears in the KB also in Category widget is determined by the knowledge article child categories. For more information, see Define a knowledge article category on page 1001.

**KB Article Comments widget**
Rating and comment option for knowledge base articles.

Ratings on articles in the KB Article Comments widget determine the article popularity in the KB top rated widget.

![KB Article Comments widget](image)

**Figure 602: KB Article Comments widget**

**KB Article Page widget**
Use the Article page widget to view Knowledge Base articles within Service Portal.

Any specialized font or formatting added in the text field for the knowledge article within the platform, appears the same way in the portal.
Getting Around in Windows

Windows 8.x

Windows 8.x is designed for using touch, mouse, and keyboard together, on hardware ranging from touch-enabled tablets and laptops to PCs and all-in-one computers, including those without touch capability.

Start screen and Desktop

- **8.1:** Microsoft updated the Windows 8.1 interface by returning the Start button, providing its ease of access along with the option of the Metro interface. The intent is to provide a seamless experience on desktops, laptops, tablets, and phone devices. By default, the Start screen is displayed. Move your mouse pointer to the bottom left corner of the screen to make the Start button appear. Click it to display the desktop; click it again to display the Start screen.

- **8:** The Start screen has a default application display you can customize:
  1. Right-click any app and the Application bar will appear at the bottom, with options for the application you have selected.
  2. To add an app to the Start screen, click Pin to Start.
     If an application is already on the Start screen, you’ll see Unpin from Start instead.

Power User menu

The Power User menu displays the most commonly used applications from the Control Panel, File Explorer, and Task Manager, as well as Restart, Run, Search, and Shutdown/Update. Access it in one of the following ways:

- Press Win + X.

<td>Displays the star rating on the article page widget. If you select Use system properties, the appearance of the star rating is defined by the glide.knowman.show_star_rating system property.</td>
</tr>
</tbody>
</table>

KB Categories widget
Lists the categories for your Knowledge Base.

Figure 604: KB Categories widget

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge Administration Knowledge bases, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see Define a knowledge article category on page 1001.

The knowledge base a portal uses is determined in the portal form. On the Service Portal configuration page (Service Portal Service Portal configuration) click Portals in the header menu. Select a portal from the list, then in the knowledge base list, select a knowledge base.
**Instance options**

The KB categories widget does not include instance options.

*KB Category Page widget*

Articles and article preview within a particular category. Categories are specified within the Knowledge Base module.

SQANDA Question widget
Use the Social Q&A question widget to view and respond to questions.
Has anyone tried ordering accessories that are not listed on the catalog?

I want to order an ergonomic mouse but everything in the company catalog is pretty basic. Can I just order one online and expense it if it's the same price?

4mo ago • Asked by Abel Tutor

1 Answer

You can always consult with your manager and they may be already on the approved list of accessories. You can also submit a request and we'll let you know if you should order it and expense it.

4mo ago • Answered by System Administrator

Service Catalog widgets

Use the Service Catalog widgets to build a catalog for your portal.

The service catalog widgets are part of the Service Portal Service Catalog [com.glide.service-portal.service-catalog] plugin, which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

Most of the configuration for the Service Catalog widgets takes place in the Service Catalog application of the platform. For more information on Service Catalog, see Service Catalog.

Catalog Content widget

The Catalog Content widget is part of the Service Catalog and includes a tiled list of all the content items available in the catalog.

The items that appear on the page are grouped by category alphabetically. Catalog items and categories are defined in the Service Catalog application in the platform. For more information on creating catalog items to appear in the catalog, see Create or edit a catalog item.

**SC Catalog Item widget**

Describe catalog items and add options for users to select from.

**Configure catalog items** using the Service Catalog in the platform UI by navigating to Service Catalog Catalog Definitions Maintain items. Catalog items must have Availability set to Desktop or Desktop and Mobile.

Any specialized font or formatting added in the description field for the catalog item within the platform, appears the same way in the portal.

Catalog variables determine what information your users are allowed to pick from, for example, color, size, or price. For more information on defining the variables in the catalog item, see Create a service catalog variable.

Determine whether users can add this item to the shopping cart by selecting the Show Add Cart button check box in the widget instance options.
### iPhone 6

**iPhone 6**

iPhone 6s offers a multitude of features packaged within cutting edge design. This phone will be part of the corporate mobile contract, and you will not be billed for its use. The device has the following technical specifications:

- iOS 9
- Retina display
- A9 chip
- Touch ID

#### What color would you like?

- [ ] Black

#### How many gb's of storage?

- [ ] 16

**Price:** $450

Figure 634: SC Save Bundles widget

Instance Options

The Save Bundles widget does not have any included instance options.

SC Saved Carts widget
The Saved Carts widget shows previously created and saved bundles from the Service Catalog.
Figure 635: SC Saved Cart widget

When you add an existing cart bundle to a shopping cart, you have two options. You can:

- Replace the items in the shopping cart with the items in the bundle.
- Add the bundle in addition to the rest of the items in the cart.

Instance Options

The Saved Carts widget does not have any included instance options.

SC Shopping Cart widget
The shopping cart widget, used in combination with Service Catalog, stores all of your orders in one place.
Figure 636: Shopping cart widget

With the shopping cart widget, you can:

- Control the quantity of items going into the cart.
- Add items to a cart. This information gets stored in the sc_cart table.
- Define who the items are being requested for.
- Save specific items together as a bundle, which can be reloaded at a later time.
- Use the Clear Cart option to remove all the items from your cart.

If you want to add a bundle to your cart from the saved cart, you have the option of replacing all of the existing cart items with the bundle items, or including the bundle items with the cart items.

The shopping cart respects most Service Catalog properties.
Instance options

![Image of instance options](image)

**Table 1107: Shopping cart instance options fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Enter the name of an ng-template you want to use to provide a different template for the shopping cart. By default, two ng-templates are provided: small_shopping_cart.html and large_shopping_cart.html.</td>
</tr>
</tbody>
</table>

Enable the Shopping Cart widget

The shopping cart widget is enabled automatically for instances upgrading to Istanbul, however, there are several ways to manually enable or disable the widget.

To enable the shopping cart for a catalog item:

1. Navigate to a catalog item on the Service Catalog page in Service Portal.
2. CTRL+right-click a catalog item widget to open the **widget instance options**.
3. Select or clear the Show Add Cart Button option to enable or disable the shopping cart for that particular catalog item.
To enable the shopping cart in the portal header:

1. From the Service Portal configuration page, select the Portal editor.
2. Select the SP Header Menu in the portal hierarchy.
3. In the Additional options section, make sure the enable cart value is set to true. Set the value to false to hide the shopping cart.
Figure 639: Shopping cart in the header menu

```
{
  "enable_cart": true,
  "displayValue": "true",
  "value": true
}
```
Service Portal configuration page widgets

Service Portal uses widgets for configuration. When you configure a page or a widget for a portal in the Service Portal Configuration page, you actually use Service Portal widgets to do so.

Service Portal configuration widgets are internal only and cannot be extended.

Configuration page widgets are included as part of the Service Portal Configuration Pages plugin [com.glide.service-portal.config], which is activated automatically when you activate the Service Portal for Enterprise Service Management plugin [com.glide.service-portal.esm].

Navigate to Service Portal Service Portal Configuration to view these widgets in action.

*SP Variable Editor widget*

The Variable Editor widget allows you to change the specifications you chose for an item in the Service Catalog.

You can embed the variable editor widget in the shopping cart widget, to allow users to edit and make changes to their cart items. The options included in the widget are determined by the specific catalog item and the variables that have been configured for it.

For more information on the service catalog variables that are available in Service Portal, see *Types of variables*.

Text Primary - Nullam id dolor id nibh ultricies vehicula ut id elit.
Text Success - Duis mollis, est non commodo luctus, nisi erat porttitor ligula.
Text Info - Maecenas sed diam eget risus varius blandit sit amet non magna.
Text Warning - Etiam porta sem malesuada magna mollis euismod.
Text Danger - Donec ullamcorper nulla non metus auctor fringilla.
**Widget Edit Panel widget**

The Widget Edit Panel appears on the main page of the Widget Editor in Service Portal Configuration.

Use the Widget Edit Panel to view widgets that have recently been updated, create a widget, or view an existing widget.

![Widget Edit Panel](image)

**Figure 646: Widget Edit panel**

**Service Portal service status widgets**

Use the service status widgets to display current, planned, and historical outages for business services to your end users.

The service catalog widgets are part of the Service Portal Service Status [com.glide.service-portal.service-status] plugin, which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

**Business Service Status widget**

View how services are running on your system.
Figure 647: Business Service Status widget

Current Status widget
The Current Status widget displays any issues reported in the system.
Current Status

No system is reporting an issue

Figure 648: Current Status widget

Planned Maintenance widget
Describes any planned system maintenance.

The widget gathers information from the cmdb_ci_outage table. Any planned maintenance within the following five days appears in the Planned Maintenance widget.

<table>
<thead>
<tr>
<th>Planned Maintenance</th>
</tr>
</thead>
<tbody>
<tr>
<td>We publish information on planned service availability below. This includes events occurring over the next 5 days.</td>
</tr>
<tr>
<td>No service maintenance is planned over the next 5 days</td>
</tr>
</tbody>
</table>

Figure 649: Planned Maintenance widget

Instance options

The Planned Maintenance widget does not have any included instance options.

Service History widget
Displays the history of specific service's status. For example, if the Bond Trading widget has a history of planned outages or degradations, the widget displays those with a varied color scheme to differentiate the outage type.
**Service History - Bond Trading**

From most recent to oldest, this list shows all outages, degradations and planned maintenance for this service.

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Service Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outage</td>
<td>Bond Trading</td>
<td>Started 2016-06-14 17:13:15, Duration 1 Hour 15 Minutes</td>
</tr>
<tr>
<td>Planned Outage</td>
<td>Bond Trading</td>
<td>Started 2016-06-10 14:50:26, Duration 3 Hours 31 Minutes</td>
</tr>
<tr>
<td>Planned Outage</td>
<td>Bond Trading</td>
<td>Started 2016-06-09 04:37:15, Duration 3 Hours 32 Minutes</td>
</tr>
<tr>
<td>Planned Outage</td>
<td>Bond Trading</td>
<td>Started 2016-06-08 16:08:12, Duration 3 Hours 24 Minutes</td>
</tr>
</tbody>
</table>

**Figure 650: Service History widget**

**Instance options**

The Service History widget does not include any instance options.

**Service Status widget**

Service Status is a visual representation of service availability. Each colored pill correlates with a type of service availability, for example, orange represents service degradation.
Figure 651: Service Status widget

**Instance options**

The Service Status widget does not have any included instance options.

*Service Status Legend widget*

Use concurrently with the Status History widget to show what the icons in the Status History widget mean.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>✔</td>
<td>No issues</td>
</tr>
<tr>
<td>🔄</td>
<td>Planned maintenance</td>
</tr>
<tr>
<td>🔄⚠️</td>
<td>Service degradation</td>

**Instance options**

The Service Status Legend widget does not have any included instance options.

*Service Status Subscription widget*

Used in conjunction with the service status widget. Users subscribe to receive updates about the service status.
Instance options

The Service Status Subscription widget does not have any included instance options.

Widget instances

When you add a widget to a page using the Service Portal Designer, it creates a widget instance. A widget instance is a reference to a widget that contains a location, properties, and CSS specific to that instance. Adding the same widget multiple times to the same page creates multiple instances.

For example, the icon link widget displays as many different versions of itself as you add to a page.

Configure widget instance options

Each instance of the widget you configure remains unique, so you can have several instances of the same widgets on a page. For example, each instance of the cool clock widget on a page shows a different time zone. Configure a widget on a page by adjusting the instance options.
Each time you add a widget to a page it creates a record on the sp_instance table with the following information:

- Reference to the column where the widget is located
- Reference to a widget
- Configuration for a widget in the form of pre-defined form fields and an Additional Options field in JSON format

1. On a page in the Service Portal Designer, point to the Edit icon ( يكنא) in a widget to open the widget instance options. You can also access widget instance options using the control + right-click menu.
2. From the Instance Options window, make the selections you want to configure your widget.

Instance options vary depending on which widget you select.
Advanced users can configure the available options for a widget. For more information, see [Widget option schema](#) on page 2382.

**Widget context menu**

From any rendered Service Portal page you can CTRL+right-click a widget to see more configuration options in a context menu.

For example, navigate to Service Portal Service Portal Home to open a sample portal page. CTRL+right-click Knowledge Base on that page.

Figure 656: Widget context menu
Note: You must have the admin or sp_admin role to see the widget context menu. When you impersonate a user without one of those roles, you can still see the menu. However, a regular user signed in without those roles cannot see the menu.

Table 1108: Widget context menu options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Widget performance</td>
<td>How long it takes for a widget to load</td>
</tr>
<tr>
<td>Instance options</td>
<td>Specify an instance of a widget. Widgets instance options vary depending on the widget you select. For example, the instance options for the cool clock widget include different time zones for each instance, so you can have the same clock four times on a page, but with all different time zones.</td>
</tr>
<tr>
<td>Instance in Page Editor</td>
<td>Opens that instance of the widget in the Page Editor</td>
</tr>
<tr>
<td>Page Designer</td>
<td>Opens the widget in the Service Portal Designer, which lets you add containers, columns, and widgets. You can add styling from the Service Portal Designer to your specific widget or to the page the widget lives on.</td>
</tr>
<tr>
<td>Edit Container Background</td>
<td>Make changes to the layout in which the widget is located.</td>
</tr>
<tr>
<td>Widget Options Schema</td>
<td>Define the actual options you can select for an instance of a widget. For more information on configuring your own instance options, see Widget option schema on page 2382.</td>
</tr>
<tr>
<td>Widget in Form Modal</td>
<td>Opens the widget form in a pop up window so you can make quick changes to the widget.</td>
</tr>
<tr>
<td>Widget in Editor</td>
<td>Opens the widget in the Widget Editor. You can use the Widget Editor to configure HTML templates, CSS, client scripts, service scripts, and demo data for the widget.</td>
</tr>
<tr>
<td>Log to console: $scope.data</td>
<td>The $scope.data object passes data from the server to the client side controller. Instead of adding console.log messages or alerts into the controller code, you can just log the $scope.data object to the browser console and view the data there.</td>
</tr>
<tr>
<td>Log to console: $scope</td>
<td>Similar to the $scope.data object, except it logs everything in $scope to the console.</td>
</tr>
</tbody>
</table>

Widget developer guide

Develop custom widgets in the Service Portal using AngularJS, Bootstrap, and the ServiceNow API.

What to know before you begin

To develop widgets, you need ServiceNow API experience to:

- Run record queries on the server.
- Create and update records.

You need AngularJS experience to:
• Bind variables to client controllers.
• Access server objects in a widget.
• Gather user input.

Parts of a widget

Like Angular directives, widgets execute a specified behavior within a Service Portal page. A widget includes:

**HTML template**

A mandatory widget component.

The HTML template requires knowledge of AngularJS to display and gather data. Use the HTML template to:

- Render the dynamic view that a user sees in the browser using information from the model and controller.
- Bind client script variables to your markup.
- Gather data from the end user.

**Client script**

A mandatory widget component.

A client script requires knowledge of both the ServiceNow API and AngularJS to create a client controller. Use the client script to:

- Map server data from JavaScript and JSON objects to client objects.
- Process data before rendering it.
- Pass data to the HTML template.
- Pass user input and data back to the server for processing.

**Server script**

A mandatory widget component.

A server script requires knowledge of the ServiceNow API to work with record data. Use the server script to:

- Set the initial state of the widget.
- Send record data to the widget client script using the data variable.
- Run server-side queries.

**Link function**

An optional widget component.

The link function requires knowledge of AngularJS. Use a link function to directly manipulate the DOM.

**Option schema**

An optional widget component.

Allows a Service Portal admin to configure a widget. Use the option schema to:

- Specify the parameters for a widget.
- Allow admin users to define instance options for a widget instance.
- Develop flexible, reusable widgets.

**Angular Providers**

An optional widget component.

Angular Providers require knowledge of AngularJS. Use Angular Providers to:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Maintain and persist state.
- Create reusable behaviors and UI components and inject them into multiple widgets.

**Dependencies**

An optional widget component.

A widget dependency is an external resource used by your widget such as JavaScript or CSS files.

**Global objects in widgets**

When a widget begins to render for the first time on a page, the server script executes first and accesses three global objects: input, options, and data. Because the input variable is a data object sent from the client script, this variable is undefined when first initialized.
When a widget is first instantiated, the server script:

1. Initializes an empty data object.
2. Initializes the input object with any data sent from the client controller, or the options object with any data used to initialize the widget.
3. Sends the data object to the client controller as JSON.

The client script:

1. Accesses the server data object using c.data.

   **Note:** By default, widgets use the c variable to represent the controller instance using controller as syntax. You can change this variable when creating or cloning widgets.

2. Uses server.update() to post changes to the data model. This method updates the server script using the input object.

   **Note:** After calling server.update(), the client script data object is automatically overwritten by the server script data object.

3. Uses c.options to access the values used to invoke the widget on the server. This object is read-only.
Using the Widget Editor

When you create a widget, a record is created in the sp_widget table. However, you can use the Widget Editor in Service Portal Configuration as your scripting environment. The Widget Editor is a full page application similar to an IDE. You can show the parts of the widget you want to edit and hide the rest, while previewing your changes in real time.

Recommendations for developing widgets

When developing custom widgets, keep these recommendations in mind for optimal performance, scalable development, and a good user experience.

Create a default state that provides an example to the end user

When initially added to a page, a widget does not have instance options defined. If a default state is not provided, a widget can appear empty and can cause confusion. Instead of creating a widget that defaults to an empty state, give your widget default data to display when no other options are defined to:
<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
<th>Learn more</th>
</tr>
</thead>
</table>
| **Create a directive instead of embedding a complex widget** | When an embedded widget is called from the server, all the scripts associated with that widget are returned. If you only need to embed a subsection of a widget, embedding the entire widget creates unnecessary overhead. Instead, use directives to share lightweight code between widgets. Use a directive instead of an embedded widget to:  
  - Share scope or custom scope behavior with multiple widgets.  
  - Share a reusable, lightweight subsection of a widget.  
  - Share a common UI feature, such as a list or an avatar.  
  - Augment widget behavior. | Reuse components with Angular Providers on page 2388. |
| **Use a service or factory to share data and persist state** | Data services and factories maintain and persist state in a widget without requiring multiple server calls enabling you to:  
  - Keep widgets in sync when changing records or filters.  
  - Share context between widgets.  
  - Develop more performant widgets. | Reuse components with Angular Providers on page 2388. |
| **Handle events with a publish/subscribe service**     | Avoid using $broadcast in the DOM. $broadcast dispatches the event name to all child scopes notifying registered listeners, which can be an expensive call that requires the use of the $rootScope global object. Instead, use a publish/subscribe service to handle events. When using a publish/subscribe service, a clear relationship forms between your widgets through callback handlers. In this model, you can better control the state of your events. |                                                |
| **Use REST calls to fetch data from the server**       | When you call server.update(), the entire widget is returned from the server. If your widget includes divergent code paths, multiple calls to update the server can affect performance. As a rule, use your |                                                |
Develop with localization, accessibility, and UI in mind

To create the best experience for your users, follow these guidelines:

- Consider the impact of your widget in a mobile environment. For example, avoid using mouseover and other events that do not translate to a mobile device.
- Use SCSS variables to reuse items.
- Use variable names when using colors.
- Wrap strings for translation in localization APIs. See Internationalize a widget on page 2402.

Clone a widget

Take advantage of existing code by cloning and editing an existing widget.

Role required: admin or sp_admin

Note: Base system widgets are read only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and do not benefit from future updates to the widgets they were cloned from.

1. Open the Widget Editor in the Service Portal Configuration page, then select an existing widget from the Select a widget list. For example, select Hello World 2.
2. From the list menu in the widget header, click Clone "Hello World 2".
3. Enter a name for the cloned widget. The widget ID is created automatically based on the widget name.
4. Select Create test page to automatically create a page containing the widget.
5. Use the check boxes to show or hide the different components of the widget editor as needed. Make changes to the HTML Template, CSS, client script, server script, or the link function.
6. In order to enable a preview of your widget, use Enable Preview from the menu. Use the eye icon that appears to show or hide a preview of your widget.

If you clone a widget that uses the Angular ng-template, you must manually clone the template and change the name of the template reference in the widget.

For example, the header menu widget uses the Angular ng-template menuTemplate. If you clone the header menu widget, you must also clone the menuTemplate and give the clone a unique name. When you open the clone of the header menu widget, you can see a reference to the menuTemplate in the HTML.

Figure 658: Hello World 2 clone
Create a new widget

Create a new widget to build a custom widget from scratch.

Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration Widget Editor.
2. Click Create a new widget.
3. Enter a name for the new widget. The widget ID is created automatically based on the widget name. Optionally select Create test page to automatically create a page containing the widget.

4. Click Submit.

**Note:** After completing development of a widget with a test page, delete the test page. Maintaining test pages can create clutter when managing pages.
The widget HTML template, client script, and server script display in the widget editor. Basic script templates are included as a guide.

Widget option schema

Widget instances allow users to uniquely configure each widget they add to a page. Use the option schema to define the parameters for your widget.

Storing instance options

When developing a widget, you can edit the option schema to create parameters for your widget, or you can create a table to store instance options. If you edit the existing option schema, any instance options defined are stored in JSON format in the Additional options, JSON format field in the sp_instance table. The following field types are available:

- String
- Boolean
- Integer
- Reference
- Choice
• Field_list (depends on table)
• Field_name (depends on table)
• Glide_list

To use other field types not supported in the option schema, create an extension table to store your custom widget option schema. Using a table enables you to:

• Add any ServiceNow field type, including fields with advanced customization, to the option schema.
• Define a complex option schema.
• Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

**Using options in a widget**

Access options in the widget from both the client script and the server script using the options global variable. You can access to any option value in your widget client script or server script using `options.optionName`.

**Client script**

```javascript
function() {
    /* widget controller */
    var c = this;
    console.log(c.options.text_color) //Outputs the text_color option for this instance
}
```

**Server script**

```javascript
(function() {
    $sp.log(options.text_color) //Logs the value of the text_color option to the browser console.
})();
```

**Define default options**

Before an option value is set on an instance, it appears as an undefined value when you access that option variable. Use the widget server script to specify default values for your options.

```javascript
(function() {
    options.text_color=options.text_color||"blue";
    options.maximum_entry_count=options.maximum_entry_count||5;
})
```

**Edit the widget option schema**

Widget instances allow users to uniquely configure each widget they add to a page. Edit the option schema to define basic parameters for your widget.

Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration Widget Editor.
2. Select the widget you want to configure the option schema for.
3. Click the menu icon (≡) and select Edit option schema.
This option only appears for users that have the right to edit the widget.

4. Click + to add a widget option.

5. Define a label, name, and type. More fields appear depending on the type you select.

Adding flexible widget options allows you to create more reusable widgets. You can add default values to help users understand each widget option.
6. Click Save.
The option schema you defined is stored in JSON format in the Option schema field in the sp_widget table. Based on this option schema, each instance of the widget can use individually defined instance options.

7. Test the option schema by adding the widget to a page in the Service Portal Designer.
   a) Navigate to Service Portal Service Portal Configuration Service Portal Designer.
   b) Add the widget to a page and click the edit icon on the widget instance to view the instance options.
   c) Configure the widget instance options.
   d) View the configuration by navigating to the instance record in the sp_instance table. The instance options are stored in JSON format in the Additional options, JSON format field.

Store instance options in a table
Create a table to store widget instance options instead of editing the existing option schema. When using a table as your widget option schema, you can define custom fields using any ServiceNow field type, add filters to fields, and search or query instance options.

Role required: admin or sp_admin
To define a custom option schema, add fields to an sp_instance extension table, then set your widget to use the extension table as a data source. Using an extension table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define complex widget options.
- Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

1. Create a table that extends an sp_instance table to store your custom option schema.
   a) Navigate to System Definition Tables.
   b) Click New.
   c) Define a label and name.
   d) In the Extends table field, select an sp_instance table that provides the necessary fields.

<table>
<thead>
<tr>
<th>Instance table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance [sp_instance]</td>
<td>Includes base instance fields.</td>
</tr>
<tr>
<td>Instance with Table [sp_instance_table]</td>
<td>Includes sp_instance fields and fields to display table data such as Table and Filter.</td>
</tr>
</tbody>
</table>

e) Save the form.

2. Define custom fields in the extension table.
   You can define any field type to use in your option schema by adding new columns in the Columns list.

3. Update your widget to use the extension table as a data source.
   a) Navigate to Service Portal Widgets.
   b) Open the widget you would like to create custom options for.
c) In the Data table field, select your `sp_instance` extension table.

4. Configure the extension table form to display the desired fields. Fields configured on the form are available as instance options.
   a) Navigate to the extension table form: `<yourInstance>/<your_extension_table>.do`.
   b) Right-click the header menu and select Configure Form Layout.
   c) Add the fields to the form.
   d) Click Save.

5. Configure the widget to display the desired fields as instance options.
   a) Navigate to Service Portal Widgets.
   b) Open the widget that has the extension table set as the data source.
   c) Use the Fields slushbucket to select fields to display as instance options.
d) Save the form.

Test the option schema by adding the widget to a page in the Service Portal Designer. Click the edit icon on the widget instance to view the instance options. After configuring the widget instance options, view the configuration by navigating to the instance record in the sp_instance extension table.

Reuse components with Angular Providers

Angular Providers are reusable components that can be injected into multiple widgets. To ensure quick loading widgets and a high performing portal, create Angular Providers instead of overloading your client controllers with persistent data and additional logic. With Angular Providers, you can maintain data for the lifetime of your Service Portal and reuse components and data objects across multiple widgets.

Role required: admin or sp_admin

By creating an Angular Provider, you can:

• Keep widgets in sync when changing records or filters.
• Share context between widgets.
• Maintain and persist state.
• Create behaviors and inject them into multiple widgets.

To learn more, visit Angular Providers.

2. Click New to create a new record.
3. Select the type of Angular Provider.
   - Directive
   - Factory
   - Service

   To facilitate migration to ECMAScript 6 in the future, consider using services over factories.

4. Define a name.
   You will use the name to associate the Provider with your widget.

5. Add a script in the Client Script field.
   A basic factory that formats a number in US currency.

   ```javascript
   function formatterFactory()
   {
       var myVal = Number;
       return {
           format: function(myVal) {
               
   ```
return '$' + myVal.toFixed(2);
}
}

6. Associate the Angular Provider with a widget.
   a) Navigate to <yourInstanceURL>/sp_config?id=widget_edit.
   b) Open the widget you would like to associate with the Angular Provider.
   c) Under Related Lists, select Angular Providers.
   d) In the Angular Providers list, click New.
   e) In the Angular Provider field, select the appropriate Provider. Check the Widget field to ensure that you are associating the Angular Provider with the correct widget.

   f) Click Save.

7. Update the appropriate scripts in your widget to inject the Angular Provider into the widget.

   Inject the factory into your widget client script by passing the name of the factory as an argument in your client controller function. You can then access the object defined in the factory function in your widget client script.
function(formatterFactory) {
    /* widget controller */
    var c = this;
    console.log(formatterFactory.format(300));
}

If defining a directive, use the directive in the widget HTML template.

8. To edit the Angular Provider after it is registered with your widget, open the Angular Provider client script in the widget editor.
   a) Navigate to Service Portal Configuration Widget Editor.
   b) Under Edit an existing widget, select the widget associated with your Angular Provider.
   c) In the Show menu, open the Dependencies list and select the Angular Provider.

Note: Only Angular Providers associated with the widget are displayed in the Dependencies list. This list includes any external resources your widget depends on.

The Angular Provider client script displays in the widget editor. In the widget editor interface, you can edit and save your widget and Provider scripts at the same time.

To use an Angular Provider with multiple widgets, register your Provider with each widget and update the appropriate scripts.

Embedded widgets

Embed a widget in the HTML template, server script, or client script.

Embed a widget in an HTML template

Use the `<widget></widget>` element to embed a widget in an HTML template. Pass in the ID of the widget you are trying to embed as a parameter.

```html
<div>
    <widget id="widget-cool-clock"></widget>
</div>
```

If a widget has an option schema, you can define instance options in JSON format.

```html
<widget id="widget-cool-clock" options='{"zone": "America/Los_Angeles","title": "San Diego, CA"}'></widget>
```

Alternatively, you can define options in the widget server script.

**HTML template**

```html
<widget id="widget-cool-clock" options='data.clockOptions'></widget>
```

**Server script**

```javascript
(function() {
    data.clockOptions = {'zone": "America/Los_Angeles","title": "San Diego, CA"};
```
Embed a widget in a client script

Use `spUtil.get()` to get a widget model in the client script.

```javascript
spUtil.get("widget-sc-cat-item", {sys_id: "your_catalog_item_sys_id"}).then(function(response) {
    c.catalogItemWidget = response;
});
```

When using the `spUtil` class in a widget client script, you must inject the class into the client script function. The following example embeds the Cool Clock widget:

**Client script**

```javascript
function(spUtil) {
    var c = this;
    spUtil.get("widget-cool-clock").then(function(response) {
        c.myClockWidget = response;
    });
}
```

**HTML template**

```html
<sp-widget widget="c.myClockWidget"></sp-widget>
```

Embed a widget in a server script

Use `$sp.getWidget()` to get a widget model in the server script.

```javascript
data.catalogItemWidget = $sp.getWidget("widget-sc-cat-item");
```

The following example embeds the Cool Clock widget:

**Server script**

```javascript
(function() {
    var coolClockOptions = {"zone": "America/Los_Angeles","title": "San Diego, CA"}
    data.coolClockWidget = $sp.getWidget('widget-cool-clock', coolClockOptions);
})();
```

**HTML template**

```html
<sp-widget widget="data.coolClockWidget"></sp-widget>
```

Widget model properties

When a widget model is called from within another widget, the HTML template, client script, and link function are loaded just as they are in the `sp_widget` record. The data property is the result of the widget server script execution. Anything that you put on the data object on the server is available in the data object on the client.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_script</td>
<td>string</td>
<td>Widget client script field.</td>
</tr>
</tbody>
</table>
### Property name | Type | Description
--- | --- | ---
**css** | string | Compiled CSS output from the SASS field for the widget.
**data** | object | Data object containing keys and values from the widget server script.
**dependencies** | array | Any third-party libraries to load before the widget executes.
**options** | object | Options used to initialize the widget.
**template** | string | HTML template field for the widget.

**Embed a widget multiple times with custom options**

Embed the cool clock widget multiple times using custom options.

**Role required: admin or sp_admin**

Create a widget that embeds multiple instances of the cool clock widget, each with a different time zone and title. Open the cool clock widget in the Widget Editor to see widget options referenced in the HTML template and the Client Script.
Figure 660: Cool Clock widget with Options highlighted

1. Clone the Cool Clock widget with the name Embedded clock.
2. Replace the code blocks with the following:

   HTML Template

   ```html
   <div class="clock">
     <span class="square">
       <svg viewBox="0 0 100 100">
         <![CDATA[
           <line ng-repeat="minor in c.minors track by $index"
                 class="minor" y1="42" y2="45" ng-attr-transform="translate(0, 0) transform("y1 y2")]>
             <circle class="clock-face" r="48"/>
           <line ng-repeat="major in c.majors track by $index"
                 class="major" y1="42" y2="45" ng-attr-transform="translate(0, 0) transform("y1 y2")">
             <circle class="clock-face" r="48"/>
           </line>
         <![CDATA[
           <line class="hour" y1="2" y2="-28" ng-attr-transform="rotateH(60 * c.date.hours) + c.date.minu" />
           <line class="minute" y1="4" y2="-30" ng-attr-transform="rotateH(6 * c.date.minutes) + c.date.minu" />
           <line class="second" y1="18" ng-attr-transform="rotateH(c.date.seconds)"/>
         ]]>]]>
       </svg>
     </span>
   </div>
   ```

   Client Script

   ```javascript
   function (timeout) {
     var c = this;
     c.darkness = "";
     if (c.options.c_color || c.options.c_color.length) {
       c.options.c_color = 'red';
     }
     var x = c.options.zone || "America/Los_Angeles";
     c.date = moment().tz(x);
     c.majors = new Array(12);
     c.minors = new Array(60);
     function tick() {
       c.date = new moment().tz(x);
       var t = c.date.hour();
       c.darkness = "";
       if (t < 13) {
         c.darkness = "morning";
       } else if (t < 19) {
         c.darkness = "afternoon";
       } else if (t < 25) {
         c.darkness = "night";
       }
       setTimeout(tick, 1000);
     }
     tick();
   }
   ```
Each instance of the clock in the embedded clock widget appears with a different time zone.
Create a widget dependency

In Service Portal, you can link JavaScript and CSS files to widgets to create dependencies between widgets and third-party libraries, external style sheets, and angular modules.

Role required: admin or sp_admin

Dependencies are loaded asynchronously from the server when needed.

Widgets can have as many or as few dependencies as needed. However, the more you add, the more content a widget must download to render on the page. Keep dependencies as small as possible for more efficient load times.

1. Create a dependency package.

A dependency package is a collection of Javascript and CSS files that can be then connected to a widget.

   a) Navigate to Service Portal Dependencies.

   b) In the dependency record, define the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your dependency. (Useful for selecting a dependency from a dropdown list)</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the dependency record.</td>
</tr>
<tr>
<td>Include on page load</td>
<td>Select if you want your dependency to be loaded onto the page on initial page load of Service Portal, or leave unchecked to load the dependency only when the linked widget is loaded onto a page.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Angular module name | Optional. Define the value if the linked JavaScript is an Angular module. Provide the name of the Angular module being loaded, so that it can be injected into the Service Portal Angular application.

2. Add files to the dependency package

After you save the information for your dependency package, use the related lists to add JS and CSS Include files. For each related list, include the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the script include.</td>
</tr>
</tbody>
</table>
| Source | Depending on whether you add a JS Include or a CSS Include, select one of these options from the list:  
  - URL  
  - UI script (for a JS Include) or Style Sheet (for a CSS Include)  

  For a JS Include, use the UI Script field to reference a UI Script found in System UI UI Scripts.  

  For the CSS Include, use the Style Sheet field to reference a record in the sp_css table. |

3. Add a dependency package to a widget

After you have created a dependency package and added files, create a relationship between the dependency and a widget.

a) Navigate to Service Portal Widgets and find the widget record you want to add the dependency to.

b) From the Dependencies related list, click Edit.

c) In the slushbucket, find the dependency you created and double-click to add it to the selected items column on the right. Save the page to return to the widget record.

Include a font icon in a single widget

If you only want one widget to have access to a font icon, include the font icon in a single widget.

Role required: admin or sp_admin

Adding an icon to a specific widget keeps the icon scoped and prevents it from interfering with other CSS on the page.

1. In the platform UI, navigate to Service Portal Widgets, then click the widget you want to add an icon to.

2. Attach the individual icon file to the widget record.

3. In the HTML template, include something like the following:

   `<div>
   <i class='font-family'>icon_name</i> you did it!
   </div>`
Make sure the class is exactly the same as the font family called out in the CSS. For example <i class='material-icons'> should be the same as the .material-icons included in the CSS. The icon_name should match the name of the file you attached.

4. In the CSS field for the widget, add the CSS for the font-icon definition. Most font-icon sets include a CSS file similar to the material icons one used below. Use the sys_id of the attachment as the src in the CSS.
An icon that you can select in the widget or widget instance.

To use custom font-icons across widgets, add the icon to a page or make it a widget dependency.
Include font icons as a widget dependency
You can include font icons wherever a widget is loaded by including them as a widget dependency.

Role required: admin or sp_admin

**Note:** CSS included as a widget dependency is not scoped and can disrupt other CSS on a page.

1. In the platform UI, navigate to Service Portal CSS and create a new style sheet.
2. Attach the font-icon set to the sp_css record you created, and use the sys_id of the attachment as the src for the font icon.
3. Navigate to Service Portal Dependencies and create a new dependency.
4. Attach the CSS record you created to the new dependency using the CSS Includes related list.
Internationalize a widget

Use the ${} or gs.getMessage() syntax in widgets to tag strings for translation so you can localize your Service Portal content.

The ${} or gs.getMessage() searches in the messages table [sys_ui_message] in the platform to see what the translation would be.

Use the HTML template to internationalize strings in a widget. Type the following in an HTML template.
Writing text as ${message} is the equivalent of writing ${gs.getMessage("message")} in other parts of the system, but written as a more legible shorthand.

**Note:** In some cases, the translation might have quotes or double quotes on it. That could lead to JavaScript errors if you are using the ${} syntax in the client script. The safest way to fetch a translated message is to do it in the server script. Then, assign the value to a client-side Angular binding.

### Translating strings in the client script

```javascript
function() {
    var c = this;
    c.message = "This message will be internationalized";
}
```

**HTML template:**

```html
<div>
    <!-- The output of this text will be internationalized. -->
    <p>{{c.message}}</p>
</div>
```

### Translating strings in the server script

Use the server script to translate schema options and other values during server-side runtime.

**Server script**

```javascript
function() {
    data.message = gs.getMessage("this message contains 'quotes'");
    // You can also translate schema options using the server script
    // For example, data.message = gs.getMessage(options.title);
}
```

**HTML template**

```html
<div>
    <p>{{c.data.message}}</p>
</div>
```

### Tutorial: Build a custom widget

Follow this tutorial to build a custom widget that displays Service Catalog items. Use this tutorial as a model to help you understand the advanced scripting power of the Service Portal.

In this tutorial, you will create the Quick Order widget. This widget:

- Displays popular items to the user prior to any search.
- Queries the Service Catalog and displays available options to the user.
- Includes an embedded SC Catalog Item widget, allowing the user to view and order items within the Quick Order widget.
- Uses an Angular Provider to display a category icon beside each queried item.

**Tutorial: Create a widget and set up a template**

Create the Quick Order widget to query items in the Service Catalog.
Role required: admin or sp_admin

1. Navigate to Service Portal Service Portal Configuration and click Widget Editor.
2. Click Create a new widget.

3. Define the following values.
   - **Widget Name**: Quick Order
   - **Widget ID**: quick_order
   - **Create a test page**: Active
   - **Page ID**: quick_order

Adding a widget to a test page creates a record in each of the following tables:

- **sp_page**
- **sp_container**
- **sp_row**
- **sp_column**
Note: You can use the Page Editor in Service Portal Configuration to view the hierarchy of elements on your test page.

4. Click Submit.
5. From the Widget Editor, open the Quick Order widget.
6. Add the following simple template to the HTML field.

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    My catalog results
  </div>
</div>
```
7. Click Save.
8. Preview your test page in a new tab using the following URL: `<yourInstanceUrl>/sp?id=quick_order`.

Your widget template displays on the test page.

---

**Tutorial: Add a server script to query an instance table**

After adding your widget and creating a basic template, you can define more advanced scripts that enable the user to query data from an instance table. Using client and server scripts, you can pass the data model between the client and server by querying data from the database, displaying it to the user, and sending any updates back to the server.

Role required: admin or sp_admin

1. From the Widget Editor, open the Quick Order widget.
2. Select Server Script to open the server script field.
3. Replace the default server script with the following custom script.

```javascript
(function() {
  if (input.keywords != null && input.keywords != '')
    data.items = getCatalogItems(input.keywords);

  function getCatalogItems(keywords) {
    var sc = new GlideRecord('sc_cat_item');
    sc.addActiveQuery();
    sc.addQuery('123TEXTQUERY321', keywords);
    sc.addQuery('sys_class_name', 'NOT IN', 'sc_cat_item_wizard,sc_cat_item_content');
    sc.addQuery('sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
    sc.setLimit(100);
    sc.orderByDesc("ir_query_score");
    sc.query();
    var results = [];
    while (sc.next()) {
      if (!$sp.canReadRecord(sc))
        continue;

      var item = {};
      $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
```
```javascript
    item.category = sc.getValue('category');
    results.push(item);
  }
  return results;
})();
```

This script performs a keyword search on the `sc_cat_item` table using the 123TEXTQUERY321 query method.

4. Replace the HTML template with the following script:

```html
   <div class="panel panel-primary">
   <div class="panel-heading">Request an item from the catalog</div>
   <div class="panel-body">
      <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
      <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
         <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
      </li>
      </ul>
   </div>
   </div>
```

This template adds a search field and displays the results of the query performed in the server script using the following Angular directives. To learn more about these directives, review the Angular API Reference.

**Table 1109: Angular directives used in the template**

<table>
<thead>
<tr>
<th>Angular directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ng-model</td>
<td>Automatically reads and writes value changes to the model variable <code>c.data.keywords</code>.</td>
</tr>
<tr>
<td>ng-model-options</td>
<td>Configures ng-model behavior. In this template, ng-model updates the model after a user has stopped typing for 250 milliseconds.</td>
</tr>
<tr>
<td>ng-change</td>
<td>Executes <code>c.server.update()</code> after the model value changes. This function posts the data object to the server script. After the script is executed, the data object is automatically updated with the new values from the server generated data object.</td>
</tr>
<tr>
<td>ng-repeat</td>
<td>Creates a template from the parent element and child elements. For each item in <code>c.data.items</code>, an instance of the template is created and the expressions <code>{item.name}</code> and <code>{item.price}</code> are replaced with the values from each item.</td>
</tr>
</tbody>
</table>

5. Add the following script to the CSS - SCSS field:

```css
   .result-container { 
      margin-top: 10px;
   }
```

6. Refresh your test page preview to view the changes.

   As you type in the search box, matching catalog items appear. Try searching for ipad.
Tutorial: Manage the empty state of a widget

Display a list of popular items to the user before any search terms are entered.

Role required: admin or sp_admin

Because no search has been executed when the widget initializes, the server input variable is undefined. This empty state may cause confusion when a user first interacts with the widget. To solve this issue, give your widget something to display when the input variable is empty. This initial data can guide your users when initially interacting with your widget.

1. From the Widget Editor, open the Quick Order widget.
2. Replace the existing server script with the following script:

```
(function() {
    if (input.keywords != null && input.keywords != '')
        data.items = getCatalogItems(input.keywords);
    else data.items = getPopularItems();

    function getCatalogItems(keywords) {
        var sc = new GlideRecord('sc_cat_item');
        sc.addActiveQuery();
        sc.addQuery('123TEXTQUERY321', keywords);
        sc.addQuery('sys_class_name', 'NOT IN',
            'sc_cat_item_wizard,sc_cat_item_content');
        sc.addQuery('sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
        sc.setLimit(100);
        sc.orderByDesc('ir_query_score');
        sc.query();
        var results = [];
        while (sc.next()) {
            if (!$sp.canReadRecord(sc))
                continue;

            var item = {};
            $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
            item.category = sc.getValue('category');
            results.push(item);
        }
        return results;
    }

    function getPopularItems() {
        var items = [];
        var count = new GlideAggregate('sc_req_item');
        count.addAggregate('COUNT','cat_item');
        count.groupBy('cat_item');
        return items;
    }
```

© 2018 ServiceNow. All rights reserved. 2407
count.addQuery('cat_item.sys_class_name', 'NOT IN', 'sc_cat_item_guide,sc_cat_item_wizard,sc_cat_item_content');
count.addQuery('cat_item.sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
count.orderByAggregate('COUNT', 'cat_item');
count.query();
while (count.next() && items.length < 9) {
    if (!$sp.canReadRecord("sc_cat_item", count.cat_item.sys_id.getDisplayValue()))
        continue; // user does not have permission to see this item
    var item = {};
    item.name = count.cat_item.name.getDisplayValue();
    item.category = count.cat_item.category.toString();
    item.price = count.cat_item.price.getDisplayValue();
    item.sys_id = count.cat_item.sys_id.getDisplayValue();
    items.push(item);
}
return items;
})();

This script introduces a new function getPopularItems() to query the database and return popular items when the input variable is empty.

3. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
            </li>
        </ul>
    </div>
    <div class="panel-footer" ng-if="c.data.keywords">
        <ng-pluralize count="c.data.items.length" when="{0: 'No items found for ', 1: 'One item matching ', other: 'Found {} items matching '}">
            {{c.data.keywords}}
        </ng-pluralize>
    </div>
</div>
```

This script provides a template to display the popular items returned from the server script.

4. Refresh your test page preview to view the changes.

The widget displays popular items to the user prior to any search input.
Tutorial: Embed an existing widget

Enable the user to view and purchase Service Catalog items in the Quick Order widget by embedding the SC Catalog Item widget.

Role required: admin or sp_admin

Instead of duplicating code, you can embed widgets to leverage pre-existing functionality. The SC Catalog Item widget is a base system widget that enables the user to view and purchase Service Catalog items.

1. Inspect the SC Catalog Item widget.

   Before embedding the SC Catalog Item widget, inspect the widget to understand what data it needs access to. You may need to update your Quick Order widget client or server script to make sure that the correct data is passed to the embedded widget.

   a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.

   b) Open the SC Catalog Item widget.

   c) Note that the widget ID is `widget-sc-cat-item`. You will use this ID to embed the widget model in the client script.

   d) Examine the server script.

   Notice that the data object includes a `sys_id` property populated by either the input or options objects. If neither input nor options include a `sys_id`, the `$sp.getParameter()` method retrieves the `sys_id` from the request query string.
To populate the input object, you can pass a catalog item sys_id from the Quick Order widget client script.

2. From the Widget Editor, open the Quick Order widget.
3. Replace the Quick Order widget client script with the following script.

```javascript
function($location, spUtil) {
    var c = this;

    c.select = function(item_id) {
        if (c.openItem == item_id) {
            c.openItem = null;
            return;
        }

        renderCatalogItemWidget(item_id);
    }
}
```
function renderCatalogItemWidget(item_id) {
    c.catalogItemWidget = null;
    spUtil.get("widget-sc-cat-item", {sys_id: item_id}).then(function(response){
        c.catalogItemWidget = response;
        c.openItem = item_id;
    });
}

This script uses spUtil.get() to retrieve the widget model by ID (widget-sc-cat-item) and define the {sys_id: item_id} object. This object posts to the server script as input.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href ng-click="c.select(item.sys_id)">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
                <div class="catalog-item" ng-if="item.sys_id == c.openItem">
                    <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
                </div>
            </li>
        </ul>
    </div>
    <div class="panel-footer" ng-if="c.data.keywords">
        <ng-pluralize count="c.data.items.length" when="{'0': 'No items found for ', '1': 'One item matching ', 'other': 'Found {} items matching '}">
            {{c.data.keywords}}
        </ng-pluralize>
    </div>
</div>
```

This template:
- Adds on-click behavior using the ng-click directive.
- Displays the embedded SC Catalog Item widget using the sp-widget directive.

5. Replace the CSS with the following script:

```css
.result-container {
    margin-top: 10px;
}
.catalog-item {
    background-color: #f5f5f5;
    padding: 10px;
    @include border-top-radius($panel-border-radius);
    @include border-bottom-radius($panel-border-radius);
}
```

6. Refresh your test page preview to view the changes.

When you select a search result, the item opens in the embedded SC Catalog Item widget.
Tutorial: Create a reusable directive and add it to a widget

Angular Providers are reusable components that can be added to multiple widgets. Using the Widget Angular Providers table, create a directive that shows a category icon next to each result in the Quick Order widget.

Role required: admin or sp_admin

Angular Providers let you build angular directives and services that can be injected into your client script controller. The code in a Provider differs from a typical Angular directive or service because it must be anonymous, without being appended to a specific module.

2. Click New to create a new record.
3. Fill out the form.
   a) Add the type and name.
      - Type: Directive
      - Name: categoryIcon
   b) Add the client script.
      ```javascript
      function() {
        return {
          template: '<span class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-{{::icon}} fa-stack-1x fa-inverse"></i></span>',
          restrict: 'E',
          replace: true,
          scope: {
            category: '='
          }
        },
      }
      ```
link: function(scope, element) {

var _iconMap = {
    "b06546f23731300054b6a3549dbe5dd8": "tablet", /* Tablets */
    "15706fc0a0aa7007fc21e1ab70c2f": "question", /* Can we help you? */
    "d68eb4d637b1300054b6a3549dbe5db2": "mobile-phone", /* Mobiles */
    "109c9d8c6112276003b17991a09ad65": "print", /* Office and Print */
    "5d643c6a3771300054b6a3549dbe5db0": "print", /* Printers */
    "2c0b59874f7b420008e6eda18110c71f": "plug", /* Peripherals */
    "280952237b1300054b6a3549dbe5dd4": "desktop" /* Software */
};

scope.icon = _iconMap[scope.category] || "shopping-cart";
}

This script associates the sys_id of the Category record with the Service Catalog item. The icon that displays is the icon defined in the Category record in the Service Catalog.
```javascript
function() {
  return {
    template: '<span class="fa fa-stack fa-lg"></span><i class="fa fa-circle fa-stack-2x"></i><i class="fa-{{::icon}} fa-stack-1x fa-inverse"></i>'
  }
},
  link: function(scope, element) {
    var _iconMap = {
      '065a9f237313b0025d43d3a6eb55b4': 'tablet', // Tablets /
      '3d78e1c0fbc66b7071f11a387e2f': 'question', // Can we help you? /
      '60be43b83073b0025d43d3a6eb55b4': 'mobile-phone', // Mobiles /
      '3d78e1c0fbc66b7071f11a387e2f': 'print', // Office and Print /
      '5d843c037313b0025d43d3a6eb55b4': 'print', // Printers /
      '2ebb59074762d656e6ec3b112c71': 'plug', // Peripherals /
      'b00695e1c0fbc66b7071f11a387e2f': 'desktop' // Software /
    };
    scope.icon = _iconMap[scope.category] || 'shopping-cart';
  }
}
```
c) Click Save.

4. Associate the new Angular directive with the Quick Order Widget.
   a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.
   b) Open the Quick Order widget.
   c) Under Related Lists, select Angular Providers.
   d) In the Angular Providers list, click New to associate an existing Angular Provider with the Quick Order widget.
   e) Add the following values to the form.
      - Angular Provider: categoryIcon
      - Widget: Quick Order

   ![New Angular Providers](image)

   f) Click Save.

5. Add the categoryIcon directive to your Quick Order HTML template.
   a) From the Widget Editor, open the Quick Order widget.
   b) Replace the HTML template with the following script.

   ```html
   <div class="panel panel-primary">
     <div class="panel-heading">Request an item from the catalog</div>
     <div class="panel-body">
       <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
       <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
       <ul class="list-group result-container">
         <li class="list-group-item" ng-repeat="item in c.data.items">
           <!-- Content of the list item -->
         </li>
       </ul>
     </div>
   </div>
   ```
6. Refresh your test page preview to view the changes.

A category icon displays beside each result.

Widget API reference

The following client and server side APIs are supported in the Service Portal.

**Supported client side APIs**

These are the supported Service Portal APIs that can be used in a widget client controller.

For detailed class and method information, see the API reference on the developer portal.
<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
</table>
| spUtil   | • addTrivialMessage(String message)  
          | • get(String widgetId)  
          | • format(String, Object)  
          | • refresh(Object $scope)  
          | • recordWatch(Object $scope, String table, String filter, Function callback)  
          | • Update(Object) |
| spModal  | • alert(String message).then(fn)  
          | • confirm(String message).then(fn)  
          | • open(Object options).then(fn)  
          | • prompt(String message, String default).then(fn) |

**Note:** g_form as a global object cannot be used in a widget client controller or in a UI script.

**Supported server side APIs**

These are the supported Service Portal APIs that can be used in a widget server script.
Class | Available methods
---|---
GlideSPScriptable | • canReadRecord(GlideRecord gr)  
• canReadRecord(String table, String sysId)  
• getCatalogItem(String sysId)  
• getCatalogItem(String sysId, Boolean isOrdering)  
• getDisplayValue(String fieldName)  
• getField(GlideRecord gr, String fieldName)  
• getFields(GlideRecord gr, String fieldNames)  
• getFieldsObject(GlideRecord gr, String fieldNames)  
• getForm(String tableName, String sysId)

• getValues(Object data, String names)  
• getWidget(String sysID, Object options)

**Widget properties**
Global variable and functions available in widget client and server scripts.

**Server script global objects**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>An object containing client-side properties set under c.data. The value is undefined until the client controller calls c.server.update().</td>
</tr>
<tr>
<td>data</td>
<td>An object containing properties set during server-side execution.</td>
</tr>
<tr>
<td>options</td>
<td>An object containing the schema option properties.</td>
</tr>
</tbody>
</table>
Client script global functions

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this.server.get([Object])</td>
<td>Calls the server and sends custom input. Returns Promise.</td>
</tr>
<tr>
<td>this.server.update()</td>
<td>Calls the server and posts this.data to the server script. Returns Promise.</td>
</tr>
<tr>
<td>this.server.refresh()</td>
<td>Calls the server and automatically replaces the current options and data from the server response. Returns Promise.</td>
</tr>
</tbody>
</table>

A promise represents the eventual result of an asynchronous operation. For more information on promises, see [https://promisesaplus.com/](https://promisesaplus.com/) or [AngularJS documentation](https://angularjs.org/).

Configure search in Service Portal

Add search sources to your portal page to configure search. A search source is a record that describes the behavior and source of some type of data.

The search group defines where search data is retrieved from, how a search entry is templated in the search result page, and whether or not type-ahead functionality is enabled for that search type. Search sources are stored in the sp_search_source table.

Configure search sources in the platform.

1. Navigate to Service Portal Portals and select the portal you want to create a search source for.
2. From the Search Sources related list, click New or Edit to change an existing search source.
3. Create a name and ID for the search source.
4. Complete the following fields on the Search Source form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Select this option to add an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>A script defining the endpoint and API calls to fetch external data. This field is only visible when Is scripted source is selected.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list that you want to draw your results from. For example, User [sys_user]. Table queries use the Zing text indexing and search engine.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Apply a filter to the table if you don't want all the search results to display. For example, Active is True.</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Select which field you want to display in the search results. For example, Name.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Select fields that also display in the search results. For example, Email, Department.</td>
</tr>
</tbody>
</table>

5. To create a typeahead search, select the Typeahead tab.
6. Make sure Enable typeahead is selected. Add a glyph to appear in the search bar, or a Page. For example, the user glyph, and the Form page.

Note: The Page field only configures the target page when an element is selected in the typeahead result. To change the link location for the full search results in the results page, edit the anchor HTML href attribute in the template to point to the page you want to navigate to. Only developers with an understanding of HTML scripting should do this advanced configuration.

Scripted sources, and Search Page Templates are advanced search features. Only developers with a scripting knowledge should configure these options. In most cases, this simple configuration should be enough.

Default portal search sources

If you don't define specific search sources for your portal, the system uses default search sources instead. Administrators can use the glide.service_portal.default_search_sources system property to define default search sources.

To make changes to the default search sources, navigate to the sys_properties list and search for the default search sources property. Copy the sys_ID of any search source you want to add into the Value field of the system property using a comma separated list.

To change the order in which the default search sources show in the Search List, change the order of the ID's in the property.

To remove the default search source behavior, delete the property value or delete the value altogether.

Search page template

Advanced users with an understanding of HTML and Angular bindings can use the Search Page Template option in the Search Source form to define the appearance of the search results.

In most cases you won't need to change the default search page template. But you can use this field to configure how your data is rendered on the search results page.

Search page templates use simple HTML where you can define Angular bindings to actually render the data on the screen. Each search source comes with a default template that can be used, or modified to display additional data that you can provide through a Data-fetch script.

Configuring search page templates requires a knowledge of HTML and Angular bindings.

Typeahead search in Service Portal

Search Sources in Service Portal have an option for typeahead search. Typeahead has a simple configuration option for administrators or an advanced option for more technical users.

Typeahead is a mechanism that returns search results as a user is typing in a search box in real-time.

Some search scripts may not be fast enough to make typeahead feasible, so you can enable typeahead for some search sources and disable it for others.

Additionally, similar to generating data for search sources, there are two ways to configure typeahead:

- Simple: Administrators can simply define an icon for typeahead results, which displays next to the primary field defined by the search results. This is the easiest configuration to get immediate typeahead results with little configuration.
• Advanced: If you need more fine-grain control over the appearance of typeahead results, you can enable advanced configuration of typeahead. Configure the template of the typeahead result in the search page template.

Service Portal Single sign-on, logins, and URL redirects

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.

Only users who understand SSO, URL redirects, and the ServiceNow platform should make any changes.

Single sign-on and Service Portal

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to Use external login. For more information on SSO and authentication in the platform, see Multiple provider single sign-on.

Require authentication for a Service Portal page

If you want to require authentication for a Service Portal page, ensure that the Public flag on the page record is not selected. For more information, see Create and edit a page using the Service Portal Designer on page 2250. If a user navigates to a non-public page, they are redirected to the login page for the requested portal.

Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages sys_public table define the page as public:

• Page: $sp
• Active: true

Configure the Service Portal login page

Administrators can configure a login page URL redirect for a portal.

1. In the sys_properties table, make sure these properties are set to the following:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.page.script</td>
<td>new</td>
<td>Login page determination</td>
</tr>
<tr>
<td></td>
<td>SPEntryPage().getLoginURL()</td>
<td></td>
</tr>
</tbody>
</table>

2. It's better to leave this alone, but if you do need to customize the actual entry page, from the Script Includes table, search for SPEntryPage.

   Note: If you make changes to the script include, it won't be upgraded with future updates.

3. Edit the script on the SPEntryPage to change the assigned portal to the portal_suffix you want. SPEntryPage uses /sp/ as the portal path to redirect to. Enter your own portal_suffix in place of sp.
Redirect to Service Portal after login

Use system properties and script includes to conditionally redirect users to a page after logging in.

Follow these steps to redirect a user to Service Portal after they log in.

1. In the sys_properties table, Add a system property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

getFirstPageURL primarily does the following:

- Redirects to login_redirect.do in order to break out of the frameset (if there is one).
- Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. Customize the after login behavior by navigating to the SPEntryPage script include.

   **Note:** If you make changes to the script include, it won't be upgraded with future updates.

   **Note:** If you are using external authentication, ensure that your IdP supports the RelayState URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

Debug Service Portal URL redirects

Pro code or low code users can debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from SPEntryPage and see the session variables it redirects based on:

1. Make sure the system property glide.entry.first.page.script has the value: new SPEntryPage().getFirstPageURL().
2. From the SPEntryPage script include, set this.logVariables = true.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to System Logs System Log All.

Service Portal SCSS Primer

SCSS is a subset of the Syntactically Awesome StyleSheets (Sass) specification and is an extension of CSS. Every valid CSS style sheet is valid SCSS.

SCSS variables

SCSS variables are a way to store information that you want to reuse throughout your style sheet. You can store things like colors, font stacks, or any CSS value you think you want to reuse. SCSS uses the $ symbol to make something a variable.

SCSS supports the follow data types:

- Numbers (including units)
- Strings (with quotes or without)
- Colors (name, or names)
- Booleans

Variables can also be arguments to or results from one of several available functions or mixins. During translation, the values of the variables are inserted into the output CSS document.

For example:

```scss
$font-stack: Helvetica, sans-serif;
$primary-color: #333;

body {
    font: 100%$font-stack;
    color: $primary-color;
}
```

For more information on Sass, see the Sass/SCSS reference.
SCSS functions
List of functions for Service Portal SCSS compiler.

**RGB functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb($red, $green, $blue)</td>
<td>Creates a Color from red, green, and blue values.</td>
</tr>
<tr>
<td>rgba($red, $green, $blue, $alpha)</td>
<td>Creates a Color from red, green, blue, and alpha values.</td>
</tr>
<tr>
<td>red($color)</td>
<td>Gets the red component of a color.</td>
</tr>
<tr>
<td>green($color)</td>
<td>Gets the green component of a color.</td>
</tr>
<tr>
<td>blue($color)</td>
<td>Gets the blue component of a color.</td>
</tr>
<tr>
<td>mix($color1, $color2, [$weight])</td>
<td>Mixes two colors together.</td>
</tr>
</tbody>
</table>

**HSL functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsl($hue, $saturation, $lightness)</td>
<td>Creates a Color from hue, saturation, and lightness values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hsla($hue, $saturation, $lightness, $alpha)</td>
<td>Creates a Color from hue, saturation, lightness, and alpha values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hue($color)</td>
<td>Gets the hue component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturation($color)</td>
<td>Gets the saturation component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lightness($color)</td>
<td>Gets the lightness component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>adjust-hue($color, $degrees)</td>
<td>Changes the hue of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lighten($color, $amount)</td>
<td>Makes a color lighter.</td>
<td>Yes</td>
</tr>
<tr>
<td>darken($color, $amount)</td>
<td>Makes a color darker.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturate($color, $amount)</td>
<td>Makes a color more saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>desaturate($color, $amount)</td>
<td>Makes a color less saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>grayscale($color)</td>
<td>Converts a color to grayscale.</td>
<td>Yes</td>
</tr>
<tr>
<td>complement($color)</td>
<td>Returns the complement of a color.</td>
<td>No</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Availability</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>invert($color)</td>
<td>Returns the inverse of a color.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Opacity functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacity($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>rgba($color, $alpha)</td>
<td>Changes the alpha component for a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacify($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>fade-in($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>transparentize($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
<tr>
<td>fade-out($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Other color functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjust-color()</td>
<td>Increases or decreases one or more components of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>scale-color()</td>
<td>Fluidly scales one or more properties of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>change-color()</td>
<td>Changes one or more properties of a color.</td>
<td>No</td>
</tr>
<tr>
<td>ie-hex-str()</td>
<td>Converts a color into the format understood by IE filters.</td>
<td>No</td>
</tr>
</tbody>
</table>

### String functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>unquote($string)</td>
<td>Removes quotes from a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>quote($string)</td>
<td>Adds quotes to a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>str-length($string)</td>
<td>Returns the number of characters in a string.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Function

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>str-insert($string, $insert, $index)</td>
<td>Inserts $insert into $string at $index.</td>
<td>No</td>
</tr>
<tr>
<td>str-index($string, $substring)</td>
<td>Returns the index of the first occurrence of $substring in $string.</td>
<td>No</td>
</tr>
<tr>
<td>str-slice($string, $start-at, [$end-at])</td>
<td>Extracts a substring from $string.</td>
<td>No</td>
</tr>
<tr>
<td>to-upper-case($string)</td>
<td>Converts a string to upper case.</td>
<td>No</td>
</tr>
<tr>
<td>to-lower-case($string)</td>
<td>Converts a string to lower case.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Number functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage($number)</td>
<td>Converts a unitless number to a percentage.</td>
<td>Yes</td>
</tr>
<tr>
<td>round($number)</td>
<td>Rounds a number to the nearest whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>ceil($number)</td>
<td>Rounds a number up to the next whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>floor($number)</td>
<td>Rounds a number down to the previous whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>abs($number)</td>
<td>Returns the absolute value of a number.</td>
<td>Yes</td>
</tr>
<tr>
<td>min($numbers…)</td>
<td>Finds the minimum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>max($numbers…)</td>
<td>Finds the maximum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>random([$limit])</td>
<td>Returns a random number.</td>
<td>No</td>
</tr>
</tbody>
</table>

### List functions

Lists in SCSS are immutable; all list functions return a new list rather than updating the existing list in-place.

All list functions work for maps as well, treating them as lists of pairs.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>length($list)</td>
<td>Returns the length of a list.</td>
</tr>
<tr>
<td>nth($list, $n)</td>
<td>Returns a specific item in a list.</td>
</tr>
<tr>
<td>set-nth($list, $n, $value)</td>
<td>Replaces the nth item in a list.</td>
</tr>
<tr>
<td>join($list1, $list2)</td>
<td>Joins together two lists into one.</td>
</tr>
</tbody>
</table>

© 2018 ServiceNow. All rights reserved. 2427
### Adding custom functions

```scss
ss @function my-calculation-function($some-number, $another-number){ @return $some-number + $another-number }
```

### SCSS nesting

SCSS lets you nest your CSS selectors in a way that follows the same visual hierarchy of your HTML.

For example:

```scss
nav {
  ul {
    margin: 0;
    padding: 0;
    list-style: none;
  }

  li { display: inline-block; }

  a {
    display: block;
    padding: 6px 12px;
    text-decoration: none;
  }
}
```

The `ul`, `li`, and `a` selectors are nested inside the `nav` selector, which is a great way to organize your CSS and make it more readable. When the widget is rendered, the generated CSS looks something like the following code block:

```css
nav ul {
  margin: 0;
  padding: 0;
  list-style: none;
}

nav li {
  display: inline-block;
}

nav a {
  display: block;
  padding: 6px 12px;
  text-decoration: none;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).
SCSS operators

SCSS has a handful of standard math operators like +, -, *, /, and %.

Use simple math to calculate widths for an aside & article. For example:

```
.container { width: 100%; }

article[role="main"] {  
  float: left;  
  width: 600px / 960px * 100%;
}

aside[role="complementary"] {  
  float: right;  
  width: 300px / 960px * 100%;
}
```

The generated CSS looks like:

```
.container {  
  width: 100%;  
}

article[role="main"] {  
  float: left;  
  width: 62.5%;
}

aside[role="complementary"] {  
  float: right;  
  width: 31.25%;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

SCSS mixins

A mixin lets you make groups of CSS declarations that you want to reuse throughout your site. You can pass in values to make your mixin more flexible.

The following code block is an example for border-radius.

```
@mixin border-radius($radius) {  
  -webkit-border-radius: $radius;  
  -moz-border-radius: $radius;  
  -ms-border-radius: $radius;  
  border-radius: $radius;
}

.box { @include border-radius(10px); }
```

The generated CSS looks like:

```
.box {  
  -webkit-border-radius: 10px;  
  -moz-border-radius: 10px;  
  -ms-border-radius: 10px;  
  border-radius: 10px;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).
Subscription Management setup guide

Because Subscription Management is active for all production instances by default, you do not need to activate a plugin. To set up Subscription Management, you assign the usage_admin role to the users who will administer subscriptions. The admins allocate users to appropriate subscriptions, monitor usage of applications (both by subscribed users and by users who are not subscribed), and update subscription levels as needed.

What to do

Assign the Usage Admins

Before you (the admin user) do anything else, assign the usage_admin role to the persons who will manage subscriptions for your organization. Admin responsibilities and activities are described in the following sections.

View the list of your subscription applications

See View your subscription applications and allocation levels on page 2431.

If your organization purchased Per-User subscriptions, the usage_admin allocates users

Note: You perform this task only for Per-User subscriptions. Your instance auto-allocates and reports on monthly usage for all other subscription types.

With a Per-User subscription, a specified number of users is entitled to use the application. You perform the following tasks:

- Build user sets.
- Allocate users to appropriate subscriptions.
- Monitor and manage the number of subscribed users.

See Allocating users to a Per-User subscription on page 2436.

What to do next

Day-to-day administration: Monitor and manage subscriptions

See Monitoring subscriptions on page 2444

Subscription Management admin guide

You use the ServiceNow® Subscription Management application to review and manage how purchased subscriptions are used on your production instance. You can monitor usage to update subscription levels and to make informed decisions about subscription purchases.
What is a subscription?

In contrast to companies that sell software licenses, ServiceNow sells subscription services.

• Your organization has purchased a subscription to an application family. The subscription entitles an agreed-upon number of users or resources in your organization to use the applications.
• For Per-User type subscriptions only, you allocate users to the subscription. As a result, the user is subscribed to the family of applications. For other subscription types, the instance auto-allocates users or resources to the subscription.
• For your organization to comply with its service contract, only subscribed users or resources should use a subscription application family.
• The Subscription Management application monitors your purchased subscriptions on production instances only.

How do you use Subscription Management?

The usage_admin can perform the following tasks:
• Receive and view subscriptions that your organization has purchased.
• Monitor and adjust allocation levels.
• Plan for renewing subscriptions.
• Determine which users (by role, by user group, or by some other criterion) should be subscribed to which Per-User subscription applications.
• Build user sets.
• Allocate users and user sets to each of the Per-User subscriptions.
• Manage user sets as users, roles, and groups change over time.

View your subscription applications and allocation levels

The Subscriptions form lists the subscriptions that your organization has purchased and indicates how many users or resources are allocated to each subscription.

Role required: usage_admin or admin

• You might not see all of the subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
• Subscription data arrives on production instances only.
• Self-hosted instances do not receive subscription information.
• Subscriptions that are marked as Display only do not currently support resource allocation or monitoring.

On your production ServiceNow instance, navigate to Subscription Management Subscriptions. The page lists all subscriptions that your organization has purchased. A color code indicates the allocation level. You can click a subscription Name to open the Subscription form, where you can:
• View or update how users are allocated to a subscription. See Subscription form on page 2432
• View the applications and plugins that are included with a subscription on page 2434
Subscription form

Use the Subscription form to view the list of applications that are associated with the subscription and to view or update how resources are allocated to a subscription.

In any list of subscriptions, click a subscription Name to open the Subscription form.

Table 1110: Fields on the Subscription form

<table>
<thead>
<tr>

| Type                      | [Read-only] Type of subscription: Per-User, Max User, PA Indicator, Capacity, or Unlimited. |

| Category                  | [Read-only] The source of the purchased subscription: ServiceNow or ServiceNow Store. |

<p>| Start date / End date     | [Read-only] Start and end of the subscription period as agreed in your service contract. This information appears in the General section of the service contract for the subscription. |</p>
<table>
<thead>
<tr>
<th>Purchased</th>
<th>[Read-only] Number of users or other resources that can be subscribed.</th>
</tr>
</thead>
</table>
| Allocated      | Number of currently subscribed users or allocated resources for the subscription.  
                 The color codes indicate the percentage of the subscription that has been used. |
| Limit to purchased | Select the check box to ensure that you do not exceed the purchased subscription limit while attempting to allocate users.  
                   If allocating a user would exceed the subscription limit and the Limit to purchased option is selected for the subscription, the user is not subscribed and is instead set to Pending status. |
| Auto-sync with user sets | Select the check box to check all associated user sets for updates regularly (added or removed users) based on the user set membership settings and then update subscription allocation accordingly. |
| Display only   | [read-only] A value of true indicates that user allocation or monitoring is not currently supported for the subscription. |

### Table 1111: Related lists on the Subscription form

<table>
<thead>
<tr>
<th>Subscription Applications</th>
<th>Applications or suites that are associated with the subscription. The users that you allocate to the subscription are subscribed to the listed applications. To view the list of plugins that are associated with an application, click the application Name.</th>
</tr>
</thead>
</table>
| Subscribed Users          | This list of users that are subscribed to the applications is populated only for Per-User subscriptions.  
                           The users were allocated o the subscription individually and/or are members of user sets that were added to the subscription. |
User Sets | User sets that were added to the subscription.
---|---
Excluded Users | Excluded users cannot be allocated to the subscription.

### View the applications and plugins that are included with a subscription

You can activate a plugin that is associated with a for-fee subscription only if your organization has purchased the subscription.

**Role required:** usage_admin or admin

1. On your production ServiceNow instance, navigate to Subscription Management Subscriptions. The page lists all subscriptions that your organization has purchased.

   **Note:** If the subscription does not appear in the list, contact your ServiceNow account representative to purchase the subscription.

2. Click a subscription name and then, on the Subscription form, click an application name in the Subscription Applications related list. (A subscription can include multiple applications.) The page lists the plugins that are associated with the application.

### View subscription histories

You can view concise data on subscription downloads and updates for your organization.

**Role required:** usage_admin or admin

1. Navigate to Subscription Management Subscriptions and then click a subscription Name.
2. On the Subscription form, click the View Subscription History related link.
3. The Subscription History popup lists the operations on subscriptions for this ServiceNow instance. Click an Operation to view details.

### View the histories of subscription users

For each Per-User subscription, you can view concise historical data on changes in subscription status for users: when users were subscribed and when they were unsubscribed, excluded, or unexcluded.

**Role required:** usage_admin or admin

1. Navigate to Subscription Management Subscriptions and then click the Name of a Per-User subscription.
2. On the Subscription form, click the View User Subscription History related link.
3. The User Subscription History popup lists the operations on user subscription status for the specified subscription. Click a User State to view details of a change in subscription status for a user.

   - **User State:** Lists the change in the user status: subscribed/unsubscribed and excluded/unexcluded
   - **Allocation Source:** Lists the name of the user set that acted as the source of the user
   - **Allocation Type:** Lists the method for allocating the user to the subscription: user set or individual
   - **Operation time and Created by:** Lists the timestamp of change and the admin who made the change

© 2018 ServiceNow. All rights reserved. 2434
View the histories of subscription user sets

You can view concise historical data on subscription user sets: when they were created, updated, or deleted.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscription User Sets and then click the Name of a user set.
2. On the Subscription User Set page, click the View User Set History related link.
3. The User Set History popup lists the operations on user sets for the specified subscription. Click an Operation to view details.

Types of subscriptions

The Subscriptions module lists all subscription types that your organization has purchased.

You allocate users only to Per-User subscriptions. Because the instance auto-allocates all other subscription types, no action is required on your part.

<table>
<thead>
<tr>
<th>Subscription type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>Your ServiceNow instance auto-allocates resources such as users, devices, software, or nodes to Capacity subscriptions. For example, resources like each CI that Discovery finds or each password reset request.</td>
</tr>
<tr>
<td>Max User</td>
<td>Your organization purchased a subscription for the anticipated maximum number of active ServiceNow users. To monitor overall usage, the instance auto-allocates each active user up to the limit of the Max User subscription.</td>
</tr>
<tr>
<td>PA Indicator</td>
<td>Your organization purchased a subscription for an application suite that uses Performance Analytics capabilities (for example, PA for ITSM or PA for Service Management). The PA admin creates indicators on tables that are used by the applications in the suite.</td>
</tr>
<tr>
<td>Per-User</td>
<td>Your organization purchased a subscription for the number of fulfiller users for subscription applications and capabilities. By default, the instance can monitor and report on usage of the application by both subscribed users and users who are not subscribed. As the usage administrator, you allocate eligible fulfillers to each Per-User subscription. After fulfiller users are subscribed, you can enable subscription enforcement.</td>
</tr>
</tbody>
</table>
Unlimited | ServiceNow Store apps only. Your instance auto-allocates and tracks active users to an Unlimited subscription. There is no limit to the number of users that can be allocated. An active user is any user in the sys_user table that has a user id and has the Active field set to true.

Why a subscription does not appear in the list

The Subscriptions list displays the subscriptions that your organization has purchased. There are, however, several types of non-subscription items that do not appear in the list.

Why does my subscription not appear in the Subscriptions list?

• You might not see all of the subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
• Self-hosted instances do not receive subscription information and therefore do not display information on the Subscriptions form.

Why is the Subscriptions list empty?

• The subscription information might not yet have arrived. The data is downloaded daily.

Allocating users to a Per-User subscription

You, the usage admin, use the Subscriptions module to allocate users to the Per-User type subscriptions that your organization has purchased.

Example: Allocating users to a Per-User subscription

In this example, your organization purchased a subscription for 200 fulfiller users. You can therefore specify the 200 users—the subscribed users—who have the right to use the subscription application and features on your production instance. You can allocate users either individually or by adding user sets to the subscription.

Note: User sets are the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, the system regularly updates the list of members based on the conditions that you specified. You do not need to manage individual users.
The subscription admin allocates a mix of user sets and individual users to the 200-user subscription.

User Set 1

Allocate

User Set 2

Allocate

5 Individual Users

Allocate

The 200 users that the admin allocated to the subscription are now subscribed to the application.
Guidelines for allocating users

- You allocate users only to Per-User subscriptions. The instance automatically reports on monthly usage for all other subscription types.
- When you add a user set to a subscription, the system allocates all users in the user set, up to the purchased subscription limit.
- In the case that adding the users in a user set would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to Pending status and are listed on the Pending Users related list.
- You can unsubscribe any user as needed.
- You can exclude users. Excluded users cannot be allocated to a subscription individually or through a user set. At any time, you can remove a user from the list of excluded users.

**Note:** If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be re-subscribed in the next synchronization cycle. To remove such a user, exclude the user.

Methods for allocating users

- Define user sets and then add user sets to the subscription
- Allocate individual users to the subscription (as many as are required)

Overview of the procedure for allocating users

1. Allocate users to the subscription using one or both of the following methods:
   - Build one or more user sets and add the user sets to the subscription.
   - Allocate individual users
2. After you have allocated users to the subscription, you can add or remove user sets and individual users as needed. In addition, you can exclude individual users as needed.

User sets

You define the criteria for a user to become a member of a user set (for example, all fulfiller users in the IT department). When you add a user set to a subscription, the system attempts to subscribe all users in the user set.

Auto-sync

The system updates the members in a user set whenever a user update causes the user to meet or fail to meet the criteria for the user set. For example, if a user loses the “fulfiller user” role, the user is removed from the user set.

To make subscriptions self-maintaining, you can auto-sync a subscription. The system then regularly subscribes or unsubscribes users based on updates to the user sets that are assigned to the subscription. The option is described in Auto-sync a subscription to user set updates on page 2440.
**How users are subscribed and unsubscribed**

- You can add a user set to any number of subscriptions.
- Users that are allocated from multiple user sets are subscribed only one time.
- In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to Pending status and are listed in the Pending Users related list.
- When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. If a user is added from another user set, however, the user is not unsubscribed.

**Why a user is not subscribed when you add a user set**

- The user set is empty (contains no users).
- The user had been excluded from the subscription.
- The user had already been allocated directly
- Another user set added the user (duplicate user)
- A user could not be allocated because adding the user would exceed the subscription limit. In this case, all users in the user set are set to Pending status. The names of the users are listed in the Pending Users related list.

**Why a user is not unsubscribed when you remove a user set**

- The user set is empty (contains no users).
- The user was already allocated directly
- The user is added from another user set

**Build a user set**

You can create a user set using either of two methods: Configure a filter that selects particular users from the User [sys_user] table or specify a particular set of user groups from the Group [sys_user_group] table.

Role required: usage_admin or admin

1. Open the Subscription User Sets page: Navigate to Subscription Management Subscription User Sets.
2. Click New and then enter a unique Name (for example, Fulfiller users in the IT department) and Description for the user set.
3. Use one of the following methods to specify the Source of the users that you will add to the user set:
### User [sys_user]

- **Description:** The Conditions setting is a standard ServiceNow condition builder.
  
  1. Specify the filters that determine which users to extract from the table. The extracted users make up the user set. For example, filter for `[role] [is] [itil]`.

  2. Click to view the number of users that the filter generates.

### Group [sys_user_group]

- **Description:** Unlock the Groups box and add appropriate groups.

  4. When the list is correct, click Submit or Update. The user set that you created is available to add to any subscription.

---

### Add a user set to a subscription

When you add a user set to a subscription, all users in the user set are allocated to the subscription.

**Role required:** usage_admin or admin

To add an existing user set to a subscription:

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.
3. On the User Sets related list, click Edit.
4. The Add User Sets form displays the list of user sets that you can add. Move the desired user sets from the Collection list into the User Sets list and then click Save.

   The users in the list are allocated to the subscription and the number of subscribed users is updated.

**Note:** In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to Pending status and are listed in the Pending Users related list. Currently subscribed users who were individually subscribed or in other users sets are not affected. See Manage users with 'Pending' status on page 2443.

5. You can configure any subscription to check associated user sets for updates regularly and then update the list of subscribed users accordingly. On the Subscription form, select Auto-sync with user sets.

**Note:** If you do not select the Auto-sync with user sets option, then the user sets that you add to the subscription are never updated and the list of subscribed users does not auto-update over time.

6. On the Subscription form, click Update.

---

### Auto-sync a subscription to user set updates

You can configure any subscription to check user sets regularly to find users who were added or removed. The system then regularly subscribes or unsubscribes users based on updates to user sets.

**Role required:** usage_admin or admin
If the system cannot allocate a user because adding the user would exceed the subscription limit, the user is set to Pending status and is listed in the Pending Users related list.

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription to update.
3. On the Subscription form, select Auto-sync user sets.
4. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Remove a user set from a subscription

When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. User sets are removed regardless of the Auto-sync with user sets setting.

Role required: usage_admin or admin

Users are removed for

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the User Sets list, select all user sets to remove.
4. In the Actions on selected rows list, select Remove From Subscription. On the Remove User Set from Subscription pop-up, click Remove.
   All users in the selected user sets are unsubscribed. If users in the user sets are pending, then the users are removed from the Pending Users list.

Delete a user set

You can delete a subscription user set only if no subscriptions use the user set.

Role required: usage_admin or admin

- **Note:** Deleting a user set is a permanent action – the user set will no longer exist. In contrast, you can remove a user set from a subscription to unsubscribe all users in the user set—the user set will still exist.

1. Ensure that the user set is not used by any subscription.
2. Navigate to Subscription Management Subscription User Sets and select the user set.
3. Click Delete.

Allocate an individual user from the Subscription form

In addition to adding user sets to a subscription, you can add individual users directly. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

- **Note:** A user set, not individual allocation, is the preferred automated method for managing the pool of users who should be subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.
3. Optional: To ensure that you do not exceed the purchased subscription limit, click Limit to purchased.
4. On the Subscribed Users related list, click Edit.
5. The form displays the list of users that you can add. Move the desired users from the Collection list into the Subscribed Users list and then click Save.
   - The selected users are allocated to the subscription. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to Pending status and is listed in the Pending Users related list.
   - The number of allocated users is updated to include the users that you added.
6. Click Update on the Subscription form.

Allocate an individual user from the User Record form

To simplify the process of setting up user capabilities, you can allocate or deallocate an individual user to a subscription while viewing the user data on the User form. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

*Note:* A user set, not individual allocation, is the preferred automated method for managing the pool of users who should be subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to User Administration Users and then click the Name of the user. The User form opens.
2. On the Manage Subscriptions related list, click Edit.
3. The Edit Members slushbucket lists the subscriptions that you can allocate the user to. To allocate the user, move a subscription from the Collection list into the Manage Subscriptions list and then click Save.

   The user is allocated to the subscription. If allocating a user would exceed the subscription limit, the user is not allocated. Instead, the user is set to Pending status and is listed in the Pending Users related list on the Subscription form.

   To deallocate the user, move a subscription from the Manage Subscriptions list into the Collection list.

4. Click Update on the User form.

   The Subscriptions related list is updated to list all subscriptions that the user is allocated to and the applications that the user is subscribed to.

Manage users with 'Pending' status

When you try to allocate users to a subscription but the subscription limit would be exceeded, the users are not subscribed and are set to Pending status. You can then deallocate some users and allocate other users to the subscription.

Role required: usage_admin or admin

Note: To allocate pending users to the subscription, the number of subscribed users must be lower than the subscription limit (the Purchased value).

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Pending Users related list, select all users to update.
4. In the Actions on selected rows list, select an action. Each action also removes the user from the Pending Users list.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allocate selected users</td>
<td>Allocates the users to the subscription.</td>
</tr>
<tr>
<td>Exclude from subscription</td>
<td>Excluded users cannot be allocated to the selected subscription.</td>
</tr>
<tr>
<td>Delete</td>
<td>Removes the selected users from Pending status and performs no other action.</td>
</tr>
</tbody>
</table>

Unsubscribe a user

When you remove a user from a subscription, the user is unsubscribed.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to unsubscribe.
4. In the Actions on selected rows list, select Remove from subscription and then click Remove on the pop-up.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be re-subscribed in the next synchronization cycle. To remove such a user, exclude the user.
Exclude a user

You can *exclude* users. Excluded users cannot be allocated to a specified subscription.

Role required: usage_admin or admin

---

**Note:** If an excluded user is a member of a user set that is auto-synced, the user is not added by synchronization.

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to exclude.
4. In the Actions on selected rows list, select Exclude from subscription and then click Exclude on the pop-up.

Remove a user from the Excluded list

You can *unexclude* a user so that the user can be allocated to a subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Excluded Users related list, select all users to unexclude.
4. In the Actions on selected rows list, select Delete and then click Delete on pop-up.

The selected users are no longer excluded and are removed from the Excluded Users related list. No other action is taken.

---

**Note:** The users are not yet allocated to the subscription. You must manually add the users or synchronize the associated update set. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

---

Monitoring subscriptions

You, the usage admin, use the Subscriptions module to allocate users to the Per-User subscriptions that your organization has purchased.
Subscription life cycle

1. Receive and view subscriptions
   - Your instance downloads subscription information and notifies you by email. Now you can review the subscriptions to decide which actions to take.

2. Allocate users to subscriptions

3. Monitor and adjust subscribed users

4. Plan for renewing subscriptions

5. Review the subscriptions that your organization has purchased

Subscription Management tasks

<table>

</tbody>
</table>

**Monitor how resources are allocated to subscriptions**

Use the Subscription Overview module to monitor how users and resources are allocated to subscriptions.

Role required: usage_admin or admin

The system displays one chart for each subscription. Use the reports to perform the following actions:

- Monitor how resources (for example, discovered nodes or password reset requests) use Capacity subscriptions.
- Plan and budget for upcoming or future subscription needs.
- Assess whether you have allocated too many fulfiller users to a Per-User subscription. You might deallocate some users or purchase a subscription for more users.
- Assess whether you have allocated too few fulfiller users to a Per-User subscription. You might allocate more users.
• Determine whether users who are not subscribed are accessing a subscription application.

Navigate to Subscription Management Subscription Overview to view the following data:
The Expired Subscriptions report lists all subscriptions where the service contract term has expired (the end date has passed). You should assess whether to renew any subscription that has expired.

Each Subscription Metrics chart displays the following data for a single subscription (one month of data is required before the report appears):

- Purchased: The number of resources purchased for the subscription
- Allocated: The average number of users for the month who have been allocated to the subscription
- Non-subscribed users: The average number of individual users who performed fulfiller actions in the associated applications without being subscribed to the applications. Click a data point to view the application.

In this example, the organization updated the purchased subscription from 15 to 20 users in November 2015. Over the course of April 2016, the usage admin had allocated an average of about 19 users. In addition, one user who was not subscribed performed fulfiller actions in an application associated with the subscription.
Monitor subscription compliance

Use the Compliance Overview module to monitor fullfiller actions by subscribed users and by users who are not subscribed to an application that your organization has purchased. In addition, a chart shows usage for applications where your organization has not yet purchased a subscription.

Role required: usage_admin or admin

Navigate to Subscription Management Compliance Overview to view the following charts:
The Unique Application Users chart shows the number of individual subscribed users who performed fulfiller actions in the application. Each user is counted one time only, regardless of number of accesses.

The Unique Out-of-Policy Users chart shows the number of individual users who performed fulfiller actions in the application without being subscribed to the application. Each user is counted one time only, regardless of number of accesses.

The Application Use Without a Purchased Subscription chart shows the number of users who performed fulfiller actions in an application even though your organization has not purchased a subscription for the application.

Configure the color codes for allocation levels

On lists, forms, and charts, a configurable color code indicates the percentage of the subscription that has been allocated.

Role required: usage_admin or admin

1. Navigate to Subscription Management Properties.
2. Update the Threshold for color codes [subscription.used.thresh] property setting and then click Save.
   Specify a percentage value greater than 0 and less than 100. Default: 90% of the purchased subscription count.
   • Subscription allocation levels below the specified threshold are marked with a green color code.
   • Allocation levels between the threshold and 100% are marked yellow.
   • Allocation levels above 100% are marked red.
Survey Management

The ServiceNow® Survey Management application allows you to create, send, and collect responses for basic surveys. You can also use the Survey widget to set up a survey within Service Portal, if installed.

Survey Management does not support domain separation.

Comparing Survey Management and Legacy Surveys

Two versions are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

Note: The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

**Configuring surveys in Survey Management**

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even users who have not logged in to the ServiceNow system.
- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.
Note: Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Survey Management roles

The Survey Management application uses the following roles.

No role is required to take assigned survey questionnaires.

Table 1114: Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Survey administrator [survey_admin] | Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu. | • survey_reader
                  • assessment_admin                                                              |
| Survey reader survey_reader | View surveys and related information, such as survey responses, survey groups, scorecards, and reports. | none                                |

Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

Table 1115: Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>

</tr>
</tbody>
</table>

Survey responses and results

There is a metric result record for each user's response to each question on every survey instance. Survey results for each question and category are calculated automatically based on these metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

Survey responses

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients' answers to each question in a category. To view the general results, navigate to Survey Survey Responses. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To
view these results, navigate to Assessments Results Category results and filter the results using the [Type.Evaluation method] [is] [Survey] condition.

![Survey filter](image)  

**Figure 664: Assessment category results**

**Survey scorecards**

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see *View a survey scorecard* on page 2057.

**View results for all surveys**

You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.  
Role required: survey_admin or survey_reader  
1. Navigate to Survey Survey Responses.
Do not confuse this module with Survey Legacy Surveys Survey Responses, which displays legacy survey responses.

The Type column displays the survey definition each response is associated with.

2. Select a response to view its details.

View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Role required: survey_admin or survey_reader

1. Navigate to Survey View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user’s response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Metric result fields
## Table 1116: Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the question's Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

### Example: calculate the normalized value for a survey metric

The normalized value is calculated based on a linear equation and the scale definition of the metric.
Equation used to calculate the normalized value

Normalized value = (Input Value - Min value defined in metric) / (Max value defined in metric - Min value defined in metric) * current metric weight / (sum of valid metric weight) * scale_factor

Note: The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then Normalized value = 1.0 – Normalized value.

Example

Calculate the normalized value for the Please rate the competency of the technician metric. The metric has the following values:

<table>
<thead>
<tr>
<th>Table 1117: Values of the metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
</tr>
<tr>
<td>Minimum value</td>
</tr>
<tr>
<td>Maximum value</td>
</tr>
<tr>
<td>Current metric weight</td>
</tr>
<tr>
<td>Number of responses</td>
</tr>
<tr>
<td>• 4 of type=number</td>
</tr>
<tr>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
</tr>
<tr>
<td>Scale factor</td>
</tr>
</tbody>
</table>

Normalized value = (3 - 1) / (6 - 1) * 10 / (10 + 10 + 10 + 10 + 10) * 10 = 0.8

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result [asmt_metric_result] table.

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to SurveyView Surveys.
2. Open a survey definition.

   The scorecard link is hidden if there are no survey results to report.

The interactive scorecard displays the name of the survey and results or comparisons of the ratings. You can display results in the following views:

- Category Results
- Question Results
- Average Ratings
- History

**Survey scorecard category results**

The Category Results view is a stacked bar chart showing survey results for all questions in a category by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer
To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

![Figure 666: Survey scorecard category results detail](image)

**Survey scorecard question results**

The Question Results view shows the results for each question in a category using different chart types, based on a data type.

**Pie chart**

The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.
Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)

© 2018 ServiceNow. All rights reserved.
**Bar chart**

A bar chart appears when question results use the Percentage data type.

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports Administration Report Ranges.

**Survey scorecard average ratings**

The Average Ratings view displays the weighted average rating for each survey question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

How courteous and...  How satisfied are...
How satisfied were...
Please rate the t...
Was technician ab...

Average Normalized value
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

![Figure 669: Average ratings detail](image)

**Survey scorecard history**

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
Figure 670: Survey scorecard trend chart

3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year’s ratings.

</tbody>
</table>

**Figure 671: Survey scorecard history - 3 years**
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd [2015], 1st [2015], 4th [2014], and 3rd [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Figure 672: Survey scorecard history - 4 quarters
Export a scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon ( ) and select Save as PNG or Save as JPEG and wait for the export to complete.

2. Click Download and save the scorecard image to a storage location.
Survey administration

Survey administrators, users with the survey_admin role, create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

• Create, customize, and publish surveys.
• Write and maintain survey questions.
• Define trigger conditions for when surveys are sent to users, such as when an incident closes.
• Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The Survey widget is provided on the base instance.

Surveys in Service Portal

If you have Service Portal installed, you can use the Survey widget to set up surveys in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal on page 2197. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.

### Table 1118: Service Portal: Instance options (properties) for the Survey widget

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Specify how many surveys to show on the Service Portal homepage (default is 5).</td>
</tr>
</tbody>
</table>

Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.
For mobile users, the survey designer property *Pagination setting for Service Portal view* is automatically set to one question per page.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.
You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Survey designer elements

The survey designer is accessible from Survey Survey Designer.

The survey designer contains controls, a header bar, and the design canvas.

**Controls**

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
Figure 673: Controls
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score between 0 and 10.

**Table 1119: Question data types**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>

<td>Reference</td>
<td>No</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>
Header bar

The tabs on the header bar display views and a menu of functions.

![Survey Designer header bar and menu](image)

Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a signature.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (…) to select an option. The list of options depends on the currently open survey.

- **Save**: Save the current survey.
- **Preview**: Display a preview of the survey as it will appear to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.

Design canvas

New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.
Figure 675: Initial appearance of the Survey Designer canvas

Configure a survey in the survey designer

The configuration values you use in this procedure are applied to the entire survey.

Role required: admin or survey_admin

1. Select Configuration in the survey designer.
2. Complete the Survey Designer Configuration form.

Table 1120: Survey Designer Configuration form

</tr>
</tbody>
</table>
| Pagination setting for Service Portal view | The setting on which the pagination is based for desktop or tablet view in Service Portal.  
• Category: default  
• Question: 1 question per page (automatic for mobile)  
• None: no pagination  

**Note:** This field is displayed only when Service Portal is installed.  

| Duration                           | Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.  

**Note:** By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey and assessment instances that are in the Work in progress or Ready to take states. |

### Survey categories

Survey categories provide a way to group questions of a similar theme for a given survey. There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

**Create a category in the survey designer**

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

**Role required:** admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to Survey Survey Designer.
2. Enter the name of the survey in the Name field.  
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box that opens.
a) Enter a new name and a description for the category.
b) Enter text in the Details field that introduces or explains the category to recipients.
c) Click the X icon to close the Properties dialog box and save your settings.

4. To add a new category, click the + icon in the title bar of an existing category. The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.
Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New.
   Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   • There is more than one category for the survey.
   • There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click Save.
   The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.
Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for a Boolean question.</td>
</tr>
</tbody>
</table>
| String option       | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.  
  - Single line: Single line text field 40 characters in length that allows strings of any length.  
  - String line wide: Full page width text field that allows a single line entry of any length.  
  - Multiline: Full page width multiline text field that allows word wrap and returns |
| Min                 | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                     |
| Max                 | Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                    |
| Allow not applicable| Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option. |
| Randomize answers   | Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. |

**Note:** Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low values if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High values if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

**Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab. The question must have a data type of Boolean, Choice, Scale, or Template.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition. You can select more than one answer. Selected answers are indicated by a check mark. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.
9. Drag and drop questions to change their order within a category or move them between categories.
10. To delete a question, click the X icon in its title bar.

Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

### Date and Date/Time data types

The Date and Date/Time data types are very similar.
- Date: On questionnaires, users select a date.
- Date/Time: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 676: Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
Image scale datatype

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer

You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in users’ queues.

1. Navigate to Survey Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.

Configure category weights for a survey

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the Weight field. For more information, see Show or hide fields on a form.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to Survey View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click Update.

View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

Navigate to Survey Survey Instances and open a survey instance.

Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Survey definition this survey instance was created from. Survey definitions</td>
</tr>
<tr>
<td></td>
<td>are stored on the Assessment Instance table, and the field label on that</td>
</tr>
<tr>
<td></td>
<td>table is Metric type.</td>
</tr>
</tbody>
</table>
### Due date
Date by which the survey instance should be completed. The system populates the due date based on the Assessment duration of the associated survey definition, which is set to 14 days by default.

The survey due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.

**Note:** By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey and assessment instances that are in the Work in progress or Ready to take states.

### State
State of the survey instance. The possible states are Ready to take, In progress, Complete, and Canceled.

### Assigned to
User this survey instance is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.

### Expiration date
Date on which the assigned user can receive a new instance of the same survey definition. The system automatically populates the expiration date based on the Schedule period of the associated survey definition.

### Related Link
**View User's Response**
Shows a read-only version of the survey responses completed by the user.

### Related List
**Assessment Instance Questions**
All instance question records, which store user response values for each question on the survey questionnaire. The following columns are relevant to surveys:
- **Category:** Displays the survey categories the questions belong to.
- **Metric:** Displays the survey questions.

---

### Survey users and groups
Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

### Administering survey users
The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user
does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

---

### Create a survey user group

Survey user groups are groups that have the Type field set to survey and that display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

**Role required:** admin, user_admin, or survey_admin

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

1. Navigate to Survey Administration User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   - The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

---

### Select recipients for a survey in the Survey Designer

You can assign survey users while designing or modifying the survey.

**Role required:** admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

---

### Designate a survey user

You can designate one survey user at a time from the Survey Definition form.

**Role required:** admin or survey_admin

1. Navigate to Survey View Surveys.
2. Open a survey definition.
   - There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

**Designate or remove multiple survey users at one time**

Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   The changes are also reflected in the Survey Users related list on the survey definition.

**Allow recipients to retake a survey**

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see *Show or hide fields on a form*.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to Surveys View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

**Publish a survey**

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.

**Note:** You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

1. Navigate to SurveyView Surveys and select a survey to publish.
2. Click Publish.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.
Publish a survey in the Survey Designer

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.

When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

Customize the appearance of a survey

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

---

**Note:**

- For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.
- For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

---

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments Admin Assessment Properties
   - Survey Administration Properties

2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click Save. You may need to clear the browser’s cache to see updates.

Assessment and survey properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_portal_surveys.sp_survey.email_redirection</td>
<td>Allow survey link from email to open in service portal view (applies only for surveys)</td>
<td>When Yes is selected, a survey accessed from a link in an email opens in the Service Portal. Note: This property applies only to surveys. Default value: No</td>
</tr>
<tr>
<td>com.snc.assessment.signature_authentication</td>
<td>Require authentication for user signature.</td>
<td>When Yes is selected, this property requires credentials for a full name signature. Default value: Yes</td>
</tr>
<tr>
<td>css.assessment.question.header.background.color</td>
<td>Question header background color</td>
<td>Sets the background color of question headers on assessment and survey questionnaires. Default value: #767676</td>
</tr>
</tbody>
</table>
### Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

#### Modify a survey definition

You can configure additional options for a survey definition.

Role required: admin or survey_admin

1. Navigate to Survey View Surveys .
   
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition.

3. Modify the fields on the Survey Definition form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey, which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the Active check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the Active check box to deactivate or activate a published survey.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Assigned to field is cleared. However, each response record includes the Created By and Updated By fields that are accessible to users with the survey_admin role.</td>
</tr>
<tr>
<td>Send notifications</td>
<td>Check box to send a notification that the survey has been taken.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the survey: Draft or Published.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click New to create a new one. The signature form contains these fields:</td>
</tr>
<tr>
<td></td>
<td>• Name: Descriptive name for this signature.</td>
</tr>
<tr>
<td></td>
<td>• Signature type: Type of signature required. The selections are Check box, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the survey.</td>
</tr>
<tr>
<td></td>
<td>• Assertion: Text you want to display to recipients.</td>
</tr>
<tr>
<td></td>
<td>By default, a property called Require authentication for user signature (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature.</td>
</tr>
<tr>
<td>Schedule period</td>
<td>Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.</td>
</tr>
<tr>
<td>Allow retake</td>
<td>Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user's My Assessments &amp; Surveys page.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Scheduled job                             | Scheduled job the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  • The system deletes the old scheduled job.  
  
  If you selected a recurring schedule period:  
  • A new scheduled job is created.  
  
  For example, if you change the schedule period from Daily to Weekly and save the record:  
  • The system deletes the daily scheduled job.  
  • Creates a weekly one set to run a week from the current date.  
  
  This field is visible to administrators only if the schedule period is Daily, Weekly, Monthly, or Yearly.                                                                                                                                                                                                                                                                                                                                |
| Introduction                               | Introductory content to display on survey questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions.                                                                                                                                                                                                                                                                                                                             |
| End note                                  | Content to display on the screen that appears when someone submits a survey questionnaire. Consider adding a thank you message, follow-up instructions, or other applicable information.                                                                                                                                                                                                                                                                                                                 |
| Pagination setting for Service Portal view | The setting on which the pagination is based for desktop or tablet view in Service Portal.  
  • Category: default  
  • Question: 1 question per page (automatic for mobile)  
  • None: no pagination  
  
  Note: This field is displayed only when Service Portal is installed.                                                                                                                                                                                                                                                                                                                                                      |
| Assessment duration                       | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to see this field.  
  
  Note: By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey and assessment instances that are in the Work in progress or Ready to take states.                                                                                                                                                                                                                                                                  |
<p>| Send notifications                        | Select the check box to send notifications for the survey when it is published. Configure the form to see the field.                                                                                                                                                                                                                                                                                                                                                                           |
| Related Links                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |</p>

<tr>
<td>Note: If you add a related list to the form, use list control to omit the New button. The system generates survey instances to produce functional surveys.</td>
<td></td>
</tr>
</tbody>
</table>

4. Save the record.

Schedule periods

The available schedule periods are Only Once, No Limit, Daily, Weekly, Monthly, and Yearly.

The default schedule period is No Limit. When you set the schedule period to anything except Only Once or No Limit, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not Complete.

For example, if you set the schedule period to Monthly and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the Expiration date field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance.
When the system generates a survey instance and the schedule period is anything except No Limit, the Expiration date field is automatically set to the appropriate date. For example, if the schedule period is Weekly, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is Weekly. The next day, a survey administrator changes the schedule period to No Limit. Sal cannot receive another survey instance until one of the following actions occurs.

• Seven days pass from the time Sal's survey instance was generated.
• A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

---

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to No Limit. Trigger conditions use a different method to regulate how often users can receive survey instances.

---

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

**Role required:** admin or survey_admin

1. Navigate to Survey Survey Designer and load a survey or create a new survey.
2. Drag the Template data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.
Create or modify survey questions

You can create and administer survey questions.

Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected Data type.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the data type if another question depends on this question.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the data type is Template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the template if another question depends on this question.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
<td></td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations. This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>Answer options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.
   Be sure to create answer options if you select the Choice or Likert Scale data type.

**Survey question data types**

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.
If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

**Date and Date/Time data types**

The Date and Date/Time data types are very similar.

- Date: On questionnaires, users select a date.

- Date/Time: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select Number, you must fill in these additional fields:

- Scale definition: Select High if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- Min and Max: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select Percentage, you must fill in these additional fields:

- Scale definition: Select High if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- Min and Max: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Figure 679: Single line
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.

If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.
Image scale datatype

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

How satisfied are you with the service provided by IT?

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

Note: N/A option is not supported for image scale type question.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template

Question templates define reusable sets of answer options for survey questions.
Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

![Template definition](image)

**Figure 682: Template definition**

Templates are available for survey questions that have Data type set to Template. The following question templates are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to Survey Templates.
   - Each template is stored as a record on the Assessment Metric Template [asmt_template] table.
2. Click New.
3. Enter a Name.
4. Right-click the form header and click Save.
5. In the Assessment Template Definitions related list, click New.
   - Create a template definition for each answer option you want to appear on a question.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

*Update min and max values to match templates*

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The system does not, however, update the fields for existing questions if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>].
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   - If the values do not match, edit the Min and Max values directly from the list.

**Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

### Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   - Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.

**Table 1127: Assessment Metric Definition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

Table 1128: Answer option order based on value

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. You may want to change the order of questions if you add a new question manually after you create other questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. When you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the Assessment Metrics related list.
   b) Edit the values in the Order column.
4. Click Update.
Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

You can configure trigger conditions to specify when to send a particular survey and the persons to send it to.

**Role required:** admin or survey_admin

1. Navigate to SurveyTrigger Conditions.
2. Click New.

**Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

<table>
<thead>
<tr>
<th>Table 1129: Trigger condition fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Assessment</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>User field</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>[Admin only] Application is set to Global.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Related Field 1-4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, Assigned to and Problem as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>
You can also create a trigger condition directly from the survey creator. If you select Certain users can take this survey, based on conditions in the Survey User Access section, the Trigger Condition form opens automatically when you click Save as Draft or Publish.

Trigger condition example

A trigger condition is configured as follows:

- Assessment: Service Desk Satisfaction Survey
- Table: Incident [incident]
- User field: Caller
- Repeat interval: 30 days
- Active: true
- Trigger randomly: false
- Related Field 1: Assigned to
- Related Field 2: Problem
- Condition: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie's complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): Boris Catino
- Problem (Related Field 2): PRB010101
- Task (automatically created): INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

Survey report example based on task field

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).

<table>
<thead>
<tr>
<th>Number</th>
<th>Metric type</th>
<th>Due date</th>
<th>State</th>
<th>Assigned to</th>
<th>Trigger table</th>
<th>Trigger ID</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>AINST0010011</td>
<td>Customer Satisfaction Survey</td>
<td>2016-09-20</td>
<td>Ready to take</td>
<td>System Administrator</td>
<td>Incident [incident]</td>
<td>Incident: INC00004305</td>
<td>INC00004305</td>
</tr>
</tbody>
</table>

To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to Reports View/Run and clicking Create a report.
Survey distribution

There are several ways for survey administrators to distribute surveys to users.

Surveys are distributed using any of the following methods.

• Send survey invitations to users
• Share a survey URL that opens the survey directly.
• Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

• Active check box is selected.
• State is Published.
• Survey is associated with at least one question.

Note: You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to Survey View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
</tbody>
</table>
Assign a survey to any user

Option: Assign a survey to any user
Description: Click Assign Survey and select one or more users, and then click OK.

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

Survey URLs

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs:

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the State of the survey instance (see table).

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready to take: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>In progress: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
</tbody>
</table>
| Complete: User has submitted all required responses. | If the schedule period is No Limit or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin.  
If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears. |

An error message appears if someone opens a URL for an unpublished or deactivated survey.

 Obtain and distribute a general survey URL

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.
Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to Survey View Surveys.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the View Survey URL related link.
   This related link is visible only if the survey definition is Active.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email.
   The Email button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys
When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin
1. Navigate to System Notification Email Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin

The survey instance URL is available on the survey instance record.

1. Navigate to Survey Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin
1. Navigate to Survey View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module

You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15 or UI11</td>
<td>Right-click the application menu you want to add the module to and select Edit Application Menu.</td>
</tr>
</tbody>
</table>

2. In the Modules related list, click New.
3. Complete the following fields.
   - Link type: Assessment
     - Do not select Survey, which is used for legacy surveys only.
   - Assessment: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys: export and import

You can export a survey and then import it to a different ServiceNow instance.

Note: Update sets are available in the Istanbul release and should be used to move data from one instance to another. For information about update sets, see Update sets.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

- Assessment Metric Template [asmt_template]
- Assessment Template Definition [asmt_template_definition]
- Metric definitions [asmt_metric_definition] (survey question answer options)
- Scheduled Jobs associated with the Survey [sys_trigger]
- Survey categories [asmt_metric_category]
- Survey questions [asmt_metric]
- Survey users [asmt_m2m_category_user]
- Trigger Condition [asmt_condition]

Export a survey
You can export a survey and then import it to another instance.
Role required: admin, survey_reader, or survey_admin

For information about update sets, see *Update sets*.

1. Navigate to Survey View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

*Import a survey*

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

---

**Note:** Update sets are available in the Istanbul release and should be used to move data from one instance to another. For information about update sets, see *Update sets*.

---

1. Verify that the target instance has assessments enabled.
2. Follow the steps in *Import an XML file* to import the assessment.

*Use update sets for surveys and assessments*

Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

*Legacy survey migration*

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.
Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to Survey Legacy Surveys Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey.

3. Under Related Links, click Migrate to Assessment.
   A dialog box appears, which describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

4. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

5. Click the reference icon beside the Assessment field to view the new survey definition.

6. Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

7. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey Legacy Administration Survey Conditions.
   b) In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

8. Navigate to Survey Administration Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.
### Table 1131: Survey question migration

### Migrated components

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

### Table 1132: Migrated components

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master [survey_master]</td>
<td>• Survey definition [asmt_metric_type]</td>
</tr>
<tr>
<td></td>
<td>• Assessable record [asmt_assessable_record], for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category [asmt_metric_category]</td>
</tr>
<tr>
<td>Survey question [survey_question_new]</td>
<td>• Survey question [asmt_metric]</td>
</tr>
</tbody>
</table>
Survey component | Assessment survey components
---|---
Question choice [question_choice] | • Assessment metric definition [asmt_metric_definition]
Survey instance [survey_instance] | • Assessment group [asmt_assessment], for system use only
| • Survey instance [asmt_assessment_instance]
Survey response [survey_response] | • Survey instance question [asmt_assessment_instance_question]
| • Survey response [asmt_metric_result]
| • Category result [asmt_category_result], for system use only

**Migrated question review**

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the Multiple Choice and Select Box types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

**Table 1133: Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. Excellent has the lowest Order value, so when the system creates a metric definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.
Table 1134: Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice vlue</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Table 1135: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.

Table 1136: Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.
Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to Self-Service My Assessments & Surveys.

   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click Take Survey on a survey card to open the questionnaire.

   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.

   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save your responses without submitting them</strong></td>
<td>Click Save. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td><strong>Submit the survey after answering all questions</strong></td>
<td>Click Submit. You cannot return to the questionnaire after submitting.</td>
</tr>
</tbody>
</table>

**Note:** The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.

**Note:** If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.

Timeline Visualizations

A timeline visualization is a representation of an organization's activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties:
a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.

Activating timeline visualizations adds the predefined CIO Roadmap timeline visualization, which shows your organization's projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.

**Key terms for timeline visualizations**

- **Lane**: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.
- **Panel**: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.
- **Summary view**: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.
- **Marker**: A bar indicating the start of a month in a 3D timeline visualization.
- **Slider**: A tool used to control the time period seen in a 3D visualization.
- **Slider track**: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.
Activate Timeline Visualization

An administrator can activate the Timeline Visualization plugin to access the functionality.

The Project Management plugin is activated if it is not already active.

1. Navigate to System Definition Plugins.
2. Find and click the plugin name.
3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files are not installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.
4. If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.
5. Click Activate.
Create a Timeline Visualization

Timeline administrators set up timeline visualizations for the organization's leaders by creating a timeline that provides visual representations of the organization's operational and strategic activities.

Additionally, they create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.

- To create a timeline visualization, navigate to Timeline Visualization Create New and create a new record.
Figure 683: Timeline visualization configuration form
Table 1137: Timeline visualization configuration form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
<tr>
<td>Panel table</td>
<td>Table that provides the records displayed as lanes and panels in the timeline.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the visualization.</td>
</tr>
<tr>
<td>Relationship field</td>
<td>Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field.</td>
</tr>
<tr>
<td>Show slider</td>
<td>Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.</td>
</tr>
<tr>
<td>Panel name</td>
<td>Field from the Panel table that contains the values displayed in the panel body.</td>
</tr>
<tr>
<td>Panel date</td>
<td>Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in 2D view. These dates also determine placement of panels on a lane. Only date and date-time fields are available on the choice list.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that sets (selected) or removes (cleared) the default status of a visualization when you have more than one defined for a specific table. Applications that include a visualization use the default visualization.</td>
</tr>
<tr>
<td>Max items per lane</td>
<td>Maximum number of items that are displayed in a lane. The default value is 500.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
</tbody>
</table>
### Table 1138: Timeline visualization configuration filtering and sorting form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [Name] [is not] [IT] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [Name] [z to a].</td>
</tr>
<tr>
<td>Panel condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in 2D and 3D view visualizations. For example, if you set [State] [is one of] [Pending, Open, Work in Progress] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>

### Table 1139: Timeline visualization configuration color options form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
</tbody>
</table>
### Create a Timeline Visualization view

The timeline visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.

You can create one timeline visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

1. Navigate to Incident All.
2. Open an incident.
3. Right-click the form header and select Configure Form Layout.
4. Under Form view and section, go to the View name field and select New.
5. Enter timeline visualization in the View name field.
6. Click Ok to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the Available and Selected columns.
8. Click Save.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label 1</strong></td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td><strong>Label 2</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Label 3</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Label 4</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Default color</strong></td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td><strong>Color 1</strong></td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
<tr>
<td><strong>Color 2</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Color 3</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Color 4</strong></td>
<td></td>
</tr>
</tbody>
</table>
Planning Your Timeline Visualization

Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.

Use Timeline Visualization

Timeline Visualization provides a high-level view of an organization's strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application also installs the CIO Roadmap, a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.

Lanes, markers, and panels

Lanes, markers, and panels are the fundamental elements of a timeline visualization. appear in the 3D view only.

Note: Lanes and markers are available in the 3D view only. A panel in the 2D view always represents a single record, while panels in 3D view may represent one or more records.

Lanes

A lane is a channel in which activities are grouped. A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

Note: The number of items displayed in a lane depends on the Max items per lane setting on Timeline Visualization form.

Markers

Markers are horizontal lines that cross all lanes and identify a transition to the next month.

Panels

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.
In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser's print option. In 3D view, panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.

Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

To view additional information about a panel:

- Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
- Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

**Personalize Timeline Visualizations**

You can configure settings for timeline visualizations like lane and panel conditions, colors, and labels.

**Personalization**

Open the Settings pane and click Configure. Complete the form as appropriate (see table).
Figure 684: Visualization personalization

Table 1140: Timeline visualization personalization form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [Name] [is not] [IT] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [Name] [z to a].</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Panel conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in the visualization. For example, if you set [State] [is one of] [Pending, Open, Work in Progress] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
<tr>
<td>Label 1, Label 2, Label 3, Label 4</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1, Color 2, Color 3, Color 4</td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
</tbody>
</table>

**Note:**

If the Max items per lane field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.
The Settings pane

Element names in the Settings pane vary based on the table and fields used to create the visualization.

The Settings pane contains the following elements:
### Table 1141: Settings pane elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
<tr>
<td>View &lt;table&gt; List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a Show all &lt;records&gt; button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

### Use the slider and slider track

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

**Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi-project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.

Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.
View timeline visualization

You can view timeline visualizations from a project.

1. Navigate to Project Projects All.
2. Scroll to the bottom of the list and click the Timeline Visualization related link.

By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click All. If a timeline visualization exists for the application’s table, a Timeline Visualization related link appears.

Work with timeline visualizations

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the stack up or down to view other panels.</td>
</tr>
<tr>
<td>Up and down navigation arrows</td>
<td>Click the arrows in a stack to view additional panels for the same month. Arrows do not appear if there are no additional panels to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating in 3D view.
Table 1144: 3D view

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider along the slider track to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Up and down arrow keys</td>
<td>Press the arrow keys to move the timeline forward or backward.</td>
</tr>
</tbody>
</table>

Installed with Timeline Visualizations

Several components are installed with timeline visualizations.

Tables

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization [roadmap_page]</td>
<td>Stores all available timeline visualizations.</td>
</tr>
<tr>
<td>Personalize Timeline [roadmap_user_page]</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>

Plugins

Timeline visualization activates the following plugin, if it is not already active.

<table>
<thead>
<tr>
<th>Plugin Name</th>
<th>Plugin ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Management</td>
<td>com.snc.project_management_v3</td>
<td>Tools that aid in planning, organizing, and managing projects by applying basic task management processes.</td>
</tr>
</tbody>
</table>

UI Policies

Timeline visualization adds the following UI policy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Timeline Visualization configuration Page to enable/ disable certain fields</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Script that hides fields in the Timeline Visualization form when the form loads.</td>
</tr>
</tbody>
</table>
Script Includes

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization [roadmap_page] table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
<tr>
<td>RoadmapUtil</td>
<td>API to generate data for lanes and panels.</td>
</tr>
</tbody>
</table>

Client Scripts

Timeline visualization adds the following client scripts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Allows changing the color fields for the item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Allows changing the field name for item_color_key whenever there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>

Business Rules

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Checks if another visualization is already set as default when user</td>
</tr>
</tbody>
</table>
Istanbul   
ServiceNow    
Now Platform Capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sets a new visualization as the default.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Timeline visualizations roles

Timeline visualizations provides two roles.

**Table 1145: Roles**

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline administrator [timeline_admin]</td>
<td>Create and edit timeline visualization pages and view timeline visualizations.</td>
</tr>
<tr>
<td>Timeline user [timeline_user]</td>
<td>View timeline visualizations. Timeline user access is also granted to users with the project_manager and project_user roles.</td>
</tr>
</tbody>
</table>

Visual Task Boards

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

With Visual Task Boards, you can view and update multiple task records, which appear as cards that can be moved between lanes. An activity stream on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLs) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

This video demonstrates how Visual Task Boards work.

**Note:** UI16 or UI15 is required to use Visual Task Boards.

The following podcast offers additional information on the use of Visual Task Boards.

Activate Visual Task Boards

Visual Task Boards are active by default on new instances. For upgraded instances, you can activate the Visual Task Boards plugin (com.glide.ui.vtb) if you have the admin role.

Role required: admin

For evaluation, you can activate the plugin for an application that requires a purchased subscription on a sub-production instance. To activate the plugin on production instances, you must purchase the subscription. To purchase a subscription, contact your ServiceNow account manager. For details on purchasing a plugin, see [Purchase a plugin](#).

Some plugins require activation by ServiceNow personnel. Request these plugins through the HI Customer Service System instead of activating them yourself. For details, see [Request a plugin](#).
For plugins that you can activate yourself, continue with the following steps.

1. Navigate to System Definition Plugins.

2. Find and click the plugin name.

3. On the System Plugin form, review the plugin details and then click the Activate/Upgrade related link.
   - If the plugin depends on other plugins, these plugins are listed along with their activation status.
   - If the plugin has optional features that are not functional because other plugins are inactive, those plugins are listed. A warning states that some files are not installed. If you want the optional features to be installed, cancel this activation, activate the necessary plugins, and then return to activating the plugin.

4. If available, select the Load demo data check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when you first activate the plugin on a development or test instance.
   - You can also load demo data after the plugin is activated by clicking the Load Demo Data Only related link on the System Plugin form.

5. Click Activate.

### Installed with Visual Task Boards

Several types of components are installed with Visual Task Boards.

### Tables installed with Visual Task Boards

Visual Task Boards add the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Member [vtb_board_member]</td>
<td>Stores a record for each member of each task board.</td>
</tr>
<tr>
<td>Private Task [vtb_task]</td>
<td>Stores a record for each personal task on each freeform board.</td>
</tr>
<tr>
<td>Visual Task Board [vtb_board]</td>
<td>Stores a record for each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card [vtb_card]</td>
<td>Stores a record for each task card on each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card History [vtb_card_history]</td>
<td>Stores records for certain task card changes, such as lane or assignee changes. Each record indicates the previous value and the new value.</td>
</tr>
<tr>
<td>Visual Task Board Lane [vtb_lane]</td>
<td>Stores a record for each lane on each task board.</td>
</tr>
</tbody>
</table>
Properties installed with Visual Task Boards

Visual Task Boards add the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.board.upload_limit</td>
<td>Sets the maximum file size in megabytes allowed for each task card attachment.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 10</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
</tbody>
</table>

**Note:** To open the System Property [sys_properties] table, enter sys_properties.list in the navigation filter.

Script includes installed with Visual Task Boards

Visual Task Boards add the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VisualTaskBoards</td>
<td>Provides general utilities for Visual Task Boards.</td>
</tr>
<tr>
<td>VTBBoardSecurity</td>
<td>Provides security utilities to control board access.</td>
</tr>
<tr>
<td>VTBGetBoardsByUser</td>
<td>Provides a method that retrieves all the boards a specified user owns or is a member of.</td>
</tr>
<tr>
<td>VTBTaskSecurity</td>
<td>Provides security utilities to control task access.</td>
</tr>
</tbody>
</table>

Client scripts installed with Visual Task Boards

Visual Task Boards add the following client scripts.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Kanban Choice</td>
<td>VTBBoard [vtb_board]</td>
<td>Adds the -- Kanban Board -- option to the Lane field. This option indicates that the task board is a flexible board.</td>
</tr>
</tbody>
</table>

Business rules installed with Visual Task Boards

Visual Task Boards add the following business rules.
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to live group</td>
<td>Board Member [vtb_board_member]</td>
<td>If a Connect Chat conversation is created for a task board, this business rule adds the board members as conversation members.</td>
</tr>
<tr>
<td>Remove member from live group</td>
<td>Board Member [vtb_board_member]</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the board members, this business rule removes the user from the conversation members.</td>
</tr>
<tr>
<td>Remove member from VTB</td>
<td>Live Group Member [live_group_member]</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the conversation members, this business rule removes the user from the task board members.</td>
</tr>
<tr>
<td>Sync board name to Connect</td>
<td>Visual Task Board [vtb_board]</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the board name, this business rule updates the conversation name.</td>
</tr>
<tr>
<td>Sync chat name to VTB board</td>
<td>Live Group Profile [live_group_profile]</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the conversation name, this business rule updates the board name.</td>
</tr>
<tr>
<td>Sync Members With VTB</td>
<td>Live Group Member [live_group_member]</td>
<td>If a Connect Chat conversation exists for a task board and a user is added to the conversation members, this business rule adds the user as a board member.</td>
</tr>
<tr>
<td>Update Board on Card Change</td>
<td>Visual Task Board Card [vtb_card]</td>

Notifications installed with Visual Task Boards

Visual Task Boards add the following notifications.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB additional assignee notification</td>
<td>Sends an email notification to users when they are designated as additional assignees for tasks.</td>
</tr>
<tr>
<td>VTB assignee notification</td>
<td>Sends an email notification to users when they are designated as the primary assignees for personal tasks.</td>
</tr>
<tr>
<td>VTB lane change notification</td>
<td>Sends an email notification to a task's assignees when the task changes lanes.</td>
</tr>
</tbody>
</table>

Supported browsers for Visual Task Boards

The system supports Visual Task Boards on most modern browsers.

**Supported browsers**

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 6.1 and later
- Internet Explorer version 10 and later
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the Internet Options Security tab) is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.
- Access Visual Task Boards on your mobile device using either a browser or the native mobile app. See [Mobile app supported devices](#) for more information.

**Scripting support**

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.

**Board structure**

There are different types of task boards for different kinds of task management. All types of boards share the same overall structure.
### Table 1146: Board types

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeform boards</td>
<td>Display any kind of task record, including personal tasks. Members of freeform boards can add and remove task cards and lanes.</td>
</tr>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match the configured filter against a particular table. Members of flexible boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
<tr>
<td>Guided boards</td>
<td>Display tasks that match the configured filter against a particular table, like flexible boards. Members of guided boards can add task cards, which are removed automatically when the tasks no longer match the filter conditions. Guided board lanes correspond to field values and cannot be edited in most cases.</td>
</tr>
</tbody>
</table>

The icon beside the board name on the Task Boards page identifies the type of board. Freeform boards appear with a grid of four squares (%28); flexible boards appear with a vertical line beside two squares (%28); guided boards appear with two vertical lines (%28).
Figure 685: Task Boards screen

All boards have these elements:
<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick panel</td>
<td>Displays labels and users associated with the board. Board members can use the quick panel to filter cards or to quickly label or assign tasks. Members can also configure what appears in the quick panel.</td>
</tr>
<tr>
<td>Lanes</td>
<td>Organize cards on a board into vertical groups. These groups often represent the status of the task, such as To Do, Doing, and Done. Each board is composed of one or more lanes. When using a guided board, each lane represents a possible field value. For example, a board on the Incident table can display one lane for each State value such as New, Active, or Resolved. Users can move cards from one lane to another to update the task that card represents.</td>
</tr>
<tr>
<td>Cards</td>
<td>Represent individual tasks. Users can add comments, attachments, and labels to cards and assign users to cards. Each card is tied to a task record; updating one immediately updates the other. For freeform boards, each card represents a personal task. For flexible and guided boards, each card represents a record from the list that board was created from.</td>
</tr>
<tr>
<td>Task board tools</td>
<td>Displays board information, a board members, the board activity stream, and board labels.</td>
</tr>
</tbody>
</table>
Figure 686: Board layout
Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.

Create a freeform board

You can create freeform task boards for tracking any kind of task or project.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Freeform.
   A new task board opens with the default freeform lanes, To Do, Doing, and Done.
4. Click the board name and enter a new name.

After the board is created, board members can:
- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Create a data driven board

You can create a flexible or guided task board for any table that extends Task, such as Incident or Change.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Data Driven Board.
4. From the Task Table list, select a base table of tasks on which to base your board, for example, an incident table.
5. From the Lane Field list, select the field you want to use for the lane headers. Create a Flexible board with editable lane headers by selecting None.
   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a guided board. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the State column, the board shows one lane for each incident state, such as New or Closed. If you select a column that is not a reference or choice, the board is a flexible board and the board shows the default lanes, To Do, Doing, and Done, with all cards in the To Do lane.
6. Create a filter to show only the records you want to work with.
   For example, you might filter out incidents that are not assigned to you.
   Any card that no longer fits the parameters of the filter is automatically removed from the task board.
7. Click the board name and enter a new name.

**Note:** For guided boards created from choice fields, such as State, the system creates a lane for each possible choice value. For guided boards created from reference fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.

After the board is created, board members can:
- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

**Delete a task board**

You can delete any task board you own.

Role required: none

Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.

1. Navigate to **Self-Service Visual Task Boards**.
2. Under **Boards you own**, point to a board and click the delete icon (X).
3. In the confirmation dialog, click Delete.

**Add or modify lanes**

Any board member can edit board lanes.

Role required: none

When you create a freeform or flexible task board, it includes the default lanes To Do, Doing, and Done. Any board member can change the names and add new lanes to accommodate the task workflow you want to track.

Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

**Note:** You cannot remove lanes from guided boards.

1. Open a task board.
2. Perform any of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create a new lane | 1. Scroll past the last lane and click Add Lane.  
|              | 2. Enter a title for the lane, then press the Enter key.                     |

The Add Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, such as Assigned to.
### Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rearrange lanes</td>
<td>Click a lane header and drag the lane to the desired drop zone. To cancel the move, press the Escape key while you drag the lane.</td>
</tr>
<tr>
<td></td>
<td>You can also change the lane order from the board configuration menu.</td>
</tr>
<tr>
<td>Hide a lane</td>
<td>1. Click the lane menu (…) in a lane header.</td>
</tr>
<tr>
<td></td>
<td>2. Select Hide Lane.</td>
</tr>
<tr>
<td></td>
<td>You can restore hidden lanes from the board configuration menu.</td>
</tr>
<tr>
<td>Delete a lane</td>
<td>1. Click the lane menu in a lane header.</td>
</tr>
<tr>
<td></td>
<td>2. Select Delete Lane.</td>
</tr>
<tr>
<td></td>
<td>3. In the confirmation dialog box, click Delete.</td>
</tr>
<tr>
<td></td>
<td>When you delete a lane on a freeform or flexible board, all the cards in the deleted lane are archived.</td>
</tr>
<tr>
<td></td>
<td>The Delete Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, and only for lanes that contain no cards.</td>
</tr>
</tbody>
</table>

### Task cards

A Visual Task Board task card can represent a personal task or a record on a table.

You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.

**Note:** Each board can display up to 2,000 cards by default. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure a different maximum card limit for freeform boards and for flexible and guided boards.

### Freeform board tasks

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.

**Add a personal task to a freeform board**

You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task [vtb_task] table.
Role required: none

1. In a lane header, click the lane menu ( ) and select Add Task. Alternatively, click Add Task at the bottom of a lane.
   A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press Enter.

Add a task to a freeform board from a form
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Role required: none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Open a task record, such as an incident.
2. Click the menu icon ( ) or right-click the form header to show the form context menu.
3. Select Add to Visual Task Board.
   A pop-up window appears with a list of freeform task boards.

4. Click the name of the board you want to add the card to.
   A confirmation message appears.
5. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.

Add a task to a freeform board from a list
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.
Role required: none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Navigate to a list of task records, such as Incident Open.
2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.

3. Click the name of the board you want to add the card to.
   A confirmation message appears.
4. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.

Add a task to a flexible or guided board

You can add cards directly to a flexible or guided board lane. These cards represent records on whichever table the board is associated with.

Role required: none

1. In a lane header, click the lane menu (atches) and select Add Task. Alternatively, click Add Task at the bottom of a lane.
A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.

Consider the example of a guided board that shows incidents with the Software category, with a lane for each assignee. If you add a card to the ITIL User lane, the new incident record Category and Assigned to fields are automatically set to Software and ITIL User.

2. Complete the form and click Submit.
   A new task card appears in the lane.

Edit card details

When you click a card on a Visual Task Board, a pop-up window appears with additional details.

Role required: none

You can edit certain values from the card details. Updating these values also updates the underlying task record.
1. Click a card. The details for that card appear in a pop-up window.
2. Alternatively, you can click an entry in the activity stream to view the details for the associated card.
3. From the card details you can:
   - Click the card title to rename the card.

Figure 687: Card details
• Modify the short description.
• Add comments or work notes in the activity stream.
• Edit the assignees.
• Click one or more of the available labels to add a label to the card.
• Add or remove file attachments.
• Create a checklist.
• Archive the card (freeform boards only).
• Move the card to a different board (freeform boards only).

Label a task card

Labels help categorize tasks and visually distinguish them on the task board.

*Enable* labels for the board.

Role required: none

You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.

![My desk phone does not work](image)

**Figure 688: Task card labels**

You can add one or more labels to a task card.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Add a label to a card from the quick panel** | 1. Drag a label from the quick panel directly to a task card.  
2. Drop the label in the drop zone. |
| **Add a label to a card from the card details** | 1. Open the card details for a task.  
2. Click the details tab (i).  
3. Under Labels, select one or more labels.  
Point to a label to display its name.  
4. Close the card detail pop-up window. |
You can use configuration options to **rename or disable** labels or to **hide** labels altogether.

### Assign a task to a user

Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.

You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.

![Task card assignees](image)

**Figure 689: Task card assignees**

When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task's Assigned to field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place.
**Note:** Assignees are not automatically granted access to the board. Only members can access the board.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add an assignee from the quick panel</strong></td>
<td>1. Drag a user’s avatar from the quick panel directly to the task card.</td>
</tr>
<tr>
<td></td>
<td>2. Drop the avatar in the Primary or Additional drop zone.</td>
</tr>
</tbody>
</table>

| **Add an assignee from the card details**   | 1. Open the card details for a task.                                         |
|                                             | 2. Click the assignees tab (👤).                                             |
|                                             | 3. Click Add Primary Assignee or Add Additional Assignee. The Add Primary     |
|                                             | Assignee option is not available if there is already a primary assignee.    |
|                                             | 4. Select a user.                                                           |
|                                             | 5. Close the card detail pop-up window.                                     |

The system sends an email notification to inform the new assignee of the change.

**Add an attachment to a task card**

You can add an attachment to a record within a task board.

Role required: none

Adding an attachment to a task card also adds the attachment to the underlying task record.
Figure 690: Add attachment

1. Click a card.
2. Click the attachment tab

( )

3. Click Add Attachment and select a file to add as an attachment.

Visual Task Board checklists

Checklists help you track the progress of tasks on your Visual Task Board. Checklists are available as a tab in the card details.
You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see Checklists.

Create a new checklist for a card
You can create a unique checklist for each Visual Task Board card.

Role required: none

1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Click Add Item.
4. Enter text for the checklist item.
5. Press the Enter key to add the checklist item.
6. Create as many additional checklist items as desired.
7. To delete a checklist item, click the minus (-) icon.
8. To reorder checklist items, click the drag icon (_drag) and drag a checklist item to a different position in the list.
9. Save the checklist as a template for easy reuse.
   a) Click the more icon (More) beside the Checklist formatter.
b) Select Save as Template.
   A dialog box appears.

c) Enter a descriptive template name to identify the checklist.
   When a user creates a checklist from a template, all templates are listed in alphabetical order and there is no way to filter which templates appear. To provide a better user experience, consider implementing a naming system for checklist templates. For example, include the name of the table or another identifier to clarify how the checklist should be used.

d) Click Save.

10. To create a task from a checklist item:
   a) Point to a checklist item and click the create task icon (▲).
   b) Select the type of task you want to create.
      An administrator can configure which task types are available.
      The new task record appears in a pop-up window. The short description is automatically populated with the checklist item text.
   c) Fill in the form with additional detail as necessary.
   d) Click Update.

Create a checklist from a checklist template
In a Visual Task Board card, you can quickly create a checklist from a checklist template you previously created.

Create at least one checklist template.
Role required: none
A template saves time by creating checklist items automatically. You can add, edit, or remove checklist items without impacting the template.

1. Open a task card that does not already contain a checklist.
2. Click the checklist tab (✓).
3. Click the more icon (▼).
   The more icon does not display unless you have added an item to the checklist, or if you have a pre-existing checklist template.
4. Under Copy items from, select a template.
   The checklist items appear automatically.

Delete a checklist from a card
You can remove a checklist from a Visual Task Board card.
Role required: none

1. Open a task card that contains a checklist.
2. Click the checklist tab (✓).
3. Click the more icon (▼).
4. Select Remove Checklist.
A confirmation dialog box appears.

5. Click Delete.

Configure which types of tasks can be created from checklist items

A system property controls which types of tasks you can create from a Visual Task Board checklist item.

Role required: admin

You might want to add custom tables or remove tables you do not use.

1. Navigate to sys_properties.list.
2. Locate the glide.ui.create_task_type_option_list property.
3. Edit the Value to add or remove tables.

You can add any table that extends Task [task]. Use the table name, not the label. For example, you would enter change_request, not Change Request. Ensure the tables listed are separated by commas, with no spaces.

The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

Archive a card

Archiving a card is a non-destructive way to remove a card from a freeform board.

Role required: none

You can archive cards you are no longer working on to reduce visual clutter. Note that it is only possible to archive cards on a freeform board.

1. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Archive one card from the lane view</strong></td>
<td>1. Point to a card and click the X icon that appears in the corner.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click Archive.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Archive one card from the card details</td>
<td>1. Click a card and view the Details tab.</td>
</tr>
<tr>
<td></td>
<td>2. Under Tools, click Archive.</td>
</tr>
<tr>
<td></td>
<td>3. In the confirmation dialog, click Confirm.</td>
</tr>
<tr>
<td>Archive all the cards in a lane</td>
<td>1. In the lane header, click the more options icon.</td>
</tr>
<tr>
<td></td>
<td>2. Select Archive All Tasks.</td>
</tr>
<tr>
<td></td>
<td>3. In the confirmation dialog, click Archive.</td>
</tr>
</tbody>
</table>

2. To see all archived cards for the current board, from the board navigation panel, open the board information menu and click View Archived Tasks. The Archived Tasks window appears.

3. To restore an archived card, point to it and click Restore.

Access a task record

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

Role required: none

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access the record from the task card</td>
<td>Click the record number on the task card.</td>
</tr>
<tr>
<td>Access the record from the card details</td>
<td>1. Open the card details for a task.</td>
</tr>
<tr>
<td></td>
<td>2. Click the record number in the header.</td>
</tr>
</tbody>
</table>

Move a card to a different lane

You can move a card from one lane to another.

Role required: none

When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

1. Open a Visual Task Board.
2. Select a card and drag it to a different lane.

To cancel the move, press the Escape key while you drag the card.

**Note:** All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident [incident] table, with a lane for each State. The Close code and Close notes fields become mandatory when
the State changes to Closed. If you attempt to move an incident card from the New lane to the Closed lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.

Move a card to a different board

You can move a card from one freeform board to another.

1. Open the card details.
2. In the details tab (i), click Move Card.
3. In the pop-up window that appears, select the board and lane to move the card to.

The board selection list displays freeform boards only.

Task board tools

The task board tools area in a Visual Task Board contains several tabs, each represented by an icon. Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

Table 1148: Conversation tool tabs

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Info](image) | Info | Contains the following information about the task board:
- Name
- Board type
- Table name and a link to open the table view (visible on data driven boards only)
- Filter conditions (visible on data driven boards only)
- Lane field (visible to the board owner, on data driven boards only)
- Owner
- Number of lanes
- Number of cards
- URL |
| ![Members](image) | Members | Lists all members and assignees of the board. You can add or remove board members, promote assignees to be members, and filter the board by member or assignee. |
## View board information

You can display key information about any task board.

Role required: none

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Labels icon" /></td>
<td>Labels</td>
<td>Use labels to visually distinguish tasks on the task board. Filter board contents by toggling the label. You need to enable labels before being able to use this tab.</td>
</tr>
<tr>
<td><img src="image" alt="Activity icon" /></td>
<td>Activity</td>
<td>Displays all of the activity for cards on the board.</td>
</tr>
<tr>
<td><img src="image" alt="Configuration icon" /></td>
<td>Configuration</td>
<td>Configure the settings for the task board. This setting is only available for the board owner. For more information, see <a href="">Configure the task board</a> on page 2582</td>
</tr>
</tbody>
</table>
Figure 693: Board owner's view of board information
2. Open the task board tools and click the board information icon (i).

Add a board as a favorite

Add boards you access frequently to the application navigator using the favorite option.

Role required: none

Adding a board as a favorite is only available in UI16.

1. Navigate to Self Service Visual Task Boards.
2. From the board you want to favorite, select the information icon from the board tools. Then select the star.
3. Remove the board as a favorite by clearing the star icon.

Add or remove a task board member

You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.

Role required: none

Only members of a task board can access the board. Any board member can add or remove other members.

1. On a Visual Task Board, open the task board tools.
2. Click the members tab.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. In the Users section, click Add Members. 2. Enter a user's name or select a user from the drop-down menu.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. In the Members section, point to a user. 2. Click the dash icon (-).</td>
</tr>
<tr>
<td>Promote an assignee to a member</td>
<td>1. In the Assignees section, point to a user. 2. Click the upward arrow icon.</td>
</tr>
<tr>
<td>Promote all assignees to members</td>
<td>In the Assignees section, click Promote All.</td>
</tr>
</tbody>
</table>

Visual Task Board SLA indicators

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.
Figure 694: Visual Task Board with SLA indicators enabled

- **SSL certification issue**

**Alert!** One or more tasks on this board require immediate attention.

- **Add Task**
- **Add Task**
- **Add Task**
Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

2. Drag a task board to a Connect mini window.

A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

2. Open a task board.
3. In the board header, click the connect with board members icon.

The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Configure the task board

The board configuration menu provides several options that affect the look and feel of the board.

Role required: none

1. From the task board tools, click the menu icon.
2. In the Background Color section, select a background color from the palette.

The background color surrounds the lane area of a board. It also appears as the color for the board on the My Task Boards page. Changes to the background color apply to all users.
3. In the Quick Panel section, toggle quick panel options as necessary.

Table 1149: Quick panel options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>When enabled, the quick panel is visible.</td>
</tr>
<tr>
<td></td>
<td>This setting applies to the current user only.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Names</td>
<td>When enabled, user names appear by user avatars in the quick panel. This setting applies to the current user only.</td>
</tr>
<tr>
<td>Show Labels</td>
<td>When enabled, labels appear on cards and in the quick panel. This setting applies to all users.</td>
</tr>
<tr>
<td>Label Names</td>
<td>When enabled, the label name appears beside the colored icon for that label in the quick panel. This setting applies to the current user only and is available only when Show Labels is enabled.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like this:

4. In the Configure Cards section, toggle card options as necessary.
- Changes to the cards apply to the current user only.

Table 1150: View options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Cards</td>
<td>When enabled, the lane width is decreased and card information and thumbnails do not appear on the card.</td>
</tr>
<tr>
<td>Show Card Info</td>
<td>When enabled, card information appears on each card. Card information typically includes details like the task state, date opened, and last user to update it. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Show Card Thumbnail</td>
<td>When enabled, cards display the first image attached to that card as a thumbnail. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show SLAs</td>
<td>When enabled, SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when Compact Cards is enabled. This setting is available only when there are SLAs associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

5. In the Configure Lanes section, show or hide lanes by selecting or clearing the check box for each lane. Rearrange lanes by dragging and dropping them in the list.

### Configure Visual Task Board labels

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

Role required: none

You can use up to five labels per board. Any board member can edit the labels on a board.

1. From the task board tools, open the activity stream.
2. Click the labels tab.
3. Toggle the Show Labels switch to the enabled position if it is not already enabled.
4. To change a label name, click the label text and enter a new value.
5. To disable or enable a specific label, toggle the switch by the label.

When a label is disabled, members cannot add that label to cards on the board. The label is hidden on cards that are already labeled.

### Modify the query or lane field for an existing board

For flexible and guided boards, you can edit the board query or lane field. This ability enables you to change the board contents while preserving the member list, board configuration settings, and, if applicable, Connect Chat conversation history.

Inform the board members that you plan to change the board query or lane field. If you or any members have manually sorted cards within a lane, the order may be reset.

Role required: none but you must be the board owner

The board query consists of filter conditions that determine which tasks the board tracks. For example, you might edit the query so the board shows only active incidents, rather than all incidents.

The lane field is the field on the underlying table that defines the lanes. For example, you might change the lane field so the lanes represent incident states, rather than assignees. This change is called a lane field pivot. Lane field pivots also make it possible to convert a flexible board to a guided board or vice versa.

1. Open a task board.
2. Click the board information icon (i) by the board name.

3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Edit the board query</strong></td>
<td>1. Under Board Filter, click Edit Filter to open the condition builder.</td>
</tr>
<tr>
<td></td>
<td>2. Add and remove conditions as needed to edit the query.</td>
</tr>
<tr>
<td></td>
<td>3. Click Save.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Change the lane field</strong></td>
<td>1. Click the Lane Field picker and select a field or the None option.</td>
</tr>
<tr>
<td></td>
<td>Guided boards have the Lane Field set to a field, such as State. Flexible</td>
</tr>
<tr>
<td></td>
<td>boards have the Lane Field set to None. You can change the Lane Field value</td>
</tr>
<tr>
<td></td>
<td>accordingly to change the board type.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click OK.</td>
</tr>
</tbody>
</table>

The board reloads to reflect the changes.

**Configure the card limit for freeform boards**

Freeform boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.freeform_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the Value to the maximum number of cards allowed for each freeform board.

**Note:** Performance degradation may occur if you set the Value to a number greater than 1,000, especially on tablet devices.

**Configure the card limit for flexible and guided boards**

Flexible and guided boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

1. **Add a new system property** with the following field values.
Field | Value
-----|-----
Name | glide.vtb.board_max
Type | integer

2. Set the Value to the maximum number of cards allowed for each flexible or guided board.

**Note:** Performance degradation may occur if you set the Value to a number greater than 1,000, especially on tablet devices.

---

**Configure the task board card view**

Configure the fields that appear in a card on a task board.

Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select Configure Form Layout.
3. Under the Form View section, select the VTB view.
   You may need to create a VTB view for the form. For more information, see *Create and delete views*.
4. Select the fields to appear on the card by adding or removing the fields from the Selected column. You can also adjust the order they appear on the form by moving the fields up or down.

---

**Workflow**

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts. The graphical workflow editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

Getting started with workflows

The graphical workflow editor provides a drag-and-drop interface for automating multi-step processes across the platform.

Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts.

The workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog.

When an activity completes, the workflow transitions to next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item; if the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical workflow editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:

1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete.

Workflow activities

A workflow activity contains instructions that are processed by the workflow.

Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:

![Notification](image)

Figure 695: Sample activity

For more information on available activities and their behaviors, see Workflow activities on page 2734.

Transitions

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.
This is a transition that always leads from the Change Approved script to the Change Task activity:

Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:

Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.
After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:

Figure 698: Sample change workflow

Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow Workflow Editor. For information about using the editor, see Create a workflow on page 2600
Workflow editing

The Workflow Editor is a user interface for defining workflows. During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:

![Workflow diagram](image)

**Figure 699: Standard change**

Workflow palette

The default workflow palette contains workflow activities and existing workflows you can use as subflows. The basic workflow palette contains these tabs:
- Workflows: Displays existing workflows and provides controls for creating new ones.
- Core: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

**Workflows tab**

The Workflows tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.

![Workflows tab in the palette](image)

**Core tab**

The Core tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see *Add an activity to a workflow* on page 2815.
Workflow canvas

The tabs on the workflow canvas allow a workflow designer to move between open workflows and access other resources.

The editor opens with the Welcome tab, which displays related help links and videos for basic workflows and Orchestration (when Orchestration is activated). From this tab, you can open articles in the ServiceNow Knowledge Base, user community conversations, live feed postings, and user documentation.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow on page 2600.

**Note:** If your organization blocks users from viewing YouTube videos, you can remove the video channel from either the workflow or Orchestration welcome pages using the procedure in Remove a blocked video channel on page 2594.

Remove a blocked video channel

If your organization blocks users from downloading the videos on the Workflow and Orchestration welcome pages, you can remove the videos.

The instructional videos on the workflow and Orchestration welcome pages are hosted on YouTube. Some organizations block viewing videos from this site. You can follow this procedure to remove the videos from either welcome page.

1. Navigate to System UI UI Pages.
2. Open the workflow_editor_welcome record.
3. From the HTML field, remove the lines shown here for one or both of the welcome pages and update the record.

- Basic workflow

```html
<div id="workflowchannel" class="widget-cotent">
  <h3 class="widget-header"> ${gs.getMessage('Channel')}$</h3>
  <div class="widget-link">
  </div>
  <iframe src="https://www.youtube.com/embed?list=PLCOmiTb5WX3o_ksSvChk1Af4yZ021Yz" width="525" height="380"
    frameborder="0" allowfullscreen="true"></iframe>
</div>

• Orchestration

```html
<div id="orcheschannel" class="widget-cotent">
  <h3 class="widget-header"> ${gs.getMessage('Channel')}$</h3>
  <div class="widget-link">
  </div>
  <iframe src="https://www.youtube.com/embed?list=PLCOmiTb5WX3o6xHIphZC0FRue4Wlz0Xm" width="525" height="380"
    frameborder="0" allowfullscreen="true"></iframe>
</div>
```
<table>
<thead>
<tr>
<th>Name</th>
<th>workflow_editor_welcome</th>
<th>Application</th>
<th>Category</th>
<th>General</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Welcome page for workflow editor</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```html
<div class="content-body">
  <div id="workflowwelcome" class="widget-content">
    <h3 class="widget-header">$gi.getMessage('Channel')</h3>
  </div>
</div>
```

Workflow interface

You interact with the workflow editor through several different elements of the window: the canvas, the canvas tabs, the title bar, the palette, and the palette tabs.

- Canvas tabs: Contains tabs for accessing workflows being edited or created.
- Title bar: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- Canvas: Provides the working surface for creating new workflows or editing existing ones.
- Palette tabs: Contains tabs for accessing activities being edited or created.
- Palette: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.
Figure 703: Workflow user interface

Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.
Controls on the right side of the title bar manage the workflow.

- **Workflow Properties**: Opens the current workflow's properties form.
- **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.
- **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see **Workflow Validation**.
- **Help**: Opens documentation to help you create the workflow.

**Workflow menu**

Click the menu icon in the title bar for additional options to configure the workflow.
These menu options are available:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Workflow</td>
<td>Creates a new workflow.</td>
</tr>
<tr>
<td>Open Existing</td>
<td>Opens another existing workflow.</td>
</tr>
<tr>
<td>Copy</td>
<td>Creates a duplicate of the workflow. Give the copy a different name.</td>
</tr>
<tr>
<td>Publish</td>
<td>Makes the personal workflow version public, overwriting the current published workflow version. This option is only available for checked out workflows.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Checkout</td>
<td>Creates a personal version of the workflow for you, which you can edit. This option is only available for published workflows.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the workflow. You cannot delete workflows that have contexts associated with them.</td>
</tr>
<tr>
<td>Set Inactive</td>
<td>Inactivates the workflow so that it cannot be used.</td>
</tr>
<tr>
<td>Expand Transitions</td>
<td>Redraws the transitions so that they do not overlap when they leave the activity condition.</td>
</tr>
<tr>
<td>Start Workflow</td>
<td>Starts a test run of the current workflow.</td>
</tr>
<tr>
<td>Validate Workflow</td>
<td>Runs validation tests on your workflow prior to publication. Use this validation to detect potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see Work on workflows on page 2614.</td>
</tr>
<tr>
<td>Collapse Transitions</td>
<td>Redraws the transitions so they overlap when they leave the activity condition.</td>
</tr>
<tr>
<td>Show Contexts</td>
<td>Displays all the contexts for the current workflow. You can use this option to troubleshoot a workflow.</td>
</tr>
<tr>
<td>Properties</td>
<td>Opens the Workflow Properties form, which defines the workflow's attributes.</td>
</tr>
<tr>
<td>Edit Inputs</td>
<td>Opens the Workflow Inputs list of variables that the workflow can accept when used as a subflow. For more information, see Pass a variable from a workflow to a subflow on page 2620.</td>
</tr>
<tr>
<td>Edit Stages</td>
<td>Opens the Workflow Stages list. For more information, see Workflow stages on page 2648. For tables with a column of Type = Workflow.</td>
</tr>
</tbody>
</table>

Managing workflows

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

Create a workflow

Automate a multi-step process by creating a workflow with the workflow editor.

- You must have the workflow_admin or workflow_creator role to use the workflow editor.
• If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 2710 before creating the workflow.

1. Navigate to Workflow Workflow Editor.
   The Welcome tab of the Workflow Editor opens. It links to workflow documentation and other related resources. If ServiceNow Orchestration is activated, the welcome screen contains resources for that feature as well.

2. On the Workflows tab in the palette, click the + icon in the upper right corner.

   A simplified version of the New Workflow form opens.

3. Fill in the Name and Table fields.
4. [Optional] Add a Description.
5. [Optional] Do one of the following:
   a) If the Conditions UI section is displayed, specify a Condition if needed and edit the fields.
      (The Conditions UI section shows only if the selected table supports conditions for launching
workflows. For example, if you select the sc_req_item table, conditions are not applicable and the Conditions UI section is not displayed.)

b) If the Stages UI section is displayed, check that the State rendering and Stage order fields contain the correct information. (The Stages UI section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the Stages UI section is displayed.)

6. Click Submit.

The new workflow is created with the Begin and End activities connected by a single transition.

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.

For more information, see Work on workflows on page 2614.

8. To change advanced settings for the workflow, click the Properties icon . If you make changes, click Update.

Workflow properties

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- Name
- Table
- Description
- If condition matches
- Condition

If you click Diagrammer view in Related Lists, the following UI sections are available in the dialog box:

- General
- Conditions
- Inputs
- Activities
- Application
- Schedule
- Stages
• Estimated Runtime

General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select Global [global] to run the workflow on all tables.</td>
</tr>
<tr>
<td>Checked out</td>
<td>[Read-only] When the workflow was checked out. Automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>[Read-only] The user who has this workflow checked out. This value is automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td>[Read-only] Check box to indicate whether the workflow has been published. Automatically set by the Publish action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>

Note: The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.

Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as sc_req_item, that does not require a condition.
### If condition matches

When the condition evaluates to true, the workflow launches an active context:
- **None**: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.
- **Run the Workflow**: The default value. The workflow engine starts the workflow if the information in the Condition field matches a record that is inserting into the table.
- **Run if no other workflows match yet**: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as `short_desc contains test`. A new workflow, which has If condition matches set to Run if no other workflows match yet, only runs if none of the four workflows have started running on the Incident record.

### Condition

A condition builder for specifying workflow conditions that trigger the behavior selected from the If condition matches list.

### Order

Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions.

### Inputs

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>

### Activities

The Activities section enables you to set activity pinning and maximum activity count.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Activity pinning | List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity pinning on page 2830. The possible options are:  
  • Set by activity: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.  
  • Pin all activities: Pins all activities in the workflow to their current version.  
  • Unpin all activities: Allows all activities in the workflow to be updated.                                                                 |
| Max activity count | The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled. |

**Application**

The Application section enables you to see application scope and scope restrictions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>[Read-only] Scope of this activity. For more information, see Application Scope.</td>
</tr>
</tbody>
</table>
| Accessible from   | Scope restrictions for this workflow. Possible settings are:  
  • All application scopes: Workflow is accessible to all application scopes.  
  • This application scope only: Workflow access is limited to the scope named in the Application field.  
  For more information see Workflow scope on page 2693.                                                                                         |

**Schedule**

Use the Schedule section to create a schedule for this workflow using the schedule builder.
### Field | Description
--- | ---
Delivery based on | The schedule type for this workflow. Possible types are:
- User-specified duration: Duration based on a user-specified value. This is the default schedule type.
- Relative duration: Duration calculated from a preconfigured schedule, such as 8-5 weekdays.
Expected time | User-defined interval. This field is visible when the schedule type is User-specified duration.
Schedule | Preconfigured schedule that determines when this workflow runs.
Timezone | Time zone for this instance.

### Stages

The Stages section appears if you select a table with Type = Workflow.

### Field | Description
--- | ---
Stage | Displays the workflow stage progress on the selected table. Optionally, select Stage rendering and Stage orderschemes to customize the appearance of the stage field. The default values cover typical scenarios.
Stage rendering | The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see *Workflow stage renderers* on page 2663.
Stage order | The order of workflow stages when you view a workflow field in a list. Select Computed to let the workflow engine compute the stage order from the order of execution in the workflow. Select User Specified to use the Order field from that *Workflow stages* on page 2648.
Name | The name of the stage as it appears in workflow fields..
Duration | Time allocated for the specific stage.
Order | The order of workflow stages when you view a workflow field in a list. Select Computed to let the workflow engine compute the stage order from the order of execution in the workflow. Select User Specified to use the Order field from that *Workflow stages* on page 2648.
### Estimated Runtime

The Estimated Runtime section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see *Workflow run time metrics* on page 2727.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires ERT</td>
<td>Check box to indicate that this workflow requires an estimated runtime configuration. You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.</td>
</tr>
<tr>
<td>Estimated Run Time</td>
<td>The initial estimate for the workflow’s run time.</td>
</tr>
<tr>
<td>Number of data points</td>
<td>[Read only] The number of times the system has compared the estimated run time to an actual run time result.</td>
</tr>
<tr>
<td>Outlier Percentage Threshold for ERT</td>
<td>[Required] The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see <em>Outlying workflow run times</em> on page 2728.</td>
</tr>
</tbody>
</table>

### Create a workflow from a table

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* on page 2710 before creating the workflow.

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.
2. Right-click in the column header and select Configure > Workflows.
The Workflow Versions on that table appear in a list.

3. Click New.
   The Workflow Version opens in New Workflow view. The Table field is filled in with the table you selected in step 1 and is read-only.

4. Enter Name.
5. [Optional] Enter Description.
6. [Optional] Edit conditions fields as necessary.
7. Click Submit.
   The new workflow is added to the Workflow Versions list.
8. Click the workflow Name.
   The new workflow is created with the Begin and End activities connected by a single transition.
9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see *Work on workflows* on page 2614.

10. (Optional) To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Create a workflow for a new service catalog item

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* on page 2710 before creating the workflow.

1. Navigate to Service Catalog Catalog Definitions Maintain Items.
2. At the top of the form, next to Catalog Items, click New "New"
   The Catalog Item form opens.
3. Add a Name.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow version dialog opens in the New Workflow View. The Table field is set to Requested Item (sc_req_item) and is read-only.

6. Add a Name.

7. [Optional] Add a Description.

8. [Optional] Change the stage information as necessary.

9. Click Submit.
The new workflow is created with the Begin and End activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.  
For more information, see Work on workflows on page 2614.
11. To change advanced settings for the workflow, click the Properties icon.
12. Click Update.
   If you close the workflow editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the Workflow field. Hover over the information icon to view a read-only summary of the workflow.

Create a workflow for an SLA Definition

Automate a multi-step process by creating a workflow from an SLA definition.

• If you are designing the workflow as part of an update set process, see Workflow movement with update sets on page 2710 before creating the workflow.

1. Open a list of SLA definitions. For example Facilities > SLA Definitions or Service Level Management > SLA Definitions.
2. At the top of the form, next to SLA Definitions, click New.
3. Select Contract SLA or Service Offering SLA.
   The SLA Definition or Service Offering SLA form opens.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter Name.
7. [Optional] Enter Description
8. [Optional] Edit conditions fields as necessary.
9. Click Submit.
   The new workflow is created with the Begin and End activities connected by a single transition.
10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows on page 2614.

11. [Optional] To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Ending workflows with multiple branches

A workflow is complete when it reaches the End activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a Join activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

![Workflow with uncompleted branch](image)

**Figure 706: Workflow with uncompleted branch**

For both branches to complete, add a Join activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The Incomplete condition of the a Join activity is met only if one of the branches cannot be completed.
Work on workflows

To complete a workflow, you add workflow activities, validate the workflow, and publish it.

Add a workflow activity

Activities determine the functionality of the workflow.

When they are created, all workflows contain Start and End activities.

For more information, see Workflow activities on page 2734.

1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow

You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.

Role required: workflow_admin

Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.

1. Open the workflow to validate in the workflow editor.
   
   When the workflow is loaded, the workflow validator icon appears in the toolbar.

2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.
3. Complete the following steps to generate a workflow validation report from the Workflow Version form
   a) Navigate to Workflow Administration Workflow Versions, and select a workflow to validate.
   b) Under Related Links, click Validate Workflow.

Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation on page 2668.

To publish a workflow:

1. Navigate to Workflow Workflow Editor.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select Publish.

If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

**Determine whether a workflow can run**

A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Role required: workflow_admin, workflow_creator, or admin

1. In the navigation filter, enter wf_workflow.list, and then open one of the workflows.
2. In the Versions related list, check for all of the following conditions:
   a) There is only one workflow version in a state of Checked out and Checked out by.
   b) There is only one version and it is not checked out. This version must be both Active and Published.
      You may need to personalize the list and add the Active column.
   c) If there are multiple versions, only one is Published.

These checks determine the only two conditions under which a workflow can run:

- A checked out version of a workflow is available for the user who has it checked out.
- A valid, published version of a workflow is available for all users who have permission to run the workflow.

Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

**Edit a published workflow**

You can edit a published workflow after you check it out.

**Note:** You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

1. Navigate to Workflow Workflow Editor.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select Checkout.
   A new version of the workflow is created and assigned to you.
   If you are in a different domain than the published workflow, the new workflow version is created in your domain.

After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.
Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.

![Figure 708: Workflows available to use as subflows](image)

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a Loading message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Subflows and the Create Task activity

If a workflow contains a *Create Task* activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

**Note:** An alternative to creating duplicate subflows that use the Create Task activity is to add a *Run Script* activity to the workflow that creates a task with a script.
In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

**Note:** Subflows on the Requested Item [sc_req_item] table in the Service Catalog cannot accept variables from parent workflows.

**Define inputs for a subflow**

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

All inputs are stored in the Variables [var_dictionary] table.

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select Edit Inputs.
3. In the Workflow Inputs window, click New.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.
5. Click Submit.

**Invoke a subflow in a workflow**
Use this procedure to add a subflow to a workflow.

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the Workflows tab to the parent workflow.
3. In the New Activity dialog box, define the variables defined by the subflow's Inputs.

   These fields can accept both static values or variables in the following format:
   
   ${variable_name}

4. Click Submit.

   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the Inputs definition.

**Prepare a subflow**

This example describes the process of preparing a subflow for use in a parent workflow.

1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select Edit Inputs.

3. In the Workflow Inputs window, click New in the Variables list.
4. Add a new variable depending on the type of values that it is going to store. The following example sets up a string value.

5. Click Submit.

6. Close the Workflows Inputs dialog.

7. Create a Run Script activity on the subflow.
   - Set the value from the parameter to a field on the current form. This is important because the Notification activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the Description field.
   
   ```javascript
   current.description = workflow.inputs.bluesubvariable;
   ```
   - Create a new field on the request form but do not display the field. This serves as temporary storage.
8. Create a Notification activity on the subflow. Use ${description} in the subject to return the value from the field.
New Activity: Notification

<table>
<thead>
<tr>
<th>Name</th>
<th>Blue Notification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>To</th>
<th>Beth Anglin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>This is for $description'12345ABC</td>
</tr>
<tr>
<td>Message</td>
<td>test notification</td>
</tr>
</tbody>
</table>

This is what the subflow would look like:
Prepare a workflow to use a subflow

After you create a subflow, use this procedure to prepare the parent workflow.

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.

   In the following example, the variable is named Blue Main Variable.

2. Click Submit.

3. Insert a Run Script activity to return the value from a field to the newly created variable.

   In this example, the value of the Short Description field is returned and given to the newly created variable.

   workflow.scratchpad.bluemainvariable = current.short_description;
4. Click Submit.
5. In the subflow activity, set the Blue Sub Variable to pass the bluemainvariable to the bluesubvariable.

${workflow.scratchpad.bluemainvariable}

This is what the main workflow looks like:
Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity.

These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

1. Navigate to Workflow Activity Definitions.
2. Select a workflow activity, such as Approval - User.
3. In the Activity Variables section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

   **Note:** If defining a new activity variable that is dependent on another activity variable, put the prefix "vars." before the name of the parent activity variable. For example, if the child field is dependent on a field named parent, put the value vars.parent in the Dependent field.

   To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

   To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

   ```plaintext
   activity.vars.variable_name = new_variable_value
   ```

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

   **Note:** There is a specific kind of input variable for any workflow that is declared against the table Requested Item [sc_request_item]. To understand the use of these variables see Workflow catalog variables on page 2630.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

1. Navigate to Workflow Workflow Editor.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select Edit Inputs.
4. Select an existing variable or click New.
   
   Note the Column name field. Use this value when accessing the variable from a script.
   
   Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.
   
   The input variables are available to use in scripts. To access an input variable from a script:
   
   ```javascript
   var input = workflow.variables.variableName // get the workflow variable identified by column name.
   ```

### Assigning values to variables from outside of workflow

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow() //Get the workflow id
var wfId = wf.getWorkflowFromName("Workflow Name");
//Start workflow, passing along name: value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of
//workflow
wf.startFlow(wfId, null, "Workflow Name", {input_var_name: input_var_value});
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow()
//Get the workflow id
var wfId = wf.getWorkflowFromName("Workflow Name");
//Start workflow, passing along object containing name/value pairs mapping to
inputs expected by the workflow
var vars = {};
vars.input_var_name1 = input_var_value1;
vars.input_var_name2 = input_var_value2;
// add as many variables as your workflow is expecting, then pass the object
wf.startFlow(wfId, null, "Workflow Name", vars);
```

### Assigning Values for Subflow Inputs from inside of a Main Workflow

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see Workflows used as subflows.

### Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```javascript
var readValue = workflow.inputs.variable_name;
```
Workflow scratchpad variables

The scratchpad in workflow is a space in the workflow context to store and share string based variables (as name:value pairs) between instances of activities within an executing instance of a workflow. The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```
workflow.scratchpad.variableName = variableValue;
```

Display

There is no way to view the contents of the scratchpad.

Access and Assignment

As stated in the Declaration section:

```
workflow.scratchpad.variableName = variableValue;
```

or:

```
var myValue = workflow.scratchpad.variableName;
```

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

```
var myVarValue = current.getElement(nameOfTheField);
```

or
```javascript
var myVarValue = current.fieldName;

or

current.variableName.setValue( "A Variable Value");
```

**Workflow catalog variables**

Workflows that are associated with the Requested Item [sc_req_item] table have a specific type of workflow input. The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.

**Scope**

For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item [sc_request_item], and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

**Declaration**

You can declare requested item catalog variables at the catalog item level or at a global level. You can declare global catalog variables using the workflow editor context menu.

Also see, **Global variable declaration option 2**.

1. Navigate to Workflow Workflow Editor.
2. Open and check out a workflow that runs against the Requested Item [sc_req_item] table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.

**Global variable declaration option 2**

You can declare global catalog variables using the Service Catalog.

1. Navigate to Service Catalog Item Variables.
2. The list of variables that appears in the workspace has a default filter of Cat Item != <blank>. Change the filter to Cat Item = <blank> and run the query.
   - The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click New to create a new variable.
4. Leave the Cat Item field blank.
5. Select the Global check box.
6. Click Submit.
   - Also see, **Global variable declaration option 1**.
Catalog item specific variable declaration option 1
You can declare a catalog item-specific variable.

These variables are only available to the catalog item referenced in the Cat Item field on the variable
record.

1. Navigate to Service Catalog Catalog Variables Item Variables.
2. Enter or select a catalog item in the Cat Item reference field.
3. Click Submit.

Also see, Catalog item specific variable declaration option 2.

Catalog item specific variable declaration option 2
You can declare a catalog item-specific variable directly from a catalog item record.

Creating a catalog variable in this way automatically sets the Cat Item reference to the catalog item
selected.

1. Navigate to Service Catalog Catalog Definitions Maintain Items.
2. Select or create a catalog item.
3. From the Variables related list, click New.
4. Ensure that the Cat Item field correctly references the catalog item previously selected or created.
5. Go to or open the Question section or tab.
6. Add a Question.
7. Add a Name.
   Variable names should not include white space and cannot begin with a number.
8. Click Submit.

Also see, Catalog item specific variable declaration option 1.

Display
Catalog specific item variables are visible in several places depending on where in the process the variable
is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the Maintain Items
module and in the Item Variable modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the Catalog Task activity in the
form of a slushbucket at the bottom of the Catalog Task activity. Item variables that are selected, are the
question and answer pairs that will appear on the task that is generated by that instance of Catalog Task
when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that
appear in the slushbucket of the Catalog Task activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The
variables selected in the slushbucket are the question and answer pairs that appear to the user on the task
form.
Access and assignment

The Catalog Item Variables are available and assigned to a specific Catalog Task activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:

```javascript
var gr  = current ; // or create and query a new GlideRecord
var itemVariable  = gr. variables [ variableName ] ; //access the service catalog variable identified by the variable name.
var itemValue  = itemVariable. getGlideObject ( ). getValue ( ) ;
var itemQuestion  = itemVariable. getGlideObject ( ). getQuestion ( ).
getLabel ( ) ;
```

Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration [sysevent_register] table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the registered_events column of the Workflow Executing Activity [wf_executing] table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a Run Script activity. In this case, the event, such as cancel, is passed to all records in the Workflow Executing [wf_executing] table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.

Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands [wf_command] table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.
Workflow events in the base system

Several workflow events are available in the base system.

Table 1152: Workflow events in the base system

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the onActivityComplete event handler.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for wf_executing.notify_termination, then set the value to true (activity.notify_termination = true) during the onExecute event.</td>
<td>Workflow Engine, Process Terminations, onNotifyTermination</td>
<td>Current thread, current mutex</td>
<td>Join activity</td>
</tr>
<tr>
<td>otherEvent</td>
<td>String value used by the Join activity to respond to an otherEvent.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about an otherEvent that has completed.</td>
<td>The Join activity transitions from n number of preceding activities. These preceding activities all create a wf_executing record, which causes a check to see if the record already exists. If the Join already exists, then the Join created by the executing transition sets the wf_executing record for deletion.</td>
<td>Join activity</td>
<td>Current thread, current mutex</td>
<td>Join activity, onOtherEvent event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>

<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>timer</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Allows <code>wf_executing</code> records to be informed about a timer activity that has completed and has fired the timer event.</td>
<td>The Timer activity schedules a job that calls a script. The script calls <code>fireEvent (wf_executing, timer)</code>.</td>
<td>Timer activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Timer activity, onTimer event handler</td>
</tr>
<tr>
<td>execute</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Informs a record in the <code>wf_executing</code> table with the initial state of Executing to proceed with its primary work.</td>
<td>The workflow engine, for each transition executed, creates an executing record with a state of Executing. Once created, the executing record is put in a queue for processing. For each item in the queue, the Rhino globals are established, the activity definition that drives the executing record is instantiated, and the <code>run()</code> function is called. When the state of a record is Executing, this function always calls onExecute.</td>
<td>Workflow engine, via the WFActivity Handler</td>
<td>Current thread, current mutex</td>
<td>All activities, onExecute event handler</td>
</tr>
<tr>
<td>Event</td>

<td>-----------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>execute (specific to Lock)</td>
<td>String value used by the Lock activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td>Informs a wf_executing record waiting to execute that the specified wait interval has passed and that it should attempt to get the lock again.</td>
<td>Lock activity schedules a job with a script that uses the workflow script include’s fireEvent(wf_executing, 'execute') method.</td>
<td>Lock activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Lock activity, onExecute event handler</td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs wf_executing records for approval activities about an approval that completed and triggered the timer event.</td>
<td>Approval Coordinator both registers for the event and triggers the event. The child approvals have listeners that determine their approval state.</td>
<td>Approval Coordinator triggers the event during its onExecute</td>
<td>Current thread, current mutex</td>
<td>Approval Coordinator, Approval - User, and Approval - Group all have onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column</td>
</tr>

*Workflow event-specific functions*

There are several functions that relate specifically to workflow events.
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>registerForEvent(eventName)</td>
<td>Function in the workflow environment that writes events represented as strings to the <code>wf_executing.registered_events</code> field.</td>
<td>The workflow events are just strings. When an activity that has registered for an event executes, a comma delimited set of events is stored with the Workflow Executing Activity [wf_executing] record. When the event is triggered in the workflow context, the <code>wf_executing</code> table looks for all executing records that contain the string that represents the event in the <code>wf_executing.registered_events</code> field.</td>
<td>The global variable <code>workflow</code> that is available to all Workflow Activity [wf_activity] records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.registerForEvent('myEventName');</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>---------</td>
<td>-----</td>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td><code>unRegisterForEvent(eventName)</code></td>
<td>Function in the workflow environment that removes a string value representing an event that has been written to the <code>wf_executing.registered_events</code> field.</td>
<td>The workflow events are just strings that are written to the <code>wf_executing.registered_events</code> field. When an activity <code>unRegisters</code> for an event, it removes the event from the comma-delimited set of events stored with the Workflow Executing Activity <code>[wf_executing]</code> record. If that string is found, it is removed.</td>
<td>The global variable workflow that is available to all Workflow Activity <code>[wf_activity]</code> records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.unRegisterForEvent('myEventName');</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td><code>fireEvent(eventName)</code></td>
<td>Function in the workflow environment that examines the contents of the <code>wf_executing.registered_events</code> field, comparing its contents to the <code>eventName</code> passed in.</td>
<td>The workflow events are just strings that are written to the <code>wf_executing.registered_events</code> field. When <code>fireEvent(eventName)</code> is called by a workflow activity, the workflow engine queues up any executing records that contain the string in the registered field.</td>
<td>The global variable workflow that is available to all Workflow Activity <code>[wf_activity]</code> records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.fireEvent('myEventName');</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>fireEvent (eventRecord, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The eventRecord is a GlideRecord of the type wf_executing.</td>
<td>This event call expects an onMyEvent event handler in the activity represented in the event record (Workflow Executing Activity [wf_executing] table). When fireEvent(eventRecord, eventName) is called by a workflow activity, the workflow engine queues up the specific executing record with that event and passes the event into the activity definition for the on&lt;eventName&gt; handler to manage. This event is queued up in its own mutex, so the current queue completes before this event is processed.</td>
<td>The workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>

</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>fireEvent</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>fireEvent (eventRecordSysId, eventName, optionalJSONObject)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts a JSON object as a third parameter. This object can specify any data expressible as JSON. You can also specify additional functionality when creating a workflow activity.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName, JSONObject);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>broadcastEvent (contextId, eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity records in a specified context, regardless of their state.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.broadcastEvent(contextId, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>---------</td>
<td>-----</td>
<td>--------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>broadcastEvent(eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity [wf_executing] records in the current context, regardless of their state.</td>
<td>This should not be confused with broadcastEvent above. This event is only available to current Workflow Executing Activity [wf_executing] records.</td>
<td>This is available only through the global workflow variable of the current context. The following is an example of its use from within an activity definition's script: workflow.broadcastEvent(eventName)</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
</tbody>
</table>

**Event-specific workflow activities**

The following workflow activities trigger events.
<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event</td>
<td>Requires an event from the event registry rather than a workflow event. This activity is located in the Notification category of the workflow tree.</td>
<td>Fires the notification event specified in the Workflow Activity [wf_activity] table.</td>
<td>1. Navigate to System Policy Events Registry 2. Create an event. 3. Navigate to System Policy Templates and create an email template. 4. Navigate to System Policy Email Notifications. 5. Create a new notification that is triggered by the event you created and sends the template you created. 6. On the workflow canvas, drag the Create Event activity onto the canvas and</td>
<td>Event Registry</td>
<td>Triggered in the current thread and handled on the worker thread in notifications. Never processed by a workflow</td>
<td>On the notification thread, outside of workflow</td>
</tr>
</tbody>
</table>
## Workflow stages

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident [incident] table has an Incident state field that indicates progress, but the service catalog uses the Stage field.

To indicate the workflow's progress through the possible stage values, the interface updates the Stage field selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's Stage field.
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of In progress.
- If an activity is in the Pending or Completed state, the stage reflects this state.
- If an activity is cancelled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

**How stage values are derived**

Stage values are derived from various sources in the interface.

- **Choices for Stage column**: Choices defined for the column selected as the Stage column for the workflow.
- **Default stages for table**: Stages defined in the Stage Default [wf_stage_default] table for the table selected.
- **Workflow-specific stages**: Applied only to the workflow for which they were defined in the Workflow Stage [wf_stage] table.
- **Stage values in existing records**: Values from the designated Stage column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named Stage, then the progress of the workflow appears in any list view containing the Stage column.
Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of In progress. Similarly, if the activity is in the Pending or Completed state, the stage reflects this state.

Example

If the workflow table is Request Item [sc_req_item], then the stage field is automatically set to the Stage column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry [sys_dictionary] table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed
Note: If an activity is cancelled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the Stages list in workflow activities.
Note: If you are creating a workflow with a table other than Request Item [sc_req_item], you must select a Stage field in the workflow properties for the workflow to have stages.

Use workflow stages

You can add or modify workflow stages.

1. Navigate to Workflow Workflow Editor.
2. Create a new workflow by clicking New or open an existing workflow.
3. In the Workflow Properties form, if the table is not the Requested Item [sc_req_item] table, select a field to display stages in the Stage field property. 

*Available fields* depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a Stage field in their dialog box.

Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

When an activity starts with a specified stage, the platform updates the Stage field with the current value. In workflows run against the Requested Item [sc_req_item] table, the `sc_req_item.stage` field is defined as a workflow type field.

When displaying the stages for a workflow on the Requested Item [sc_req_item] table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an In progress state. Similarly, if the activity is in the Pending or Completed state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select Edit Stages. Again, these stage values are combined with the choices, defaults, and existing values.
Workflow stages

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:

- Approval
- Order
- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow Default Stages (by table).
2. Click New.
3. Select a stage Set.
   You can create a new set by clicking New, typing a name, and clicking Submit.
4. Select a corresponding Table.
5. Click Submit.
   The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

Add a stage to an existing workflow
If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.
1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages.
4. In the Workflow Stages list, click New.
5. On the Workflow Stage form, fill in the fields as appropriate.
   Do not use a Name or Value field value that already exists in the base system.

Add a stage to a workflow activity
After stages are added to a workflow, you can assign them to the workflow activities.
1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the Stage field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click Update.

Translate workflow stages
You can provide translations for workflow stage names so the names appear in the language selected for the instance.

The instance must already have Internationalization support installed.

Language-specific text appears in workflow fields displayed in a list, workflow stage sets, and the workflow editor for users with that language selected. Language-specific text does not automatically appear when
displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.

You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

1. Set the interface language to French.
2. Navigate to Workflow Workflow Editor.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select Edit Stages.
5. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.
6. Confirm that the workflow stages display the French text.

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages [wf_stage] table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to French.
2. In the application navigation filter, enter wf_stage.list.
3. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.

Workflow stage sets

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a Stage field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

Updates to workflow stage values

During an upgrade, the system makes changes to the Value field of records in the Workflow Stage [wf_stage] table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support Localization settings and enable workflows to display translated text in the Stage field.

Create a new stage set

You can create a new stage set by creating a stage set record and adding stage set entries manually.

Create a stage set record only when you want additional stages that are not available on the table by default.

1. Navigate to Workflow Stage Sets.
2. Click New.
3. Enter a Name that indicates the purpose of the stage set. For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.

4. Click Submit.

5. Open the new stage set record.

6. In the Stage Set Entries related list, click New. Each stage set entry can be used as the Stage for an activity in a workflow that uses this stage set.

7. Enter a Name that indicates the stage name to appear in workflow fields.

8. Enter a Value to use when referencing the entry, such as in a script.

9. Click Submit.

10. In the Stage Set Entries related list, ensure that each entry has a unique Order value. Enter a low value for stages that should appear early in the workflow and a higher value for later stages.

The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

*Import stages from a choice list*
You can import the choice list values of a workflow field as stages for a workflow.

Create a choice list as follows:
• Add a custom field of Type Workflow to the table.
• Configure the custom field to use a choice list.
• If you are creating a new field, set the Choice List type to Display without --None-- and create the choices for the newly created field.

For more information, see Create a workflow stage field on page 2659.

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties
4. In the Workflow Properties dialog box, click the Stages tab.
5. From the Stage field list, verify that the correct workflow field is selected.
6. In the Related Links section, click Import Stages from Choice List.
7. In the dialog box asking you to confirm that you want to import the choice list, click OK.
8. Click Update.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

Export a stage set from a workflow
You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Export to Stage Set.
5. Enter a unique Name for the new stage set.
6. Click OK.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

Add a stage set to a workflow
You can add any number of stage sets to an existing workflow.

When multiple stage sets have stage set entries with the same Value, the stage appears on the workflow only once.

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Import from Stage Set.
5. Select the stage set.
6. Click Ok.
7. Import additional stage sets as needed for the workflow.

After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see Add a stage to a workflow activity on page 2655.

Use a default stage set
You can assign a stage set as a default set to any number of tables.
The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow Default Stages (by table).
2. Click New.
3. Select a Table.
4. Select the Set you want to assign to the selected table.
5. Click Submit.

Create a workflow stage field

Workflows can provide a summary of workflow progress by updating any field of the Workflow type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Role required: admin

In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow.

For more information, see Workflow stages on page 2648.

To create a workflow stage field:

1. Navigate to Workflow Default Stages (by table).
2. Right-click near a column header and select Configure List Layout.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the Type set to Workflow.
   For detailed steps, see Add a new field to a table.
5. Click Save.
6. Right-click the field label and select Configure Dictionary.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select Dropdown with --None-- from the Choice list.
9. Click Update.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.

- To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the Stage field selected in the workflow properties. For detailed steps about importing a choice list, see Import stages from a choice list on page 2657.
- The Value of each choice must match the Value of the corresponding workflow stage.
- Do not use spaces in the Value field for either choices or stages. Use underscores in place of spaces.
- Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

For detailed steps on defining choice lists, see Define an option for a choice list.

11. To see workflow stages as icons, add the field to the list layout of the workflow table.

For detailed steps, see Configure the list layout.

After you create or update the workflow field:

- Unless the workflow uses the Requested Item [sc_req_item] table, ensure that the workflow field is selected from the Stage field list in the workflow properties. For detailed steps, see Select a stage field on page 2660. If a workflow uses the Requested Item table, the stage field is automatically set to the Stage field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

Select a stage field
A Stage field allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see Create a workflow stage field on page 2659.

Unless the workflow uses the Requested Item [sc_req_item] table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed.

To add or edit a workflow stage field:

1. Navigate to Workflow > Workflow Editor.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the General tab.
5. In the Table list, verify that the table containing the workflow field is selected.
6. Click the Stages tab.
7. From the Stage field list, select the workflow field.
8. Click Update.

Workflow stage field icons and tooltips
A workflow stage field displays icons to indicate the workflow stage.

Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.
### Table 1158: Workflow field icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>Current active step</td>
</tr>
<tr>
<td>🔄⚠️</td>
<td>Approval pending</td>
</tr>
<tr>
<td>🖐️</td>
<td>Approval rejected</td>
</tr>
<tr>
<td>✔️</td>
<td>Complete</td>
</tr>
<tr>
<td>✗️</td>
<td>Late (Change/Request) or Canceled (Catalog)</td>
</tr>
<tr>
<td>🔄≠️</td>
<td>Skipped (Catalog only)</td>
</tr>
</tbody>
</table>

**Stage tooltips**

Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.
### Table 1159: Stage renderers and tooltip behavior

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
</tbody>
</table>
When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage.

If you do not want the approver’s name included in the tooltip, navigate to System Properties Service Catalog and clear the Show the current pending approver’s name in the stage widget mouseover check box.

Show the current pending approver’s name in the stage widget mouseover
✓ Yes ❌ No

Figure 714: Property for displaying pending approver’s name

Workflow stage renderers
Workflow stage renderers determine how a workflow displays stages in a workflow field.
There are multiple renderers available.
**Note:** Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.

**Workflow-driven**

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

**Note:** If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

**Main flow**

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

**Linear**

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more *Condition Workflow activities* on page 2764. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.
The linear renderer displays all these stages in one workflow field. The parent workflow specifies the Waiting for approval, Fulfillment, and Completed stages. The subflow specifies the Delivery and Waiting for Task, and Delivery OK stages.

**Progress bar**

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.
The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The Stage order field on the Stages tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the Order column on the Workflow Stages record

### Legacy

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the WorkflowIconsSCR script include to define which icons to use, add the attribute icons=WorkflowIconsSCR to the Attributes field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute icons=WorkflowIconsStages.

The legacy renderer works with all tables except the Requested item [sc_req_item] table. In this case, use the requested item renderer instead.

### Requested item

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item [sc_req_item] table.

Select a stage renderer

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Consider the following when selecting a stage renderer:

- Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.
### Table 1160: Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear</td>
<td>• The parent workflow and all subflows must modify the same current record.</td>
</tr>
<tr>
<td></td>
<td>• In the properties for all subflows, the Stage field value for all subflows must match that of the parent workflow.</td>
</tr>
<tr>
<td></td>
<td>• The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.</td>
</tr>
<tr>
<td></td>
<td>• On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows.</td>
</tr>
<tr>
<td>Main flow</td>
<td>• The workflow contains subflows.</td>
</tr>
<tr>
<td></td>
<td>• You do not want or need to reveal the details about the subflows.</td>
</tr>
<tr>
<td>Progress bar</td>
<td>• The workflow properties must have a Stage ordering value of User-defined</td>
</tr>
<tr>
<td></td>
<td>• There must be workflow stages within the workflow.</td>
</tr>
<tr>
<td></td>
<td>• Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the Value and Order fields.</td>
</tr>
</tbody>
</table>

To select a stage renderer:

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Stages tab.
5. From the Stage rendering list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select Legacy for either one.
   - If you want to use the linear renderer, make sure you select Linear in the properties for the parent workflow and all subflows.
6. Click Update.

Workflow fields with deleted records

Workflow fields may indicate when a record required by the workflow is deleted.

After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see Restore a deleted record and reference.

Figure 718: Workflows with missing records

The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

Workflow validation

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

Highlighting critical errors

The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the
subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.

![Workflow Diagram]

**Figure 719: Validate missing subflow**

**Validations at publishing**

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

**Validation warning**

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.
Validation failure

A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Workflow validation report

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
Figure 722: Workflow validation report

Header summary

- The header of the validation report summarizes the entire validation run against the specified workflow.
  - Validate Summary: The overall score reflects the most severe notification level encountered during the validation.
  - Total checks performed: The total number of validations run is also broken down to show the number at each notification level.

Report columns

- The body of the report displays the results of each individual validation check that was performed. The
columns are Type, Level, and Message. You can sort and filter these columns as you would any list.

Table 1161: Workflow termination and external dependencies levels

<table>
<thead>
<tr>
<th>Name</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Info</td>
<td>Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

Message

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see Validate a workflow on page 2614
Workflow validator

ServiceNow offers several workflow validators for workflow designers to test their workflows. This page lists all available workflow validators. See Workflow validation on page 2668 for information on using workflow validators and the workflow validation report to see the type of information that is returned.

ValidateTransitionOut

The ValidateTransitionOut validator finds activity conditions with no exit transitions.

Validation summary

- Risk: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: All conditions have transitions.
• Invalid Result: Invalid
• Invalid Message: This workflow contains <condition count> activity conditions without an output transition.
• Suggested Action: If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.
• Publishable: Yes
• Runnable: Yes
• Related Information: None

Troubleshooting

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the Notification and Timer activities both execute at the start of the workflow. The Timer is the entity that decides when the workflow ends. In this situation, executing the Notification, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the Notification activity as a Warning that the designer can ignore.

Figure 723: Condition with no valid transition

In the second example, the Notification activity has no exit transition. The designer missed this because of the layout. The transition from the Timer activity passes behind the Notification activity and appears to connect the exit from the Notification activity to the End. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow's designer intended for the Notification activity to transition to the End.
Figure 724: No condition out

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

**ValidateTransitionIn**
The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.

**Validation summary**

- **Risk:** Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose:** Find activities that do not have inbound transitions.
- **Severity Level:** Warning.
- **Valid Result:** Valid.
- **Valid Message:** All activities in this workflow have at least one inbound transition.
- **Invalid Result:** Invalid.
- **Invalid Message:** This workflow contains <activity count> activity conditions without an input transition.
- **Suggested Action:** Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

**Troubleshooting**

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from Set Values does not stop at Approval - User (there is no arrow end). Instead, that transition goes directly to End. As a result, Approval - User cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.
Figure 725: TransitionIn invalid

This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.

ValidateDanglingTransition
The ValidateDanglingTransition validator finds and reports any transitions that do not terminate on an activity.

**Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

**Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- Risk: A workflow with dangling transitions will silently hang a workflow with no recovery options.
- Severity Level: Critical
- Valid Result: Valid
- Valid Message: Valid
- Invalid Result: Invalid
- Invalid Message: Invalid
- Suggested Action: Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- Publishable: No
- Runnable: No
- Related Information: None
**Troubleshooting**

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the ValidateDanglingTransition validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record's transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record's workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to Workflow Administration Workflow Version.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select Configure > Related Lists, move Workflow Activity-->Workflow Version from the Available list to the Selected list, and click Save.
5. In the Workflow Activities related list, select the activity cited in the validator.
6. In the Workflow Activity form, view the Workflow Transitions section or tab and identify the transition in that list that has no value or a null value in the To column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The Critical warning should disappear. The workflow should execute as expected on the next appropriate transaction.

**ValidateSubflows**

The ValidateSubflows validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

---

**Warning:** This is a critical error that prevents a workflow from running.

---

**Validation summary**

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** This workflow contains <count> valid subflows.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains <invalid count> invalid subflow(s) of <total subflow count> total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.
Troubleshooting

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the ValidateSubflows validator is when a workflow:

• Is checked out to User A.
• Is a subflow in a parent workflow being run by User B.
• Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the ValidateSubflow validator is when a workflow:

• Is a subflow in a parent workflow being run by any user.
• Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

Note: You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate

The ValidateScriptForCurrentDotUpdate validator finds workflow activities with scripts that use the current.update() function.

Calling current.update() causes significant performance delays in transaction processing and might cause an instance to hang.

Validation summary

• Risk: At best, a workflow that uses current.update() in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: The JavaScript in this workflow has no instances of 'current.update()'.
• Invalid Result: Invalid
• Invalid Message: This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
• Suggested Action: Remove current.update() from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.
• Publishable: Yes
• Runnable: Yes

Problems with current.update() in workflow scripts

A workflow initiates execution in one of these ways:
• Script Engine: If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
• Script: Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling startFlow().

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the update() of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls current.update() on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on update() on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

Troubleshooting

This validator detects the use of current.update() in any of the editable script fields. Do not call current.update() from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

ValidateLowestCommonTable
The ValidateLowestCommonTable validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item [sc_req_item] table is the lowest table in a workflow containing a Catalog Task activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

Note: This validator provides information only. It does not indicate an error or warning condition.
Validation summary

- Risk: This validator informs only and has no risk associated with it.
- Severity Level: Data/Information
- Valid Result: Valid
- Valid Message: The lowest common table in this workflow is <<table_name>>.
- Invalid Result: N/A (informational only)
- Invalid Message: N/A (informational only)
- Suggested Action: None
- Publishable: Yes
- Runnable: Yes
- Related Information: Tables and classes, Workflow activities on page 2734

ValidateTableChange

The ValidateTableChange validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request [change_request] table but has a Catalog Request activity on the canvas is invalid, since the activity is not compatible with the selected table.

Validation summary

- Risk: If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- Severity Level: Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- Valid Result: Valid
- Valid Message: All activities are valid for the newly selected table
- Invalid Result: Invalid Activity
- Invalid Message: This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- Suggested Action: Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities on page 2734

Troubleshooting

Navigate to Workflow Administration Activity Definitions. Note the Table column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.
When a workflow is set to the Global [global] table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

**ValidateParentFlow**
The ValidateParentFlow validator reports any workflows that use the workflow as a subflow.

**Validation summary**

- **Risk:** There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Currently <workflow version name> is not a subflow.
- **Invalid Result:** None
- **Warning Message:** This workflow version (<workflow version name>) is required as a subflow in <workflow version count> other workflows.
- **Suggested Action:** Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** *Workflows used as subflows* on page 2617

**Troubleshooting**

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of *input variables*. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

**ValidateSingleEnd**
The ValidateSingleEnd validator finds and identifies multiple End activities in a single workflow.
Multiple End activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

**Validation summary**

- Risk: If the execution paths to the End activities are not mutually exclusive, then the first End encountered completes the workflow and cancels all other executing activities.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: This workflow contains 1 End activity.
- Invalid Result: Invalid Activity
- Invalid Message: This workflow contains <count of ends> End activities.
- Suggested Action: Remove extraneous End activities that are not intended as part of the design.
- Publishable: Yes
- Runnable: Yes
- Related Information: None

**Troubleshooting**

As soon as an End activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second End activity that is still executing. Those executing activities are canceled as part of the End activity's clean up actions. Therefore, the results of designing workflows with multiple Ends must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple End activities. In the following example, the paths to the two Ends are mutually exclusive execution paths. If this was a large workflow, with many activities between Branch and the second End, the value of the multiple ends becomes apparent. Tracing a No response from User is invalid to a single End behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the End after the Notification activity terminates the workflow.
Figure 726: Mutually exclusive execution paths

The next example has multiple End activities in execution paths that are not mutually exclusive. A Yes response from User is valid causes the Set Values activity to finish immediately. By reaching its End activity first, this execution path cancels the Approval for Apps and the DB Task activities, which might not be the desired outcome. If the paths are all expected to complete before End, the activities should come to a Join (as in the previous example) that transitions to a single End.
Figure 727: Mutually inexclusive execution paths

**Note:** To add the second End, right-click to copy the original End activity and paste it onto the canvas. In most cases, a single End is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

**ValidateUpdateSetDependencies**
The ValidateUpdateSetDependencies validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see *Create an update set*.

**Validation summary**

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
• Invalid Message: This workflow has dependent workflows that are in a different update set.
• Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  • Ensure that all update sets migrate concurrently.
  • Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.

• Publishable: Yes
• Runnable: Yes
• Related Information: Workflow movement with update sets on page 2710

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

• A published subflow is in a different update set than the parent workflow and that update set is In progress.
• A subflow is checked out by another user, who is working in a different update set than the current user.

Note: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
**Risks**

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

**Possible solutions**

**Solution 1**

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

**Solution 2**

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

*ValidateUpdateSetParentDependencies*

The ValidateUpdateSetParentDependencies validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.
Validation summary

- Risk: If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: There were no Update Set dependency issues found.
- Invalid Result: Invalid
- Invalid Message: This workflow has dependent workflows that are in a different update set.
- Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow movement with update sets on page 2710

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

Note: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.
1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   • This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see Update sets.

Solution 2
Move dependent workflows between update sets.
1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   • If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   • The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateInputVarUpdateSetDependencies
The ValidateInputVarUpdateSetDependencies validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently in progress.
Validation summary

- Risk: Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
- Purpose: Determine whether input variables that belonged to this workflow were deleted in a different update set.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: There were no Input Variable Update Set dependency issues found.
- Invalid Result: Invalid
- Invalid Message: There are input variables that have been deleted and logged in a different update set.
- Suggested Action: If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow movement with update sets on page 2710

Troubleshooting

Workflow input variables get individual entries in the Customer Update related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal on page 2713 when the validator issues this warning.

ValidateWorkflowEndStages
The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- Risk: The stage indicator will not show the workflow is completed.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Workflow end stages are valid.
- Invalid Result: invalid
- Invalid Message: End activity A found with invalid stage "S."
- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities on page 2734
Troubleshooting

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

ValidateWorkflowStageColumn
The ValidateWorkflowStageColumn validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

Validation summary

- Risk: The stage indicators may not display appropriate information.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Workflow stage values are valid.
- Invalid Result: Warning
- Info Summary: Stage warnings found.
- Invalid Messages:
  - Table T does not have a column named C.
  - Workflow for table T has stages, but no stage column.
  - Table T has a stage column "C," but no stages are set by activities.
  - Workflow on table T has stage column "C" that is not type=workflow.
- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities on page 2734, Workflow stages

Troubleshooting

To check the stage column:

1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting Properties.
3. View the Stages tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

ValidateWorkflowStateExceptionValues
The ValidateWorkflowStateExceptionValues validator checks a number of stage aspects in workflow activities for correctness.

This validator has multiple possible error messages.
Validation summary

- Risk: The stage indicators may not display appropriate information.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Workflow stage values are valid.
- Invalid Result: invalid
- Warning summary: Stage warnings found.
- Invalid Messages:
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y

- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities on page 2734

Troubleshooting

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by clicking the menu icon and selecting Edit Stages.
3. Check the names and values.
   Ensure that the names and values are unique and are not empty.
4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Workflow Stages

Figure 728: Validate Workflow State Values

Tip: Make a list of which activities assign which stages.

Workflow concepts

You can do many things using the workflow editor.

- Modify core activities and conditions.
- Create custom activities and reuse the data for other workflows.

See Orchestration activity designer on page 1359.
• Download activity packs from the ServiceNow Store and create packs for upload.
• Edit workflows graphically.
• Define transitions between workflow activities.
• For the table that corresponds to the workflow, customize business rules.
• Summarize workflow progress through stages.
• Validate workflows to identify potential problems.
• Publish workflows for other users.
• Edit multiple tables without needing to directly modify them.

Workflow versions

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

Note: Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other’s workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

Workflow scope

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the workflow editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

Note: Any script that is created in the workflow editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.
Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment.
See Application scope.

For information on how to configure the scope for a workflow, see Workflow properties on page 2602.

Workflows and domain separation

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- Workflow [wf_workflow]: used for delegated administration or process separation.
- Workflow Version [wf_workflow_version]: used for delegated administration or process separation.
- Workflow Context [wf_context]: used for data separation.

Note: The Workflow Version table [wf_workflow_version] table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The workflow editor displays a workflow's domain in the title bar after the workflow name.
Figure 729: Workflow editor domain

Workflows and delegated administration

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow records in the Workflow [wf_workflow] and Workflow Version [wf_workflow_version] tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user's domain. This new version is a unique record in the Workflow [wf_workflow] table. After the user publishes this new workflow, other users in the child domain use the
new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request - Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

**Workflow permissions**

When a user starts a new workflow, the workflow runs with that user's domain and credentials. The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

**Workflows and data separation**

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.
Workflow records in the Workflow Contexts [wf_contexts] table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows in a child domain, a user
in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other's service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request's approval history.

**Workflow engine operation order**

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The Run after bus. rules run workflow property defines if a workflow is Default or Deferred.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see *Execution order of scripts and engines*. 
Before business rules (order <1000)
Do not use current.update() here

Default workflows
Do not use current.update() 

Before business rules (order >=1000)
Do not use current.update() 

Database operation
(insert, update, delete)

The current record is inserted or updated at the end of the database operation.

After business rules (order <1000)
Use current.update() if there is no deferred workflow

Deferred workflows
Do not use current.update()
Workflow caching

The workflow engine caches commonly-used published workflows to improve performance. Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to Workflow Administration Properties and modify the value of the The max number of models that will be concurrently held in the LRU cache (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables. Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Version [wf_versionable]</td>
<td>Tracks different versions of element definitions [wf_element_activity].</td>
</tr>
<tr>
<td>Workflow [wf_workflow]</td>
<td>The master records of workflows.</td>
</tr>
<tr>
<td>Workflow Context [wf_context]</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Workflow Execution [wf_workflow_execution]</td>
<td>Synthetic &quot;current&quot; records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Instance [wf_workflow_instance]</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Version [wf_workflow_version]</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Activities</td>
<td></td>
</tr>
<tr>
<td>Activity Variables [wf_activity_variable]</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Workflow Activity [wf_activity]</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity Definition [wf_activity_definition]</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Workflow Executing Activity [wf_executing]</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
<tr>
<td>Workflow components</td>
<td></td>
</tr>
<tr>
<td>Element Provider [wf_element_provider]</td>
<td>Template definitions for custom activities.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variable [item_option_new]</td>
<td></td>
</tr>
<tr>
<td>Workflow Condition [wf_condition]</td>
<td>All of the defined conditions in workflows.</td>
</tr>
<tr>

</tbody>
</table>

## Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

## Viewing a workflow context

Workflow contexts can be found in two places:
- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow All Contexts and selecting an active context.

## Displaying workflow progress

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.
• Show Timeline displays the workflow context as a **timeline**.
• Show Workflow displays the workflow context in the graphical workflow editor.

**Graphical interface**

To view the workflow context in the graphical workflow editor interface, click the Show Workflow link from either the workflow context record or the current record.

Figure 733: Show workflow

In the top right hand corner are two controls:
| ![Refresh Icon]  | Refreshes the workflow context. |
| ![Question Mark Icon]  | Displays a key of the colors used in the workflow to denote the state of activities and transitions: |

### Execution order

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In Workflow Live Workflows Active Contexts or All Contexts, Open the context you want to examine. Click Show Workflow, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Cancel a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context State to Canceled. To cancel an executing workflow, you can use the cancelContext(context) script. You can define an on Cancel script to clean up unresolved workflow activities.

Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

To cancel an active workflow:

1. Navigate to Workflow Active Contexts.
2. Select a workflow context record.
3. Select the Cancel related link.
   A confirmation window appears.

4. Click OK.
   The Wait for Cancel window appears. The workflow engine attempts to cancel the workflow gracefully.

If the workflow does not respond to the cancel command, the Force Cancel window appears.
5. Click Force cancel to interrupt the thread the workflow is actively executing or click Continue waiting to continue waiting for the workflow to cancel gracefully.

**Warning:** Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

**Cancel a workflow with the cancelContext(context) script**
To cancel an executing workflow, you can use the cancelContext(context) script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

For more information, see the API reference.

**Define an on-cancel script**
Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The sys_id of the workflow context is available in this script using the context_sys_id variable.

To define this script:

1. Navigate to Workflow Workflow Versions.
2. Select a workflow version that you have checked out.
   Workflow versions that are not checked out are not editable.
3. Edit the On-cancel script field.
   You may need to configure the form to add this field.
4. Click Update.

This example script adds a comment to a Requested Item [sc_req_item] record indicating the workflow for that request has been canceled.

```javascript
var grContext = new GlideRecord("wf_context");
grContext.get(context_sys_id);
var grReq = new GlideRecord("sc_req_item");
```
Scheduling a workflow

In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as Create Task or Catalog Task are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow Scheduled Workflows and click New. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Daily: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>• Weekly: On a particular day of the week.</td>
</tr>
<tr>
<td></td>
<td>• Monthly: On a particular day of the month</td>
</tr>
<tr>
<td></td>
<td>• Periodically: After every set duration.</td>
</tr>
<tr>
<td></td>
<td>• Once: At one specific date and time.</td>
</tr>
<tr>
<td>Time</td>
<td>For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.</td>
</tr>
<tr>
<td>Day</td>
<td>For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>For periodical workflows, the interval between workflows, beginning from the Starting date and time.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Starting</td>
<td>For periodical workflows, the first date and time to run the workflow. For scheduled workflows run once, the date and time to run the workflow.</td>
</tr>
</tbody>
</table>

**Workflow movement with update sets**

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow [wf_workflow] record and only retain the latest version with the update type of Workflow.

For information about update sets, see Update sets.

**Workflow update set migration use case - simple**

Create a new workflow with no dependencies and then migrate the workflow in an update set.

1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.
   
   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

**Workflow update set migration use case - subflow dependency (success)**

Successfully edit and migrate an existing workflow and its dependent subflow.

1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   
   Assume that Workflow B was previously published and migrated to the production instance.
4. User A publishes Workflow A.
   
   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.
Workflow update set migration use case - subflow dependency (failure)

Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published, but has not been migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.
5. User A completes Update Set C and migrates it to the production instance.
6. Update Set C commits with warnings.
7. Workflow A is invoked on the production instance with the following results:
   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.
   To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies on page 2684.

Workflow update set migration use case - subflow dependency (risk)

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a User ID.
   Note: Assume that Workflow B was previously published and migrated to the production instance.
4. User A uses the return value of Workflow B to generate approvals.
5. User B selects Update Set D.
6. User B checks out Workflow B (the subflow in Workflow A).
7. User B modifies the return value of the workflow by changing it from a User ID to a String Message.
8. User A publishes Workflow A.
9. User A cancels publishing and validates Workflow A.

10. User A is warned that Workflow B was modified by a user in a different update set.

11. User A ignores this warning and publishes Workflow A.

Note: A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

12. User A completes Update Set C and migrates it to the production instance.

13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.

14. User B publishes Workflow B.

Note: User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See ValidateUpdateSetDependencies on page 2684 to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.

Note: A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.

17. Update Set D commits without warnings.

18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

Input variable movement

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables [var_dictionary] table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

Input variable movement use case - two input variables

An existing workflow already contains two input variables.

1. User A checks out the workflow.

2. User A adds two input variables.

   ServiceNow adds to the current update set one customer update record for each new variable.
The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.

3. User A publishes the workflow.

There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.

4. Verify variables included in a specific workflow.

5. User A completes the update set.

6. Adding Input Variables - Success

User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.

- The two existing input variables are already present because of the earlier version.
- The system adds the two new input variables when the user commits the update set.
- The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
- The new published workflow version uses all four variables.
- The user tests the new workflow version and it runs as expected.

Verify variables included in a specific workflow

Follow the steps in this page to verify the variables that are included in a specific workflow.

1. Navigate to System Update Sets Local Update Sets.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the XML Payload.
5. Search for the name of one of the columns or search for var_dictionary.

There is one var_dictionary entry for each input variable.

Input variable removal

Deleting workflow input variables, like insert and update actions, creates a customer update record in a user's current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

Input variable removal risk

An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.
   The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.
4. User A continues working on other features in Update Set A that need to be moved to production.
5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.

   The update set entry that deletes the workflow input variable now applies to the production instance.
   The prior version of the workflow is running on this instance and still references the missing variable.

   **Input variable removal solution**
   When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

   If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see *Update sets*.

   **Note:** If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

   **Input variable removal prevention**
   Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

   This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See *ValidateUpdateSetDependencies* on page 2684 for more details.

   **Avoiding duplicate workflows**
   Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

   The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

   **Commit a workflow in an update set**
   Follow the steps in this page to commit a workflow in an update set.

   1. Workflow A - Version 1 is created and published in Update Set A.
   2. Update Set A is completed and migrated to a local instance.
   3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.

      In the first migration, there are no prior versions.

   4. Workflow A - Version 1 becomes the only published version of the workflow.

   **Update set migration example**
   It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

   Consider this example:

   1. Workflow A - Version 1 is migrated and committed to the production instance.
   2. Update Set B is created.
   3. Update Set C is created.
   4. Workflow A - Version 2 is published in Update Set B.
      
      A customer update record is added to Update Set B with the Version 2 payload.
      
      A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.

6. Workflow A - Version 3 is published in Update Set C.
   A customer update record is added to Update Set C with the Version 3 payload.
   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.

7. Update Set C is completed.

8. Update Set C is migrated and committed to the production instance.
   Workflow A - Version 1 is set to unpublished.
   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.
   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

**Update set migration risk**

Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.

3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.
   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

**Workflow timelines**

The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline’s perspective for a more granular view of the data.

---

**Note:** Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

---

**Use a timeline**

By default, the timeline displays all activities and transitions requested when first opened.

Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

1. Navigate to Workflow Live Workflows Active Contexts.

2. Select a context.

3. In Related Links, click Show Timeline to display the timeline for the entire context.
   The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.
4. Use the Range Selectors at the top of the timeline to change the perspective.

![Range Selectors](image)

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max.

5. Use the starting and ending calendar fields to select the timeline perspective.

These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.
1. Move the slider from right to left to view all the spans on a long timeline.

2. Adjust the end points of the slider to make arbitrary changes to the magnification.

   A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.

   Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity.

   This action highlights the activity in the activity pane.
9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.

10. Double-click a span to display a history record for that activity.

   History records shows information such as the State and the starting and ending times.
Timeline for a selected activity

You can display a partial workflow timeline.

1. Navigate to Workflow Live Workflows Active Contexts.
2. Open a Workflow Context record.
3. On the Workflow Activity History related list, select one or more individual activities.
4. Click Show Timeline from the action menu.
   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.
5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow's context with the parent workflow context.
   1. Navigate to Workflow Live Workflows History.
   2. Select individual history items from the list.
   3. Select the Show Timeline option from the actions menu.

   History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is Multiple Contexts. The timeline draws only the activities and relationships of the history items selected.

**View subflows in a workflow timeline**

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.
Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
Available error information

This table shows which activities support error exits.

Table 1167: Available error information

<table>
<thead>
<tr>
<th>Activity</th>

</tr>
</tbody>
</table>

Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.

![Switch]

Check assignment group

Always

Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the State and Result of the activity and provides a brief Fault Description (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling on page 2721 for the information available to each activity.
**Execution order**

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

To view the order in which a workflow activity was executed:

1. Navigate to Workflow Live Workflows Active Contexts or All Contexts.
2. Open the context you want to examine.
3. Click Show Workflow.
4. Hover the cursor over a finished or executing activity.

   A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.
**Figure 736: Activity execution order**

**Workflow log**

View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to Workflow Administration Properties and enable the Log workflow debug messages property.
In this example, an SSH activity named File Read specifies an invalid MID Server.

Figure 737: Error handling log

If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the Workflow Log related list. The message displays the target IP address and the credential details.
Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select Add condition from the context menu.
4. Add a condition exit with the following values:
   - Name: Error
   - Condition: activity.state=='faulted'
5. Click Submit.
The Error exit appears on the activity.

6. Connect the Error exit to another activity for handling the error state, such as Notification or Log Message.

Reconfigure an approval condition

Approval activities react differently to script errors than the other activities.

Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as Skipped, which can appear to be an Approved state. To prevent this from happening, reconfigure the Approved exit as follows:

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the Approved exit.
3. Add the following script to the Condition field:
   ```javascript
   && activity.state != 'faulted'
   ```
   This prevents the activity from continuing down the normal path in an error state and ensures that Skipped or Approved is the desired state.
4. Click Update.

Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.
Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.

For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

To collect run time metrics for a workflow:

1. Navigate to Workflow Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Estimated Runtime tab.
5. To enable the collection of run time metrics, check that the Requires ERT option is selected.
6. Open a configuration from the Estimated Run Time column.
7. In Estimated Run Time, enter an initial estimate for the workflow's run time.
   The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the Outlier Percentage Threshold for ERT field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   The system uses a default value of 20.
9. Click Update.

Outlying workflow run times

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the Estimated Run Time and Outlier Percentage Threshold for ERT values in the workflow properties. These values are used in the following formulas.

Table 1168: Formulas for computing workflow outlier ranges

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td>Estimated Run Time * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100) = 10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td>(Estimated Run Time - Outlier Value) to (Estimated Run Time + Outlier Value)</td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

Workflow estimated run time updates

When a workflow runs within the outlier range, its estimated run time is automatically updated.

The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a GlideDateTime.
For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10 seconds</td>
<td>10 seconds</td>
<td>10 seconds</td>
</tr>
<tr>
<td>2</td>
<td>12 seconds</td>
<td>11 seconds</td>
<td>11 seconds</td>
</tr>
<tr>
<td>3</td>
<td>9 seconds</td>
<td>10.333 seconds</td>
<td>10 seconds</td>
</tr>
</tbody>
</table>

**Note:** Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

**Troubleshoot workflows**

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

**Execution path troubleshooting in timelines**

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.
Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state. Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

1. Run the workflow.
2. Navigate to Workflow All Contexts.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the Workflow Activity History related list.
5. Right-click an activity and select Workflow Debug Toggle Execution Path Highlighting from the context menu.

All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.
6. Right-click a rollback activity and select **Workflow Debug Toggle Rollback Highlighting** from the context menu.

The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

**Note:** The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.

You can clear individual rollback paths or all rollback highlighting.

Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Role required: workflow_admin

The different levels of access are:

- View: View the dashboard and refresh report widgets.
- Customize: Refresh, add, delete, and rearrange widgets.

On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

The default reports on the dashboard include:

- Workflow contexts providing run time metrics
- Active workflows started during a specified time period
- Workflows run between yesterday and today
• Workflows by state for the current month
• Aged workflow contexts for the past month

2.

To find and add more widgets, click the Add Content icon ( ) in the upper left corner of the dashboard.

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

Workflow gauges

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

Table 1169: Workflow gauges

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERT Dashboard Controls</td>
<td></td>
</tr>
<tr>
<td>Outlier Finished Workflows for ERT (Percentage Outlier)</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>Outlier Long Running Workflows for ERT (Percentage Outlier)</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td>Workflow Dashboard</td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>
</tr>
<tr>
<td>Gauges Workflow Context</td>
<td></td>
</tr>
<tr>
<td>Number of Active Workflows Started Hourly Over Time (Yesterday)</td>
<td>Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).</td>
</tr>
<tr>
<td>Outlier Finished Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Context</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
</tbody>
</table>
## Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing [wf_workflow_timing] table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

## Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

### Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Role required: admin

Add a system property with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

## Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see Workflow activities reference on page 2735.

### Core activities provided in the base system

- Approval and rollback workflow activities on page 2739
Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Activity designer components.

Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read Approval and rollback workflow activities.

Table 1170: Approval and rollback activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Action workflow activity</td>
<td>The Approval Action activity performs an approval action on the current task.</td>
</tr>
<tr>
<td>Approval Coordinator workflow activity</td>
<td>The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.</td>
</tr>
<tr>
<td>Approval - Group workflow activity</td>
<td>The Approval - Group activity creates approval records for each member of a specified group.</td>
</tr>
</tbody>
</table>
### Activity

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Approval - User workflow activity</strong> on page 2750</td>
<td>The Approval - User activity creates one or more individual user approvals.</td>
</tr>
<tr>
<td><strong>Generate workflow activity</strong> on page 2755</td>
<td>The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path.</td>
</tr>
<tr>
<td><strong>Manual Approvals workflow activity</strong> on page 2758</td>
<td>The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process.</td>
</tr>
<tr>
<td><strong>Rollback To workflow activity</strong> on page 2760</td>
<td>The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.</td>
</tr>
</tbody>
</table>

### Condition activities

Condition activities provide conditional branching and logical operation functionality for workflows.

#### Table 1171: Condition activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>If workflow activity</strong> on page 2764</td>
<td>The If activity checks a condition or script to determine if a Yes or No transition should be taken.</td>
</tr>
<tr>
<td><strong>Switch workflow activity</strong> on page 2765</td>
<td>The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.</td>
</tr>
<tr>
<td><strong>Wait for condition workflow activity</strong> on page 2769</td>
<td>The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.</td>
</tr>
<tr>
<td><strong>Wait for WF Event workflow activity</strong> on page 2770</td>
<td>The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.</td>
</tr>
</tbody>
</table>

### Notify activities

Notify activities manage calls and SMS messages in Notify.

#### Table 1172: Notify activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Forward call workflow activity</strong> on page 414</td>
<td>The Forward Call activity forwards a Notify call to an E.164-compliant phone number.</td>
</tr>
<tr>
<td><strong>Input workflow activity</strong> on page 415</td>
<td>The Input activity creates a phone menu by presenting a list of options on a Notify call.</td>
</tr>
<tr>
<td><strong>Hangup workflow activity</strong> on page 417</td>
<td>The Hangup activity disconnects an active Notify phone call.</td>
</tr>
</tbody>
</table>
### Activity

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Play workflow activity</strong> on page 417</td>
<td>The Play activity plays a sound file on a Notify call.</td>
</tr>
<tr>
<td><strong>Record workflow activity</strong> on page 418</td>
<td>The Record workflow activity records audio from a user on a Notify call.</td>
</tr>
<tr>
<td><strong>Reject workflow</strong> on page 419</td>
<td>The Reject workflow activity rejects an incoming Notify call.</td>
</tr>
<tr>
<td><strong>Say workflow activity</strong> on page 419</td>
<td>The say workflow activity allows you to play a message, using text to speech, on a Notify call.</td>
</tr>
<tr>
<td><strong>Forward to notify client workflow activity</strong> on page 419</td>
<td>The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
<tr>
<td><strong>Call workflow activity</strong> on page 413</td>
<td>The Call activity makes outbound phone calls using a Notify workflow.</td>
</tr>
<tr>
<td><strong>Join conference call workflow activity</strong> on page 411</td>
<td>The Join Conference Call connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td><strong>Send SMS workflow activity</strong> on page 413</td>
<td>The send SMS workflow activity to send short text messages using Notify to users' phones.</td>
</tr>
<tr>
<td><strong>Queue workflow activity</strong> on page 420</td>
<td>The Queue activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

### Notification activities

Notification workflow activities notify users of events that occur during the workflow.

Table 1173: Notification activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Create Event workflow activity</strong> on page 2780</td>
<td>The Create Event activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td><strong>Notification workflow activity</strong> on page 2781</td>
<td>The Notification activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>

### Timer activities

Timer activities pause workflows for set periods of time.

Table 1174: Timer activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SLA Percentage Timer workflow activity</strong> on page 2782</td>
<td>The SLA Percentage Timer activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Timer workflow activity on page 2783</strong></td>
<td>The Timer activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>

### Task activities

Task activities create and modify workflow tasks.

**Table 1175: Task activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add Worknote workflow activity on page 2788</strong></td>
<td>The Add Worknote activity adds text to the Worknotes field of the current incident record.</td>
</tr>
<tr>
<td><strong>Attachment Note workflow activity on page 2788</strong></td>
<td>The Attachment Note activity adds an attachment to the current record.</td>
</tr>
<tr>
<td><strong>Catalog Task workflow activity on page 2789</strong></td>
<td>The Catalog Task activity creates a service catalog task record.</td>
</tr>
<tr>
<td><strong>Create Task workflow activity on page 2793</strong></td>
<td>The Create Task activity generates a record on any of the tables that extend Task [task].</td>
</tr>
</tbody>
</table>

### Utility activities

Utility activities provide controls over the path of the workflow, and other useful tools.

**Table 1176: Utility activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Branch workflow activity on page 2797</strong></td>
<td>The Branch activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td><strong>Join workflow activity on page 2797</strong></td>
<td>The Join activity unites multiple execution paths into one transition.</td>
</tr>
<tr>
<td><strong>Lock workflow activity on page 2798</strong></td>
<td>The Lock activity prevents other instances of this workflow from continuing past this activity until the lock is released.</td>
</tr>
<tr>
<td><strong>Log Message workflow activity on page 2801</strong></td>
<td>The Log Message activity writes a message to the workflow log.</td>
</tr>
<tr>
<td><strong>Log Trace workflow Message on page 2801</strong></td>
<td>The Log Trace Message activity writes a trace message to the workflow log.</td>
</tr>
<tr>
<td><strong>REST Message workflow activity on page 2801</strong></td>
<td>The REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.</td>
</tr>
<tr>
<td><strong>Return Value workflow activity on page 2803</strong></td>
<td>The Return Value activity returns a value to a parent workflow, when run from a subflow.</td>
</tr>
</tbody>
</table>
### Activity Description

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Script workflow activity on page 2803</td>
<td>The Run Script activity runs the specified script in the scope of the workflow version.</td>
</tr>
<tr>
<td>Set Values workflow activity on page 2803</td>
<td>The Set Values activity sets values on the current record.</td>
</tr>
<tr>
<td>Turnstile workflow activity on page 2804</td>
<td>The Turnstile activity limits how many times a workflow can pass through the same point.</td>
</tr>
<tr>
<td>Unlock workflow activity on page 2805</td>
<td>The Unlock activity releases a lock that was previously placed by the Lock activity.</td>
</tr>
</tbody>
</table>

### Subflow activities

Subflow activities run and manage workflows from a parent workflow.

**Table 1177: Subflow activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher workflow activity on page 2806</td>
<td>The Parallel Flow Launcher activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>

### Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

### Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer.

### Approval and rollback workflow activities

Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the Approval - User and Approval Action activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear
greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read Approval workflow activities and approval engines on page 2823.

**Approval Action workflow activity**
The Approval Action activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.

**Note:** When an Approval Action activity is used to mark a task approved, the activity marks all pending approvals as No Longer Required. This activity behaves differently from Set Values or Run Script when used to set the Approval field's value.

**Results**

The result value of the activity is the final approval disposition selected by the approver. The result value can be Approved or Rejected. A workflow designer can assign a result value using the activity.result variable from within a script field of the activity.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1178: Approval Action activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Mark task approved</td>
</tr>
<tr>
<td></td>
<td>• Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>• Mark task requested</td>
</tr>
<tr>
<td></td>
<td>• Disregard pending approvals: the system sets approval records to no longer required and marks the activity as approved.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition runs after this activity.

**Table 1179: Approval Action activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to move to the next workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>
States
The activity state tells the workflow engine what to do with the activity.

Table 1180: Approval Action activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Approval Coordinator workflow activity
The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.

Note: This activity is only available when the workflow runs on a table that extends Task.

To create an Approval Coordinator activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click Submit.

After you click Submit, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the Approval Coordinator activity completes, all pending approvals that were created by any of the Approval Coordinator approval activities are immediately set to No Longer Required. If a single user is called as an approver twice by the same workflow, such as when a single user is both a product approver and an executive approver, any approvals for that user after the first are skipped.

Results
The result value of the Approval Coordinator activity depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables
Input variables determine the initial behavior of the activity.
## Table 1181: Approval Coordinator activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Any child activity to be approved: Any child activity (User, Group, or Manual Approval) that completes with a result of approved causes the Approval Coordinator activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• All child activities to be approved: All child activities of the Approval Coordinator activity must complete with a result of approved to cause the Approval Coordinator activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• The first approval or rejection from any child activity: The first child activity that completes with a result of approved or rejected causes the Approval Coordinator activity to complete with the same result.</td>
</tr>
<tr>
<td></td>
<td>• Condition based on script: Call a script to determine how to manage an approval or rejection.</td>
</tr>
<tr>
<td>When a rejection occurs</td>
<td>Only appears if Wait for is set to All child activities to be approved or Any child activity to be approved. Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the Approval Coordinator activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• Wait for other responses before deciding: Wait until we get other responses from other child activities before making an approval or rejection decision. This allows users to change their minds until a decision is made.</td>
</tr>
<tr>
<td></td>
<td>In addition, if Wait for is set to Any child activity to approve then a single child activity completion with a result of approved will cause the Approval Coordinator activity to complete with a result of approved even if other child activities have completed with a result of rejected.</td>
</tr>
</tbody>
</table>
### Conditions

The conditions determine which transition runs after this activity.

**Table 1182: Approval Coordinator activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Table 1183: Approval Coordinator activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - Group workflow activity**

The Approval - Group activity creates approval records for each member of a specified group.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the Wait For field.

**Results**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1184: Approval - Group activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Group When</td>
<td>Specify when this activity generates a group approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the group approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - Group Approvers</td>
<td>Specify the groups whose approval will be requested.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Groups</td>
<td>The groups whose approval will be requested. To edit this field, click the lock icon. To select specific groups by name, use the lookup list. To select groups from field values on the current record at runtime, click the tree icon. Each member of the group will be assigned an individual approval record. If no group is selected, the activity automatically sets the approval to Approved.</td>
</tr>
</tbody>
</table>

**Approval - Group Condition**

Specify how the activity decides to approve or reject the group approval, based on the responses from individual members of the group.

<table>
<thead>
<tr>
<th>Wait for</th>
<th>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity's approval. Options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• An approval from each group: Any user from each group can approve and the first approval from each group causes the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• An approval from any group: Any user from any group can approve and the first approval from any group causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• An approval from everyone from all groups: All users from all groups must approve to cause the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• First response from each group: The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
</tr>
</tbody>
</table>

Indicate what happens when any user rejects their approval request. Options are:

• Reject the approval: Immediately complete the activity with a result of rejected.
• First response from any group: The first approval or rejection from any user in any group causes the activity to complete with a result of approved or rejected.
• Condition based on script: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.

</tbody>
</table>

Approval - Advanced
If desired, write a script for determining additional users to request approvals from.
### Conditions

The following conditions determine which transition runs after this activity.

**Table 1185: Approval - Group activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Table 1186: Approval - Group activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
</tbody>
</table>

---

Field | Description
--- | ---
Advanced | Select this check box to write a script for determining additional users to request approvals from. Use the Additional groups script to customize group approvals.

Additional groups script

If the Advanced check box is selected, this script is called to determine any additional group approvals to be created. The script needs to set the variable `answer` to a comma-separated list of group ids or an array of group ids to add as approver groups. For example:

```javascript
answer = [];
answer.push('id1');
answer.push('id2');
```
<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - User workflow activity**

The Approval - User activity creates one or more individual user approvals.

**Results**

The result value is the final approval disposition. This disposition depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

**Table 1187: Approval - User activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User When</td>
<td>Specify when this activity generates a user approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - User Approvers</td>
<td>Specify the users whose approval will be requested.</td>
</tr>
<tr>
<td>Users</td>
<td>The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as ${assigned_to}. If no user is selected, the activity automatically sets the approval to Approved.</td>
</tr>
</tbody>
</table>

**Note:** Workflow only manages approval records generated by the Approval User activity. After starting the workflow, newly added approvals do not affect the workflow context.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Groups</td>
<td>Groups whose members should also receive approvals. Note that this is different than the Approval - Group activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as ${assignment_group}.</td>
</tr>
<tr>
<td>Approval - User Condition</td>
<td>Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers.</td>
</tr>
<tr>
<td>WAIT FOR</td>
<td>A choice between different approval logics to determine which individual approvals result in approval of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Anyone to approve: Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• Everyone to approve: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• First response from anyone: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td></td>
<td>• Condition based on script: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
</tbody>
</table>

**Note:** Note that if **Wait for** is set to **Anyone to approve** then a single approval will cause the activity to complete with a result of approved even if one or more users reject.

<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Generate workflow activity**

The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path.

---

**Note:** This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The Generate activity follows all transitions through the workflow to each activity. For each activity:

- If it is a **task activity**, creates the task and sets:
  - The State to Pending
  - The Expected Start Date
  - The Due Date

- If it is an approval activity, creates the approvals and sets:
  - The approval State to Not Requested
• The Expected Start Date
• The Due Date

Expected start dates and due dates are calculated based on the Expected Duration of all of the tasks and approvals between the Generate activity and the activity being updated. In the case of a branched path (between a Branch and Join activity), the longer duration will be used for any post-branch activities. The Generate activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the Generate activity, select the Skip during generate check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the Skip during generate check box selected:
• Rejected (for any of the approval activities)
• No condition of If activity
• Continue condition of Turnstile activity
• Incomplete condition of Join activity

Input variables

Input variables determine the initial behavior of the activity.

Table 1190: Generate activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the Generate activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
<tr>
<td>Generate tasks</td>
<td>If selected, tasks are created when running the Generate activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1191: Generate activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

**Example**

![Generate workflow diagram](image)

**Figure 740: Generate workflow**

In this example, the following approvals are generated:

- Approval-2
- Approval-3

Approval-4 is skipped since the Rejected condition of Approval-3 has Skip during generate selected.

Here is an example of using the Generate activity that describes the expected start and due dates:
Figure 741: Generate workflow start and due date

In this example, if the Generate activity is run on Jan 1, 2016, the following expected start dates and due dates would be set for the generated tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
<td>Jan. 3, 2016</td>
</tr>
<tr>
<td>Task 4 (1 day)</td>
<td>Jan. 3, 2016</td>
<td>Task 3 is 2 days</td>
<td>Jan. 4, 2016</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Task 4 ends the latest before the Join</td>
<td>Jan. 5, 2016</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the Join is Task 3/Task 4.

**Manual Approvals workflow activity**

The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of approved. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow. The workflow waits for the approval to be closed before proceeding.

**Results**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
- Rejected
Input variables

Input variables determine the initial behavior of the activity.

Table 1192: Manual Approvals activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Any manual user or group approval: Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• All manual user or group approvals: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• The first response from any manual approval: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
<tr>
<td></td>
<td>In addition, if Wait for is set to Anyone to approve then a single approval will cause the activity to complete with a result of approved even if one or more users reject.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.
Table 1193: Manual Approvals activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1194: Manual Approvals activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>

<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Rollback To workflow activity

The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

Rollback To determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. Rollback To then marks all the approvals that have transitioned between the rollback and the transitioned to activity as Not Yet Requested and the tasks as either Open or Pending.

Use the Rollback To activity for all workflows in which multiple rollbacks are required. Rollback To has no variables.

Conditions

The conditions determine which transition runs after this activity.
Table 1195: Rollback To activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1196: Rollback To activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Rollback To behavior

The Rollback To activity transitions directly to the activity specified by the transition line arrow.

Use the Rollback To activity for all workflows that use multiple or nested rollbacks. Rollback To resets the targeted task (the direct transition) to Open. All tasks that have executed between the Rollback To activity and the targeted task (rolled back task) are set to Pending.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
Figure 742: Rollback to workflow

Transition history

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:
(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested

Figure 743: Rollback To workflow transition

Rollback To activity
When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.
A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

Condition Workflow activities

Condition activities provide conditional branching and logical operation functionality for workflows.

*If workflow activity*

The If activity checks a condition or script to determine if a Yes or No transition should be taken.

If the workflow creator specifies both the Condition and the Advanced script, both must evaluate successfully for activity to take the Yes transition.

**Results**

The workflow designer can assign a result value using activity.result from within the Script field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- Yes
- No

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the Yes transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the Advanced check box. You may then enter a script that is evaluated. If your script sets the variable answer to yes, then the Yes transition is taken. Otherwise, the No transition is taken.</td>
</tr>
</tbody>
</table>

**Conditions**

The following conditions determine which transition comes after the activity.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the Advanced script, if specified, returns yes.</td>
</tr>
</tbody>
</table>
**Condition**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Taken when either the condition does not match or the Advanced script, if specified, returns no.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1199: If activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Switch workflow activity**

The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a Variable or Field to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the Condition field of the activity condition, the workflow progresses through that activity condition.

**Results**

The variable or field selected in the Variable or Field activity variable determines the possible result values.

**Input variables**

The following variables determine the behavior of the activity.

**Table 1200: Switch activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Variable or Field as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
Field or Field

<table>
<thead>
<tr>
<th>Field or Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable or Field</td>
<td>Select the source of the value compared against the switch activity conditions. The field label and available options depend on the Type selection. • Variable: select any service catalog variable. • Field: select any field from the Table defined in the workflow properties.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1201: Switch activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Example**

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.
Figure 744: Switch activity example

The Field selected is the incident Assigned to field.
If the value of the Assigned to field of the workflow-triggering incident is Service Desk or Field Services, the workflow populates values on the incident record before continuing. If the Assigned to value is Hardware, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see Manage workflow activity conditions on page 2820.
Figure 746: Hardware group condition

Wait for condition workflow activity
The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the Wait for condition activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see Timer workflow activities on page 2782.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.
Note: A Wait for condition activity should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as 'changed,' try inserting a one-second timer.

Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. The activity transitions when the result value is true.

Input variables

The following variables determine the behavior of the activity.

Table 1202: Wait for condition activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the answer variable to true.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1203: Wait for condition activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Wait for WF Event workflow activity

The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the workflow.fireEvent('eventName') API call.
Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. This activity transitions when the specified event fires.

Input variables

The following variables determine the behavior of the activity.

Table 1204: Wait For WF Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1205: Wait For WF Event activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Notify workflow activities

Notify activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the Table field value is Notify Call [notify_call].

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the current.is_human variable, such as with an If workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

Note: Do not add a Timer activity between multiple Notify activities that interact with active phone calls.
**Important**: When creating a Notify workflow, set the workflow If condition matches field to -- None --. Notify controls which workflow to run based on the configured number groups.

**Forward call workflow activity**

The Forward Call activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the forward call activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

**Table 1206: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The forward call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**

The Input activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Table 1207: Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
</tbody>
</table>
### Variable

<table>
<thead>
<tr>
<th>Advanced</th>
<th>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Script</strong></td>
<td>Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  1: {
    "say": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  2: {
    "say": "type 2 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as myCustomData in the example above.

### Conditions

The conditions determine the transition that comes after this activity.

The input activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition Name to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language `[notify_language]` table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition Condition value to `parseInt(workflow.scratchpad.digits) == <expected digits>`.

For example, to transition through a condition when the caller presses the number 3, set the Condition to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

### Scratchpad Entries

The activity uses the workflow scratchpad to write persistent values.
Table 1208: Values written to scratchpad

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
</tbody>
</table>
| workflow.scratchpad.menu<activity name> | The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using var previousActivity = "choices";
|                              | var choicesMenu = workflow.scratchpad.menu[previousActivity]; var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input. var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item. |

**Hangup workflow activity**

The Hangup activity disconnects an active Notify phone call.

You can use the hangup activity to disconnect only calls that have been answered. Use the reject activity to disconnect calls that have not been answered.

**Play workflow activity**

The Play activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

Table 1209: Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>
You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity
The Record workflow activity records audio from a user on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

Reject workflow
The Reject workflow activity rejects an incoming Notify call.

You can use the reject activity to disconnect only calls that have not yet been answered. Use the hang up activity to disconnect calls that have been answered.
Input variables

Input variables determine the initial behavior of the activity.

Table 1212: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity

The say workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables

Input variables determine the initial behavior of the activity.

Table 1213: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return {language: 'en-US', text: 'Text to read'}.</td>
</tr>
</tbody>
</table>

Forward to notify client workflow activity

The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.

Input variables

Input variables determine the initial behavior of the activity.

Table 1214: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
</tbody>
</table>
### Variable Description

**Script**
Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.

**Timeout (in seconds)**
Enter the amount of time to wait for the call to be connected before hanging up.

**Record**
Select this check box to record the call.

### Conditions

The conditions determine which transition comes after this activity. The Forward to Notify Client activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

*Call workflow activity*
The Call activity makes outbound phone calls using a Notify workflow.

### Input variables

Input variables determine the initial behavior of the activity.

**Table 1215: Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Notify Number</strong></td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td><strong>Phone number to call</strong></td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as {notify_number: 'sys_id', phone_number: '+316...'}</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The call activity does not specify any conditions by default.
You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

*Join conference call workflow activity*

The Join Conference Call connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Table 1216: Input variables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
</tr>
<tr>
<td>Advanced</td>
</tr>
<tr>
<td>Script</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

**Scratchpad entries**

The activity uses the workflow scratchpad to read persistent values.
Table 1217: Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the join conference call activity will log an error. When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Send SMS workflow activity
The send SMS workflow activity to send short text messages using Notify to users' phones.

Input variables
Input variables determine the initial behavior of the activity.

Table 1218: Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format <code>{notify_number: </code>...sys_id...`, users: [...], groups: [...], numbers: [...]}. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

*Queue workflow activity*

The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

**Workflow notification activities**

Notification workflow activities notify users of events that occur during the workflow.

*Create Event workflow activity*

The Create Event activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.
Results

Finished: the activity added the event to the event queue.

Input variables

Table 1219: Create Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>The first parameter of the event.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this parameter is a string value, it must be within quotes (&quot; &quot;).</td>
</tr>
<tr>
<td>Parameter 2</td>
<td>The second event parameter.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this parameter is a string value, it must be within quotes (&quot; &quot;).</td>
</tr>
</tbody>
</table>

Notification workflow activity

The Notification activity sends an email or SMS message to specified users or groups.

Input variables

Table 1220: Notification activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressees</td>
<td></td>
</tr>
<tr>
<td>To</td>
<td>The users who will be recipients of the email.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>The members of the groups that will be recipients of the email.</td>
</tr>
<tr>
<td>Advanced</td>
<td>If selected, the script in the To (script) field is called to specify additional recipients of the email.</td>
</tr>
<tr>
<td>To (script)</td>
<td>If Advanced is selected, this script is called and should set the variable answer to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.</td>
</tr>
<tr>
<td>Message</td>
<td></td>
</tr>
</tbody>
</table>
Field | Description
---|---
Subject | The subject line of the email.
Message | The email body that is sent. To include the value of a field in the message body, place the cursor at the point in the text where you want the field’s value inserted. Then click the + icon next to Fields and select the field you want.

States

The activity state tells the workflow engine what to do with the activity.

Table 1221: Notification activity states

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the run function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

Timer workflow activities

Timer activities pause workflows for set periods of time.

*SLA Percentage Timer workflow activity*

The SLA Percentage Timer activity pauses the workflow for a duration equal to a percentage of an SLA. A workflow must run on the Task SLA table to use this activity.

Results

Table 1222: SLA Percentage Timer activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.
Table 1223: SLA Percentage Timer activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>The duration to pause the workflow for, as a percentage of the current SLA</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

Table 1224: SLA Percentage Timer states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the SLA reaches the specified percentage. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Timer workflow activity**

The Timer activity pauses the workflow for a specified period of time.

This duration can be an absolute time value or a relative value based on a defined schedule. It is best to adjust the Duration so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see wait for condition.

**Results**

Table 1225: Timer activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration.</td>
</tr>
</tbody>
</table>
Input variables

Input variables determine the initial behavior of the activity.

Table 1226: Timer activity input variables

<tr>
<td>Script</td>
<td>The script that sets 'answer' to the number of seconds for the duration.</td>
</tr>
<tr>
<td>Appears only when Timer based on is Script</td>
<td></td>
</tr>
<tr>
<td>Timer Schedule</td>
<td>The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:</td>
</tr>
<tr>
<td>Schedule based on</td>
<td>• This workflow's schedule: The schedule uses workflow context date, time, and an optional Time zone based on value.</td>
</tr>
<tr>
<td>Appears only when Schedule based on is A specific schedule.</td>
<td>• A specific schedule: The schedule uses a pre-defined Schedule and an optional Time zone based on value.</td>
</tr>
<tr>
<td>Schedule field</td>
<td>• A schedule field: The schedule uses a value from a table and an optional Time zone based on value.</td>
</tr>
<tr>
<td>Appears only when Schedule based on is A schedule field.</td>
<td></td>
</tr>
<tr>
<td>Timer Time Zone</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Time zone based on | The time zone for calculating the duration. The time zone may be based on:
- No time zone: Default. Workflow uses the GMT time zone.
- A specific time zone: A predefined Time zone.
- A time zone field: A Time zone field to track time duration from a field on the form.

Time zone | The predefined time zone.
Appears only when Time zone based on is A specific time zone.

Time zone field | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.
Appears only when Time zone based on is A time zone field.

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1227: Timer activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The Timer activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Example**

You can use a Timer activity to pause the workflow until the end of the business day.
In this example, the script evaluates the time between the now variable and the eod variable. The eod variable is defined, in 24 hour time, as 4:00 PM. The script then sets the answer variable to the difference between these variables, in seconds, and logs a message.

```javascript
// get now and calc end of day (4:00pm)

var now = new Date();

var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);

answer = (eod.getTime() - now.getTime()) / 1000;

workflow.debug('Timer will fire @: ' + eod + ' (' + (answer / 60) + ') minutes from now');
```

Figure 747: Timer example
Task workflow activities

Task activities create and modify workflow tasks. Task activities are only available when the workflow runs on a table that extends Task.

*Add Worknote workflow activity*

The Add Worknote activity adds text to the Worknotes field of the current incident record. A workflow must run on the Incident table to use this activity.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

*Attachment Note workflow activity*

The Attachment Note activity adds an attachment to the current record.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the [code] tag. Entries in a journal field that use irregular HTML do not work if the glide.ui.allow_deep_html_validation property is true. This property is set to false by default.

**Results**

- Finished: the activity added the attachment to the record.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>When this activity runs, it makes a note on the current record that a file has been attached. Specify the field on the current record in which you want this note to appear. The options are:</td>
</tr>
<tr>
<td></td>
<td>• none (defaults to Work Notes)</td>
</tr>
<tr>
<td></td>
<td>• Additional Comments</td>
</tr>
<tr>
<td></td>
<td>• Work notes</td>
</tr>
</tbody>
</table>

Attachment note information
### Catalog Task workflow activity

The Catalog Task activity creates a service catalog task record.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item [sc_req_item] table.

### Results

You can assign a result value using activity.result from within a script field of the activity. The final State value of the catalog task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

### Input fields

The values you enter in the following fields determine the behavior of the activity.

#### Table 1230: Catalog task activity information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog Task Activity Settings</td>
<td>The following fields specify the behavior of the Catalog Task Activity.</td>
</tr>
<tr>
<td>Task Table</td>
<td>The table on which this activity runs. In most cases, leave set to the default value: [sc_req_item].</td>
</tr>
<tr>
<td>Priority</td>
<td>The value you want assigned to the Priority field for the new task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
<tr>
<td>Catalog Task Record Settings</td>
<td>The following fields specify the field values that this activity sets for the catalog task it creates.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Task value from       | Specify how you want to populate fields on the new task.  
|                       | • Fields: a predefined set of fields including Fulfillment group, Assigned to, Short description and Instructions.  
|                       | • Template: an existing template for the selected task table.  
|                       | • Values: values that you specify using a Set Values widget.  
<p>|                       | After you select a value for Task value from, additional fields specific to that value appear on the form.                                                                                                   |
| Fulfillment group     | The group that is responsible for completing the task. Populates the Assignment group field on the new task.                                                                                              |
| Only appears when Task value from is set to Fields |                                                                                                                                           |
| Assigned to           | The user who is responsible for completing the task. Populates the Assignment to field on the new task.                                                                                                  |
| Only appears when Task value from is set to Fields |                                                                                                                                           |
| Short description     | A short description for the task. Populates the Short description field on the new task.                                                                                                               |
| Only appears when Task value from is set to Fields |                                                                                                                                           |
| Instructions          | The task instructions for the user to complete prior to closing the task. Populates the Description field on the new task.                                                                              |
| Only appears when Task value from is set to Fields |                                                                                                                                           |
| Template              | The values in the task will be populated from the values in the template you select.                                                                                                                       |
| Only appears when Task value from is set to Template |                                                                                                                                           |
| SetValues             | Select any field on the task record to a value you specify here.                                                                                                                                        |
| Only appears when Task value from is set to Values |                                                                                                                                           |
| Advanced              | Check Advanced if you want to use a script to assign values on the catalog task. When you check Advanced, a text box appears where you can enter your script.                                                  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Script</td>

</table>
| Schedule based on         | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  • This workflow's schedule: The schedule uses workflow context date, time, and an optional Time zone based on value.  
  • A specific schedule: The schedule uses a pre-defined Schedule and an optional Time zone based on value.  
  • A schedule field: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule                  | The predefined Schedule from a list.                                                                                                                                                                           |
| Schedule field            | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.                                               |
| Time zone based on        | The time zone for calculating the duration. The time zone may be based on:  
  • No time zone: Default. Workflow uses the GMT time zone.  
  • A specific time zone: A specific Time zone that you choose from a choice list.  
  • A time zone field: A Time zone field to track time duration from a field on the form.                                                                 |
| Time zone                 | Select the time zone you want from the choice list.                                                                                                                                                          |
| Time zone field           | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.                                               |

**States**

The activity state tells the workflow engine what to do with the activity.
Table 1231: Catalog Task activity states

<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

*Create Task workflow activity*

The Create Task activity generates a record on any of the tables that extend Task [task].

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If the Wait for completion check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

**Results**

You can assign a result value using activity.result from within a script field of the activity. By default, the final State value of the task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

**Input variables**

The following variables determine the behavior of the activity.

Table 1232: Create Task activity input variables

<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Utility workflow activities

Utility activities provide controls over the path of the workflow, and other useful tools.

*Branch workflow activity*

The Branch activity splits the workflow into multiple transition paths from a single activity.

To add a transition path, drag the Branch activity onto the canvas. When the Branch activity properties form displays, click Submit to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click Add Condition.

All transitions from this activity execute concurrently. This activity provides a single Always condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.

Branching can affect the behavior of rollback activities. See *Rollback To activity* on page 2825 for more information.

*Join workflow activity*

The Join activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a Join activity, any subsequent activities execute twice.

To add Join to the canvas, click Submit. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

Results

Provide an Incomplete transition out of a Join whenever it is possible for any predecessor activities to follow a transition path that does not lead to the Join activity.

Table 1234: Join activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>Join exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the Join.</td>
</tr>
</tbody>
</table>
### Incomplete

Join exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the Join activity.

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incomplete</td>
<td>Join exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the Join activity.</td>
</tr>
</tbody>
</table>

**Lock workflow activity**

The Lock activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the Unlock activity. The lock may also be released when the Max duration is reached.

When an instance of the workflow reaches the Lock activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until Max attempts has been reached.

**Note:**

We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.
Since a Lock activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a Lock and Unlock activity block. This may cause the
Unlock activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:

- Approval activities
- Task activities
- Timer activities
- Wait for condition activity
- Wait for WF Event activity

## Results

### Table 1235: Lock activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock Max attempts times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

## Input variables

Input variables determine the initial behavior of the activity.

### Table 1236: Lock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>A unique mutex key. The Unlock activity activity uses this key to release the lock.</td>
</tr>
<tr>
<td>Duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the Unlock activity.</td>
</tr>
<tr>
<td>Max. duration</td>
<td>Specify how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state will be set to ‘timeout’ and the activity result will be set to ‘failed’.</td>
</tr>
<tr>
<td>Max. attempts</td>
<td>Specify the maximum number of times the activity may attempt to obtain the lock.</td>
</tr>
<tr>
<td>Delay between attempts</td>
<td>The amount of time required after a failed lock attempt before another lock attempt is allowed.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The workflow engine is waiting to obtain a lock.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully obtained the lock.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The activity could not obtain a lock within the number of attempts specified by the Max. attempts input variable.</td>
</tr>
</tbody>
</table>

*Log Message workflow activity*

The Log Message activity writes a message to the workflow log.

Use this activity to add entries to the workflow's log for debugging or tracing purposes.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.</td>
</tr>
</tbody>
</table>

*Log Trace workflow Message*

The Log Trace Message activity writes a trace message to the workflow log.

The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity on page 2801 activity.

*REST Message workflow activity*

The REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

The REST Message activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

**Note:** If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.
## Input variables

Table 1239: REST Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Message Name</td>
<td>Name of the REST message to run. This is a reference field to the REST Message [sys_rest_message] table (System Web Services Outbound REST Message).</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method [sys_rest_message_fn] table (System Web Services Outbound REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
<tr>
<td>Rest Message Variables</td>
<td>Values to use for variables defined in the HTTP Method record. Use the following format for the string: name1=value1, name2=value2, ... For example, use name=${nameValue}, id=${idValue} where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rest Message Script</td>
<td></td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable.</td>
</tr>
</tbody>
</table>

*Return Value workflow activity*

The Return Value activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see *Workflows used as subflows* on page 2617.

Use this activity within a subflow to store data that the parent flow can access. The Return Value activity adds the data from the subflow's value variable to the parent workflow's scratchpad.

**Scratchpad entries**

The activity uses the workflow scratchpad to read and write persistent values.

*Table 1240: Return Value activity scratchpad entries*

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow value variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a Map return value to variable that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

*Run Script workflow activity*

The Run Script activity runs the specified script in the scope of the workflow version.

**Note:** All changes to current are automatically updated. There is no need to call current.update()

**Input variables**

Input variables determine the initial behavior of the activity.

*Table 1241: Run Script activity input variables*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

*Set Values workflow activity*

The Set Values activity sets values on the current record.
Input Fields

The values you enter in the following fields determine the behavior of the activity.

Table 1242: Set Values Activity Input Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set these values</td>
<td>From the drop down box on the left, select the field on the current record whose value you want to set. In the user-input field to the right, select or enter the value to which you want that field set.</td>
</tr>
</tbody>
</table>

**Note:** Using the Set Values activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the Approval Action activity.

Turnstile workflow activity

The Turnstile activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the Rollback To workflow activity on page 2760 activity.

Results

You can assign a result value using the activity.result variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

Table 1243: Turnstile activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The Allowed iterations value is greater than the number of times the workflow accessed this activity.</td>
</tr>
<tr>
<td>Cancel</td>
<td>The workflow accessed this activity more times than the Allowed iterations value.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

Table 1244: Turnstile activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>
**Conditions**

The conditions determine which transition comes after this activity.

**Table 1245: Turnstile activity conditions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Table 1246: Turnstile activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is triggered.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Unlock workflow activity**

The Unlock activity releases a lock that was previously placed by the Lock activity.

To release a lock, specify the same lock key that was specified in the Lock activity. If the Lock activity had a Duration specified, and that duration has already passed, the lock will already be released.

**Input variables**

Input variables determine the initial behavior of the activity.
Table 1247: Unlock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a Lock activity. For more information, see Lock activity.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Table 1248: Unlock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished</td>
<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

Subflow activities in workflow

Subflow activities run and manage workflows from a parent workflow.

The Parallel Flow Launcher subflow activity is available.

Parallel Flow Launcher workflow activity

The Parallel Flow Launcher activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

**Note:** The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

**Note:** Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches of no more than 500 at a time.

Activity variables

Activity variables determine the initial behavior of the activity.

Table 1249: Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher configuration</td>
<td>A unique name for the activity.</td>

</tr>
<tr>
<td></td>
<td>for (var i = 0; i &lt; coordinator.getNumFlows(); i++)</td>
</tr>
<tr>
<td></td>
<td>writeFlowResultsToTable( i, coordinator.getFlow(i) );</td>
</tr>
</tbody>
</table>
### Field Description

**Finished script**

The script that runs after all subflows launched by the activity are complete. You can use variables that contain completed flow information in this script.

The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the `getFlow(index)` method. For example:

```javascript
for (var i = 0; i < coordinator.getNumFlows(); i++)
    writeFlowResultsToTable(i, coordinator.getFlow(i));
```

This field is available when Process finished is selected.

### States

The activity state tells the workflow engine what to do with the activity. To view an activity's state, point to the activity. A pop-up window shows the State and Result of the activity. If the activity is in an error state, the pop-up window provides a brief Fault Description.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>

### WorkflowCoordinator object

A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

When using a WorkflowCoordinator object, you can create a Parallel Flow Launcher activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the Advanced activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the `save(variableName)` function on the WorkflowCoordinator object. You can reference the object using the value passed in the `variableName` parameter. For example, you can create a WorkflowCoordinator object in a Run Script activity, save the object using `<object>.save('coord')`, and then call this object by entering `coord` in the Workflow activity variable of a subsequent Parallel Flow Launcher activity.
• Define the WorkflowCoordinator within the Workflow activity variable. Add the javascript: identifier at the beginning of the script. The Parallel Flow Launcher example on page 2810 shows how to use a WorkflowCoordinator object in this way.

• Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

Completed subflow values in scripts
The Parallel Flow Launcher activity exposes additional variables you can use in scripts.

Table 1251: Additional variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coordinator</td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the Finished script to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the WorkflowCoordinator.load('&lt;Activity&gt;') function. For example, to load the WorkflowCoordinator object from a Parallel Flow Launcher activity called Launch Subflows, enter var coord = WorkflowCoordinator.load('Launch Subflows'); in a later activity.</td>
</tr>
</tbody>
</table>
| flow | The subflow launched by the activity that completed most recently. You can use this variable in the Flow complete script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use var flow = coord.getFlow(I); where I is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:  
  • index: the numerical index of this subflow based on the order it was launched  
  • workflow: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow  
  • inputs: any input values provided to the launched subflow  
  • status: status of the subflow context  
  • output: the value returned by the subflow  
  • contextId: the sys_id of the workflow context for the subflow |

Parallel Flow Launcher example
This example shows how to use the Parallel Flow Launcher activity with an array of input values and with a WorkflowCoordinator object.
Sample workflow

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

![Parallel flow launcher business case](image)

Figure 749: Parallel flow launcher business case

Provision the application nodes

The first Parallel Flow Launcher activity launches the Provision Node subflow four times. The activity passes a unique IP address to each subflow from an array in the Inputs variable. The scripts defined in the Flow complete and Finished script variables write log messages regarding the status of the subflows.
Activity Properties: Parallel Flow Launcher

Name: Provision application nodes

Stage:

Inputs:
- [u_host: '192.168.0.10'],
- [u_host: '192.168.0.20'],
- [u_host: '192.168.0.30'],

Advanced:

Workflow: Provision Node

Count:

Max flows: 25

Max simultaneous: 5

Process flow complete:

Flow complete:

```javascript
// To access the flow that completed, use the 'flow' variable.
var flowOutput = flow.output;

workflow.debug("Provision Node Finished. Context: " + flow.contextId);
```

Process finished:

Finished script:

```javascript
// To access the set of completed workflows use the 'coordinator' variable.
var flowResult = coordinator.getFlow(1).output;

workflow.debug("All Nodes Provisioned");
```

Update
Add nodes to the load balancer

The second Parallel Flow Launcher activity uses WorkflowCoordinator objects to specify which subflows to run. The coordinator variable stores the completed flow information from the previous Provision Nodes activity. The script then retrieves the IP address and port for each node that was provisioned. The coord2 WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the coord2 WorkflowCoordinator object runs the SetupDNS subflow once to configure the load balancer.

```javascript
var coordinator = WorkflowCoordinator.load("Provision Nodes");
var coord2 = new WorkflowCoordinator(
    workflow: 'Add Node to Load Balancer'
);
for (var i = 0; i < coordinator.getNumFlows(); i++) {
    var ip = coordinator.getInput(i).ip;
    var port = coordinator.getOutput(i);
    coord2.add(
        ip: ip,
        port: port
    );
}
var loadBalancerIP = '10.0.20.10';
coord2.add( { ip: loadBalancerIP, hostname: 'www.snow1.net', 'SetupDNS'});
coord2;
```

Figure 751: Specifying which subflows to run

View workflow activity descriptions

Tooltips are available for workflow activities to help you understand how to use each activity.

1. To view an activity description in the workflow editor, point to the icon for the activity in the palette.
To modify activity descriptions, navigate to Workflow Administration Activity Definitions and edit the Description field.

Note: To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the Activity Properties window.

Elements in workflow activity definitions

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See Workflow activities on page 2734 for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.
Table 1252: Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible activity.results value. The activity result usually determines which condition the activity transitions through.</td>
</tr>

<td>Determines which transition the activity follows after completing. See Manage workflow activity conditions on page 2820 for more information.</td>
</tr>
<tr>
<td>States</td>
<td>Determines how the workflow handles the record being executed.</td>
</tr>
</tbody>
</table>

Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
3. Create any additional conditions needed for the activity and ensure that all exits are connected.

4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

**Note:** All activity descriptions have a Table value. If this value is Global, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.
Duplicate a workflow activity

You can duplicate an activity used in a workflow, including all the configured properties.

1. Right-click the activity and select Copy Activity from the context menu.
   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add transitions.
Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity. All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

Note:

Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.
3. To remove a transition, click to highlight it, and then press Delete.

Custom activity transitions

Controls on the Approval - User activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of Approved or Rejected.

Transitions defined using this method do not become a permanent feature of the Approval - User activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

Manage workflow activity conditions

Activities contain default conditions that determine which transitions are followed.

For example, the Approval - User activity has two conditions, Approved and Rejected.

Figure 754: Example of activity conditions
You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

1. Right-click the activity and select Add Condition from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>• current: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>• activity.result: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>• activity: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks.</td>
</tr>
<tr>
<td></td>
<td>• activity.vars: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the Generate activity does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click Submit.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select Reorder Conditions.

A dialog box appears, with a list of the available conditions.
Drag the conditions to a new position in the list.
6. Click OK.

Activity result value

The result value specified by an activity controls the condition through which the activity transitions. Use the result value as part of the Condition field in the activity. For example, if the Condition field of an Approval - User activity contains activity.result == 'rejected', the activity transitions through that condition when a rejection is received from the approver. Result values are set in the Script field of the activity definition.

Edit the workflow activity properties form

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.
1. Navigate to Workflow > Administration > Activity Definitions.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the Edit Variables Layout related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables. The activity variables appear as separate items that you can rearrange on the form.

For more details on using the form design interface, see Using the form designer.
Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activites are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals on page 2016.

![Figure 756: Unavailable approval activities](image)

To turn approval engines off for the table, navigate to the System Properties > Approval Engines and change the setting for the table to Turn engines off.
## Figure 757: Turn off approval engines

**Correct a skipped workflow approval activity**

While a workflow is in an active context, an approval activity can skip to the next activity.
An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a dot-walked field, such as current.opened_by.department.manager, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

1. Navigate to Workflow Live Workflows All Contexts.
2. Click the date and time in the Started column for the workflow that is incorrectly processing approval activities.
3. In Related Links, click Show Workflow.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see Debugging business rules.
   - Point to each processed approval activity to find activities where the State is Finished and Result is Skipped.
5. Navigate to Workflow Workflow Editor and open the workflow.
6. Double-click the skipped approval activity.
7. Click Users or Groups.
8. Assign an active user or group for the approval activity. For more information, see Workflow error handling on page 2721.

**Rollback To activity**

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Rollback To behavior**

The Rollback To activity transitions directly to the activity specified by the transition line arrow.

Use the Rollback To activity for all workflows that use multiple or nested rollbacks. Rollback To resets the targeted task (the direct transition) to Open. All tasks that have executed between the Rollback To activity and the targeted task (rolled back task) are set to Pending.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
Figure 758: Rollback to workflow

**Transition history**

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open

(9) Task 2: reset to Pending

(10) Approval 1: reset to Not Yet Requested
Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers. Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

Table 1254:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Activity</td>
<td>Notes</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------</td>
</tr>
<tr>
<td>Input</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Play</td>
<td>Supports variable substitution in the URL field only.</td>
</tr>
<tr>
<td>Forward call</td>
<td>Supports variable substitution in the Phone number field only.</td>
</tr>
</tbody>
</table>

**Scratchpad variables**

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax ${variable_name}. You do not need to include either workflow.scratchpad or activity.scratchpad before the variable name. For example, to use the variable activity.scratchpad.langCode = ‘en-US’, call ${langCode} within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format ${object.value}. For example, you can get the name of a user object, such as workflow.scratchpad.user = {name:'john.smith'} by calling ${user.name}.

**The digit variable**

The Input activity exposes the ${digit} variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

**Use multiple timer activities in one workflow**

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:

- workflow.scratchpad.endTime
- workflow.scratchpad.realStartTime
- workflow.scratchpad.retroactiveSecsLeft

**Publish a custom workflow activity**

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks Publish, which makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click Checkout. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out
activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the workflow editor palette.

**Note:** Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.

---

**Locked versions**

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the workflow editor, selects the checked-out version, and selects Force Checkout, and then Publish.

**Workflow activity pinning**

Workflow administrators can *pin* a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

**Note:** Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.
